IrmLogMaxDirectorySize	Specifies the maximum size of all IRM logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB.

IrmLogMaxFileSize	Specifies the maximum file size for a single log file. When a file reaches the specified size, a log file is created, and the instance number is incremented. The default value is 10 MB.
IrmLogPath	Specifies the IRM log location. The default path is C:\Program Files\Microsoft\Exchange Server\V14\Logging\IRMLogs.

For detailed syntax and parameter information, see the following topics:

- Set-MailboxServer
- Set-ClientAccessServer
- Set-TransportServer
- Set-UMServer

Return to top

1.11.4.9 Managing Information Rights Management

Managing Information Rights Management

Exchange Server 2010 > Messaging Policy and Compliance > Information Rights Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-01-28*

1.11.4.9.1 Enable or Disable IRM for Internal Messages

Enable or Disable IRM for Internal Messages

Messaging Policy and Compliance > Information Rights Management > Managing Information Rights Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Microsoft Exchange Server 2010, Information Rights Management (IRM) is enabled by default for internal messages. This allows you to create transport protection rules and Microsoft Outlook protection rules to IRM-protect messages in transport and on Microsoft Outlook 2010 clients. Enabling IRM for internal messages is a prerequisite for all other IRM features in Exchange 2010, such as transport decryption, journal rule decryption, IRM in Microsoft Office Outlook Web App, and IRM in Microsoft Exchange ActiveSync.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Use the Shell to enable IRM for internal messages

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to enable IRM for internal messages.

This example enables IRM for internal messages for the Exchange organization.

```
Set-IRMConfiguration -InternalLicensingEnabled $true
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Use the Shell to disable IRM for internal messages

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to disable IRM for internal messages.

Caution:
Disabling IRM for internal messages disables all IRM features in the Exchange organization. The client-side IRM features in Outlook, for example, the ability to read, reply to, forward, and create IRM-protected messages using an Active Directory Rights Management Services (AD RMS) server, aren't affected.

This example disables IRM for internal messages for the Exchange organization.

```
Set-IRMConfiguration -InternalLicensingEnabled $false
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

1.11.4.9.2 Create a Transport Protection Rule

Create a Transport Protection Rule

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can use transport protection rules to apply persistent rights protection to messages based on message properties such as sender, recipient, message subject, and content.

Caution:
Before you create transport rules in your production environment, use a test environment to learn how to create transport rules and test them thoroughly. The transport rules created in this topic are examples. You can create transport rules by using the appropriate transport rule predicates and values based on your requirements.

Important:
If you configure transport protection rules to protect messages using Information Rights Management (IRM), and you also use journaling, consider enabling journal report decryption to allow the Journaling agent to save an unencrypted copy of the message in the journal report. For more information, see Understanding Journal Report Decryption.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Prerequisites

A server running Active Directory Rights Management Services (AD RMS) is available in your organization.

Important:
After you create a transport protection rule, if the rule can't be applied to messages because an AD RMS server is unavailable, messages will be queued on Hub Transport servers. Depending on the volume of these messages, additional disk space may be consumed on Hub Transport servers. Exchange will attempt to IRM-protect the message three times. After these attempts, if the AD RMS server is unreachable or the message can't be IRM-protected, a non-delivery report (NDR) is sent to the sender.

Use the EMC to create a transport protection rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Transport rules" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Hub Transport**.
2. In the action pane, click **New Transport Rule**.
3. On the **Introduction** page, complete the following fields:
   - **Name** Type a name for the transport rule.
   - **Comments** (optional) You can use this field to describe the rule's functionality, and relevant details such as a change request or trouble ticket number, date, and name of the administrator. Text in this field has no impact on rule functionality.
   - **Enabled** New rules are enabled by default. If you want the rule to be

created in a disabled state, clear the check box.

4. On the **Conditions** page, complete the following fields:
   - In the **Step 1. Select Condition(s)** box, select all the conditions that you want to apply to this rule.

     Important:
     If you don't select any conditions when creating a transport protection rule, all messages handled by servers running Microsoft Exchange Server 2010 with Hub Transport servers installed in your organization are IRM-protected. IRM-protecting all messages requires more resources. Therefore, we recommend that you plan your Hub Transport servers and AD RMS deployment accordingly.

   - If you selected conditions in the **Select Conditions** box, in the **Step 2. Edit the rule description by clicking an underlined value** box, click each blue underlined word.
   - When you click a blue underlined word, a window opens to prompt you for the values to apply to the condition. Select the values that you want to apply, or type the values manually. If the window requires that you manually add values to a list, type a value, and then click **Add**. Repeat this process until you have entered all the values, and then click **OK** to close the window.
   - Repeat the previous step for each condition that you selected. After you configure all the conditions, click **Next**.
5. On the **Actions** page, complete the following fields:
   - In the **Step 1. Select actions** box, select **rights protect message with RMS template**.
   - In the **Step 2: Edit the rule description by clicking an underlined value** box, click the underlined words **RMS template**.
   - In the **Select RMS template** dialog box, select an available RMS template, and then click **OK**.
6. (Optional) On the **Exceptions** page, select an exception you want to use, and then type the appropriate value if required.
7. On the **Create Rule** page, review the **Configuration Summary** to make sure the predicates and values used in the conditions and any exceptions appear as expected. Make sure the RMS template selected is the one you intend to use.
8. Click **New** to create the transport rule.
9. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to create a transport protection rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Transport rules" entry in the Messaging Policy and Compliance Permissions topic.

To create a transport protection rule, you must have rights management templates created in your AD RMS deployment. This example retrieves the available templates from your AD RMS cluster.

```
Get-RMSTemplate | fl
```

This example creates the transport protection rule Protect-BusinessCriticalProject. The rule IRM-protects messages that contain the phrase "Business Critical" in the Subject field with the **Do Not Forward** template.

Note:

The `SubjectContainsWords` value is used in this example. You can use any combination of transport rule values to form the conditions and exceptions for the rule.

```
New-TransportRule -Name "Protect-BusinessCriticalProject" -SubjectContainsWords "
```

For detailed syntax and parameter information, see Get-RMSTemplate and New-TransportRule.

Other Tasks

After you create a transport protection rule, you may also want to:

- Enable or Disable a Transport Rule
- Enable or Disable Transport Decryption
- Enable or Disable Journal Report Decryption

1.11.4.9.3 Create an Outlook Protection Rule

Create an Outlook Protection Rule

Messaging Policy and Compliance > Information Rights Management > Managing Information Rights Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Using Microsoft Outlook protection rules, you can protect messages with Information Rights Management (IRM) by applying an Active Directory Rights Management Services (AD RMS) template in Outlook 2010 before the messages are sent.

Important:

If you configure Outlook protection rules to IRM-protect messages, consider enabling transport decryption to allow transport agents, including the Transport Rules agent, to decrypt and access the message. If you use journaling, you should also consider enabling journal report decryption to allow the Journaling agent to save an unencrypted copy of the message in the journal report. For more information, see Understanding Journal Report Decryption.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Prerequisites

You must have an AD RMS server deployed in the same Active Directory forest as your server running Microsoft Exchange Server 2010.

Use the Shell to create an Outlook protection rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to create Outlook protection rules.

This example creates the Outlook protection rule Project Contoso. The rule protects messages sent to the ContosoPMs distribution group with the AD RMS template Business Critical.

```
New-OutlookProtectionRule -Name "Project Contoso" -SentTo "DL-ContosoPMs@contoso.
```

Note:
When you use the `SentTo` predicate for an Outlook protection rule and specify a distribution group, only messages addressed to the distribution group in the To, Cc, or Bcc fields are IRM-protected. IRM protection isn't applied to messages addressed to individual members of the distribution group.

You can also use the `FromDepartment` and `SentToScope` predicates to apply IRM protection to messages sent from users in the specified department or messages sent to the specified scope (`InOrganization` for internal messages, `All` for all recipients).

For detailed syntax and parameter information, see New-OutlookProtectionRule.

Other Tasks

After you create an Outlook protection rule, you may also want to:

- Remove an Outlook Protection Rule
- Enable or Disable Transport Decryption
- Enable or Disable Journal Report Decryption

1.11.4.9.4 Remove an Outlook Protection Rule

Remove an Outlook Protection Rule

Messaging Policy and Compliance > Information Rights Management > Managing Information Rights Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Using Microsoft Outlook protection rules, you can protect messages with Information Rights Management (IRM) by applying an Active Directory Rights Management Services (AD RMS) template in Outlook 2010 before the messages are sent. To prevent an Outlook protection rule from being applied, you can disable the rule. Removing an Outlook protection rule removes the rule definition from Active Directory.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Use the Shell to remove an Outlook protection rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to remove Outlook protection rules.

This example removes the Outlook protection rule OPR-DG-Finance.

```
Remove-OutlookProtectionRule -Identity "OPR-DG-Finance"
```

For detailed syntax and parameter information, see Remove-OutlookProtectionRule.

Use the Shell to remove all Outlook protection rules

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to remove Outlook protection rules.

This example removes all Outlook protection rules in the Exchange organization.

```
Get-OutlookProtectionRule | Remove-OutlookProtectionRule
```

For detailed syntax and parameter information, see Get-OutlookProtectionRule and Remove-OutlookProtectionRule.

Other Tasks

After you remove an Outlook protection rule, you may also want to create an Outlook protection rule. For detailed steps, see Create an Outlook Protection Rule.

1.11.4.9.5 Add the Federation Mailbox to the AD RMS Super Users Group

Add the Federation Mailbox to the AD RMS Super Users Group

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

For the following Microsoft Exchange Server 2010 Information Rights Management (IRM)

features to be enabled, you must add the Federation mailbox (a system mailbox created by Exchange 2010 Setup) to the super users group on your organization's Active Directory Rights Management Services (AD RMS) cluster:

- IRM in Microsoft Office Outlook Web App
- Journal report decryption
- Transport decryption

You can configure a mail-enabled distribution group as a super users group in AD RMS. Members of the distribution group are granted an owner use license when they request a license from the AD RMS cluster. This allows them to decrypt all RMS-protected content published by that cluster. Whether you use an existing distribution group or create a distribution group and configure it as the super users group in AD RMS, we recommend that you dedicate the distribution group for this purpose and configure the appropriate settings to approve, audit, and monitor membership changes.

Note:
If a super users group is already configured on an AD RMS cluster, any modifications to the distribution group membership can take up to 24 hours to be refreshed by the AD RMS cluster. This is a result of caching the group membership on the cluster.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Prerequisites

An AD RMS cluster is deployed in the Active Directory forest.

Use the Shell to add the Federation mailbox to a distribution group

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Distribution groups" entry in the Mailbox Permissions topic.

If a distribution group has been created and configured as a super users group in the AD RMS cluster, you can add the Exchange 2010 Federation mailbox as a member of that group. If a super users group isn't configured, you must create a distribution group and add the Federation mailbox as a member.

1. Create a distribution group dedicated for use as an AD RMS super users group. For details, see Create a Distribution Group.
2. Add the user **FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042** to the new distribution group. The Federation mailbox is a system mailbox, and therefore not visible in the EMC. To add it to a distribution group, you must use the Add-DistributionGroupMember cmdlet from the Shell.
   This example adds the Federation mailbox to the ADRMSSuperUsers distribution group.

```
Add-DistributionGroupMember ADRMSSuperUsers -Member FederatedEmail.4c1
```

For detailed syntax and parameter information, see Add-DistributionGroupMember.

Use AD RMS to set up a super users group

Perform the following procedure on an AD RMS cluster. The account used to perform this procedure must be a member of the AD RMS Enterprise Administrators local group on the AD RMS server.

1. Open the Active Directory Rights Management Services console and expand the AD RMS cluster.
2. In the console tree, expand **Security Policies**, and then click **Super Users**.
3. In the action pane, click **Enable Super Users**.
4. In the result pane, click **Change Super User Group** to open the **Super Users** property sheet.
5. In the **Super user group** box, type the e-mail address of the distribution group you created in the previous procedure, or click **Browse** to select a distribution group.

Other Tasks

After you add the Federation mailbox to the AD RMS super users group, you may also want to:

- Enable or Disable Information Rights Management on Client Access Servers
- Enable or Disable Transport Decryption
- Enable or Disable Journal Report Decryption

1.11.4.9.6 Enable or Disable Transport Decryption

Enable or Disable Transport Decryption

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Enabling transport decryption allows the Transport Rules agent on Hub Transport servers to access content in messages protected by Information Rights Management (IRM). As a result, other transport agents can access message content and possibly make changes to it. For example, the Transport Rules agent may need to inspect message content and apply transport rules (such as rules that apply a disclaimer to the message). To successfully decrypt IRM-protected messages, you must add the Federated Delivery mailbox to the super users group configured on your Active Directory Rights Management Services (AD RMS) server.

Important:

Members of the super users group are granted an owner use license when they request a license from the AD RMS cluster. This allows them to decrypt all RMS-protected content created by that AD RMS cluster.

When enabling transport decryption, you can specify the following settings:

- **Mandatory** Rejects messages that can't be decrypted and returns a non-delivery report (NDR) to the sender.
- **Optional** Uses a best-effort approach to decryption. If possible, messages are decrypted, but they're delivered even if decryption fails.

To learn more about transport decryption, see Understanding Transport Decryption.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Prerequisites

- An AD RMS server exists in the Active Directory forest and is accessible.
- The Federated Delivery mailbox has been added to the AD RMS super users group. For details, see Add the Federation Mailbox to the AD RMS Super Users Group.

Use the Shell to enable transport decryption

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to enable transport decryption.

This example enables transport decryption for the Microsoft Exchange Server 2010 organization. Messages that can't be decrypted are rejected, and an NDR is returned to the sender.

```
Set-IRMConfiguration -TransportDecryptionSetting Mandatory
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Use the Shell to disable transport decryption

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to disable transport decryption.

This example disables transport decryption for the Exchange 2010 organization.

```
Set-IRMConfiguration -TransportDecryptionSetting Disabled
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Other Tasks

After you enable or disable transport decryption, you may also want to:

- Enable or Disable Journal Report Decryption
- Enable or Disable Information Rights Management on Client Access Servers

Configure IRM for Exchange Search and Discovery

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Microsoft Exchange Server 2010, you can configure Information Rights Management (IRM) so that Exchange Search can index IRM-protected messages.

When members of the Discovery Management role group use Multi-Mailbox Search to perform a discovery search, IRM-protected messages are returned in the search results and copied to the Discovery mailbox specified in the search. Furthermore, in Exchange 2010 Service Pack 1 (SP1) and later, members of the Discovery Management role group can use Outlook Web App to access the IRM-protected messages that were copied to the Discovery mailbox as a result of the discovery search.

Note:
Members of the Discovery Management role group can't access IRM-protected messages exported from a Discovery mailbox to another mailbox or to a .pst file. IRM-protected messages in a Discovery mailbox can be accessed only by using Outlook Web App.

Looking for other management tasks related to managing IRM? Check out Managing Information Rights Management.

Prerequisites

- IRM is configured in your Exchange 2010 organization. To learn more, see Enable or Disable IRM for Internal Messages.
- The Federation mailbox is added to the Active Directory Rights Management Services (AD RMS) super users group. To learn more, see Add the Federation Mailbox to the AD RMS Super Users Group.

Use the Shell to configure IRM for Exchange Search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to configure IRM for Exchange Search.

This example configures IRM to allow Exchange Search to index IRM-protected messages.

Note:
By default, the *SearchEnabled* parameter is set to `$true`. To disable indexing of IRM-protected messages, set it to `$false`. Disabling indexing of IRM-protected messages prevents them from being returned in search results when users search their mailbox or when discovery managers use Multi-Mailbox Search.

```
Set-IRMConfiguration -SearchEnabled $true
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Use the Shell to configure IRM for discovery

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to configure IRM for discovery.

This example specifies that members of the Discovery Management role group can access IRM-protected messages that reside in the Discovery mailbox.

Note:
By default, the *EDiscoverySuperUserEnabled* parameter is set to `$true`. To disable access to IRM-protected messages for members of the Discovery Management role group, set it to `$false`.

```
Set-IRMConfiguration -EDiscoverySuperUserEnabled $true
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Other Tasks

After you configure IRM for Exchange Search and discovery, you may also want to:

- Enable or Disable IRM for Internal Messages
- Enable or Disable Information Rights Management Logging

1.11.4.9.8 Enable or Disable Journal Report Decryption

Enable or Disable Journal Report Decryption

Messaging Policy and Compliance > Information Rights Management > Managing Information Rights Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Enabling journal report decryption allows the Journaling agent to attach a decrypted copy of a rights-protected message to the journal report. Before you enable Journal Report Decryption, you must add the Federated Delivery mailbox to the super users group configured on your Active Directory Rights Management Services (AD RMS) server.

Important:
Members of the super users group are granted an owner use license when they request a license from the AD RMS cluster. This allows them to decrypt all RMS-protected content created by that AD RMS cluster.

Looking for other management tasks related to Information Rights Management (IRM)? Check out Managing Information Rights Management.

Prerequisites

- An AD RMS cluster is installed in the Active Directory forest.
- The Federated Delivery mailbox has been added to an AD RMS super users group. For details, see Add the Federation Mailbox to the AD RMS Super Users Group.

Use the Shell to enable Journal Report Decryption

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to enable Journal Report Decryption.

This example enables Journal Report Decryption for the Exchange organization.

```
Set-IRMConfiguration -JournalReportDecryptionEnabled $true
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Use the Shell to disable Journal Report Decryption

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to disable journal report decryption.

This example disables Journal Report Decryption for the Exchange organization.

```
Set-IRMConfiguration -JournalReportDecryptionEnabled $false
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Other Tasks

After you enable Journal Report Decryption, you may also want to:

- Enable Per-Mailbox Database Journaling
- Create a Journal Rule

Enable or Disable Information Rights Management on Client Access Servers

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Enabling Information Rights Management (IRM) on Client Access servers enables the following features:

- Microsoft Office Outlook Web App
- IRM in Microsoft Exchange ActiveSync

When IRM is enabled on Client Access servers, Outlook Web App users can IRM-protect messages by applying an Active Directory Rights Management Services (AD RMS) template created on your AD RMS cluster. Outlook Web App users can also view IRM-protected messages and supported attachments. Before you enable IRM on Client Access servers, you must add the Federation mailbox to the super users group on the AD RMS cluster.

Important:

Members of the super users group are granted an owner use license when they request a license from the AD RMS cluster. This allows them to decrypt all RMS-protected content by that cluster.

You can use the **Set-IRMConfiguration** cmdlet to enable or disable IRM in Outlook Web App and IRM in Exchange ActiveSync for the entire Exchange 2010 organization.

You can also control IRM in Outlook Web App at the following levels:

- **Per-Outlook Web App virtual directory** To enable or disable IRM in Outlook Web App for an Outlook Web App virtual directory, use the **Set-OWAVirtualDirectory** cmdlet and set the *IRMEnabled* parameter to `$false` or `$true` (default). This allows you to disable IRM in Outlook Web App for one virtual directory on an Exchange 2010 Client Access server, while keeping it enabled on another virtual directory on a different Client Access server.
- **Per-Outlook Web App mailbox policy** To enable or disable IRM in Outlook Web App for an Outlook Web App mailbox policy, use the **Set-OWAMailboxPolicy** cmdlet and set the *IRMEnabled* parameter to `$false` or `$true` (default). This allows you to enable IRM in Outlook Web App for one set of users and disable it for another set of users by assigning them a different Outlook Web App mailbox policy.

You can also control IRM in Exchange ActiveSync per Microsoft ActiveSync mailbox policy. To disable or enable IRM in Exchange ActiveSync for an ActiveSync mailbox policy, use the **Set-ActiveSyncMailboxPolicy** cmdlet and set the *IRMEnabled* parameter to `$false` or `$true` (default). This allows you to enable IRM in Exchange ActiveSync for one set of users and disable it for another set of users by assigning them a different ActiveSync mailbox policy.

Note:

In the release to manufacturing (RTM) version of Microsoft Exchange Server 2010, the *OWAEnabled* parameter is used to enable or disable IRM in Outlook Web App. In Microsoft Exchange Server 2010 Service Pack 1 (SP1), the *OWAEnabled* parameter is replaced by the *ClientAccessServerEnabled* parameter, which enables or disables IRM in Outlook Web App and IRM in Exchange ActiveSync (provided that the other requirements for these features are met).

Looking for other management tasks related to rights protection? Check out Managing Information Rights Management.

Prerequisites

- An AD RMS cluster is installed in the Active Directory forest.
- The Federation mailbox has been added to the AD RMS super users group. For detailed instructions, see Add the Federation Mailbox to the AD RMS Super Users Group.
- IRM features are enabled for the organization. For detailed instructions, see Enable or Disable IRM for Internal Messages.

Use the Shell to enable IRM on Client Access servers

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to enable IRM on Client Access servers.

This example enables IRM on a Client Access server for an Exchange 2010 organization.

```
Set-IRMConfiguration -ClientAccessServerEnabled $true
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Use the Shell to disable IRM on Client Access servers

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Rights protection" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to disable IRM on Client Access servers.

This example disables IRM on a Client Access server for an Exchange 2010 organization.

```
Set-IRMConfiguration -ClientAccessServerEnabled $false
```

For detailed syntax and parameter information, see Set-IRMConfiguration.

Other Tasks

After you enable IRM on Client Access servers, you may also want to:

- Create a Transport Protection Rule.
- View or Configure Exchange ActiveSync Mailbox Policy Properties.

Enable or Disable Information Rights Management Logging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Exchange 2010 Service Pack 1 (SP1), you can use Information Rights Management (IRM) logs to monitor and troubleshoot IRM operations on Mailbox, Hub Transport, Client Access, and Unified Messaging servers. IRM logging is enabled by default.

IRM logs use the following common set of parameters:

- *IrmLogEnabled* Enables or disables IRM logging. Default: $true
- *IrmLogMaxAge* Specifies the maximum age of IRM log files. Files older than the specified age are deleted. Default: 30 days.
- *IrmLogMaxDirectorySize* Specifies the maximum size of the directory that contains IRM logs. When a directory reaches its maximum file size, the server deletes the oldest log files first. Default: 250 Mb.
- *IrmLogMaxFileSize* Specifies the maximum size of each IRM log file. When a log file reaches the specified size, a new log file is created. Default: 10 MB.
- *IrmLogPath* Specifies the location of the IRM log directory. Default: `<Exchange 2010 Install path>\V14\Logging\IRMLogs`.

To configure IRM logging for each server role, use the corresponding **Set** cmdlet. For example, to configure IRM logging on a Hub Transport server, use the **Set-TransportServer** cmdlet.

Looking for other management tasks related to IRM? Check out Managing Information Rights Management.

Use the Shell to enable IRM logging on a server

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Configure IRM logging" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the Exchange Management Console (EMC) to enable IRM logging on a server.

This example enables IRM log on a Hub Transport server.

```
Set-TransportServer -Identity EXCH01 -IRMLogEnabled $true
```

For detailed syntax and parameter information, see the following topics:

- Set-TransportServer
- Set-MailboxServer
- Set-ClientAccessServer
- Set-UMServer

Use the Shell to disable IRM logging on a

server

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Configure IRM logging" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the Exchange Management Console (EMC) to disable IRM logging on a server.

This example disables IRM logging on a Hub Transport server.

```
Set-TransportServer -Identity EXCH01 -IRMLogEnabled $false
```

For detailed syntax and parameter information, see the following topics:

- Set-TransportServer
- Set-MailboxServer
- Set-ClientAccessServer
- Set-UMServer

1.11.5 Journaling

Journaling

Managing Journaling

Get step-by-step guidance for managing journaling in your organization.

1.11.5.1 Understanding Journaling

Understanding Journaling

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-10-26*

Journaling can help your organization respond to legal, regulatory, and organizational compliance requirements by recording inbound and outbound e-mail communications. When planning for messaging retention and compliance, it's important to understand journaling, how it fits in your organization's compliance policies, and how Microsoft Exchange Server 2010 helps you secure journaled messages.

Contents

Why Journaling Is Important

First, you must understand the difference between journaling and archiving:

- Journaling is the ability to record all communications, including e-mail communications, in an organization for use in the organization's e-mail retention or archival strategy. To meet an increasing number of regulatory and compliance requirements, many organizations must maintain records of communications that occur when employees perform daily business tasks.
- *Archiving* refers to backing up the data, removing it from its native environment, and storing it elsewhere, therefore reducing the strain of data storage. You may use Exchange journaling as a tool in your e-mail retention or archival strategy.

Although journaling may not be required by a specific regulation, compliance may be achieved through journaling under certain regulations. For example, corporate officers in some financial sectors may be held liable for the claims made by their employees to their customers. To verify that the claims are accurate, a corporate officer may set up a system where managers review some part of employee-to-client communications regularly. Every quarter, the managers verify compliance and approve their employees' conduct. After all managers report approval to the corporate officer, the corporate officer reports compliance, on behalf of the company, to the regulating body. In this example, e-mail messages might be one type of the employee-to-client communications that managers must review; therefore, journaling can be used to collect all e-mail messages sent by client-facing employees. Other client communication mechanisms may include faxes and telephone conversations, which may also be subject to regulation. The ability to journal all classes of data in an enterprise is a valuable functionality of the IT architecture.

The following list shows some of the more well-known U.S. and international regulations where journaling may help form part of your compliance strategies:

- Sarbanes-Oxley Act of 2002 (SOX)
- Security Exchange Commission Rule 17a-4 (SEC Rule 17 A-4)
- National Association of Securities Dealers 3010 & 3110 (NASD 3010 & 3110)
- Gramm-Leach-Bliley Act (Financial Modernization Act)
- Financial Institution Privacy Protection Act of 2001
- Financial Institution Privacy Protection Act of 2003
- Health Insurance Portability and Accountability Act of 1996 (HIPAA)
- Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism Act of 2001 (Patriot Act)
- European Union Data Protection Directive (EUDPD)
- Japan's Personal Information Protection Act

Return to top

Journaling Agent

In an Exchange 2010 organization, all e-mail traffic is routed by the Hub Transport server. All messages traverse at least one Hub Transport server in their lifetime. The *Journaling agent* is a compliance-focused transport agent that processes messages on Hub Transport servers. It fires on the **OnSubmittedMessage** and **OnRoutedMessage** transport events.

Note:

In Exchange 2010, the Journaling agent is a built-in agent. Built-in agents aren't included in the list of agents returned by the **Get-TransportAgent** cmdlet. For more details, see Understanding Transport Agents.

Exchange 2010 provides the following journaling options:

- **Standard journaling** Standard journaling is configured on a mailbox database. It enables the Journaling agent to journal all messages sent to and from mailboxes located on a specific mailbox database. To journal all messages to and from all recipients and senders, you must configure journaling on all mailbox databases on all Mailbox servers in the organization.
- **Premium journaling** Premium journaling enables the Journaling agent to perform more granular journaling by using journal rules. Instead of journaling all mailboxes residing on a mailbox database, you can configure journal rules to match your organization's needs by journaling individual recipients or members of distribution groups. You must have an Exchange Enterprise client access license (CAL) to use premium journaling.

When you enable standard journaling on a mailbox database, this information is saved in Active Directory and is read by the Journaling agent. Similarly, journal rules configured with premium journaling are also saved in Active Directory and applied by the Journaling agent. For more information about how to configure standard and premium journaling, see Journaling.

Return to top

Journal Rules

Here are key aspects of a journal rule that you should understand:

- Journal Rule Scope Defines which messages are journaled by the Journaling agent.
- Journal Recipients Specifies the SMTP address of the recipient you want to

journal.

- Journaling Mailbox Specifies one or more mailboxes used for collecting journal reports.

Journal Rule Scope

You can target the journal rule to Internal, External, or Global recipients. The following list describes these scopes:

- **Internal** Journal rules with the scope set to Internal target messages sent and received by recipients inside your Exchange organization.
- **External** Journal rules with the scope set to External target messages sent to recipients or received from senders outside your Exchange organization.
- **Global** Journal rules with the scope set to Global target all messages that pass through Hub Transport servers. These include messages that may have already been processed by journal rules in the Internal and External scopes.

Journal Recipients

You can implement targeted journaling rules by specifying the SMTP address of the recipient you want to journal. The recipient can be an Exchange mailbox, distribution group, or a contact. These recipients may be subject to regulatory requirements, or they may be involved in legal proceedings where e-mail messages or other communications are collected as evidence. By targeting specific recipients or groups of recipients, you can easily configure a journaling environment that matches your organization's processes and regulatory and legal requirements, and minimize storage and other costs associated with retention of large amounts of data.

All messages sent to or from the journaling recipients you specify in a journaling rule are journaled. If you specify a distribution group as the journaling recipients, all messages sent to and from members of the distribution group are journaled. If you don't specify a journaling recipient, all messages sent to or from recipients that match the journal rule scope are journaled.

Unified Messaging-Enabled Journal Recipients

Many organizations that implement journaling may also use Unified Messaging (UM) to consolidate their e-mail, voice mail, and fax infrastructure. However, you may not want the journaling process to generate journal reports for messages generated by Unified Messaging. In these cases, you can decide whether to journal voice mail messages and missed call notification messages handled by an Exchange 2010 Unified Messaging server or to skip such messages. If your organization doesn't require journaling of such messages, you can reduce the amount of hard disk space required to store journal reports by skipping such messages. When you enable or disable the journaling of voice mail messages and missed call notification messages, your change is applied to all Hub Transport servers in your organization.

Note:

Messages that contain faxes generated by a Unified Messaging server are always journaled, even if you configure a journal rule that specifies not to journal Unified Messaging voice mail and missed call notification messages.

For more information about how to enable or disable voice mail and missed call notification messages, see Managing Journaling.

Return to top

Journaling Mailbox

The journaling mailbox is used for collecting journal reports. How the journaling mailbox is configured depends on your organization's policies, regulatory requirements, and legal requirements. You can specify one journaling mailbox to collect messages for all the journal rules configured in the organization, or you can use different journaling mailboxes for different journal rules or sets of journal rules.

Important:
Journaling mailboxes contain very sensitive information. You must secure journaling mailboxes because they collect messages that are sent to and from recipients in your organization. These messages may be part of legal proceedings or may be subject to regulatory requirements. Various laws require that messages remain tamper-free before they're submitted to an investigatory authority. We recommend that you create policies that govern who can access the journaling mailboxes in your organization, limiting access to only those individuals who have a direct need to access them. Speak with your legal representatives to make sure that your journaling solution complies with all the laws and regulations that apply to your organization.

For more information about how to configure the journaling mailbox, see Managing Journaling.

For more information about how to protect journaling mailboxes, see Protecting Journal Reports.

Return to top

Journal Rule Replication

Journal rules are stored in Active Directory and applied by all Hub Transport servers in the Exchange 2010 organization. When you create, modify, or remove a journal rule on a Hub Transport server, the change is replicated to all Active Directory servers in the organization. All Hub Transport servers in the organization then retrieve the updated journal rule configuration from the Active Directory servers and apply the new or modified journal rules.

By replicating all the journal rules across the organization, Exchange 2010 enables you to provide a consistent set of journal rules across the organization. All messages that pass in or through your Exchange 2010 organization are subject to the same journal rules.

Important:
Replication of journal rules across an organization is dependant on Active Directory replication. Replication time between Active Directory domain controllers varies depending on the number of sites in the organization and the speed of links and other factors outside the control of Microsoft Exchange. Consider replication delays when you implement journal rules in your organization. For more information about Active Directory replication, see Active Directory Replication Technologies.

Important:
Each Hub Transport server caches distribution group membership to avoid repeated round trips to Active Directory. The expanded groups cache reduces the number of requests that each Hub Transport server must make to an Active Directory domain controller. By default, entries in the expanded groups cache expire in four hours. Therefore, if you specify a distribution group as the journal recipient, changes to distribution group membership may not be applied to journal rules until the expanded groups cache is updated. To force an immediate update of the recipient cache, you must stop and start the Microsoft Exchange Transport service. You must do this for each Hub Transport server where you want to forcibly update the recipient cache.

Return to top

Journal Reports

A *journal report* is the message that the Journaling agent generates when a message matches a journal rule and is to be submitted to the journaling mailbox. The original

message that matches the journal rule is included unaltered as an attachment to the journal report. The body of a journal report contains information from the original message such as the sender e-mail address, message subject, message-ID, and recipient e-mail addresses. This is also referred to as envelope journaling, and is the only journaling method supported by Exchange 2010 and Exchange 2007.

For more information about journal reports and how to manage and protect them, see the following topics:

- Understanding Journal Reports
- Protecting Journal Reports
- Understanding How to Manage Journal Reports

Journal Reports and IRM-Protected Messages

When implementing journaling in an Exchange 2010 environment, you must consider journaling reports and IRM-protected messages. IRM-protected messages will affect the search and discovery capabilities of third-party archiving systems that don't have RMS support built-in. In Exchange 2010, you can configure Journal Report Decryption to save a clear-text copy of the message in a journal report. For more information, see Understanding Journal Report Decryption.

Return to top

Interoperability with Exchange 2003 and Exchange 2007

Exchange 2010 supports journaling in a mixed Exchange 2010 and Exchange 2003 organization. Exchange 2010 can read the Exchange 2003 journaling configuration present on Exchange 2010 mailbox databases, and then journal messages to either an Exchange 2003 or Exchange 2010 journaling mailbox.

Exchange 2003 can't read the journaling configuration used by Exchange 2010. However, Exchange 2010 stamps journaled messages and journal reports with properties that Exchange 2003 can read. If a message has already been journaled by Exchange 2010 and the journal reports are sent to the same journaling mailbox, Exchange 2003 doesn't journal the message again. If a message is a journal report, Exchange 2003 treats the Exchange 2010 journal report as if it was an Exchange 2003 journal report.

For more information about journaling in a coexistence environment, see Understanding Journaling in a Mixed Exchange 2003 and Exchange 2010 Environment.

There is little difference between journaling functionality in Exchange 2010 and Exchange 2007. However, Exchange 2010 journal rules use a different format than journal rules in Exchange 2007. Exchange 2010 Setup creates a separate container in Active Directory to store Exchange 2010 journal rules. When you set up the first Exchange 2010 server in an Exchange 2007 organization, Setup creates a copy of the Exchange 2007 journal rules and stores them in the new container. When Setup finishes, the journal rules used by both versions are consistent. After Setup completes, if you change he journal rule configuration on an Exchange 2007 server, you must make the same change on an Exchange 2010 server to ensure they're consistent. You can also export journal rules from Exchange 2007 and import them on an Exchange 2010 server. For details, see Export and Import Exchange 2007 Journal Rules.

Return to top

Using Exchange Hosted Services

Journaling is enhanced by or is also available as a service from Microsoft Exchange Hosted

Services.

Exchange Hosted Services is a set of four distinct hosted services:

- Hosted Filtering, which helps organizations protect themselves from e-mail-borne malware
- Hosted Archive, which helps them satisfy retention requirements for compliance
- Hosted Encryption, which helps them encrypt data to preserve confidentiality
- Hosted Continuity, which helps them preserve access to e-mail during and after emergency situations

These services integrate with any on-premises Exchange servers that are managed in-house or Hosted Exchange e-mail services that are offered through service providers. For more information about Exchange Hosted Services, see Microsoft Exchange Hosted Services.

1.11.5.2 Understanding Journal Reports

Understanding Journal Reports

Exchange Server 2010 > Messaging Policy and Compliance > Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-02-09*

Journal reports contain important message content and metadata. Understanding the structure of journal reports allows you to interpret the information in these reports.

Looking for management tasks related to managing journaling? See Managing Journaling.

Contents

Journal Reports

A *journal report* is the message generated by the Journaling agent on a Hub Transport server and delivered to the journaling mailbox. The original message is included unaltered as an attachment to the journal report. This type of journal report is called an *envelope journal report*.

Note:
Microsoft Exchange Server 2010 supports envelope journaling only.

When using standard journaling, journal reports are generated for all messages sent or received by mailboxes on a mailbox database enabled for journaling. When using premium journaling, journal reports are generated for messages that match a journal

rule.

For more information about journaling, see Understanding Journaling.

The information contained in a journal report is organized so that every value in each header field has its own line. This enables you to easily parse journal reports manually or by using an automated process, depending on your requirements.

When the Journaling agent journals a message, it tries to capture as much detail as possible about the original message. This information is very important in determining the intent of the message, its recipients, and its senders. For example, whether the recipients that are identified in the message are directly addressed in the To field, the Cc field or are included as part of a distribution list may determine the nature and extent of their involvement in the e-mail communication.

Depending on the situation, Exchange 2010 may generate more than one journal report for a single message. Whether a single message generates one journal report or multiple journal reports depends on several factors, such as message bifurcation or distribution group expansion.

Journal reports can potentially contain very sensitive information and must be protected so that they can't be viewed by unauthorized individuals. For more information about how you can protect journal reports, see Protecting Journal Reports.

For more information about managing journal reports, see Understanding How to Manage Journal Reports.

Return to top

Journal Report Fields

The following sections describe each field contained within journal reports generated by Exchange 2010. These fields are separated into basic and extended fields, as shown in the following table.

Basic and extended journal report fields

Basic journal report fields	Extended journal report fields
Sender	To
Subject	Cc
Message-ID	Bcc
Recipient	On-Behalf-Of

Whether extended journal report fields are populated depends on whether recipient addressing can be determined. This happens in the following circumstances:

- **MAPI submission to a Client Access server** Recipient addressing can be determined when a message is submitted to a Client Access server using a MAPI client such as Microsoft Outlook 2010.
- **Authenticated SMTP submission to a Hub Transport server** Recipient addressing can also be determined when a message is submitted to a Hub Transport server in an authenticated SMTP session. The authenticated sender must not have the `ms-Exch-Smtp-Accept-Any-Sender` permission because this generally indicates that the sender was an Exchange server.

If recipient addressing can be determined for a particular recipient, the recipient e-mail

address is inserted into the appropriate extended To, Cc, or Bcc fields described in the "Extended journal report fields" table later in this topic. The recipient e-mail address isn't inserted into the basic Recipient field described in the "Basic journal report fields" table later in this topic.

If a message is submitted to a Hub Transport server by using any other method, such as anonymous submission from an Edge Transport server or submission from a server running Exchange Server 2003, Exchange can't verify that the recipient addressing hasn't been tampered with. If recipient addressing can't be verified, the recipient e-mail address is inserted in the basic Recipient field and not into an extended To, Cc, or Bcc field.

For each recipient addressed on a message, one recipient journal report field is added. No recipient field contains more than one recipient e-mail address, except as follows:

- Recipient fields that contain recipients that have been expanded from a distribution group
- Recipient fields that contain recipients that have received a message forwarded from another mailbox

For expanded or forwarded messages, the e-mail address of the recipient that received final delivery of the message and the e-mail address of the distribution group or mailbox that was originally addressed are included.

Basic Journal Report Fields

Basic fields in Exchange 2010 journal reports include the sender, subject, and Message-ID of the original message. All journal reports include this information if it's present in the original message.

The fourth basic field is the Recipient field. Exchange 2010 only classifies information that it knows is correct. If Exchange can't determine whether a recipient was included in the To, Cc, or Bcc recipient fields, the recipient is added to the Recipient field in the journal report.

The following table lists the basic fields that are included in the body of journal reports.

Basic journal report fields

Field name	Description
Sender	The Sender field displays the SMTP address of the sender specified in the From header. If the message is sent on behalf of another sender, the field displays the address specified in the Sender header.
Subject	The Subject field displays the subject header value.
Message-ID	The Message-ID field displays the SMTP Message-ID.
Recipient	The Recipient field displays the SMTP address of a recipient included in an e-mail message when Exchange can't determine the recipient addressing of that message. This includes messages from the Internet or unauthenticated senders and messages that originated from legacy Exchange servers. Recipients added by transport rules or other transport agents are also listed in the Recipient field.

Extended Journal Report Fields

Extended fields in Exchange 2010 journal reports provide more recipient details, if available. The To, Cc, and Bcc fields in the journal report let you view how recipients are addressed in the original message.

The On-Behalf-Of field is populated if the SMTP headers of a message contain both the From and Sender header fields, regardless of whether the message was submitted directly to a Hub Transport server. The SMTP address contained in the From header field is populated in the On-Behalf-Of field.

The following table lists the extended fields that may be included in the body of journal reports.

Extended journal report fields

Field name	Description
On-Behalf-Of	The On-Behalf-Of field displays the SMTP address of the mailbox from which the message appears if the Send On Behalf Of feature is specified by the sender.
To	The To field displays the SMTP address of a recipient included in the message envelope and in the To header field of the message. The recipient address can be included either directly by the sender, or indirectly through distribution list expansion or if the message was forwarded to the recipient by another mailbox. To indicate whether the message went through distribution list expansion or was forwarded, the To field may also contain one Expanded field or one Forwarded field, separated with commas. For more information about these fields, see the "Expanded and Forwarded fields" table later in this topic.
Cc	The Cc field displays the SMTP address of a recipient included in the message envelope and in the Cc header field of the message. The recipient address can be included either directly by the sender, or indirectly through distribution list expansion or if the message was forwarded to the recipient by another mailbox. To indicate whether the message went through distribution list expansion or was forwarded, the Cc field may also contain one Expanded field or one Forwarded field, separated with commas. For more information about these fields, see the "Expanded and Forwarded fields" table later in this topic.
Bcc	The Bcc field displays the SMTP address of a recipient included in the message envelope and in the Bcc header field of the message. The recipient address can be included either

	directly by the sender, or indirectly through distribution list expansion or if the message was forwarded to the recipient by another mailbox. To indicate whether the message went through distribution list expansion or was forwarded, the Bcc field may also contain one Expanded field or one Forwarded field, separated with commas. For more information about these fields, see the "Expanded and Forwarded fields" table later in this topic.

Expanded and Forwarded Fields

The Expanded and Forwarded fields are included as fields on Recipient, To, Cc, or Bcc fields when that recipient has either been expanded from a distribution group or has had the message forwarded from another mailbox. The following table describes the Expanded and Forwarded fields.

Expanded and Forwarded fields

Field	Description
Expanded	The Expanded field is displayed as a field of the To, Cc, and Bcc fields that are described earlier in this topic. The Expanded field is preceded by a comma. The SMTP address displayed in the Expanded field is the address of the distribution group that contains either the recipient specified in the To, Cc, or Bcc field or the nested distribution lists that contain the specified recipient. The address displayed in this field is always the first distribution list to be expanded, regardless of how many nested distribution lists may be between the original parent distribution list and the expanded final recipient specified in the To, Cc, or Bcc field.
Forwarded	The Forwarded field is displayed as a field of the To, Cc, and Bcc fields that are described earlier in this topic. The Forwarded field is preceded by a comma. Usually, the Forwarded field displays the e-mail address of a mailbox configured to forward e-mail messages to the account specified in the To, Cc, or Bcc field. If a chain of forwarding mailboxes is configured, where each mailbox forwards messages to the next one, the first forwarding mailbox is displayed in this field and the SMTP address of the final, non-forwarding mailbox in the chain is displayed in the To, Cc, or Bcc field.

The Journaling agent generates a journal report if a journaling recipient (the recipient specified in a journal rule) is detected in one of the following scenarios:

- The journaling recipient is the sender or a recipient specified in the To, Cc, or

Bcc fields.
- The journaling recipient is a member of a distribution group that's specified in the To, Cc, or Bcc fields.
- A message is automatically forwarded to a journaling recipient.

In the following cases, information about some recipients who aren't journaling recipients may not be included in the journal report.

- **Message chipping occurs** When a Hub Transport server handles a message that's sent to more than 1,000 recipients, either through distribution group expansion or if more than 1,000 recipients are specified in the To, Cc or Bcc fields, the server generates a separate or copy of the message for every 1,000 recipients. This is performed to reduce system resources used during message expansion. By default, each copy contains a maximum of 1,000 recipients. This is known as *message chipping*. Each instance of the message is known as a *chipped message*.
  The Journaling agent processes each chipped message to determine if there are any journaling recipients included in the recipient list. For example, if a message is sent to a distribution group that contains 5,000 members, the Hub Transport server generates five chipped messages, each containing 1,000 recipients. The Journaling agent generates a single journal report for each chipped message that contains a journaling recipient. The journal report contains details of only the 1,000 recipients included in the recipient list of the chipped message. If the distribution group membership contains only one journaling recipient, the Journaling agent generates a single journal report. That report lists only the 1,000 members that were expanded as a result of message chipping.
- **Distribution group expansion servers are specified** When a Hub Transport server receives a message sent to an individual recipient or a distribution group marked for journaling, and a distribution group which has another Hub Transport server specified as the expansion server, the journal report lists the distribution groups as To, Cc, or Bcc recipients, but the Expanded field doesn't include members of the distribution group that wasn't expanded on that server.
  For example, consider a message sent to two distribution groups (DL-Journaled, DL-NotJournaled) and a mailbox user (UserA). The DL-Journaled distribution contains journal recipients. The DL-NotJournaled distribution group has the Hub Transport server HT2 specified as an expansion server. In this example, the following steps are taken:
  .1.The message is first processed by Hub Transport server HT1. HT1 expands DL-Journaled and detects journaling recipients. HT1 generates a journal report that contains the following noteworthy fields:
    To/Cc/Bcc This field includes DL-Journaled, DL-NotJournaled, and UserA.
    Expanded This field includes members of DL-Journaled. If DL-Journaled contains more than 1,000 members, message chipping may occur, which would generate more than one chipped message. It may also include membership of any other distribution groups expanded on HT1 for this particular chipped message (for example, a distribution group that's a member of DL-Journaled).
  .2.HT1 delivers the journal report to the journaling mailbox.
  .3.HT1 marks the message as journaled by inserting the x-header `X-MS-Exchange-Organization-Processed-By-Journaling`.
  .4.HT1 bifurcates the message and sends it to HT2, the expansion server specified for DL-NotJournaled.
  .5.HT1 delivers the message to the next hop for the recipients expanded from DL-Journaled (which could include further bifurcation) and UserA.
  .6.HT2 receives the message. It inspects the message headers and determines that the message has been journaled.
  .7.HT2 expands the DL-NotJournaled distribution group. None of the expanded

recipients are journaling recipients. Therefore, no additional journal reports are generated.

.8. HT2 delivers the message to the next hop for the recipients expanded from DL-NotJournaled (which could include further bifurcation).

Return to top

Journal Report Headers

In Exchange 2003, the journaling of messages and the identification of journal reports are controlled by using the X-EXCH50 binary large object (BLOB). In Exchange 2010, the X-EXCH50 BLOB is deprecated and replaced with SMTP headers. The organization SMTP headers can be accessed only by the Exchange 2010 transport components, and they're removed by the header firewall before a message is delivered to a mailbox or to an SMTP server outside the Exchange 2010 organization.

The following headers are used by the journaling agent:

- `X-MS-Exchange-Organization-Journal-Report` This SMTP header identifies an Exchange 2010 journal report. This allows the message to act as a system message, allowing it to bypass message size and mailbox recipient restrictions. The header is removed when the journal report is delivered to a journal mailbox.
- `X-MS-Journal-Report` This SMTP header is added to a journal report when it's delivered to a journal mailbox, to indicate the message is a journal report. This header lets you differentiate a journal report from a regular message, but it isn't used by any Exchange 2010 transport components.
- `X-MS-Exchange-Organization-Processed-By-Journaling` This SMTP header identifies messages that have been processed by the Exchange 2010 Journaling agent. If the header is included in a message, Exchange 2010 recognizes that the message has already been processed by the Journaling agent on a previous Hub Transport server, and it doesn't journal the message again. This header is removed before the message is delivered to recipients.

These SMTP headers don't contain values. As previously described, the existence of these headers in a message determines whether the message is a journal report or has been processed by the Journaling agent.

For more information, see the following topics:

- Understanding Header Firewall
- Understanding Journaling in a Mixed Exchange 2003 and Exchange 2010 Environment

Return to top

Examples of Journal Reports

The first figure in this section shows an example of a journal report that was generated when a message was sent from an Exchange 2010 mailbox to a Hub Transport server. The message was sent by mailbox user Jennifer Kim to the following recipients:

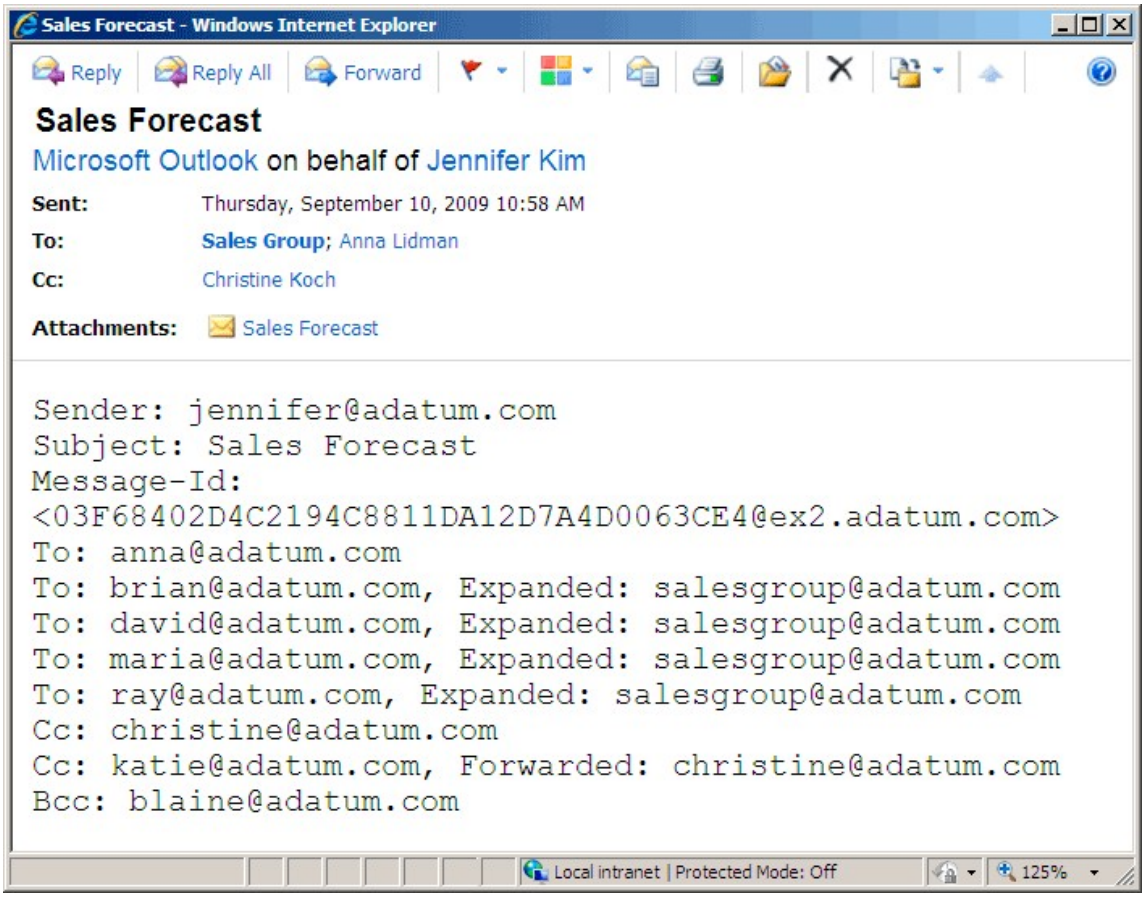
- To: SalesGroup distribution group, Anna Lidman
- Cc: Christine Hughes

  Note:

  Christine's mailbox is configured to automatically forward messages to the mailbox for Katie Jordan, and also keep a copy.

- Bcc: Blaine Dockter

A single journal report was created when the original message was sent. The journal report shown in the following figure lists all the recipients addressed in the To field, including recipients expanded from the SalesGroup distribution group, the Cc field, including recipients to whom the message was forwarded automatically, and the Bcc field recipient.



The following figure shows an example of a journal report that was generated when a message that originated from the Internet was processed by a Hub Transport server. The recipients addressed in this example are the same as the recipients in the previous example. However, in the journal report in this figure, all recipients are included in the Recipient field because the original message was sent from the Internet, and Exchange can't verify that the recipient addressing hasn't been tampered with. As with the first example, a single journal report is created.

1.11.5.3 Understanding How to Manage Journal Reports

Understanding How to Manage Journal Reports

Exchange Server 2010 > Messaging Policy and Compliance > Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-10-13*

When you use Microsoft Exchange Server 2010 to deploy journaling, the following factors can affect the delivery and availability of journal reports generated when a recipient or sender receives or sends messages that are journaled:

- **Journaling mailbox size** You must determine how high to set the mailbox quota on journaling mailboxes.
- **Alternate journaling mailbox** You should consider how configuring an alternate journaling mailbox affects journal report delivery.

For more information, see Understanding Journaling.

Looking for management tasks related to journaling? See Managing Journaling.

Journaling Mailbox Size

When you configure a journaling mailbox to accept journal reports, you must determine the maximum size of the journaling mailbox. As with any other mailbox, the maximum size depends on the data to be stored in the mailbox, the hardware resources available, and the disaster recovery requirements for the server where the journaling mailbox is located. In addition to these considerations, you must also consider what will occur if a journaling

mailbox exceeds the configured mailbox quota.

When you configure the **Prohibit send and receive at (KB)** option for a storage quota on a journaling mailbox, the mailbox accepts journal reports until it reaches the configured storage quota. When the prohibit send and receive storage quota is exceeded, the journaling mailbox stops accepting journal reports.

Exchange doesn't return journal reports to the original sender as it does with regular messages. Instead, it holds undelivered journal reports in a mail queue and tries to redeliver them until delivery is successful. Although this enables Exchange to eventually deliver all the journal reports generated, it can be problematic in organizations with high messaging traffic because the mail queues on the affected Hub Transport servers can grow quickly.

To reduce the possibility that your journaling mailbox will reject journal reports because it has reached the configured storage quota, we recommend that you configure its prohibit send and receive storage quota to the maximum size that your hardware resources and disaster recovery capabilities allow for.

Important:

If you configure journaling mailboxes without storage quotas, monitor the Mailbox server to ensure that it doesn't exceed the available hardware resources or disaster recovery capabilities.

If you must configure a prohibit send and receive storage quota on a journaling mailbox and expect that the configured storage quota might be exceeded, you can configure an alternate journaling mailbox. For more information about alternate journaling mailboxes, see "Alternate Journaling Mailbox" later in this topic. When a journal report is rejected by a journaling mailbox, Event ID 8010 is logged in the Application event log. By monitoring the Application event log for this event, you can be alerted to a potential problem with the journaling mailbox and resolve the situation quickly.

For information about how to configure storage quotas on a journaling mailbox, see Configure Storage Quotas for a Mailbox.

Alternate Journaling Mailbox

When the journaling mailbox is unavailable, you may not want rejected journal reports to collect in an e-mail queue on Hub Transport servers. Instead, you can configure an alternate journaling mailbox to store those journal reports. The alternate journaling mailbox receives the journal reports as attachments in the non-delivery reports (NDRs) generated when the journaling mailbox or the server on which it's located refuses delivery of the journal report or becomes unavailable.

When the journaling mailbox becomes available again, you can use the **Send Again** feature of Microsoft Office Outlook to submit journal reports for delivery to the journaling mailbox.

Different mailbox databases and journal rules may be configured to deliver journal reports to different journaling mailboxes. However, when you configure an alternate journaling mailbox, all the journal reports that are rejected or can't be delivered across your entire Exchange 2010 organization are delivered to the alternate journaling mailbox. Therefore, it's important to make sure that the alternate journaling mailbox and the Mailbox server where it's located can support many journal reports.

Caution:

If you configure an alternate journaling mailbox, you must monitor the mailbox to make sure that it doesn't become unavailable. If the alternate journaling mailbox also becomes unavailable or rejects journal reports at the same time, the rejected journal reports are

lost and can't be retrieved. This is an important factor when considering whether to use an alternate journaling mailbox.

After an alternate journaling mailbox is configured, only journal reports submitted for delivery to any unavailable journaling mailbox are redirected to it. Journal reports that have already failed delivery before the alternate journaling mailbox is configured aren't redirected.

If you configure an alternate journaling mailbox, you can reduce the load on your Hub Transport servers and Mailbox servers. Exchange doesn't continually try to deliver the journal reports to an unavailable journaling mailbox. Instead, Exchange redirects them to the alternate journaling mailbox where they can remain until you're ready to resubmit them to the journaling mailbox.

However, because the alternate journaling mailbox collects all the rejected journal reports for the entire Exchange 2010 organization, you must make sure that this doesn't violate any laws or regulations that apply to your organization. If laws or regulations prohibit your organization from allowing journal reports sent to different journaling mailboxes from being stored in the same alternate journaling mailbox, you may be unable to configure an alternate journaling mailbox. Discuss this with your legal representatives to determine whether you can use an alternate journaling mailbox.

When you configure an alternate journaling mailbox, you should use the same criteria that you used when you configured the journaling mailbox. You must make sure that the following conditions are true:

- **Authorized submission** Only authorized accounts should be able to submit journal reports.
- **Authorized access** Only those individuals who are authorized to access the mailbox are given access to the mailbox.
- **Adequate storage quota** Configure a storage quota that meets the needs of your data, hardware, and disaster recovery needs.

Remember that because the alternate journaling mailbox accepts rejected journal reports for all journaling mailboxes in your Exchange 2010 organization, the hardware resource requirements and mailbox storage quotas may be significantly larger than those required for a journaling mailbox.

For more information about how to configure an alternate journaling mailbox, see Configure or Remove an Alternate Journaling Mailbox.

1.11.5.4 Understanding Journaling in a Mixed Exchange 2003 and Exchange 2010 Environment

Understanding Journaling in a Mixed Exchange 2003 and Exchange 2010 Environment

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-01-20*

When planning for journaling in a mixed Microsoft Exchange Server 2010 and Exchange Server 2003 environment, it's important to understand how they interoperate.

Note:

For journaling interoperability, Exchange 2003, Exchange 2010, and Exchange Server 2007 have similar characteristics.

To learn more about journaling, see Understanding Journaling.

Looking for management tasks related to managing journaling? See Managing Journaling.

Contents

Journaling in Exchange 2003

The journaling feature in Exchange 2003 allows you to journal all the mailboxes on a mailbox database. If you want to journal only some mailboxes in a mailbox database, you have to do either of the following:

- Journal all the mailboxes in that mailbox database.
- Create a new mailbox database, enable journaling on that mailbox database, and then move the mailboxes to be journaled to the new database.

Exchange 2003 doesn't let you centrally manage its journaling capabilities. You have to manage journaling on a per-mailbox store and per-Mailbox server basis.

By default, when a message is journaled in Exchange 2003, only the original message is delivered to the journaling mailbox. To journal the envelope information of the original message, you must manually enable *envelope journaling*. Even with envelope journaling enabled, only basic subject and recipient information is captured.

Return to top

Journaling in Exchange 2010

The journaling feature in Exchange 2010 has been significantly redesigned to enable more control over what recipients and senders you journal. In Exchange 2010, you can create journal rules to target specific recipients and senders, distribution groups, or a combination of both. It doesn't matter where the recipients or senders are located.

Using journal rules, the granularity of journaling is improved so that you can selectively journal one or more recipients. You can also locate mailboxes that you want to journal on a mailbox database that may also contain mailboxes you don't want to journal. Only the messages that are sent from or to senders and recipients for which you've created journal rules are journaled.

In addition, you manage journal rules centrally on Hub Transport servers. Journal rules are stored in Active Directory. Journal rules created on a Hub Transport server are automatically replicated throughout the Active Directory forest and become available to all Hub Transport servers. This means that all Hub Transport servers in your organization use the same journaling configuration.

In Exchange 2010, you can still journal messages on a per-mailbox database basis. This configuration is equivalent to the Exchange 2003 per-mailbox database configuration where all messages sent to or from mailboxes on a journaled mailbox database are

journaled.

Exchange 2010 uses envelope journaling and provides much more information in the journal envelopes to help you sift through the potentially large amount of data that can be collected when mailboxes are journaled. The journal envelopes are formatted to enable automated searching of journal report contents by third-party or custom applications.

For more information about journal reports in Exchange 2010, see Understanding Journal Reports.

Return to top

How Exchange 2003 and Exchange 2010 Identify Journal Reports and Journaled Messages

In Exchange 2003, the journaling of messages and the identification of journal reports are controlled by using the X-EXCH50 binary large object (BLOB). The X-EXCH50 BLOB contains extended information about the message that can't be stored elsewhere in the e-mail message. The information stored in the X-EXCH50 BLOB contains a variety of information, such as journaling, spam confidence level (SCL), and other MAPI properties that don't have MIME representation.

By examining the X-EXCH50 BLOB, Exchange 2003 can determine whether a message is a journal report and therefore bypasses various system limits, such as message size and mailbox recipient restrictions. Exchange 2003 also uses the X-EXCH50 BLOB to determine whether a message has already been journaled on a previous hop on another Exchange 2003 server. This prevents other Exchange 2003 servers that may handle the message from journaling it again. However, the limitation of the X-EXCH50 BLOB is that it's a proprietary Extended Simple Mail Transfer Protocol (ESMTP) verb. As such, it can't be propagated by computers that don't have Exchange installed.

In Exchange 2010, the X-EXCH50 BLOB is deprecated and replaced with SMTP headers to which the header firewall is applied. These SMTP headers can be accessed only by the Exchange 2010 transport components. They are removed from messages before delivery to mailboxes or delivery outside the Exchange 2010 organization. The following SMTP headers are used by the Exchange 2010 Journaling agent:

- **X-MS-Exchange-Organization-Processed-By-Journaling** This SMTP header identifies messages that have been processed by the Exchange 2010 Journaling agent. If this header is included in a message, Exchange 2010 recognizes that the message has already been processed by the Journaling agent on a previous hop by another Hub Transport server and doesn't journal the message again.
- **X-MS-Exchange-Organization-Journal-Report** This SMTP header identifies an Exchange 2010 journal report in the transport pipeline. If this header is included in a message, Exchange 2010 knows the message is a journal report. It allows the message to act as a system message and bypass message size and mailbox recipient restrictions.
- **X-MS-Journal-Report** Before delivering a journal report to the journaling mailbox or an external journaling recipient, the header firewall removes all Exchange Server Organization headers, including the `X-MS-Exchange-Organization-Journal-Report` header. Instead, the `X-MS-Journal-Report` header is added to identify it as an Exchange 2010 journal report after it has left the transport pipeline. This header isn't used by any Exchange

2010 transport components. It lets you differentiate a journal report from a regular message.

For more information about the SMTP header firewall, see Understanding Header Firewall.

Return to top

Exchange 2003 and Exchange 2010 Journaling Interoperability

This section describes how journaling functionality works in a mixed Exchange environment.

Supporting Exchange 2003 Journaling in an Exchange 2010 Organization

Exchange 2003 and Exchange 2010 identify journal reports and journaled messages differently. To support journaling in a mixed Exchange 2003 and Exchange 2010 organization, Exchange 2010 supports using the X-EXCH50 BLOB. However, Exchange 2003 doesn't support or recognize the new SMTP headers that are used by Exchange 2010.

When Exchange 2010 journals a message, it adds a property to the X-EXCH50 BLOB in addition to the `X-MS-Exchange-Organization-Processed-By-Journaling` SMTP header so that Exchange 2003 servers that encounter the message know that the message has already been journaled.

Exchange 2010 treats journal reports similarly. When a journal report is created in Exchange 2010, the X-EXCH50 BLOB is added to the message in addition to the `X-MS-Journal-Report` header. This enables the journal report to travel through the Exchange organization and to be treated as a journal report by all the Exchange servers that it encounters.

Exchange 2010 also reads the Exchange 2003 journaling configuration from Active Directory. This configuration tells the Exchange 2010 Hub Transport servers which Exchange 2003 mailbox databases have journaling enabled and also which journaling mailboxes they have sent the journal reports to. When a message is sent to a recipient on a journaled Exchange 2003 mailbox database from Exchange 2010, the Exchange 2010 Hub Transport server journals the message and sends a journal report to the journaling mailbox configured on the Exchange 2003 mailbox database.

For more information about journal reports in Exchange 2010, see Understanding Journal Reports.

Configuring Routing Group Connectors Between Exchange 2003 and Exchange 2007

When you install a Hub Transport server in an Exchange 2003 organization, Exchange 2010 automatically creates the routing group **Exchange Routing Group (DWBGZMFD01QNBJR)**. This routing group contains all the computers in the organization that are running Exchange 2010. All Exchange 2010 servers are members of this routing group. Exchange 2010 configures a routing group connector to connect the Exchange 2010 routing group to an existing Exchange 2003 routing group.

The routing group connector created by Exchange 2010 is configured to enable the X-EXCH50 BLOB to pass between Exchange 2010 servers and Exchange 2003 servers. If you create additional routing group connectors between the Exchange 2010 routing group and other Exchange 2003 routing groups, the connectors are also configured to enable the X-EXCH50 BLOB to pass between Exchange 2010 servers and Exchange 2003

servers.

Important:

You must use the **New-RoutingGroupConnector** cmdlet to create routing group connectors between Exchange 2010 servers and Exchange 2003 servers. The **New-RoutingGroupConnector** cmdlet configures the required permissions and defaults to enable communication between Exchange 2010 and Exchange 2003. For more information, see New-RoutingGroupConnector.

For more information about routing group connectors, see the following topics:

- Understanding Message Routing
- Create Additional Routing Group Connectors from Exchange 2010 to Exchange 2003

Reducing Multiple Journal Reports

In a native Exchange 2010 organization, when a message passes through Hub Transport servers, the message is evaluated by the Journaling agent. Unless the recipient list changes on that message before delivery, the Journaling agents on later Hub Transport servers don't reevaluate the message. Because the message is evaluated for journaling only on one Hub Transport server, only one journal report is typically created and sent to the journaling mailbox.

When messages are journaled in a mixed Exchange 2003 and Exchange 2010 organization, the possibility of creating multiple journal reports for a single message increases. This is because both an Exchange 2010 Hub Transport server and the Exchange 2003 server that receive or send the message from or to a Hub Transport server evaluate the message for journaling.

Exchange 2010 reduces multiple journal reports that are generated for a single message by supporting the X-EXCH50 BLOB. The Exchange 2010 Hub Transport server stamps the X-EXCH50 BLOB on the original message with the address of the journaling mailbox where the journal report was sent. When an Exchange 2003 server receives the message from the Exchange 2010 Hub Transport server, the Exchange 2003 server examines the X-EXCH50 BLOB to see whether the message has been journaled. If it has been journaled, and if the journal report was sent to the same journaling mailbox configured on the mailbox store where the mailbox resides, Exchange 2003 doesn't generate another journal report.

Note:

Although Exchange 2010 supports the X-EXCH50 BLOB, the Journaling agent doesn't read it when it evaluates a message that was received from an Exchange 2003 server. If a message matches an Exchange 2010 journal rule, a journal report is created, even if Exchange 2003 already journaled the message and sent a journal report to the same journaling mailbox.

Journaling Mailbox Location

If you want to journal mailboxes that reside on an Exchange 2003 mailbox database, the journaling mailbox must be located in an Exchange 2003 mailbox database that doesn't have journaling enabled. Configuring a mailbox database to journal messages to a mailbox located on a non-Exchange 2003 mailbox database isn't supported. If you locate a journaling mailbox in an Exchange 2003 mailbox database being journaled, excessive disk utilization can occur.

You can configure Exchange 2010 journal rules to deliver journal reports to either Exchange 2003 or Exchange 2010 mailboxes.

Distribution Group Expansion

Both Exchange 2003 and Exchange 2010 provide distribution groups. Distribution groups are mail-enabled groups that can contain any number of e-mail recipients. When a sender

sends a message to a distribution group, the server takes the original message, accesses the distribution group membership, and sends the message to each recipient in the membership list. This process is known as distribution group expansion.

In both Exchange 2003 and Exchange 2010, you can specify which servers perform distribution group expansion. This is typically done to optimize server and network traffic load. By default, Exchange 2010 distribution groups are configured to use any Hub Transport server as a distribution group expansion server. Any Exchange server can act as a distribution group expansion server in Exchange 2003.

When you install Exchange 2010 into an existing Exchange 2003 organization and perform journaling in this mixed organization, we recommend that you configure all distribution groups to use Exchange 2010 Hub Transport servers as distribution group expansion servers. This is recommended because messages wouldn't be journaled, even if the recipients are configured for journaling, if the following conditions are true:

- Exchange 2010 recipients are configured for journaling.
- Exchange 2010 recipients are included in the distribution group Sales, for example.
- The Sales distribution group is configured to use an Exchange 2003 distribution list expansion server.

In this scenario, the following chain of events occurs if an Exchange 2010 sender sends a message to the Sales distribution group:

1. The message is sent to a Hub Transport server.
2. Because the Sales distribution group isn't configured to use a Hub Transport server as the distribution group expansion server, the journal rules in the Exchange 2010 organization can't access the distribution group recipients. Therefore, no journal rules can be applied to the recipients in the distribution group.
3. The message is routed to the Exchange 2003 server for expansion.
4. The Exchange 2003 server expands the distribution group. Because the Exchange 2003 server can't access the Exchange 2010 journal rule configuration, no messages are journaled.
5. The Exchange 2003 server routes the expanded messages back to the Exchange 2010 Hub Transport server for delivery to the Exchange 2010 recipients.
6. The Hub Transport server receives the message. Because this isn't the first server to route these messages, the Hub Transport server assumes the messages have already been evaluated for journaling and the journal rules aren't applied.

Return to top

1.11.5.5 Protecting Journal Reports

Protecting Journal Reports

Exchange Server 2010 > Messaging Policy and Compliance > Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-10-26*

If journaling is configured in a Microsoft Exchange Server 2010 organization, the Journaling agent generates journal reports that contain message metadata, and the entire original message is attached to the journal report. It's important to protect the integrity of journal reports and the journaling mailbox, and to protect them from unauthorized access.

You can protect journal reports sent inside an Exchange 2010 organization and journal reports that are sent to third-party solution providers.

Looking for management tasks related to journaling? See Managing Journaling.

Protecting Journal Reports Sent Inside an Exchange 2010 Organization

Exchange 2010 protects journal reports in transit by performing the following tasks:

- It uses secure links between Hub Transport servers and Mailbox servers in the Exchange 2010 organization.
- It sends the journal report as Exchange and authenticates the session between the Hub Transport server and the Mailbox server.
- It accepts only secure, authenticated connections when journal reports are sent between Hub Transport servers and Mailbox servers in the same Exchange 2010 organization.

We recommend that you configure the journaling mailbox to accept messages sent only from the Exchange recipient object and that you configure the mailbox to require senders to be authenticated. This helps reduce the possibility of tampering with journal reports delivered to the journaling mailbox. For more information, see Create and Configure a Journaling Mailbox.

Additionally, you must implement adequate access controls to ensure the journaling mailbox is protected from unauthorized access. These controls should include measures such as recording and monitoring password changes to journaling mailbox user accounts, domain logons by such user accounts, and changes to mailbox permissions for journaling mailboxes.

Caution:

Improperly secured communication links, journaling mailboxes, or servers can expose sensitive data.

Protecting Journal Reports Sent to Third-Party Solution Providers

You can configure Exchange 2010 to send journal reports to a recipient that doesn't reside in the same Exchange 2010 organization as the Hub Transport server, including recipients residing on another e-mail system within the organization, or to an e-mail system outside the organization. You can use such a configuration to send journal reports to third-party providers of archival or other journaling solutions that aren't Exchange 2010-based.

In configurations where the source and destination servers aren't servers running Exchange 2010 or Exchange Server 2007 in the same Exchange organization, the connections between the two servers may not be automatically encrypted. However, even in these configurations, you can use Exchange 2010 to help protect the journal reports sent to the third-party solution providers.

You can use the following Exchange solutions to help protect communication between the Exchange server and the third-party solution providers:

- Configure Transport Layer Security (TLS) between the two systems.
- Require authentication on the receiving system.
- Accept only e-mail messages from the SMTP address of the Exchange contact.
- Configure a mail-enabled contact that sends e-mail messages to the SMTP address of the third-party solution and configure Exchange 2010 to send

journal reports to that contact. Then configure the contact to accept journal reports only from an Exchange recipient.

Caution:
Improperly secured communication links, journaling mailboxes, or servers can expose sensitive data.

TLS is a standard protocol used to provide secure communications over TCP/IP networks such as the Internet. It enables clients to authenticate servers or, optionally, servers to authenticate clients. It also provides a secure channel by encrypting communications. For more information, see TLS Functionality and Related Terminology in Exchange 2010.

Important:
TLS encrypts the SMTP session between two hosts. If you configure TLS to protect journal messages, and Exchange doesn't directly deliver mail to the destination server that stores the journal reports, you must configure TLS between each server through which the journal report travels to the destination server.

Important:
Journal message recipients in a distribution group cannot view decrypted message attachments in an Exchange 2010 environment
This issue occurs because Exchange 2010 does not decrypt the journal message if at least one SMTP address of a distribution group member is not present in any journal rules. This behavior is by design.

Topic Last Modified: *2012-07-23*

If journaling is enabled in an Exchange organization, either by using journal rules or standard journaling (per-mailbox database journaling), you can create a mailbox that's used for collecting journal reports. This is known as a journaling mailbox.

This topic shows you how to create a journaling mailbox. Additionally, this topic provides the following recommended steps to configure the journaling mailbox.

- **Configure the journaling mailbox to accept messages only from the Microsoft Exchange recipient** Journaling mailboxes receive journal reports from the Journaling agent. To maintain the integrity of the journaling mailbox, and to prevent fake journal reports and other messages, you should configure the journaling mailbox to receive e-mail only from the Journaling agent. The Journaling agent delivers journal reports to the journaling mailbox by using the Microsoft Exchange recipient, a system mailbox that isn't visible in the global address list (GAL). For more information about the Microsoft Exchange recipient, see Understanding the Microsoft Exchange Recipient.
- **Disable storage quota limits for the journaling mailbox** A journaling mailbox is used by the Journaling agent to deliver a journal report for the following:
  - Every message that matches the parameters of a journal rule
  - Every message that is sent or received by mailboxes on a mailbox database (if you use per-mailbox database journaling)

  Depending on the messaging traffic in your organization, and the number of messages that have to be journaled, a journaling mailbox can potentially grow to a very large size. If you set a low storage quota, delivery of new journal reports to the mailbox will stop after the quota is reached. Therefore, we recommend that you disable mailbox quotas for the journaling mailbox or enable a **Prohibit send and receive quota**. For more information about mailbox storage quotas, see Understanding Quota Messages.

  Important:
  If you disable mailbox storage quota limits on a mailbox, we recommend that you monitor the mailbox size. We recommend that you configure the mailbox to accept messages only from the Microsoft Exchange recipient, and not accept messages sent by unauthenticated senders.
- **Grant Full Access permissions to users for the journaling mailbox** After you've created a journaling mailbox, if the mailbox is intended for programmatic access or if you want to grant access to authorized users such as records managers, you must grant full access permission to access the mailbox.

To learn more about journaling mailboxes and the Journaling agent, see Understanding Journaling.

Important:
Journaling mailboxes contain very sensitive information. You must secure journaling

mailboxes because they collect messages that are sent to and from recipients in your organization. These messages may be part of legal proceedings or may be subject to regulatory requirements. Various laws require that messages remain tamper-free before they're submitted to an investigatory authority. We recommend that you create policies that govern who can access the journaling mailboxes in your organization, limiting access to only those individuals who have a direct need to access them. Speak with your legal representatives to make sure that your journaling solution complies with all the laws and regulations that apply to your organization.

Looking for other management tasks related to journaling? Check out Managing Journaling.

Step 1: Use the EMC or the Shell to create a journaling mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "User mailboxes" entry in the Mailbox Permissions topic.

Use the EMC

1. In the console tree, click **Recipient Configuration**.
2. In the action pane, click **New Mailbox**.
3. On the **Introduction** page, click **User Mailbox**.
4. On the **User Type** page, click **New User**.
5. On the **User Information** page, complete the following fields:
   - **Specify the organizational unit rather than using a default one** Select this check box to select an organizational unit (OU) other than the default (which is the recipient scope). If the recipient scope is set to the forest, the default value is set to the **Users** container in the Active Directory domain that contains the computer on which the Exchange Management Console is running. If the recipient scope is set to a specific domain, the **Users** container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default. To select a different OU, click **Browse** to open the **Select Organizational Unit** dialog box. This dialog box displays all OUs in the forest that are within the specified scope. Select the desired OU, and then click **OK**. To learn more about recipient scopes, see Understanding Recipient Scope.
   - **First name**, **Initials**, and **Last name** Because this mailbox will be used to collect journal reports, it isn't necessary to complete these fields.
   - **Name** Use this box to type a display name for the journaling mailbox. This is the name that's listed in Active Directory. By default, this box is populated with the names you enter in the **First name**, **Initials**, and **Last name** boxes. If you didn't use those boxes, you must still type a name in this field. The name can't exceed 64 characters.
   - **User logon name (User Principal Name)** Use this box to type the name that the user will use to log on to the journaling mailbox. The user logon name consists of a user name and a suffix. Typically, the suffix is the domain name in which the user account resides.
   - **User logon name (pre-Windows 2000)** Use this box to type the name for the user that's compatible with the legacy versions of Microsoft Windows (prior to the release of Windows 2000 Server). This field is automatically populated based on the **User logon name (User Principal Name)** field. This field is required.
   - **Password** Use this box to type the password that the user must use to log on to the journaling mailbox.

     Note:
     Journaling mailboxes can potentially contain sensitive information. We recommend using a complex password that exceeds the

password requirements your organization may have for normal user accounts.

- **Confirm password** Use this box to confirm the password that you typed in the **Password** box.
- **User must change password at next logon** Select this check box if you want the user to reset the password when they first log on to the journaling mailbox.

  If you select this check box, at first logon, the user will be prompted with a dialog box in which to change the password. The user won't be allowed to perform any tasks until the password is successfully changed.

  Requiring a password change at first logon is a good practice for accounts you create for your users. It forces the user to change the password, which prevents the use of any default passwords provided by the administrator during account creation. A forced password change on first logon also ensures that the administrator doesn't have knowledge of the user password after first logon. This may not be necessary for journaling mailboxes because the associated user accounts are created and used by the administrator or by administrator-controlled processes that may access the journaling mailbox.

6. On the **Mailbox Settings** page, complete the following fields:
   - **Alias** Use this box to type an alias for the journaling mailbox. The alias can't exceed 64 characters and must be unique in the forest.
   - **Specify the mailbox database rather than using a database automatically selected** Select this check box to specify a mailbox database instead of allowing Exchange to select a database for you. Click **Browse** to open the **Select Mailbox Database** dialog box. This dialog box lists all the mailbox databases in your Exchange organization. By default, the mailbox databases are sorted by name. You can also click the title of the corresponding column to sort the databases by storage group name or server name. Select the mailbox database you want to use, and then click **OK**. This is an optional field.

     Note:

     When you plan to use journaling, consider the storage requirements for journaling mailboxes. These will vary depending on the number and size of messages captured by the Journaling agent.

   - **Managed folder mailbox policy** Select this check box to specify a managed folder mailbox policy for the journaling mailbox. A managed folder mailbox policy is a logical grouping of managed folders. When a managed folder mailbox policy is applied to a user's mailbox, all the managed folders that are linked to the policy are deployed in a single operation, thereby making the deployment of messaging records management (MRM) easier. To learn more, see Understanding Managed Folders.

     Click **Browse** to open the **Select Managed Folder Mailbox Policy** dialog box. Use this dialog box to select the managed folder mailbox policy to be associated with this mailbox. This is an optional field.

     Some third-party archiving or retention solutions retrieve journal reports from the journaling mailbox and store them in an external database, or require you to automatically forward a copy of the journal report to the external database or e-mail address. If you use a similar solution, and if it doesn't automatically purge messages from the journaling mailbox after retrieving them, the journaling mailbox may continue to grow and consume storage space. You can create a managed folder mailbox policy and apply it to the journaling mailbox to

automatically purge messages after a certain period.

- **Exchange ActiveSync mailbox policy** Journaling mailboxes are not meant to be accessed by using Microsoft Exchange ActiveSync. You don't have to select this option when you create a journaling mailbox.

7. On the **Archive Settings** page, leave the **Create an archive mailbox for this account** check box cleared.
8. On the **New Mailbox** page, review your configuration settings. To make any configuration changes, click **Back**. To create the journaling mailbox, click **New**.
9. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell

This example creates a journaling mailbox with the following parameters:

- **Name** Vault5
- **User Principal Name** vault@contoso.com
- **Mailbox Database** Database2

After you enter the first command, you are prompted for a password.

```
$password = Read-Host "Enter password" -AsSecureString
New-Mailbox -Name Vault5 -UserPrincipalName vault@contoso.com -Database "Database
```

For detailed syntax and parameter information, see New-Mailbox.

Step 2 (optional but recommended): Use the Shell to configure the journaling mailbox to accept messages only from the Microsoft Exchange recipient

Caution:

This procedure shouldn't be performed in organizations in which the journaling mailbox is required to receive e-mail from non-Exchange mail hosts, unauthenticated senders, or senders other than the Microsoft Exchange recipient.

Note:

You can't use the EMC to perform this procedure because the Microsoft Exchange recipient, a system mailbox, isn't visible in the GAL.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "User mailboxes" entry in the Mailbox Permissions topic.

This example configures delivery restrictions on a journaling mailbox with the display name Journaling Mailbox to accept messages only from the Microsoft Exchange recipient and to accept messages only from authenticated senders.

```
Set-Mailbox "Journaling Mailbox" -AcceptMessagesOnlyFromSendersOrMembers "Microso
```

For detailed syntax and parameter information, see Set-Mailbox.

Step 3 (optional but recommended): Use the EMC or the Shell to disable storage quota limits for the journaling mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "User mailboxes " entry in the Mailbox Permissions topic.

Use the EMC

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the journaling mailbox you created.
3. In the action pane, click **Properties**.
4. On the **Mailbox Settings** tab, select **Storage Quotas**, and then click **Properties**.
5. In **Storage Quotas**, clear the **Use mailbox database defaults** check box, and then click **OK**.
6. Click **Apply**, and then click **OK**.

Use the Shell

This example disables mailbox quotas for the journaling mailbox vault.

```
Set-Mailbox "vault" -UseDatabaseQuotaDefaults $false -IssueWarningQuota unlimited
```

For detailed syntax and parameter information, see Set-Mailbox.

Step 4 (optional but recommended): Grant Full Access permissions to selected users for accessing the journaling mailbox

For detailed instructions about how to grant Full Access permissions to a mailbox, see Manage Full Access Permissions.

Other Tasks

After you create and configure a journaling mailbox, you may also want to perform the following procedures.

- Configure or Remove an Alternate Journaling Mailbox
- Create a Journal Rule
- Enable Per-Mailbox Database Journaling

1.11.5.6.2 Configure or Remove an Alternate Journaling Mailbox

Configure or Remove an Alternate Journaling Mailbox

Messaging Policy and Compliance > Journaling > Managing Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

If a journaling mailbox becomes unavailable, journal reports sent to it are rejected and resubmitted for delivery. Journal reports are never returned to the original sender. If you don't want the rejected journal reports to remain in the delivery queue, you can configure an alternate journal mailbox to receive the journal reports until the journaling mailbox becomes available.

Only journal reports submitted for delivery after an alternate journaling mailbox is configured are redirected. Journal reports that failed delivery before the alternate journaling mailbox was configured aren't redirected. Journal reports are delivered to the alternate journaling mailbox as attachments in a non-delivery report (NDR). When the journaling mailbox becomes available, you can use the **Send Again** feature in Outlook 2010 to resubmit the journal reports for delivery.

Important:

When you configure an alternate journaling mailbox, it applies to the whole Exchange organization. Journal reports rejected by any journaling mailbox are redirected to the same alternate journaling mailbox.

For more information about how to manage journal reports, see Understanding How to Manage Journal Reports.

Looking for other management tasks related to journaling? Check out Managing Journaling.

Caution:

If you configure an alternate journaling mailbox, you must monitor the mailbox to make sure that it doesn't become unavailable. If the alternate journaling mailbox also becomes unavailable and rejects journal reports, the rejected journal reports are lost and can't be retrieved.

Use the Shell to configure an alternate journaling mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the EMC to configure an alternate journaling mailbox.

To configure Exchange to redirect rejected journal reports to an alternate journaling mailbox, you must specify the SMTP address of an existing mailbox in your organization.

1. Create a mailbox to use as the alternate journaling mailbox. For information about how to create and configure a journaling mailbox, see Create and Configure a Journaling Mailbox.
2. Use the Shell to configure the mailbox as the alternate journaling mailbox. This example configures the alternate journaling mailbox alternatemailbox@contoso.com.

```
Set-TransportConfig -JournalingReportNdrTo alternatemailbox@contoso.co
```

For detailed syntax and parameter information, see Set-TransportConfig.

Use the Shell to remove an alternate journaling mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to remove an alternate journaling mailbox.

If you no longer want to redirect rejected journal reports to an alternate journaling mailbox, you must remove the SMTP address of that mailbox. When you remove the SMTP address of the mailbox, rejected journal reports stay in the delivery queue until they're successfully delivered.

This example removes an alternate journaling mailbox.

```
Set-TransportConfig -JournalingReportNdrTo "<>"
```

For detailed syntax and parameter information, see Set-TransportConfig.

1.11.5.6.3 Create a Journal Rule

Create a Journal Rule

Messaging Policy and Compliance > Journaling > Managing Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Journal rules are used to enable journaling of specific recipients. Journal rules are replicated across the Exchange organization to all the Hub Transport servers. Journal rules use premium journaling. To use premium journaling, you must have an Exchange Enterprise client access license (CAL). For more information, see Understanding Journaling.

Caution:
There are important security and resource considerations when you configure the journaling mailbox that receives journal reports. For more information, see "Journaling Mailbox" in Understanding Journaling and Protecting Journal Reports.

Looking for other management tasks related to journaling? Check out Managing Journaling.

Prerequisites

A journaling mailbox has been created, or an existing mailbox is available for use as the journaling mailbox.

What Do You Want to Do?

- Use the EMC to create a journal rule
- Use the Shell to create a journal rule

Use the EMC to create a journal rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance

Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Hub Transport**.
2. In the result pane, click the **Journal Rules** tab, and then in the action pane, click **New Journal Rule**.
3. On the **New Journal Rule** page, complete the following fields:
   - 3.a. **Rule name** Type a name for the journal rule.
   - 3.b. **Send Journal reports to e-mail address** Click **Browse**. In the **Select Recipient** window, select the recipient that will receive the journal reports.
   - 3.c. **Scope** Select the scope to which the journal rule should be applied. The following scopes are available:
     - **Global** Global rules process all e-mail messages that pass through a Hub Transport server. These include messages that may have already been processed by internal rules and external rules.
     - **Internal** Internal rules process e-mail messages sent and received by recipients in the Exchange 2010 organization.
     - **External** External rules process e-mail messages sent to recipients or sent from senders outside the Exchange 2010 organization.
   - 3.d. **Journal messages for recipient** If you want to journal messages sent to or from a specific recipient, click **Browse** to select the recipient. In the **Select Recipient** window, select the mailbox, contact, or distribution group that you want to journal, and then click **OK**. All messages sent to or from this recipient are journaled.
   - 3.e. **Enable Rule** Journal rules are enabled by default. To create the rule in a disabled state, clear the check box.
4. Click **New** to create the journal rule.
5. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - 5.a. A status of **Completed** indicates that the wizard completed the task successfully.
   - 5.b. A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to create a journal rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

This example creates a journal rule to journal all messages sent to and received by the recipient user1@contoso.com.

```
New-JournalRule -Name "Discovery Journal Recipients" -Recipient user1@contoso.com
```

For detailed syntax and parameter information, see New-JournalRule.

Other Tasks

After you create a journal rule, you may also want to:

- Configure or Remove an Alternate Journaling Mailbox
- Enable or Disable a Journal Rule
- Configure Journal Rule Properties
- Remove a Journal Rule

1.11.5.6.4 Configure Journal Rule Properties

Configure Journal Rule Properties

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

A journal rule defines the scope of messages to journal, the journaled recipient, and the journaling mailbox to which journal reports are delivered. You can use either the EMC or the Shell to view or configure a journal rule.

Important:

If you specify a distribution group as the journal recipient, messages sent to the distribution group, as well as messages sent and received by members of the distribution group, are journaled.

These procedures describe how to configure premium journaling. To use premium journaling, you must have the Exchange Enterprise Client Access License (CAL). For more information, see Understanding Journaling.

Looking for other management tasks related to journal rules? Check out Managing Journaling.

Cautions

- If you don't specify a journal recipient in the **Journal messages for recipient** field in the EMC or the *Recipient* parameter of the journal rule when modifying it from the Shell, journal reports are generated for all messages within the selected scope. If you decide to not specify a journal recipient, we recommend that you consider the increase in messaging traffic and the storage requirements for the mailbox database where the journaling mailbox is located.
- There are important security and resource considerations when you configure the journaling mailbox that receives journal reports. For more information, see Protecting Journal Reports.

What Do You Want to Do?

- Use the EMC to view or configure journal rule properties
- Use the Shell to configure journal rule properties
- Use the Shell to view journal rule properties

Use the EMC to view or configure journal rule properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, expand the appropriate forest and then navigate to **Organization Configuration > Hub Transport**.

2. In the result pane, click the **Journal Rules** tab and then select the journal rule you want to view or configure.

3. In the action pane, click **Properties**.

4. Use the **General** tab to view or configure the following journal rule properties.
   - **Rule name** This field shows the name of the journal rule. You can change the journal rule name. The length of the name can't exceed 64 characters.
   - **Status** This field displays rule status as enabled or disabled. You can't modify this field.
   - **Modified** This field displays the timestamp when the rule was last modified or the rule creation time if the rule has never been modified. You can't modify this field.
   - **Send Journal reports to e-mail address** This field shows the recipient that will receive the journal reports. To change the e-mail address that receives journal reports, click **Browse**. In the **Select Recipient** window, select the mailbox, contact, or distribution group to send journal reports to, and then click **OK**.
   - **Scope** This field specifies whether the journal rule is applied to internal recipients and senders only, to external recipients and senders only, or to both. Select one of the following:
     - **Global** Global rules apply to all messages that pass through a Hub Transport server.
     - **Internal** Internal rules apply to messages sent and received by recipients in the Exchange organization.
     - **External** External rules apply to messages sent or received by recipients outside the Exchange organization.
   - **Journal messages for recipient** This field specifies the mailbox, contact, or distribution group that you want to journal. To target a specific recipient or distribution group, select the **Journal messages for recipient** check box and then click **Browse**. In the **Select Recipient** window, select the mailbox, contact, or distribution group that you want to journal, and then click **OK**.

Use the Shell to configure journal rule properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

This example changes the name of the journal rule `JR-Sales` to `TraderVault`. The following rule settings are also changed:

- Recipient
- JournalEmailAddress
- Scope

```
Set-JournalRule -Identity TraderVault -Recipient traders@woodgrovebank.com -Journ
```

Use the Shell to view journal rule properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the 'Journaling' entry in the Messaging Policy and Compliance

Permissions topic.

This example retrieves the journal rule Brokerage Journal Rule, and pipes the output to the **Format-List** command to display rule properties in a list format:

```
Get-JournalRule "Brokerage Journal Rule" | Format-List
```

For more information about pipelining, see Pipelining.

This example displays a summary list of all journal rules in the Exchange 2010 organization:

```
Get-JournalRule
```

For more information about how to work with the information returned by a command, see Working with Command Output.

For detailed syntax and parameter information, see Get-JournalRule.

For More Information

Understanding Journaling

Managing Journaling

Set-JournalRule

1.11.5.6.5 Enable or Disable a Journal Rule

Enable or Disable a Journal Rule

Messaging Policy and Compliance > Journaling > Managing Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can use journal rules to perform granular journaling of messages sent and received by specified recipients. When you enable or disable journal rules on a Hub Transport server, the modified journal rule is replicated across the Microsoft Exchange Server 2010 organization and is available to all the Exchange 2010 Hub Transport servers.

Looking for other tasks related to journaling? Check out Managing Journaling.

Use the EMC to enable or disable a journal rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Hub Transport**.
2. In the result pane, click the **Journal Rules** tab and select the journal rule that you want to enable or disable.
3. In the action pane, if the journal rule isn't enabled, click **Enable Rule** to enable it. If the journal rule is enabled, click **Disable Rule** to disable it.

Use the Shell to enable or disable a journal rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the 'Journaling' entry in the Messaging Policy and Compliance Permissions topic.

This example enables the Contoso Journal Rule.

```
Enable-JournalRule "Contoso Journal Rule"
```

This example disables the Contoso Journal Rule.

```
Disable-JournalRule "Contoso Journal Rule"
```

Other Tasks

After you've enabled or disabled a journal rule, you may also want to:

- Create a Journal Rule
- Remove a Journal Rule
- Configure Journal Rule Properties

1.11.5.6.6 Remove a Journal Rule

Remove a Journal Rule

Messaging Policy and Compliance > Journaling > Managing Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Journal rules allow you to perform granular journaling of messages sent and received by specified recipients. You can remove a journal rule when it's no longer needed. You can also temporarily disable a journal rule without removing it.

Looking for other tasks related to journaling? Check out Managing Journaling.

Important:

If you remove a journal rule from a Hub Transport server, the journal rule will be removed from the entire Exchange 2010 organization.

Use the EMC to remove a journal rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Hub Transport**.
2. In the result pane, click the **Journal Rules** tab, and then select the journal rule that you want to remove.
3. In the action pane, click **Remove**.
4. Click **Yes** to confirm that you want to remove the journal rule.

Use the Shell to remove a journal rule

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Use the *WhatIf* parameter to verify that the results of the operation are what you expect. For more information about the *WhatIf* parameter, see WhatIf, Confirm, and ValidateOnly Switches.

This example removes the journal rule Brokerage Journal Rule.

```
Remove-JournalRule "Brokerage Journal Rule"
```

For detailed syntax and parameter information, see Remove-JournalRule.

Other Tasks

After you remove a journal rule, you may also want to:

- Create a Journal Rule
- Configure Journal Rule Properties

1.11.5.6.7 Disable or Enable Journaling of Voice Mail and Missed Call Notifications

Disable or Enable Journaling of Voice Mail and Missed Call Notifications

Messaging Policy and Compliance > Journaling > Managing Journaling >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

In Microsoft Exchange Server 2010, when you create a journal rule to journal e-mail messages sent to or from recipients or senders in an Exchange organization, voice mail and missed call notifications generated by Unified Messaging (UM) servers are included. Use the procedures in this topic to modify this behavior for your entire organization to support your organization's compliance policies.

Caution:

Before disabling or enabling journaling of voice mail messages and missed called notifications, we recommend that you ensure that the action meets your organization's compliance requirements.

Important:

Using this procedure in an organization where journaling isn't enabled has no impact.

Looking for other management tasks related to journaling? Check out Managing Journaling.

What do you want to do?

Use the Shell to disable journaling of voice mail and missed call notifications

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You cannot use the EMC to disable journaling of voice mail and missed call notifications.

This example disables journaling of voice mail and missed call notifications by setting the *VoicemailJournalingEnabled* parameter to `$false`.

```
Set-TransportConfig -VoicemailJournalingEnabled $false
```

For detailed syntax and parameter information, see Set-TransportConfig.

Use the Shell to enable journaling of voice mail and missed call notifications

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You cannot use the EMC to enable journaling of voice mail and missed call notifications.

This example enables journaling of voice mail and missed call notifications by setting the *VoicemailJournalingEnabled* parameter to `$true`.

```
Set-TransportConfig -VoicemailJournalingEnabled $true
```

For detailed syntax and parameter information, see Set-TransportConfig.

For More Information

Understanding Journaling

1.11.5.6.8 Enable Per-Mailbox Database Journaling

Enable Per-Mailbox Database Journaling

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Per-mailbox database journaling (also known as standard journaling) delivers a copy of all messages sent to and received by mailboxes on the specified mailbox database to the specified journaling mailbox.

Important:
Journaling mailboxes contain very sensitive information. You must secure journaling mailboxes because they collect messages that are sent to and from recipients in your organization. These messages may be part of legal proceedings or may be subject to regulatory requirements. Various laws require that messages remain tamper-free before they're submitted to an investigatory authority. We recommend that you create policies that govern who can access the journaling mailboxes in your organization, limiting access to only those individuals who have a direct need to access them. Speak with your legal representatives to make sure that your journaling solution complies with all the laws and regulations that apply to your organization.

Looking for other tasks related to journaling? Check out Managing Journaling.

Prerequisites

A journaling mailbox has been created. For details, see Create and Configure a Journaling Mailbox.

Important:
There are important security and resource considerations when you configure the journaling mailbox that receives journal reports. For more information, see Understanding Journaling and Understanding Journal Reports.

Use the EMC to enable per-mailbox database journaling

Note:
Because a mailbox database may be part of a database availability group (DAG) and therefore reside on multiple Exchange 2010 servers, mailbox database properties are managed from the **Organization Configuration** node in the Exchange Management Console.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

1. Navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Database Management** tab, and then click the mailbox database on which you want to enable journaling.
3. In the action pane, under the mailbox database name, click **Properties**.
4. In **<Mailbox Database> Properties**, click the **Maintenance** tab.
5. Select the **Journal Recipient** check box, and then click **Browse**.
6. In **Select Recipient**, select the recipient that will receive the journal reports, and then click **OK**.

Use the Shell to enable per-mailbox database journaling

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

This example enables journaling for the mailbox database Sales Database and sets Sales Database Journal Mailbox as the journal recipient. The *JournalRecipient* parameter specifies the secured e-mail mailbox to which journal reports are sent.

```
Set-MailboxDatabase "Sales Database" -JournalRecipient "Sales Database Journal Ma
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

Other Tasks

After you enable per-mailbox database journaling, you may also want to:

- Disable Per-Mailbox Database Journaling
- Create a Journal Rule

1.11.5.6.9 Disable Per-Mailbox Database Journaling

Disable Per-Mailbox Database Journaling

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Per-mailbox database journaling delivers a copy of all messages sent to and received by mailboxes on the specified mailbox database to the specified journaling mailbox. You can use the EMC or the Shell to disable per-mailbox database journaling for a mailbox database. However, to disable per-mailbox database journaling for all mailbox databases in your organization, you must use the Shell.

Looking for other management tasks related to journaling? Check out Managing Journaling.

Caution:

Disabling message journaling on a mailbox database may result in your organization being out of compliance with any applicable messaging retention policies. When you disable message journaling on a mailbox database, journal receipts are no longer sent for messages sent or received by mailboxes on that mailbox database.

Use the EMC to disable per-mailbox database journaling

Note Because a mailbox database may be part of a database availability group (DAG) and therefore reside on multiple Exchange 2010 servers, mailbox database properties are managed from the **Organization Configuration** node in the Exchange Management Console.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

1. Navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Database Management** tab, and then click the mailbox database for which you want to disable per-mailbox database journaling.
3. In the action pane, click **Properties**.
4. On the **Maintenance** tab, clear the **Journal Recipient** check box.

Use the Shell to disable per-mailbox database journaling

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

This example disables per-mailbox database journaling on the Sales Database mailbox database.

```
Set-MailboxDatabase "Sales Database" -JournalRecipient $Null
```

This example disables per-mailbox database journaling on all mailbox databases in the Exchange organization. The Get-MailboxDatabase cmdlet is used to retrieve all mailbox databases in the Exchange organization, and results from the cmdlet are piped to the Set-MailboxDatabase cmdlet.

```
Get-MailboxDatabase | Set-MailboxDatabase -JournalRecipient $Null
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

1.11.5.6.10 Export and Import Exchange 2007 Journal Rules

Export and Import Exchange 2007 Journal Rules

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Journal rules allow you to granularly journal messages sent to and from specific recipients. Journal reports containing message metadata fields such as sender, recipients, message ID, and subject are delivered to the journaling mailbox specified in the rule, along with a copy of the original message as an attachment. To learn more about journaling, see Understanding Journaling.

Microsoft Exchange Server 2010 and Exchange Server 2007 use the same X-headers to specify that a message has already been journaled and also to identify journal reports. An Exchange 2010 Hub Transport server won't generate a duplicate journal report for a message that's already been journaled by another Exchange 2010 or Exchange 2007 Hub Transport server. Journaling considerations for organizations that contain Exchange Server 2003 and Exchange 2010 servers are covered in Understanding Journaling in a Mixed Exchange 2003 and Exchange 2010 Environment.

Although journaling in Exchange 2010 is similar to journaling in Exchange 2007, there are some differences in the journal rule object. When you install the first Exchange 2010 Hub Transport server in an Exchange 2007 environment, Setup creates a new container for Exchange 2010 journal rules, converts all Exchange 2007 journal rules to the Exchange 2010 format, and stores them in this new container in Active Directory. After Setup completes, the Exchange 2010 journal rule collection is identical to the Exchange 2007 journal rule collection. The same journal rules are applied to messages at the first Hub Transport server that handles the messages, regardless of whether it's running Exchange 2010 or Exchange 2007.

Managing Journal Rules in Coexistence

During the time your Exchange organization contains both Exchange 2010 and Exchange 2007 Hub Transport servers, you must manage Exchange 2010 journal rules from the EMC or the Shell on an Exchange 2010 server, and Exchange 2007 journal rules from the EMC or the Shell on an Exchange 2007 server.

To help you keep journal rules consistent in Exchange 2010 and Exchange 2007, when you create or modify journal rules by using the EMC or the Shell in Exchange 2010, these tools provide you helpful messages prompting you to make the same changes in the Exchange 2007 environment.

Prerequisites

Your organization contains both Exchange 2010 and Exchange 2007 Hub Transport servers.

Use the Shell to export the journal rule collection from Exchange 2007

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the EMC to export the journal rule collection from Exchange 2007.

This example exports the Exchange 2007 journal rule collection. In the first step, the **Export-JournalRuleCollection** cmdlet is used to export Exchange 2007 journal rules and store them in a variable. In the second step, the **Set-Content** cmdlet is used to save exported journal rules from the variable to the Ex2007-JournalRules.xml file in the C:\MyDocs folder. You must perform this procedure on an Exchange 2010 Hub Transport server because the Exchange 2010 **Export-JournalRuleCollection** cmdlet is aware of both journal rule formats, and it exports the Exchange 2007 journal rules when you use the *ExportLegacyRules* switch.

```
$file = Export-JournalRuleCollection -ExportLegacyRules
Set-Content -Path "C:\MyDocs\Ex2007-JournalRules.xml" -Value $file.FileData -Enco
```

For detailed syntax and parameter information, see the following topics:

- Export-JournalRuleCollection
- Set-Content

Use the Shell to import the journal rule collection to Exchange 2010

Caution:

When you import journal rules, all Exchange 2010 journal rules are replaced with the rules imported from the .xml file. We recommend that you test this procedure in a test environment before implementing it in a production environment. To make sure you can roll back to the previous state, we recommend that you export the existing Exchange 2010 journal rules to a file before importing the Exchange 2007 journal rules. If you plan to save the file in the same location where you've saved the exported Exchange 2007

journal rules, use distinct and descriptive file names for the journal rules exported from each version.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Journaling" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to import the journal rule collection to Exchange 2010.

This example imports the journal rule collection from the Ex2007-JournalRules.xml file to the Exchange 2010 journal rule collection. In the first step, the **Get-Content** cmdlet is used to retrieve data from the .xml file to the variable *$Data*. In the second step, the **Import-JournalRuleCollection** cmdlet is used to import the rules from the variable *$Data*.

```
[Byte[]]$Data = Get-Content -Path "C:\MyDocs\Ex2007-JournalRules.xml" -Encoding B
Import-JournalRuleCollection -FileData $Data
```

For detailed syntax and parameter information, see the following topics:

- Import-JournalRuleCollection
- Get-Content

Other Tasks

After you export or import the journal rule collection, you may also want to:

- Create a Journal Rule
- Remove a Journal Rule

1.11.6 Messaging Records Management

Messaging Records Management

Exchange Server 2010 > Messaging Policy and Compliance >

1.11.6.1 Understanding Messaging Records Management

Understanding Messaging Records Management

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-01-22*

Organizations and users handle an increasing volume of e-mail every day. The growing volumes of e-mail contain messages that are important to the organization from a business, legal, or regulatory perspective, and may need to be retained for a certain period, depending on the organization's messaging policies. However, many e-mail messages may not have any retention value beyond a certain period, if at all. For example, a user's mailbox may contain critical messages that need to be retained, such as messages related to business strategy, transactions, product development, or customer interactions. However, messages such as newsletter subscriptions or personal e-mail may not have any retention value, and therefore don't need to be retained beyond a certain period. Retaining messages with little retention value results in mailbox growth that requires more resources on mailbox servers.

Messaging records management (MRM) is the records management technology in Microsoft Exchange Server 2010 that helps organizations reduce the legal risks associated with e-mail. MRM makes it easier to keep the messages needed to comply with company policy, government regulations, or legal needs, and to remove content that has no legal or business value. This is accomplished through the use of retention policies or managed folders:

- **Retention policies** Retention policies, the new MRM technology in Exchange 2010, use retention tags to apply retention settings. You create retention tags, and link them to a retention policy. Mailboxes that have a retention policy applied to them are processed by the Managed Folder Assistant, a mailbox assistant that runs on a schedule and provisions retention tags in mailboxes. To learn more about retention policies, see Understanding Retention Tags and Retention Policies.
- **Managed folders** Managed folders, the MRM technology introduced in Exchange Server 2007 and also available in Exchange 2010, have managed content settings applied to them. You create managed folders and link them to a managed folder mailbox policy. Mailboxes that have managed folder mailbox policies applied are processed by the Managed Folder Assistant, a mailbox assistant that runs on a schedule and provisions managed folders in mailboxes. To learn more about managed folders, see Understanding Managed Folders.

When a message reaches its retention age, the retention action specified in the retention tag (or the managed content settings for a managed folder) is taken. Messages can be

moved to the Deleted Items folder, deleted with the ability to recover them from the Recoverable Items folder, or permanently deleted. Retention tags also provide an additional action of moving a message to the user's archive mailbox, if an archive mailbox has been provisioned for the user. Managed content settings for managed folders also provide an additional action of moving a message to a managed custom folder.

Messaging Records Management Strategy

Retention policies and managed folders provide two different approaches to MRM. You can use either MRM technology to enforce basic MRM policies on default folders and on the entire mailbox. For MRM to be effective, users must participate in the process of classifying messages based on their nature and retention value.

With retention tags, you can apply default retention settings to default folders such as the Inbox folder, and apply a default policy tag (DPT) to the entire mailbox. The DPT retention settings are applied to untagged items that may reside in folders without a retention tag, such as custom folders created by the user. Retention tags help both types of users: Users who file e-mail into folders and keep few messages in the Inbox, and users who leave most of their e-mail in the Inbox. Retention tags have a lesser impact on the user's workflow because users aren't required to file messages in folders based on the folder's retention settings. They can apply any personal tag to custom folders, and also explicitly apply a different tag to individual messages.

With managed folders, users participate in the MRM process by classifying their own messages and sorting them into managed folders. This sorting process ensures that messages are classified according to the users' preferences and the organization's needs. It also helps eliminate the mishandling of messages that can occur with a completely automated messaging management solution.

The strategy to make Exchange 2010 messaging retention management and policy enforcement more reliable, effective, and easy to use is based on three principles:

- Users classify their own messages.
- Messages that have no retention value are removed.
- Messages that have some retention value are retained.

Users Classify Their Own Messages

With Exchange 2010, users participate in the MRM process by classifying their own messages. Users with a retention policy applied can either move a message to a folder that has a retention tag applied or can apply a personal tag to the message. If the user doesn't take any action, one of the following retention settings is applied:

- **Messages in default folders with a retention policy tag applied** If the message is located in a default folder that has a retention policy tag applied, the folder's retention settings are applied to the message.
- **Messages in custom folders with a personal tag applied** If the message is located in a custom folder to which the user has applied a personal tag, the folder's retention settings are applied to the message.
- **Messages in default or custom folders without a retention tag** If the message is located in a default or custom folder that doesn't have a retention tag applied to it, the DPT is applied to the message.

Regardless of the location of the message, any time a user explicitly applies a tag to a message, the user's action is honored.

Messages That Have No Retention Value Are Removed

Retention policies and managed folder mailbox policies are applied to the user's mailbox by the Managed Folder Assistant. This assistant processes mailboxes that have a retention policy or a managed folder mailbox policy applied. For mailboxes that have a retention policy applied, the Managed Folder Assistant applies the retention tags included

in the policy to default folders and the entire mailbox. Any personal tags included in the policy are provisioned and become available to users in Microsoft Outlook 2010 and Microsoft Office Outlook Web App.

Messages That Have Some Retention Value Are Retained

Messages that have some retention value are retained based on the retention settings applied to the message, folder, or mailbox. However, keep in mind that users can delete or remove messages from their mailbox; MRM isn't designed to prevent users from deleting their own messages. If your organization requires messages to be retained outside a user's mailbox for long-term storage, consider implementing journaling. To learn more about journaling, see Understanding Journaling.

If your organization wants to preserve messages for users to meet e-discovery and retention requirements, consider deploying large mailboxes and placing those users on legal hold. To learn more about legal hold, see Understanding Litigation Hold.

1.11.6.2 Understanding Retention Tags and Retention Policies

Understanding Retention Tags and Retention Policies

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-12-11*

Messaging records management (MRM) is the records management technology in Microsoft Exchange Server 2010 that helps organizations reduce legal risks associated with e-mail and other communications. MRM makes it easier to keep messages needed to comply with company policy, government regulations, or legal needs, and to remove content that has no legal or business value.

Organizations formulate MRM policies that specify the retention period for different classes of e-mail messages. However, in the past, enforcing those policies has often been challenging. Attempts to automate the MRM process have met with limited success. The MRM functionality in Exchange 2010 addresses these challenges.

Looking for management tasks related to MRM? See Deploying Messaging Records Management.

Contents

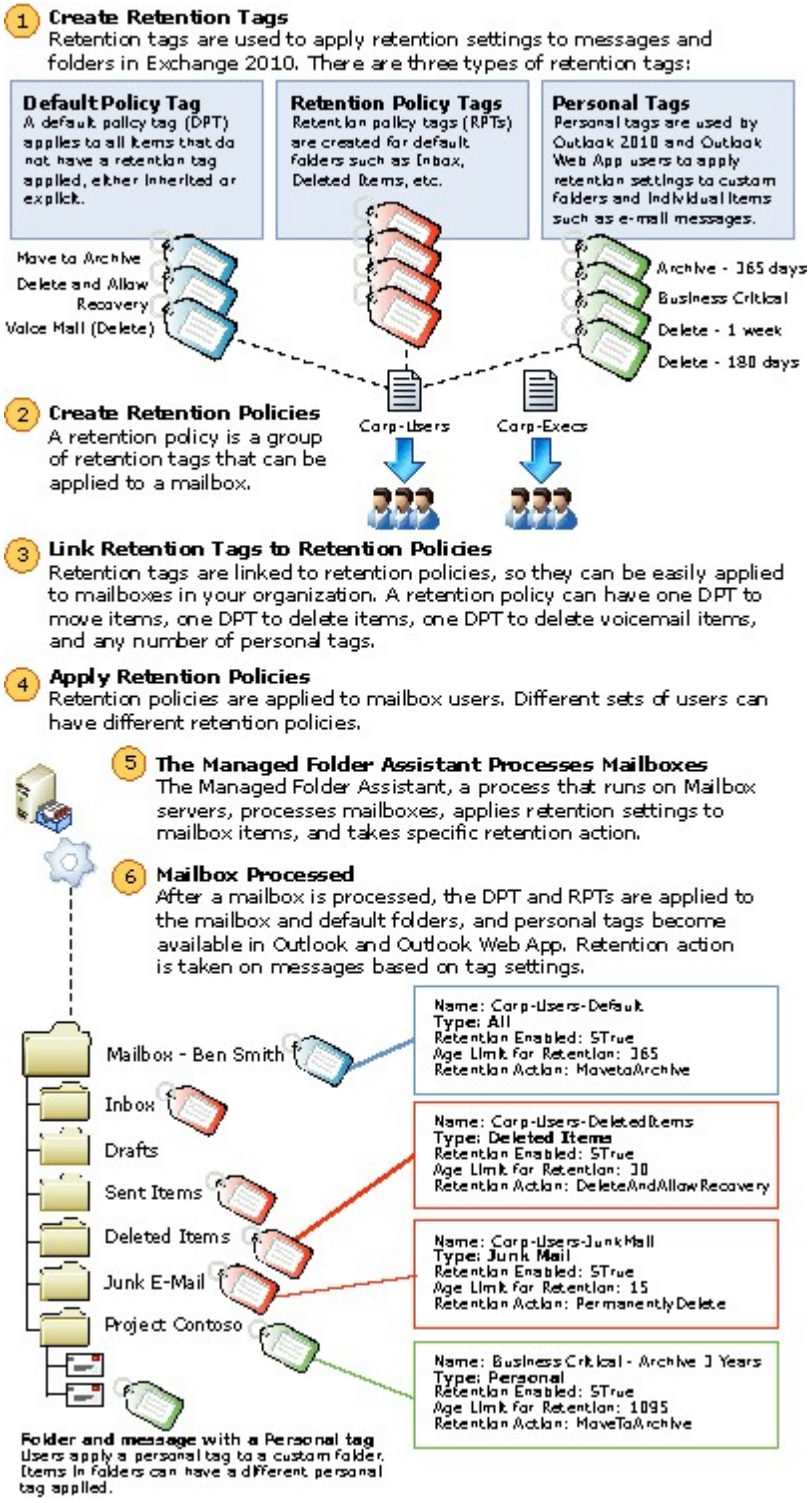
Messaging Records Management Strategy

MRM in Exchange 2010 is accomplished by using *retention tags* and *retention policies*.

Before discussing the details about each of these retention features, it's important to learn how the features are used in the overall Exchange 2010 MRM strategy. This strategy is based on:

- Assigning *retention policy tags* (RPTs) to default folders, such as the Inbox.
- Applying *default policy tags* (DPTs) to mailboxes to manage the retention of all untagged items.
- Allowing the user to assign *personal tags* to custom folders and individual items.
- Separating MRM functionality from users' Inbox management and filing habits. Users aren't required to file messages in managed folders based on retention requirements. Individual messages can have a different retention tag than the one applied to the folder in which they're located.

The following figure illustrates the tasks involved in implementing this strategy.



Return to top

Requirements

The following table shows requirements for the Mailbox server and client application.

Retention tag and retention policy requirements

Location	Requirement
Mailbox server	Exchange 2010 is required.
Client application (to view retention tags and apply personal tags)	Only Microsoft Outlook 2010 and Microsoft Office Outlook Web App users apply personal tags and view the retention tags applied to their mailbox folders or items. **Note:** Because retention policies are processed on Mailbox servers, they're independent of the Outlook version used by the users in your organization. You can still apply retention policies to user mailboxes running Microsoft Office Outlook 2007 and earlier. In these cases, RPTs in the policy apply to the default folders in their mailbox, and the DPT applies to untagged mailbox items.

Return to top

Retention Tags

As illustrated in the preceding figure, retention tags are used to apply retention settings to folders and individual items such as e-mail messages and voice mail. These settings specify how long a message remains in a mailbox and the action to be taken when the message reaches the specified retention age. When a message reaches its retention age, it's moved to the personal archive or deleted.

Unlike managed folders (the MRM feature introduced in Exchange Server 2007), retention tags allow users to tag their own mailbox folders and individual items for retention. Users no longer have to file items in managed folders provisioned by an administrator based on message retention requirements.

Note:

Managed folders are still available in Exchange 2010. To learn more, see Understanding Managed Folders.

Types of Retention Tags

There are three types of retention tags:

- **Default policy tags** DPTs apply to untagged mailbox items in the entire mailbox. Untagged items are mailbox items that don't already have a retention tag applied, either by inheritance from the folder in which they're located or by the user.
- **Retention policy tags** RPTs apply retention settings to default folders such as the Inbox, Deleted Items, and Sent Items. Mailbox items in a default folder that have an RPT applied inherit the folder's tag. Users can't apply or change an RPT applied to a default folder, but they can apply a different tag to the items in a default folder.
  You can create RPTs for the folders shown in the following table.

Folders in which you can create RPTs

Folder name	Details
Calendar	This default folder is used to store meetings and appointments. **Important:**

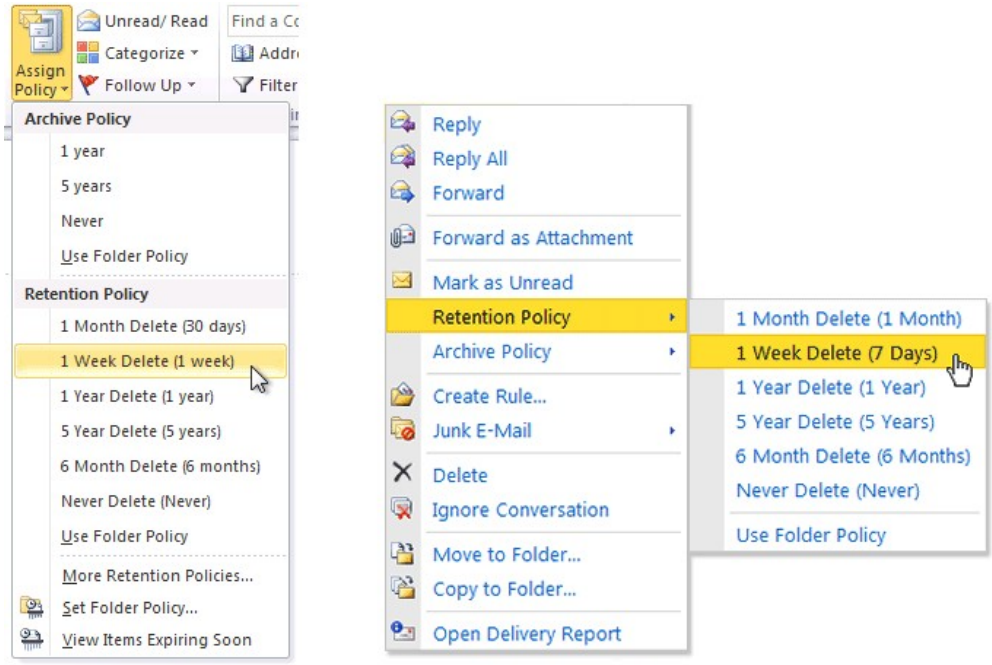
	RPTs for the Calendar and Tasks default folders are supported in Microsoft Exchange Server 2010 SP2 RU4. For details, see the Exchange Server Team Blog article Calendar and Tasks Retention Tag Support in Exchange 2010 SP2 RU4.
Conversation History	This folder is created by Microsoft Lync (previously Microsoft Office Communicator). Although it's not treated as a default folder by Outlook, it's treated as a special folder by Exchange and can have RPTs applied.
Deleted Items	This default folder is used to store items deleted from other folders in the mailbox. Outlook and Outlook Web App users can manually empty this folder. Users can also configure Outlook to empty the folder upon closing Outlook.
Drafts	This default folder is used to store draft messages that haven't been sent by the user. Outlook Web App also uses this folder to save messages that were sent by the user but not submitted to the Hub Transport server.
Inbox	This default folder is used to store messages delivered to a mailbox.
Journal	This default folder contains actions selected by the user. These actions are automatically recorded by Outlook and placed in a timeline view.
Junk E-mail	This default folder is used to save messages marked as junk e-mail by the content filter on an Exchange server or by the anti-spam filter in Outlook.
Notes	This folder contains notes created by users in Outlook. These notes are also visible in Outlook Web App. RPTs for the Notes folder are supported only in Exchange 2010 SP1.
Outbox	This default folder is used to temporarily store messages sent by the user until they're submitted to a Hub Transport server. A copy of sent messages is saved in the Sent Items default folder. Because messages usually remain in this folder for a brief period, it isn't necessary to create an RPT for this folder.
RSS Feeds	This default folder contains RSS feeds.
Recoverable Items	This is a hidden folder in the Non-IPM sub-tree. It contains the Deletions, Versions, Purges, and Audits sub-folders. Retention tags for this folder

	move items from the Recoverable Items folder in the user's primary mailbox to the Recoverable Items folder in the user's archive mailbox. You can assign only the **Move To Archive** retention action to tags for this folder. To learn more, see Understanding Recoverable Items.
Sent Items	This default folder is used to store messages that have been submitted to a Hub Transport server.
Sync Issues	This folder contains synchronization logs. To learn more, see Synchronization error folders.
Tasks	This default folder contains task items. Messages that are flagged by a user also appear in the To-Do List view. However, these messages are not task items, and do not reside in the Tasks folder. **Important:** RPTs for the Calendar and Tasks default folders are supported in Exchange Server 2010 SP2 RU4. For details, see the Exchange Server Team Blog article Calendar and Tasks Retention Tag Support in Exchange 2010 SP2 RU4.

Important:

You can't include more than one RPT for the same default folder type in one retention policy. For example, if a retention policy has an Inbox tag, you can't add another RPT of type Inbox to that retention policy.
You can't apply RPTs to the Contacts folder.

- **Personal tags** Personal tags are available to Outlook 2010 and Outlook Web App users as part of their retention policy. Users can apply personal tags to folders they create or to individual items, even if those items already have a different tag applied. In Outlook 2010 and Outlook Web App, personal tags with the **Move to Archive** action appear as **Archive Policy**, and personal tags with the **Delete and Allow Recovery** or **Permanently Delete** actions appear as **Retention Policy**, as shown in the following figure.



Outlook 2010 Outlook Web App

Messages that have a personal tag applied are always processed based on the personal tag's settings. Depending on the personal tags you create, users can apply a personal tag to a message so that it's moved or deleted sooner or later than the settings specified in the DPT or RPTs applied to that user's mailbox. You can also create personal tags with retention disabled. This allows users to tag items so they're never moved to an archive or never expire.

Note:

Users can apply archive policies to default folders, user-created folders or subfolders, and individual items. Users can apply a retention policy to user-created folders or subfolders and individual items (including subfolders and items in a default folder), but not to default folders.

In Exchange 2010 SP1, users can use the Exchange Control Panel (ECP) to select additional personal tags that aren't linked to their retention policy. The selected tags then become available in Outlook 2010 and Outlook Web App. To enable users to select additional tags from the ECP, you must add the MyRetentionPolicies Role to the user's role assignment policy. To learn more about role assignment policies for users, see Understanding Management Role Assignment Policies. If you allow users to select additional personal tags, all personal tags in your Exchange organization become available to them.

Note:

Personal tags are a premium feature. Mailboxes with policies that contain these tags (or as a result of users adding the tags to their mailbox) require an Exchange Enterprise client access license (CAL).

Retention Age Limit and Retention Actions

When you enable a retention tag, you must specify a retention age for the tag. This age indicates the number of days to retain a message after it arrives in the user's mailbox.

The retention age for non-recurring items (such as e-mail messages) is calculated differently than items that have an end date or recurring items (such as meetings and tasks). To learn how the retention age is calculated for different types of items, see How Retention Age is Calculated.

You can also create retention tags with retention disabled or disable tags after they're created. Because messages that have a disabled tag applied aren't processed by the Managed Folder Assistant, no retention action is taken. As a result, users can use a disabled personal tag as a **Never Move** tag or a **Never Delete** tag to override a DPT or RPT that would otherwise apply to the message.

When creating or configuring an RPT, you can select from one of the following actions to specify what retention action should be taken when a mailbox item reaches its retention age:

- **Move to Archive** This action moves a message to the user's archive mailbox. Tags that have this action applied are known as *archive tags*. Messages are moved to a folder in the archive mailbox that has the same name as the source folder in the user's primary mailbox. This allows users to easily locate messages in their archive mailbox. The **Move to Archive** action is available only for DPTs and personal tags. You can't create an RPT with the **Move to Archive** action. If the mailbox user doesn't have an archive mailbox, no action is taken. To learn more about archive mailboxes, see Understanding Personal Archives.
- **Delete and Allow Recovery** This action emulates the behavior when the Deleted Items folder is emptied. Tags that have this action applied are known as *deletion tags*. When this action occurs, and deleted item retention is configured for the mailbox database or the user, messages move to the Recoverable Items folder. The Recoverable Items folder (previously known as the dumpster) provides the user another chance to recover deleted messages. To do so, the user would access the **Recover Deleted Items** dialog box in Outlook 2010 or Outlook Web App. To learn more about recoverable items, see Understanding Recoverable Items.
- **Permanently Delete** This action permanently deletes a message. Like tags with the **Delete and Allow Recovery** action, tags that have this action applied are known as deletion tags. When this action is applied to a message, it's purged from the mailbox. This action is like a deleted message being removed from the Recoverable Items folder. After this happens, the user can no longer recover the message.
- **Mark as Past Retention Limit** This action isn't available in the Exchange Management Console (EMC); you must use the Shell. This action marks a message as expired after it reaches its retention age. In Outlook 2010 and Outlook Web App, expired items are displayed with the notification stating 'This item has expired' and 'This item will expire in 0 days'. In Outlook 2007, items marked as expired are displayed by using strikethrough text.

Important:

If litigation hold is enabled for a mailbox user, permanently deleted items are retained in the Recoverable Items folder until litigation hold is removed. Multi-Mailbox Search will still return permanently deleted messages in search results. To learn more, see Understanding Litigation Hold and Understanding Multi-Mailbox Search.

If single item recovery is enabled for the mailbox, permanently deleted items are retained in the Recoverable Items folder until the deleted item retention period for the mailbox database (or the deleted item retention period for the mailbox, if specified) is reached. To learn more, see Understanding Recoverable Items.

In Exchange 2010 SP1, the **Move to the Deleted Items Folder** and the **Move to a Managed Custom Folder** actions have been removed from retention tags.

For details about how to create retention tags, see Create a Retention Tag.

Return to top

Retention Policies

You can use retention policies to group one or more retention tags and apply them to mailboxes. A mailbox can't have more than one retention policy. Retention tags can be linked to or unlinked from a retention policy at any time, and the changes automatically take effect for all mailboxes that have the policy applied.

A retention policy can have the following retention tags:

- One or more RPTs for supported default folders

  Note:
  You can't link more than one RPT for a particular default folder (such as Deleted Items) to the same retention policy.

- One DPT with the **Move to Archive** action
- One DPT with the **Delete and Allow Recovery** or **Permanently Delete** actions
- One DPT for voice mail messages in Exchange 2010 SP1
- Any number of personal tags

Although you can add any number of personal tags to a retention policy, having many personal tags with different retention settings can confuse users. We recommend linking no more than 10 personal tags to a retention policy.

Note:
Although a retention policy doesn't need to have any retention tags linked to it, we don't recommend using this scenario. If mailboxes with retention policies don't have retention tags linked to them, this may cause mailbox items to never expire.

A retention policy can contain both archive tags (tags that move items to the personal archive mailbox) and deletion tags (tags that delete items). A mailbox item can also have both types of tags applied. Archive mailboxes don't have a separate retention policy. The same retention policy is applied to the primary and archive mailbox.

When planning to create retention policies, you must consider whether they'll include both archive and deletion tags. As mentioned earlier, a retention policy can have one DPT that uses the **Move to Archive** action and one DPT that uses either the **Delete and Allow Recovery** or **Permanently Delete** action. The DPT with the **Move to Archive** action must have a lower retention age than the DPT with a deletion action. For example, you can use a DPT with the **Move to Archive** action to move items to the archive mailbox in two years, and a DPT with a deletion action to remove items from the mailbox in seven years.

For details about how to create a retention policy, see Create a Retention Policy.

For details about how to add retention tags to a retention policy, see Add or Remove Retention Tags from a Retention Policy.

For details about how to apply a retention policy to mailboxes, see Apply a Retention Policy to Mailboxes.

Default Archive and Retention Policy

In Exchange 2010 SP1, Exchange Setup creates the retention policy Default Archive and Retention Policy. When you enable a personal archive for a mailbox, the Default Archive and Retention Policy is automatically applied to the mailbox if it doesn't already have a retention policy. If you later apply a retention policy to the mailbox, tags from the Default Archive and Retention Policy are no longer available to the mailbox. Existing items that have tags from the Default Archive and Retention Policy applied are still processed and moved to the archive or deleted based on the tag.

The following table lists the default retention tags linked to the Default Archive and Retention Policy.

Retention tags linked to the Default Archive and Retention Policy in Exchange 2010 SP1

Name	Type	Retention age (days)	Retention action
Default 2 years move to archive	DPT	730	Move to Archive
Personal 1 year move to archive	Personal tag	365	Move to Archive
Personal 5 year move to archive	Personal tag	1,825	Move to Archive
Personal never move to archive	Personal tag	Not applicable	Move to Archive
Recoverable Items 14 days move to archive	Recoverable Items folder	14	Move to Archive
1 Week Delete	Personal tag	7	Delete and Allow Recovery
1 Month Delete	Personal tag	30	Delete and Allow Recovery
6 Month Delete	Personal tag	180	Delete and Allow Recovery
1 Year Delete	Personal tag	365	Delete and Allow Recovery
5 Year Delete	Personal tag	1,825	Delete and Allow Recovery
Never Delete	Personal tag	Not applicable	Delete and Allow Recovery

In the release to manufacturing (RTM) version of Exchange 2010, Exchange Setup creates the retention policy called **Default Archive Policy**. This policy doesn't contain personal tags with the **Delete and Allow Recovery** action.

Return to top

Managed Folder Assistant

The Managed Folder Assistant, a mailbox assistant that runs on Mailbox servers, processes mailboxes that have a retention policy applied.

The Managed Folder Assistant applies the retention policy by inspecting items in the mailbox and determining whether they're subject to retention. It then stamps items subject to retention with the appropriate retention tags and takes the specified retention action on items past their retention age.

In Exchange 2010 SP1, the Managed Folder Assistant is a throttle-based assistant. Throttle-based assistants are always running and don't need to be scheduled. The system resources they can consume are throttled. You can configure the Managed Folder Assistant to process all mailboxes on a Mailbox server within a certain period (known as a *work cycle*). Additionally, at a specified interval (known as the *work cycle checkpoint*), the assistant refreshes the list of mailboxes to be processed. During the refresh, the

assistant adds newly created or moved mailboxes to the queue. It also reprioritizes existing mailboxes that haven't been processed successfully due to failures and moves them higher in the queue so they can be processed during the same work cycle.

You can also use the Start-ManagedFolderAssistant cmdlet to manually trigger the assistant to process a specified mailbox. For more details, see Configure the Managed Folder Assistant.

In Exchange 2010 RTM, the Managed Folder Assistant runs on a specified schedule. By default, it's scheduled to run daily from 01:00 through 09:00 (1:00 A.M. through 9:00 A.M.). You can schedule the assistant to run at a time when the Mailbox server is relatively idle or not under a heavy load. When determining a schedule for the assistant, consider other processes that compete for Mailbox server resources, such as offline defragmentation of the mailbox database and antivirus scans.

Note:

The Managed Folder Assistant doesn't take any action on messages that aren't subject to retention, specified by disabling the retention tag. You can also disable a retention tag to temporarily suspend items with that tag from being processed.

Moving Items Between Folders

A mailbox item moved from one folder to another inherits any tags applied to the folder to which it's moved. If an item is moved to a folder that doesn't have a tag assigned, the DPT is applied to it. If the item has a tag explicitly assigned to it, the tag always takes precedence over any folder-level tags or the default tag.

Removing or Deleting a Retention Tag from a Retention Policy

When a retention tag is removed from the retention policy applied to a mailbox, the tag is no longer available to the user and can't be applied to items in the mailbox.

Existing items that have been stamped with that tag continue to be processed by the Managed Folder Assistant based on those settings and any retention action specified in the tag is applied to those messages.

However, if you delete the tag, the tag definition stored in Active Directory is removed. This causes the Managed Folder Assistant to process all items in a mailbox and restamp the ones that have the removed tag applied. Depending on the number of mailboxes and messages, this process may significantly consume resources on all Mailbox servers that contain mailboxes with retention policies that include the removed tag.

Important:

If a retention tag is removed from a retention policy, any existing mailbox items with the tag applied will continue to expire based on the tag's settings. To prevent the tag's settings from being applied to any items, you should delete the tag. Deleting a tag removes it from any retention policies in which it's included.

Disabling a Retention Tag

If you disable a retention tag, the Managed Folder Assistant ignores items that have that tag applied. Items that have a retention tag for which retention is disabled are either never moved or never deleted, depending on the specified retention action. Because these items are still considered tagged items, the DPT doesn't apply to them. For example, if you want to troubleshoot retention tag settings, you can temporarily disable a retention tag to stop the Managed Folder Assistant from processing messages with that tag.

Note:

The retention period for a disabled retention tag is displayed to the user as **Never**. If a user tags an item believing it will never be deleted, enabling the tag later may result in unintentional deletion of items the user didn't want to delete. The same is true for tags with the **Move to Archive** action.

Return to top

Retention Hold

When users are temporarily away from work and don't have access to their e-mail, retention settings can be applied to new messages before they return to work or access their e-mail. Depending on the retention policy, messages may be deleted or moved to the user's personal archive. You can temporarily suspend retention policies from processing a mailbox for a specified period by placing the mailbox on retention hold. When you place a mailbox on retention hold, you can also specify a retention comment that informs the mailbox user (or another user authorized to access the mailbox) about the retention hold, including when the hold is scheduled to begin and end. Retention comments are displayed in supported Outlook clients. You can also localize the retention hold comment in the user's preferred language.

Note:

Placing a mailbox on retention hold doesn't affect how mailbox storage quotas are processed. Depending on the mailbox usage and applicable mailbox quotas, consider temporarily increasing the mailbox storage quota for users when they're on vacation or don't have access to e-mail for an extended period. For more information about mailbox storage quotas, see Configure Storage Quotas for a Mailbox.

During long absences from work, users may accrue a large amount of e-mail. Depending on the volume of e-mail and the length of absence, it may take these users several weeks to sort through their messages. In these cases, consider the additional time it may take the users to catch up on their mail before removing them from retention hold.

If your organization has never implemented MRM, and your users aren't familiar with its features, you can also use retention holds during the initial *warm-up and training* phase of your MRM deployment. You can create and deploy retention policies and educate users about the policies without the risk of having items moved or deleted before users can tag them. A few days before the warm-up and training period ends, you should remind users of the warm-up deadline. After the deadline, you can remove the retention hold from user mailboxes, allowing the Managed Folder Assistant to process mailbox items and take the specified retention action.

For details about how to place a mailbox on retention hold, see Place a Mailbox on Retention Hold.

Return to top

1.11.6.3 Understanding Managed Folders

Understanding Managed Folders

Exchange Server 2010 > Messaging Policy and Compliance > Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-02-14*

Managed folders are a messaging records management (MRM) feature introduced in Microsoft Exchange Server 2007 that's also available in Exchange Server 2010. Using managed folders, you can specify retention settings for default folders such as Inbox, Deleted Items, and Sent Items, and create custom managed folders with their own retention settings. Managed folders rely on users to classify messages for retention, and

move the messages to appropriate managed folders based on retention requirements.

Contents

Managed Folders

Managed folders are an Active Directory representation of folders in a mailbox. You can define two types of managed folders:

- **Managed default folders** Managed default folders are managed folder objects created for default folders such as Inbox, Deleted Items, Sent Items, and others. Exchange 2010 Setup creates a set of managed default folders. You can use these folders or create additional ones for different sets of users.
- **Managed custom folders** Managed custom folders are managed folder objects you can use to create custom folders in a user's mailbox. The folders are created under a top-level folder called Managed Folders.

Note:

Managed custom folders are a premium feature of MRM. Each mailbox that has managed custom folders requires an Exchange Server Enterprise client access license (CAL).

Return to top

Managed Content Settings

Managed content settings specify the retention and journaling settings for a managed folder. The settings can be for a specific message class (such as e-mail messages, calendar items, and tasks), or they can be for all message classes. You can specify multiple managed content settings for different message classes, allowing you to specify different retention settings for different types of items in the same folder.

These retention settings include a message class (whether retention is enabled for the specified message class), the retention age, and a retention action. The retention age specifies the period for which a message is retained in the mailbox. The retention action specifies the action to take after the item is past its retention age. For example, you can create a managed content setting for a managed default folder that moves all items to the Deleted Items folder after 120 days.

You can select from one of the following retention actions:

- **Move to the Deleted Items Folder** Use this action to move items to the Deleted Items folder upon expiration.
- **Move to a Managed Custom Folder** Use this action to move items to a managed custom folder. To use this action, you must first create the managed custom folder.
- **Delete and Allow Recovery** Use this action to move items to the Recoverable Items folder. Deleted items are available for recovery from the Recoverable Items folder until the deleted item retention time specified for the mailbox database or the user mailbox elapses.

- **Permanently Delete** Use this action to permanently delete items. Users can't recover items that have been permanently.
- **Mark as Past Retention Limit** Use this action to mark items as expired after they reach their retention age. Items marked as expired are displayed by using strikethrough text in Microsoft Outlook 2010 and Office Outlook 2007.

You can also specify whether the retention age is calculated from when a message is delivered to a mailbox or when it's moved to the folder it currently resides in. For calendar items and recurring tasks, the retention age is calculated from the end date of the item. For details about how the retention age is calculated, see How Retention Age is Calculated. For details about creating managed content settings for a managed folder, see Create Managed Content Settings.

Return to top

Journaling and Managed Folders

You can use managed folders to journal (automatically forward) copies of specific items to another location. Content can be journaled to any location that has an SMTP e-mail address, including another Exchange mailbox or a mail contact. You can assign a text label to messages to help preserve classification information and to enable automated sorting of journaled messages by the recipient. When an item is journaled, it's attached as an unaltered copy to a new e-mail message. Some properties of the item being journaled are assigned as properties of the new e-mail message, which facilitates review and automated sorting.

Important:

Journal reports generated by the Managed Folder Assistant on mailbox servers are different from journal reports generated by the Journaling agent on Hub Transport servers when you use standard (per-mailbox database) or premium journaling. To learn more about journaling, see Understanding Journaling.

Managed Folder Mailbox Polices

A managed folder mailbox policy is a logical grouping of managed folders that can be applied to mailboxes, allowing you to apply managed content settings for multiple managed folders to a user. A policy can contain a mix of managed default folders and managed custom folders. However, you can't add two managed default folders of the same type (such as the Inbox) to the same policy. Managed folders can be added or removed from a managed folder mailbox policy at any time. A mailbox user can have only one managed folder mailbox policy applied.

For details about how to create or apply a managed folder mailbox policy, see Create a Managed Folder Mailbox Policy and Apply a Managed Folder Mailbox Policy to Users.

Return to top

Managed Folder Assistant

The Managed Folder Assistant is a process that runs on Mailbox servers and applies managed folder mailbox policies to mailboxes located on that server. The assistant retrieves the list of managed folders associated with a policy, provisions managed folders in mailboxes, and processes items in those folders. Items for which retention is enabled are stamped with the retention age. The retention action specified in applicable managed content settings is taken on items that have reached their retention age.

In Exchange 2010 SP1, the Managed Folder Assistant is a throttle-based assistant. Throttle-based assistants don't run on a schedule. Instead, they're configured to process

all mailboxes on a Mailbox server within a certain period of time (known as a *work cycle*). Additionally, at a specified interval known as the *work cycle checkpoint*, the Managed Folder Assistant refreshes the list of mailboxes to be processed. During the refresh, the assistant adds newly created or moved mailboxes to the queue. It also reprioritizes existing mailboxes that haven't been processed successfully for awhile due to failures and moves them higher in the queue so they can be processed during the same work cycle.

In Exchange 2010, the Managed Folder Assistant is a schedule-based assistant that's scheduled to run from 01:00 through 09:00 (1:00 A.M. through 9:00 A.M.) every day. You can modify the assistant's schedule to make sure there's minimal user impact. You can also start and stop the assistant manually by using the Exchange Management Shell. To learn more about scheduling the assistant, see Configure the Managed Folder Assistant.

Note:
In Exchange 2010, the Managed Folder Assistant also applies retention policies for MRM. You can apply either a retention policy or a managed folder mailbox policy to a mailbox. If you modify the Managed Folder Assistant schedule, it impacts both MRM features.

Return to top

1.11.6.4 Planning for Messaging Records Management

Planning for Messaging Records Management

Exchange Server 2010 > Messaging Policy and Compliance > Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-06-02*

Although configuring and managing messaging records management (MRM) features in Microsoft Exchange Server 2010 is technically straightforward, planning for a successful MRM implementation can require time, thought, and input from a variety of business disciplines. In addition to Exchange administrators and the IT department, executives, records managers, human resources personnel, legal advisors, and even end users can play important roles in the planning process.

Where Do I Start?

Before implementing an MRM solution, there are many factors to consider, and not all of them are technical. The following sections describe some of these factors.

Sandbox

To learn about installing, configuring, and maintaining MRM, we recommend that you first set up a test environment (also known as a *sandbox* installation). Exchange administrators who are well versed in the details of setting up and configuring MRM in a test environment are in a better position to consult with and make recommendations to other members of the organization about the technical requirements for a successful MRM solution. You can set up a virtualized sandbox environment by using the Windows Server 2008 operating system and Hyper-V. For more information, see Virtualization with Hyper-V: Overview.

You can also use this virtualized environment to test other messaging policy and compliance features such as personal archive, Multi-Mailbox Search, journaling, and Information Rights Management (IRM).

Policies and Plans

The MRM features in Exchange 2010 help your organization implement its records retention and management policies. An effective MRM implementation begins with a records management policy. As you plan to implement an MRM solution, we recommend that you set up a team for the purposes of creating or updating the records management policy of your organization. Among the groups to consider including in the policy creation or review process are:

- Records management professionals
- Legal counsel
- Human resources
- Training
- Senior management
- Information technology (IT) management
- Consultants

The team's task is to create a records management policy that's sufficiently broad in scope to address the organization's current and future needs, but also sufficiently clear and detailed to enable the policy to be implemented by an Exchange administrator as an MRM solution. The process of developing this policy can be lengthy. This is because each team member considers, makes suggestions, and revises the work of the others, balancing legal requirements, budget, complexity, and administrative and human considerations to create a policy from which a manageable MRM implementation can be created.

Concerns for the team to consider, especially in organizations that have a well developed e-mail culture, include:

- User concerns and possible resistance to an MRM solution
- How to monitor and enforce the organization's messaging policies

Keeping Messages Where They Can Be Managed

To manage messages, the Managed Folder Assistant must have access to them. This means that messages must be stored on an Exchange server for effective MRM. This has two consequences:

- Users' mailboxes must often be increased in size so that they can hold more items.
- Access to personal folder (.pst) files on users' computers should be limited or eliminated.

Increasing Mailbox Size

Keeping all user messages in mailboxes on the server usually means increasing users' mailbox storage quotas, possibly to a gigabyte (GB) or more. The increased performance of Exchange 2010 helps to make these larger mailboxes manageable. A number of changes have been made to the Extensible Storage Engine (ESE) to increase performance and reduce storage requirements. These changes help you in planning for and deploying larger mailbox quotas at a lower cost. For more details about changes to ESE, see New Exchange Core Store Functionality.

Personal Archive

In Exchange 2010, you can provision personal archives for your users, allowing them to have an online archive mailbox that can be accessed using Microsoft Outlook 2010 and Microsoft Office Outlook Web App. Archive mailboxes provide functionality similar to .pst files used by Outlook, but eliminates the risks associated with using .pst files. For more details about some of the risks your organization is exposed to due to the use of .pst files, and how your users can benefit from a personal archive, see Understanding Personal Archives.

With a combination of larger mailboxes and archive mailboxes, you can plan to reduce the usage of .pst files in your organization, with the goal of eliminating it.

Limiting Access to .pst Files

You can start moving users away from using .pst files by creating a group policy that prevents new items from being added to existing .pst files. Making .pst files read-only gives users access to the .pst files they may already have while encouraging them to keep the messages that they want to keep in their Exchange mailboxes. If you plan to deploy archive mailboxes, data from pst files can be moved to the user's archive mailbox. Eventually, you may want to create a group policy to remove access to .pst files altogether.

Limiting access to .pst files can disrupt the work habits of some users, but it also has a number of advantages.

Keeping user messages on the server and limiting access to .pst files can:

- Significantly increase the effectiveness of MRM by keeping messages where they can be managed and monitored.
- Reduce the risk of losing important data that's stored on individual hard disks rather than on servers that are backed up regularly.
- Help to reduce the loss of the organization's intellectual property when vendors, interns, and employees leave the organization.
- Improve users' access to their data by keeping everything in their mailboxes.
- Make Outlook Web App more effective because all user messages are available anywhere with only a Web connection.
- Reduce the cost of legal discovery during a lawsuit. The process of capturing and discovering information that's stored in .pst files is labor-intensive and expensive because .pst files must first be located on user computers and then the contents must be processed by legal personnel.

Configuring User's Systems to Prevent Moving or Copying Exchange Mailbox Data to .pst Files

Outlook 2010 allows you to effectively control your organization's mailbox data so it can't be moved or copied to a .pst file. This allows users to open .pst files and copy the data into an Exchange mailbox, but not copy or move messages from the Exchange mailbox to .pst files. Using Outlook 2010, you can provide your users with a migration path to move messaging data from .pst files to their primary Exchange mailbox or their archive mailbox (if it's provisioned).

To disable the copying of Exchange mailbox data to a .pst file, set the following registry value for your Outlook 2010 users. You can set the registry value by configuring administrative templates in a group policy. You can add Outlook 2010 Group Policy settings to a Group Policy object by adding the Outlook14.adm policy file. For more information about adding or removing an administrative template, see Add or remove an Administrative Template (.adm file).

Caution:
Incorrectly editing the registry can cause serious problems that may require you to reinstall your operating system. Problems resulting from editing the registry incorrectly may not be able to be resolved. Before editing the registry, back up any valuable data.

Registry path	**HKEY_CURRENT_USER/Software/Microsoft/Office/14/Outlook**
Registry value	**DisableCrossAccountCopy**
Value type	REG_MULTI_SZ
Value data	Domain names used for user's primary SMTP e-mail addresses. For example, use contoso.com to prevent copying or moving data from any mailbox that uses a contoso.com e-mail address as the primary SMTP e-mail address. Use * (asterisk) to

	prevent moving or copying data from any mailbox. **Note:** In Exchange 2010, domains used for generating e-mail addresses for recipients in your organization are configured as accepted domains. For more information, see Managing Accepted and Remote Domains.

Note:
Using the **DisableCrossAccountCopy** registry value on a computer running Outlook 2010 doesn't prevent the Outlook 2010 user from copying data to the primary or archive mailbox.

Configuring User's Systems to Operate Without .pst Files in Outlook 2010

Note:
The registry values in this section can also be set for Microsoft Office Outlook 2007. Change the Outlook version from 14 to 12.0 to apply these changes to Outlook 2007.

1. **Disable copying or moving messages to .pst files** Create a group policy that sets the following registry subkey to a value of 1. This setting prevents users from moving or copying messages to .pst files. Users can still create new .pst files but they can't add anything to them. This setting blocks only Microsoft Outlook .pst files. It allows Microsoft SharePoint .pst files to be connected and updated in a user's Outlook profile. A similar registry key can be used to disable writing to .pst files in Office Outlook 2003.

Caution:
Incorrectly editing the registry can cause serious problems that may require you to reinstall your operating system. Problems resulting from editing the registry incorrectly may not be able to be resolved. Before editing the registry, back up any valuable data.

Registry path	**HKEY_CURRENT_USER/Software/Microsoft/Office/14/Outlook/PST**
Registry value	**PstDisableGrow**
Value type	DWORD
Value data	1

2. **Disable AutoArchive** Create a group policy that sets the following registry subkeys to a value of 0. These settings disable the **AutoArchive** menu in Outlook and remove the **AutoArchive** option, which is shown when the user clicks **Tools** > **Options**, and then clicks the **Other** tab.

Registry path	**HKEY_CURRENT_USER/Software/Policies/Microsoft/Office/14/Outlook/Preferences**

Registry value	Value type	Value data
ArchiveDelete	DWORD	0
ArchiveMount	DWORD	0
ArchiveOld	DWORD	0
DeleteExpired	DWORD	0
DoAging	DWORD	0
PromptForAging	DWORD	0

3. **Disable creation of new .pst files** Create a group policy that sets the following registry subkey to a value of 5575. This setting removes the **Outlook Data File** option in Outlook, which is shown when the user clicks **File**, and then points to **New**.

Registry path	**HKEY_CURRENT_USER/Software/Policies/Microsoft/Office/14/Outlook/DisableCmdBarItemsList**
Registry value	**TCID1**
Value type	DWORD
Value data	5575

Pilot Program

Starting with a pilot implementation can help you to fine tune your MRM solution and learn about end-user satisfaction before an organization-wide implementation. For example, you may discover that users find a six-month retention period for the Inbox too short, and that they're more comfortable with a one-year limit. Or you may discover that additional journaling would result in a need to upgrade your archiving solution.

Members of an MRM planning team may also be good candidates for the first members of an MRM pilot program. Additional members can be recruited from IT personnel and from interested management personnel. When the pilot program is in stable operation, you can recruit additional members of the organization to join. Any user reluctance to adopt managed messaging can sometimes be lessened with the promise of a larger mailbox, automatic e-mail management (including automatic deletion of routine notices and messages that can be placed in a short-retention folder), and training to deal with any questions or concerns.

How Do I Implement MRM?

When it's time to implement your MRM solution in your organization, you may want to consider a phased implementation to allow the people in the organization and your Exchange system to adapt to the changes required.

Human Considerations During an MRM Implementation

Gradually introducing MRM to users gives them time to adapt to necessary changes in their work habits. A workable plan is to:

1. Start a pilot program to test and refine the solution.
2. Invite additional users to join the pilot program. Larger mailboxes and availability of an archive mailbox can be an incentive to join.
3. When you're ready to roll out MRM to the entire organization, start by offering training on MRM and relevant organization messaging policies.
4. Increase the size of users' mailboxes.
5. Apply retention policies to users' mailboxes, but with expiration turned off. Encourage users to familiarize themselves with MRM and to the appropriate retention tags according to their needs and the organization's message retention policy.
6. Three weeks after retention policies are applied to users, enable MRM and make .pst files read-only.
7. Be ready to provide a high level of support for users at the start of MRM implementation. (Training in advance of rollout reduces user questions and concern.)
8. Monitor system performance.
9. Monitor user compliance.

System Considerations During an MRM Implementation

Your Exchange system must adapt to MRM. The first time the Managed Folder Assistant runs, it typically processes a large number of items. This can be a resource-intensive process for both the Mailbox server and the network. It can also result in Outlook clients consuming large amounts of time and network resources while synchronizing mailbox contents with the server. You should plan carefully to avoid overloading resources. Running the Managed Folder Assistant when the load on the server is light and adding users gradually rather than all at once can help to ensure a smooth transition.

Training and the Human Element

People take their e-mail personally, even when it isn't their personal e-mail. If faced with abrupt changes to the organization's messaging policies, users may feel annoyed or confused, especially if the new policies involve automatically deleting messages. Changes to long-established methods (such as never emptying the Inbox or saving everything to .pst files) have the potential to cause significant disruption for some users. To assure that your MRM implementation proceeds with as little disruption as possible, consider the following recommendations.

Phased implementation

Introduce MRM gradually rather than all at once.

Training

Training users helps to address concerns in advance and makes for a smoother implementation. Some training topics to consider include:

- An introduction to the organization's messaging policies.
- The necessity for MRM in the modern workplace, including an overview of the potential legal liability that results from a lack of records management, and how that liability can cost the organization money and endanger jobs.
- How automatic e-mail deletion can be a timesaver by automatically deleting outdated content that routinely accumulates.
- How larger mailbox sizes provide more room for message storage.
- How server-based storage increases mobile access to data.
- How there may be unavoidable changes to the way users perform certain tasks (for example, not being able to add messages to .pst files), and the necessity of paying more attention to classifying and handling messages.
- How MRM helps to conserve the organization's IT resources.

Advance notice

Notify users in advance that changes are coming. Specifically, notify users of the exact dates that MRM will be implemented and remind them about the changes that will occur.

User support

Excellent user support in the early phases of the implementation can ease the transition to MRM. Issues that arise during the deployment phase are usually less technical than might be expected. Often, the concerns revolve around users asking questions of the "What do I do?" nature. Having a team of people who can answer this type of question will help to manage these concerns.

Compliance, Monitoring, and Enforcement

The following are some of methods by which users can evade MRM policies:

- Saving messages to .pst files (if .pst files aren't disabled by group policy)
- Forwarding messages to other locations (such as an external e-mail account)
- Saving messages as files on their computers
- Sending messages to Microsoft OneNote (by using Outlook 2010 or Outlook 2007)
- Printing messages
- If your organization has deployed managed folders, by placing all of their mailbox folders in the managed folder that has the longest retention setting.

Educating users about the messaging policies of your organization can help to ensure

compliance. However, monitoring may be necessary to ensure that your MRM solution is effective. Enforcement of messaging policies will likely require involvement and guidance from senior management.

Complying with Legal Discovery Orders

In Exchange 2010, Multi-Mailbox Search helps you to comply with legal discovery orders for electronically stored information. You can use Multi-Mailbox Search to search the contents of specified Exchange 2010 mailboxes. You can create powerful search queries using a number of search parameters. Messages returned by the search are copied to the specified Discovery mailbox. To learn more about Multi-Mailbox Search, see Understanding Multi-Mailbox Search.

1.11.6.5 How Retention Age is Calculated

How Retention Age is Calculated

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-12-11*

If you set a retention limit on items that have a retention tag or are within a managed folder, the Managed Folder Assistant tests the age of those items, and takes the specified action for items that have exceeded their retention limit.

Determining the Age of Different Types of Items

For mailboxes that use retention policies, the retention age of mailbox items is calculated from the date of delivery. When the Managed Folder Assistant processes items in a mailbox, it stamps a start date and an expiration date for all items that have retention tags with the **Delete and Allow Recovery** or **Permanently Delete** retention action. Items that have an archive tag are also stamped with a move date.

In Microsoft Exchange Server 2010 Service Pack 1 (SP1), the retention age for items in the **Deleted Items** default folder is calculated based on the date of delivery unless the item was moved or deleted from a folder that doesn't have an inherited or implicit retention tag. Consider the following examples:

- A user receives a message in the Inbox folder on 01/26/2011. The Inbox folder has a retention tag configured to delete items in 365 days.
  1. The Managed Folder Assistant processes the message. It stamps the message with a start date of 01/26/2011 and an expiration date of 01/26/2012.
  2. The user soft-deletes the item on 02/27/2011.The item is moved to the Deleted Items folder, which has a retention tag configured to delete the item in 30 days.
  3. The Managed Folder Assistant processes the message. It recalculates the expiration date based on the start date (01/26/2011).
  4. Because the item is older than 30 days, it is deleted immediately.
- A user receives an item in the Inbox folder on 01/26/2011. The Inbox folder doesn't have a retention tag applied, and the retention policy doesn't contain a default policy tag.
  1. The user soft-deletes the item on 02/27/2011. The item is moved to the Deleted Items folder, which has a retention tag configured to delete items in 30 days.

.2.The Managed Folder Assistant processes the mailbox on 03/27/2011, and determines that the item doesn't have a start date. It stamps the current date as the start date and 04/27/2011 as the expiration date.
.3.The item is deleted on 04/27/2011, which is 30 days after it was deleted or moved to the Deleted Items folder.

The same conditions are true for both *move tags* (tags that have the **Move to Archive** retention action) and *delete tags* (tags that have the **Delete and Allow Recovery** and **Permanently Delete** retention actions).

Important:
Retention tags include retention settings such as retention age and retention action. However, to configure retention settings for a managed folder, you must create managed content settings for it. A UNRESOLVED_TOKEN_VAL(xCoNameNoMk) Exchange Server 2010 mailbox can be configured to use either a retention policy or a managed folder mailbox policy.

When you create managed content settings for a managed folder, you can select one of the following options to specify how the Managed Folder Assistant determines when a retention period starts:

- When the item is delivered to the user's mailbox (or for calendar items and recurring tasks, when the item is older than its end date)
- When the user moves the item into the managed folder

After determining when a retention period starts, the Managed Folder Assistant uses rules to determine the age of items for the purpose of enforcing retention limits. The following tables describe the rules used for various items.

Calendar Items

Depending on whether a calendar item is in the Deleted Items folder, the Managed Folder Assistant uses the following rules to calculate the age of calendar items and enforce retention limits. The steps for each rule are listed in the order in which they are performed.

Location of calendar items	Rules
Calendar items in the Deleted Items folder	1.A calendar item expires according to its `message-received date`, if one exists. 2.If a calendar item doesn't have a `message-received date`, it expires according to its `message-creation date`. 3.If a calendar item has neither a `message-received date` nor a `message-creation date`, it doesn't expire.
Calendar items not in the Deleted Items folder	• Non-recurring calendar items expire according to their `end date`. • Recurring calendar items expire according to the `end date` of their last occurrence. Recurring calendar items with no `end date` don't expire.

Tasks

Depending on whether a task is in the Deleted Items folder, the Managed Folder Assistant uses the rules listed in the following table to calculate the age of tasks and enforce retention limits. The steps for each rule are listed in the order in which they are performed.

Location of tasks	Rules

Tasks in the Deleted Items folder	1. A task expires according to its `message-received date`, if one exists. 2. If a task doesn't have a `message-received date`, it expires according to its `message-creation date`. 3. If a task has neither a `message-received date` nor a `message-creation date`, it doesn't expire.
Tasks not in the Deleted Items folder	• Non-recurring tasks: .1. A non-recurring task expires according to its `message-received date`, if one exists. .2. If a non-recurring task doesn't have a `message-received date`, it expires according to its `message-creation date`. .3. If a non-recurring task has neither a `message-received date` nor a `message-creation date`, it doesn't expire. • A recurring task expires according to the `end date` of its last occurrence. If a recurring task doesn't have an `end date`, it doesn't expire. • A regenerating task (which is a recurring task that regenerates a specified time after the preceding instance of the task is completed) doesn't expire.

Note:

In Exchange 2010, retention tags aren't supported for the Calendar and Tasks default folders. The Managed Folder Assistant doesn't process items in these folders.

Other Items

For all other types of items, the Managed Folder Assistant uses the following rules to calculate the age and enforce retention limits. These items include:

- E-mail messages
- Contacts
- Documents
- Faxes
- Journal items
- Meeting requests, responses, and cancellations
- Missed calls

The steps for each rule are listed in the order in which they are performed.

Period at which retention starts	Rules
When an item is delivered to a user's mailbox	1. If the item has a `message-received date`, the `message-received date` is used. 2. If the item doesn't have a `message-received date`, the `message-creation date` is used. 3. If the item doesn't have a `message-creation date`, the message doesn't expire.

When a user moves the item to the managed folder	1. If the item has a `move date`, the move date is used. 2. If the item doesn't have a `move date`, the item doesn't expire.

Corrupted Items

Any corrupted items in a mailbox are skipped by the Managed Folder Assistant, and they don't expire.

1.11.6.6 Deploying Messaging Records Management

Deploying Messaging Records Management

Exchange Server 2010 > Messaging Policy and Compliance > Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-12-01*

1.11.6.6.1 Checklist: Deploying Retention Policies

Checklist: Deploying Retention Policies

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-07-30*

Use this checklist to deploy retention policies in your Microsoft Exchange Server 2010 organization. Before you start working with this checklist, make sure you're familiar with the concepts in the following topics:

- Understanding Messaging Records Management
- Understanding Retention Tags and Retention Policies

Checklist for Deploying Retention Policies

Done?	Tasks	Topic
	Assess messaging records management (MRM) requirements for different sets of users.	Understanding Messaging Records Management
	Determine which Microsoft Outlook client versions are in use.	Get-LogonStatistics
	Create retention tags.	Create a Retention Tag
	Create retention policies.	Create a Retention Policy
	Add retention tags to retention policies.	Add or Remove Retention Tags from a Retention Policy
	Place mailboxes on retention hold.	Place a Mailbox on Retention Hold
	Apply a retention policy to a single mailbox for testing purposes.	Apply a Retention Policy to Mailboxes
	Optional: Implement client blocking to block legacy Outlook clients.	Configure Outlook Client Blocking
	Begin user communication and training activities. Include a deadline when retention policies will be processed, and items moved or deleted.	Not applicable
	Apply retention policy to additional mailboxes.	Apply a Retention Policy to Mailboxes
	A few days in advance, remind users about the deadline.	Not applicable
	At the deadline, remove the retention hold from mailboxes.	Place a Mailbox on Retention Hold

1.11.6.6.2 Create a Retention Tag

Create a Retention Tag

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Retention tags are used to apply retention settings to folders and individual items such as messages, notes, and contacts. These settings specify how long a message remains in the mailbox and the action to take when the message reaches the specified retention age. When a message reaches its retention age, it's moved to the archive mailbox, deleted, or flagged for user attention.

There are three types of retention tags:

- **Retention policy tags (RPTs)** These tags are created for default folders such as Inbox and Deleted Items.
- **Default policy tags (DPTs)** These tags apply to all items that don't have a retention tag applied, either inherited or explicit. You can have a maximum of three default policy tags in a retention policy: a DPT with the **Move to Archive** action, a DPT with the **Delete and Allow Recovery** or **Permanently Delete** action to delete messages from the primary and archive mailboxes, and a DPT for voice mail messages.
- **Personal tags** These tags are available to Microsoft Outlook 2010 and Microsoft Office Outlook Web App users as part of their retention policy. Users can apply personal tags to folders they create or to individual items, even if those items already have a different tag applied.

To learn more about retention tags, see Understanding Retention Tags and Retention Policies.

Note:

After you create retention tags, additional steps are required to deploy them to user mailboxes. You must add retention tags to a retention policy, and then apply the policy to a mailbox. For details, see Add or Remove Retention Tags from a Retention Policy and Apply a Retention Policy to Mailboxes.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

What Do You Want To Do?

- Use the EMC to create a retention tag
- Use the Shell to create a retention tag

Use the EMC to create a retention tag

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, expand the forest you want, and then navigate to **Organization Configuration** > **Mailbox**.
2. In the action pane, click **New Retention Policy Tag**.
3. On the **New Retention Policy Tag** page, complete the following fields:
   - **Tag Name** Use this box to type a name for the retention tag. This is the

name of the retention tag object in Active Directory. This name can contain up to 64 characters.

- **Tag Type** Use this list to select the type of retention tag that you want to create. To create a RPT for a default folder (for example, **Inbox**), select the default folder name. To create a DPT, select **All other folders in the mailbox**. To create a personal tag, select **Personal Folder**.
- **Age limit for retention (days)** Click this button to specify that items have a retention period. In the corresponding text box, type the number of days in the retention period. (The range of values is from 1 through 24,855 days.)
- **Action to take when the age limit is reached** After clicking **Age limit for retention (days)**, you can use this list to specify what should happen to an item when it's past the age limit for retention. The choices include:

  Delete and Allow Recovery If you select this option, messages are deleted but can be recovered by using the Recover Deleted Items feature in Outlook or Outlook Web App. To learn more about these features see the "Recover deleted items" topic for Outlook or Outlook Web App.

  Note:
  Users can only recover deleted items for the retention time you specify in the *RetainDeletedItemsFor* parameter of the Set-Mailbox cmdlet.

  Permanently Delete If you select this option, messages are permanently deleted and aren't recoverable by the user.
  Move to Archive If you select this option, messages are automatically moved to the user's archive mailbox. If you haven't created an archive mailbox for the user, no action is taken.

Note:
You can't use the EMC to create a retention tag with the Mark as Past Retention Limit retention action. You must use the New-RetentionPolicyTag cmdlet with the *MarkAsPastRetentionLimit* parameter.

- **Disable this tag** Click this button to disable the processing of this tag. The Managed Folder Assistant won't process messages that have a disabled tag applied.
- **Comments** Use this box to type a comment that will be displayed to the user in Outlook. For example, to alert users that MRM is enabled on the folder, you could type the following message: "Messages are removed from this folder after 120 days." The maximum length of this comment is 255 characters. To configure localized comments, use the Set-RetentionPolicyTag cmdlet.

4. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to create a retention tag

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Use the Shell to create a retention policy tag for the default

folder Deleted Items

This example creates a retention policy tag for the default folder Deleted Items. When the tag is applied to a mailbox, items in the Deleted Items folder are permanently deleted after 30 days.

```
New-RetentionPolicyTag "Corp-Exec-DeletedItems" -Type DeletedItems -Comment "Dele
```

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Use the Shell to create a default policy tag to move messages

This example creates a default policy tag to move messages. When the tag is applied to a mailbox, items without an inherited or explicitly applied retention tag are moved to the archive mailbox after 365 days.

```
New-RetentionPolicyTag "Corp-Exec -Default" -Type All -Comment "Items without a r
```

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Use the Shell to create a default policy tag to delete messages

This example creates a default policy tag to delete messages. When the tag is applied to a mailbox, items without an inherited or explicitly applied retention tag are deleted after 1,095 days (three years).

```
New-RetentionPolicyTag "Corp-Exec -Default" -Type All -Comment "Items without a r
```

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Use the Shell to create a default policy tag for voice mail messages

This example creates a default policy tag for voice mail messages. When the tag is applied to a mailbox, voice mail messages without an inherited or explicitly applied retention tag are deleted after 14 days.

```
New-RetentionPolicyTag "Corp-Exec -Voice Mail" -Type All -MessageClass voicemail
```

Note:

By default, the *MessageClass* parameter defaults to *, which applies to all message types. A mailbox can have a maximum of three default tags: a DPT with the **Move to Archive** action, a DPT with the **Delete and Allow Recovery** or **Permanently Delete** actions to delete messages from the primary and archive mailboxes, and a DPT for voice mail messages. You can only specify the *MessageClass* parameter for voice mail DPTs.

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Use the Shell to create a personal tag

This example creates the personal tag Corp-BusinessCritical. Items to which the tag is applied are moved to the user's archive mailbox after three years.

```
New-RetentionPolicyTag "Corp-BusinessCritical" -Type Personal -Comment "Business
```

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Other Tasks

After you create a retention tag, you may also want to:

- Create a Retention Policy
- Apply a Retention Policy to Mailboxes
- Place a Mailbox on Retention Hold

1.11.6.6.3 Create a Retention Policy

Create a Retention Policy

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Using retention policies, you can group one or more retention tags and apply them to mailboxes. A mailbox can't have more than one retention policy. Retention tags can be linked to or removed from a retention policy at any time.

A retention policy can contain the following retention tags:

- One or more retention policy tags (RPTs) for supported default folders
- One default policy tag (DPT) with the **Move to Archive** action.
- One DPT with the **Delete and Allow Recovery** or the **Permanently Delete** action.
- One DPT for voice mail.
- Any number of personal tags

To learn more about retention policies and retention tags, see Understanding Retention Tags and Retention Policies.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

Prerequisites

- A retention policy with the same name as the one being created doesn't already exist in your Exchange organization.
- One or more retention tags should exist so you can associate them to the new retention policy.

Note:

You can create a retention policy without linking any retention tags to it. Retention tags can be added or removed from a retention policy at any time. However, tags aren't applied to a mailbox until they're linked to a retention policy and the Managed Folder Assistant processes the mailbox.

What Do You Want To Do?

- Use the EMC to create a retention policy
- Use the Shell to create a retention policy

Use the EMC to create a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, expand the forest you want, and then navigate to **Organization Configuration** > **Mailbox**.
2. In the action pane, click **New Retention Policy**.

3. On the **Introduction** page, complete the following fields:
   - **Name** Use this box to type a name for the retention policy.
   - **Add** Click this button to add retention tags to the policy. To remove a tag from the policy, click the tag name, and then click **Remove** ().

4. On the **Select Mailboxes** page, click **Add** to select the mailboxes to which you want to apply the retention policy.

   Note:
   You can create a retention policy without applying it to any mailboxes. You can also apply the policy to mailboxes at a later time by using the EMC or the Shell. For details, see Apply a Retention Policy to Mailboxes.

5. On the **New Retention Policy** page, review your configuration settings. To make any configuration changes, click **Back**. To create the retention policy, click **New**.

6. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to create a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example creates the retention policy Corp-Execs-RetPol and links the tags Corp-Exec-Default, Corp-Exec-Inbox, and Corp-Exec-DeletedItems to the policy.

```
New-RetentionPolicy "Corp-Execs-RetPol" -RetentionPolicyTagLinks "Corp-Exec-Defau
```

For detailed syntax and parameter information, see New-RetentionPolicy.

Other Tasks

After you create a retention policy, you may also want to:

- Apply a Retention Policy to Mailboxes
- Add or Remove Retention Tags from a Retention Policy
- Configure the Managed Folder Assistant
- Place a Mailbox on Retention Hold

1.11.6.6.4 Add or Remove Retention Tags from a Retention Policy

Add or Remove Retention Tags from a Retention Policy

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can add retention tags to a retention policy when the policy is created or any time thereafter. For details about how to create a retention policy, including how to simultaneously add retention tags, see Create a Retention Policy.

A retention policy can contain the following retention tags:

- One or more retention policy tags (RPTs) for supported default folders
- One default policy tag (DPT) with the **Move to Archive** action.
- One DPT with the **Delete and Allow Recovery** or the **Permanently Delete** action
- One DPT for voice mail
- Any number of personal tags

Note:
Retention tags aren't applied to a mailbox until they're linked to a retention policy and the Managed Folder Assistant processes the mailbox. To learn more about the Managed Folder Assistant, see Configure the Managed Folder Assistant.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

Use the EMC to add retention tags to or remove retention tags from a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, on the **Retention Policies** tab, select the retention policy to which you want to add retention tags.
3. In the action pane, click **Properties**.
4. In **<Retention policy name> Properties**, on the **General** tab, use the following settings:
   - **Add** Click this button to add a retention tag to the policy.
   - Select a tag from the list, and then click this button to remove the tag from the policy.

Use the Shell to add retention tags to or remove retention tags from a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Mailbox Permissions topic.

This example adds the retention tags VPs-Default, VPs-Inbox, and VPs-DeletedItems to the retention policy RetPolicy-VPs, which doesn't already have retention tags linked to it.

Caution:
If the policy has retention tags linked to it, this command replaces the existing tags.

```
Set-RetentionPolicy -Identity "RetPolicy-VPs" -RetentionPolicyTagLinks "VPs-Defau
```

This example adds the retention tag VPs-DeletedItems to the retention policy RetPolicy-VPs, which already has other retention tags linked to it.

```
$TagList = (Get-RetentionPolicy "RetPolicy-VPs").RetentionPolicyTagLinks
$TagList.Add((Get-RetentionPolicyTag 'VPs-DeletedItems').DistinguishedName)
Set-RetentionPolicy "RetPolicy-VPs" -RetentionPolicyTagLinks $TagList
```

This example removes the retention tag VPs-Inbox from the retention policy RetPolicy-VPs.

```
$TagList = (Get-RetentionPolicy "RetPolicy-VPs").RetentionPolicyTagLinks
$TagList.Remove((Get-RetentionPolicyTag 'VPs-Inbox').DistinguishedName)
Set-RetentionPolicy "RetPolicy-VPs" -RetentionPolicyTagLinks $TagList
```

For detailed syntax and parameter information, see the following topics:

- Set-RetentionPolicy
- Get-RetentionPolicy
- Get-RetentionPolicyTag

Other Tasks

After you link retention tags to a retention policy, you may also want to:

- Apply a Retention Policy to Mailboxes
- Configure the Managed Folder Assistant
- Place a Mailbox on Retention Hold

1.11.6.6.5 Apply a Retention Policy to Mailboxes

Apply a Retention Policy to Mailboxes

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can use retention policies to group one or more retention tags and apply them to mailboxes to enforce message retention settings. A mailbox can't have more than one retention policy.

Caution:

Messages are expired based on settings defined in the retention tags linked to the policy. These settings include actions such moving messages to the personal archive or permanently deleting them. Before applying a retention policy to one or more mailboxes, we recommended that you test the policy and inspect each retention tag associated with it.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

Use the EMC to apply a retention policy to a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying retention policies" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, expand the forest you want, and then navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the mailbox to which you want to apply the retention policy. You can select multiple mailboxes by using the Shift or Ctrl keys.
3. In the action pane, click **Properties**.
4. In **<Mailbox User> Properties**, on the **Mailbox Settings** tab, select **Messaging Records Management**, and then click **Properties**.
5. In **Messaging Records Management**, select the **Apply Retention Policy** check box, and then click **Browse** to select the retention policy you want to apply to the mailbox.
6. Click **OK**, and then in **<Mailbox User> Properties**, click **Apply**.

Use the Shell to apply a retention policy to a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying retention policies" entry in the Messaging Policy and Compliance Permissions topic.

This example applies the retention policy RP-Finance to Bharat's mailbox.

```
Set-Mailbox "Bharat" -RetentionPolicy "RP-Finance"
```

For detailed syntax and parameter information, see Set-Mailbox.

Use the Shell to change a retention policy for mailboxes

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying retention policies" entry in the Messaging Policy and Compliance Permissions topic.

This example applies the new retention policy New-Retention-Policy to all mailboxes that have the old policy Old-Retention-Policy.

```
$OldPolicy={Get-RetentionPolicy "Old-Retention-Policy"}.distinguishedName
Get-Mailbox -Filter {RetentionPolicy -eq $OldPolicy} -Resultsize Unlimited | Set-
```

For detailed syntax and parameter information, see the following topics:

- Get-RetentionPolicy
- Get-Mailbox
- Set-Mailbox

1.11.6.6.6 Export and Import Retention Tags

Export and Import Retention Tags

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3*

Topic Last Modified: *2012-03-08*

There are several scenarios in which you may want to export or import retention tags, including:

- Applying the same retention policies across all servers in a multi-forest Exchange organization
- Applying the same retention policies in a hybrid deployment where some mailboxes reside in your on-premises Exchange organization and some reside in Exchange Online
- Applying retention policies in an Exchange Online Archiving scenario, where users with on-premises Exchange 2010 mailboxes have a cloud-based archive

In these scenarios, the Managed Folder Assistant can correctly process an item that has a retention tag applied after the item or the mailbox is moved to another organization.

Note:

To keep retention tags and retention policies synchronized between two organizations, every time you make changes to a retention tag or policy in the source organization, you must perform this procedure to export retention tags and policies from the source organization and import them in the destination organization.
You can't select specific retention tags or policies to export. The `Export-RetentionTags.ps1` script exports all retention tags and policies from an organization.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

Export retention tags from an on-premises Exchange organization

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. Run this Exchange Management Shell command to change directory to the **Scripts** subdirectory in your Exchange installation path.

```
Cd "<Exchange Server installation path>\Scripts"
```

Important:

If you're importing or exporting retention tags and retention policies to Exchange Online, you must connect your Windows PowerShell session to Exchange Online. For details, see Connect Windows PowerShell to the Service.

Run the `Export-RetentionTags.ps1` script to export retention tags to an .xml file.

```
Export-RetentionTags.ps1 "c:\docs\ExportedRetentionTags.xml"
```

Import retention tags to an Exchange organization

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. Run this Shell command to change the directory to the **Scripts** subdirectory in

your Exchange installation path.

```
Cd "<Exchange Server installation path>\Scripts"
```

2. Run the `Import-RetentionTags.ps1` script to import retention tags from a previously exported .xml file.

Important:
If you're importing or exporting retention tags and retention policies to Exchange Online, you must connect your Windows PowerShell session to Exchange Online. For details, see Connect Windows PowerShell to the Service.

Note:
When running this script against Exchange Online, you may be prompted to confirm that you want to run software from an untrusted publisher. Verify that the name of the publisher appears as `CN=Microsoft Corporation, OU=MOPR, O=Microsoft Corporation, L=Redmond, S=Washington, C=US`, and then click `R` to allow the script to be run once or `A` to always run.

```
Import-RetentionTags.ps1 "c:\docs\ExportedRetentionTags.xml"
```

3. If the destination organization contains any retention tags or retention policies that aren't found in the .xml file you're importing, you'll be prompted whether you want to delete them. If true synchronization of retention tags and retention policies between the source and destination organizations is desired, select the option to delete them. This makes sure both organizations contain the same retention tags and retention policies.

Warning:
If you delete a retention policy in the destination organization that's applied to mailbox users, you may receive additional prompts before deleting the policy. If you delete a retention policy that's applied to mailbox users, those users will no longer have a retention policy applied. Depending on your organization's compliance requirements, you should apply another retention policy to these users to avoid the risk of being out of compliance.

Other Tasks

After you export and import retention tags, you may also want to:

- Apply a Retention Policy to Mailboxes
- Add or Remove Retention Tags from a Retention Policy

1.11.6.6.7 Configure the Managed Folder Assistant

Configure the Managed Folder Assistant

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

The *Managed Folder Assistant* is a Microsoft Exchange Mailbox Assistant that applies message retention settings configured in retention policies or managed folder mailbox policies. If a mailbox uses a managed folder mailbox policy, it also creates any managed folders and applies managed content settings to them.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

Differences Between Exchange 2010 SP1 and Exchange 2010 RTM

Before performing the procedures in this topic, it's important that you understand how the Managed Folder Assistant works in Microsoft Exchange Server 2010 Service Pack 1 (SP1) and in the release to manufacturing (RTM) version of Exchange 2010:

- **Exchange 2010 SP1** In Exchange 2010 SP1, the Managed Folder Assistant is a throttle-based assistant. Throttle-based assistants are always running and don't need to be scheduled. The system resources they can consume are throttled. You can configure the Managed Folder Assistant to process all mailboxes on a Mailbox server within a certain period (known as a *work cycle)*.
- **Exchange 2010 RTM** In Exchange 2010 RTM, the Managed Folder Assistant is a schedule-based assistant. Schedule-based assistants run based on the schedule specified for the assistant.

Important:

In Exchange 2010 RTM, the Managed Folder Assistant is scheduled to run from 01:00 (1:00 A.M.) to 09:00 (9:00 A.M.) daily. You can modify the schedule to suit your requirements.

Note:

The Managed Folder Assistant stops as soon as all mailboxes are processed. It doesn't run continuously until the end of the scheduled period.

When the Managed Folder Assistant is running, it processes all the mailboxes on a server. If the Managed Folder Assistant doesn't finish processing the mailboxes on the server during the time that you've scheduled, it automatically resumes processing where it left off the next time it runs. There is one Managed Folder Assistant for each server.

Running the Managed Folder Assistant is a resource-intensive process, especially when it's run for the first time. The first time the Managed Folder Assistant runs, it typically processes a large number of items. This can be a resource-intensive process for the Mailbox server and the network. It can also result in Microsoft Outlook clients consuming large amounts of time and network resources while synchronizing with the server. Be sure to plan carefully to avoid overloading resources.

You should run the Managed Folder Assistant only when your server can tolerate the extra load. This is usually during off-peak hours. You should also run the Managed Folder Assistant often enough to meet your organization's message retention requirements.

Use the Shell to configure the Managed Folder Assistant in Exchange 2010 SP1

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the EMC to configure the Managed Folder Assistant in Exchange 2010 SP1.

This example configures the Managed Folder Assistant to process all mailboxes within one day.

```
Set-MailboxServer MyMailboxServer -ManagedFolderWorkCycle 1
```

For detailed syntax and parameter information, see Set-MailboxServer.

Use the EMC to schedule the Managed Folder Assistant in Exchange 2010 RTM

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Server Configuration** > **Mailbox**.
2. In the result pane, right-click the Mailbox server for which you want to schedule the Managed Folder Assistant, and then click **Properties**.
3. Click the **Messaging Records Management** tab.
4. In the **Schedule the Managed Folder Assistant** box, select **Use Custom Schedule**, and then click **Customize**.
5. In **Schedule**, select the times and days during which you want the Managed Folder Assistant to run.
6. Click **OK**.

Use the Shell to schedule the Managed Folder Assistant in Exchange 2010 RTM

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

In Exchange 2010 RTM, the Managed Folder Assistant is a schedule-based assistant. This example sets the Managed Folder Assistant schedule to start running at 14:00 (2:00 P.M.) Sunday and continue running until all mailboxes are processed or until 13:00 (1:00 P.M.) the following Sunday, whichever comes first.

```
Set-MailboxServer -Identity MyMailboxServer -ManagedFolderAssistantSchedule "Sun.
```

For detailed syntax and parameter information, see Set-MailboxServer.

Use the Shell to start the Managed Folder Assistant in Exchange 2010 SP1

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to start the Managed Folder Assistant in Exchange 2010 SP1.

In Exchange 2010 SP1, you can use the **Start-ManagedFolderAssistant** cmdlet to have the Managed Folder Assistant process the specified mailbox.

This example triggers the Managed Folder Assistant to immediately process Bharat Suneja's mailbox.

```
Start-ManagedFolderAssistant -Identity bharat.suneja@contoso.com
```

Use the Shell to start the Managed Folder Assistant in Exchange 2010 RTM

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the EMC to start the Managed Folder Assistant in Exchange 2010 RTM.

In Exchange 2010 RTM, you can use the **Start-ManagedFolderAssistant** cmdlet to manually start the Managed Folder Assistant. You may need to manually start the assistant during testing, troubleshooting, or to process mailboxes immediately during a period when the assistant isn't scheduled to run. Every time the **Start-ManagedFolderAssistant** cmdlet is run, processing of mailboxes stops and then restarts, reprocessing all the mailboxes on the server from the beginning.

This example manually starts the Managed Folder Assistant. When you manually start the Managed Folder Assistant, it continues running until all mailboxes on the Mailbox server are processed or until the assistant is stopped manually.

```
Start-ManagedFolderAssistant
```

This example triggers the Managed Folder Assistant to immediately process Bharat Suneja's mailbox.

```
Start-ManagedFolderAssistant -Mailbox bharat.suneja@contoso.com
```

For detailed syntax and parameter information, see Start-ManagedFolderAssistant.

1.11.6.6.8 Configure Outlook Client Blocking

Configure Outlook Client Blocking

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Microsoft Exchange Server 2010, you can use retention policies or managed folders for messaging records management (MRM). Only users running Microsoft Outlook 2010 have access to all client features for retention policies and managed folders. Users running Office Outlook 2007 have access only to managed folders. However, both retention policies and managed folder mailbox policies are applied on the Mailbox server by the Managed Folder Assistant, regardless of the Outlook client version used by the user. Older Outlook clients do not expose the MRM functionality of these features. For example, because Outlook 2007 does not support retention policies, users can't apply personal tags to items or folders.

You can block users who are running older versions of Outlook from accessing their Exchange mailboxes. You can also block access on a per-mailbox or on a per-Client Access server basis.

Looking for other management tasks related to MRM? Check out Deploying Messaging

Records Management.

MRM Feature Availability by Client Application and Version

The following table lists the MRM features available in various client applications and versions.

MRM features

Client application	Available MRM client features
Outlook 2010	All
Outlook 2007	Managed folders
Outlook 2003 Service Pack 2 (SP2) while connected to an Exchange server and working in online mode	The following applies: • Managed folder comments are displayed only when the user clicks the managed folder icon in the folder header or clicks **View**, and then clicks **Policy**. • Managed folder quotas are supported. Error messages appear when a folder exceeds the quota.

Outlook 2003 SP2 while disconnected from an Exchange server and working in Cached Exchange Mode	The following applies:
	• Managed custom folder icons are displayed.
	• Managed folder comments aren't displayed.
	• Managed folder quotas aren't supported. Specifically:
	  • No folder quota error messages are displayed.
	  • Folder quota information isn't synced with the Exchange server.

Outlook versions earlier than Outlook 2003 SP2	None
Other e-mail client software	None

The following table shows version numbers for Outlook.

Outlook versions

Outlook version	Version number
Outlook 2010	14
Outlook 2007	12
Outlook 2003	11
Outlook 2002	10
Outlook 2000	9
Outlook 98	8.5
Outlook 97	8

Note:
Before making any changes, note that hotfixes and service pack releases may affect the client version string. Be careful when you restrict client access because server-side Exchange components must also use MAPI to log on. Some components report their client version as the component name (such as SMTP or OLE DB), while others report the Exchange build number (such as 6.0.4712.0). For this reason, avoid restricting clients that have version numbers that start with 6.<*x.x.*>. For example, to prevent MAPI access completely, instead of specifying **0.0.0-6.5535.65535.65535**, specify the two ranges so that the server components can log on. For example, specify the following: **0.0.0-5.9.9; 7.0.0-**.

After you perform these procedures, be aware that when users are blocked from accessing their mailboxes, they will receive the following warning message.

Your Exchange Server administrator has blocked the version of Outlook that you are using. Contact your administrator for assistance.

To bypass the warning that MRM features aren't supported for e-mail clients running versions of Outlook earlier than Outlook 2010, you can use the *ManagedFolderMailboxPolicyAllowed* parameter of the **New-Mailbox**, **Enable-Mailbox**, and **Set-Mailbox** cmdlets in the Shell. When a managed folder mailbox policy is assigned to a mailbox by using the *ManagedFolderMailboxPolicy* parameter, the warning appears by default unless you use the *ManagedFolderMailboxPolicyAllowed* parameter.

Use the Shell to block versions of Outlook on a per-mailbox basis

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "User mailboxes" entry in the Mailbox Permissions topic.

Note:
You can't use the EMC to block versions of Outlook on a per-mailbox basis.

This example blocks all Outlook versions earlier than 11.8010.8036.

```
Set-CASMailbox -Identity adam@contoso.com -MAPIBlockOutlookVersions "-11.8010.803
```

This example restores access to a mailbox that's blocked by a version of Outlook.

```
Set-CASMailbox -Identity adam@contoso.com -MAPIBlockOutlookVersion $null
```

For detailed syntax and parameter information, see Set-CASMailbox.

Use the Shell to block Outlook versions on a Client Access server

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "RPC Client Access settings" entry in the Client Access Permissions topic.

This example blocks Outlook clients prior to version 12.0.0 from accessing the mailbox on an Exchange 2010 Client Access server.

Important:
The value used for the *Value* parameter in this command is an example. You must

determine the correct client version numbers. In Exchange 2010, you can use the Get-LogonStatistics cmdlet to retrieve the versions of MAPI clients that are connected to the mailbox database.

```
Set-RpcClientAccess -Server CAS01 -BlockedClientVersions "0.0.0-5.65535.65535;7.0
```

For detailed syntax and parameter definition, see Set-RpcClientAccess.

1.11.6.6.9 Migrate from Managed Folders

Migrate from Managed Folders

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Microsoft Exchange Server 2010, messaging records management (MRM) is performed by using retention tags and retention policies. A retention policy is a group of retention tags that can be applied to a mailbox. Managed folders, the MRM technology introduced in Exchange Server 2007, are supported for interoperability.

A mailbox that has a managed folder mailbox policy applied can be migrated to use a retention policy. To do so, you must create retention tags that are equivalent to the managed folders linked to the user's managed folder mailbox policy.

Important:

Before you migrate from managed folders to retention policies in your production environment, we recommend that you test the process in a test environment.

Looking for other management tasks related to MRM? Check out Deploying Messaging Records Management.

Comparing Retention Tags to Managed Folders

Unlike managed folders, which require users to move items to a managed folder based on retention settings, retention tags can be applied to a folder or an individual item in the mailbox. This process has minimal impact on the user's workflow and e-mail organization methods. When a folder has retention tags applied, all items in that folder inherit the retention settings. Users can further specify retention settings by applying different retention tags to individual items in that folder.

Managed folders support different managed content settings for a folder, each with a different message class (such as e-mail items or calendar items). Retention tags don't require a separate managed content settings object because the retention settings are specified in the tag's properties. It isn't supported to create retention tags for particular message classes. Retention tags also don't allow you to use journaling (which is performed by the Managed Folder Assistant).

The following table compares the MRM functionality available when using retention tags or managed folders.

Retention tags vs. managed folders

Functionality	Retention tags	Managed folders
Specify retention settings for default folders (such as Inbox)	Use retention policy tags (RPTs)	Use managed default folders
Specify retention settings for entire mailbox	Use a default policy tag (DPT)	Use managed default folders
Use retention settings for custom folders	Use personal tags	Using managed custom folders
Require managed content settings	No (retention settings included in a retention tag)	Yes
Use retention settings for different message classes (such as e-mail messages, voice mail, or calendar items)	No	Yes
Support the Move To Archive action, which moves items to the user's archive mailbox	Yes	No
Support the Move To Managed Folder action	No	Yes
Allow journaling using the Managed Folder Assistant	No	Yes
Policy applied to user	Retention policy	Managed folder mailbox policy
Maximum number of policies that can be applied to a mailbox user	1	1
Processed by the Managed Folder Assistant	Yes	Yes
Client support	Microsoft Outlook 2010 and Office Outlook Web App	Outlook 2010, Office Outlook 2007, and Outlook Web App

Use the Shell to migrate mailbox users from managed folders

Note:
You can't use the EMC to migrate mailbox users from managed folders.

For the following procedures, Contoso mailboxes have a managed folder mailbox policy applied containing the following managed folders.

Managed folders for Contoso

Managed folder	Managed content settings	Retention enabled	Retention age	Retention action
Corp-DeletedItems	CS-Corp-DeletedItems	Yes	30 days	Delete and Allow Recovery

Corp-SentItems	CS-Corp-SentItems	Yes	1,825 days	Move to Deleted Items
Corp-JunkMail	CS-Corp-JunkMail	Yes	30 days	Permanently Delete
Corp-EntireMailbox	CS-Corp-EntireMailbox	Yes	365 days	Move to Deleted Items
30 Days	CS-30Days	Yes	30 days	Move to Deleted Items
5 Years	CS-5Years	Yes	1,825 days	Move to Deleted Items
Never Expire	CS-NeverExpire	No	365 days	Not applicable

The following are general steps for migrating users from this managed folder mailbox policy to a retention policy. Each step is detailed later in this topic:

1. Create retention tags for the migration.
2. Create a retention policy and link the newly created retention tags to the policy.
3. Apply the retention policy to user mailboxes.

Important:
After you apply the retention policy to a user and the Managed Folder Assistant runs, the managed folders in the user's mailbox become unmanaged.

Step 1: Create retention tags for the migration

There are two methods you can use for this step:

- Create retention tags based on the managed folders and their corresponding managed content settings. With this method, you use the **New-RetentionPolicyTag** cmdlet with the *ManagedFolderToUpgrade* parameter. When you specify this parameter, the corresponding retention tag is automatically applied to the managed folder.
- Create retention tags by manually specifying the retention settings. With this method, you use the **New-RetentionPolicyTag** cmdlet without the *ManagedFolderToUpgrade* parameter. When you don't specify this parameter, any retention policy tags you add to the policy are applied to the default folders, and the default policy tag is applied to the entire mailbox. However, any personal tags you add to the policy aren't automatically applied to the managed folders.

Create retention tags based on managed folders

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example creates retention tags based on the corresponding managed content settings shown in the Contoso managed folder mailbox policy.

```
New-RetentionPolicyTag Corp-DeletedItems -ManagedFolderToUpgrade Corp-DeletedItem
New-RetentionPolicyTag Corp-SentItems -ManagedFolderToUpgrade Corp-SentItems
New-RetentionPolicyTag Corp-JunkMail -ManagedFolderToUpgrade Corp-JunkMail
New-RetentionPolicyTag Corp-EntireMailbox -ManagedFolderToUpgrade Corp-EntireMail
New-RetentionPolicyTag 30Days -ManagedFolderToUpgrade 30Days
New-RetentionPolicyTag 5Years -ManagedFolderToUpgrade 5Years
New-RetentionPolicyTag NeverExpire -ManagedFolderToUpgrade NeverExpire
```

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Create retention tags manually

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example creates retention tags based on the managed folders and corresponding managed content settings shown in the Contoso managed folder mailbox policy. The retention settings are specified manually without using the *ManagedFolderToUpgrade* parameter.

```
New-RetentionPolicyTag Corp-DeletedItems -Type DeletedItems -RetentionEnabled $tr
New-RetentionPolicyTag Corp-SentItems -Type SentItems -RetentionEnabled $true -Ag
New-RetentionPolicyTag Corp-JunkMail -Type JunkMail -RetentionEnabled $true -AgeL
New-RetentionPolicyTag Corp-EntireMailbox -Type All -RetentionEnabled $true -AgeL
New-RetentionPolicyTag 30Days -Type Personal -RetentionEnabled $true -AgeLimitFor
New-RetentionPolicyTag 5Years -Type Personal -RetentionEnabled $true -AgeLimitFor
New-RetentionPolicyTag NeverExpire -Type Personal -RetentionEnabled $false
```

For detailed syntax and parameter information, see New-RetentionPolicyTag.

Step 2: Create a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example creates the retention policy RP-Corp and links the newly created retention tags to the policy.

```
New-RetentionPolicy RP-Corp -RetentionPolicyTagLinks Corp-DeletedItems,Corp-SentI
```

For detailed syntax and parameter information, see New-RetentionPolicy.

Step 3: Apply the retention policy to user mailboxes

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying retention policies" entry in the Messaging Policy and Compliance Permissions topic.

This example applies the newly created retention policy RP-Corp to the mailbox user Ken Kwok.

```
Set-Mailbox -Identity Kwok -RetentionPolicy RP-Corp
```

For detailed syntax and parameter information, see Set-Mailbox.

1.11.6.6.10 Port Managed Folder

Port Managed Folder

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

In Microsoft Exchange Server 2010, retention policies, the new Exchange 2010 messaging records management (MRM) feature, replace managed folders, the MRM feature

introduced in Exchange Server 2007. Using the Port Managed Folder wizard, you can port managed folders to retention tags, thereby maintaining the same retention settings as the managed folder.

Considerations

When porting a managed folder to a retention tag, consider the following:

- Managed folders have associated managed content settings. These settings control the lifespan of items in users' mailboxes, including the age limit for retention, the retention action, and the message type. In this case, message type refers to the type of message such as e-mail messages, appointments, meeting requests, and voice mail.
- A managed folder can have multiple managed content settings for the different message classes associated with it.
- The following retention tags don't support different message classes:
  - Retention policy tags (RPTs) which are applied to default folders such as Inbox and Deleted Items.
  - Personal tags, which are available to Microsoft Outlook 2010 and Microsoft Office Outlook Web App users to apply to custom folders and individual messages.
- Default policy tags (DPTs), which are applied to the entire mailbox, are the only retention tags that support the `Voicemail` message class (in addition to the `All` message class, denoted by the asterisk (*) symbol).
- If the managed folder you want to port has multiple managed content settings for different message classes, only one retention tag is created, and the highest retention age of all the managed content settings is used as the retention age for the ported tag, irrespective of the message class of the managed content settings.
  For example, review the following managed content settings for the managed folder Corp-DeletedItems.

Managed content settings	Message class	Retention age	Retention action
CS-DeletedItems	*	60	Permanently Delete
CS-DeletedItems-Voicemail	Voicemail	14	Permanently Delete
CS-DeletedItems-Fax	Fax	120	Delete and Allow Recovery

  When you port the managed folder Corp-DeletedItems to the retention tag Ported-DeletedItems, the tag will have the following settings.

Retention tag	Message class	Retention age	Retention action
Ported-DeletedItems	*	120 (the highest retention age of all managed content settings associated with the ported managed folder)	Delete and Allow Recovery

- By default, managed default folders of the type All are ported to DPTs.
- Managed default folders of folder types other than All are ported to RPTs.
- Managed custom folders are ported to personal tags.
- Retention tags created by porting managed folders contain the managed folder name in the **LegacyManagedFolder** property. After you port or create

retention tags, you must link the tags to a retention policy and apply the policy to a mailbox. When the Managed Folder Assistant processes the mailbox and finds a managed folder that matches a ported retention tag, the assistant applies the retention tag to the managed folder. The ported retention tag must be linked to the user's retention policy for this to occur.

Looking for other management tasks related to MRM? See Deploying Messaging Records Management.

What Do You Want To Do?

- Use the EMC to port a managed folder
- Use the Shell to port a managed folder

Use the EMC to port a managed folder

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. Navigate to **Organization Configuration** > **Mailbox**.
2. In the action pane, click **Port from Managed Folder to Tag**.
3. On the **Introduction** page, complete the following fields:
   - **Tag Name** Use this box to type a name for the new retention tag. This name can be up to 64 characters in length.
   - **Select the managed folder to upgrade** Click **Browse** to select a managed folder to port.
   - **Comments** Use this box to type a comment that will be displayed to the user in Outlook. For example, to alert users that MRM is enabled on the folder, you could type the following message: "Messages are removed from this folder after 120 days." The maximum length of this comment is 255 characters. To configure localized comments, use the Set-RetentionPolicyTag cmdlet.
4. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to port a managed folder

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example ports the managed folder MF-Corp-DeletedItems to the retention tag Tag-Corp-DeletedItems.

```
New-RetentionPolicyTag -Name 'Tag-Corp-DeletedItems' -ManagedFolderToUpgrade 'MF-
```

For detailed syntax and parameter information see New-RetentionPolicyTag.

Other Tasks

After you port a managed folder, you may also want to:

- Create a Retention Policy
- Apply a Retention Policy to Mailboxes
- Place a Mailbox on Retention Hold

1.11.6.6.11 Place a Mailbox on Retention Hold

Place a Mailbox on Retention Hold

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Placing a mailbox on retention hold suspends the processing of a retention policy or managed folder mailbox policy for that mailbox. Retention hold is designed for scenarios such as a user being on vacation or away temporarily.

During retention hold, users can log on to their mailbox and change or delete items. When you perform a mailbox search, deleted items that are past the deleted item retention period aren't returned in search results. To make sure items changed or deleted by users are preserved in legal hold scenarios, you must place a mailbox on legal hold. For more information, see Place a Mailbox on Litigation Hold.

You can also include retention comments for mailboxes you place on retention hold. The comments are displayed in supported versions of Microsoft Outlook.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

Use the EMC to place a mailbox on retention hold

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can use the EMC to place a mailbox on retention hold, regardless of whether the mailbox has a retention policy or a managed folder mailbox policy applied. Mailboxes that have a retention policy or a managed folder mailbox policy applied are processed by the Managed Folder Assistant.

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the mailbox you want to place on retention hold.
3. In the action pane, click **Properties**.
4. In **<Mailbox> Properties**, on the **Mailbox Settings** tab, click **Messaging Records Management**, and then click **Properties**.
5. In **Messaging Records Management**, complete the following fields:
   - **Halt Retention Policy during this period** Select this check box to place the mailbox on retention hold.
   - **Start date** Select this check box and use the associated lists to specify when the retention hold should begin.

- **End date** Select this check box and use the associated lists to specify when the retention hold should end.

Use the Shell to place a mailbox on retention hold

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example places Michael Allen's mailbox on retention hold.

```
Set-Mailbox "Michael Allen" -RetentionHoldEnabled $true
```

For detailed syntax and parameter information, see Set-Mailbox.

Use the Shell to remove retention hold for a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example removes the retention hold from Michael Allen's mailbox.

```
Set-Mailbox "Michael Allen" -RetentionHoldEnabled $false
```

For detailed syntax and parameter information, see Set-Mailbox.

Other Tasks

After you place a mailbox on retention hold, you may also want to:

- Increase the mailbox quota. See Configure Storage Quotas for a Mailbox.
- Perform a discovery search on the mailbox. See Create a Discovery Search.

1.11.6.6.12 Configure Retention Tag Properties

Configure Retention Tag Properties

Messaging Policy and Compliance > Messaging Records Management > Deploying Messaging Records Management >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-10-10*

Retention tags are used to apply retention settings to folders and individual items such as messages and notes. These settings specify how long a message remains in the mailbox and the action to take when the message reaches the specified retention age. When a message reaches its retention age, it's moved to the archive mailbox, deleted, or flagged for user attention.

There are three types of retention tags:

- **Retention policy tags (RPTs)** These tags are created for default folders such as Inbox and Deleted Items.
- **Default policy tags (DPTs)** These tags apply to all items that don't have a retention tag applied, either inherited or explicit. You can have a maximum of three default policy tags in a retention policy: a DPT with the **Move to Archive** action, a DPT with the **Delete and Allow Recovery** or **Permanently Delete** action to delete messages from the primary and archive mailboxes, and a DPT for voice mail messages.
- **Personal tags** These tags are available to Outlook 2010 and Outlook Web App users as part of their retention policy. Users can apply personal tags to folders they create or to individual items, even if those items already have a different tag applied.

To learn more about retention tags, see Understanding Retention Tags and Retention Policies.

Looking for other management tasks related to messaging records management (MRM)? Check out Deploying Messaging Records Management.

What Do You Want to Do?

- Use the EMC to configure retention tag properties
- Use the Shell to configure retention tag properties

Use the EMC to configure retention tag properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, on the **Retention Policy Tags** tab, select the retention tag you want to configure.
3. In the action pane, click **Properties**.
4. Use the **General** tab to view or modify the following settings:
   - **Name** Use this unlabeled box at the top of the page to view or change the tag name.
   - **Modified** This read-only field displays the last date and time that the retention tag was modified.
   - **Tag Type** This read-only field displays the tag type.
   - **Age limit for retention (days)** Click this button to specify that items have a retention period. In the corresponding text box, type the number of days in the retention period. (The range of values is from 1 through 24,855 days.)
   - **Action to take when the age limit is reached** After clicking **Age limit for retention (days)**, you can use this list to specify what should happen to an item when it's past the age limit for retention. The choices include:

     Move to the Deleted Items Folder This option isn't available for retention tags. If you select this option for a retention tag, messages that have the tag applied won't be moved to the Deleted Items folder.

     Move to a Managed Custom Folder This option isn't available for retention tags. An error is generated if you select this option.

     Delete and Allow Recovery If you select this option,

messages are deleted but can be recovered by using the Recover Deleted Items feature in Outlook or Outlook Web App. To learn more about these features see the "Recover deleted items" topic for Outlook or Outlook Web App.

Note:
Users can only recover deleted items for the retention time you specify in the *RetainDeletedItemsFor* parameter of the Set-Mailbox cmdlet.

Permanently Delete If you select this option, messages are permanently deleted and aren't recoverable by the user.
Mark as Past Retention Limit This option isn't available for retention tags. If you select this option for a retention tag, messages that have the tag applied won't be marked as past the retention limit.
Move to Archive If you select this option, messages are automatically moved to the user's archive mailbox. If you haven't created an archive mailbox for the user, no action is taken.

- **Disable this tag** Click this button to disable the tag. If a DPT or a RPT is disabled, the tag is no longer applied to the mailbox. If a personal tag is disabled, the retention period is displayed to the user as **Never**. If the user applies the tag to an item, the item never expires. .

Important:
Items that have a disabled retention tag applied aren't processed by the Mailbox Assistant. If you want to prevent a tag from being applied to items, we recommend disabling the tag rather than deleting it. When you delete a tag, the tag configuration is deleted from Active Directory, and the Mailbox Assistant processes all messages to remove the deleted tag.

Note:
If a user applies a tag to an item believing the item will never be deleted, enabling the tag later may delete items the user wanted to retain. The same is true for tags with the **Move to Archive** action.

- **Comments** Use this box to type a comment that will be displayed to Outlook and Outlook Web App users. For example, to alert users that MRM is enabled on the folder, you could type the message: "Messages are removed from this folder after 120 days." The maximum length of this comment is 255 characters. To configure localized comments, use the Set-RetentionPolicyTag cmdlet.

Use the Shell to configure retention tag properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example disables the Corp-BusinessCritical tag.

```
Set-RetentionPolicyTag "Corp-BusinessCritical" -RetentionEnabled $false
```

This example retrieves all retention policy tags for the Inbox default folder and disables them.

```
Get-RetentionPolicyTag -Types Inbox | Set-RetentionPolicyTag -RetentionEnabled $f
```

This example retrieves all retention policy tags for the Inbox default folder and sets the retention age to 30 days.

```
Get-RetentionPolicyTag -Types DeletedItems | Set-RetentionPolicyTag -AgeLimitForR
```

For detailed syntax and parameter information, see Set-RetentionPolicyTag and Get-RetentionPolicyTag.

1.11.6.6.13 Configure Retention Policy Properties

Configure Retention Policy Properties

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

To apply retention tags to a mailbox, you must add them to a retention policy, and then apply the policy to the mailbox. A mailbox can't have more than one retention policy. Retention tags can be added to or removed from a retention policy at any time. To learn more about retention policies, see Understanding Retention Tags and Retention Policies.

A retention policy can contain the following retention tags:

- One or more retention policy tags (RPTs) for supported default folders
- One default policy tag (DPT) with the **Move to Archive** action
- One DPT with the **Delete and Allow Recovery** or the **Permanently Delete** action
- One DPT for voice mail
- Any number of personal tags

Note:

Retention tags aren't applied to a mailbox until they're linked to a retention policy and the Managed Folder Assistant processes the mailbox. To learn more about the Managed Folder Assistant, see Configure the Managed Folder Assistant.

Looking for other management tasks related to messaging records management (MRM)? See Deploying Messaging Records Management.

What Do You Want to Do?

- Use the EMC to configure a retention policy
- Use the Shell to configure a retention policy

Use the EMC to configure a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, on the **Retention Policies** tab, select the retention policy you want to configure.
3. In the action pane, click **Properties**.

4. Use the **General** tab to view or modify the following settings:
   - **Name** Use this unlabeled box at the top of the page to view or change the policy name.
   - **Add** Click this button to add a retention tag to the policy.
   - Select a tag from the list, and then click this button to remove the tag from the policy.

5. Use the **Mailboxes** tab to view or modify the list of mailboxes to which the policy applies:
   - **Add** Click this button to add mailboxes to the policy.
   - Select a mailbox from the list, and then click this button to remove the mailbox from the policy.

Use the Shell to configure a retention policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example links the retention tags VPs-Default, VPs-Inbox, and VPs-DeletedItems to the retention policy RetPolicy-VPs, which doesn't already have retention tags linked to it.

Caution:
If the policy has retention tags linked to it, this command replaces the existing tags.

```
Set-RetentionPolicy -Identity RetPolicy-VPs -RetentionPolicyTagLinks "VPs-Default
```

This example adds the retention tag VPs-DeletedItems to the retention policy RetPolicy-VPs, which already has other retention tags linked to it.

```
$TagList = (Get-RetentionPolicy RetPolicy-VPs).RetentionPolicyTagLinks
$TagList.Add((Get-RetentionPolicyTag 'VPs-DeletedItems').DistinguishedName)
Set-RetentionPolicy RetPolicy-VPs -RetentionPolicyTagLinks $TagList
```

This example removes the retention tag VPs-Inbox from the retention policy RetPolicy-VPs.

```
$TagList = (Get-RetentionPolicy RetPolicy-VPs).RetentionPolicyTagLinks
$TagList.Remove((Get-RetentionPolicyTag 'VPs-Inbox').DistinguishedName)
Set-RetentionPolicy RetPolicy-VPs -RetentionPolicyTagLinks $TagList
```

This example applies the retention policy RetPolicy-VPs to Bharat Suneja's mailbox.

```
Set-Mailbox "Bharat Suneja" -RetentionPolicy "RetPolicy-VPs"
```

This example removes the retention policy from Tony Smith's mailbox.

```
Set-Mailbox "Tony Smith" -RetentionPolicy $null
```

For detailed syntax and parameter information, see the following topics:

- Set-RetentionPolicy
- Get-RetentionPolicy
- Get-RetentionPolicyTag
- Set-Mailbox

1.11.6.6.14 Deploying Managed Folders

Deploying Managed Folders

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-10-12*

1.11.6.6.14.1 Create a Managed Default Folder

Create a Managed Default Folder

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

A managed default folder is a mailbox folder (such as the Inbox folder) that appears in Office Outlook 2007 by default and to which MRM has been applied. The retention and journaling of messages in managed default folders are controlled by managed content settings that are applied to the folder

Note:

Additional steps are necessary to deploy new managed folders. You can perform these steps by using other wizards in the Exchange Management Console or cmdlets in the Exchange Management Shell. For example, you can use the New Managed Content Settings wizard or the **New-ManagedContentSettings** cmdlet to create managed content settings for managed default folders. These settings control how the messages in the folder are handled. For more information about the steps required to fully implement managed folders, see Deploying Managed Folders.

Looking for other management tasks related to managed folders? Check out Deploying Managed Folders.

Use the Shell to create a managed default folder

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
In Exchange 2010 SP1, you can't use the Exchange Management Console (EMC) to create a managed default folder.

This example creates a managed default folder Corp-VPs-Inbox of type Inbox. The comment 'Messages are removed from the Inbox folder after 120 days ' will be displayed in supported clients, and users will be unable to minimize the comment in Outlook.

```
New-ManagedFolder -Name 'Corp-VPs-Inbox' -DefaultFolderType Inbox -Comment 'Messa
```

For detailed syntax and parameter information, see New-ManagedFolder.

1.11.6.6.14.2 Create a Managed Custom Folder

Create a Managed Custom Folder

Messaging Records Management > Deploying Messaging Records Management > Deploying Managed Folders >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-09*

A *managed custom folder* is a managed folder that's created by an Exchange administrator and placed in a user's mailbox for messaging records management (MRM) purposes. The retention and journaling of messages in managed custom folders are controlled by managed content settings that are applied to the folder.

Note:
Managed custom folders are a premium feature of MRM. Each mailbox that has managed custom folders requires an Exchange Server Enterprise client access license (CAL). To learn more about the licensing requirements for MRM, see "Client Access Licenses and MRM" in Understanding Messaging Records Management.

Note:
Additional steps are required to deploy new managed folders. You can perform these steps by using other wizards in the Exchange Management Console or cmdlets in the Exchange Management Shell. For example, you can use the New Managed Content Settings wizard or the **New-ManagedContentSettings** cmdlet to create managed content settings for managed custom folders. These settings control how the messages in the folder are handled. For more information about the steps required to fully implement MRM, see Deploying Managed Folders.

Looking for other management tasks related to managed folders? Check out Deploying Managed Folders.

Use the Shell to create a managed custom

folder

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
In Exchange 2010 SP1, you can't use the Exchange Management Console (EMC) to create a managed custom folder.

This example creates the Business Critical managed custom folder that has a folder quota of 1.99 gigabytes. A folder comment is also enabled.

```
New-ManagedFolder -Name 'Business Critical' -FolderName 'Business Critical' -Stor
```

Note:
You cannot specify a value larger than 1.99 GB for the *StorageQuota* parameter when you run this command. Instead, you can use the value "unlimited" if you want to specify a size that is larger than 1.99 GB.

For detailed syntax and parameter information, see New-ManagedFolder.

1.11.6.6.14.3 Create Managed Content Settings

Create Managed Content Settings

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Managed content settings are used to define message retention settings and retention action for managed folders. Message lifespan is controlled in two ways:

- By controlling content *retention* and removing content that is no longer needed.
- By automatically *journaling* (copying) important content to a separate storage location outside the mailbox. This can be any location that has a SMTP e-mail address, including another Exchange mailbox. When the item is journaled, a label is applied to it that indicates how the user classified the item.

Important:
The managed folder assistant generates journal reports based on managed content settings for a managed folder. This approach is different than that of the Journaling agent, which generates journal reports as a part of either standard or premium journaling. For more details about Journaling, see Understanding Journaling.

For example, the managed content settings that you apply to a user's Inbox folder could specify that its contents should be automatically deleted or moved to another folder after 60 days.

Note:
In addition to the well-known message types (such as **All mailbox content** and **Calendar items**) to which you can apply managed content settings, you can use the *MessageClass* parameter of the **New-ManagedContentSettings** cmdlet in the Exchange Management Shell to specify a custom message class or a specific message class such as

IPM.NOTE.SMIME. For more information, see New-ManagedContentSettings

Looking for other management tasks related to managed folders? Check out Deploying Managed Folders.

Caution

Be cautious when using the managed default folder named Entire Mailbox. Managed content settings that are applied to the Entire Mailbox folder control every folder in the mailbox except:

- Managed custom folders (and their subfolders)
- Managed default folders (and their subfolders)

A managed default folder is a default folder in the mailbox (such as Inbox, Calendar, or Contacts) that is linked to a managed folder mailbox policy. If a default folder in the mailbox is not linked to a managed folder mailbox policy, then the "entire mailbox" policy will apply to that default folder.

Prerequisite

You must have at least one managed default folder or one managed custom folder for which to create managed content settings. For detailed instructions, see the following topics:

- Create a Managed Default Folder
- Create a Managed Custom Folder

Use the Shell to create managed content settings

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:

In Exchange 2010 SP1, you can't use the EMC to create managed folder content settings.

This example creates managed content settings for the managed default folder Calendar with the following parameters:

- **Name** MyCalendarSettings
- **MessageClass** CalItems
- **AgeLimitForRetention** 30 days
- **RetentionAction** MoveToDeletedItems

```
New-ManagedContentSettings -FolderName Calendar -MessageClass CalItems -Name MyCa
```

For detailed syntax and parameter information, see New-ManagedContentSettings.

Other Tasks

After you create managed content settings for a managed folder, you may also want to:

- Create a Managed Folder Mailbox Policy
- Add a managed folder to a managed folder mailbox policy. For instructions, see Configure Managed Folder Mailbox Policy Properties.

1.11.6.6.14.4 Create a Managed Folder Mailbox Policy

Create a Managed Folder Mailbox Policy

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Managed folder mailbox policies are used to create logical groupings of managed folders. When a managed folder mailbox policy is applied to users' mailboxes, all the managed folders that are linked to the policy are deployed in a single operation.

You can create as many managed folder mailbox policies as you want. You can also add as many managed folders to each policy as you want, but each user mailbox can have only one managed folder mailbox policy.

If your organization has existing managed folders (including their corresponding managed content settings), you can add them to the managed folder mailbox policy as you create it. You can also add or remove managed folders from a managed folder mailbox policy any time after the policy is created.

Note:

Managed custom folders are a premium feature of messaging records management (MRM). Mailboxes with policies that include managed custom folders require an Exchange Server Enterprise client access license (CAL). Managed default folders require only an Exchange Server Standard CAL.

Caution

Be cautious when using the managed default folder named Entire Mailbox. Managed content settings that are applied to the Entire Mailbox folder control every folder in the mailbox except:

- Managed custom folders (and their subfolders)
- Managed default folders (and their subfolders)

A managed default folder is a default folder in the mailbox (such as Inbox, Calendar, or Contacts) that is linked to a managed folder mailbox policy. If a default folder in the mailbox is not linked to a managed folder mailbox policy, then the "entire mailbox" policy will apply to that default folder.

Use the Shell to create a managed folder mailbox policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:

In Exchange 2010 SP1, you can't use the Exchange Management Console (EMC) to create a managed folder mailbox policy.

This example creates the managed folder mailbox policy MyManagedFolderMailboxPolicy and links the Inbox managed default folder and Business Critical managed customer folder to the policy.

```
New-ManagedFolderMailboxPolicy -Name "MyManagedFolderMailboxPolicy" -ManagedFolde
```

For detailed syntax and parameter information, see New-ManagedFolderMailboxPolicy.

Other Tasks

After you create a managed folder mailbox policy, you may also want to:

- Apply a Managed Folder Mailbox Policy to Users
- Configure the Managed Folder Assistant

1.11.6.6.14.5 Apply a Managed Folder Mailbox Policy to Users

Apply a Managed Folder Mailbox Policy to Users

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Managed folder mailbox policies are used to create logical groupings of managed folders. When a managed folder mailbox policy is applied to users' mailboxes, all the managed folders linked to the policy are deployed in a single operation. You can apply only one managed folder mailbox policy to a user mailbox.

Important:

Managed custom folders are a premium feature of messaging records management (MRM). Mailboxes with policies that include managed custom folders require an Exchange Server Enterprise client access license (CAL).

Use the Shell to apply a managed folder mailbox policy to a user's mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:

In Exchange 2010 SP1, you can't use the Exchange Management Console (EMC) to apply a managed folder mailbox policy to a mailbox.

This example applies the mailbox policy Corp-VPs Managed Folder Mailbox Policy to user Chris' mailbox.

```
Set-Mailbox -Identity Chris -ManagedFolderMailboxPolicy "Corp-VPs Managed Folder
```

For detailed syntax and parameter information, see Set-Mailbox.

Other Tasks

After you apply a managed folder mailbox policy to a mailbox, you may also want to Configure the Managed Folder Assistant.

1.11.6.6.14.6 Turn Off or Suspend Messaging Records Management

Turn Off or Suspend Messaging Records Management

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

To meet individual, IT, or business requirements, you may need to turn off or temporarily suspend messaging records management (MRM) for an individual user or for a Mailbox server. Reasons you may need to turn off or suspend MRM include:

- If a mailbox user is away from the office or is otherwise unable to access e-mail, you can temporarily disable MRM for the mailbox by placing it on retention hold. When a mailbox is on retention hold, it's no longer processed by the Managed Folder Assistant. When the mailbox user returns or is able to access the mailbox again, you can remove the retention hold from the mailbox.
- If you need to test or troubleshoot performance issues, you can temporarily turn off MRM on that server by clearing the schedule for the Managed Folder Assistant.
- If you need to remove a retention tag from mailboxes (which have a retention policy with that tag applied), you can remove the tag from the policy.
- If you want a retention policy or a managed folder mailbox policy to no longer apply to a mailbox, you can remove the policy from the mailbox.
- If your organization decides not to use MRM features, you can turn off MRM permanently for the entire organization. If you later decide to deploy MRM, you have the ability to do so.

Place mailboxes on retention hold

You can place mailboxes on retention hold to turn off MRM temporarily (for example when users are on vacation). This suspends the processing of managed folder mailbox policies for the mailbox until retention hold is disabled. This is different from placing mailboxes on legal hold.

For details about how to place a mailbox on retention hold, see Place a Mailbox on Retention Hold.

To learn more about legal hold, see Understanding Litigation Hold.

Turn off MRM temporarily for individual servers

There are two ways in which you can stop the Managed Folder Assistant from running on a server:

- Use the EMC to clear the managed folder assistant's schedule. For detail instructions, see Configure the Managed Folder Assistant.

- In the Shell, run the Set-MailboxServer cmdlet and set the *ManagedFolderAssistantSchedule* parameter to $null.

When you stop the Managed Folder Assistant, managed content settings are no longer applied to managed folders on that server. No new managed custom folders are created and retention and journaling policies aren't enforced. However, folder quotas continue to be enforced.

Remove retention tags from mailboxes

To remove a retention tag from a mailbox, you unlink the tag from the retention policy. When you unlink a retention policy tag (RPT) for a default folder, the default mailbox tag applies to all items in that folder. When you unlink a personal tag, it's no longer available to the user.

This Shell example unlinks the retention tag Delete - 3 Days from the retention policy Corp-Users.

```
$tags = (Get-RetentionPolicy "Corp-Users").RetentionPolicyTagLinks
$tags -= "Deleted Items - 3 Days"
Set-Retention Policy "Corp-Users" -RetentionPolicyTagLinks $tags
```

Remove retention policies from mailboxes

You can stop a retention policy from applying to a mailbox by removing the policy from the mailbox user's properties.

This Shell example removes the retention policy from the mailbox jpeoples.

```
Set-Mailbox jpeoples -retentionpolicy $null.
```

This Shell example removes the retention policy from all mailboxes in the Exchange organization.

```
Get-Mailbox -ResultSize unlimited -Filter {RetentionPolicy -ne $null} | Set-Mailb
```

This Shell example removes the retention policy Corp-Finance from all mailbox users who have the policy applied.

```
Get-Mailbox -ResultSize unlimited -Filter {RetentionPolicy -eq "Corp-Finance"} |
```

For detailed syntax and parameter information, see Set-Mailbox and Get-Mailbox.

Remove managed folder mailbox policies from mailboxes

This example removes managed folder mailbox policy from the mailbox jpeoples, without affecting the managed folders in the mailbox.

```
Set-Mailbox -Identity jpeoples -ManagedFolderMailboxPolicy:$null
```

Remove managed folders and MRM policies from mailboxes

In Exchange Server 2010, you can use the *ManagedFolderMailboxPolicy* parameter of the Set-Mailbox cmdlet to remove all MRM policies and attributes from a mailbox. When you run this cmdlet, the following tasks are performed:

- MRM policies and MRM properties for any managed folders that were created as part of any MRM policies are removed
- Managed folders that are empty are removed from the mailbox
- Managed folders that contain items are converted to standard folders

This Shell example removes the managed folder mailbox policy and all managed folders from the mailbox jpeoples.

```
Set-Mailbox -Identity jpeoples -RemoveManagedFolderAndPolicy
```

Turn off MRM permanently for an entire organization

To turn off MRM for an organization, delete all its managed custom folders and delete all managed folder mailbox policies. After this is complete, folder quotas, retention, and journaling policies aren't enforced, and the MRM root folder and all managed custom folders are converted into normal folders that can be moved, renamed, or deleted by the user.

For details about how to turn off MRM, see Permanently Turn Off Messaging Records Management for an Organization.

Note:

If the user deletes all the managed custom folders in the **Managed Folders** root folder, the **Managed Folders** root folder is converted into a normal folder—one that can be moved, renamed, or deleted like any other folder.
If the user doesn't delete all the managed custom folders in the **Managed Folders** root folder, users won't be able to move, rename, or delete it.

Permanently Turn Off Messaging Records Management for an Organization

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Deleting all the managed default folders and managed custom folders within your organization will eliminate all messaging records management (MRM) functionality. If you do this, mailbox retention settings will no longer be checked and message content won't be journaled (copied) to other locations.

Although deleting all the managed custom folders from Active Directory removes the managed content settings that apply to folders, it doesn't remove the folders from users' mailboxes. Instead, the root folder for managed custom folders (called Managed Folders) and any managed custom folders are converted into normal, unmanaged folders that can be moved, renamed, or deleted by the user like any other folder.

Looking for other management tasks related to MRM? Check out Deploying Managed Folders.

Use the EMC to permanently turn off messaging records management

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the Exchange Management Console (EMC) to remove retention tags and retention policies. You must use the Shell to remove them.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Managed Custom Folders** tab.
3. Right-click a managed folder, and then click **Remove**.
4. Repeat steps 3 and 4 until all of the managed folders have been deleted.
5. In the result pane, click the **Managed Folders Mailbox Policies** tab.
6. Right-click a managed folder mailbox policy, and then click **Remove**.
7. Repeat steps 6 and 7 until all the managed folder mailbox policies are deleted.
8. In the result pane, click the **Managed Default Folders** tab.
9. Repeat steps 4 through 8.

Use the Shell to permanently turn off messaging records management

To permanently turn off MRM, you must remove all retention tags, retention policies, managed folders, and managed folder mailbox policies.

Important:
When you remove a retention tag from Active Directory, all mailboxes to which the tag is applied as a part of retention policy are processed by the Managed Folder Assistant. All items in affected mailboxes are restamped. This may result in additional resource consumption on the Mailbox servers containing the affected mailboxes. We recommend that you consider the server load and usage profile and schedule the Managed Folder Assistant on those servers to run at a time when there will be minimal impact on users. For details about how to schedule the Managed Folder Assistant, see Configure the Managed Folder Assistant.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Remove retention tags

This example removes the retention tag Corp-Users-Default

```
Remove-RetentionPolicyTag "Corp-Users-Default"
```

This example removes all retention tags.

```
Get-RetentionPolicyTag | Remove-RetentionPolicyTag
```

For detailed syntax and parameter information, see Remove-RetentionPolicyTag and Get-RetentionPolicyTag.

Remove retention policies

This example removes the retention policy Corp-Users.

```
Remove-RetentionPolicy "Corp-Users"
```

This example removes all retention policies.

```
Get-RetentionPolicy | Remove-RetentionPolicy
```

For detailed syntax and parameter information, see Remove-RetentionPolicy and Get-RetentionPolicy.

Remove managed folders

This example removes the managed folder My Managed Folder.

```
Remove-ManagedFolder "My Managed Folder"
```

This example removes all managed folders.

```
Get-ManagedFolder | Remove-ManagedFolder
```

For detailed syntax and parameter information, see Remove-ManagedFolder and Get-ManagedFolder.

Remove managed folder mailbox policies

This example removes the managed folder mailbox policy My Managed Folder Policy.

```
Remove-ManagedFolderMailboxPolicy "My Managed Folder Policy"
```

This example removes all managed folder mailbox policies.

```
Get-ManagedFolderMailboxPolicy | Remove-ManagedFolderMailboxPolicy
```

For detailed syntax and parameter information, see Remove-ManagedFolderMailboxPolicy and Get-ManagedFolderMailboxPolicy.

1.11.6.6.14.7 Configure Managed Content Settings

Configure Managed Content Settings

Messaging Records Management > Deploying Messaging Records Management > Deploying Managed Folders >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Managed content settings are applied to the managed folders in users' mailboxes to control the retention and journaling of messages for messaging records management (MRM). Managed content settings define when messages that are no longer needed are to be removed or journaled (copied) to a separate storage location outside the mailbox. For example, the managed content settings that you apply to a user's Inbox folder could specify that its contents should be automatically deleted or moved to another folder after 60 days.

Important:

The managed folder assistant generates journal reports based on managed content settings for a managed folder. This approach is different than that of the Journaling agent, which generates journal reports as a part of either standard or premium journaling. For more details about Journaling, see Understanding Journaling.

Looking for other management tasks related to managed folders? Check out Deploying Managed Folders.

Configure managed content settings

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
In Exchange 2010 SP1, you can't use the EMC to configure managed content settings.

The following command configures the managed content setting MyManagedContentSettings to apply a retention age of 120 days, delete messages upon expiration, and allow recovery.

```
Set-ManagedContentSettings -Identity MyManagedContentSettings -RetentionEnabled $
```

For detailed parameter and syntax information, see Set-ManagedContentSettings.

Understanding Managed Folders

Create Managed Content Settings

Deploying Managed Folders

1.11.6.6.14.8 Configure Managed Folder Properties

Configure Managed Folder Properties

Messaging Records Management > Deploying Messaging Records Management > Deploying Managed Folders >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

A *managed folder* is a folder in a user's mailbox to which messaging records management (MRM) has been applied. There are two types of managed folders:

- *Managed default folders* (such as the Inbox) appear, by default, in a user's Office Outlook 2007 or later mailbox.
- *Managed custom folders* are created by Exchange administrators specifically for MRM.

Note:
Managed custom folders are a premium feature of MRM. Each mailbox that has managed custom folders requires an Exchange Server Enterprise client access license (CAL). Managed default folders require only an Exchange Server Standard CAL.

The retention and journaling of messages in managed folders are controlled by managed content settings that are applied to the folder.

Note:
Managed custom folders are typically given names that reflect their intended role in users' mailboxes. For example, a managed custom folder for personal e-mail may be

given the name **Personal E-mail**.

Looking for other management tasks related to managed folders? Check out Deploying Managed Folders.

Use the Shell to configure managed folder properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
In Exchange 2010 SP1, you can't use the EMC to configure managed folder properties.

This example applies to managed default folders

This example changes the name of the Inbox managed default folder to Corp-VPs-Inbox and sets a comment to be displayed in supporting clients.

```
Set-ManagedFolder -Identity Inbox -Name Corp-VPs-Inbox -Comment "Email messages w
```

For detailed parameter and syntax information, see Set-ManagedFolder.

Note:
Although the comment in this example mentions a specific retention period, actual retention time for messages in a managed folder depends on the folder's managed content settings. A managed folder can have multiple managed content settings for different message classes, such as e-mail messages, calendar items, and tasks, with different retention settings.

This example applies to managed custom folders

This example changes the name of the managed custom folder Business Critical to Corp-Business Critical. It also specifies a storage limit of 500 MB on the folder and sets a comment to be displayed in supporting clients.

```
Set-ManagedFolder -Identity "Business Critical" -FolderName "Corp-Business Critic
```

Note:
Although the comment in this example mentions a specific retention period, actual retention time for messages in a managed folder depends on the folder's managed content settings. A managed folder can have multiple managed content settings for different message classes, such as e-mail messages, calendar items, and tasks, with different retention settings.

For detailed parameter and syntax information, see Set-ManagedFolder.

1.11.6.6.14.9 Configure Managed Folder Mailbox Policy Properties

Configure Managed Folder Mailbox Policy Properties

Messaging Records Management > Deploying Messaging Records Management > Deploying Managed Folders >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-09-02*

A *managed folder mailbox policy* is a logical grouping of managed folders. When a managed folder mailbox policy is applied to a user's mailbox, all the managed folders that are linked to the policy are deployed in a single operation, thereby making the deployment of messaging records management (MRM) easier. This topic shows you how to view the properties of a managed folder mailbox policy and how to add or remove associated folders from that policy.

Note:
After you assign a managed folder mailbox policy to a mailbox user, the managed folders and settings are applied to the mailbox when the Managed Folder Assistant runs and processes the mailbox.

Looking for other management tasks related to managed folders? Check out Deploying Managed Folders.

Configure managed folder mailbox policies

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

Note:
In Exchange 2010 SP1, you can't use the EMC to configure managed folder mailbox policies.

The following command adds the Inbox managed default folder and Business Critical managed custom folder to the managed folder mailbox policy MyManagedFolderPolicy.

```
Set-ManagedFolderMailboxPolicy -Identity MyManagedFolderPolicy -ManagedFolderLink
```

For detailed parameter and syntax information, see Set-ManagedFolderMailboxPolicy.

For More Information

Messaging Records Management

Understanding Managed Folders

Deploying Managed Folders

1.11.6.6.14.10 Use Exchange Management Shell Scripts for Managed Folders

Use Exchange Management Shell Scripts for Managed Folders

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-04-28*

You can use Shell cmdlets and scripts to manage messaging records management (MRM)

in Microsoft Exchange Server 2010. We recommend that you test MRM features in a non-production environment first. When you're ready to implement MRM in production, you can use the same scripts in your production environment to accurately and consistently replicate managed folders, managed content settings, and managed folder mailbox policies.

Note:

Managed custom folders are a premium feature of MRM. Each mailbox that has managed custom folders requires an Exchange Server Enterprise client access license (CAL). Mailboxes with policies that include managed custom folders require an Exchange Server Enterprise CAL.

Use the Shell to manage managed folders

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. Create a script by entering Shell commands in a text editor, as shown in the sample script that follows.
2. Save the text file for the script with the .ps1 file extension (for example, MRM_Sample_Script.ps1).
3. At the command prompt in the Shell, enter the path and file name of the script (for example, **C:\Scripts\MRM_Sample_Script.ps1**, or **.\MRM_Sample_Script.ps1** for a script in the working directory).

The following is a sample script for MRM. For an explanation of the actions performed, see the comments within the script.

```
# MRM_Sample_Script.ps1
# This script demonstrates the fundamentals of performing messaging records manag
# Create a new managed custom folder.
New-ManagedFolder -Name "Important E-mail" -FolderName "Business Folder A"
# Create a variable, "$age," to use in the next command.
$age = New-TimeSpan -Day 30
# Create managed content settings for the new managed custom folder that delete i
New-ManagedContentSettings -Name "Retention settings for Business Folder A" -Fold
# Create a managed folder mailbox policy.
New-ManagedFolderMailboxPolicy -Name "Business Folder A" -ManagedFolderLinks "Imp
# Apply the managed folder mailbox policy to a mailbox.
Set-Mailbox -Identity Administrator -ManagedFolderMailboxPolicy "Business Folder
# Schedule the Managed Folder Assistant to run the entire week.
$ServerName= cmd /c echo %computername%
Set-MailboxServer -ID $ServerName -ManagedFolderAssistantSchedule "Sun.12:00-Sun.
# Start the Managed Folder Assistant.
Start-ManagedFolderAssistant
```

1.11.6.7 Monitoring Messaging Records Management

Monitoring Messaging Records Management

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-11-03*

View Performance Counters for Messaging Records Management

Performance Counters for Messaging Records Management

Messaging Records Management Errors and Events

1.11.6.7.1 View Performance Counters for Messaging Records Management

View Performance Counters for Messaging Records Management

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-09*

You can use Windows Reliability and Performance Monitor (Perfmon.exe) to select and view performance counters for messaging records management (MRM). By using performance counters, you can monitor the Managed Folder Assistant while it runs resource-intensive MRM processes.

For a list of performance counters for MRM, see Performance Counters for Messaging Records Management.

Looking for other tasks related to monitoring MRM? Check out Monitoring Messaging Records Management.

Use Windows Reliability and Performance Monitor to view performance counters for MRM

To perform this procedure, the account you use must be delegated membership in the local Administrators group.

1. To start Windows Reliability and Performance Monitor, click **Start**, click **Run**, and then type **perfmon**.
2. In the console tree, navigate to **Monitoring Tools** > **Performance Monitor**.
3. Click the plus sign (+) button on the toolbar. The **Add Counters** dialog box appears.
4. From the **Select counter from computer** list, select one of the following options:
   - If you are performing this procedure on a local computer, select **<Local computer>**. This is the default selection.
   - If you are performing this procedure remotely, select the server you want to monitor.
5. In the list of performance counters, expand **MSExchange Assistants - Per Database** or the **MSExchange Managed Folder Assistant**.
6. Select the performance counters you want to monitor.
7. For performance counters under **MSExchange Assistants - Per Database**, to view the counters for all mailbox databases, in **Instances of selected object**, click **All instances**. Or, to specify one or more mailbox databases, select instances from the list.
8. To add the selected counters so that the counters appear in Windows Reliability and Performance Monitor, and to begin collecting performance data, click **Add**.

1.11.6.7.2 Performance Counters for Messaging Records Management

Performance Counters for Messaging Records Management

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-11-23*

The performance counters in this topic monitor the Managed Folder Assistant as it implements messaging records management (MRM) for Microsoft Exchange Server 2010. Because running the Managed Folder Assistant is a resource-intensive process, you should run it only when your server can tolerate the additional load. You should also monitor server performance when the Managed Folder Assistant is running. In addition to the performance counters listed in this topic, you may also want to monitor additional performance counters that monitor items such as disk performance and CPU usage.

For more information about monitoring computers running MRM, see Monitoring Messaging Records Management.

Performance Counters for MRM

The following table describes performance counters for MRM.

Performance counters, performance objects, and description

Performance counter	Performance object	Description
Average Mailbox Processing Time In Seconds	MSExchange Assistants	Counts the average processing time of mailboxes for time-based assistants.
Mailboxes Processed	MSExchange Assistants	Counts the number of mailboxes processed by time-based assistants since the service started.
Mailboxes processed/sec	MSExchange Assistants	Determines the rate of mailboxes processed by time-based assistants per second.
Items Deleted but Recoverable	MSExchange Managed Folder Assistant	Counts the number of items deleted by the Managed Folder Assistant since the start of the most recent schedule interval. (The items are still recoverable through the Recoverable Items folder.) The number includes items in the mailboxes scheduled for processing during the schedule interval and items in any mailboxes that you specified for processing. This counter is reset to zero at the start of each schedule interval.
Items Journaled	MSExchange Managed Folder Assistant	Counts the number of items journaled by the Managed Folder Assistant since the start of the most recent schedule

		interval. The number includes items in the mailboxes scheduled for processing during the current work cycle and items in any mailboxes you specified for processing. This counter is reset to zero at the start of each work cycle.
Items Marked as Past Retention Date	MSExchange Managed Folder Assistant	Counts the number of items marked as past their retention date by the Managed Folder Assistant since the start of the most recent schedule interval. The number includes items in mailboxes scheduled for processing during the schedule interval and items in any mailboxes you specified for processing. This counter is reset to zero at the start of each schedule interval.
Items Moved	MSExchange Managed Folder Assistant	Counts the number of items moved by the Managed Folder Assistant since the start of the most recent schedule interval. The number includes items in the mailboxes scheduled for processing during the schedule interval and items in any mailboxes you specified for processing. This counter is reset to zero at the start of each schedule interval.
Items Permanently Deleted	MSExchange Managed Folder Assistant	Counts the number of items permanently deleted by the Managed Folder Assistant since the beginning of the most recent schedule interval. The number includes items in the mailboxes scheduled for processing during the schedule interval and items in any mailboxes you specified for processing. This counter is reset to zero at the beginning of each schedule interval.
Items Subject to Retention Policy	MSExchange Managed Folder Assistant	Counts the number of items subject to retention policy by the Managed Folder Assistant since the start of the most recent schedule interval. The number includes items in the mailboxes scheduled for processing during the schedule interval and items in any mailboxes you specified for processing. This counter is reset to zero at the start of each schedule interval. This counter is the sum of the following four expiration-related counters: • Items Journaled • Items Marked as Past Retention Date • Items Moved

		• Items Permanently Deleted
TotalSizeItemsExpired - Size of Items subject to Retention Policy (In Bytes)	MSExchange Managed Folder Assistant	Indicates the total size of items expired by the Managed Folder Assistant (SoftDelete, HardDelete, MoveToArchive). The following items are included: • Messages subject to deletion or move to a managed custom folder by a managed folder mailbox policy • Messages subject to deletion or move to archive by the user's retention policy • Messages expired by dumpster policy • Messages cleaned up by system cleanup tags This counter is reset to zero at every work cycle checkpoint of the Managed Folder Assistant work cycle.
TotalSizeItemsSoftDeleted - Size of Items Deleted but Recoverable (In Bytes)	MSExchange Managed Folder Assistant	Indicates the total size of items soft deleted by the Managed Folder Assistant. The following items are included: • Messages soft deleted by a managed folder mailbox policy • Messages soft deleted by a retention policy This counter is reset to zero at every work cycle checkpoint of the Managed Folder Assistant work cycle.
TotalSizeItemsPermanentlyDeleted - Size of Items Permanently Deleted (In Bytes)	MSExchange Managed Folder Assistant	Indicates the total size of items soft deleted by the Managed Folder Assistant. The following items are included: • Messages hard deleted by a managed folder mailbox policy • Messages hard deleted by a retention policy • Messages hard deleted by the Recoverable Items policy This counter is reset to zero at every work cycle checkpoint of the Managed Folder Assistant work cycle.
TotalSizeItemsMoved -	MSExchange Managed	Indicates the total size of items

Size of Items Moved due to an Archive policy tag (In Bytes)	Folder Assistant	moved to a folder or moved to archive by the Managed Folder Assistant. The following items are included: • Messages moved to a managed custom folder by a managed folder mailbox policy • Messages moved to the personal archive by a retention policy This counter is reset to zero at every work cycle checkpoint of the Managed Folder Assistant work cycle.
TotalItemsWithPersonalTag - Items stamped with Personal Tag (Expiry or Archive)	MSExchange Managed Folder Assistant	Indicates the number of times a user tags items with a personal tag. This includes both Deletion and Archive tags. For example: • An item is tagged with a personal tag. • An item with a personal tag is retagged with another personal tag. If a folder is tagged with a personal tag, the counter is incremented by the total number of items in the folder.
TotalItemsWithDefaultTag - Items stamped with Default Tag (Expiry or Archive)	MSExchange Managed Folder Assistant	Indicates the number of items assigned a default policy tag (DPT) based on a user action, for example, when a user selects a message with a personal tag and selects **Use folder policy**. If a new user is assigned a retention policy with a DPT, the counter is incremented by the number of items that will be assigned the DPT due to the retention policy. **Note:** If a user has a retention policy with a DPT, new messages that arrive through transport get a default tag, and this isn't tracked by this counter.
TotalItemsWithSystemCleanupTag - Items stamped with System Cleanup Tag	MSExchange Managed Folder Assistant	Indicates the number of items tagged with the system cleanup tag. This includes mailbox metadata items that aren't visible to users.
TotalItemsExpiredByDefaultExpiryTag - Items expired due to a default	MSExchange Managed Folder Assistant	Indicates the number of items expired (soft or hard deleted) by the Managed Folder Assistant due to any non-personal (default or system) tag in a

Expiry Tag		retention policy. This doesn't include the items expired by Recoverable Items clean up or system clean up.
TotalItemsExpiredByPersonalExpiryTag - Items expired due to a personal Expiry Tag	MSExchange Managed Folder Assistant	Indicates the number of items expired (soft or hard deleted) by the Managed Folder Assistant due to a personal tag in the retention policy.
TotalItemsMovedByDefaultArchiveTag - Items moved due to a default Archive Tag	MSExchange Managed Folder Assistant	Indicates the number of items moved to the archive by the Managed Folder Assistant due to any non-personal (default or system) archive tag in a retention policy. This doesn't include the items moved to the Recoverable Items folder in archive by Recoverable Items cleanup.
TotalItemsMovedByPersonalArchiveTag - Items Moved due to an Archive Tag	MSExchange Managed Folder Assistant	Indicates the number of items moved to the archive by the Managed Folder Assistant due to a personal archive tag in a retention policy.
TotalMovedDumpsterItems - Mailbox Dumpsters Moved Items	MSExchange Managed Folder Assistant	Indicates the number of items moved to the Recoverable Items folder in the archive by Recoverable Items cleanup.

1.11.6.7.3 Messaging Records Management Errors and Events

Messaging Records Management Errors and Events

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-09*

Messaging records management (MRM) generates events that you can view in Event Viewer. This allows you to troubleshoot and verify the performance of the Managed Folder Assistant. Event Viewer tracks the following kinds of events in the following order, based on importance:

1. Error events
2. Warning events
3. Informational events

MRM Errors and Events

The following tables provide lists of events that you can use to troubleshoot MRM. The logging types include the following:

- Events labeled as **LogAlways** are always logged individually.
- Events labeled as **LogPeriodic** are logged only once in any five-minute period, not every time they occur. This helps to prevent excessive log entries.

MRM events in the Managed Folder Assistant category

Event ID	Category	Event type	Logging	Value or description
10001	Managed Folder Assistant	Error	LogAlways	The Managed Folder Assistant failed to provision mailbox *<display name, mailbox GUID, legacy DN>* because of damaged data in Active Directory. Exception details: *<details>*. To correct this, run the **Get-ManagedFolder** cmdlet and fix the errors reported.
10002	Managed Folder Assistant	Error	LogAlways	There was an invalid update to managed folder *<folder>* in Active Directory. You may resolve this by deleting and recreating the managed folder object.
10003	Managed Folder Assistant	Error	LogPeriodic	Could not get the server configuration object from Active Directory. *<Exception details>*. Check for domain controller network connectivity issues or incorrect DNS configuration.
10004	Managed Folder Assistant	Error	LogAlways	The retention policy for folder *<folder>* in mailbox *<mailbox>* will not be applied. The managed folder assistant is unable to process managed content setting *<content setting>*

				for the managed folder <*managed folder*>. The RetentionAction is MoveToFolder but a destination folder was not specified. Please specify a destination folder.
10005	Managed Folder Assistant	Error	LogAlways	Retention policy will not be applied to folder <*folder*> in mailbox <*mailbox*>. Unable to process Managed Content Setting <*content setting*> for the Managed Folder <*managed folder*>. The RetentionAction is MoveToFolder but the destination folder <*folder*> is the same as the source folder <*folder*>. Please specify a destination folder that is different from the source folder.
10006	Managed Folder Assistant	Error	LogAlways	Unable to apply the managed content setting on folder <*folder*> because the folder was not found in mailbox <*mailbox*>.
10007	Managed Folder Assistant	Error	LogAlways	The managed folder assistant will not process mailboxes on this server because one or more managed folders in Active Directory have invalid data. Please verify all the managed folders contained

				in the managed folders container in Active Directory. Exception details: *<details>*
10008	Managed Folder Assistant	Error	LogAlways	The retention policy for folder *<folder>* in mailbox *<mailbox>* will not be applied. The managed folder assistant is unable to process managed content setting *<setting>* for the managed folder *<folder>*. The RetentionAction is MoveToFolder but a destination folder was not specified. Please specify a destination folder.
10009	Managed Folder Assistant	Error	LogAlways	The managed folder assistant skipped processing all databases on the local server because it could not read the audit log parameters from Active Directory. It will try again later in the schedule window. Current database: *<database>*
10010	Managed Folder Assistant	Error	LogAlways	The managed folder assistant skipped processing all databases on the local server because the audit log is enabled but the path to the audit log is missing in Active Directory.

				It will try again later in the schedule window. Current database: *<database>*
10011	Managed Folder Assistant	Error	LogAlways	The managed folder assistant could not configure the audit log. It will stop processing the current database: '%1'. It will try again later in the schedule window. Exception details: *<details>*
10012	Managed Folder Assistant	Error	LogAlways	The managed folder assistant did not write to the audit log. It will stop processing the current database: *<database>*. It will try to write to the audit log again later in the schedule window. Exception details: *<details>*
10013	Managed Folder Assistant	Warning	LogAlways	The managed folder assistant was unable to provision the managed default folder *<folder>* in mailbox *<mailbox>* because it was not found in the mailbox.
10014	Managed Folder Assistant	Error	LogAlways	The managed folder assistant was unable to create the managed root folder *<folder>* in mailbox *<mailbox>* because the

				mailbox has several folders with the same name.
10015	Managed Folder Assistant	Error	LogAlways	The managed folder assistant detected a cycle among the policies in mailbox *<mailbox>* that will enforce retention by moving items to a destination folder and then back to the source folder. The policies involved are: *<policies>*
10016	Managed Folder Assistant	Error	LogPeriodic	Managed content setting *<setting>* will not be applied to mailbox *<mailbox>* because the AgeLimitForRetention is not greater than 0.

1.11.6.8 Messaging Records Management Terminology in Exchange 2010

Messaging Records Management Terminology in Exchange 2010

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-09*

The following table defines the core components associated with messaging records management (MRM) in Microsoft Exchange Server 2010. MRM is a records management technology in Exchange 2010 that helps organizations reduce the risks associated with e-mail and other communications. MRM makes it easier to keep messages needed to comply with company policy, government regulations, or legal needs, and to remove content that has no legal or business value.

default policy tag (DPT)

New with Exchange 2010, a DPT is a retention tag that applies to all items in a mailbox that don't already have a retention tag applied. You can have only one DPT in a retention policy.

filer user or filer

A user who regularly files mailbox items into folders.

Compare to piler user or piler.

journaling

The ability to record communications, including e-mail communications, in an organization for use in the organization's e-mail retention or archival strategy. In MRM, journaling commonly refers to the process of sending a journal report about messages in a managed folder to the specified SMTP address. This process is performed by the Managed Folder Assistant.

managed content settings

The retention information created for managed folders. A managed folder can have multiple content settings for different message types such as e-mail messages, voice mail, and calendar items. Message retention settings defined in content settings for a managed folder apply to messages in that managed folder.

managed folder

In the Exchange management interfaces (Exchange Management Console and Exchange Management Shell), a managed folder is an Active Directory object. In a mailbox, a managed folder is a folder to which managed content settings have been applied.

Managed Folder Assistant

One of the Microsoft Exchange Mailbox Assistants in Exchange 2010. The Managed Folder Assistant is responsible for message expiration and compliance. It processes mailboxes and applies retention policies and managed folder mailbox policies.

managed folder mailbox policy

A logical grouping of managed folders. When a managed folder mailbox policy is applied to a user's mailbox, all managed folders linked to the policy are deployed in a single operation.

personal tag

New with Exchange 2010, a personal tag is a retention tag available to Microsoft Office Outlook Web App and Microsoft Outlook 2010 users for applying retention settings to custom folders and individual items, such as e-mail messages.

piler user or piler

A user who doesn't file mailbox items regularly. Piler users tend to have a large Inbox and rely on search to find messages.

Compare to filer user or filer.

policy

See retention policy or managed folder mailbox policy.

retention policy tag (RPT)

New with Exchange 2010, an RPT is a retention tag that's applied to default folders such as Inbox and Deleted Items.

retention policy

New with Exchange 2010, a retention policy is logical grouping of retention tags. When a retention policy is applied to a user’s mailbox, all retention tags linked to the policy are deployed in a single operation.

retention tag

New with Exchange 2010, retention tags are used to apply retention settings to messages and folders to user mailboxes. There are three types of retention tags:

- Default policy tags (DPTs)
- Retention policy tags (RPTs)
- Personal tags

1.11.7 Discovery

1.11.7.1 Understanding Multi-Mailbox Search

Understanding Multi-Mailbox Search

Exchange Server 2010 > Messaging Policy and Compliance > Discovery >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-10-10*

If your organization adheres to legal discovery requirements (related to organizational policy, compliance, or lawsuits), Microsoft Exchange Server 2010 Multi-Mailbox Search can help you perform discovery searches for relevant content within Exchange mailboxes.

Multi-Mailbox Search uses the content indexes created by Exchange Search. The Exchange Control Panel (ECP) provides an easy-to-use search interface for non-technical personnel such as legal and compliance officers, records managers, and human resources (HR) professionals. Role Based Access Control (RBAC) provides the Discovery Management management role group to delegate discovery tasks to non-technical personnel, without the need to provide elevated privileges that may allow a user to make any operational changes to Exchange configuration.

Contents

Looking for management tasks related to Multi-Mailbox Search? See Managing Discovery.

Uses for Multi-Mailbox Search

The following are common uses of Multi-Mailbox Search:

- **Legal discovery** Complying with legal discovery requests for messaging records is one of the most important tasks for organizations involved in lawsuits. Without a dedicated tool, searching messaging records within several mailboxes that may reside in different mailbox databases can be a time-consuming and resource-intensive task. Using Multi-Mailbox Search, you can search a large volume of e-mail messages stored in mailboxes across one or more Exchange 2010 servers, and possibly in different locations.
- **Internal investigations** Multi-Mailbox Search can help you facilitate requests from managers or legal departments as part of internal investigations.
- **Human Resources monitoring** Multi-Mailbox Search can help you facilitate HR requests, such as standard e-mail monitoring requirements or a specific search.

Return to top

Exchange Search and Advanced Query Syntax

Multi-Mailbox Search uses the content indexes created by Exchange Search. To provide the extensive search functionality required by Multi-Mailbox Search, new capabilities have been added to Exchange Search. With a single content indexing engine, no additional resources are used to crawl and index mailbox databases for Multi-Mailbox Search when discovery requests are received by IT departments.

To learn more about Exchange Search, see Understanding Exchange Search.

Multi-Mailbox Search also uses Advanced Query Syntax (AQS), the familiar query syntax used by Windows Search and Instant Search in Microsoft Office Outlook 2007 and Outlook 2010. Users proficient with AQS can easily construct powerful search queries to search content indexes.

For more information about AQS, see Using Advanced Query Syntax Programmatically.

Return to top

Discovery Management Role Group and Management Roles

For users to perform discovery searches, you must add them to the Discovery Management RBAC role group. This role group consists of two management roles: the Mailbox Search role, which allows a user to perform a discovery search, and the Legal Hold role, which allows a user to place a mailbox on litigation hold. To learn more about the Discovery Management RBAC role group, see Discovery Management. To learn more about RBAC, see Understanding Role Based Access Control.

By default, the Discovery Management role group doesn't have any members. The permissions to perform discovery-related tasks aren't assigned to any user. Also, by default, Exchange administrators don't have the permissions to perform a discovery search. Exchange administrators who are members of the Organization Management management role group can add users to the Discovery Management role group and

create custom role groups to narrow the scope of a discovery manager to a subset of users. Auditing of RBAC role changes makes sure that adequate records are kept to track assignment of the Discovery Management role group. For details, see Overview of Administrator Audit Logging.

Important:
If a user hasn't been added to the Discovery Management role group or isn't assigned the Mailbox Search role, the Multi-Mailbox Search user interface isn't displayed to the user in the ECP, and the Multi-Mailbox Search cmdlets aren't available in the Exchange Management Shell.

For more information about adding users to the Discovery Management role group, see Add a User to the Discovery Management Role Group.

Caution:
Multi-Mailbox Search is a powerful feature that allows a user with the appropriate permissions to potentially have access to all messaging records stored throughout the Exchange 2010 organization. It's important to control and monitor discovery activities, including addition of members to the Discovery Management role group or any other role group with the Mailbox Search management role, assignment of the Mailbox Search management role, and assignment of mailbox access permission to discovery mailboxes.

Return to top

Discovery Mailboxes

When performing a discovery search, you must specify a target mailbox in which to store the search results. A discovery mailbox is a special type of Exchange 2010 mailbox that provides the following functionality:

- **Easier and secure target mailbox selection** When you use the ECP to create a discovery search, only discovery mailboxes are made available as a repository in which to store search results. You don't need to sort through a potentially long list of mailboxes available in the organization. This also eliminates the possibility of a discovery manager accidentally selecting another user's mailbox or an unsecured mailbox in which to store potentially sensitive message content.
- **Large mailbox storage quota** The target mailbox should be able to store a large amount of message data that may be returned by a discovery search. By default, discovery mailboxes have a mailbox storage quota of 50 gigabytes (GB). You can modify the quota to suit your requirements.

  Note:
  In Exchange 2010 Service Pack 1 (SP1), a discovery manager can get an estimate of search results to determine the total number and size of items returned by a discovery search.

- **Secure by default** Like all mailbox types, a discovery mailbox has an associated Active Directory user account. However, this account is disabled by default. Only users explicitly authorized to access a discovery mailbox have access to it. Members of the Discovery Management role group are assigned Full Access permissions to the default discovery mailbox. Any additional discovery mailboxes you create don't have mailbox access permissions assigned to any user.

  Important:
  In Exchange 2010 SP1, you can enable mailbox audit logging to audit access to mailboxes and actions such as folder or message access and deletions by mailbox owners, delegates, and administrators. For more details, see Understanding Mailbox Audit Logging.

- **E-mail delivery disabled** Although visible in Exchange address lists, users can't send e-mail to a discovery mailbox. E-mail delivery to discovery mailboxes is prohibited by using delivery restrictions. This preserves the integrity of search results.

Exchange 2010 Setup creates one discovery mailbox with the display name **Discovery Search Mailbox**. You can use the Shell to create additional discovery mailboxes. By default, the additional discovery mailboxes you create won't have any mailbox access permissions assigned. For details about how to create a discovery mailbox, see Create a Discovery Mailbox.

Multi-Mailbox Search also uses a system mailbox with the display name **SystemMailbox {e0dc1c29-89c3-4034-b678-e6c29d823ed9}** to hold Multi-Mailbox Search metadata. System mailboxes aren't visible in the Exchange Management Console (EMC) or in Exchange address lists. Before removing a mailbox database where the Multi-Mailbox Search system mailbox is located, you must move the mailbox to another mailbox database.

Return to top

Performing a Discovery Search

Users who have been added to the Discovery Management role group can perform discovery searches. To learn more about the Discovery Management role group, see Discovery Management Role Group and Management Roles earlier in this topic.

You can perform a discovery search using the Web-based interface in the ECP, as shown in the following figure. This makes it easier for non-technical users such as records managers, compliance officers, or legal and HR professionals to use Multi-Mailbox Search. You can also use the Shell to perform discovery searches.

Note:

In a hybrid deployment, which is an environment where some mailboxes exist on your on-premises Mailbox servers and some mailboxes exist in a cloud-based organization, you can perform discovery searches of your cloud-based mailboxes using the ECP in your on-premises organization. If you intend to copy messages to a discovery mailbox, you must select an on-premises discovery mailbox. Messages from cloud-based mailboxes that are returned in search results are copied to the specified on-premises discovery mailbox. For more details about hybrid deployments, see Understanding Hybrid Deployment.

When performing a search, a search object is created in Exchange 2010. This object can be manipulated to start, stop, modify, and remove the search. Items returned by a discovery search are copied to the discovery mailbox selected as the target mailbox for the search. Multiple searches can run concurrently.

Note:

Multi-Mailbox Search is an Exchange 2010 feature. Only mailboxes located on Exchange 2010 servers can be searched using Multi-Mailbox Search. You can search a maximum of 25,000 mailboxes in a single search. To search more than 25,000 mailboxes, you can split the search into multiple searches. For example you can search mailboxes of users in a distribution group or a dynamic distribution group.
Multi-Mailbox Search doesn't search messages in .pst files. To decrease management and legal discovery costs, we recommend provisioning archive mailboxes for users. To learn more about archive mailboxes, see Understanding Personal Archives.

The following applies to performing a discovery search:

- **Keywords** You can specify keywords and phrases to search message content. You can also use the logical operators **AND**, **OR**, and **NOT**. To search for an exact match of a multiple word phrase, you must enclose the phrase in quotation marks. For example, searching for the phrase **"plan and competition"** returns messages that contain an exact match of the phrase, whereas specifying **plan AND competition** returns messages that contain the words **plan** and **competition** anywhere in the message. You can also use AQS. For details, see Using Advanced Query Syntax Programmatically. For more information about advanced keyword searches, see Advanced Keyword Searches.

  Note:

  Multi-Mailbox Search doesn't support regular expressions.

  You must capitalize logical operators such as **AND** and **OR** for them to be treated as operators instead of keywords. We recommend that you use explicit parenthesis for any query that mixes multiple logical operators (AND, OR, NOT, etc.) to avoid mistakes or misinterpretations. For example, if you want to search for messages that contain either WordA or WordB AND either WordC or WordD, you must use **(WordA OR WordB) AND (WordC OR WordD)**.
- **Senders or recipients** To narrow a search, you can specify the senders or recipients of messages. You can use e-mail addresses, display names, or the name of a domain to search for items sent to or from everyone in the domain. For example, to find e-mail sent by anyone to Contoso, Ltd, specify **@contoso.com** in the **From** field in the ECP. You can also specify **@contoso.com** in the *Senders* parameter in the Shell.
- **Date range** By default, Multi-Mailbox Search doesn't limit searches by a date range. To search for messages sent during a specific date range, you can narrow the search by specifying the start and end dates. If you don't specify an end date, the search will return the latest results every time you restart it.
- **Mailboxes** Multi-Mailbox Search can search all mailboxes located on Exchange 2010 Mailbox servers in the Exchange organization, or you can specify the mailboxes to be searched. You can also specify a distribution group to include mailbox users who are members of the group.
- **Personal archive** By default, if the personal archive is enabled for a mailbox user, Multi-Mailbox Search also searches the archive mailbox. There's no option in the ECP to override this. To exclude archive mailboxes, you must use the Shell to create or modify the search.
- **Message types** By default, only e-mail messages are searched. However, you can also include the following message types to search: contacts, documents, instant messaging conversations, journal, meetings, and notes.
- **Attachments** Multi-Mailbox Search searches attachments supported by Exchange Search. Support for additional file types can be added by installing

search filters (also known as an iFilter) for the file type on Mailbox servers.

- **Unsearchable items** Unsearchable items are mailbox items that can't be indexed by Exchange Search. Reasons include lack of an installed search filter for an attached file, a filter error, and encrypted messages. When creating a discovery search, you can include unsearchable items in search results.
- **Safe list** Certain file types don't contain content that can be indexed and, as a result, aren't indexed by Exchange Search. These file types aren't considered unsearchable items. Mailbox items containing these file types aren't returned in the list of unsearchable items. For more details, see Default Filters for Exchange Search.
- **Encrypted items** Because messages encrypted using S/MIME aren't indexed by Exchange Search, Multi-Mailbox Search doesn't search these messages. If you select the option to include failed items in search results, these S/MIME-encrypted messages are returned as failed items.
- **IRM-protected items** Messages protected using Information Rights Management (IRM) are indexed by Exchange Search and therefore included in discovery search results. Messages must be protected by using an Active Directory Rights Management Services (AD RMS) server in the same Active Directory forest as the Exchange 2010 Mailbox server. For more information about IRM, see Information Rights Management.

  Important:

  When Exchange Search fails to index an IRM-protected message, either due to a decryption failure or because IRM is disabled, the protected message isn't added to the list of failed items. If you select the option to include failed items in search results, the results may not include protected messages that couldn't be decrypted.
  To include IRM-protected messages in a search, you can create another discovery search to return messages with .rpmsg attachments. You can use the query string `attachment:rpmsg` to search all protected messages. This will return all IRM-protected messages from the mailboxes searched, whether indexed or not. This may result in some duplication of search results in scenarios where one search returns messages that match the search criteria, including protected messages that have been indexed successfully. The search doesn't return protected messages that couldn't be indexed. Performing a second search for all protected messages also includes protected messages that were successfully indexed and returned by the first search. Additionally, the protected messages returned by the second search may not match the search criteria such as keywords used for the first search.

- **Deduplication** In Exchange 2010 SP1, you can enable *deduplication* of discovery search results to copy only one instance of a unique message to the discovery mailbox. Deduplication has the following benefits:
  - Lower storage requirement and smaller discovery mailbox size due to reduced number of messages copied.
  - Reduced workload for discovery managers, legal counsel, or others involved in reviewing discovery search results.
  - Reduced cost of discovery, depending on the number of duplicate items in search results.

  If you select a discovery mailbox located on an Exchange 2010 server that hasn't been upgraded to Exchange 2010 SP1, deduplication of search results isn't performed. To use deduplication, you must select a discovery mailbox located on an Exchange 2010 SP1 Mailbox server.
- **Search result estimates** When creating a discovery search in Exchange 2010 SP1, the discovery manager can select the option to estimate the search results before deciding whether to copy messages returned by the search to the discovery mailbox. The search result estimate includes the total number of items returned by the search, their total size, and a breakdown of items returned for each keyword specified. A search estimate provides the following benefits:
  - The discovery manager can determine the effectiveness of the search query.

Using search estimates, a discovery manager can perform a **what-if** analysis of search queries and keywords, and then create more effective queries.

- The discovery manager can avoid copying a large number of items that may not meet the requirements or the purpose of the search, but still need to be reviewed.
- In scenarios where a search query results in a large number of items that need to be copied, the discovery manager can work with the Exchange administrator to determine if adequate storage is available to store the results in the discovery mailbox.

Note:

Deduplication isn't considered when calculating search result estimates. When you run the search again with the option to copy messages to a discovery mailbox, the actual number of messages copied may be less than the estimate provided when you use the estimate-only option.

For details about how to perform a discovery search, see Create a Discovery Search.

Return to top

Viewing Search Results

Search results are copied to the discovery mailbox selected as the target mailbox for the search. If you use a target mailbox other than the default Discovery Search Mailbox, you must assign mailbox access permissions to authorized users so they can access that discovery mailbox. Authorized users can access the mailbox using Microsoft Office Outlook Web App or Outlook.

For information about how to assign Full Access mailbox permissions for a mailbox, see Manage Full Access Permissions.

If a discovery manager selects the option to copy search results to a discovery mailbox, a folder with the same name as the search is created in the target mailbox. To store messages returned from that mailbox, a subfolder is created for each mailbox searched. The folder name consists of the mailbox user's display name along with the date and time when the search was created. Messages are copied to a folder that has the same name as their location in the searched mailbox. For example, if the search name is Discovery-ProjectContoso, and a message located in the Inbox folder in Paul Shen's primary mailbox is returned, the folder hierarchy created in the discovery mailbox would be **Discovery-ProjectContoso -> Paul Shen-9/4/2009 3:57:10 PM -> Primary Mailbox > Inbox**. Any message flags, including read/unread status and follow-up flags, are maintained.

Note:

If the discovery manager selects the deduplication option, a single instance of messages found in multiple locations across all mailboxes searched is copied to the **Results - <timestamp>** folder. If the discovery manager selects the full logging option for the search, the search log contains an entry for each instance of the message.

Annotations

In Exchange 2010 SP1, when a discovery manager reviews messages copied to a discovery mailbox, he or she can add annotations to the message. The discovery manager can then search the discovery mailbox for messages with annotations containing specific words or phrases.

Discovery managers can use annotations to associate a case number or another unique identifier with a message, making it easy to search for all items with that number.

Note:

Annotations are stored with the message in the discovery mailbox. If you deliver messages to a third party, consider that the information in annotations may be accessible

to the third party. We recommend that you not store any confidential information in annotations.

Return to top

Logging of Discovery Searches

There are two types of logging available for discovery searches:

- **Basic logging** Basic logging is enabled by default for all mailbox searches. It includes information about the search and who performed it. Information captured about basic logging appears in the body of the e-mail message sent to the mailbox where the search results are stored. This message is located in the folder created to store search results.
- **Full logging** Full logging includes information about all messages returned by the search. This information is provided in a comma-separated value (.csv) file attached to the e-mail message that contains basic logging information. The name of the search is used for the .csv file name. This information may be required for compliance or record-keeping purposes. To enable full logging, you must select **Enable full logging** in the ECP or specify the logging level using the *LogLevel* parameter in the Shell. In Exchange 2010 SP1, the .csv log file is included in a compressed (.zip) file.

Note:

When using the Shell to create or modify a search, you can also disable logging.

For details, see Multi-Mailbox Search Logging.

Return to top

Litigation Hold and Discovery

As part of discovery requests, you may be required to preserve mailbox content until a lawsuit is disposed. To preserve mailbox content, messages deleted or altered by the mailbox user must also be preserved. In Exchange 2010, this is accomplished by using litigation hold.

When a mailbox is placed on litigation hold, messages and other mailbox items deleted by the user, and all instances of changes made to certain properties of mailbox items, are preserved in the Recoverable Items folder. To learn more about litigation hold, see Understanding Litigation Hold. For details about how to place a mailbox on litigation hold, see Place a Mailbox on Litigation Hold.

Return to top

Preserving Mailboxes for Discovery

When an employee leaves an organization, it's a common practice to disable or remove the mailbox. After you disable a mailbox, it is disconnected from the user account but remains in the mailbox database for a certain period, 30 days be default. The Managed Folder Assistant does not process disconnected mailboxes and any retention policies or managed folder mailbox policies are not applied during this period. You can't search content of a disconnected mailbox. Upon reaching the deleted mailbox retention period, the mailbox is purged from the mailbox database.

If your organization requires that retention settings be applied to messages of employees who are no longer in the organization or if you may need to retain an ex-employee's

mailbox for an ongoing or future discovery search, you must not disable or remove the mailbox. You can take the following steps to ensure the mailbox can't be accessed and no new messages are delivered to it.

1. Disable the Active Directory user account using **Active Directory Users & Computers** or other Active Directory or account provisioning tools or scripts. This prevents mailbox logon using the associated user account.

   Important:

   Users with full access mailbox permission will still be able to access the mailbox. To prevent access by others, you must remove their full access permission from the mailbox. For more information about how to remove Full Access permissions on a mailbox, see Manage Full Access Permissions.

2. Set the message size limit for messages that can be sent from or received by the mailbox user to a very low value, 1 KB for example. This prevents delivery of new mail to and from the mailbox. For more information about how to configure message size limits for a mailbox, see Configure Message Size Limits for a Mailbox or a Mail-Enabled Public Folder.
3. Configure delivery restrictions for the mailbox so nobody can send messages to it. For details, see Configure Message Delivery Restrictions

Important:

You must take the above steps along with any other account management processes required by your organization, but without disabling or removing the mailbox or the associated user account.

When planning to implement mailbox retention for messaging retention management or discovery, you must take employee turnover into consideration. Long-term retention of ex-employee mailboxes will require additional storage on Mailbox servers and also result in an increase in Active Directory database because it requires that the associated user account be retained for the same duration. Additionally, it may also require changes to your organization's account provisioning and management processes.

1.11.7.2 Managing Discovery

Managing Discovery

Exchange Server 2010 > Messaging Policy and Compliance > Discovery >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-01-28*

Add a User to the Discovery Management Role Group

Create a Discovery Search

Start or Stop a Discovery Search

Modify a Discovery Search

Remove a Discovery Search

Create a Discovery Mailbox

Use Mailbox Search to Delete Messages

Re-create Discovery and Other System Mailboxes in Exchange 2010

1.11.7.2.1 Add a User to the Discovery Management Role Group

Add a User to the Discovery Management Role Group

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

If you want users to be able to use Microsoft Exchange Server 2010 Multi-Mailbox Search, you need to add them to the Discovery Management role group. Members of the Discovery Management role group have Full Access mailbox permission for the Discovery Search Mailbox that's created by Exchange Setup.

Note:

Be default, the Discovery Management role group doesn't have any members. Administrators with the Organization Management role are also unable to create or manage discovery searches without being added to the Discovery Management role group.

For more information about the Discovery Management role group, see Discovery Management.

For more information about Role Based Access Control (RBAC), see Understanding Role Based Access Control.

Looking for other management tasks related to Multi-Mailbox Search? Check out Managing Discovery.

Use the Shell to add a user to the Discovery Management role group

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Role groups" entry in the Role Management Permissions topic.

Note:

You can't use the EMC to add a user to the Discovery Management role group.

This example adds the user EAdams to the Discovery Management role group.

```
Add-RoleGroupMember -Identity "Discovery Management" -Member Eadams
```

Other Tasks

After you add a user to the Discovery Management role group, you may also want to:

- Create a Discovery Search
- Start or Stop a Discovery Search
- Remove a Discovery Search

Create a Discovery Search

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can use Exchange Management Shell cmdlets or the Exchange Control Panel (ECP) to create a discovery search. Search results are copied to the discovery mailbox selected as the target mailbox for the search.

Looking for other management tasks related to search? Check out Managing Discovery.

Caution:

Not specifying any source mailboxes to search will result in searching all mailboxes on all Exchange 2010 servers in the entire Exchange organization.
Not specifying a search query will result in the entire content of the specified mailboxes being copied to the target mailbox.
Depending on the scope of the search and the number and size of items returned, the discovery mailbox you select to store search results can potentially grow to a large size. Make sure the disk volumes where the mailbox database and transaction logs are located have adequate free space.
If you use mailbox quotas to limit mailbox sizes, be sure to configure the target mailbox with an adequate quota limit to allow sufficient storage for items returned by the search.

What Do You Want to Do?

- Create a New Multi-Mailbox Search
- Use the Shell to create a discovery search

Use the Shell to create a discovery search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Multi-Mailbox Search" entry in Messaging Policy and Compliance Permissions topic.

This example creates the discovery search Contoso-Case1. The search will return e-mail messages that meet the following conditions:

- Contain the words Contoso and Project A
- Sent or received from January 1, 2009, through December 31, 2009

The search is run against all mailboxes within all Exchange 2010 Mailbox servers in the organization. Search results will be saved in the mailbox Discovery Search Mailbox, in a folder with the same name as the search. Full logging is enabled for the search.

```
New-MailboxSearch -Name "Contoso-Case1" -StartDate "1/1/2009" -EndDate "12/31/200
```

For detailed parameter and syntax information, see New-MailboxSearch.

Note:

By default, a discovery search doesn't include items that can't be indexed by Exchange Search. To include such items in the search results, the *IncludeUnsearchableItems* switch is included in the preceding command.

Other Tasks

After you create a discovery search, you may also want to:

- Start or Stop a Discovery Search
- Modify a Discovery Search
- Remove a Discovery Search

1.11.7.2.3 Start or Stop a Discovery Search

Start or Stop a Discovery Search

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can stop or restart a discovery search at any time. For example, if you want to modify search properties such as keywords or mailboxes searched, you must first stop a search. You can then restart the search after making the required changes.

Looking for other management tasks related to search? Check out Managing Discovery.

Use the Shell to start or stop a discovery search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the 'Multi-Mailbox Search' entry in Messaging Policy and Compliance Permissions topic.

This example stops the search Discovery-ProjectContoso

```
Stop-MailboxSearch -Name "Discovery-ProjectContoso"
```

This example starts the stopped search Discovery-ProjectContoso.

```
Start-MailboxSearch -Name "Discovery-ProjectContoso"
```

For detailed parameter and syntax information, see Start-MailboxSearch and Stop-MailboxSearch.

Use the ECP to start or stop a discovery search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the 'Multi-Mailbox Search' entry in Messaging Policy and Compliance Permissions topic.

1. Navigate to **My Organization** > **Reporting** > **Mailbox Searches**.
2. To stop a search that's in progress, select the search, and then click the **Stop Search** icon.
3. To start a search that was stopped, select the search, and then click the **Restart Search** icon. A warning appears, stating that the existing search will be removed from the target mailbox. Click **Yes**.

Other Tasks

After you start a discovery search, you may also want to:

- Modify a Discovery Search
- Remove a Discovery Search

1.11.7.2.4 Modify a Discovery Search

Modify a Discovery Search

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

After you create a discovery search, you can modify it to change the search parameters. For example, you can change the mailboxes to be searched, date ranges, key words, logging options, or you can specify a different discovery mailbox to store search results. Any changes you make to the search properties will be used when you restart the search.

You can use the Shell to modify a discovery search. However, you can also use the Exchange Control Panel for the same task. For instructions about using the Exchange Control Panel to modify a discovery search, see Edit a Mailbox Search.

Looking for other management tasks related to managing Multi-Mailbox Search? Check out Managing Discovery.

Caution:

If a discovery search is running, you must stop it before modifying it. When you restart the search, the results from the last time the search was run are removed from the discovery mailbox. However, the logs from previous searches are saved.

Prerequisites

A discovery search has been created and isn't running.

Use the Shell to modify a discovery search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Multi-Mailbox Search" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the EMC to modify a discovery search.

This example modifies the discovery search Search-Project Contoso to search mailboxes belonging to members of the DG-ProjectManagers distribution group.

```
Set-MailboxSearch -Identity "Search-Project Contoso" -SourceMailboxes "DG-Project
```

For detailed syntax and parameter information, see Set-MailboxSearch.

Other Tasks

After you modify a discovery search, you may also want to:

- Remove a Discovery Search
- Start or Stop a Discovery Search

1.11.7.2.5 Remove a Discovery Search

Remove a Discovery Search

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Microsoft Exchange Server 2010, you can use Multi-Mailbox Search to create a discovery search. You can remove a discovery search at any time. When you remove a discovery search, search results are removed from the discovery mailbox.

Looking for other management tasks related to Multi-Mailbox Search? Check out Managing Discovery.

Use the Shell to remove a discovery search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Multi-Mailbox Search" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to remove a discovery search.

This example removes the discovery search Discovery-ProjectContoso.

```
Remove-MailboxSearch "Discovery-ProjectContoso"
```

For detailed syntax and parameter information, see Remove-MailboxSearch.

Use the Exchange Control Panel to remove a discovery search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Multi-Mailbox Search" entry in the Messaging Policy and Compliance Permissions topic.

1. Navigate to **My Organization** > **Reporting** > **Mailbox Searches**.
2. Select the search you want to remove, and then click  .

Other Tasks

After you remove a discovery search, you may also want to create a discovery search. For detailed steps, see Create a Discovery Search.

1.11.7.2.6 Create a Discovery Mailbox

Create a Discovery Mailbox

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Microsoft Exchange Server 2010 Setup creates a Discovery mailbox by default. Discovery mailboxes are available as target mailboxes for discovery searches in the Exchange Control Panel. You can create additional Discovery mailboxes as required. A Discovery mailbox can't be repurposed or converted to another type of mailbox. You can remove a Discovery mailbox using the same procedure used to remove other types of mailboxes.

Caution:
After a discovery search is completed, the Discovery mailbox used as a target mailbox for the search can potentially contain sensitive information. You should control access to Discovery mailboxes and ensure only authorized persons have access to them.

Looking for other management tasks related to Multi-Mailbox Search? Check out Managing Discovery.

Use the Shell to create a Discovery mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Creating discovery mailboxes" entry in Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to create a Discovery mailbox.

This example creates the Discovery mailbox SearchResults using the **New-Mailbox** cmdlet with the `Discovery` switch.

```
New-Mailbox SearchResults -Discovery -UserPrincipalName SearchResults@contoso.com
```

For detailed syntax and parameter information, see New-Mailbox.

This example lists Discovery mailboxes in an Exchange organization.

```
Get-Mailbox -Resultsize unlimited -Filter {RecipientTypeDetails -eq "DiscoveryMai
```

Other Tasks

After you create a Discovery mailbox, you may also want to:

- Add a User to the Discovery Management Role Group
- Create a Discovery Search

1.11.7.2.7 Use Mailbox Search to Delete Messages

Use Mailbox Search to Delete Messages

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Exchange 2010 Service Pack 1 (SP1), you can use the **Search-Mailbox** cmdlet to search for and delete messages from a mailbox.

To search for and delete messages in one step, run the **Search-Mailbox** cmdlet with the *DeleteContent* switch. However, when you do this, you can't preview search results or generate a log of messages that will be returned by the search. To preview a log of the messages found in the search before they're deleted, you can run the **Search-Mailbox** cmdlet with the *LogOnly* switch.

As an additional safeguard, you can first copy the messages to another mailbox by using the *TargetMailbox* and *TargetFolder* parameters. By doing this, you retain a copy of the deleted messages in case you need to access them again.

Looking for other management tasks related to discovery? Check out Managing Discovery.

Prerequisites

- If the mailbox from which you want to delete messages has single item recovery enabled, you must first disable the feature. For details, see Enable Single Item Recovery for a Mailbox.
- If the mailbox from which you want to delete messages is placed on litigation hold, we recommend that you check with your records management or legal department before removing the hold and deleting the mailbox content. After you obtain approval, follow the steps listed in the topic Clean Up the Recoverable Items Folder.

Use the Shell to search for messages and log the search results

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Delete mailbox content" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the Exchange Management Console (EMC) to search for messages and log search results.

This example searches April Stewart's mailbox for messages that contain the phrase "Your bank statement" in the Subject field and logs the search results in the SearchAndDeleteLog folder of the administrator's mailbox. Messages aren't copied to or deleted from the target mailbox.

Note:
The *LogOnly* parameter is available only in Exchange 2010 SP1.

```
Search-Mailbox -Identity "April Stewart" -SearchQuery "Subject:'Your bank stateme
```

For detailed syntax and parameter information, see Search-Mailbox.

Use the Shell to search for and delete messages

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Delete mailbox content" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the Exchange Management Console (EMC) to search for and delete messages.

This example searches April Stewart's mailbox for messages that contain the phrase "Your bank statement" in the Subject field and deletes the messages from the source mailbox without copying the search results to another folder.

Important:
When you use the **Search-Mailbox** cmdlet with the *DeleteContent* switch, messages are permanently deleted from the source mailbox. Before you permanently delete messages, we recommend that you either use the *LogOnly* switch to generate a log of the messages found in the search before they're deleted or copy the messages to another mailbox before deleting them from the source mailbox.

```
Search-Mailbox -Identity "April Stewart" -SearchQuery "Subject:'Your bank stateme
```

This example searches April Stewart's mailbox for messages that contain the phrase "Your bank statement" in the Subject field, copies the search results to the folder AprilStewart-DeletedMessages in the mailbox BackupMailbox, and deletes the messages from April's mailbox.

```
Search-Mailbox -Identity "April Stewart" -SearchQuery "Subject:'Your bank stateme
```

For detailed syntax and parameter information, see Search-Mailbox.

1.11.7.2.8 Re-create Discovery and Other System Mailboxes in Exchange 2010

Re-create Discovery and Other System Mailboxes in Exchange 2010

See Also

Messaging Policy and Compliance > Discovery > Managing Discovery >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-05-14*

This article describes how to re-create and enable missing Discovery and other system mailboxes in Microsoft Exchange Server 2010.

Arbitration user accounts and mailboxes are created when you run the Setup.com /PrepareAD command to prepare Active Directory as part of the Exchange 2010 installation. Arbitration mailboxes are used for managing approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.You can find the Arbitration user accounts in the Users Organizational Unit (OU) in Active Directory. The accounts resemble the following:

- SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9} – This account is used by the Multi-Mailbox Search process to store discovery search metadata.
- FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042 – This account is used for federated mail.
- SystemMailbox{1f05a927-af78-475a-aba4-fc281398eb54} – This account is used for moderated transport.
- DiscoverySearchMailbox{D919BA05-46A6-415f-80AD-7E09334BB852} – This account is used as the target mailbox for discovery searches in the exchange control panel. Discovery search is used when you search for emails across all the mailboxes.

Because system mailboxes are not visible in the Exchange Management Console (EMC) or in Exchange address lists, they are rarely deleted accidentally.

If a system mailbox is deleted accidentally, features that rely on that mailbox no longer work. For example, if the Discovery system mailbox is deleted accidentally, the search process does not function correctly, and discovery managers can no longer perform searches or manage existing searches. To enable the discoverability functionality in this case, you must re-create the Discovery system mailbox.

For more information about the Discovery process, see Managing Discovery.

For more information about Arbitration mailboxes, see Understanding Moderated Transport.

Use the Exchange Management Shell to re-create the system mailboxes and user accounts

1. You must first delete the user accounts for the accidentally deleted mailboxes from Active Directory. By default, Exchange 2010 Setup creates system mailboxes in the Users container in Active Directory. For example, the account that was deleted may resemble one of the following:
   - SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}
   - SystemMailbox{1f05a927-af78-475a-aba4-fc281398eb54}
   - FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042
   - DiscoverySearchMailbox{D919BA05-46A6-415f-80AD-7E09334BB852}

   For more information about how to delete a user account from Active Directory, see Delete a User Account.
2. Prepare Active Directory. To do this, run Microsoft Exchange 2010 Setup by using the **/PrepareAD** switch in the root domain of your Active Directory forest. For more information, see Prepare Active Directory and Domains.
3. Make sure that you enable the mailbox only for the accounts that were re-created. You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Mailbox Permissions topic.

The following example describes how to enable the Arbitration and Discovery system mailboxes:

```
Enable-Mailbox -Arbitration -Identity "FederatedEmail.4c1f4d8b-8179-4148-93bf-00a
Enable-Mailbox -Arbitration -Identity "SystemMailbox{1f05a927-8668-4003-adad-9b80
Enable-Mailbox -Arbitration -Identity "SystemMailbox{e0dc1c29-89c3-4034-b678-e6c2
Enable-Mailbox -Discovery "DiscoverySearchMailbox {D919BA05-46A6-415f-80AD-7E0933
```

To set the correct display for the **SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}** mailbox, you can use the Set-Mailbox command. For example, run the following command:

```
Set-Mailbox -Arbitration -Identity "SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d8
```

If you have re-created the FederatedEmail system mailbox, you can reset the default quota for the **FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042** mailbox by using the Set-Mailbox command. For example, run the following command:

```
Set-Mailbox -Arbitration -Identity "FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95f
```

To determine whether the Enable-Mailbox and Set-Mailbox commands were applied correctly, you can use the Get-Mailbox command. Run the following command to verify the status of the Arbitration mailboxes:

```
Get-Mailbox -Arbitration
```

If the Enable-Mailbox and Set-Mailbox commands were applied correctly, the following results are returned.

Name	Alias	ServerName	ProhibitSendQuota
SystemMailbox {e0dc1c29-89c3-4034-b678-e6c29d823ed9}	SystemMailbox {e0dc1c29-89c3-4034-b678-e6c29d823ed9}	*EXch1*	Unlimited
FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042	FederatedEmail.4c1f4d8b-8179-4148-93bf-00a95fa1e042	*EXch1*	Unlimited
SystemMailbox {1f05a927-af78-475a-aba4-fc281398eb54}	SystemMailbox {1f05a927-af78-475a-aba4-fc281398eb54}	*EXch1*	1 MB (1,048,576 bytes)

Run the following command to verify the status of the DiscoverySearchMailbox mailbox:

```
Get-Mailbox -Identity DiscoverySearchMaibox*
```

If the Enable-Mailbox and Set-Mailbox commands were applied correctly, the following result is returned.

Name	Alias	ServerName	ProhibitSendQuota
DiscoverySearchMailbox {D919BA05-46A6-415f-80AD-7E09334BB852}	DiscoverySearchMailbox {D919BA05-46A6-415f-80AD-7E09334BB852}	*EXch1*	50 GB (53,687,091,200 bytes)

1.11.8 Litigation Hold

Litigation Hold

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-07-23*

Understanding Litigation Hold

Learn about the litigation hold feature, which allows you to preserve items in user mailboxes and protect the items from deletion by users or automated processes.

Place a Mailbox on Litigation Hold

Learn how to use the Exchange Management Console, the Exchange Control Panel, or the Exchange Management Shell to place a mailbox on litigation hold.

1.11.8.1 Understanding Litigation Hold

Understanding Litigation Hold

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-09-23*

When a reasonable expectation of litigation exists, organizations are required to preserve electronically stored information (including e-mail) that's relevant to the case. This expectation can occur before the specifics of the case are known, and preservation is often broad. Organizations may preserve all e-mail related to a specific topic, or all e-mail for certain individuals. Depending on the organization's electronic discovery (eDiscovery) practices, some of the measures adopted by organizations to preserve e-mail include the following:

- End users may be asked to preserve e-mail by not deleting any messages. However, users may still delete e-mail knowingly or inadvertently.
- Automated deletion mechanisms such as messaging records management (MRM) may be suspended. This could result in large volumes of e-mail cluttering the user mailbox, and thus impacting user productivity. Suspending automated deletion also doesn't prevent users from manually deleting e-mail.
- Some organizations copy or move e-mail to an archive to make sure it isn't deleted, altered, or tampered with. This increases costs due to manual efforts required to copy or move messages to an archive, or third-party products used to collect and store e-mail outside Microsoft Exchange.

Failure to preserve e-mail may expose an organization to legal and financial risks such as scrutiny of the organization's records retention and discovery processes, adverse legal judgments, sanctions, or fines.

In Exchange Server 2010, you can use litigation hold to accomplish the following goals:

- Enable users to be placed on hold and keep mailbox items in an unaltered state
- Preserve mailbox items that may have been deleted or edited by users
- Preserve mailbox items automatically deleted by MRM
- Keep the litigation hold transparent from the user by not having to suspend

MRM
- Enable discovery searches of items placed on hold

Placing a Mailbox on Litigation Hold

Authorized users that have been added to the Discovery Management role-based access control (RBAC) role group or assigned the legal hold management role can place mailbox users on litigation hold. You can delegate the task to records managers, compliance officers, or attorneys in your organization's legal department, while assigning the least privileges. To learn more about assigning the Discovery Management role group, see Add a User to the Discovery Management Role Group.

In Exchange 2010 SP1, you can use the Exchange Management Console (EMC), the Exchange Control Panel (ECP) or the Exchange 2010 Management Shell to place a mailbox on litigation hold. In Exchange 2010 RTM, you must use the Set-Mailbox cmdlet to place a mailbox on litigation hold. To learn more about placing a mailbox on litigation hold, see Place a Mailbox on Litigation Hold.

Many organizations require that users be informed when they're placed on litigation hold. Additionally, when a mailbox is on litigation hold, any retention policies applicable to the mailbox user don't need to be suspended. Because messages continue to be deleted as expected, users may not notice they're on litigation hold. If your organization requires that users on litigation hold be informed, you can add a notification message to the mailbox user's **Retention Comment** property. Outlook 2010 displays the notification in the backstage area. The **Retention Comment** property can be added using the Exchange Management Console (EMC) or the Exchange Management Shell.

Note:

In Exchange 2010, the **Retention Comment** property is used to display a notification for both retention hold and litigation hold.

Litigation Hold and Mailbox Quotas

Items in the Recoverable Items folder aren't calculated toward the user's mailbox quota. In Exchange 2010, the Recoverable Items folder has its own quota. When a user's Recoverable Items folder exceeds the warning quota for recoverable items (as specified by the *RecoverableItemsWarningQuota* parameter), an event is logged in the Application event log of the Mailbox server. When the folder exceeds the quota for recoverable items (as specified by the *RecoverableItemsQuota* parameter), users won't be able to empty the Deleted Items folder or permanently delete mailbox items. Also copy-on-write won't be able to create copies of modified items. Therefore, it's critical that you monitor the Recoverable Items quotas for mailbox users placed on litigation hold.

For mailbox databases, the default *RecoverableItemsWarningQuota* and *RecoverableItemsQuota* values are set to 20 Gb and 30 Gb respectively. These settings are usually sufficient for storing several years of mailbox data when on litigation hold. To modify these values for a mailbox database, use the Set-MailboxDatabase cmdlet. To modify them for individual mailboxes, use the Set-Mailbox cmdlet.

Litigation Hold and the Recoverable Items Folder

Litigation hold uses a new Exchange 2010 feature called the Recoverable Items folder. This folder replaces the feature informally known as the *dumpster* in previous versions of Exchange. The Recoverable Items folder is hidden from the default view of Microsoft Outlook, Microsoft Office Outlook Web App, and other e-mail clients. To learn more about the Recoverable Items folder, see Understanding Recoverable Items.

By default, when a user deletes a message from a folder other than the Deleted Items folder, the message is moved to the Deleted Items folder. This is known as a *move*. When a user *soft deletes* an item (accomplished by pressing the SHIFT and DELETE keys) or deletes an item from the Deleted Items folder, or empties the Deleted Items folder, the message is moved to the Recoverable Items folder, thereby disappearing from the user's view.

Items in the Recoverable Items folder are retained for the deleted item retention period configured on the user's mailbox database. By default, the deleted item retention period is set to 14 days for mailbox databases. In Exchange 2010, you can also configure a storage quota for the Recoverable Items folder. This protects the organization from a potential denial of service (DoS) attack due to rapid growth of the Recoverable Items folder and therefore the mailbox database. If a mailbox is not placed on litigation hold, items are purged permanently from the Recoverable Items folder on a first in, first out (FIFO) basis when the Recoverable Items warning quota is exceeded, or if the item has resided in the folder for a longer time than the deleted item retention period.

The Recoverable Items folder has the following three subfolders used to store deleted items in various states and facilitate litigation hold:

1. **Deletions** Items removed from the Deleted Items folder or soft deleted from other folders are moved to the Deletions subfolder and are visible to the user when using the Recover Deleted Items feature in Outlook. By default, items reside in this folder until the deleted item retention period configured for the mailbox expires.
2. **Purges** When a user deletes an item from the Recoverable Items folder (by using the Recover Deleted Items tool in Outlook or Outlook Web App), the item is moved to the Purges folder. Items that exceed the deleted item retention period configured on the mailbox database or the mailbox are also moved to the Purges folder. Items in this folder aren't visible to users if they use the Recover Deleted Items tool. When the mailbox assistant processes the mailbox, items in the Purges folder are purged from the mailbox database. When you place the mailbox user on litigation hold, the mailbox assistant doesn't purge items in this folder.
3. **Versions** In Exchange 2010, when a user who is placed on litigation hold changes specific properties of a mailbox item, the original item is preserved to meet discovery obligations. A copy of the original mailbox item is created before the changed item is written. The original copy is saved in the Versions folder. This process is known as *copy on write*. Copy on write applies to items residing in any mailbox folder. The Versions folder isn't visible to users. The following table lists the message properties that trigger copy on write.

Properties that trigger copy on write

Item type	Properties that trigger copy on write
Messages (IPM.Note*) Posts (IPM.Post*)	• Subject • Body • Attachments • Senders/Recipients • Sent/Received Dates
Items other than messages and posts	Any change to a visible property, except the following: • Item location (when an item is moved between folders) • Item status change (read or unread) • Changes to retention tag applied to an item
Items in the default folder Drafts	None (items in the Drafts folder exempt from copy on write)

Important:
In Exchange 2010 SP1, copy-on-write is disabled for calendar items in the organizer's mailbox when meeting responses are received from attendees and the tracking information for the meeting is updated. Changes to RSS feeds are not captured by copy-on-write.

Note:
Although the Purges and Versions folders aren't visible to the user, all items in the Recoverable Items folder are indexed by Exchange Search, and are discoverable using Multi-Mailbox Search.

After a mailbox user is removed from litigation hold, items in the Purges and Versions folders are purged by the mailbox assistant.

1.11.8.2 Place a Mailbox on Litigation Hold

Place a Mailbox on Litigation Hold

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

A litigation hold preserves deleted mailbox items and records changes made to mailbox items. Deleted and changed items are returned in a discovery search.

Use the EMC to place a mailbox on litigation hold

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Litigation hold" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the mailbox you want to place on litigation hold.
3. In the action pane, click **Properties**.
4. In **<Mailbox> Properties**, on the **Mailbox Settings** tab, click **Messaging Records Management**, and then click **Properties**.
5. In **Messaging Records Management**, complete the following fields:
   - **Enable Litigation Hold** Select this check box to place the mailbox on litigation hold.
   - **Messaging Records Management Description URL** Use this box to enter the location of a Web page or document that contains more information about the litigation hold or retention hold policies in your organization. The URL is displayed in the Backstage area of Microsoft Outlook 2010. This makes it easier for users to access linked Help documents, and may reduce calls to your Help desk or Legal department by answering common questions.
   - **Comments** Use this box to enter the text that you want to be displayed to the mailbox user in the Backstage area of Outlook 2010.

Use the ECP to place a mailbox on litigation hold

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Litigation hold" entry in the Messaging Policy and Compliance Permissions topic.

For details about using the Exchange Control Panel (ECP) to place a mailbox on litigation hold, see Put a Mailbox on Litigation Hold.

Use the Shell to place a mailbox on litigation hold

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Litigation hold" entry in the Messaging Policy and Compliance Permissions topic.

This example places the mailbox joe@contoso.com on litigation hold.

Note:
It may take up to an hour for the litigation hold to take effect.

```
Set-Mailbox joe@contoso.com -LitigationHoldEnabled $true
```

For detailed syntax and parameter information, see Set-Mailbox.

Use the Shell to remove a mailbox from litigation hold

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Litigation hold" entry in the Messaging Policy and Compliance Permissions topic.

This example removes the mailbox joe@contoso.com from litigation hold.

```
Set-Mailbox joe@contoso.com -LitigationHoldEnabled $false
```

For detailed syntax and parameter information, see Set-Mailbox.

Other Tasks

After you place a mailbox on litigation hold, you may also want to create a discovery search. For detailed steps, see Create a Discovery Search.

1.11.9 Archiving

Archiving

Exchange Server 2010 > Messaging Policy and Compliance >

Managing Archives

Learn how to create and manage personal (on-premises) and cloud-based archives for your users.

1.11.9.1 Understanding Personal Archives

Understanding Personal Archives

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-13*

Personal archives (also called *on-premises archives*) help you regain control of your organization's messaging data by eliminating the need for personal store (.pst) files and allowing users to store messages in an *archive mailbox* accessible in Microsoft Outlook 2010 and Microsoft Office Outlook Web App.

Looking for management tasks related to personal archives? See Managing Archives.

Looking for information about cloud-based archives? See Understanding Exchange Online Archiving.

Contents

Messaging Data and .pst Files

Outlook uses .pst files to store data locally on users' computers or network shares. Unlike offline store (.ost) files (which are used by Outlook in Cached Exchange Mode to store a

copy of the mailbox for offline access), .pst files aren't synchronized with the user's Exchange mailbox. If a user moves messages to a .pst file, those messages are removed from the mailbox.

Using .pst files to manage messaging data can result in the following issues:

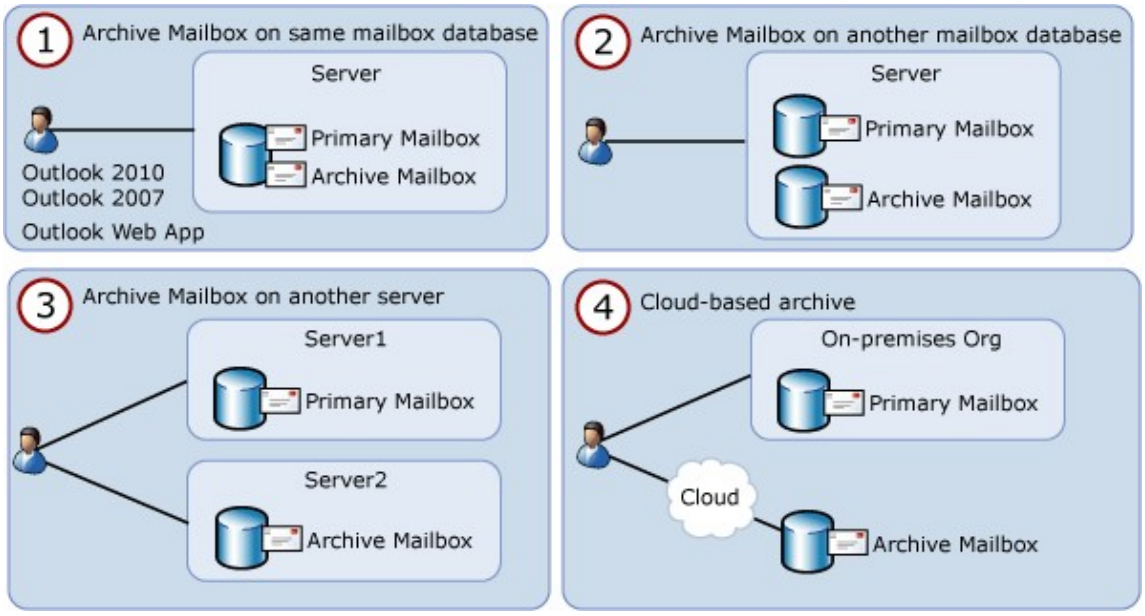
- **Unmanaged files** Generally, .pst files are created by users and reside on their computers or network shares. They aren't managed by your organization. As a result, users can create several .pst files containing the same or different messages and store them in different locations, with no organizational control.
- **Increased discovery costs** Lawsuits and some business or regulatory requirements sometimes result in discovery requests. Locating messaging data that resides in .pst files on users' computers can be a costly manual effort. Because tracking unmanaged .pst files can be difficult, .pst data may be undiscoverable in many cases. This could possibly expose your organization to legal and financial risks.
- **Inability to apply messaging retention policies** Messaging retention policies can't be applied to messages located in .pst files. As a result, depending on business or applicable regulations, your organization may not be in compliance.
- **Risk of data theft** Messaging data stored in .pst files is vulnerable to data theft. For example, .pst files are often stored in portable devices such as laptops, removable hard drives, and portable media such as USB drives, CDs, and DVDs.
- **Fragmented view of messaging data** Users who store information in .pst files don't get a uniform view of their data. Messages stored in .pst files are generally available only on the computer where the .pst file resides. As a result, if users access their mailboxes using Outlook Web App or Outlook on another computer, the messages stored in their .pst files are inaccessible.

Return to top

Personal Archives

In Microsoft Exchange Server 2010, personal archives provide users an alternative storage location in which to store historical messaging data. A personal archive is an additional mailbox (called an archive mailbox) enabled for a mailbox user. Outlook 2010, Outlook 2007, and Outlook Web App users have seamless access to their archive mailbox. Using either of these client applications, users can view an archive mailbox and move or copy messages between their primary mailbox and the archive. Personal archives present a consistent view of messaging data to users and eliminate the user overhead required to manage .pst files. Eliminating the use of .pst files significantly reduces your organization's exposure to the risks outlined in the previous section.

In Exchange 2010 Service Pack 1 (SP1), you can provision a user's personal archive on the same mailbox database as the user's primary mailbox, another mailbox database on the same Mailbox server, or a mailbox database on another Mailbox server in the same Active Directory site. This provides flexibility to use tiered storage architecture and to store archive mailboxes on a different storage subsystem, such as near-line storage. In cross-premises Exchange 2010 deployments, you can also provision a cloud-based archive for mailboxes located on your on-premises Mailbox servers.



Return to top

Client Access to Archive Mailboxes

The following table lists the client applications that can be used to access archive mailboxes.

Client access to archive mailboxes

Client	Access to archive mailbox
Outlook 2010, Outlook 2007, and Outlook Web App	Yes. Outlook 2010, Outlook 2007 and Outlook Web App users can copy or move items from their primary mailbox to their archive mailbox, and can also use retention policies to move items to the archive. **Note:** Outlook 2010 and Outlook 2007 users can also copy or move items from .pst files to their archive mailbox. Outlook 2007 users require the Office 2007 Cumulative Update for February 2011. Some differences in archive support exist between Outlook 2010 and Outlook 2007. For more information, see Exchange Team Blog article, see Yes Virginia, there is Exchange 2010 archive support in Outlook 2007.
Outlook 2003 and older clients	No.
Microsoft Exchange ActiveSync	No.

Note:
Personal archives are a premium feature and require an Exchange Enterprise client access license (CAL). For details about how to license Exchange, see Exchange Server Licensing. For details about the versions of Microsoft Outlook required to access an archive mailbox, see License requirements for Personal Archive and retention policies.

Outlook doesn't create a local copy of the archive mailbox on a user's computer, even if it's configured to use Cached Exchange Mode. Users can access an archive mailbox in online mode only.

Delegate Access

Delegate access is when a user or set of users is provided access to another user's mailbox. There are several scenarios for providing delegate access, including:

- Providing one or more users with access to the mailbox of a user who is no longer employed by the organization. In this case, users who may be given delegate access include the departed user's manager or supervisor or another user who will assume the departed user's responsibilities.
- Providing one or more users with access to a shared mailbox.
- Providing executive assistants with access to the mailboxes of the executives they're assisting.

In Exchange 2010 SP1, when you assign Full Access permissions to a mailbox, the delegate to which you assign the permissions can also access the user's personal archive. Delegates must use Outlook to access the mailbox, and they must connect to an Exchange 2010 SP1 Client Access server for Autodiscover purposes. Autodiscover is an Exchange 2010 service that provides configuration settings to automatically configure Outlook clients. When delegates use Outlook to access an Exchange 2010 SP1 mailbox, both the primary mailbox and the personal archive to which they have access are visible from Outlook. For details about assigning Full Access permissions, see Manage Full Access Permissions.

Return to top

Moving Messages to the Archive Mailbox

There are several ways to move messages to archive mailboxes:

- **Move or copy messages manually** Mailbox users can manually move or copy messages from their primary mailbox or a .pst file to their archive mailbox. The archive mailbox appears as another mailbox or .pst file in Outlook and Outlook Web App.
- **Move or copy messages using Inbox rules** Mailbox users can create Inbox rules in Outlook or Outlook Web App to automatically move messages to a folder in their archive mailbox. To learn more, see Learn About Inbox Rules.
- **Move messages using retention policies** You can use retention policies to automatically move messages to the archive. Users can also apply a personal tag to move messages to the archive. For details about archive and retention policies, see Archive and Retention Policies later in this topic.

  Note:
  Personal tags are available only in Outlook 2010 and Outlook Web App.

- **Import messages from .pst files** In Exchange 2010 SP1, you can use a mailbox import request to import messages from a .pst file to a user's archive or primary mailbox. For details, see Understanding Mailbox Import and Export Requests. Tools used to locate .pst files within an organization are available from Microsoft partners. For a list of Microsoft partners for archiving, see "Archive and Compliance Partners" in Independent Software Vendors.

Archive and Retention Policies

In Exchange 2010, you can apply archive policies to a mailbox to automatically move messages from a user's primary mailbox to the archive mailbox after a specified period. Archive policies are implemented by creating retention tags that use the **Move to Archive** retention action.

Messages are moved to a folder in the archive mailbox that has the same name as the

source folder in the primary mailbox. If a folder with the same name doesn't exist in the archive mailbox, it is created when the Managed Folder Assistant moves a message. Re-creating the same folder hierarchy in the archive mailbox allows users to find messages easily.

To learn more about retention policies, retention tags, and the **Move to Archive** retention action, see Understanding Retention Tags and Retention Policies.

Important:
You can't apply a managed folder mailbox policy to mailboxes that have a personal archive. Managed content settings created for managed folders can't use the **Move to archive** action. To learn more about managed folders, see Understanding Managed Folders.

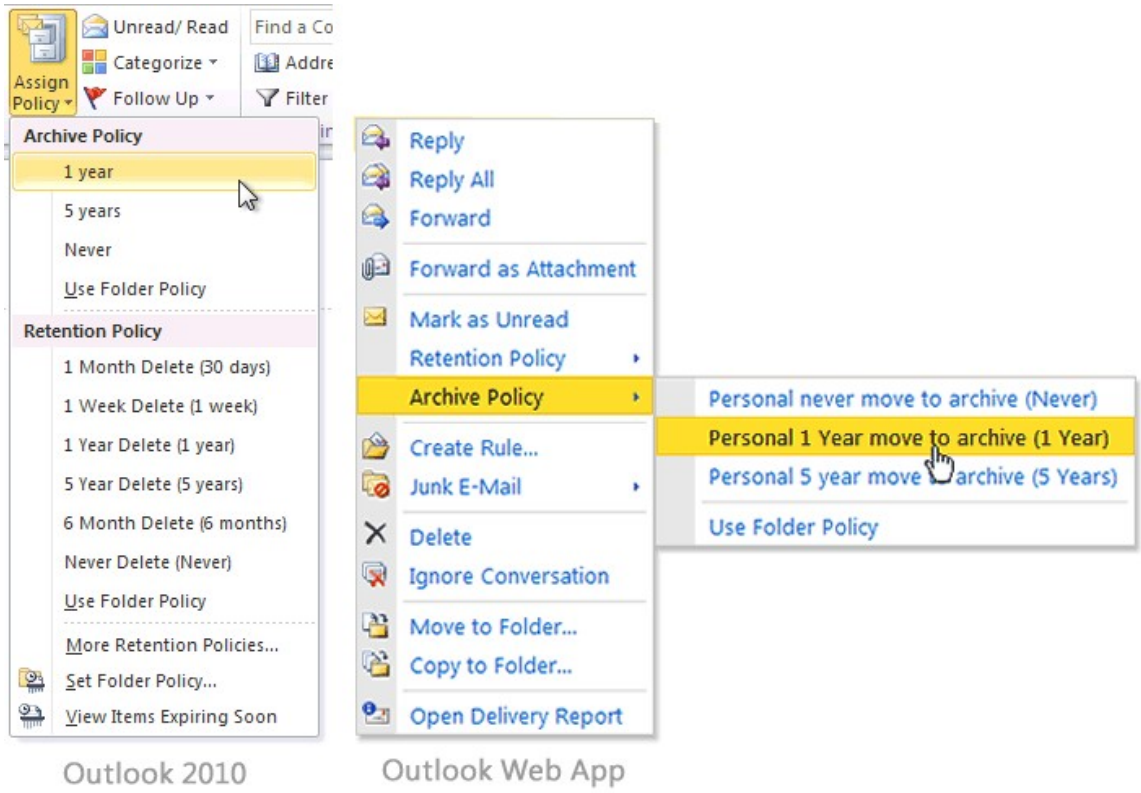
Default Archive and Retention Policy

Exchange Setup creates the default archive and retention policy **Default Archive and Retention Policy**. This policy contains retention tags that have the **Move to Archive** action, as shown in the following table.

Default archive and retention policy

Retention tag name	Tag type	Description
Default 2 year move to archive	Default	Messages are automatically moved to the archive mailbox after two years. Applies to items in the entire mailbox that don't have a retention tag applied explicitly or inherited from the folder.
Personal 1 year move to archive	Personal	Messages are automatically moved to the archive mailbox after one year.
Personal 5 year move to archive	Personal	Messages are automatically moved to the archive mailbox after five years.
Personal never move to archive	Personal	Messages are never moved to the archive mailbox.
Recoverable Items 14 days move to archive	Personal	Messages are moved from the Recoverable Items folder of the user's primary mailbox to the Recoverable Items folder of the archive mailbox. Users attempting to recover deleted items in the archive must use the Recover Deleted Items feature on the archive mailbox.

If you enable a personal archive for a mailbox user and the mailbox doesn't already have a retention policy assigned, the default archive and retention policy is automatically assigned. After the Managed Folder Assistant processes the mailbox, these tags become available to the user, who can then tag folders or messages to be moved to the archive mailbox. By default, e-mail messages from the entire mailbox are moved after two years.



Before provisioning archive mailboxes for your users, we recommend that you inform them about the archive policies that will be applied to their mailbox and provide subsequent training or documentation to meet their needs. This should include details about the following:

- Functionality available within the archive, the default archive and retention policies.
- Information about when messages may be moved automatically to the archive.
- Information about the folder hierarchy created in the archive mailbox.
- How to apply personal tags (displayed in the **Archive policy** menu in Outlook and Outlook Web App).

Note:
If you apply a retention policy to users who have an archive mailbox, the retention policy replaces the default archive and retention policy. You can create one or more retention tags with the **Move to Archive** action, and then link the tags to the retention policy. You can also add the default **Move to Archive** tags (which are created by Setup and linked to the Default Archive and Retention Policy) to any retention policies you create.

In Exchange 2010 SP1, the default archive and retention policy contains additional retention tags with the **Delete and Allow Recovery** action. To learn more, see Understanding Retention Tags and Retention Policies.

For information about compliance and archiving in Outlook 2010, see Plan for compliance and archiving in Outlook 2010.

Return to top

Archive Quotas

Archive mailboxes are designed so that users can store historical messaging data outside their primary mailbox. Often, users use .pst files due to low mailbox storage quotas and the restrictions imposed when these quotas are exceeded. For example, users can be prevented from sending messages when their mailbox size exceeds the Prohibit send quota. Similarly, users can be prevented from sending and receiving messages when their mailbox size exceeds the Prohibit send and receive quota.

To eliminate the need for .pst files, you can provide an archive mailbox with storage limits that meet the user's requirements. However, you may still want to retain some control of the storage quotas and growth of archive mailboxes to help monitor costs and expansion.

To help with this control, you can configure archive mailboxes with an *archive warning quota* and an *archive quota*. When an archive mailbox exceeds the specified archive warning quota, a warning event is logged in the Application event log. When an archive mailbox exceeds the specified archive quota, messages are no longer moved to the archive, a warning event is logged in the Application event log, and a quota message is sent to the mailbox user. By default, in Exchange 2010 SP1, the archive warning quota is set to 45 gigabytes (GB) and the archive quota is set to 50 GB. In Exchange 2010 release to manufacturing (RTM), both quotas are set to **Unlimited**.

The following table lists the events logged and warning messages sent when the archive warning quota and archive quota are met.

Archive quota alerts

Quota	Event ID	Type	Source	Category	Message
Archive warning quota	10022	Warning	MSExchangeMailboxAssistants	Managed Folder Assistant	The archive mailbox '*<Display Name>*:*<GUID>*:*<Mailbox Database>*:*<Server FQDN>*' exceeded the archive warning quota '*<Archive warning quota>*'. Archive mailbox size is '*<Size>*' bytes.
Archive quota	8538	Warning	MSExchangeIS	General	The archive mailbox for *<Legacy DN>* has exceeded the maximum archive mailbox size. You can't copy or move items into the archive mailbox. All message retention actions that move items to the archive

					mailbox will fail, and the primary mailbox may contain items with expired retention tags until the archive mailbox is within the maximum size limit. The mailbox owner should be notified about the condition of the archive mailbox.

For details about how to configure archive quotas, see Configure Archive Quotas for a Personal (On-Premises) Archive.

Return to top

Personal Archives and Other Exchange Features

This section explains the functionality between personal archives and various Exchange features:

- **Exchange Search** The ability to quickly search messages becomes even more critical with archive mailboxes. For Exchange Search, there's no difference between the primary and archive mailbox. Content in both mailboxes is indexed. Because the archive mailbox isn't cached on a user's computer (even when using Outlook in Cached Exchange Mode), search results for the archive are always provided by Exchange Search. When searching the entire mailbox in Outlook 2010, search results include the users' primary and archive mailbox. To learn more about Exchange Search, see Understanding Exchange Search.
- **Multi-Mailbox Search** When a discovery manager uses Multi-Mailbox Search to perform a discovery search, users' archive mailboxes are also searched. There's no option to exclude archive mailboxes when creating a discovery search from the Exchange Control Panel (ECP). When using the Exchange Management Shell to create a discovery search, you can exclude the archive by using the *DoNotIncludeArchive* switch. For details, see New-MailboxSearch.

  Note:
  You can't use Multi-Mailbox Search to search a disconnected mailbox.

  To learn more about Multi-Mailbox Search, see Understanding Multi-Mailbox Search.
- **Litigation hold** When you put a mailbox on litigation hold, the hold is placed on both the primary and the archive mailbox. To learn more about litigation hold, see Understanding Litigation Hold.
- **Recoverable Items folder** The archive mailbox contains its own Recoverable Items folder, and is subject to the same Recoverable Items folder quotas as the primary mailbox. To learn more about recoverable items, see Understanding Recoverable Items.

Return to top

Managing Archive Mailboxes

In Exchange 2010, creating and managing archive mailboxes is integrated with common mailbox management tasks, such as the following:

- **Creating an archive mailbox** You can create an archive mailbox when creating a mailbox, or you can enable an archive mailbox for an existing mailbox. For details, see Create a Personal (On-Premises) or Cloud-Based Archive for a New Mailbox and Enable a Personal (On-Premises) or Cloud-Based Archive for an Existing Mailbox.
- **Moving an archive mailbox** You can move a user's archive mailbox to another mailbox database on the same Mailbox server or to another server. In Exchange 2010 SP1, you can move a user's archive mailbox independent of the primary mailbox. In Exchange 2010 RTM, a user's archive mailbox resides on the same Mailbox server as the primary mailbox. To move a user's archive mailbox, you must create a mailbox move request. For details, see Create a Local Move Request.
- **Disabling an archive mailbox** You may want to disable a user's archive mailbox for troubleshooting purposes or if you're moving the primary mailbox to a version of Exchange that doesn't support personal archives. Disabling an archive is similar to disabling a primary mailbox. For details, see Disable a Personal (On-Premises) or Cloud-Based Archive for a Mailbox. A disabled archive mailbox is retained in the mailbox database until the deleted mailbox retention period for that database is reached. During this period, you can reconnect the archive to a mailbox user. When the deleted mailbox retention period is reached, the disconnected archive mailbox is purged from the mailbox database.
- **Retrieving mailbox statistics and folder statistics** You can retrieve mailbox statistics and mailbox folder statistics for a user's archive mailbox by using the *Archive* switch with the Get-MailboxStatistics and Get-MailboxFolderStatistics cmdlets.

Return to top

1.11.9.2 Understanding Exchange Online Archiving

Understanding Exchange Online Archiving

Exchange Server 2010 > Messaging Policy and Compliance > Archiving >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-05-04*

Microsoft Exchange Online Archiving is a cloud-based, enterprise-class archiving solution for your Exchange Server 2010 Service Pack 1 (SP1) or later on-premises organization. With Exchange Online Archiving, your organization can host your users' primary mailboxes on your on-premises servers and store their historical e-mail data in cloud-based archive mailboxes. This solution can assist your organization with archiving, compliance, regulatory, and e-discovery challenges, while simplifying your on-premises infrastructure. EOA provides you the following advantages:

- **Help meet long-term retention requirements** Cloud-based archives allow you to store large quantities of messaging data off-site in secure and controlled datacenters. Exchange Online Archiving helps your organization meet regulatory compliance or business requirements for long-term retention of e-

mail. Using archive policies, messages are moved from on-premises mailboxes to the cloud-based archives. The same retention policies applied to on-premises mailboxes can be enforced on cloud-based archives.

- **Help meet eDiscovery and litigation hold requirements** With cloud-based archives for your on-premises mailbox users, you can perform seamless discovery searches across both the on-premises primary mailbox and the cloud-based archive. When users are placed on litigation hold in your on-premises organization, their cloud-based archive is also placed on hold.
- **Lower storage costs** Moving historical e-mail data to a cloud-based archive allows you to reduce your organization's storage requirements. You can provision users' primary mailboxes with appropriate mailbox quotas, which keeps mailbox sizes in control and your storage costs low.
- **Provide Anywhere Access** Cloud-based archive mailboxes are similar to an on-premises archive mailbox. Using Outlook 2010, Outlook 2007 or Outlook Web App, users are able to access older messages and content in the archive transparently, without requiring any additional configuration on their computers.

Note:
Outlook users can access an archive mailbox in online mode. Archive mailboxes aren't cached to the user's computer when using Outlook in Cached Exchange Mode.

To learn about the various archiving terms used in Exchange 2010, see Archiving Terminology in Exchange 2010.

Exchange Online Archiving Requirements and Setup

The following are general requirements required to configure Exchange Online Archiving.

- You must purchase an Exchange Online Archiving subscription for the Exchange Online service included with Office 365. For more information, see Exchange Online Archiving subscription.
- User's primary mailboxes must be hosted on on-premises Exchange 2010 SP1 or later Mailbox servers.
- You must configure a subset of steps required for a hybrid deployment between your on-premises organization and Office 365. Details are described in Configure Exchange Online Archiving.
- Users must use Outlook 2010, Outlook 2007 SP2, or Outlook Web App to access the cloud-based archive mailbox.
- To use Office 2010 or Office 2007 with Exchange Online Archiving, you must configure your users' computers to support Office 365. For more information, see Manually update and configure desktops for Office 365.

To set up Exchange Online Archiving, you must perform a subset of steps required for a hybrid deployment for Exchange Online. If your on-premises organization has been upgraded to Exchange 2010 SP2, you can use the Hybrid Configuration Wizard to perform this setup. Additionally, you can configure single sign-on, which is based on Active Directory Federation Services (AD FS). This allows your users to access on-premises mailboxes and cloud-based archives with a single username and password..

Note:
Although you can configure Exchange Online Archiving without setting up single sign-on using AD FS, we highly recommend that you configure single sign-on. Doing so helps to avoid additional authentication prompts when users try to access their cloud-based archive.
If you deploy a configuration without AD FS, access to the cloud-based archive using Microsoft Outlook is supported only when the user's UPN in your on-premises and cloud-

based organizations matches and both use the same password. In this case, Microsoft Outlook users will be prompted for credentials when accessing the cloud-based archive for the first time. When entering credentials, users can select the **Save password** option to avoid subsequent authentication prompts.

For complete instructions about how to set up Exchange Online Archiving for you organization, see Configure Exchange Online Archiving

Managing Exchange Online Archiving

Managing cloud-based archives is similar to managing personal (on-premises) archives. You can use the Exchange Management Console (EMC) or the Exchange Management Shell to perform the following tasks:

- Create a cloud-based archive. For details, see Create a Personal (On-Premises) or Cloud-Based Archive for a New Mailbox.
- Enable a cloud-based archive. For details, see Enable a Personal (On-Premises) or Cloud-Based Archive for an Existing Mailbox.
- Disable a cloud-based archive. For details, see Disable a Personal (On-Premises) or Cloud-Based Archive for a Mailbox.

  Warning:

  When you disable a cloud-based archive, it is disconnected from the user account. Disconnected archives are retained in Exchange Online for a period of 30 days. During this period, it's possible to reconnect the archive to the same user account. After this period, the disconnected archive is purged from Exchange Online and can't be recovered.

- Connect a disconnected cloud-based archive to a user mailbox. For details, see Connect a Disconnected Personal (On-Premises) or Cloud-Based Archive.

Moving Data to a Cloud-Based Archive

You can use retention policies to move messages to a user's cloud-based archive. When you enable an archive, the default retention policy called **Default Archive and Retention Policy** is automatically applied to the user. This policy has a default policy tag (DPT) assigned that moves items to the archive mailbox after two years. You can also create your own archive and retention policies and apply them to mailbox users. To learn more about archive policies, see Understanding Personal Archives. To learn more about retention tags and retention policies, see Understanding Retention Tags and Retention Policies.

Users can also move messages to their archive by using the following methods:

1. Apply archive policies to individual messages or folders. Archive policies are implemented by creating personal tags that use the **Move to Archive** action. For details about how to create retention tags, see Create a Retention Tag.
2. Use Inbox rules to either move messages to a folder that has an archive policy assigned or have the rule apply an archive policy to the message itself. To learn more about Inbox rules, see Manage email messages by using rules.
3. Move messages manually in Outlook or Outlook Web App.

For all these operations, the cloud-based archive behavior is similar to a personal archive.

Exporting Data From a Cloud-Based Archive

Users can move messages from their cloud-based archive to their primary mailbox by

using Outlook or Outlook Web App. Users can also move or export messages to a .pst file by using Outlook. For details, see Export Multi-Mailbox Search Results to an Outlook Data File (.pst).

Note:
To protect your organization's messaging data, you can disable users' ability to move messages from their primary mailbox or cloud-based archive to a .pst file or another mailbox. To do this, use Registry entries or the group policy settings included in the Office 2010 Administrative Templates. For details, see Plan for compliance and archiving in Outlook 2010.

You can also export a cloud-based archive to a .pst file by first moving it to an on-premises Mailbox server and then creating a mailbox export request. To learn more about export requests, see Understanding Mailbox Import and Export Requests.

Cloud-Based Archives and Retention

Archive policies, which you create on an on-premises Mailbox server, move messages to the user's personal or cloud-based archive. Once in the archive, messages must continue to be processed and removed based on the user's retention policy.

To accomplish this, you must export retention policies and retention tags from your on-premises organization and import them to your cloud-based organization in Exchange Online. After you complete the import process, the imported policies are applied to cloud-based archive mailboxes, and messages expire based on users' retention policies.

Important:
If you make changes to retention tags or retention policies in your on-premises organization (for example, if you create a new retention tag, modify the retention age property of an existing tag, or remove a tag), you must perform the export and import procedure again to make sure that the retention tags and policies from your on-premises organization are also updated in Exchange Online.

Cloud-Based Archives, Discovery, and Litigation Hold

In Exchange 2010, you can use Multi-Mailbox Search to perform discovery searches in mailboxes across your organization. When performing a discovery search, users' cloud-based archives are also searched. No additional action is required to include a cloud-based archive in the search. Messages returned in a search are copied to the on-premises discovery mailbox specified in the search. To learn more about discovery searches, see Understanding Multi-Mailbox Search.

Similarly, when a mailbox user is placed on litigation hold, the user's cloud-based archive is also placed on hold. Messages aren't purged from the cloud-based archive until the hold is removed. To learn more about litigation hold, see Understanding Litigation Hold.

Cloud-Based Archives and Auditing

The following auditing features in Exchange 2010 also work with Exchange Online Archiving:

Mailbox audit logging In Exchange 2010 SP1 and later, you can enable mailbox audit logging to log access by delegate users or administrators and the mailbox owner. When mailbox audit logging is enabled for a mailbox, the configured settings are also applied to the user's cloud-based archive. The same on-premises tools used to retrieve audit log entries for the on-premises mailbox also return mailbox audit entries for the cloud-based

archive. To learn more, see Understanding Mailbox Audit Logging.

Administrator audit logging In Exchange 2010 SP1 and later, administrator audit logging allows you to audit actions taken administrators when they use the EMC, Exchange Control Panel (ECP), or the Shell to make a change in your organization. If admin audit logging is enabled on your on-premises server, all administrative operations performed against Exchange Online Archiving are also logged. You must search the administrator audit logs in your on-premises Exchange organization separately from the Exchange Online Archiving audit logs. To learn more, see Overview of Administrator Audit Logging.

1.11.9.3 Configure Exchange Online Archiving

Configure Exchange Online Archiving

Exchange Server 2010 > Messaging Policy and Compliance > Archiving >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-02-20*

Microsoft Exchange Online Archiving is a cloud-based, enterprise-class archiving solution for your Exchange Server 2010 on-premises organization. With Exchange Online Archiving, your organization can host your users' primary mailboxes on your on-premises servers and store their historical e-mail data in Exchange Online archive mailboxes. This solution can help your organization with archiving, compliance, regulatory, and e-discovery challenges, while simplifying your on-premises infrastructure.

To learn more about the advantages of Exchange Online Archiving, download *Microsoft Exchange Online Archiving: Service Description*, available on the Microsoft Download Center as part of the Office 365 for Enterprise Service Descriptions.

Requirements for Configuring Exchange Online Archiving

The following are general requirements for configuring Exchange Online Archiving.

- You must purchase an Exchange Online Archiving subscription for the Exchange Online service included with Microsoft Office 365. For more information, see Exchange Online Archiving subscription.
- Your users' primary mailboxes must be hosted on on-premises Exchange 2010 Mailbox servers.
- You will configure a full hybrid deployment using the Hybrid Configuration wizard. For more information, see Configure Exchange Online Archiving with Exchange Server 2010 later in this topic.
- Users must use Outlook 2010, Outlook 2007 SP2, or Outlook Web App to access the cloud-based archive mailbox.

Note:

To use Office 2010 or Office 2007 with Exchange Online Archiving, you must configure your users' computers to support Office 365. For more information, see Manually update and configure desktops for Office 365.

Configure Exchange Online Archiving with

Exchange 2010

A hybrid deployment connects an Office 365 organization to your on-premises Exchange 2010 organization by configuring the hybrid features of one or more on-premises Exchange 2010 servers. These Exchange 2010 services must be updated to Service Pack 3 (SP3) for Exchange 2010 Server (SP3) or greater to enable hybrid functionality with the latest release of Office 365. After you configure a hybrid deployment using the Hybrid Configuration wizard, users in the on-premises organization can connect to Exchange Online archives that are located in the Office 365 organization and have other hybrid deployment features enabled. To learn more about hybrid deployments, see Understanding Hybrid Deployments with Exchange 2010 SP3.

To configure a hybrid deployment to support Exchange Online Archiving in your Exchange 2010 organization, a comprehensive deployment checklist with step-by-step procedures is available on the Microsoft Download Center. To select the appropriate checklist, you must first decide if your organization wants to use single sign-on. Single sign-on is optional for hybrid deployments, but strongly recommended. If you want to configure a full hybrid deployment and select different deployment options, you should see the Exchange Server Deployment Assistant for more information.

With single sign-on, which is based on Active Directory Federation Services (AD FS) 2.0, users can access both their personal (on-premises) archive and Exchange Online archive with a single user name and password. Single sign-on also benefits administrators. For example, you can control account policies through the on-premises Active Directory, which gives you the ability to manage password policies, workstation restrictions, lock-out controls, and more, without having to perform additional tasks in Office 365.

To deploy single sign-on, you must also deploy additional servers to support it. If you don't configure single sign-on, users with an Exchange Online archive will need to use separate user names and passwords for their on-premises and archive mailboxes.

For complete instructions about setting up single-sign on, including how to prepare for it, see Prepare for Single Sign-on.

If you want to configure a limited hybrid deployment to support Exchange Online Archiving in your Exchange 2010 organization, select the deployment checklist that is appropriate based on your decision regarding the use of single sign-on:

- To configure a limited hybrid deployment **with** single sign-on, download the following document: http://go.microsoft.com/fwlink/p/?linkid=248654
- To configure a limited hybrid deployment **without** single sign-on, download the following document: http://go.microsoft.com/fwlink/p/?linkid=248653

If you've already configured a full hybrid deployment in your Exchange 2010 organization and want to enable your deployment to support Exchange Online Archiving, you must purchase an Exchange Online Archiving subscription with Office 365. On-premises support for Exchange Online archiving is automatically configured and enabled by the Hybrid Configuration wizard. For more information about subscriptions, see Exchange Online Archiving subscription.

Managing Exchange Online Archiving

After Exchange Online Archiving is deployed in your organization, there are several management tasks you can perform. Managing Exchange Online archives is very similar to managing personal archives (also called *on-premises archives*).

For a list of management procedures, see Managing Archives. To learn more about personal archives, see Understanding Personal Archives.

1.11.9.4 Archiving Terminology in Exchange 2010

Archiving Terminology in Exchange 2010

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-12-01*

archive mailbox

Generic term for a user's archive mailbox, whether hosted on-premises on an Exchange 2010 Mailbox server or in the cloud on Exchange Online. Archive mailboxes don't receive inbound mail. You can't create an archive mailbox for a user without a primary mailbox.

cloud-based archive

An archive mailbox in Exchange Online. For Exchange Online Archiving, a cloud-based archive is associated with an on-premises primary mailbox. Exchange Online and Office 365 customers can also have a cloud-based archive for a cloud-based primary mailbox.

cloud-based archive mailbox

See *cloud-based archive*

Exchange Online Archiving

Exchange Online Archiving is a cloud-based archiving solution for on-premises organizations running Exchange 2010 Service Pack 1 (SP1) or later. With Exchange Online Archiving, organizations can host their users' primary mailboxes on on-premises servers while storing the historical e-mail data in cloud-based archives. To learn more about Exchange Online Archiving, see Understanding Exchange Online Archiving.

online archive

The default Outlook and Outlook Web App display name for a personal or cloud-based archive mailbox. You can change the display name of an archive mailbox by using the **Set-Mailbox** cmdlet.

on-premises archive

See *personal archive*.

personal archive

Also known as an *on-premises archive*, a personal archive is an additional mailbox (called an *archive mailbox*) that's enabled for a mailbox user to provide an alternate storage location in which to store historical messaging data. To learn more about personal archives, see Understanding Personal Archives.

primary mailbox

An Exchange mailbox that receives inbound mail and can be cached to a user's computer when using Microsoft Outlook in Exchange Cached Mode. The primary mailbox also contains a set of default folders such as **Inbox**, **Deleted Items** and **Sent Items**.

1.11.9.5 Managing Archives

Managing Archives

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-11-08*

Create a Personal (On-Premises) or Cloud-Based Archive for a New Mailbox

Enable a Personal (On-Premises) or Cloud-Based Archive for an Existing Mailbox

Configure Archive Quotas for a Personal (On-Premises) Archive

Disable a Personal (On-Premises) or Cloud-Based Archive for a Mailbox

Connect a Disconnected Personal (On-Premises) or Cloud-Based Archive

Modify Archive Policies

1.11.9.5.1 Create a Personal (On-Premises) or Cloud-Based Archive for a New Mailbox

Create a Personal (On-Premises) or Cloud-Based Archive for a New Mailbox

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP1*

Topic Last Modified: *2012-07-23*

Creating a personal archive (also called an *on-premises archive*) or cloud-based archive for a mailbox helps you regain control of your organization's messaging data by eliminating the need for personal store (.pst) files and allowing you to meet your organization's message retention and eDiscovery requirements. With archiving enabled, users can store messages in an archive mailbox, which is accessible by using Microsoft Outlook 2010 and Outlook Web App.

In Exchange 2010 Service Pack 1 (SP1) and later, the archive and the mailbox can be located on different Mailbox servers in your on-premises Exchange organization. To learn more, see Understanding Personal Archives.

Looking for other management tasks related to archiving? Check out Managing Archives.

Prerequisites

The procedures in this topic show you how to create personal and cloud based archives. However, to create cloud-based archives, you must first configure Exchange Online Archiving. For details, see Configure Exchange Online Archiving.

Use the EMC to create a mailbox and enable a personal or cloud-based archive

You need to be assigned permissions before you can perform this procedure. To see what

permissions you need, see the "Mailbox users" entry in the Mailbox Permissions topic.

1. In the console tree, click **Recipient Configuration**.
2. In the action pane, click **New Mailbox**.
3. On the **Introduction** page, select one of the following options:
   - **User Mailbox** Click this button to create a mailbox that is owned by a user to send and receive e-mail messages.
     The Active Directory account that is associated with user mailboxes must reside in the same forest as the Exchange server. To use an account in a trusted forest, select **Linked Mailbox**.
   - **Linked Mailbox** Click this button to create a user mailbox that is accessed by a user in a separate, trusted forest. You must still create a user account in the forest in which Exchange Server resides. This is required to create the necessary Active Directory object for storing the mailbox information.
     Linked mailboxes might be necessary for organizations that choose to deploy Exchange in a resource forest. The resource forest scenario allows an organization to centralize Exchange in a single forest, while allowing access to the Exchange organization with user accounts in one or more trusted forests.
4. On the **User Type** page, click **New User**.
5. On the **User Information** page, complete the following fields:
   - **Specify the organizational unit rather than using a default one** Select this check box to select an organizational unit (OU) other than the default (which is the recipient scope). If the recipient scope is set to the forest, the default value is set to the **Users** container in the Active Directory domain that contains the computer on which the Exchange Management Console is running. If the recipient scope is set to a specific domain, the **Users** container in that domain is selected by default. If the recipient scope is set to a specific OU, that OU is selected by default. To select a different OU, click **Browse** to open the **Select Organizational Unit** dialog box. This dialog box displays all OUs in the forest that are within the specified scope. Select the desired OU, and then click **OK**. To learn more about recipient scopes, see Understanding Recipient Scope.
   - **First name** Use this box to type the first name of the user. This field is optional.
   - **Initials** Use this box to type the initials of the user. This field is optional.
   - **Last name** Use this box to type the last name of the user. This field is optional.
   - **Name** Use this box to type a name for the user. This is the name that's listed in Active Directory. By default, this box is populated with the names you enter in the **First name**, **Initials**, and **Last name** boxes. If you didn't use those boxes, you must still type a name in this field. The name can't exceed 64 characters.
   - **User logon name (User Principal Name)** Use this box to type the name that the user will use to log on to the mailbox. The user logon name consists of a user name and a suffix. Typically, the suffix is the domain name in which the user account resides.
   - **User logon name (pre-Windows 2000)** Use this box to type the name for the user that is compatible with the legacy versions of Microsoft Windows (prior to the release of Windows 2000 Server). This field is automatically populated based on the **User logon name (User Principal Name)** field. This field is required.
   - **Password** Use this box to type the password that the user must use to log on to his or her mailbox.

     Note:
     Make sure that the password you supply complies with the password length, complexity, and history requirements of the domain in which you are creating the user account.
   - **Confirm password** Use this box to confirm the password that you typed

in the **Password** box.

- **User must change password at next logon** Select this check box if you want the user to reset the password when they first logon to the mailbox.

  If you select this check box, at first logon, the new user will be prompted with a dialog box in which to change the password. The user won't be allowed to perform any tasks until the password is successfully changed.

6. On the **Mailbox Settings** page, complete the following fields:
   - **Alias** Use this box to type an alias for the mailbox. The alias can't exceed 64 characters and must be unique in the forest.
   - **Specify the mailbox database rather than using a database automatically selected** Select this check box to specify an Exchange 2010 mailbox database instead of allowing Exchange to select a database for you. Click **Browse** to open the **Select Mailbox Database** dialog box. This dialog box lists all the Exchange 2010 mailbox databases in your Exchange organization. By default, the mailbox databases are sorted by name. You can also click the title of the corresponding column to sort the databases by database name or server name. Select the mailbox database you want to use, and then click **OK**. This is an optional field.
   - **Managed folder mailbox policy** Leave this check box cleared. Managed folders aren't compatible with archives because archives use retention policies. To learn more, see Understanding Retention Tags and Retention Policies.
   - **Exchange ActiveSync mailbox policy** Select this check box to specify an Exchange ActiveSync mailbox policy for the mailbox. Exchange ActiveSync enables access to an Exchange mailbox from a mobile device. To learn more, see Understanding Exchange ActiveSync Mailbox Policies.

     Click **Browse** to open the **Select ActiveSync Mailbox Policy** dialog box. Use this dialog box to select the policy that you want associated with this mailbox. This is an optional field.
7. On the **Archive Settings** page, select one of the following options:
   - **Create a local archive** Click this button to create a personal archive on an on-premises Exchange 2010 Mailbox server.

     If you want to specify a mailbox database on which to host the archive, select the associated check box and then click **Browse**.
   - **Create a remote hosted archive** Click this button to create a cloud-based archive in Exchange Online. Click **Browse** and then select the target delivery domain for your cloud-based organization. The target delivery domain is a remote domain that's created when you configure a hybrid deployment for Exchange Online Archiving. To learn more, see Configure Exchange Online Archiving.

     Note:

     When you enable a cloud-based archive for an on-premises mailbox, the user's archive status is displayed as **Cloud-based Archive Pending**. It may take up to two hours for the cloud-based archive to be created and the status updated in your on-premises organization. During this time, the user will still be able to access their primary mailbox.
8. On the **New Mailbox** page, review your configuration settings. To make any configuration changes, click **Back**. To create the new mailbox, click **New**.
9. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Note:

If you selected the **Managed folder mailbox policy** check box on the **Mailbox Settings** page, you'll receive an error because archive mailboxes and managed folders are incompatible. Archive mailboxes use retention policies. To learn more, see Understanding Retention Tags and Retention Policies.

Use the Shell to create a mailbox and enable a personal archive

This example creates the user Chris Ashton in Active Directory, creates the mailbox on mailbox database DB01, and enables a personal archive. The password must be reset at the next logon. To set the initial value of the password, this example creates a variable (`$password`), prompts you to enter a password, and assigns that password to the variable as a **SecureString** object.

```
$password = Read-Host "Enter password" -AsSecureString
New-Mailbox -UserPrincipalName chris@contoso.com -Alias chris -Archive -Database
```

For detailed syntax and parameter information, see New-Mailbox.

Use the Shell to create a mailbox and enable a cloud-based archive

In this example, `service.contoso.com` is the target delivery domain. The domain must exist as a remote domain in your on-premises organization that's created when you configure a hybrid deployment for Exchange Online Archiving. Run this command to retrieve the target delivery domain:

```
Get-RemoteDomain | Where {$_.TargetDeliveryDomain -eq $true}
```

This example creates the user Chris Ashton in Active Directory, creates the mailbox on mailbox database DB01, and enables a cloud-based archive. The password must be reset at the next logon. To set the initial value of the password, this example creates a variable (`$password`), prompts you to enter a password, and assigns that password to the variable as a **SecureString** object. The *ArchiveDomain* parameter specifies the target delivery domain you retrieved in the previous command.

```
$password = Read-Host "Enter password" -AsSecureString
New-Mailbox -UserPrincipalName chris@contoso.com -Alias chris -Database "DB01" -N
```

Other Tasks

After you create the mailbox and a personal archive, you may also want to configure archive quotas to limit the size of the personal archive. For details, see Configure Archive Quotas for a Personal (On-Premises) Archive.

1.11.9.5.2 Enable a Personal (On-Premises) or Cloud-Based Archive for an Existing Mailbox

Enable a Personal (On-Premises) or Cloud-Based Archive for an Existing Mailbox

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP1*

Topic Last Modified: *2012-07-23*

Enabling a personal archive (also called an *on-premises archive*) or cloud-based archive for an existing mailbox helps you regain control of your organization's messaging data by eliminating the need for personal store (.pst) files and allowing you to meet your organization's message retention and eDiscovery requirements. With archiving enabled, users can store messages in an archive mailbox, which is accessible by using Microsoft Outlook 2010 and Outlook Web App.

In Exchange 2010 Service Pack 1 (SP1) and later, the archive and the mailbox can be located on different Mailbox servers in your on-premises Exchange organization. To learn more, see Understanding Personal Archives.

Looking for other management tasks related to archiving? Check out Managing Archives.

Prerequisites

- The procedures in this topic show you how to enable personal and cloud based archives. However, to enable cloud-based archives, you must first configure Exchange Online Archiving. For details, see Configure Exchange Online Archiving.
- We recommend that mailbox users move all current archive data stored in their .pst files into their Inbox so they don't lose any messages. Alternatively, administrators can move the mailbox data by using the **Import-Mailbox** cmdlet. For more information, see Understanding Mailbox Import and Export Requests.

Use the EMC to enable a personal or cloud-based archive for an existing mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Mailbox Permissions topic.

Note:

Properties specific to a user mailbox are controlled by the **Set-Mailbox** cmdlet. In the EMC, you can set additional properties, and the permissions may vary depending upon the feature that you're configuring. With the permissions listed for this procedure, you can edit all of the settings available in the **<User Mailbox> Properties** dialog box.

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the mailbox for which you want to enable a personal or cloud-based archive.
3. In the action pane, click **Enable Archive**.
4. In **Enable Archive Mailbox**, select one of the following options:
   - **Create a local archive** Click this button to enable a personal archive on an on-premises Exchange 2010 Mailbox server.
     If you want to specify a mailbox database on which to host the archive, select the associated check box, and then click **Browse**.
   - **Create a remote hosted archive** Click this button to enable a cloud-based archive in Exchange Online. Click **Browse** and then select the target delivery domain for your cloud-based organization. The target delivery domain is a remote domain that's created when you configure a hybrid deployment for Exchange Online Archiving. To learn more, see Configure Exchange Online Archiving.

Note:
When you enable a cloud-based archive for an on-premises mailbox, the user's archive status is displayed as **Cloud-based Archive Pending**. It may take up to two hours for the cloud-based archive to be created and the status updated in your on-premises organization. During this time, the user will still be able to access their primary mailbox.

Use the Shell to enable a personal archive for an existing mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Mailbox Permissions topic.

This example enables the personal archive for Tony Smith's mailbox.

```
Enable-Mailbox "Tony Smith" -Archive
```

This example enables the personal archive for all mailboxes on mailbox database DB01.

```
Get-Mailbox -Database DB01 | Enable-Mailbox -Archive
```

For detailed syntax and parameter information, see Enable-Mailbox and Get-Mailbox.

Use the Shell to enable a cloud-based archive for an existing mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Mailbox Permissions topic.

Before you can enable a cloud-based archive, you need to obtain the target delivery domain. The domain must exist as a remote domain that's created in your on-premises organization when you configure a hybrid deployment for Exchange Online Archiving. Run this command to retrieve the target delivery domain.

```
Get-RemoteDomain | Where {$_.TargetDeliveryDomain -eq $true}
```

This example enables a cloud-based archive for the existing user Ayla Kol. The *ArchiveDomain* parameter specifies the target delivery domain that was retrieved in the previous command. In this example, service.contoso.com is the target delivery domain.

```
Enable-Mailbox ayla@contoso.com -RemoteArchive -ArchiveDomain "service.contoso.co
```

For detailed syntax and parameter information, see Enable-Mailbox.

Other Tasks

After you enable the personal archive, you may want to configure archive storage quotas. For details, see Configure Archive Quotas for a Personal (On-Premises) Archive.

1.11.9.5.3 Configure Archive Quotas for a Personal (On-Premises) Archive

Configure Archive Quotas for a Personal (On-Premises) Archive

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP1*

Topic Last Modified: *2012-07-23*

Because personal (on-premises) archives are created with unlimited storage quotas by default, you'll need to use the mailbox's property page to configure storage quotas for the personal archive. The following is a list of the quotas that you can configure with a description of each.

- **Archive warning quota** When a personal archive exceeds the specified archive warning quota, an event is logged for the Exchange administrator and a warning message is sent to the mailbox user.
- **Archive quota** When a personal archive exceeds the specified archive quota, messages are no longer moved to the archive and a warning message is sent to the mailbox user.

In the EMC, you can configure only the archive warning quota. In the Shell, you can configure the archive quota and the archive warning quota.

Looking for additional management tasks related to personal archive? Check out Managing Archives.

Use the EMC to configure the archive warning quota for a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Mailbox Permissions topic.

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the user mailbox you want to configure.
3. In the action pane, click **Properties**.
4. In **<Mailbox Name> Properties**, click the **Mailbox Settings** tab.
5. Select **Archive Quota**, and then click **Properties**.
6. Select the **Issue warning at (MB)** check box, and then use the corresponding box to type the personal archive size in megabytes (MB), at which a warning will be sent to the user.
7. Click **OK**.

Use the Shell to configure the archive quota and archive warning quota for a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Mailbox Permissions topic.

Note:

You can't use the EMC to configure the archive quota for a mailbox.

This example sets the Chris Ashton mailbox archive quota to 1 gigabyte (GB), at which time the user will receive a warning message that the personal archive is full and will no

longer be able to move items to the personal archive. This example also sets the archive warning quota to 950 MB, at which time the user will receive a warning message that the personal archive is almost full.

```
Set-Mailbox -Identity "Chris Ashton" -ArchiveQuota 1GB -ArchiveWarningQuota 950MB
```

For detailed syntax and parameter reference, see Set-Mailbox.

1.11.9.5.4 Disable a Personal (On-Premises) or Cloud-Based Archive for a Mailbox

Disable a Personal (On-Premises) or Cloud-Based Archive for a Mailbox

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP1*

Topic Last Modified: *2012-07-23*

You may want to disable a user's personal (on-premises) or cloud-based archive for troubleshooting purposes or if you're moving the mailbox to a version of Exchange that doesn't support personal archives.

If you disable a personal archive, all information in the archive will be kept in the mailbox database until the mailbox retention time passes and the personal archive is permanently deleted. (By default, Exchange keeps disconnected mailboxes, including archive mailboxes, for thirty days. To modify the mailbox retention period, see Configure Deleted Mailbox and Disabled Personal Archive Retention.)

If you want to reconnect the personal archive to that mailbox, you can use the **Connect-Mailbox** cmdlet with the *Archive* parameter. If you want to reconnect a cloud-based archive to a mailbox, you can use the **Enable-Mailbox** cmdlet with the *RemoteArchive* parameter. For more information, see Connect a Disconnected Personal (On-Premises) or Cloud-Based Archive.

Important:

The retention period for disconnected cloud-based archives is covered by the service level agreement (SLA) for Exchange Online Archiving. During this period, you can reconnect the cloud-based archive to the on-premises mailbox from which it was disconnected. After this period, the disconnected cloud-based archive is permanently deleted.

Looking for other management tasks related to personal archives? Check out Managing Archives.

Use the EMC to disable a personal archive

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Personal archives" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the mailbox for which you want to disable the personal archive.

   Note:

   You can create a filter to find all of the personal archives in your organization. In the result pane, click **Add Filter**. In the filter's list boxes, specify the following values: **Has Archive** > **Equals** > **Yes**. Click **Apply Filter**.
3. In the action pane, click **Disable Archive**.

4. A warning box appears confirming that you want to disable the archive. Click **Yes**.

Use the Shell to disable a personal archive

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Personal archives" entry in the Mailbox Permissions topic.

Disabling the personal archive will remove the archive from the mailbox and mark it in the mailbox database for deletion. This example disables the archive for Chris Ashton's mailbox. It doesn't disable the mailbox.

```
Disable-Mailbox -Identity "Chris Ashton" -Archive
```

A warning appears confirming that you want to disable the archive. Type **Y** to continue.

For detailed syntax and parameter information, see Disable-Mailbox.

Use the Shell to disable a cloud-based archive

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Personal archives" entry in the Mailbox Permissions topic.

Note:
You can’t use the EMC to disable a cloud-based archive.

Disabling the cloud-based archive removes the archive from the mailbox and marks it in Exchange Online for deletion. This example disables the cloud-based archive for Chris Ashton's mailbox. It doesn't disable the primary mailbox.

```
Disable-Mailbox -Identity "Chris Ashton" -RemoteArchive
```

A warning appears confirming that you want to disable the cloud-based archive. Type **Y** to continue.

For detailed syntax and parameter information, see Disable-Mailbox.

Other Tasks

After you disable the on-premises or cloud-based archive, you may want to reconnect the disconnected archive. For details, see Connect a Disconnected Personal (On-Premises) or Cloud-Based Archive.

1.11.9.5.5 Connect a Disconnected Personal (On-Premises) or Cloud-Based Archive

Connect a Disconnected Personal (On-Premises) or Cloud-Based Archive

Messaging Policy and Compliance > Archiving > Managing Archives >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP1*

Topic Last Modified: *2012-07-23*

When you disable a personal (on-premises) or cloud-based archive, it becomes disconnected. A disconnected personal archive is retained in the mailbox database for a specified amount of time. By default, Exchange retains disconnected personal archives for 30 days. During this time, you can recover the personal archive by associating it with an existing mailbox. You can modify the deleted mailbox retention period to retain a deleted mailbox or personal archive for a longer or shorter period. For more information, see Configure Deleted Mailbox and Disabled Personal Archive Retention.

Note:
If you disable a personal archive for a user mailbox and then enable a personal archive for that same mailbox, the mailbox will get a new personal archive.

The retention period for disconnected cloud-based archives is covered by the service level agreement (SLA) for Exchange Online Archiving. During this period, you can reconnect the cloud-based archive to the on-premises mailbox from which it was disconnected. After this period, the disconnected cloud-based archive is permanently deleted.

Looking for other management tasks related to personal archives? Check out Managing Archives.

Use the EMC to connect a disconnected personal archive

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Personal archives" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Recipient Configuration** > **Disconnected Mailbox**.

   Note:
   If the personal archive that you want to connect to a mailbox isn't displayed in the result pane, restart the Microsoft Exchange Information Store service, and then run the **Clean-MailboxDatabase** cmdlet against the mailbox database that contains the personal archive.

2. In the result pane, select the personal archive that you want to connect to a primary mailbox.
3. In the action pane, click **Connect to Primary Mailbox**.
4. A warning appears confirming that you want to connect the personal archive to a specific user. This is the user to whom the archive belongs. Click **Yes**.

Use the Shell to connect a disconnected personal archive

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Personal archives" entry in the Mailbox Permissions topic.

1. If you don't know the name of the personal archive, you can view it in the Shell by running the following command. This example finds all disconnected personal archives on mailbox database DB01 and displays additional information about the personal archives such as the GUID and item count.

   ```
   Get-MailboxDatabase "DB01" | Get-MailboxStatistics | Where {($_.Discon
   ```

2. Connect the personal archive to the primary mailbox. This example connects Chris Ashton's archive to Chris Ashton's primary mailbox and uses the GUID as the personal archive's identity.

   ```
   Connect-Mailbox -Identity "8734c04e-981e-4ccf-a547-1c1ac7ebf3e2" -Arch
   ```

3. A warning appears stating that you'll have to wait for Active Directory replication to complete before the user can access the personal archive.

For detailed syntax and parameter information, see the following topics:

- Get-MailboxDatabase
- Get-MailboxStatistics
- Connect-Mailbox

Connect a disabled cloud-based archive

You can connect a disabled cloud-based archive to the user account from which it was disconnected by enabling a cloud-based archive for the mailbox. If a disconnected cloud-based archive exists for the mailbox, it will be connected. For details, see Enable a Personal (On-Premises) or Cloud-Based Archive for an Existing Mailbox.

Important:

When you attempt to connect a disconnected cloud-based archive to a mailbox, if the cloud-based archive has been permanently deleted, a new cloud-based archive is created.

1.11.9.5.6 Modify Archive Policies

Modify Archive Policies

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

In Exchange 2010 SP1 and later, you can use archive policies to automatically move mailbox items to personal (on-premises) or cloud-based archives. Archive policies are retention tags that use the **Move to Archive** retention action.

Exchange Setup creates a retention policy called **Default Archive and Retention Policy**. This policy has a default policy tag (DPT) assigned that moves items to the archive mailbox after two years. The policy also includes a number of personal tags that users can apply to folders or mailbox items to automatically move or delete messages. If a mailbox doesn't have a retention policy assigned when it's archive-enabled, the **Default Archive and Retention Policy** is automatically applied to it by Exchange. You can also create your own archive and retention policies and apply them to mailbox users. To learn more, see Understanding Retention Tags and Retention Policies.

You can modify retention tags included in the default policy to meet your business requirements. For example, you can modify the archive DPT to move items to the archive after three years instead of two. You can also create additional personal tags and either add them to a retention policy, including the **Default Archive and Retention Policy**, or allow users to add personal tags to their mailboxes from the Exchange Control Panel (ECP).

Looking for other management tasks related to archives? Check out Managing Archives.

Use the EMC to modify the default archive policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, on the **Retention Policy Tags** tab, select the **Default 2 year move to archive** retention tag.
3. In the action pane, click **Properties**.

4. Use the **General** tab to view or modify the following settings:
   - **Name** Use this unlabeled box at the top of the page to view or change the tag name.
   - **Modified** This read-only field displays the last date and time that the retention tag was modified.
   - **Tag Type** This read-only field displays the tag type.
   - **Age limit for retention (days)** Click this button to specify that items be moved to archive after a certain period. By default, this setting is configured to move items to the archive after two years (730 days). To modify this setting, in the corresponding text box, type the number of days in the retention period. The range of values is from 1 through 24,855 days.
   - **Action to take when the age limit is reached** Don't modify this field for archive policies.
   - **Disable this tag** Click this button to disable the tag. If a DPT or a RPT is disabled, the tag is no longer applied to the mailbox. If a personal tag is disabled, the retention period is displayed to the user as **Never**. If the user applies the tag to an item, the item is never moved to the user's archive mailbox.

     Important:
     Items that have a disabled retention tag applied aren't processed by the Mailbox Assistant. If you want to prevent a tag from being applied to items, we recommend disabling the tag rather than deleting it. When you delete a tag, the tag configuration is deleted from Active Directory, and the Mailbox Assistant processes all messages to remove the deleted tag.

     Note:
     If a user applies a tag to an item believing the item will never be moved, enabling the tag later may move items the user wanted to retain in the primary mailbox.
   - **Comments** Use this box to type a comment that will be displayed to Outlook and Outlook Web App users. For example, to alert users that MRM is enabled on the folder, you could type the message: "Messages are removed from this folder after 120 days." The maximum length of this comment is 255 characters. To configure localized comments, use the Set-RetentionPolicyTag cmdlet.

Use the Shell to modify archive policies

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Messaging records management" entry in the Messaging Policy and Compliance Permissions topic.

This example modifies the `Default 2 year move to archive` tag to move items after 1,095 days (3 years).

```
Set-RetentionPolicyTag "Default 2 year move to archive" -Name "Default 3 year mov
```

This example disables the `Default 2 year move to archive` tag.

```
Set-RetentionPolicyTag "Default 2 year move to archive" -RetentionEnabled $false
```

This example retrieves all archive DPTs and personal tags and disables them.

```
Get-RetentionPolicyTag | ? {$_.RetentionAction -eq "MoveToArchive"} | Set-Retenti
```

For detailed syntax and parameter information, see Set-RetentionPolicyTag and Get-RetentionPolicyTag.

1.11.10 Mailbox Audit Logging

Mailbox Audit Logging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-07-22*

Understanding Mailbox Audit Logging

Learn about the new Mailbox Audit Logging feature that allows you to track mailbox owner, delegate, and administrator logons to a mailbox, as well as what actions are taken while the user is logged on.

Managing Mailbox Audit Logging

Learn how to manage Mailbox Audit Logging.

1.11.10.1 Understanding Mailbox Audit Logging

Understanding Mailbox Audit Logging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-08-30*

Because mailboxes can potentially contain sensitive, high business impact (HBI) information and personally identifiable information (PII), it's important that you track who logs on to the mailboxes in your organization and what actions are taken. It's especially important to track access to mailboxes by users other than the mailbox owner. These users are referred to as *delegate users*.

By using *mailbox audit logging*, you can log mailbox access by mailbox owners, administrators, and delegates (including administrators who have full mailbox access permissions). Mailboxes are considered to be accessed by an administrator only in the following scenarios:

- Discovery search is used to search a mailbox
- The New-MailboxExportRequest cmdlet is used to export a mailbox
- Microsoft Exchange Server MAPI Editor is used to access the mailbox

When you enable audit logging for a mailbox, you can specify which user actions (for example, accessing, moving, or deleting a message) should be logged for a logon type (administrator, delegate user, or owner). The audit log entries also include important information, such as the client IP address, host name, and the process or client that is used to access the mailbox. For items that are moved, the entry includes the name of the destination folder.

Note:

For mailboxes such as the Discovery Search Mailbox, which may contain more sensitive information, consider enabling mailbox audit logging for mailbox owner actions such as message deletion.

Contents

Mailbox Audit Logs

Mailbox audit logs are generated for each mailbox that has mailbox audit logging enabled. Log entries are stored in the Audits subfolder of the audited mailbox Recoverable Items folder. This ensures that all audit logs are available from a single location, regardless of which client access method was used to access the mailbox or which server or workstation an administrator used to access the mailbox audit log. If you move a mailbox to another Mailbox server, the mailbox audit logs for that mailbox are also moved because they're located in the mailbox.

By default, mailbox audit log entries are retained in the mailbox for 90 days. You can modify this retention period by using the *AuditLogAgeLimit* parameter together with the **Set-Mailbox** cmdlet. If a mailbox is on litigation hold, audit logs are retained until the hold is removed.

Return to top

Enabling Mailbox Audit Logging

Mailbox audit logging is enabled per mailbox. Use the **Set-Mailbox** cmdlet to enable or disable mailbox audit logging. For details, see Enable or Disable Mailbox Audit Logging for a Mailbox.

When you enable mailbox audit logging for a mailbox, access to the mailbox and certain administrator and delegate actions are logged by default. To log actions taken by the mailbox owner, you must specify which owner actions should be audited. The following table lists the actions logged by mailbox audit logging, including the logon types for which the action is logged.

Mailbox actions logged by mailbox audit logging

Action	Description	Administrator	Delegate	Owner
Copy	An item is copied to another folder.	Yes	Not applicable	Not applicable
Create	An item is created in the mailbox. (For example, a message is sent or received.) **Note:** Folder creation isn't audited.	Yes*	Yes*	Yes

FolderBind	A mailbox folder is accessed.***	Yes*	Yes**	Yes
HardDelete	An item is deleted permanently from the Recoverable Items folder.	Yes*	Yes*	Yes
MessageBind	An item is accessed in the reading pane or opened.***	Yes	Not applicable	Not applicable
Move	An item is moved to another folder.	Yes*	Yes	Yes
MoveToDeletedItems	An item is moved to the Deleted Items folder.	Yes*	Yes	Yes
SendAs	A message is sent using Send As permissions.	Yes*	Yes*	Not applicable
SendOnBehalf	A message is sent using Send on Behalf permissions.	Yes*	Yes	Not applicable
SoftDelete	An item is deleted from the Deleted Items folder.	Yes*	Yes*	Yes
Update	An item's properties are updated.	Yes*	Yes*	Yes

* Audited by default if auditing is enabled for a mailbox.

** Entries for folder bind actions that are performed by delegates are consolidated. One log entry is generated for individual folder access within a time span of three hours.

*** FolderBind and MessageBind are not logged for the default calendar.

Mailbox access by authorized automated processes, such as accounts used by third-party tools or accounts used for lawful monitoring, can create a large number of mailbox audit log entries. This may not be of interest to your organization. You can configure such accounts to bypass mailbox audit logging. For details, see Bypass a User Account From Mailbox Audit Logging.

If you no longer require certain types of mailbox actions to be audited, you should modify the mailbox's audit logging configuration to disable those actions. Existing log entries aren't purged until the configured audit log age for the mailbox is reached.

Return to top

Searching Mailbox Audit Log Entries

You can use the following methods to search mailbox audit log entries:

- **Synchronously search a single mailbox** You can use the **Search-MailboxAuditLog** cmdlet to synchronously search mailbox audit log entries for a single mailbox. The cmdlet displays search results in the Exchange Management Shell window. For more information, see Search-MailboxAuditLog and Search the Mailbox Audit Log for a Mailbox.
- **Asynchronously search one or more mailboxes** You can create a mailbox audit log search to asynchronously search mailbox audit logs for one or more mailboxes, and then have the search results sent to a specified e-mail address. The search results are sent as an XML attachment. To create the search, use the New-MailboxAuditLogSearch cmdlet. For details, see Create a Mailbox Audit Log Search.
- **Use auditing reports in Exchange Control Panel** You can use the **Auditing** tab in Exchange Control Panel (ECP) to run auditing reports or export entries from the mailbox audit log and the administrator audit log. For details, see Auditing Tab.

Mailbox Audit Log Entries

The following table describes the fields logged in a mailbox audit logging entry.

Mailbox audit log fields

Field	Populated with
Operation	One of the following actions: • Copy • Create • FolderBind • HardDelete • MessageBind • Move • MoveToDeletedItems • SendAs • SendOnBehalf • SoftDelete • Update
OperationResult	One of the following results: • Failed • PartiallySucceeded • Succeeded
LogonType	Logon type of the user who performed the operation. Logon types include: • Owner • Delegate • Admin
DestFolderId	Destination folder GUID for move operations.
DestFolderPathName	Destination folder path for move operations.
FolderId	Folder GUID.
FolderPathName	Folder path.
ClientInfoString	Details that identify which client or Exchange component performed the operation.
ClientIPAddress	Client computer IP address.
ClientMachineName	Client computer name.

ClientProcessName	Name of the client application process.
ClientVersion	Client application version.
InternalLogonType	Logon type of the user who performed the operation. Logon types include: • Owner • Delegate • Admin
MailboxOwnerUPN	Mailbox owner user principal name (UPN).
MailboxOwnerSid	Mailbox owner security identifier (SID).
DestMailboxOwnerUPN	Destination mailbox owner UPN, logged for cross-mailbox operations.
DestMailboxOwnerSid	Destination mailbox owner SID, logged for cross-mailbox operations.
DestMailboxOwnerGuid	Destination mailbox owner GUID.
CrossMailboxOperation	Information about whether the operation logged is a cross-mailbox operation (for example, copying or moving messages among mailboxes).
LogonUserDisplayName	Display name of user who is logged on.
DelegateUserDisplayName	Delegate user display name.
LogonUserSid	SID of user who is logged on.
SourceItems	ItemID of mailbox items on which the logged action is performed (for example, move or delete). For operations performed on a number of items, this field is returned as a collection of items.
SourceFolders	Source folder GUID.
ItemId	Item ID.
ItemSubject	Item subject.
MailboxGuid	Mailbox GUID.
MailboxResolvedOwnerName	Mailbox user resolved name in the format *DOMAIN\SamAccountName*.
LastAccessed	Time when the operation was performed.
Identity	Audit log entry ID.

1.11.10.2 Managing Mailbox Audit Logging

Managing Mailbox Audit Logging

Exchange Server 2010 > Messaging Policy and Compliance > Mailbox Audit Logging >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-07-16*

Enable or Disable Mailbox Audit Logging for a Mailbox

Bypass a User Account From Mailbox Audit Logging

Search the Mailbox Audit Log for a Mailbox

Create a Mailbox Audit Log Search

1.11.10.2.1 Enable or Disable Mailbox Audit Logging for a Mailbox

Enable or Disable Mailbox Audit Logging for a Mailbox

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-10-03*

By using mailbox audit logging, you can track logons to a mailbox, and also track what actions are taken while the user is logged on. When you enable mailbox audit logging for a mailbox, some actions performed by administrators and delegates are logged by default. None of the actions performed by the mailbox owner are logged. To learn more about mailbox audit logging, see Understanding Mailbox Audit Logging.

Caution:
Auditing of mailbox owner actions can generate a large number of mailbox audit log entries. Therefore, this feature is disabled by default. We recommend that you enable auditing only of specific owner actions that are needed to meet business or security requirements.

Note:
You can't use the Exchange Management Console (EMC) or the Exchange Control Panel (ECP) to enable or disable mailbox audit logging.

Looking for other management tasks related to mailbox audit logging? Check out Managing Mailbox Audit Logging.

Use the Shell to enable or disable mailbox audit logging

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging Policy and Compliance Permissions topic.

This example enables mailbox audit logging for Ben Smith's mailbox.

```
Set-Mailbox -Identity "Ben Smith" -AuditEnabled $true
```

This example disables mailbox audit logging for Ben Smith's mailbox.

```
Set-Mailbox -Identity "Ben Smith" -AuditEnabled $false
```

For detailed syntax and parameter information, see Set-Mailbox.

Use the Shell to specify logging settings for administrator, delegate, and owner access

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging Policy and Compliance Permissions topic.

This example specifies that the `SendAs` or `SendOnBehalf` actions performed by delegate users will be logged for Ben Smith's mailbox.

```
Set-Mailbox -Identity "Ben Smith" -AuditDelegate SendAs,SendOnBehalf -AuditEnable
```

This example specifies that the `MessageBind` and `FolderBind` actions performed by administrators will be logged for Ben Smith's mailbox.

Note:
MessageBind and FolderBind actions are not logged for the default Calendar.

```
Set-Mailbox -Identity "Ben Smith" -AuditAdmin MessageBind,FolderBind -AuditEnable
```

This example specifies that the `HardDelete` action performed by the mailbox owner will be logged for Ben Smith's mailbox.

```
Set-Mailbox -Identity "Ben Smith" -AuditOwner HardDelete -AuditEnabled $true
```

For detailed syntax and parameter information, see Set-Mailbox.

Other Tasks

After you enable mailbox audit logging, you may also want to:

- Search the Mailbox Audit Log for a Mailbox
- Create a Mailbox Audit Log Search

1.11.10.2.2 Bypass a User Account From Mailbox Audit Logging

Bypass a User Account From Mailbox Audit Logging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

When you enable mailbox audit logging for a mailbox, specified mailbox access events (for example, accessing a folder or a message, or permanently deleting a message) are logged. However, access by some authorized accounts, such as accounts used by third-party tools or accounts used for lawful monitoring, can create a large number of mailbox audit log entries and may not be of interest to your organization.

You can configure a user or computer account to bypass mailbox audit logging, so actions taken by that user or account for any mailbox aren't logged. By bypassing trusted user or

computer accounts that need frequent access to mailboxes, you can reduce the noise in mailbox audit logs.

Note:
When an account is configured to bypass mailbox audit logging, access to any mailbox by that account won't be logged. You can't configure an account to bypass the logging of access to a specific mailbox.

Caution:
If you use mailbox audit logging to audit mailbox access and actions, you must monitor mailbox audit bypass associations at regular intervals. If a mailbox audit bypass association is added for an account, the account can access any mailbox in the organization to which it has been assigned permissions, without any mailbox audit logging entries being generated for such access or any actions taken (such as message deletions).

Looking for other management tasks related to mailbox audit logging? Check out Managing Mailbox Audit Logging.

Use the Shell to enable mailbox audit logging bypass for an account

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to enable mailbox audit logging bypass for an account.

This example enables mailbox audit logging bypass for the ServiceAccess account.

```
Set-MailboxAuditBypassAssociation -Identity "ServiceAccess" -AuditBypassEnabled $
```

For detailed syntax and parameter information, see Set-MailboxAuditBypassAssociation.

Use the Shell to disable mailbox audit logging bypass for an account

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to disable mailbox audit logging bypass for an account.

This example disables mailbox audit logging bypass for the ServiceAccess account.

```
Set-MailboxAuditBypassAssociation -Identity "ServiceAccess" -AuditBypassEnabled $
```

For detailed syntax and parameter information, see Set-MailboxAuditBypassAssociation.

Other Tasks

After you enable or disable mailbox audit logging bypass for a user or computer account, you may also want to:

- Enable or Disable Mailbox Audit Logging for a Mailbox
- Search the Mailbox Audit Log for a Mailbox
- Create a Mailbox Audit Log Search

1.11.10.2.3 Search the Mailbox Audit Log for a Mailbox

Search the Mailbox Audit Log for a Mailbox

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can synchronously search mailbox audit log entries for a mailbox and have the search results displayed in the Shell.

Note:
By default, mailbox audit logging is disabled for all mailboxes. For each mailbox you want to audit, you must enable audit logging and specify the mailbox owner, delegate, or administrator actions you want to audit. For more details, see Enable or Disable Mailbox Audit Logging for a Mailbox.

If you want to search mailbox audit logs for multiple mailboxes and have the results sent by e-mail to a specified address, you must create a mailbox audit log search instead. For more information, see Create a Mailbox Audit Log Search.

Looking for other management tasks related to mailbox audit logging? Check out Managing Mailbox Audit Logging.

Use the Shell to search the mailbox audit log for a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging Policy and Compliance Permissions topic.

Note:
You can't use the EMC to search the mailbox audit log for a mailbox.

This example retrieves mailbox audit log entries for Ken Kwok's mailbox for actions performed by administrators and user delegates between 1/1/2010 and 12/31/2010. A maximum of 2,000 log entries are returned.

```
Search-MailboxAuditLog -Identity kwok -LogonTypes Admin,Delegate -StartDate 1/1/2
```

For detailed syntax and parameter information, see Search-MailboxAuditLog.

Other Tasks

After you search the mailbox audit log for a mailbox, you may also want to enable or disable mailbox audit logging. For detailed steps, see Enable or Disable Mailbox Audit Logging for a Mailbox.

1.11.10.2.4 Create a Mailbox Audit Log Search

Create a Mailbox Audit Log Search

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can create a mailbox audit log search to asynchronously search one or more mailboxes and have the search results sent by e-mail as an XML file to specified addresses.

Note:

By default, mailbox audit logging is disabled for all mailboxes. For each mailbox you want to audit, you must enable audit logging and specify the mailbox owner, delegate, or administrator actions you want to audit. For more details, see Enable or Disable Mailbox Audit Logging for a Mailbox.

To search mailbox audit logs for a single mailbox and have the results displayed in the Shell, see Search the Mailbox Audit Log for a Mailbox.

Looking for other management tasks related to mailbox audit logging? Check out Managing Mailbox Audit Logging.

Use the Shell to create a mailbox audit log search

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging Policy and Compliance Permissions topic.

Note:

You can't use the Exchange Management Console (EMC) to create a mailbox audit log search.

This example creates the mailbox audit log search Admin and Delegate Access to search Ken Kwok's and April Stewart's mailboxes for administrator and delegate logons from 1/1/2010 to 12/31/2010. The search results are sent by e-mail to auditors@contoso.com.

```
New-MailboxAuditLogSearch "Admin and Delegate Access" -Mailboxes "Ken Kwok","Apri
```

For detailed syntax and parameter information, see New-MailboxAuditLogSearch.

Other Tasks

After you create a mailbox audit log search, you may also want to enable or disable mailbox audit logging. For detailed steps, see Enable or Disable Mailbox Audit Logging for a Mailbox.

1.12 Security

Security

Exchange Server 2010 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-02-14*

By default, Exchange Server 2010 is designed to help your organization be more secure. The server role-based Exchange Setup installs only the code required for a selected server role, thereby minimizing attack surface. Setup enables only the services required for a given server role and creates the necessary firewall exceptions (rules) in Windows Firewall with Advanced Security to allow communication with those services.

The following topics are gateways to information about security in Exchange 2010.

Exchange 2010 Security Guide

The Exchange 2010 Security Guide provides a comprehensive overview of the security features included in Exchange 2010.

Certificates

View a list of links to topics that provide information about managing digital certificates in Exchange 2010.

Securing Client Access Servers

View a list of links to topics that provide information about managing the security of your Client Access servers.

Securing Transport Servers

View a list of links to topics that provide information about managing the security of your transport infrastructure.

Securing Unified Messaging Servers

View a list of links to topics that provide information about managing the security of your Unified Messaging servers.

Permissions

View a list of links to topics that provide information about the permissions models used by Exchange 2010, including the permissions required to perform operations in each area of Exchange 2010.

Administrator Audit Logging

View a list of links to topics that provide information about administrator audit logging and how to use it to log the cmdlets run in the Exchange Management Shell, the Exchange Management Console, and the Exchange Control Panel.

Mailbox Audit Logging

View a list of links to topics that provide information about mailbox audit logging, a feature that allows you to track mailbox owner, delegate, and administrator logons to a mailbox, as well as what actions are taken while the user is logged on.

1.12.1 Exchange 2010 Security Guide

Exchange 2010 Security Guide

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-03-08*

This guide is written for the IT administrator responsible for securing the Microsoft Exchange Server 2010 deployment and is designed to help the IT administrator understand and manage the overall security environment where Exchange is installed.

In the past, for each version of Microsoft Exchange, the Exchange team has published stand-alone security hardening guides with permission and security information. This approach made sense for locking down services and directories after Exchange 2010 Setup ran. However, starting with Microsoft Exchange Server 2007, Exchange Setup enables only those services that are required by the server role that's being installed. Microsoft Exchange is no longer installed and then hardened for security. It's designed to help you be more secure by default.

Therefore, unlike earlier versions of Microsoft Exchange where IT administrators had to perform multiple procedures to lock down their servers that were running Microsoft Exchange, Exchange 2010 requires no lock-down or hardening.

Scope

Exchange 2010 was developed using Microsoft Security Development Lifecycle (SDL) principles. A security review was performed for each feature and component. Carefully chosen default settings ensure a more secure deployment. The scope of this guide is to inform administrators about security-related features and the features that may affect security considerations. This guide links to security-related topics in Exchange 2010 documentation. These topics are listed in Appendix 1: Additional Security-Related Documentation. This guide doesn't cover any steps to harden the Windows Server operating system.

Contents

What's New

Exchange 2010 includes the following new security features:

- **Role-Based Access Control** Exchange 2010 includes a new role-based access control model that lets your organization granularly manage permissions assigned to different stakeholders such as recipient administrators, server administrators, records and discovery managers, and organization administrators.
- **Throttling Policies** Exchange 2010 introduces throttling mechanisms on Mailbox, Client Access, and Transport servers to protect your organization from denial of service attacks and reduce the impact of such attacks.
- **Federated Delegation** Exchange 2010 introduces new federated delegation features that enable you to allow your users to securely collaborate with users in external organizations. Using federated delegation, users can share their calendar and contacts with users in external federated organizations. Cross-forest collaboration is also made possible, without the need to set up and manage Active Directory trust relationships.
- **Information Rights Management** Exchange 2010 includes new information protection and control features that enable you to protect sensitive message content at multiple levels while maintaining your organization's ability to decrypt, search, and apply messaging policies to protected content.
- **No Security Configuration Wizard** In Exchange 2010, Setup makes the configuration changes necessary to install and enable only those services required for a particular Exchange server role and to limit communication to only those ports required for the services and processes running on each server role. This removes the need for tools such as the Security Configuration Wizard (SCW) to configure these settings.

The Exchange 2010 Security Development Lifecycle

In early 2002, Microsoft introduced the Trustworthy Computing initiative. Since Trustworthy computing was introduced, the development process at Microsoft and in the Microsoft Exchange team has focused on developing software that helps you become more secure. For more information, see Trustworthy Computing.

In Exchange 2010, Trustworthy Computing was implemented in the following core areas:

- **Secure by design** Exchange 2010 was designed and developed in compliance with The Trustworthy Computing Security Development Lifecycle. The first step in creating a more secure messaging system was to design threat models and test each feature as it was designed. Multiple security-related improvements were built into the coding process and practices. Build-

time tools detect buffer overruns and other potential security threats. No system can guarantee complete security. However, by including secure design principles into the whole design process, Exchange 2010 is more secure than earlier versions have been.

- **Secure by default** One goal of Exchange 2010 was to develop a system in which most network communications are encrypted by default. Except for Server Message Block (SMB) communications and some Unified Messaging (UM) communications, the goal was met. By using self-signed certificates, the Kerberos protocol, Secure Sockets Layer (SSL), and other industry standard encryption techniques, almost all Exchange 2010 data is protected on the network. In addition, role-based setup makes it possible to install Exchange 2010 so that only the services, and the permissions related to those services, are installed with a specific and appropriate server role. In earlier versions of Microsoft Exchange, all services for all functionality had to be installed.
- **Anti-spam and antivirus functionality** Exchange 2010 includes a suite of anti-spam agents that run at the perimeter network on the Edge Transport server role, and can also be installed on the Hub Transport server role residing on the internal network. Antivirus functionality is further improved by the addition of Microsoft Forefront Protection 2010 for Exchange Server as a Microsoft solution.
- **Secure in deployment** As Exchange 2010 was developed, the pre-release version was deployed in the Microsoft IT production environment. Based on the data from that deployment, the Microsoft Exchange Server Best Practices Analyzer has been updated to scan for real-world security configurations, and pre-deployment and post-deployment best practices have been documented in the Exchange 2010 Help.
  In the past, permission management was documented and delivered after the core documentation was finished. However, we know that permissions management isn't an add-in process. It should be built into the overall planning and deployment of your Exchange 2010 deployment. Therefore, we've streamlined our permission documentation and integrated it into the core documentation to provide seamless context for administrators as they plan for and deploy their administrative model. Exchange 2010 includes a new role-based permissions model that allows you to grant granular permissions to administrators and users to enable them to perform tasks with the minimum permissions required.
- **Communications** Now that Exchange 2010 is released, the Exchange team is committed to keeping software up-to-date and you informed. By keeping your system up-to-date with Microsoft Update, you can make sure that the latest security updates are installed in your organization. Exchange 2010 also includes anti-spam updates. In addition, by subscribing to the Microsoft Technical Security Notifications, you can keep up with the latest security issues in Exchange 2010.

Getting Secure—Best Practices

Some basic best practices will help you create and maintain a more secure environment. Generally, running analyzer tools periodically and keeping software and antivirus signatures files up to date are the most effective ways to optimize your Exchange 2010 environment for security.

Setup and Installation Recommendations

These best practices will help you create a more secure Exchange 2010 environment:

- **Delegate Setup** The first Exchange 2010 server you install in your organization requires that the account you use to run Setup must be a member of the Enterprise Administrators group. The account you use is added to the Organization Management role group created by Exchange 2010 Setup. You can use delegated setup to allow administrators who aren't members of the Organization Management role group to set up subsequent servers. For more details, see Provision Exchange 2010 Server and Delegate Setup.

- **File system permissions** Exchange 2010 Setup assigns the minimum required permissions on the file system where Exchange binaries and data are stored. You must not make any changes to the Access Control Lists (ACLs) on the root folders and the Program Files folder on the file system.
- **Install paths** We recommend that you install Exchange 2010 binaries on a non-system drive (a volume other than where the operating system is installed). Exchange databases and transaction logs can grow rapidly, and must be located on non-system volumes sized for capacity and performance. Many other logs generated by different Exchange components, such as transport logs, are also stored in the same install path as Exchange binaries and can grow significantly, depending on the configuration and your messaging environment. In Exchange 2010, the maximum size of many log files and the maximum storage space a log file folder can occupy is configurable, and is set to a default of 250 Megabytes. To prevent a potential system outage because of low disk space, we recommend that you assess the logging requirements for each server role and configure the logging options and log file storage locations to meet your requirements.
- **Blocking legacy Outlook clients** Based on your requirements, you can configure Outlook client blocking to block legacy Outlook client versions. Certain Exchange 2010 features, such as Outlook Protection Rules and Personal Archives, don't support legacy Outlook clients. For more information about Outlook client blocking, see Configure Outlook Client Blocking.
- **Decoupling SMTP addresses from usernames** By default, Exchange generates e-mail addresses and aliases based on the mailbox user's username. Many organizations create an additional e-mail address policy to decouple user e-mail addresses from usernames for added security. For example, if the user Ben Smith's username is bsmith and the domain is contoso.com, the primary e-mail address generated by the default e-mail address policy is bsmith@contoso.com. You can create an additional e-mail address policy to generate e-mail addresses that don't use the user's alias or username. For example, creating an e-mail address policy to use the template `%g.%s@domain` generates e-mail addresses in the format Firstname.Lastname@domain. For the user Ben Smith, the policy will generate the address Ben.Smith@contoso.com. Or, you can decouple e-mail addresses from usernames by specifying an alias that's different from the username when you create or enable a mailbox.

Note:

If a user's primary SMTP address doesn't match the UPN on the account, the user can't use their e-mail address to sign in to Microsoft Office Outlook Web App and must provide a username using the DOMAIN\username format. When using Microsoft Outlook, the user must provide the username in DOMAIN \username format if prompted for credentials when Outlook connects to the Autodiscover service.

Microsoft Update

Microsoft Update is a service that offers the same downloads as Microsoft Windows Update—plus the latest updates for other Microsoft programs. It can help you keep your server more secure and performing at its best.

A key feature of Microsoft Update is Windows Automatic Update. This feature automatically installs high-priority updates that are critical to the security and reliability of your computer. Without these security updates, your computer is more vulnerable to attack from cyber-crooks and malicious software (malware).

The most reliable way to receive Microsoft Update is to have the updates delivered automatically to your computer by using Windows Automatic Updates. You can turn on Automatic Updates when you sign up for Microsoft Update.

Windows will then analyze the Microsoft software that's installed on your computer for

any current and past high-priority updates it requires and then download and install them automatically. After that, when you connect to the Internet, Windows repeats the update process for any new high-priority updates.

To enable Microsoft Update, see Microsoft Update.

The default mode of Microsoft Update requires that each Exchange server is connected to the Internet to receive automatic updates. If you are running servers that aren't connected to the Internet, you can install Windows Server Update Services (WSUS) to manage the distribution of updates to computers in your organization. You can then configure Microsoft Update on the internal Microsoft Exchange computers to contact your internal WSUS server for updates. For more information, see Microsoft Windows Server Update Services 3.0.

WSUS isn't the only Microsoft Update management solution available. For more information about Microsoft security releases, processes, communications and tools, see the Microsoft Security Update Guide.

Tasks No Longer Required in Exchange 2010

It's no longer necessary to install or run the following tools:

- The URLScan security tool isn't required for IIS 7. In earlier versions of Microsoft Exchange, it was a common practice to install IIS tools such as URLScan to secure an IIS installation. Exchange 2010 requires Windows Server 2008, which includes IIS 7. Many of the security features that were originally available in UrlScan are now available in the IIS 7 Request Filtering features.
- You no longer need to install the Exchange Best Practices Analyzer. In earlier versions of Microsoft Exchange, it was a common practice to install and run the Exchange Best Practices Analyzer before installation and regularly after that. Exchange 2010 Setup includes the Exchange Best Practices Analyzer components and runs them during setup. It isn't required to run the Exchange Best Practices Analyzer before setup.
- You no longer need to use the Security Configuration Wizard (SCW) or the Exchange templates for SCW. Exchange 2010 Setup installs only those services required for a given Exchange server role, and creates Windows Firewall with Advanced Security rules to open only the ports required for the services and processes for that server role. It's no longer required to run the Security Configuration Wizard (SCW) to do this. Unlike Exchange Server 2007, Exchange 2010 isn't included with SCW templates.

Staying Secure—Best Practices

These best practice recommendations will help you keep your Exchange 2010 environment secure.

Keeping Software up to Date

As mentioned in an earlier section, running Microsoft Update is a best practice. In addition to running Microsoft Update on all servers, it's also very important to keep all client computers up to date and to maintain antivirus updates on all computers in your organization.

In addition to Microsoft software, make sure that you run the latest updates for all software that's running in your organization.

Anti-Spam Updates

Exchange 2010 also uses the Microsoft Update infrastructure to keep the anti-spam filters up-to-date. By default, with manual updates, the administrator must visit Microsoft Update to download and install the content filter updates. The content filter update data is updated and available every two weeks.

Manual updates from Microsoft Update include the Microsoft IP Reputation Service or spam signature data. The Microsoft IP Reputation Service and spam signature data is only available with Forefront Security for Exchange Server anti-spam automatic updates.

For more information about how to enable Forefront anti-spam automatic updates, see Understanding Anti-Spam Updates.

Running Antivirus Software

Viruses, worms, and other malicious content transmitted by e-mail systems are a destructive reality faced by most Microsoft Exchange administrators. Therefore, you must develop a defensive antivirus deployment for all messaging systems. This section provides best practices recommendations for the deployment of antivirus software for Exchange 2010.

You should pay additional attention to two important changes in Exchange 2010 when you select an antivirus software vendor:

- Starting with Exchange Server 2007, Microsoft Exchange is based on a 64-bit architecture.
- Exchange 2010 includes transport agent functionality.

These two changes mean that antivirus vendors must provide Exchange 2010-specific software. Antivirus software that's written for earlier versions of Exchange is unlikely to operate correctly with Exchange 2010.

To use a defense-in-depth approach, we recommend that you deploy antivirus software that's designed for messaging systems at either the SMTP gateway or at the Exchange servers that host mailboxes, in addition to antivirus software on the user desktop.

You decide what types of antivirus software to use and where the software is deployed by determining the appropriate balance between the cost and risk you are willing to assume. For example, some organizations run antivirus messaging software at the SMTP gateway, file-level antivirus scanning at the Exchange server, and antivirus client software on the user desktop. This approach provides messaging-specific protection at the client. Other organizations may tolerate higher costs and therefore improve security by running antivirus messaging software at the SMTP gateway, file-level antivirus scanning at the Exchange server, and antivirus client software on the user desktop, together with antivirus software that's compatible with Exchange Virus Scanning Application Programming Interface (VSAPI) 2.5 on the Exchange Mailbox server.

Running Antivirus Software on Edge Transport Servers and Hub Transport Servers

Transport-based antivirus software is implemented as or includes transport agents. Transport agents act on transport events, much like event sinks in earlier versions of Microsoft Exchange. For more details, see Understanding Transport Agents.

Note:

Messages that aren't routed through transport, such as items in public folders, Sent Items, and calendar items, which can only be scanned on a Mailbox server, aren't protected by transport-only virus scanning.

Third-party developers can write customized transport agents to take advantage of the underlying MIME-parsing engine for robust transport-level antivirus scanning. For a list of Exchange antivirus and anti-spam partners, see Independent Software Vendors.

In addition, Forefront Protection for Exchange Server is an antivirus software package that's tightly integrated with Exchange 2010 and offers additional antivirus protection for your Exchange environment. For more information, see Microsoft Forefront Protection 2010 for Exchange Server.

The most important position for messaging antivirus software is at the first line of defense in your organization. This is the SMTP gateway through which external messages enter your messaging environment. In Exchange 2010, the first line of defense is the Edge Transport server.

If you use a non–Exchange SMTP server or gateway to receive inbound e-mail before Exchange, you should implement sufficient anti-spam and antivirus functionality on the non–Exchange SMTP hosts.

In Exchange 2010, all messages are routed through a Hub Transport server. This includes messages sent or received from outside the Exchange organization and messages sent within the Exchange organization. Messages sent to a mailbox located on the same Mailbox server as the sender. To better guard against virus outbreaks from inside the organization and to provide a second line of defense, we also recommend that you run transport-based antivirus software on Hub Transport servers.

Running Antivirus Software on Mailbox Servers

In addition to virus scanning on transport servers, a Microsoft Exchange Virus Scanning API (VSAPI) scanning solution running on Mailbox servers may be an important layer of defense in many organizations. You should consider running a VSAPI antivirus solution if any of the following conditions is true:

- Your organization doesn't have complete and reliable desktop antivirus scanning products deployed.
- Your organization wants the additional protection that scanning mailbox databases can provide.
- Your organization has developed custom applications that have programmatic access to an Exchange database.
- Your user community regularly posts messages in public folders.

Antivirus solutions that use Exchange VSAPI run directly within the Exchange information store process. VSAPI solutions are likely the only solutions that can protect against attack vectors that put infected content inside the Exchange information store while bypassing the standard client and transport scanning. For example, VSAPI is the only solution that scans data that's submitted to a database by CDO (Collaboration Data Objects), WebDAV, and Exchange Web Services (EWS). In addition, when a virus outbreak does occur, frequently a VSAPI solution provides the quickest way to remove and eliminate viruses from an infected mail database.

Exchange Server and File System Antivirus

If you deploy file-system antivirus software to protect your Exchange servers, consider the following:

- You must exclude Exchange server directories where the Exchange mailbox and public folder databases are stored, from file system antivirus scanners. For details, see File-Level Antivirus Scanning on Exchange 2010.
- File system antivirus scanners only protect files. To protect e-mail messages, you should also consider implementing Exchange-aware antivirus or messaging security products such as including Microsoft Forefront, or suitable partner or third-party products. For details about anti-spam and antivirus protection, see Understanding Anti-Spam and Antivirus Functionality. For details, see Forefront Protection 2010 for Exchange Server: Overview.
- You must keep antivirus and anti-spam signatures up-to-date for effective protection.
- Reports from antivirus and anti-spam software or services should be reviewed regularly to ensure protection is enabled and performing as required, detect incidents quickly, and take any required action.

Using Exchange Hosted Services

Spam and virus filtering is improved by or is also available as a service from Microsoft Exchange Hosted Services. Exchange Hosted Services is a set of four distinct hosted

services:

- Hosted Filtering, which helps organizations protect themselves from e-mail-borne malware
- Hosted Archive, which helps organizations satisfy compliance and retention requirements
- Hosted Encryption, which helps organizations encrypt data to preserve confidentiality
- Hosted Continuity, which helps organizations preserve access to e-mail during and after outages

These services integrate with any on-premises Exchange servers that are managed in house. For more information, see Forefront Online Protection for Exchange.

Using Attachment Filtering

In Exchange 2010, attachment filtering lets you apply filters on Edge Transport servers to control the attachments that users receive. Attachment filtering is increasingly important in today's environment where many attachment types contain harmful viruses or unsuitable material that may cause significant damage to the user's computer or to the organization by damaging important documentation or releasing sensitive information to the public.

You can use the following types of attachment filtering to control attachments that enter or leave your organization through an Edge Transport server:

Filtering based on file name or file name extension You can filter attachments by specifying the exact file name or file name extension to be filtered. An example of an exact file name filter is BadFilename.exe. An example of a file name extension filter is *.exe.

Filtering based on file MIME content type You can also filter attachments by specifying the MIME content type to be filtered. MIME content types indicate what the attachment is, whether it's a JPEG image, an executable file, a Microsoft Office Excel 2010 file, or some other file type. Content types are express as type/subtype. For example, the JPEG image content type is express as image/jpeg.

If an attachment matches one of these filtering criteria, you can configure the following actions to be performed on the attachment:

- Block whole message and attachment
- Strip attachment but allow message through
- Silently delete message and attachment

For more details, see Understanding Attachment Filtering.

Note:

You can't use the Attachment Filter agent to filter attachments based on their content. You can use transport rules to inspect the message and attachment content, and take actions such as deleting or rejecting the message, or IRM-protecting the message and attachments. For details, see Understanding Transport Rules.

File Filtering Using Forefront Protection for Exchange Server

The file filtering functionality that's provided by Forefront Protection for Exchange Server includes advanced features aren't available in the Attachment Filter agent included with Exchange 2010.

For example, container files, which are files that contain other files, can be scanned for offending file types. Forefront Protection for Exchange Server filtering can scan the following container files and act upon embedded files:

- PKZip (.zip)
- GNU Zip (.gzip)
- Self-extracting compressed file archives (.zip)
- Compressed files (.zip)

- Java archive (.jar)
- TNEF (winmail.dat)
- Structured storage (.doc, .xls, .ppt, and more)
- MIME (.eml0
- SMIME (.eml)
- UUEncode (.uue)
- Unix tape archive (.tar)
- RAR archive (.rar)
- MACBinary (.bin)

Note:
The Attachment Filter agent included with Exchange 2010 detects file types even if they've been renamed. Attachment filtering also makes sure that compressed Zip and LZH files don't contain blocked attachments by performing a file name extension match against the files in the compressed Zip or LZH file. Forefront Protection for Exchange Server file filtering has the additional capability of determining whether a blocked attachment has been renamed within a container file.

You can also filter files by file size. Also, you can configure Forefront Protection for Exchange Server to quarantine filtered files or to send e-mail notifications based Exchange on file filter matches.

For more information, see Protecting Your Microsoft Exchange Organization with Microsoft Forefront Security for Exchange Server.

Running the Exchange Best Practices Analyzer

The Exchange Best Practices Analyzer is one of the most effective tools that you can run regularly to help verify that your Exchange environment is secure. The Exchange Best Practices Analyzer automatically examines your Microsoft Exchange deployment and determines whether it's configured according to Microsoft best practices. In Exchange 2010, the Exchange Best Practices Analyzer is installed as part of Exchange Setup and can be run from the Tools section of the Exchange Management Console (EMC). With the appropriate network access, the Exchange Best Practices Analyzer examines all your Active Directory Domain Services (AD DS) servers and Exchange servers. The Exchange Best Practices Analyzer includes permissions inheritance checks. Also, it tests for validation of RBAC permissions. This include tests to ensure all users can access the Exchange Control Panel (ECP), all default RBAC roles created by Exchange Setup are configured properly, and there's at least one administrative account present within the Exchange organization.

Network Port Usage and Firewall Hardening

Windows Server 2008 includes Windows Firewall with Advanced Security, a stateful packet inspection firewall that's enabled by default. Windows Firewall with Advanced Security provides the following functionality:

- Filtering of all IP version 4 (IPv4) and IP version 6 (IPv6) traffic entering or leaving the computer. By default, all incoming traffic is blocked unless it's a response to a previous outgoing request from the computer (solicited traffic), or it's specifically allowed by a rule created to allow that traffic. By default, all outgoing traffic is allowed, except for service hardening rules that prevent standard services from communicating in unexpected ways. You can choose to allow traffic based on port numbers, IPv4 or IPv6 addresses, the path and name of an application, or the name of a service that's running on the computer, or other criteria.
- Protecting network traffic entering or exiting the computer by using the IPsec protocol to verify the integrity of the network traffic, to authenticate the

identity of the sending and receiving computers or users, and to optionally encrypt traffic to provide confidentiality.

Exchange 2010 is designed to run with the Windows Server Firewall with Advanced Security enabled. Exchange Setup creates the required firewall rules to allow Exchange services and processes to communicate. It creates only the rules required for the services and processes installed on a given server role. For more details about network port usage and firewall rules created for each Exchange 2010 server role, see Exchange Network Port Reference.

On Windows Server 2008 and Windows Server 2008 R2, Windows Firewall with Advanced Security allows you to specify the process or service for which a port is opened. This is more secure because it restricts usage of the port to the process or service specified in the rule. Exchange 2010 Setup creates firewall rules with the process name specified. In some cases, an additional rule that isn't restricted to the process is also created for compatibility purposes. You can disable or remove the rules that aren't restricted to the processes and keep the corresponding rules which are also created by Exchange 2010 Setup and are restricted to processes, if your deployment supports them. Rules that aren't restricted to processes are distinguished by the word (GFW) in the rule name. We recommend that you perform sufficient testing of the rules in your environment before you disable the rules that aren't restricted to a process.

The following table lists the Windows Firewall rules created by Exchange Setup, including the ports opened on each server role.

Windows Firewall rules

Rule name	Server roles	Port
MSExchangeRPCEPMap (GFW) (TCP-In)	All roles	RPC-EPMap
MSExchangeRPC (GFW) (TCP-In)	Client Access, Hub Transport, Mailbox, Unified Messaging	Dynamic RPC
MSExchange - IMAP4 (GFW) (TCP-In)	Client Access	143, 993 (TCP)
MSExchange - POP3 (GFW) (TCP-In)	Client Access	110, 995 (TCP)
MSExchange - OWA (GFW) (TCP-In)	Client Access	5075, 5076, 5077 (TCP)
MSExchangeMailboxReplication (GFW) (TCP-In)	Client Access	808 (TCP)
MSExchangeIS (GFW) (TCP-In)	Mailbox	6001, 6002, 6003, 6004 (TCP)
MSExchangeTransportWorker (GFW) (TCP-In)	Hub Transport	25, 587 (TCP)
SESWorker (GFW) (TCP-In)	Unified Messaging	Any
UMService (GFW) (TCP-In)	Unified Messaging	5060, 5061 (TCP)
UMWorkerProcess (GFW) (TCP-In)	Unified Messaging	5065, 5066, 5067, 5068

Important:

When modifying the default port used by an Exchange 2010 service, you must also

modify the corresponding Windows Firewall with Advanced Security firewall rule to allow communication over the nondefault port you decide to use. Exchange 2010 doesn't change firewall rules when you change default ports used for a service.

Throttling Parameters and Client Throttling Policies

Exchange 2010 includes throttling parameters on Transport, Client Access Server and Mailbox server roles to control different parameters of connections related to each protocol. Exchange 2010 also includes client throttling policies to control the load on Client Access servers. These throttling parameters and policies help you to control the load and protect Exchange 2010 servers from denial of service attacks targeted at different protocols.

Throttling Parameters on Transport Servers

On Exchange 2010 Transport servers, message throttling parameters are implemented on the server and on Send and Receive connectors to control message processing rates, SMTP connection rates, and SMTP session time-out values. Together, these throttling parameters protect transport servers from being overwhelmed by accepting and delivering lots of messages, providing protection from rogue SMTP clients and denial of service attacks.

You can configure the following throttling policies on Exchange 2010 Transport servers using the **Set-TransportServer** cmdlet.

Transport server throttling parameters

Parameter	Description
MaxConcurrentMailboxDeliveries	The *MaxConcurrentMailboxDeliveries* parameter specifies the maximum number of delivery threads that the Hub Transport server can have open at the same time to deliver messages to mailboxes. The store driver on the Hub Transport server is responsible for delivering messages to and from Mailbox servers. This limit applies to the delivery of messages to any mailboxes in the Exchange organization. **Default** 20 deliveries
MaxConcurrentMailboxSubmissions	The *MaxConcurrentMailboxSubmissions* parameter specifies the maximum number of delivery threads that the Hub Transport server can have open at the same time to accept messages from mailboxes. The store driver on the Hub Transport server is responsible for delivering messages to and from Mailbox servers. This limit applies to the acceptance of new messages from any mailboxes in the Exchange organization. **Default** 20 submissions
MaxConnectionRatePerMinute	The *MaxConnectionRatePerMinute* parameter specifies the maximum rate at which new inbound connections can be opened to the Hub Transport server or the Edge Transport server. These connections are opened to

	any Receive connectors that exist on the server. **Default** 1,200 connections per minute.
MaxOutboundConnections	The *MaxOutboundConnections* parameter specifies the maximum number of concurrent outbound connections that the Hub Transport server or Edge Transport server can have open at the same time. The outbound connections occur by using the Send connectors that exist on the server. The value that's specified by the *MaxOutboundConnections* parameter applies to all Send connectors that exist on the transport server. **Default** 1,000 connections. If you enter a value of unlimited, no limit is imposed on the number of outbound connections. This value can also be configured using the EMC.
MaxPerDomainOutboundConnections	The *MaxPerDomainOutboundConnections* parameter specifies the maximum number of connections that an Internet-facing Hub Transport server or Edge Transport server can have open to any single remote domain. The outbound connections to remote domains occur by using Send connectors that exist on the server. **Default** 20 connections per domain If you enter a value of unlimited, no limit is imposed on the number of outbound connections per domain. This value can also be configured using the EMC.
PickupDirectoryMaxMessagesPerMinute	The *MaxPerDomainOutboundConnections* parameter specifies the rate of message processing for both the **Pickup** directory and **Replay** directory. Each directory can independently process message files at the rate that's specified by the *PickupDirectoryMaxMessagesPerMinute* parameter. **Defaults** By default, the Pickup directory can process 100 messages per minute, and the Replay directory can process 100 messages per minute at the same time. The Pickup directory and the Replay directory scan for new message files once

	every 5 seconds, or 12 times per minute. This 5-second polling interval isn't configurable. This means the maximum number of messages that can be processed during each polling interval is the value that you assign to the *PickupDirectoryMaxMessagesPerMinute* parameter divided by 12 (PickupDirectoryMaxMessagesPerMinute/12). By default, a maximum of just over eight messages can be processed during each 5-second polling interval.

Throttling Parameters on Send Connectors

The following throttling parameters are available on Send connectors. Use the **Send-Connector** cmdlet to configure these parameters.

Send connector throttling parameters

Parameter	Description
ConnectionInactivityTimeOut	The *ConnectionInactivityTimeOut* parameter specifies the maximum time that an open SMTP connection with a destination messaging server can remain idle before the connection is closed. **Default** 10 minutes.
SmtpMaxMessagesPerConnection	The *SmtpMaxMessagesPerConnection* parameter specifies the maximum number of messages this Send connector server can send per connection. **Default** 20 messages

Throttling Parameters on Receive Connectors

You can configure the following throttling parameters on Receive connectors on Exchange 2010 Transport servers to control connection parameters such as inactivity timeouts, maximum number of connections and the number of SMTP protocol errors allowed during a connection. Use the **Set-ReceiveConnector** cmdlet to configure these parameters.

Receive connector throttling parameters

Parameter	Description
ConnectionInactivityTimeOut	The *ConnectionInactivityTimeOut* parameter specifies the maximum time that an open SMTP connection with a source messaging server can remain idle before the connection is closed. **Default on Hub Transport servers** 5 minutes. **Default on Edge Transport servers** 1 minute.
ConnectionTimeOut	The *ConnectionTimeOut* parameter specifies the maximum time that an SMTP connection with a source messaging server can remain

	open, even if the source messaging server is transmitting data. **Default on Hub Transport servers** 10 minutes **Default on Edge Transport servers** 5 minutes. The value specified by the ConnectionTimeout parameter must be larger than the value specified by the ConnectionInactivityTimeout parameter.
MaxInboundConnection	The *MaxInboundConnection* parameter specifies the maximum number of inbound SMTP connections that this Receive connector allows at the same time. **Default** 5,000
MaxInboundConnectionPercentagePerSource	The *MaxInboundConnectionPercentagePerSource* parameter specifies the maximum number of SMTP connections that a Receive connector allows at the same time from a single source messaging server. The value is expressed as the percentage of available remaining connections on a Receive connector. The maximum number of connections that are permitted by the Receive connector is defined by the *MaxInboundConnection* parameter. **Default** 2 percent
MaxInboundConnectionPerSource	The *MaxInboundConnectionPerSource* parameter specifies the maximum number of SMTP connections that a Receive connector allows at the same time from a single source messaging server. **Default** 100 connections
MaxProtocolErrors	The *MaxProtocolErrors* parameter specifies the maximum number of SMTP protocol errors that a Receive connector allows before the Receive connector closes the connection with the source messaging server. **Default** 5 errors

Throttling Parameters for the POP3 Service

The following throttling parameters are available for the Microsoft Exchange POP3 service on Client Access servers. Use the **Set-POPSettings** cmdlet to configure these parameters. For details, see Set Connection Limits for POP3.

POP3 service throttling parameters

Parameter	Description

MaxCommandSize	The *MaxCommandSize* parameter specifies the maximum size of a single command. The possible values are from 40 through 1024 bytes. **Default** 40 bytes.
MaxConnectonFromSingleIP	The *MaxConnectionFromSingleIP* parameter specifies the number of connections that the specified server accepts from a single IP address. The possible values are from 1 through 25,000. **Default** 2,000 connections
MaxConnections	The *MaxConnections* parameter specifies the total number of connections that the specified server accepts. This includes authenticated and unauthenticated connections. The possible values are from 1 through 25,000. **Default** 2,000 connections.
MaxConnectionsPerUser	The *MaxConnectionsPerUser* parameter specifies the maximum number of connections that the Client Access server accepts from a particular user. The possible values are from 1 through 25,000. **Default** 16 connections.
PreAuthenticationConnectionTimeOut	The *PreAuthenticatedConnectionTimeout* parameter specifies the time to wait before closing an idle connection that isn't authenticated. The possible values are from 10 through 3,600 seconds. **Default** 60 seconds.

Throttling Parameters for the IMAP4 Service

The following throttling parameters are available for the Microsoft Exchange IMAP4 service on Client Access servers. Use the **Set-IMAPSettings** cmdlet to configure these parameters. For details, see Set Connection Limits for IMAP4.

IMAP4 service throttling parameters

Parameter	Description
AuthenticationConnectionTimeOut	The *AuthenticatedConnectionTimeout* parameter specifies the period of time to wait before closing an idle authenticated connection. The possible values are from 30 through 86400 seconds. **Default** 1,800 seconds
MaxCommandSize	The *MaxCommandSize* parameter specifies the maximum size of a single command. The default size is 40 bytes. The possible values are from 40 through 1024 bytes.

	Default 40 bytes.
MaxConnectionFromSingleIP	The *MaxConnectionFromSingleIP* parameter specifies the number of connections that the specified server accepts from a single IP address. The possible values are from 1 through 25,000. **Default** 2,000 connections
MaxConnections	The MaxConnections parameter specifies the total number of connections that the specified server accepts. This includes authenticated and unauthenticated connections. The possible values are from 1 through 25,000. **Default** 2,000 connections
MaxConnectionsPerUser	The *MaxConnectionsPerUser* parameter specifies the maximum number of connections that the Client Access server accepts from a particular user. The possible values are from 1 through 25,000. **Default** 16 connections.
PreAuthenticatedConnectionTimeOut	The *PreAuthenticatedConnectionTimeout* parameter specifies the time to wait before closing an idle connection that isn't authenticated. The possible values are from 10 through 3600 seconds. **Default** 60 seconds

Client Throttling Policies

In Exchange 2010, you can use client throttling policies to manage Client Access server performance by controlling parameters such as the number of concurrent connections for each client access protocol, the percentage of time that a client session can use to run LDAP operations, RPC operations, and client access operations. There's a default client throttling policy that's generally sufficient to manage the load placed on Client Access servers. You can modify the default policy parameters or create custom policies that meet the requirements for your deployment.

Throttling policies are available for the following user groups and access methods:

- Anonymous access
- Cross-premises access (CPA)
- Exchange ActiveSync (EAS)
- Exchange Web Services (EWS)
- IMAP
- POP
- Outlook Web App (OWA)
- RPC Client Access (RCA)

The following throttling settings are available in client throttling policies for each of these user groups (Anonymous access and CPA) and access methods (EAS, EWS, IMAP, OWA, POP, and RCA).

Client throttling policy settings

Throttling setting	Anonymous Access	CPA	EAS	EWS	IMAP	OWA	POP	RCA
Max Concurrency	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Percent Time in AD	Yes	N. A.	Yes	Yes	Yes	Yes	Yes	Yes
Percent Time in CAS	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Percent Time in Mailbox RPC	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

CPA Cross-Premises Access

EAS Exchange ActiveSync

EWS Exchange Web Services

OWA Outlook Web App

In addition to these throttling settings based on user groups and access methods, the following throttling settings are available in a client throttling policy.

Client throttling policy parameters

Parameter	Description
CPUStartPercent	The *CPUStartPercent* parameter specifies the per-process CPU percentage at which users governed by this policy begin to be backed off. Valid values are from 0 through 100. Use $null to turn off CPU percentage-based throttling for this policy.
EASMaxDeviceDeletesPerMonth	The *EASMaxDeviceDeletesPerMonth* parameter specifies a limit to the number of Exchange ActiveSync partnerships that a user can delete per month. By default, each user can delete a maximum of 20 partnerships per calendar month. When the limit is reached, the partnership deletion attempt fails and an error message is displayed to the user.
EASMaxDevices	The *EASMaxDevices* parameter specifies a limit to the number of Exchange ActiveSync partnerships that a user can have at one time. By default, each user can create 10 Exchange ActiveSync partnerships with their Exchange account. After users exceed the limit, they must delete one of their existing partnerships before they can create any more new partnerships. An e-mail error

	message describing the limitation is sent to the user when the limit is exceeded. Also, an event is logged in the Application log when a user exceeds the limit.
EWSFastSearchTimeOutInSeconds	The *EWSFastSearchTimeoutInSeconds* parameter specifies the amount of time that searches made using Exchange Web Services continue before they time out. If the search takes more than the time indicated by the policy value, the search stops and an error is returned. The default value of this setting is 60 seconds.
EWSFindCountLimit	The *EWSFindCountLimit* parameter specifies the maximum result size of FindItem or FindFolder calls that can exist in memory on the Client Access server at the same time for this user in this current process. If an attempt is made to find more items or folders than your policy limit allows, an error is returned. However, the limit isn't strictly enforced if the call is made within the context of an indexed page view. Specifically, in this scenario, the search results are truncated to include the number of items and folders that fit within the policy limit. You can then continue paging into your results set via further FindItem or FindFolder calls.
EWSMaxSubscriptions	The *EWSMaxSubscriptions* parameter specifies the maximum number of active push and pull subscriptions that a user can have on a specific Client Access server at the same time. If a user tries to create more subscriptions than the configured maximum, the subscription fails, and an event is logged in Event Viewer.
ExchangeMaxCmdlets	The *ExchangeMaxCmdlets* parameter specifies the number of cmdlets that can be run within a specific time period before their execution is slowed down. The value specified by this parameter should be less than the value specified by the *PowerShellMaxCmdlets parameter*. The time period used for this limit is specified by the *PowerShellMaxCmdletsTimePeriod* parameter. We recommend that you set values for both parameters at the same time.
ForwardeeLimit	The *ForwardeeLimit* parameter specifies the limits for the number of recipients that can be configured in Inbox Rules when using the forward or redirect action. This parameter doesn't limit the number of messages that can be forwarded or redirected to the

	recipients that are configured.
MessageRateLimit	The *MessageRateLimit* parameter specifies the number of messages per minute that can be submitted to transport. For messages submitted through the Mailbox server role (Outlook Web App, Exchange ActiveSync, or Exchange Web Services), this results in the deferral of messages until the quota for the user is available. Specifically, messages appear in the Outbox or Drafts folder for longer periods of time when users submit messages at a rate greater than the MessageRateLimit parameter. For POP or IMAP clients submitting messages directly to transport using SMTP, clients receive a transient error if they submit at a rate that exceeds the MessageRateLimit parameter. Exchange tries to connect and send the messages at a later time.
PowerShellMaxCmdletQueueDepth	The *PowerShellMaxCmdletQueueDepth* parameter specifies the number of operations allowed to be run by the user. This value directly affects the behavior of the *PowerShellMaxCmdlets* and *PowerShellMaxConcurrency* parameters. For example, the *PowerShellMaxConcurrency* parameter consumes at least two operations defined by the *PowerShellMaxCmdletQueueDepth* parameter but additional operations are also consumed by per cmdlet execution. The number of operations depends on the cmdlets that are run. We recommend that the value for the *PowerShellMaxCmdletQueueDepth* parameter be at least three times larger than the value of the *PowerShellMaxConcurrency parameter*. This parameter won't affect Exchange Control Panel operations or Exchange Web Services operations.
PowerShellMaxCmdlets	The *PowerShellMaxCmdlets* parameter specifies the number of cmdlets that can be run within a specific time period before their execution is stopped. The value specified by this parameter should be more than the value specified by the *ExchangeMaxCmdlets* parameter. The time period used for this limit is specified by the *PowerShellMaxCmdletsTimePeriod* parameter. Both values should be set at the same time.
PowerShellMaxCmdletsTimePeriod	The *PowerShellMaxCmdletsTimePeriod* parameter specifies the time period, in seconds, that the throttling policy uses to determine whether the number of cmdlets being run exceeds the limits specified by

	the *PowerShellMaxCmdlets* and *ExchangeMaxCmdlets* parameters.
PowerShellMaxConcurrency	The *PowerShellMaxConcurrency* parameter specifies different information depending on context: In the context of Remote PowerShell, the *PowerShellMaxConcurrency* parameter specifies the maximum number of Remote PowerShell sessions that a Remote PowerShell user can have open at the same time. In the context of Exchange Web Services, the *PowerShellMaxConcurrency* parameter specifies the number of concurrent cmdlet executions that a user can have at the same time. This parameter value doesn't necessarily correlate to the number of browsers opened by the user
RecipientRateLimit	The *RecipientRateLimit* parameter specifies the limits on the number of recipients that a user can address in a 24-hour period.

For more details about Exchange 2010 throttling policies, see Understanding Client Throttling Policies.

Role-Based Access Control

Role-Based Access Control (RBAC) is the new permissions model in Exchange 2010 that allows you to control, at both broad and granular levels, what administrators and users can do. With RBAC, it's no longer required to modify Access Control Lists (ACLs) on Active Directory objects such as Organizational Units and containers to allow granular delegation of permissions to groups such as helpdesk operators or for functions such as recipient management. Active Directory

For more details, see Understanding Role Based Access Control. For a list of default RBAC management roles included in Exchange 2010, see Built-in Management Roles. For a list of default role groups, see Built-in Role Groups.

Role groups created by Exchange 2010 Setup or by you are created in Active Directory as universal security groups in the Microsoft Exchange Security Groups OU. You can add members to a role group by using the **New-RoleGroupMember** cmdlet or by using the Exchange Control Panel (ECP). When you add a member to a role group, the user or group is added to the corresponding Active Directory security group. You can use a Restricted Group policy to restrict membership for critical RBAC role groups such as Discovery Management. When you implement a Restricted Group policy, the group membership is monitored by Active Directory domain controllers and any users not included in the policy are automatically removed.

Important:
If you use Restricted Groups to restrict group membership for RBAC role groups, any changes you make to a role group using Exchange 2010 tools must also be made in the Restricted Group policy in Active Directory. For details, see Group Policy Security Settings.

Active Directory

Exchange Server stores configuration data in the Configuration partition and recipient data in the Domain partition of Active Directory Domain Services (AD DS). For details about permissions required to set up an Exchange 2010 organization, see Exchange 2010 Deployment Permissions Reference. Communication with Active Directory domain controllers is secured by using Kerberos authentication and encryption.

Exchange 2010 provides a new authorization layer inside Exchange, known as Role Based Access Control (RBAC), instead of relying on applying access control entries (ACEs) for every account that requires the appropriate permissions. In earlier versions of Microsoft Exchange, Exchange Setup relied on ACEs within Active Directory for Exchange administrators to be able to manage objects within the domain partition. Exchange administrators are granted the ability to perform certain operations within a specific scope through RBAC. The Exchange server runs the authorized actions on behalf of the administrator or users by using the permissions granted within Active Directory through the Exchange Windows Permissions and Exchange Trusted Subsystem security groups. For more information on RBAC, see Understanding Role Based Access Control.

In Exchange 2010, /PrepapareDomain doesn't apply any ACEs for the Exchange Windows Permissions universal security group to the **AdminSDHolder** container in Active Directory. If /PrepareDomain detects any ACEs granted to the Exchange Windows Permissions universal security group, the ACEs are removed. This has the following implications:

- Members of the Exchange Windows Permissions universal security group can't modify membership of protected security groups such as Enterprise Admins and Domain Admins. This has the following implications.
- Members of the Exchange Windows Permissions universal security group can't force password reset of an account protected by the **AdminSDHolder**.
- Members of the Exchange Windows Permissions universal security group can't alter the permissions of any group or account protected by the AdminSDHolder.

As a best practice, we recommend that you don't mailbox-enable accounts protected by the **AdminSDHolder** and do maintain separate accounts for Active Directory administrators: one account for Active Directory administration, and one account for regular day-to-day use, including e-mail. For details, see the following topics:

- Description and Update of the Active Directory AdminSDHolder Object
- Exchange 2010 and Resolution of the AdminSDHolder Elevation Issue

Exchange Server Accounts

Exchange 2010 Setup creates a new organizational unit (OU) in the root domain called Microsoft Exchange Security Groups. The following table shows the new universal security groups.

Microsoft Exchange security groups

Security group	Description
Exchange All Hosted Organizations	This group contains all the Exchange Hosted Organization Mailboxes groups. It's used for applying Password Setting Objects to all hosted mailboxes. This group shouldn't be deleted.
Exchange Servers	This group contains all the Exchange servers. This group should not be deleted. We strongly discourage making any membership changes to this group.

Exchange Trusted Subsystem	This group contains Exchange servers Exchange run Exchange cmdlets on behalf of users via Management service. Its members will have permission to read and modify all Exchange configuration, and also user accounts and groups. This group shouldn't be deleted.
Exchange Windows Permissions	This group contains Exchange servers that run Exchange cmdlets on behalf of users via Management service. Its members will have permission to read and modify all Windows accounts and groups. This group should not be deleted. We strongly discourage making any membership changes to this group, and suggest monitoring group membership.
ExchangeLegacyInterop	This group is for interoperability with Exchange 2003 servers within the same forest. This group should not be deleted.

In addition to these security groups, setup also creates the following security groups that correspond to RBAC role groups with the same name.

Security groups that correspond to RBAC role groups

Security group	RBAC role group
Delegated Setup	Delegated Setup
Discovery Management	Discovery Management
Help Desk	Help Desk
Hygiene Management	Hygiene Management
Organization Management	Organization Management
Public Folder Management	Public Folder Management
Recipient Management	Recipient Management
Records Management	Records Management
Server Management	Server Management
UM Management	UM Management
View-Only Organization Management	View-Only Organization Management

Also, when you create a new role group, Exchange 2010 creates a security group with the same name as the role group. For details, see the following topics:

- Built-in Role Groups
- Create a Role Group

Users are added or removed from these security groups when you add or remove users from role groups using the **Add-RoleGroupMember** or **Remove-RoleGroupMember** cmdlets, or by using the **Role Based Access Control (RBAC) User Editor** in the ECP.

File system

Exchange 2010 Setup creates directories with minimum permissions required for Exchange 2010 to function. We don't recommend any additional hardening of permissions to the default access control lists (ACLs) on directories created by setup.

Services

Exchange 2010 Setup doesn't disable any Windows services by default. The following table lists services enabled by default on each server role. Only the services required for operation of a particular Exchange 2010 server role are enabled by default.

Services installed by Exchange Setup

Service name	Service short name	Security context	Description and dependencies	Default startup type	Server roles	Required (R) or optional (O)
Microsoft Exchange Active Directory Topology	MSExchangeADTopology	Local System	Provides Active Directory topology information to Exchange services. If this service is stopped, most Exchange services cannot start. This service has no dependencies.	Automatic	Mailbox, Hub Transport, Client Access, Unified Messaging	R
Microsoft Exchange ADAM	ADAM_MSExchange	Network Service	Stores configuration data and recipient data on the Edge Transport server. This service represents the named instance of Active Directory Lightweight Directory Service (AD LDS) that's automatically created by	Automatic	Edge Transport	R

			Setup during Edge Transport server installation. This service depends on the COM+ Event System service.			
Microsoft Exchange Address Book	MSExchangeAB	Local System	Manages client address book connections. This service depends on the Microsoft Exchange Active Directory Topology service.	Automatic	Client Access	R
Microsoft Exchange Anti-spam Update	MSExchangeAntispamUpdate	Local System	Provides the Microsoft Forefront Protection 2010 for Exchange Server anti-spam update service. On Hub Transport servers, this service depends on the Microsoft Exchange Active Directory Topology service. On Edge Transport servers, this service depends on the Microsoft Exchange ADAM service.	Automatic	Hub Transport, Edge Transport	O

Microsoft Exchange Credential Service	MSExchangeEdgeCredential	Local System	Monitors credential changes in AD LDS and installs the changes on the Edge Transport server. This service depends on the Microsoft Exchange ADAM service.	Automatic	Edge Transport	R
Microsoft Exchange EdgeSync	MSExchangeEdgeSync	Local System	Connects to an AD LDS instance on subscribed Edge Transport servers over a secure LDAP channel to synchronize data between a Hub Transport server and an Edge Transport server. This service depends on the Microsoft Exchange Active Directory Topology service. If Edge Subscription isn't configured, this service can be disabled.	Automatic	Hub Transport	O
Microsoft Exchange File Distribution	MSExchangeFDS	Local System	Distributes offline address book (OAB) and custom Unified	Automatic	Client Access, Unified Messaging	R

			Messaging prompts. This service depends on the Microsoft Exchange Active Directory Topology and Workstation services.			
Microsoft Exchange Forms-Based Authentication	MSExchangeFBA	Local System	Provides forms-based authentication to Outlook Web App and the Exchange Control Panel. If this service is stopped, Outlook Web App and the Exchange Control Panel won't authenticate users. This service has no dependencies.	Automatic	Client Access	R
Microsoft Exchange IMAP4	MSExchangeIMAP4	Network Service	Provides IMAP4 service to clients. If this service is stopped, clients won't be able to connect to this computer using the IMAP4 protocol. This service depends on the Microsoft Exchange Active	Manual	Client Access	O

			Directory Topology service.			
Microsoft Exchange Information Store	MSExchangeIS	Local System	Manages the Exchange Information Store. This includes mailbox databases and public folder databases. If this service is stopped, mailbox databases and public folder databases on this computer are unavailable. If this service is disabled, any services that explicitly depend on it will fail to start. This service is dependent on the RPC, Server, Windows Event Log, and Workstation services.	Automatic	Mailbox	R
Microsoft Exchange Mail Submission Service	MSExchangeMailSubmission	Local System	Submits messages from the Mailbox server to Exchange 2010 Hub Transport servers. This service depends on the Microsoft	Automatic	Mailbox	R

			Exchange Active Directory Topology service.			
Microsoft Exchange Mailbox Assistants	MSExchange MailboxAssistants	Local System	Performs background processing of mailboxes in the Exchange store. This service depends on the Microsoft Exchange Active Directory Topology service.	Automatic	Mailbox	R
Microsoft Exchange Mailbox Replication Service	MSExchange MailboxReplication	Local System	Processes mailbox moves and move requests. This service depends on the Microsoft Exchange Active Directory Topology and Net.Tcp Port Sharing service.	Automatic	Client Access	O
Microsoft Exchange Monitoring	MSExchange Monitoring	Local System	Allows applications to call the Exchange diagnostic cmdlets. This service has no dependencies.	Manual	All	O
Microsoft Exchange POP3	MSExchange POP3	Network Service	Provides POP3 service to clients. If this service is stopped, clients can't connect to this	Manual	Client Access	O

			computer using the POP3 protocol. This service depends on the Microsoft Exchange Active Directory Topology service.			
Microsoft Exchange Protected Service Host	MSExchangeProtectedServiceHost	Local System	Provides a host for several Exchange services that must be protected from other services. This service depends on the Microsoft Exchange Active Directory Topology service.	Automatic	Hub Transport, Client Access	R
Microsoft Exchange Replication Service	MSExchangeRepl	Local System	Provides replication functionality for mailbox databases on Mailbox servers in a database availability group (DAG). This service depends on the Microsoft Exchange Active Directory Topology service.	Automatic	Mailbox	O
Microsoft Exchange RPC Client Access	MSExchangeRPC	Network Service	Manages client RPC connections for	Automatic	Mailbox, Client Access	O (Mailbox), R (Client Access)

			Exchange. This service depends on the Microsoft Exchange Active Directory Topology service.			
Microsoft Exchange Search Indexer	MSExchange Search	Local System	Drives indexing of mailbox content, which improves the performance of content search. This service depends on the Microsoft Exchange Active Directory Topology and Microsoft Search (Exchange Server) services.	Automatic	Mailbox	O
Microsoft Exchange Server Extension for Windows Server Backup	WSBExchange	Local System	Enables Windows Server Backup users to back up and recover application data for Microsoft Exchange. This service has no dependencies.	Manual	Mailbox	O
Microsoft Exchange Service Host	MSExchange ServiceHost	Local System	Provides a host for several Exchange services. On internal server roles,	Automatic	All	R

			this service depends on the Microsoft Exchange Active Directory Topology service. On Edge Transport servers, this service depends on the Microsoft Exchange ADAM service.			
Microsoft Exchange Speech Engine	MSSpeechService	Network Service	Provides speech processing services for Unified Messaging. This service depends on the Windows Management Instrumentation (WMI) service.	Automatic	Unified Messaging	R
Microsoft Exchange System Attendant	MSExchangeSA	Local System	Forwards directory lookups to a global catalog server for legacy Outlook clients, generates e-mail addresses and OABs, updates free/busy information for legacy clients, and maintains permissions and group memberships for the	Automatic	Mailbox	R

			server. If this service is disabled, any services that explicitly depend on it will fail to start. This service is dependent on the RPC, Server, Windows Event Log, and Workstation services.			
Microsoft Exchange Throttling	MSExchange Throttling	Network Service	Limits the rate of user operations. This service depends on the Microsoft Exchange Active Directory Topology service.	Automatic	Mailbox	R
Microsoft Exchange Transport	MSExchange Transport	Network Service	Provides SMTP server and transport stack. On Hub Transport servers, this service depends on the Microsoft Exchange Active Directory Topology service. On Edge Transport servers, this service depends on the Microsoft Exchange ADAM service.	Automatic	Hub Transport, Edge Transport	R

Microsoft Exchange Transport Log Search	MSExchangeTransportLogSearch	Local System	Provides remote search capability for Microsoft Exchange Transport log files. On Hub Transport servers, this service depends on the Microsoft Exchange Active Directory Topology service. On Edge Transport servers, this service depends on the Microsoft Exchange ADAM service.	Automatic	Hub Transport, Mailbox, Edge Transport	O
Microsoft Exchange Unified Messaging	MSExchangeUM	Local System	Enables Microsoft Exchange Unified Messaging features. This allows voice and fax messages to be stored in Exchange and gives users telephone access to e-mail, voice mail, calendar, contacts, or an auto attendant. If this service is stopped, Unified Messaging isn't	Automatic	Unified Messaging	R

			available. This service depends on the Microsoft Exchange Active Directory Topology and the Microsoft Exchange Speech Engine service.			
Microsoft Search (Exchange Server)	msftesql-Exchange	Local System	This is a Microsoft Exchange-customized version of Microsoft Search. This service is dependent on the RPC service.	Manual	Hub Transport, Mailbox	O

Certificates

Exchange 2010 Setup creates self-signed certificates to secure communication over different protocols such as HTTP, SMTP, POP3 and IMAP4. The self-signed certificates created by Setup are valid for five years. This ensures that the self-signed certificates don't have to be renewed for a significant part of an Exchange 2010 deployment and messaging services aren't affected by the expiration of self-signed certificates.

For external client access mechanisms and protocols, such as Outlook Web App, POP3, IMAP4, Outlook Anywhere, and AutoDiscover, we recommend that you:

- Use certificates signed by a commercial certification authority (CA) that's trusted by clients accessing those services.
- Use the New Exchange Certificate wizard or the New-ExchangeCertificate cmdlet to create certificate signing requests for commercial CAs. Certificate requests generated using these tools ensure that all Exchange certificate requirements are met.
- Consider the certificate requirements for each protocol or service for which you want to allow external client access.
  - On Client Access servers, certificates are used to protect HTTP traffic (Outlook Anywhere, Outlook Web App, AutoDiscover, Exchange ActiveSync, and Exchange Web Services) by using Secure Sockets Layer, and POP3 and IMAP4 traffic by using SSL or Transport Layer Security (TLS). For details, see Managing SSL for a Client Access Server.
  - On transport servers, certificates are used to protect SMTP traffic by using TLS. For details, see Understanding TLS Certificates.
  - On Unified Messaging servers, certificates are used to protect Voice over Internet Protocol (VoIP) traffic. For details, see Understanding Unified Messaging VoIP Security.
  - For Federation, certificates are used to encrypt SAML tokens exchanged with the Microsoft Federation Gateway (MFG) and with federated partner

organizations. For details, see Understanding Federation.

- Monitor certificate validity dates and renew certificates from CAs in a timely manner to avoid service disruption.
- When storing certificates exported with the associated private key, protect the exported file by using appropriate access controls on the folder/file where it's stored. Depending on your organization's security requirements, consider enabling auditing of file access for folders where certificate files with private keys are stored.

NTLM Considerations

The NTLM protocol is significantly less secure than the Kerberos protocol. In Exchange 2010, the POP3 and IMAP4 protocols don't support NTLM authentication when `SecureLogin` is specified as the *LoginType*. For details, see Configuring Authentication for POP3 and IMAP4. Exchange 2010 services that use Windows Integrated Authentication can use either NTLM or Kerberos protocols. Kerberos is used for Client Access server communication to an Exchange 2010 Mailbox server, and between Client Access servers for Outlook Web App, Exchange ActiveSync, and Exchange Web Services. For details about services that use NTLM to authenticate, see Exchange Network Port Reference.

Dual Factor Authentication

Dual factor authentication mechanisms use another authenticator in addition to the user's logon credentials (username and password), such as randomly generated tokens, or a digital certificate on a smartcard along with a PIN. Many organizations deploy dual factor authentication to allow secure access to the organization's network.

Exchange 2010 doesn't include native support for dual factor authentication. Exchange 2010 uses Internet Information Server (IIS) 7 for client access through HTTP (AutoDiscover, Outlook Web App, Outlook Anywhere, Exchange ActiveSync, and Exchange Web Services). Many dual factor authentication products that integrate with IIS are available from partners and third parties, and work with Exchange client access services such as Outlook Web App. Before deploying dual factor authentication products for Exchange services, we recommend that you test them adequately to ensure they meet your organization's security requirements and provide the functionality you require.

Federation

Exchange 2010 introduces new federation features to enable secure collaboration between federated Exchange organizations. Exchange 2010 organizations can create a federation trust with the Microsoft Federation Gateway, and then establish organization relationships with other federated organizations to share availability information and Calendars. Organizations can also allow users to share their availability information, Calendar and Contacts with users in external federated organizations by using Sharing Policies. For more details about Federation Trusts and Federated Sharing, see Understanding Federation and Understanding Federated Delegation.

After you establish a Federation Trust with MFG, sharing between two federated organizations doesn't occur unless you create an Organization Relationship. By default, however, sharing between your users and users in external federated organizations is enabled by using the Default Sharing Policy assigned to users. The policy allows Calendar sharing with free/busy information only to users in all external federated organizations. If you don't want to allow users to share their calendar and free/busy information with users in all external federated domains, you must disable the Default Sharing Policy or change the domain name specified in the policy to only those domains you want to allow sharing with. You must make this change before you create a Federation Trust with MFG. For more details, see Disable a Sharing Policy and Configure Sharing Policy Properties.

You can disable all Federation features for an organization, including Federated Delegation, by removing the organization's Federation Trust with MFG. For more details, see Remove a Federation Trust.

Secure/Multipurpose Internet Mail Extensions (S/MIME)

Secure/Multipurpose Internet Mail Extensions (S/MIME) is a standard for public key encryption and signing of MIME data which provides authentication, message integrity, nonrepudiation, and data privacy for messaging data. Users can sign or encrypt messages, or both, using S/MIME certificates. For more information about S/MIME, see Understanding S/MIME.

S/MIME is a client-side technology without any interoperability requirements for e-mail servers. From a message transfer perspective, S/MIME signed or encrypted messages are transferred no differently than clear text (not encrypted) messages. Actual rendering of message is done on the client-side after certificate and message validation checks. For Outlook Web App, S/MIME support is provided by using an ActiveX control. Although Outlook Web App supports most popular browsers such as Microsoft Internet Explorer, Mozilla FireFox and Safari, ActiveX controls are an Internet Explorer feature. Outlook Web App users using other browsers can't access S/MIME features and may have to use another e-mail client which supports S/MIME. For more details about S/MIME support in Outlook Web App, see Outlook Web App and S/MIME.

For more details about S/MIME support in Outlook, see Overview of certificates and cryptographic e-mail messaging in Outlook.

Whereas S/MIME offers security benefits to an organization, when you evaluate the technology, you should consider the following:

- S/MIME encrypted messages are opaque to your organization. Messaging security software such as antivirus and anti-spam can't inspect message content, including message body and any attachments.
- Because message content and attachments are encrypted, your organization's messaging policies, including transport rules, can't be applied to S/MIME-encrypted messages.
- Modifying S/MIME-signed messages to comply with your organization's messaging policies, for example to apply a disclaimer or personalized signature, invalidates the message.
- Encrypted messaging content can't be inspected for any content violations, and your organization can't protect sensitive information. This includes any personally identifiable information (PII), from leaving the organization.
- S/MIME-encrypted messages can't be indexed by Exchange Search and are therefore not searchable by discovery.
- To meet local regulations or discovery requirements during litigation, your organization may be required to produce copies of all encrypted messages that are not encrypted.

Exchange 2010 offers Information Rights Management (IRM) features that allow your organization to apply persistent protection to sensitive messaging content so only specified recipients can access IRM-protected messages. Your organization can also implement controls on how such content is used after it's delivered to recipients. For example, you can prevent messages from being printed, replied to, or forwarded inside or outside the organization. Also, your organization can still decrypt the IRM-protected content for scanning by antivirus and anti-spam software and other transport agents, applying messaging policies using transport rules, and enable archiving and discovery of IRM-protected messages. IRM features are also available in all web browsers supported

by Outlook Web App and in Windows Mobile devices. For more details about IRM, see Understanding Information Rights Management.

Server Role Considerations

This section lists security-related considerations for the Exchange 2010 server role.

Mailbox Server Considerations

In Exchange 2010, architectural changes have been made to the Exchange store and connectivity from MAPI clients such as Outlook. MAPI clients connect to the Client Access Server, isolating the Mailbox server from client traffic. Mailbox servers communicate only with Client Access servers that use RPCSec, and with Active Directory Domain Services (AD DS) servers in your organization. Mailbox servers don't require Internet connectivity.

Storage

Storage is a critical component of Mailbox servers. You must plan your Mailbox server storage sub-system to ensure satisfactory performance and adequate storage space is available for your deployment. For more details about planning for Mailbox server storage, see Mailbox Server Storage Design.

After Mailbox server deployment, you should monitor the following the following:

- Availability of storage sub-system.
- Availability of sufficient free disk space on volumes that contain the mailbox database and transaction logs. A mailbox or Public Folder database is unmounted when the volume storing the database or transaction logs for it run out of free disk space.

You can use Microsoft Federation Gateway Systems Center Operations Manager to monitor storage availability and disk free space. For more details, see Systems Center Operations Manager 2007.

When planning for and monitoring storage, if you plan to use the following features, you must consider their storage requirements:

- **Journaling** When you use journaling to keep messages for long-term archival, depending on whether you use standard (per-mailbox database) or premium journaling (journal rules), messages sent to and from all recipients in a mailbox database or the recipients specified in a journal rule are delivered in a journal report to the journaling mailbox or recipient specified. The result can be a large number of journal reports delivered to a journaling mailbox. When planning storage for Mailbox servers, you must consider journaling mailbox sizes. You can control journaling mailbox sizes by configuring sufficient mailbox quotas for a journaling mailbox. For more details about journaling and mailbox quotas, see the following topics:
  - Understanding Journaling
  - Configure Storage Quotas for a Mailbox
- **Litigation Hold** When you place a mailbox on litigation hold, items deleted by the user by using the Recover Deleted Items functionality in Outlook and Outlook Web App and messages deleted by automated processes such as MRM are retained till litigation hold is removed. In Exchange 2010, the Recoverable Items warning quota and Recoverable Items quota are set to 20 GB and 30 GB. For more details, see the following topics:
  - Understanding Litigation Hold
  - Understanding Recoverable Items

High Availability

High Availability of Mailbox servers is critical in ensuring messaging service availability. Exchange 2010 includes Database Availability Groups (DAGs) for high availability of Mailbox servers. DAGs can provide availability when your Exchange deployment

experiences a failure of the storage sub-system, the server, or network connectivity, or an outage of a whole datacenter. For more details about planning and implementing a highly available Exchange 2010 deployment, see High Availability and Site Resilience.

By default, in Exchange 2010, replication (log shipping) traffic between DAG members located in different Active Directory sites is encrypted. You can encrypt replication traffic between servers in the same Active Directory site by setting the NetworkEncryption property of the DAG to Enabled. Use the **Set-DatabaseAvailabilityGroup** cmdlet to modify this property for a DAG.

Replication occurs over a single TCP port, by default TCP port 64327. You can modify the port used for replication. For details, see Configure Database Availability Group Properties.

Parameters for high availability

Parameter	Description
NetworkEncryption	The *NetworkEncryption* parameter specifies whether network encryption is enabled. Valid values include: • `Disabled` disabled on all networks • `Enabled` enabled on all networks • `InterSubnetOnly` Enabled for inter-subnet communication only • `SeedOnly` enabled only for seeding **Default** `InterSubnetOnly`
ReplicationPort	The *ReplicationPort* parameter specifies a Transmission Control Protocol (TCP) port for replication (log shipping and seeding) activity. **Default** If this parameter isn't specified, the default port for replication is TCP 64327.

Mailbox Permissions and Access

By default, Exchange 2010 doesn't allow administrators to access mailboxes. If your organization uses applications or services that require access to a mailbox, you must assign appropriate mailbox permissions to accounts used by such applications or services. We recommend that you don't configure such applications or services to use administrator credentials.

Although all mailboxes can potentially contain sensitive information valuable to an organization, the following mailboxes deserve special attention from a security perspective, and permissions to access these mailboxes must be controlled and monitored to meet your organization's security requirements.

- **Discovery mailboxes** Discovery mailboxes are used by the Exchange 2010 Multi-Mailbox Search feature. This allows discovery managers who are members of the Discovery Management role group to search messages in all mailboxes in an Exchange 2010 organization. Messages returned by a discovery search are copied to the specified Discovery mailbox. Exchange 2010 Setup creates a default Discovery Search Mailbox. For more details, see Understanding Multi-Mailbox Search.
- **Journaling mailboxes** When you configure journaling for a mailbox database or create Journal Rules to journal messages to and from specified recipients, journal reports are delivered to the specified journaling mailbox. For more details, see the following topics:
  - Understanding Journaling
  - Create and Configure a Journaling Mailbox

In addition to protecting these mailboxes, notice that an administrator can use transport rules to inspect message content and also deliver a copy of the message to another recipient, even as a Bcc recipient. The permissions required to manage transport rules are listed in the Transport rules entry in the Messaging Policy and Compliance Permissions topic. We recommend that you use adequate controls to monitor and control the creation and modification of transport rules and that you also regularly audit transport rule actions for all rules.

Client Access Server Considerations

In Exchange 2010, the following clients connect to Client Access servers to access mailboxes:

- Outlook clients using MAPI
- Outlook clients using Outlook Anywhere
- Web browsers using Outlook Web App,
- Mobile devices using Exchange ActiveSync
- POP3 & IMAP4 clients
- Applications that use Exchange Web Services (EWS)

By default, these client access methods are secured by using encrypted data paths. Also by default, Outlook clients connecting to a Client Access server using MAPI use RPC encryption. Outlook Web App, Outlook Anywhere and Exchange ActiveSync access is secured by using Secure Sockets Layer (SSL).

For external client access, you must obtain and install certificates signed by a certification authority (CA) trusted by the client. For more details, see Managing SSL for a Client Access Server.

By default, POP3 and IMAP4 services are disabled on Exchange 2010 Client Access servers. If you enable them, we recommend that you use Transport Layer Security (TLS) or Secure Sockets Layer (SSL) to help secure communication by using these protocols. For more details, see the following topics:

- Understanding POP3 and IMAP4
- Configuring TLS and SSL for POP3 and IMAP4 Access

we recommend that you use appropriate firewalls and access controls when you publish Client Access servers for external access. Microsoft Forefront Threat Management Gateway (TMG) 2010 includes publishing wizards to easily and securely publish Exchange 2010 Client Access servers for external access. For more details, see Forefront Threat Management Gateway (TMG) 2010.

Important:
Locating Client Access servers on perimeter networks isn't supported.

On Client Access servers, Internet Information Server (IIS) is used to provide HTTP protocol access to services such as Outlook Web App, Exchange ActiveSync, Outlook Anywhere, AutoDiscover, Exchange Control Panel (ECP), Exchange Web Services and Offline Address Book (OAB). Remote PowerShell also uses IIS, And all RPS requests, including requests by the Exchange Management Console (EMC), are logged in IIS logs. IIS logs can grow to consume a large amount of disk space. IIS, a Windows Server component, doesn't include a mechanism to clear older logs based on the size of the directory in which the log files reside. As a best practice, IIS logs should be moved to a non-system volume, so growth of log files doesn't result in the system volume running out of disk space, which can cause a service outage. You should monitor log file growth and implement a mechanism to manually archive or delete logs as required. For details, see Configuring Logging in IIS 7.

Transport Server Considerations

Exchange 2010 offers two transport server roles that are designed for different purposes.

- **Edge Transport** The Edge Transport server role is a non-domain joined

transport server, usually located in perimeter networks, that transfers messages between your Exchange organization and external SMTP hosts. Although designed for perimeter networks, you can also locate Edge Transport servers on the internal network and join the server to an Active Directory domain as a member server.

- **Hub Transport** The Hub Transport server role transfers messages within the organization, including messages between Exchange servers, messages from SMTP clients such as users using POP3 and IMAP4, and application servers and devices.

By default, in Exchange 2010, SMTP communication is secured using TLS.

SMTP communication between Hub Transport servers Hub Transport servers in an Exchange organization use TLS to help secure SMTP communication within the organization. We recommend that you keep TLS enabled on Hub Transport servers. In Exchange 2010, organizations using non-Exchange devices or appliances to perform TLS encryption can offload TLS from Hub Transport servers to such appliances. For more details, see Disabling TLS Between Active Directory Sites to Support WAN Optimization.

SMTP communication between Hub Transport and Edge Transport servers All traffic between Hub Transport servers and Edge Transport servers is authenticated and encrypted. The underlying mechanism for authentication and encryption is mutual TLS. Instead of using X.509 validation to validate certificates, Exchange 2010 uses direct trust to authenticate certificates. Direct trust means the presence of the certificate in Active Directory or Active Directory Lightweight Directory Services (AD LDS) validates the certificate. Active Directory is considered a trusted storage mechanism. When direct trust is used, it doesn't matter whether the certificate is self-signed or signed by a certification authority (CA).When you subscribe an Edge Transport server to an Active Directory site, the Edge Subscription publishes the Edge Transport server's certificate in Active Directory. Hub Transport servers consider the published certificate valid. The Microsoft EdgeSync service updates AD LDS on Edge Transport servers that have Hub Transport server certificates, which are considered valid by the Edge Transport server.

SMTP communication between Edge Transport servers and external hosts In Exchange 2010, SMTP communication between Edge Transport servers and anonymous external hosts is secured by default using opportunistic TLS. You don't require a certificate issued by a trusted CA and no configuration steps are necessary. Receive Connectors offer TLS negotiation for inbound SMTP connections. Send Connectors also tries TLS negotiation for all outbound SMTP connections. Opportunistic TLS doesn't perform certificate validation, allowing the use of self-signed certificates. For details, see TLS Functionality and Related Terminology in Exchange 2010.

Note:

By default, Hub Transport servers can't communicate with external SMTP hosts as no Receive Connectors exist on Hub Transport servers that allow anonymous hosts to communicate. You can configure Hub Transport servers to communicate with anonymous hosts. For details, see Configure Internet Mail Flow Directly Through a Hub Transport Server. We don't recommend this topology because it increases security risks by exposing to the Internet the Exchange 2010 server and all roles installed on that server. We recommend that you implement a perimeter network-based SMTP gateway, such as the Edge Transport server, instead.

SMTP communication between Hub or Edge Transport servers and smart hosts In Exchange 2010, you can configure a Send Connector to route mail for remote domains, including Internet mail, to a SMTP gateway generally residing on the perimeter network. Although it's possible to create a Send Connector to route e-mail to a smart host without using any authentication, we recommend that you use appropriate authentication for such connectors. If you use Basic authentication, we recommend using Basic authentication over TLS. If you select the externally secured option, it's assumed that authentication is performed using a non-Exchange mechanism such as IPsec. When you

configure the connector with the address of a smart host, you can use either the smart host's IP address or its fqdn. We recommend using the smarthost's IP address because it offers protection against DNS poisoning, versus the convenience of using the FQDN.

Using Domain Security for SMTP communication with partners In Exchange 2010, you can use Domain Security to help secure message communication paths with partner domains. Domain Security uses mutual TLS to provide session-based encryption and authentication. For mutual TLS authentication, the source and destination hosts verify the connection by performing X.509 certificate validation. Transport servers communicating with partner domains configured for Domain Security require a certificate signed by a trusted third party or an internal certification authority. If using an internal CA, the certificate revocation list (CRL) must be published and reachable by the partner host. For details, see the following topics:

- Understanding Domain Security
- White Paper: Domain Security in Exchange 2007

Exchange 2010 uses the default SMTP port (TCP port 25) for SMTP communication. Exchange Setup creates the required firewall rules in Windows Firewall with Advanced Security to allow communication over default ports. If you specify a different port for a connector, Exchange doesn't modify firewall rules or automatically create a new rule to allow communication over the nondefault port. You must manually modify firewall configuration to allow communication over nondefault ports. When you configure a receive connector for a nondefault port, the SMTP clients submitting messages to the connector must also be configured to use the nondefault port.

In Exchange 2010, you can locate the Hub Transport server role on an Exchange 2010 Mailbox server. This includes a Mailbox server that's a member of a Database Availability Group (DAG). We recommend that you don't locate the Hub Transport server role on a Mailbox server, especially in topologies where no Edge Transport servers are deployed, in order to isolate Mailbox servers from the Internet. You can locate Hub Transport server role on Client Access servers. You must follow the sizing guidelines for each server role when collocating server roles on the same server.

When specifying a smart host for a Send Connector on a Hub Transport or an Edge Transport server, we recommend that you use IP addresses instead of the fully qualified domain name (FQDN) of a smart host, to protect from DNS poisoning and spoofing. This also minimizes the effect of any DNS outages on the transport infrastructure. DNS servers used in perimeter networks must be used only for outbound resolution. The perimeter DNS servers may contain records for Hub Transport servers. You can also use Hosts files on Edge Transport servers to avoid creating records for Hub Transport servers on DNS servers located in perimeter networks.

In addition to the steps discussed in this section, you should consider using sufficient message size restrictions on connectors, and message throttling settings on transport servers. For more details, see the following topics:

- Understanding Message Size Limits
- Understanding Message Throttling

Unified Messaging Considerations

When planning to deploy Unified Messaging (UM) server role, you must consider the different communication channels used by UM to communicate with IP gateways or IP PBX.

By default, when you create a UM dial plan, it will communicate in an unsecured mode. Also, the Unified Messaging servers associated with the UM dial plan will send and receive data from IP gateways, IP PBXs, and other Exchange 2010 computers by using no encryption. In unsecured mode, both the Real-Time Transport Protocol (RTP) media channel and SIP signaling information won't be encrypted.

You can configure a Unified Messaging server to use mutual TLS to encrypt the SIP and

RTP traffic sent and received from other devices and servers. When you add a Unified Messaging server to a UM dial plan and configure the dial plan to use SIP secured mode, only the SIP signaling traffic will be encrypted, and the RTP media channels will still use TCP. TCP isn't encrypted. However, if you add a Unified Messaging server to a UM dial plan and configure the dial plan to use secured mode, both the SIP signaling traffic and the RTP media channels are encrypted. A secure signaling media channel that uses Secure Real-Time Transport Protocol (SRTP) also uses mutual TLS to encrypt the VoIP data.

If the IP gateway or IP PBX you use supports IPsec, you can also use IPsec to help secure the communication between a UM server and the IP gateway or IP PBX.

For more details, see Understanding Unified Messaging VoIP Security.

UM also submits messages such as missed call notifications and voice mail messages to Hub Transport servers. By default, this communication occurs over SMTP using TLS encryption.

You can configure a UM mailbox policy for PIN-less access. This allows a caller to access voice mail without having to enter a PIN, based on the CallerID of the call. Spoofing of CallerID is insignificant. We recommend that you not enable PIN-less access to voice mail. Also, we recommend that you review the default PIN settings and configure them to meet your organization's security requirements. The following settings can be configured for a UM mailbox policy using the **Set-UMMailboxPolicy** cmdlet.

Parameters to control user PIN for voice mail access

Parameter	Description
AllowCommonPatterns	The *AllowCommonPatterns* parameter specifies whether to allow obvious PINs. Examples of obvious PINs include subsets of the telephone number, sequential numbers, or repeated numbers. If set to $false, sequential and repeated numbers and the suffix of the mailbox extension are rejected. If set to $true, only the suffix of the mailbox extension is rejected.
AllowPinlessVoiceMailAccess	The *AllowPinlessVoiceMailAccess* parameter specifies whether users associated with the UM mailbox policy are required to use a PIN to access their voice mail. A PIN is still required to access their e-mail and calendar. **Default** disabled (`$false`).
LogonFailusresBeforePINReset	The *LogonFailuresBeforePINReset* parameter specifies the number of sequential unsuccessful logon attempts before the mailbox PIN is automatically reset. To disable this feature, set this parameter to Unlimited. If this parameter isn't set to Unlimited, it must be set to less than the value of the *MaxLogonAttempts* parameter. The range is from 0 through 999. **Default** 5 failures.
MaxLogonAttempts	The *MaxLogonAttempts* parameter specifies the number of times users can try unsuccessfully to log on, in sequence,

	before the UM mailboxes are locked. The range is from 1 through 999. **Default** 15 attempts.
MinPINLength	The *MinPINLength* parameter specifies the minimum number of digits required in a PIN for UM-enabled users. The range is from 4 through 24. **Default** 6 digits
PINHistoryCount	The *PINHistoryCount* parameter specifies the number of previous PINs that are remembered and aren't allowed during a PIN reset. This number includes the first time that the PIN was set. The range is from 1 through 20. **Default** 5 PINs
PINLifetime	The *PINLifetime* parameter specifies the number of days until a new password is required. The range is from 1 through 999. If you specify Unlimited, the users' PINs won't expire. **Default** 60 days

In Exchange 2010, voice mail messages can be marked as protected. Voice mail messages are protected using Information Rights Management (IRM). You can configure voice mail protection settings by configuring the following parameter in a UM mailbox policy. For more details, see the following topics:

- Understanding Protected Voice Mail
- Understanding Information Rights Management

Protected voice mail parameters

Parameter	Description
ProtectAuthenticatedVoicemail	The *ProtectAuthenticatedVoiceMail* parameter specifies whether Unified Messaging servers that answer Outlook Voice Access calls for UM-enabled users associated with the UM mailbox policy create protected voice mail messages. If the value is set to Private, only messages marked as private are protected. If the value is set to All, every voice mail message is protected. **Default** None (No protection is applied to voice mail messages)
ProtectUnauthenticatedVoiceMail	The *ProtectUnauthenticatedVoiceMail* parameter specifies whether the Unified Messaging servers that answer calls for UM-enabled users associated with the UM mailbox policy create protected voice mail messages. This also applies when a message is sent from a UM auto attendant to a UM-enabled user associated with the

	UM mailbox policy. If the value is set to Private, only messages marked as private are protected. If the value is set to All, every voice mail message is protected. **Default** None (No protection is applied to voice mail messages)
RequireProtectedPlayOnPhone	The *RequireProtectedPlayOnPhone* parameter specifies whether users associated with the UM mailbox policy can only use Play on Phone for protected voice mail messages or whether users can use multimedia software to play the protected message. **Default** `$false`. Users are able to use both methods to listen to protected voice mail messages.

Important:

For UM servers to continue to answer calls, it's critical that they have access to Active Directory. We recommend that you monitor Active Directory availability

1.12.2 Exchange Network Port Reference

Exchange Network Port Reference

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-09-25*

This topic provides information about ports, authentication, and encryption for all data paths that are used by Microsoft Exchange Server 2010. The "Notes" sections that follow each table clarify or define non-standard authentication or encryption methods.

Transport Servers

Exchange 2010 includes two server roles that perform message transport functionality: Hub Transport server and Edge Transport server.

The following table provides information about ports, authentication, and encryption for data paths between these transport servers and other Exchange 2010 servers and services.

Transport server data paths

Data path	Required ports	Default authentication	Supported authentication	Encryption supported?	Encrypted by default?
Hub Transport server to Hub Transport server	25/TCP (SMTP)	Kerberos	Kerberos	Yes, using Transport Layer Security (TLS)	Yes
Hub Transport server to Edge Transport server	25/TCP (SMTP)	Direct trust	Direct trust	Yes, using TLS	Yes
Edge Transport server to Hub Transport server	25/TCP (SMTP)	Direct trust	Direct trust	Yes, using TLS	Yes
Edge Transport server to Edge Transport server	25/TCP (SMTP)	Anonymous, Certificate	Anonymous, Certificate	Yes, using TLS	Yes
Mailbox server to Hub Transport server via the Microsoft Exchange Mail Submission Service	135/TCP (RPC)	NTLM. If the Hub Transport and the Mailbox server roles are on the same server, Kerberos is	NTLM/ Kerberos	Yes, using RPC encryption	Yes

		used.			
Hub Transport to Mailbox server via MAPI	135/TCP (RPC)	NTLM. If the Hub Transport and the Mailbox server roles are on the same server, Kerberos is used.	NTLM/ Kerberos	Yes, using RPC encryption	Yes
Unified Messaging server to Hub Transport server	25/TCP (SMTP)	Kerberos	Kerberos	Yes, using TLS	Yes
Microsoft Exchange EdgeSync service from Hub Transport server to Edge Transport server	50636/TCP (SSL)	Basic	Basic	Yes, using LDAP over SSL (LDAPS)	Yes
Active Directory access from Hub Transport server	389/TCP/UDP (LDAP), 3268/ TCP (LDAP GC), 88/TCP/ UDP (Kerberos), 53/TCP/UDP (DNS), 135/ TCP (RPC netlogon)	Kerberos	Kerberos	Yes, using Kerberos encryption	Yes
Active Directory Rights Management Services (AD RMS) access from Hub Transport server	443/TCP (HTTPS)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using SSL	Yes*
SMTP clients to Hub Transport server (for example, end-users using Windows Live Mail)	587 (SMTP) 25/TCP (SMTP)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using TLS	Yes

Notes on Transport Servers

- All traffic between Hub Transport servers is encrypted by using TLS with self-signed certificates that are installed by Exchange 2010 Setup.

Note:
In Exchange 2010, TLS can be disabled on Hub Transport servers for internal SMTP communication with other Hub Transport servers in the same Exchange organization. We don't recommend that you do this unless it is absolutely required. For more information, see Disabling TLS Between Active Directory Sites to Support WAN Optimization.

- All traffic between Edge Transport servers and Hub Transport servers is authenticated and encrypted. Mutual TLS is the underlying mechanism for authentication and encryption. Instead of using X.509 validation, Exchange 2010 uses *direct trust* to authenticate the certificates. Direct trust means that the presence of the certificate in Active Directory or Active Directory Lightweight Directory Services (AD LDS) acts as validation for the certificate. Active Directory is considered a trusted storage mechanism. When direct trust is used, it doesn't matter whether the certificate is self-signed or signed by a certification authority (CA). When you subscribe an Edge Transport server to the Exchange organization, the Edge Subscription publishes the Edge Transport server certificate in Active Directory for the Hub Transport servers to validate. The Microsoft Exchange EdgeSync service updates AD LDS together with the set of Hub Transport server certificates for the Edge Transport server to validate.
- EdgeSync uses a secure LDAP connection from the Hub Transport server to subscribed Edge Transport servers over TCP 50636. AD LDS also listens on TCP 50389. Connections to this port don't use SSL. You can use LDAP utilities to connect to the port and to check AD LDS data.
- By default, traffic between Edge Transport servers in two different organizations is encrypted. Exchange 2010 Setup creates a self-signed certificate, and TLS is enabled by default. This allows any sending system to encrypt the inbound SMTP session to Exchange. Also by default, Exchange 2010 tries TLS for all remote connections.
- Authentication methods for traffic between Hub Transport servers and Mailbox servers differ when the Hub Transport server roles and Mailbox server roles are installed on the same computer. When mail submission is local, Kerberos authentication is used. When mail submission is remote, NTLM authentication is used.
- Exchange 2010 also supports Domain Security. Domain Security refers to the functionality in Exchange 2010 and Microsoft Outlook 2010 that provides a low-cost alternative to S/MIME or other message-level, over-the-Internet security solutions. Domain Security provides you a way to manage secure message paths between domains over the Internet. After you configure these secure message paths, messages that have successfully traveled over the secure path from an authenticated sender are displayed to Outlook and Outlook Web Access users as "Domain Secured." For more information, see Understanding Domain Security.
- Many agents can run on Hub Transport servers and Edge Transport servers. Generally, anti-spam agents rely on information that's local to the computer on which the agents run. Therefore, a minimum of communication with remote computers is required. Recipient filtering is the exception. Recipient filtering requires calls to either AD LDS or Active Directory. As a best practice, run recipient filtering on the Edge Transport server. In this case, the AD LDS directory is on the same computer as the Edge Transport server. Therefore, no remote communication is required. When recipient filtering has been installed and configured on the Hub Transport server, recipient filtering accesses Active Directory.
- The Sender Reputation feature in Exchange 2010 uses the Protocol Analysis agent. This agent also makes various connections to outside proxy servers to determine inbound message paths for suspect connections.
- All other anti-spam functionality uses such data as safelist aggregation and recipient data for recipient filtering. This data is gathered, stored, and accessed only on the local computer. Frequently, the data is pushed to the

local AD LDS directory by using the Microsoft Exchange EdgeSync service.

- Information Rights Management (IRM) agents on Hub Transport servers make connections to Active Directory Rights Management Services (AD RMS) servers in the organization. AD RMS is a Web service that's secured by using SSL as a best practice. Communication with AD RMS servers occurs by using HTTPS, and Kerberos or NTLM is used for authentication, depending on the AD RMS server configuration.
- Journal rules, transport rules, and message classifications are stored in Active Directory and accessed by the Journaling agent and the Transport Rules agent on Hub Transport servers.

Mailbox Servers

Whether NTLM or Kerberos authentication is used for Mailbox servers depends on the user or process context that the Exchange Business Logic layer consumer is running under. In this context, the consumer is any application or process that uses the Exchange Business Logic layer. As a result, many entries in the **Default Authentication** column of the **Mailbox server data paths** table are listed as **NTLM/Kerberos**.

The Exchange Business Logic layer is used to access and communicate with the Exchange store. The Exchange Business Logic layer is also called from the Exchange store to communicate with external applications and processes.

If the Exchange Business Logic layer consumer is running as Local System, the authentication method is always Kerberos from the consumer to the Exchange store. Kerberos is used because the consumer must be authenticated by using the Local System computer account, and a two-way authenticated trust must exist.

If the Exchange Business Logic layer consumer isn't running as Local System, the authentication method is NTLM. For example, NTLM is used when you run an Exchange Management Shell cmdlet that uses the Exchange Business Logic layer.

The RPC traffic is always encrypted.

The following table provides information about ports, authentication, and encryption for data paths to and from Mailbox servers.

Mailbox server data paths

Data path	Required ports	Default authentication	Supported authentication	Encryption supported?	Encrypted by default?
Active Directory access	389/TCP/UDP (LDAP), 3268/TCP (LDAP GC), 88/TCP/UDP (Kerberos), 53/TCP/UDP (DNS), 135/TCP (RPC netlogon)	Kerberos	Kerberos	Yes, using Kerberos encryption	Yes
Admin remote access (Remote Registry)	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using IPsec	No
Admin remote access (SMB/	445/TCP (SMB)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using IPsec	No

File)					
Availability Web service (Client Access to Mailbox)	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes
Clustering	135/TCP (RPC) See Notes on Mailbox Servers after this table.	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using IPsec	No
Content indexing	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes
Log shipping	64327 (customizable)	NTLM/ Kerberos	NTLM/ Kerberos	Yes	No
Seeding	64327 (customizable)	NTLM/ Kerberos	NTLM/ Kerberos	Yes	No
Volume shadow copy service (VSS) backup	Local Message Block (SMB)	NTLM/ Kerberos	NTLM/ Kerberos	No	No
Mailbox Assistants	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	No	No
MAPI access	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes
Microsoft Exchange Active Directory Topology service access	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes
Microsoft Exchange System Attendant service legacy access (Listen to requests)	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	No	No
Microsoft Exchange System Attendant service legacy access to Active Directory	389/TCP/UDP (LDAP), 3268/ TCP (LDAP GC), 88/TCP/ UDP (Kerberos), 53/TCP/UDP (DNS), 135/ TCP (RPC netlogon)	Kerberos	Kerberos	Yes, using Kerberos encryption	Yes
Microsoft Exchange	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes

System Attendant service legacy access (As MAPI client)					
Offline address book (OAB) accessing Active Directory	135/TCP (RPC)	Kerberos	Kerberos	Yes, using RPC encryption	Yes
Recipient Update Service RPC access	135/TCP (RPC)	Kerberos	Kerberos	Yes, using RPC encryption	Yes
Recipient update to Active Directory	389/TCP/UDP (LDAP), 3268/TCP (LDAP GC), 88/TCP/UDP (Kerberos), 53/TCP/UDP (DNS), 135/TCP (RPC netlogon)	Kerberos	Kerberos	Yes, using Kerberos encryption	Yes

Notes on Mailbox Servers

- The **Clustering** data path listed in the preceding table uses dynamic RPC over TCP to communicate cluster status and activity between the different cluster nodes. The Cluster service (ClusSvc.exe) also uses UDP/3343 and randomly allocated, high TCP ports to communicate between cluster nodes.
- For intra-node communications, cluster nodes communicate over User Datagram Protocol (UDP) port 3343. Each node in the cluster periodically exchanges sequenced, unicast UDP datagrams with every other node in the cluster. The purpose of this exchange is to determine whether all nodes are running correctly, and also to monitor the health of network links.
- Port 64327/TCP is the default port used for log shipping. Administrators can specify a different port for log shipping.
- For HTTP authentication in which **Negotiate** is listed, Kerberos is tried first, and then NTLM.

Client Access Servers

Unless noted, client access technologies, such as Outlook Web App, POP3, or IMAP4 are described by the authentication and encryption from the client application to the Client Access server.

The following table provides information about ports, authentication, and encryption for data paths between Client Access servers and other servers and clients.

Client Access server data paths

Data path	Required ports	Default authentication	Supported authentication	Encryption supported?	Encrypted by default?
Active	389/TCP/UDP	Kerberos	Kerberos	Yes, using	Yes

Directory access	(LDAP), 3268/ TCP (LDAP GC), 88/TCP/ UDP (Kerberos), 53/TCP/UDP (DNS), 135/ TCP (RPC netlogon)			Kerberos encryption	
Autodiscover service	80/TCP, 443/ TCP (SSL)	Basic/ Integrated Windows authentication (Negotiate)	Basic, Digest, NTLM, Negotiate (Kerberos)	Yes, using HTTPS	Yes
Availability service	80/TCP, 443/ TCP (SSL)	NTLM/ Kerberos	NTLM, Kerberos	Yes, using HTTPS	Yes
Mailbox Replication Service (MRS)	808/TCP	Kerberos/ NTLM	Kerberos, NTLM	Yes, using RPC encryption	Yes
Outlook accessing OAB	80/TCP, 443/ TCP (SSL)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using HTTPS	No
Outlook Web App	80/TCP, 443/ TCP (SSL)	Forms Based Authentication	Basic, Digest, Forms Based Authentication , NTLM (v2 only), Kerberos, Certificate	Yes, using HTTPS	Yes, using a self-signed certificate
POP3	110/TCP (TLS), 995/ TCP (SSL)	Basic, Kerberos	Basic, Kerberos	Yes, using SSL, TLS	Yes
IMAP4	143/TCP (TLS), 993/ TCP (SSL)	Basic, Kerberos	Basic, Kerberos	Yes, using SSL, TLS	Yes
Outlook Anywhere (formerly known as RPC over HTTP)	80/TCP, 443/ TCP (SSL)	Basic	Basic or NTLM	Yes, using HTTPS	Yes
Exchange ActiveSync application	80/TCP, 443/ TCP (SSL)	Basic	Basic, Certificate	Yes, using HTTPS	Yes
Client Access server to Unified Messaging server	5060/TCP, 5061/TCP, 5062/TCP, a dynamic port	By IP address	By IP address	Yes, using Session Initiation Protocol (SIP) over TLS	Yes
Client Access server to a Mailbox server	80/TCP, 443/ TCP (SSL)	NTLM/ Kerberos	Negotiate (Kerberos with fallback to	Yes, using IPsec	No

that is running an earlier version of Exchange Server			NTLM or optionally Basic,) POP/ IMAP plain text		
Client Access server to Exchange 2010 Mailbox server	RPC. See Notes on Client Access Servers.	Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes
Client Access server to Client Access server (Exchange ActiveSync)	80/TCP, 443/ TCP (SSL)	Kerberos	Kerberos, Certificate	Yes, using HTTPS	Yes, using a self-signed certificate
Client Access server to Client Access server (Outlook Web Access)	80/TCP, 443/ TCP (HTTPS)	Kerberos	Kerberos	Yes, using SSL	Yes
Client Access server to Client Access server (Exchange Web Services)	443/TCP (HTTPS)	Kerberos	Kerberos	Yes, using SSL	Yes
Client Access server to Client Access server (POP3)	995 (SSL)	Basic	Basic	Yes, using SSL	Yes
Client Access server to Client Access server (IMAP4)	993 (SSL)	Basic	Basic	Yes, using SSL	Yes
Office Communications Server access to Client Access server (when Office Communications Server and Outlook Web App integration is enabled)	5075-5077/ TCP (IN), 5061/TCP (OUT)	mTLS (Required)	mTLS (Required)	Yes, using SSL	Yes

Note:
Integrated Windows authentication (NTLM) is not supported for POP3 or IMAP4 client connectivity. For more information, see the "Client Access Features" sections in

Discontinued Features.

Notes on Client Access Servers

- In Exchange 2010, MAPI clients such as Microsoft Outlook connect to Client Access servers.
- The Client Access servers use many ports to communicate with Mailbox servers. With some exceptions, those ports are determined by the RPC service, and they aren't fixed.
- For HTTP authentication where **Negotiate** is listed, Kerberos is tried first, and then NTLM.
- When an Exchange 2010 Client Access server communicates with a Mailbox server that runs Microsoft Exchange Server 2003, it's a best practice to use Kerberos and disable NTLM authentication and Basic authentication. It's also a best practice to configure Outlook Web App to use forms-based authentication with a trusted certificate. For Exchange ActiveSync clients to communicate through the Exchange 2010 Client Access server to the Exchange 2003 back-end server, Windows Integrated Authentication must be enabled on the Microsoft-Server-ActiveSync virtual directory on the Exchange 2003 back-end server. To use Exchange System Manager on an Exchange 2003 server to manage authentication on an Exchange 2003 virtual directory, download and install the hotfix referenced in Microsoft Knowledge Base article 937031, Event ID 1036 is logged on an Exchange 2007 server that is running the CAS role when mobile devices connect to the Exchange 2007 server to access mailboxes on an Exchange 2003 back-end server.

  Note:
  Although the Knowledge Base article is specific to MicrosoftExchange Server 2007, it's also applicable to Exchange 2010.

- When a Client Access server proxies POP3 requests to another Client Access server, the communication occurs over port 995/TCP. This is true regardless of whether the connecting client uses POP3 and requests TLS (on port 110/TCP) or connects on port 995/TCP using SSL. Similarly, for IMAP4 connections, the requesting server uses port 993/TCP to proxy requests regardless of whether the connecting client uses IMAP4 and requests TLS (on port 443/TCP) or connects to port 995 using IMAP4 with SSL encryption

Client Access Server Connectivity

In addition to having a Client Access server in every Active Directory site that contains a Mailbox server, it’s important to avoid restricting traffic between Exchange servers. Make sure that all defined ports that are used by Exchange are open in both directions between all source and destination servers. The installation of a firewall between Exchange servers or between an Exchange 2010 Mailbox or Client Access server and Active Directory isn’t supported. However, you can install a network device if traffic isn’t restricted and all available ports are open between the various Exchange servers and Active Directory.

Unified Messaging Servers

IP gateways and IP PBXs support only certificate-based authentication that uses mutual TLS for encrypting SIP traffic and IP-based authentication for Session Initiation Protocol (SIP)/TCP connections. IP gateways don't support either NTLM or Kerberos authentication. Therefore, when you use IP-based authentication, the connecting IP address or addresses are used to provide authentication mechanism for unencrypted (TCP) connections. When IP-based authentication is used in Unified Messaging (UM), the UM server verifies that the IP address is allowed to connect. The IP address is configured on the IP gateway or IP PBX.

IP gateways and IP PBXs support mutual TLS for encrypting SIP traffic. After you successfully import and export the required trusted certificates, the IP gateway or IP PBX

will request a certificate from the UM server, and then it will request a certificate from the IP gateway or IP PBX. Exchanging the trusted certificate between the IP gateway or IP PBX and the UM server enables the IP gateway or IP PBX and UM server to communicate over an encrypted connection by using mutual TLS.

The following table provides information about port, authentication, and encryption for data paths between UM servers and other servers.

Unified Messaging server data paths

Data path	Required ports	Default authentication	Supported authentication	Encryption supported?	Encrypted by default?
Active Directory access	389/TCP/UDP (LDAP), 3268/TCP (LDAP GC), 88/TCP/UDP (Kerberos), 53/TCP/UDP (DNS), 135/TCP (RPC netlogon)	Kerberos	Kerberos	Yes, using Kerberos encryption	Yes
Unified Messaging Phone interaction (IP PBX/VoIP Gateway)	5060/TCP , 5065/TCP, 5067/TCP (unsecured), 5061/TCP, 5066/TCP, 5068/TCP (secured), a dynamic port from the range 16000-17000/TCP (control), dynamic UDP ports from the range 1024-65535/UDP (RTP)	By IP address	By IP address, MTLS	Yes, using SIP/TLS, SRTP	No
Unified Messaging Web Service	80/TCP, 443/TCP (SSL)	Integrated Windows authentication (Negotiate)	Basic, Digest, NTLM, Negotiate (Kerberos)	Yes, using SSL	Yes
Unified Messaging server to Client Access server	5075, 5076, 5077 (TCP)	Integrated Windows authentication (Negotiate)	Basic, Digest, NTLM, Negotiate (Kerberos)	Yes, using SSL	Yes
Unified Messaging server to Client Access server (Play on Phone)	Dynamic RPC	NTLM/Kerberos	NTLM/Kerberos	Yes, using RPC encryption	Yes

Unified Messaging server to Hub Transport server	25/TCP (TLS)	Kerberos	Kerberos	Yes, using TLS	Yes
Unified Messaging server to Mailbox server	135/TCP (RPC)	NTLM/ Kerberos	NTLM/ Kerberos	Yes, using RPC encryption	Yes

Notes on Unified Messaging Servers

- When you create a UM IP gateway object in Active Directory, you must define the IP address of the physical IP gateway or IP PBX (Private Branch eXchange). When you define the IP address on the UM IP gateway object, the IP address is added to a list of valid IP gateways or IP PBXs (also called SIP peers) that the UM server is allowed to communicate with. When you create the UM IP gateway, you can associate it with a UM dial plan. Associating the UM IP gateway with a dial plan allows the Unified Messaging servers that are associated with the dial plan to use IP-based authentication to communicate with the IP gateway. If the UM IP gateway has not been created, or if it is not configured to use the correct IP address, authentication fails and the UM servers don't accept connections from that IP gateway's IP address. Also, when you implement mutual TLS and IP gateway or IP PBX and UM servers, the UM IP gateway must be configured to use the FQDN. After you configure the UM IP gateway with an FQDN, you must also add a host record to the DNS forward lookup zone for the UM IP gateway.
- In Exchange 2010, a UM server can either communicate on port 5060/TCP (unsecured) or on port 5061/TCP (secured), and can be configured to use both.

For more information, see Understanding Unified Messaging VoIP Security and Understanding Protocols, Ports, and Services in Unified Messaging.

Windows Firewall Rules Created by Exchange 2010 Setup

Windows Firewall with Advanced Security is a stateful, host-based firewall that filters inbound and outbound traffic based on firewall rules. Exchange 2010 Setup creates Windows Firewall rules to open the ports required for server and client communication on each server role. Therefore, you no longer have to use the Security Configuration Wizard (SCW) to configure these settings. To learn more about Windows Firewall with Advanced Security, see Windows Firewall with Advanced Security and IPsec.

This table lists the Windows Firewall rules created by Exchange Setup, including the ports opened on each server role. You can view these rules using the Windows Firewall with Advanced Security MMC snap-in.

Rule name	Server roles	Port	Program
MSExchangeADTopology - RPC (TCP-In)	Client Access, Hub Transport, Mailbox, Unified Messaging	Dynamic RPC	Bin \MSExchangeADTopologyService.exe
MSExchangeMonitoring - RPC (TCP-In)	Client Access, Hub Transport, Edge Transport, Unified Messaging	Dynamic RPC	Bin \Microsoft.Exchange.Management.Monitoring.exe

MSExchangeServiceHost - RPC (TCP-In)	All roles	Dynamic RPC	Bin\Microsoft.Exchange.ServiceHost.exe
MSExchangeServiceHost - RPCEPMap (TCP-In)	All roles	RPC-EPMap	Bin\Microsoft.Exchange.Service.Host
MSExchangeRPCEPMap (GFW) (TCP-In)	All roles	RPC-EPMap	Any
MSExchangeRPC (GFW) (TCP-In)	Client Access, Hub Transport, Mailbox, Unified Messaging	Dynamic RPC	Any
MSExchange - IMAP4 (GFW) (TCP-In)	Client Access	143, 993 (TCP)	All
MSExchangeIMAP4 (TCP-In)	Client Access	143, 993 (TCP)	ClientAccess\PopImap\Microsoft.Exchange.Imap4Service.exe
MSExchange - POP3 (FGW) (TCP-In)	Client Access	110, 995 (TCP)	All
MSExchange - POP3 (TCP-In)	Client Access	110, 995 (TCP)	ClientAccess\PopImap\Microsoft.Exchange.Pop3Service.exe
MSExchange - OWA (GFW) (TCP-In)	Client Access	5075, 5076, 5077 (TCP)	All
MSExchangeOWAAppPool (TCP-In)	Client Access	5075, 5076, 5077 (TCP)	Inetsrv\w3wp.exe
MSExchangeAB-RPC (TCP-In)	Client Access	Dynamic RPC	Bin\Microsoft.Exchange.AddressBook.Service.exe
MSExchangeAB-RPCEPMap (TCP-In)	Client Access	RPC-EPMap	Bin\Microsoft.Exchange.AddressBook.Service.exe
MSExchangeAB-RpcHttp (TCP-In)	Client Access	6002, 6004 (TCP)	Bin\Microsoft.Exchange.AddressBook.Service.exe
RpcHttpLBS (TCP-In)	Client Access	Dynamic RPC	System32\Svchost.exe
MSExchangeRPC - RPC (TCP-In)	Client Access, Mailbox	Dynamic RPC	Bin\Microsoft.Exchange.RpcClientAccess.Service.exe
MSExchangeRPC - PRCEPMap (TCP-In)	Client Access, Mailbox	RPC-EPMap	Bin\Microsoft.Exchange.RpcClientAccess.Service.exe

MSExchangeRPC (TCP-In)	Client Access, Mailbox	6001 (TCP)	Bin \Microsoft.Exchange.RpcClientAccess.Service.exe
MSExchangeMailboxReplication (GFW) (TCP-In)	Client Access	808 (TCP)	Any
MSExchangeMailboxReplication (TCP-In)	Client Access	808 (TCP)	Bin \MSExchangeMailboxReplication.exe
MSExchangeIS - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin\Store.exe
MSExchangeIS RPCEPMap (TCP-In)	Mailbox	RPC-EPMap	Bin\Store.exe
MSExchangeIS (GFW) (TCP-In)	Mailbox	6001, 6002, 6003, 6004 (TCP)	Any
MSExchangeIS (TCP-In)	Mailbox	6001 (TCP)	Bin\Store.exe
MSExchangeMailboxAssistants - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin \MSExchangeMailboxAssistants.exe
MSExchangeMailboxAssistants - RPCEPMap (TCP-In)	Mailbox	RPC-EPMap	Bin \MSExchangeMailboxAssistants.exe
MSExchangeMailSubmission - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin \MSExchangeMailSubmission.exe
MSExchangeMailSubmission - RPCEPMap (TCP-In)	Mailbox	RPC-EPMap	Bin \MSExchangeMailSubmission.exe
MSExchangeMigration - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin \MSExchangeMigration.exe
MSExchangeMigration - RPCEPMap (TCP-In)	Mailbox	RPC-EPMap	Bin \MSExchangeMigration.exe
MSExchangerepl - Log Copier (TCP-In)	Mailbox	64327 (TCP)	Bin \MSExchangeRepl.exe
MSExchangerepl - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin \MSExchangeRepl.exe
MSExchangerepl - RPC-EPMap (TCP-In)	Mailbox	RPC-EPMap	Bin \MSExchangeRepl.exe
MSExchangeSearch - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin \Microsoft.Exchange.Search.ExSearch.exe
MSExchangeThrottling	Mailbox	Dynamic RPC	Bin

- RPC (TCP-In)			\MSExchangeThrottling.exe
MSExchangeThrottling - RPCEPMap (TCP-In)	Mailbox	RPC-EPMap	Bin \MSExchangeThrottling.exe
MSFTED - RPC (TCP-In)	Mailbox	Dynamic RPC	Bin\MSFTED.exe
MSFTED - RPCEPMap (TCP-In)	Mailbox	RPC-EPMap	Bin\MSFTED.exe
MSExchangeEdgeSync - RPC (TCP-In)	Hub Transport	Dynamic RPC	Bin \Microsoft.Exchange.EdgeSyncSvc.exe
MSExchangeEdgeSync - RPCEPMap (TCP-In)	Hub Transport	RPC-EPMap	Bin \Microsoft.Exchange.EdgeSyncSvc.exe
MSExchangeTransportWorker - RPC (TCP-In)	Hub Transport	Dynamic RPC	Bin \edgetransport.exe
MSExchangeTransportWorker - RPCEPMap (TCP-In)	Hub Transport	RPC-EPMap	Bin \edgetransport.exe
MSExchangeTransportWorker (GFW) (TCP-In)	Hub Transport	25, 587 (TCP)	Any
MSExchangeTransportWorker (TCP-In)	Hub Transport	25, 587 (TCP)	Bin \edgetransport.exe
MSExchangeTransportLogSearch - RPC (TCP-In)	Hub Transport, Edge Transport, Mailbox	Dynamic RPC	Bin \MSExchangeTransportLogSearch.exe
MSExchangeTransportLogSearch - RPCEPMap (TCP-In)	Hub Transport, Edge Transport, Mailbox	RPC-EPMap	Bin \MSExchangeTransportLogSearch.exe
SESWorker (GFW) (TCP-In)	Unified Messaging	Any	Any
SESWorker (TCP-In)	Unified Messaging	Any	UnifiedMessaging \SESWorker.exe

UMService (TCP-In)	Unified Messaging	5060, 5061	Bin\UMService.exe
UMWorkerProcess (GFW) (TCP-In)	Unified Messaging	5065, 5066, 5067, 5068	Any
UMWorkerProcess (TCP-In)	Unified Messaging	5065, 5066, 5067, 5068	Bin \UMWorkerProcess.exe
UMWorkerProcess -	Unified Messaging	Dynamic RPC	Bin

RPC (TCP-In)			\UMWorkerProcess.exe

Notes on Windows Firewall Rules Created by Exchange 2010 Setup

- On servers that have Internet Information Services (IIS) installed, Windows opens the HTTP port (port 80, TCP) and HTTPS port (port 443, TCP). Exchange 2010 Setup doesn't open these ports. Therefore, these ports don't appear in the preceding table.
- In Windows Server 2008 and in Windows Server 2008 R2, Windows Firewall with Advanced Security allows you to specify the process or service for which a port is opened. This is more secure because it restricts usage of the port to the process or service specified in the rule. Exchange Setup creates firewall rules with the process name specified. In some cases, an additional rule that isn't restricted to the process is also created for compatibility. You can disable or remove the rules that aren't restricted to the processes, and then keep the corresponding rules restricted to processes if your deployment supports them. The rules that are not restricted to processes are distinguished by the word **(GFW)** in the rule name.
- Many Exchange services use remote procedure calls (RPCs) for communication. Server processes that use RPCs contact the RPC Endpoint Mapper to receive dynamic endpoints and register those endpoints in the Endpoint Mapper database. RPC clients contact the RPC Endpoint Mapper to determine the endpoints used by the server process. By default, the RPC Endpoint Mapper listens on port 135 (TCP). When it configures the Windows Firewall for a process that uses RPCs, Exchange 2010 Setup creates two firewall rules for the process. One rule allows communication with the RPC Endpoint Mapper, and the other rule allows communication with the dynamically assigned endpoint. To learn more about RPCs, see How RPC Works. For more information about creating Windows Firewall rules for dynamic RPC, see Allowing Inbound Network Traffic that Uses Dynamic RPC.

Note:
You can't modify the Windows Firewall rules created by Exchange 2010 Setup. You can create custom rules based on them, and then disable or delete them.

For more information, see Microsoft Knowledge Base article 179442, How to configure a firewall for domains and trusts.

1.12.3 Certificates

Certificates

Exchange Server 2010 > Security >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-12-01*

In Exchange 2010, digital certificates are used for authentication and encryption of the following:

- SMTP traffic (using Transport Layer Security) between transport servers
- HTTP traffic (using Secure Sockets Layer) for client access methods such as Outlook Web App , Outlook Anywhere, Exchange ActiveSync, and Exchange Web Services
- HTTP traffic for federation

The following topics explain how to use certificates:

Create a New Exchange Certificate

Import an Exchange Certificate

Assign Services to a Certificate

View Exchange Certificate Properties

Export an Exchange Certificate

Renew an Exchange Certificate

Additionally, the following topics explain how certificates are used for different services.

Understanding SSL for Outlook Anywhere

Understanding Redirection for Outlook Anywhere with a Single SSL Certificate

Configuring SSL and Exchange ActiveSync

Managing SSL for a Client Access Server

Configure SSL for Exchange ActiveSync

Configure SSL for Outlook Anywhere

Configuring TLS and SSL for POP3 and IMAP4 Access

Configure Outlook Web App Virtual Directories to Use SSL

Test-FederationTrustCertificate

1.12.3.1 Create a New Exchange Certificate

Create a New Exchange Certificate

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

After you have installed the Client Access server role, you'll need to create a Secure Sockets Layer (SSL) certificate for the various services in your organization.

Prerequisites

The Client Access server role has been installed.

What Do You Want to Do?

- Use the EMC to create a new Exchange certificate
- Use the Shell to create a new Exchange certificate

Use the EMC to create a new Exchange certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

1. In the console tree, click **Server Configuration**.
2. In the action pane, click **New Exchange Certificate** to open the New Exchange Certificate wizard. This wizard helps you determine what type of certificates you need for your Exchange organization.
3. On the **Introduction** page, enter a friendly name for your certificate.
4. On the **Domain Scope** page, select the **Enable wildcard certificate** check box, and then enter a root domain if you want to apply the certificate to all subdomains automatically by creating a wildcard certificate.
5. If you didn't choose to create a wildcard certificate, use the Exchange Configuration page to select the services and protocols that your certificate will need to support. Choose from the following options:
   - **Federated Sharing** If you will be using this certificate for Federated Sharing, select the **Use this certificate for Federated Sharing** check box.
   - **Client Access server (Outlook Web App)** If you'll be using this certificate for Outlook Web App, select the appropriate boxes for Outlook Web App on the Intranet or on the Internet and enter the domain name you use to access Outlook Web App.
   - **Client Access server (Exchange ActiveSync)** If you'll be using this certificate for Exchange ActiveSync, select the **Exchange ActiveSync is enabled** check box and enter the domain name you use to access Exchange ActiveSync.
   - **Client Access server (Exchange Web Services, Outlook Anywhere, and Autodiscover)** If you'll be using this certificate for Exchange Web Services, Outlook Anywhere, or the Autodiscover service, select the applicable check boxes and enter the external host name for your organization. For the Autodiscover service, choose whether you will be using the Long URL

format, the Short URL format, or a custom format. In the **Autodiscover URL to use** box, enter the full URL to the Autodiscover service.

- **Client Access server (POP/IMAP)** Select the check boxes to specify whether your users will be using POP and IMAP on the Intranet and the Internet. Enter the domain names to use for both POP and IMAP.
- **Unified Messaging Server** If you'll be using Unified Messaging, choose whether you'll use a self-signed certificate or a public certificate. You must use a public certificate if you are using Unified Messaging with Office Communications Server. For either option, enter the fully qualified domain name (FQDN) of your Unified Messaging server.
- **Hub Transport Server** Enter the FQDN of your Hub Transport server if you'll be using mutual TLS to help secure Internet mail or if you'll be using a Hub Transport server for POP and IMAP client submission.
- **Legacy Exchange Server** Select **Use legacy domains** and enter the legacy domain name if you're upgrading from a previous version of Exchange Server and will be operating in a coexistence scenario for a period of time during the upgrade.

6. Review the list of domains that will be added to the certificate on the **Certificate Domains** page. You can click **Add** to add another domain or click one of the domains listed and then click **Edit** if you need to make changes. Use the **Set as common name** option to choose one of the domains to be the common name of the certificate.

7. On the **Organization and Location** page, enter information about your Exchange organization. You'll need to enter the name of your Organization, the Organization unit, and location information including the Country/region, City/locality, and State/province. Under the **Certificate Request File Path** section, click **Browse** to select a location for the certificate request file, and then enter the file name you want to use.

8. On the **Certificate Completion** page, verify that all the information you've entered is correct. If it is, click **New**.

9. On the **Completion** page, follow the steps listed to complete your request. This page also contains the cmdlet syntax necessary to create a new certificate.

Use the Shell to create a new Exchange certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

The code example below outputs the certificate request in Base64 format to the command-line console. You must send the certificate request to a certification authority (CA) within the organization, a trusted CA outside the organization, or a commercial CA. You can do this by pasting the certificate request output into an e-mail message or into the appropriate field on the certificate request Web page of the CA. You can also save the certificate request to a file using a text editor such as Notepad.

The certificate that results has the following attributes associated with it:

- Subject name: c=<ES>,o=<Woodgrove Bank>,cn=mail1.woodgrovebank.com
- Subject alternate names: woodgrovebank.com and example.com
- An exportable private key

```
New-ExchangeCertificate -GenerateRequest -SubjectName "c=US, o=Woodgrove Bank, cn
```

1.12.3.2 Import an Exchange Certificate

Import an Exchange Certificate

[This topic is in progress.]

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-06-06*

You can use the Import Exchange Certificate wizard to import a certificate from a file with the extension of .pfx.

Prerequisites

The Client Access server role has been installed and you have previously exported a certificate with a private key as a file with the extension .pfx.

What Do You Want to Do?

- Use the EMC to import a new Exchange certificate
- Use the Shell to import a new Exchange certificate

Use the EMC to import a new Exchange certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

1. In the console tree, click **Server Configuration**.
2. From the action pane, click **Import Exchange Certificate** to open the Import Exchange Certificate wizard.
   - This wizard helps you import a certificate with a valid private key to your Exchange server. You must enter the password of the private key for a successful import.
3. On the **Introduction** page, click **Browse** to select the file that contains the exported certificate, and then enter the password for the certificate.
4. On the **Exchange Server Selection** page, select the Exchange server that you want to import the certificate to.
5. On the **Completion** page, verify that all previously selected options are correct.
6. On the final page, follow the steps listed to complete your request. This page also displays the Shell cmdlet syntax necessary to import the certificate.

Use the Shell to import a new Exchange certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

This example imports an Exchange certificate from a file named import.pfx.

```
Import-ExchangeCertificate -Path c:\certificates\import.pfx -Password:(Get-Creden
```

1.12.3.3 Assign Services to a Certificate

Assign Services to a Certificate

Exchange Server 2010 > Security > Certificates >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can assign specific services to your Secure Sockets Layer (SSL) certificate. The services you can assign include POP, IMAP, IIS, Unified Messaging, and SMTP.

Prerequisites

The Client Access server role has been installed and at least one certificate is installed on your Client Access server.

What Do You Want to Do?

- Use the EMC to assign services to a certificate
- Use the Shell to assign services to a certificate

Use the EMC to assign services to a certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

1. In the console tree, select **Server Configuration**.
2. In the action pane, click **Assign Services to Certificate** to open the Assign Services to Certificate wizard.
   - This wizard helps you assign the appropriate services to your certificate for your Exchange organization. For assistance creating a certificate, see Create a New Exchange Certificate.
3. On the **Assign Services** page, use the check boxes in the **Assign Services** section to choose the services you want to assign to your certificate. If you chose services during certificate creation, these services will already be checked. Click **Assign**.
4. On the **Completion** page, verify that all of the services were assigned properly.
   - If you attempt to assign the Unified Messaging service to the certificate and the certificate is running in TCP mode only, assignment will fail. In order to use a certificate for Unified Messaging, it must be set to run in TLS mode or Dual mode. For more information see Create a Certificate for Enabling Mutual TLS in Unified Messaging.

Use the Shell to assign services to a certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

This example assigns the IMAP, POP, IIS, and SMTP services to the certificate.

```
Enable-ExchangeCertificate -Server 'EXCH-H-868' -Services 'IMAP, POP, IIS, SMTP'
```

1.12.3.4 View Exchange Certificate Properties

View Exchange Certificate Properties

Exchange Server 2010 > Security > Certificates >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can view the properties of any existing Exchange certificate. The properties include the valid dates, serial number, and public key type.

Prerequisites

The Client Access server role has been installed and at least one certificate is installed on your Client Access server.

What Do You Want to Do?

- Use the EMC to view Exchange certificate properties
- Use the Shell to view Exchange certificate properties

Use the EMC to view Exchange certificate properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client Access Permissions topic.

1. In the console tree, click **Server Configuration**.
2. Select the server that contains the certificate, and then select the certificate you want to view.
3. From the action pane, click **Open**.
   - You can view information about the certificate on the **General**, **Details**, and **Certification Path** pages of the **Exchange Certificate** dialog box.

Use the Shell to view Exchange certificate properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Client Access server security settings" entry in the Client

Access Permissions topic.

This example displays all the properties for an Exchange certificate in a formatted list.

```
Get-ExchangeCertificate 0271A7F1CA9AD8A27152CCAE044F968F068B14B8 | fl
```

1.12.3.5 Clone an Existing Certificate

Clone an Existing Certificate

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-08-25*

Microsoft Exchange Server 2010 creates a self-signed certificate during installation that uses all the server and domain names that are known to Exchange at the time of installation. These certificates are valid for 12 months. In some cases, it may make sense to clone these certificates if the Subject and Subject Alternative Names can be used for other computers. Be aware that only the certificate metadata and not the key sets are cloned.

Looking for other management tasks related to certificates? See Certificates.

Use the Shell to clone an existing certificate

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Certificate management" entry in the Transport Permissions topic.

Note:
You can't use the EMC to clone an existing certificate.

To clone a new certificate from an existing certificate, you must first identify the current default certificate for the domain by using the **Get-ExchangeCertificate** cmdlet. The following example clones the self-signed Exchange certificate for the FQDN mail1.contoso.com. It first retrieves the certificates for mail1.contoso.com, and then filters the result for the self-signed certificate, and finally pipelines that result to the **New-ExchangeCertificate** cmdlet to clone a new certificate.

```
Get-ExchangeCertificate -DomainName mail1.contoso.com | Where {$_.IsSelfSigned -e
```

After you run this command, the Shell displays a prompt asking you if you want to overwrite the existing default SMTP certificate. Click **N** to clone the certificate without overwriting the default SMTP certificate.

The example above assumes that there is only a single self-signed Exchange certificate in your deployment, which is the case in a typical installation. However, if you have multiple self-signed certificates in your organization, you should first run the **Get-ExchangeCertificate** cmdlet and then use the thumbprint of the specific certificate you want to clone. The following example shows how to clone an existing certificate in this manner, assuming that the thumbprint value for the certificate you want to clone is c4248cd7065c87cb942d60f7293feb7d533a4afc. The first result of running **Get-ExchangeCertificate** is used to display the details of the self-signed certificates installed so you can determine which thumbprint to use.

```
Get-ExchangeCertificate -DomainName mail1.contoso.com | Where {$_.IsSelfSigned -e
Get-ExchangeCertificate -Thumbprint c4248cd7065c87cb942d60f7293feb7d533a4afc | Ne
```

For detailed syntax and parameter information, see Get-ExchangeCertificate and New-ExchangeCertificate.

1.12.3.6 Generate Request for Third-Party Certificate Services

Generate Request for Third-Party Certificate Services

Exchange Server 2010 > Security > Certificates >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-02-01*

Microsoft Exchange Server 2010 creates a self-signed certificate during installation that uses all the server and domain names known to Exchange at the time of installation. However, you can also use certificates signed by a certification authority (CA). If you are using a CA to generate certificates, you must provide a certificate request according to that CA's requirements.

To generate a certificate request, you can use the **New-ExchangeCertificate** cmdlet with the *GenerateRequest* parameter. You can then save the request in a file using the **Set-Content** cmdlet. The resulting file will be a PKCS #10 request (.req) file. PKCS #10 is the Certification Request Syntax Standard specified by RFC 2314. (For details, see http://www.ietf.org/rfc/rfc2314.txt.)

Looking for other management tasks related to certificates? Check out Certificates.

Prerequisites

You must contact your CA to determine its requirements for new certificate requests.

Use the Shell to generate a certificate request from a CA

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Certificate management" entry in the Transport Permissions topic.

Note:

For instructions on using the Exchange Management Shell to generate a certificate request, see Create a New Exchange Certificate.

This example generates a certificate request for the Contoso server, mail1. The common name (CN) of the Subject Name contains the fully qualified domain name (FQDN) of the server and the Subject Alternative Name contains all the accepted domains for Contoso.

```
$Data = New-ExchangeCertificate -GenerateRequest -SubjectName "c=us, o=contoso co
Set-Content -Path "c:\Certificates\mail1.contoso.com.req" -Value $Data
```

This example generates a certificate request for the Contoso server, mail1. The certificate request is similar to the preceding example, but the certificate request is saved as a DER-encoded certificate request file.

```
$Data = New-ExchangeCertificate -GenerateRequest -SubjectName "c=us, o=contoso co
Set-Content -Path "c:\Certificates\mail1.contoso.com.req" -Value $Data.FileData -
```

This example creates a certificate request from an existing Contoso.com certificate.

```
$Data = Get-ExchangeCertificate -Thumbprint c4248cd7065c87cb942d60f7293feb7d533a4
Set-Content -Path "c:\ certificates\mail1.contoso.com.req" -Value $Data
```

This example creates a certificate request with a wildcard character for all Contoso.com subdomains.

```
$Data = New-ExchangeCertificate -GenerateRequest -SubjectName "C=us, O=contoso co
Set-Content -Path "c:\certificates\mail1.contoso.com.req" -Value $Data
```

For detailed syntax and parameter information, see New-ExchangeCertificate.

Other Tasks

After you generate the certificate request, you may also want to install the certificate issued by the CA in your organization. For detailed steps, see Install Certificates Issued for Certificate Requests.

1.12.3.7 Install Certificates Issued for Certificate Requests

Install Certificates Issued for Certificate Requests

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-08-25*

Microsoft Exchange Server 2010 creates a self-signed certificate during installation that uses all the server and domain names that are known to it at the time of installation. However, you can also use certificates that are signed by a Certification Authority (CA). After you have sent the certificate request to a CA, the CA issues a certificate or chain of certificates. In both cases, the certificates are delivered as files that you must install with the **Import-ExchangeCertificate** cmdlet.

Important:

Do not use the Certificate Manager snap-in to import the certificates for any service on an Exchange server. Using the Certificate Manager snap-in to import certificates on Exchange servers will fail. Therefore, TLS or other Exchange certificate services will not work.

Looking for other management tasks related to certificates? Check out Certificates.

Prerequisites

- You must first generate a certificate request and send that request to your CA. For detailed steps, see Generate Request for Third-Party Certificate Services.
- You must place the certificates issued by your CA at a location accessible on your network.

Use the Shell to install certificates issued

by a CA

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Certificate management" entry in the Transport Permissions topic.

Note:
You can't use the EMC to install certificates issued by a CA.

You use the **Import-ExchangeCertificate** cmdlet to install a certificate issued by your CA. The following example shows how to import and enable a certificate for SMTP TLS:

```
Import-ExchangeCertificate -FileData ([Byte[]]$(Get-Content -Path c:\certificates
```

The following example shows how to import a certificate and enable it for a Client Access server that supports POP3 clients.

```
Import-ExchangeCertificate -FileData ([Byte[]]$(Get-Content -Path c:\certificates
```

1.13 Federation

Federation

Exchange Server 2010 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

1.13.1 Understanding Federation

Understanding Federation

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-03-06*

Information workers frequently need to collaborate with external recipients, vendors, partners, and customers and share their free/busy (also known as calendar availability) and contact information. Federation in Microsoft Exchange Server 2010 helps with these collaboration efforts. *Federation* refers to the underlying trust infrastructure that supports *federated delegation*, an easy method for users to share calendar and contact information with recipients in other external federated organizations. To learn more about federated delegation, see Understanding Federated Delegation.

Looking for management tasks related to federation? Check out Managing Federation.

Contents

Microsoft Federation Gateway

The Microsoft Federation Gateway, a free cloud-based service offered by Microsoft, acts as the trust broker between your on-premises Exchange 2010 organization and other federated Exchange 2010 organizations. If you want to configure federation in your Exchange organization, you must establish a one-time federation trust with the Microsoft Federation Gateway, so that it can become a federation partner with your organization. With this trust in place, users authenticated by Active Directory (known as *identity providers*) are issued Security Assertion Markup Language (SAML) delegation tokens by the Microsoft Federation Gateway. These delegation tokens allow users from one federated organization to be trusted by another federated organization. With the Microsoft Federation Gateway acting as the trust broker, organizations aren't required to establish multiple individual trust relationships with other organizations, and users can access external resources using a single sign-on (SSO) experience. For more information, see Understanding the Microsoft Federation Gateway.

Return to top

Federation Trust

To use Exchange 2010 federated delegation features, you must establish a federation trust between your Exchange 2010 organization and the Microsoft Federation Gateway. Establishing a federation trust with the Microsoft Federation Gateway exchanges your

organization's digital security certificate with the Microsoft Federation Gateway and retrieves the Microsoft Federation Gateway certificate and federation metadata. You can establish a federation trust by using the New Federation Trust wizard in the Exchange Management Console (EMC) or the **New-FederationTrust** cmdlet in the Exchange Management Shell. A self-signed certificate is automatically created by the New Federation Trust wizard and is used for signing and encrypting delegation tokens that allow users to be trusted by external federated organizations. For details about certificate requirements, see Certificate Requirements for Federation later in this topic.

For details about how to create a federation trust, see Create a Federation Trust.

When you create a federation trust with the Microsoft Federation Gateway, an *application identifier* (AppID) is automatically generated for your Exchange organization and provided in the output of the New Federation Trust wizard or the **New-FederationTrust** cmdlet. The AppID is used by the Microsoft Federation Gateway to uniquely identify your Exchange organization. It's also used by the Exchange organization to provide proof that your organization owns the domain for use with the Microsoft Federation Gateway. This is done by creating a text (TXT) record in the Domain Name System (DNS) zone of each federated domain.

For details about how to create a TXT record, see Create a TXT Record for Federation.

Return to top

Federated Organization Identifier

The *federated organization identifier* (OrgID) defines which of the authoritative accepted domains configured in your organization are enabled for federation. Only recipients that have e-mail addresses with accepted domains configured in the OrgID are recognized by the Microsoft Federation Gateway and are able to use federated delegation features. When you create a new federation trust, an OrgID is automatically created with the Microsoft Federation Gateway. This OrgID is a combination of a pre-defined string and the first accepted domain selected for federation in the wizard. For example, in the Manage Federation wizard, if you specify the federated domain **contoso.com** as your organization's primary SMTP domain, the **FYDIBOHF25SPDLT.contoso.com** account namespace will be automatically created as the OrgID for the federation trust.

This subdomain doesn't have to be an accepted domain in your Exchange organization and doesn't require a domain name system (DNS) proof of ownership TXT record. The only requirement is that accepted domains selected to be federated are limited to a maximum of 32 characters. Additionally, if you use the Manage Hybrid Configuration wizard to create a federation trust associated with configuring a hybrid deployment between your on-premises organization and an Exchange Online organization, the OrgID for the federated trust is also automatically configured with the automated namespace. The only purpose of this subdomain is to serve as the federated namespace for the Microsoft Federation Gateway to maintain unique identifiers for recipients that request SAML delegation tokens. For more information about SAML tokens, see SAML Tokens and Claims

You can add or remove accepted domains at any time. If you want to enable or disable all federation features in your organization, all you have to do is enable or disable the OrgID.

Important:

If you change the OrgID, accepted domains, or the AppID used for federation, all federation features are affected in your organization. This also affects any external federated organizations, including Office 365 and hybrid deployment configurations. We recommend that you notify all external federated partners of any changes to these configuration settings.

For more information about configuring the federated OrgID, see the following topics:

- Manage Federation
- Configure Federated Delegation

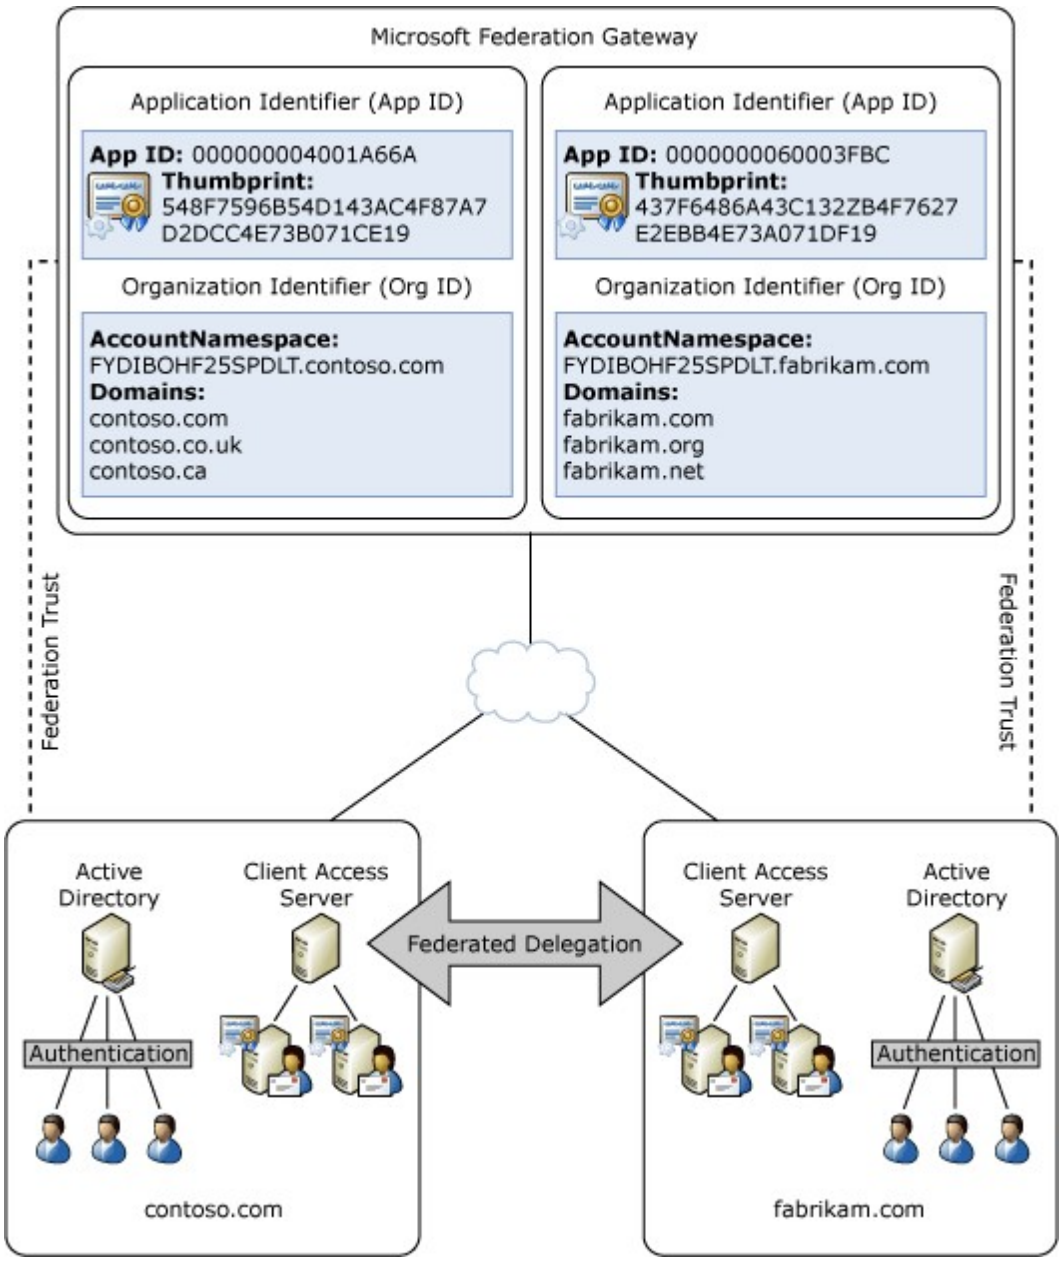
Return to top

Federation Example

Two Exchange organizations, Contoso, Ltd. and Fabrikam, Inc., want their users to be able to share free/busy information with each other. Each organization creates a federation trust with the Microsoft Federation Gateway and configures its account namespace to include the domain used for its user's e-mail address domain.

Contoso employees use one of the following e-mail address domains: contoso.com, contoso.co.uk, or contoso.ca. Fabrikam employees use one of the following e-mail address domains: fabrikam.com, fabrikam.org, or fabrikam.net. Both organizations make sure that all accepted e-mail domains are included in the account namespace for their federation trust with the Microsoft Federation Gateway. Rather than requiring a complex Active Directory forest or domain trust configuration between the two organizations, both organizations configure an organization relationship with each other to enable free/busy sharing.

The following figure illustrates the federation configuration between Contoso, Ltd. and Fabrikam, Inc.



Certificate Requirements for Federation

To establish a federation trust with the Microsoft Federation Gateway, either a self-signed certificate or an X.509 certificate signed by a certification authority (CA) must be created and installed on the Exchange 2010 server used to create the trust. We recommend using a self-signed certificate, which can be automatically created and installed using the New Federation Trust wizard in the EMC. This certificate is used only to sign and encrypt delegation tokens used for federated delegation. Only one certificate is required for the federation trust. Exchange 2010 automatically distributes the certificate to other Exchange 2010 servers in the organization.

If you want to use an X.509 certificate signed by an external CA, the certificate must meet the following requirements:

- **Trusted CA** If possible, the X.509 Secure Sockets Layer (SSL) certificate

should be issued from a CA trusted by Windows Live. However, you can use certificates issued by CAs that aren't currently certified by Microsoft. For a current list of trusted CAs, see Trusted Root Certification Authorities for Federation Trusts.

- **Subject key identifier** The certificate must have a subject key identifier field. Most X.509 certificates issued by commercial CAs have this identifier.
- **CryptoAPI cryptographic service provider (CSP)** The certificate must use a CryptoAPI CSP. Certificates that use Cryptography API: Next Generation (CNG) providers aren't supported for federation. If you use Exchange to create a certificate request, a CryptoAPI provider is used. For more information, see Cryptography API: Next Generation.
- **RSA signature algorithm** The certificate must use RSA as the signature algorithm.
- **Exportable private key** The private key used to generate the certificate must be exportable. You can specify that the private key be exportable when you create the certificate request using the New Exchange Certificate wizard in the EMC or the New-ExchangeCertificate cmdlet in the Shell.
- **Current certificate** The certificate must be current. You can't use an expired or revoked certificate to create a federation trust.
- **Enhanced key usage** The certificate must include the enhanced key usage (EKU) type **Client Authentication (1.3.6.1.5.5.7.3.2)**. This usage type is used to prove your identity to a remote computer. If you use the EMC or the Shell to generate a certificate request, this usage type is included by default.

Note:

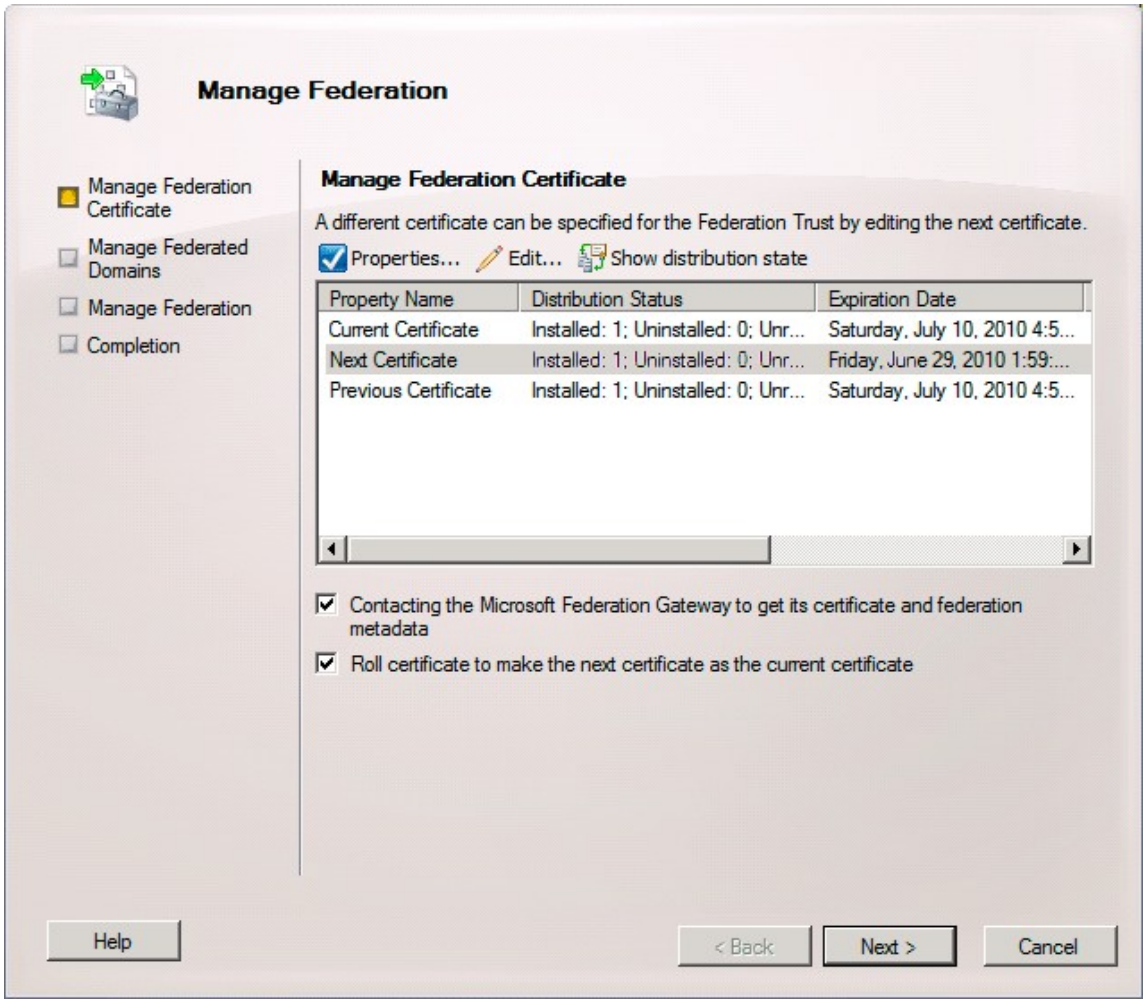
Because the certificate isn't used for authentication, it doesn't have any subject name or subject alternative name requirements. You can use a certificate with a subject name that's the same as the host name, the domain name, or any other name.

Return to top

Transitioning to a New Certificate

The certificate used to create the federation trust is designated as the current certificate. However, you may need to install and use a new certificate for the federation trust periodically. For example, you may need to use a new certificate if the current certificate expires or to meet a new business or security requirement. To ensure a seamless transition to a new certificate, you must install the new certificate on your Exchange 2010 server and configure the federation trust to designate it as the next certificate. Exchange 2010 automatically distributes the next certificate to other Exchange 2010 servers in the organization. Depending on your Active Directory topology, distribution of the certificate may take awhile. You can verify the certificate status using the Manage Federation wizard in the EMC or the Test-FederationTrustCertificate cmdlet in the Shell.

After you verify the certificate's distribution status, you can configure the trust to use the next certificate. After switching certificates, the current certificate is designated as the previous certificate, and the next certificate is designated as the current certificate. The new certificate is published to the Microsoft Federation Gateway, and all new tokens exchanged with the Microsoft Federation Gateway are encrypted using the new certificate. The following figure illustrates how you can use the Manage Federation wizard to configure this transition.



For more information about how to transition to a new certificate, see Manage Federation.

Note:
This certificate transition process is used only by federation. If you use the same certificate for other Exchange 2010 features that require certificates, you must take the feature requirements into consideration when planning to procure, install, or transition to a new certificate.

Return to top

1.13.2 Understanding Federated Delegation

Understanding Federated Delegation

Exchange Server 2010 > Federation >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-10-26*

Information workers frequently have to collaborate with partners, customers, vendors, or

other contacts outside their Exchange organization. For effective cross-organization collaboration, your users may have to share their free/busy (also known as calendar availability) information for scheduling meetings. Depending on the nature of the business relationship, users may have to share more detailed calendar information. Similarly, users may also have to share their contacts with these external recipients. In Microsoft Exchange Server 2010, federated delegation helps accomplish these goals.

Looking for management tasks related to federated delegation? See Managing Federated Delegation.

Contents

Collaboration Before Exchange 2010 and Federated Delegation

Earlier versions of Exchange had limited sharing capabilities and required complex set up and ongoing maintenance. For example, to share availability information with users in another Exchange organization, you had to use the Inter-Organization Replication tool to replicate public folders between Exchange organizations. This process required you to create Active Directory trusts between both organizations, as well as manage service account credentials.

For recipients to be visible in Exchange address lists, many organizations used different tools such as GALSync to synchronize one organization's recipients to another organization. Setting up trusts, managing credentials, and replication with multiple external organizations was difficult and cumbersome. Creating Active Directory forest or domain trusts and credential management also had security implications. Opening additional ports on firewalls between the two organizations or establishing a virtual private network (VPN) was also required.

With the introduction of Exchange Web Services, the Availability service, and the Client Access server role in Exchange Server 2007, the replication of public folder free/busy data wasn't necessary. However, trust or credential information and global address list (GAL) synchronization was still necessary to make free/busy information available to external organizations.

Sharing a Calendar or Contacts folder also involved assigning permissions to access the folder to users in trusted organizations. The only way to accomplish this was by creating Active Directory trusts between the two organizations, which had additional security implications.

For more information, see How to Configure the Availability Service for Cross-Forest Topologies.

Return to top

Federated Delegation

Using federated delegation in Exchange 2010, users can share information with recipients in external federated organizations by establishing a federation trust and creating organization relationships between Exchange 2010 organizations. Organizations can also use sharing policies to allow users to create individual sharing relationships with recipients in other organizations. Federated delegation uses the Microsoft Federation Gateway, a Microsoft cloud-based service, as the trust broker between two federated organizations. To enable federated delegation, the organizations between which you want to share information only have to establish a one-time federation trust with the Microsoft Federation Gateway and configure either an organization relationship or sharing policies with each other.

Important:

If you disable the federated organization identifier for your Exchange 2010 organization, all federation features are disabled for your organization.

To learn more about the Microsoft Federation Gateway and federation trusts, see the following:

- Microsoft Federation Gateway
- Understanding Federation
- Create a Federation Trust
- Manage Federation.

Federated delegation offers two ways for users to share calendar and contact information with external recipients: Organization relationships and sharing policies.

Organization Relationships

Organization relationships allow you to enable federated delegation with another federated organization for the purpose of sharing calendar free/busy information between users in both organizations. Organization relationships are one-to-one relationships between two organizations. Rather than requiring a complex Active Directory forest or domain trust configuration between the two organizations (which may also require opening multiple ports on firewalls in both organizations or establishment of a VPN), both organizations are required to establish only one federation trust with the Microsoft Federation Gateway and to configure their federated organization identifier prior to configuring the organization relationship with each other.

Requirements for Organization Relationships

The following are required for organization relationships:

- An Exchange 2010 Client Access server exists in each Exchange organization.
- Each Exchange organization has created a federation trust with the Microsoft Federation Gateway.
- Each Exchange organization has configured a federated organization identifier. Domains used for generating users' e-mail addresses have been added to the organization identifiers.
- An organization relationship exists in each corresponding organization.
- The Mailbox servers that are hosting user mailboxes can reach the Microsoft Federation Gateway servers and the federated partner organizations CAS servers.

Note:

Office Outlook 2007 users can't specify SMTP addresses of external recipients to display availability information. Recipients must be picked from the GAL, which requires GAL synchronization with the external organization. Outlook 2007 users with mailboxes on Exchange 2007 Service Pack 2 (SP2) Mailbox servers can use Office Outlook Web Access on an Exchange 2007 SP2 Client Access server.

Creating Organization Relationships

When you create an organization relationship with an external organization, users in the external organization can access your users' free/busy information. No replication of GAL information is required. With this configuration in place, Outlook 2010 and Office Outlook Web App users can simply enter the SMTP address of an external recipient when scheduling meetings.

When creating an organization relationship, you can specify one of the following three levels of calendar availability access:

- No free/busy access
- Free/busy access with time only
- Free/busy access with time, plus subject and location

For users in your organization to have access to external users' free/busy information or to allow for one-way sharing of their free/busy information with the external organization, the administrator in the external organization must also create an organization relationship with your organization. However, the external administrator can specify a different level of access for their users that's different from the level you specified. In a one-way sharing example, the external administrator would configure their organization relationship so that their users' free/busy information isn't shared with users in your organization, but the free/busy information for your users would be visible to the users in the external organization based on your organization relationship settings.

Note:

If users don't want to share their free/busy information with others, they can modify the Default permission entry in Outlook. To do this, users navigate to the **Calendar Properties** > **Permissions** tab, select the **Default** permission, and select **None** from the **Permission Level** list. Their free/busy information won't be visible to internal or external users, even if an organization relationship exists with an external organization. The organization relationship honors the permissions set by the user.

When you create an organization relationship, Exchange 2010 connects to the Autodiscover Web service published by the external organization to obtain the Availability service endpoint. You can also specify the external organization's Availability service endpoint manually when creating the relationship.

To create an organization relationship with an external organization, you can use the New Organization Relationship wizard in the Exchange Management Console (EMC) or the New-OrganizationRelationship cmdlet in the Exchange Management Shell.

For details instructions about how to create an organization relationship, see Create an Organization Relationship.

Sharing Policies

Unlike organization relationships, which only enable sharing of free/busy information with recipients in other federated Exchange organizations, sharing policies enable user-established, people-to-people sharing of both calendar and contact information with different types of external users. Sharing polices allow your users to share both their free/busy and contact information (including the Calendar and Contacts folders) with recipients in other external federated organizations. For recipients that aren't in an external federated organization or are in non-Exchange organizations, sharing policies allow people-to-people sharing of their calendar information with anonymous users through the use of Internet Calendar Publishing.

With sharing policies, you won't need to manage your users' collaboration relationships. Instead, they get to decide which external recipients they want to collaborate with. Using Outlook 2010 or Outlook Web App, users can invite external recipients in other federated domains to access their Calendar or Contacts folder and also request that they share theirs in return. Users can also grant anonymous access to their calendar information to any individual who has Internet access. With sharing policies, you only control what types of users they can share information with and how much information they can share. If

necessary, you can also disable a user's or group's sharing policy.

Sharing policies are assigned to mailbox users. The default sharing policy applied to users allows availability information to be shared with all external federated domains. After you create a federation trust with the Microsoft Federation Gateway and configure the federated organization identifier, users can invite users in any external federated organization to share their calendar and contact information.

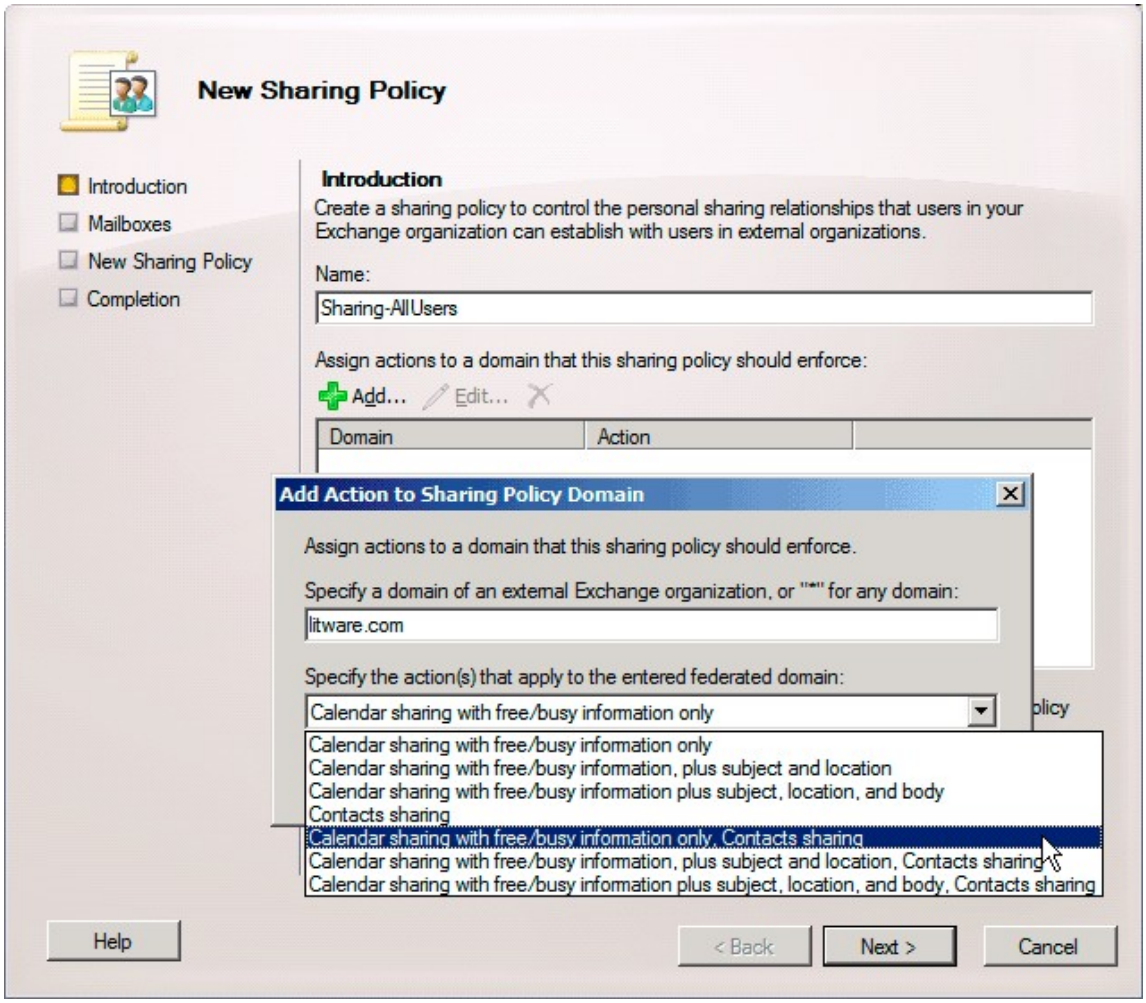
Important:

To participate in federated delegation, the external user's organization must also have a federation trust established with the Microsoft Federation Gateway, and the federated organization identifier must be configured.

To allow access to user's calendars by recipients in non-federated domain organizations, such as family members, friends, or users in non-Exchange organizations, a separate sharing policy should be created that allows for anonymous calendar access through the use of Internet Calendar Publishing. For details, see Enable Internet Calendar Publishing.

Sharing policies can contain pairs of domain names and the sharing actions allowed for users from those domains. As shown in the following figure, you can specify the following actions that apply to the external domain specified in a sharing policy:

- Calendar sharing with free/busy information only
- Calendar sharing with free/busy information, plus subject and location
- Calendar sharing with free/busy information plus subject, location and body
- Contacts sharing
- Calendar sharing with free/busy information only, Contacts sharing
- Calendar sharing with free/busy information, plus subject and location, Contacts sharing
- Calendar sharing with free/busy information plus subject, location, and body, Contacts sharing



When creating a sharing invitation, your users can select the information they want to share, provided that the action is allowed by the user's sharing policy. For example, let's say you create a sharing policy with the following settings for Fabrikam and other federated domain organizations:

- **Calendar sharing with free/busy information, plus subject and location** for external users in Fabrikam.com
- **Calendar sharing with free/busy information only** for external users in all other federated domain organizations (represented by the asterisk [*] symbol)

Users who have this policy applied can either share their calendar free/busy information with other federated domain organizations or can also share additional limited details if they invite users from Fabrikam.com.

For details about how to create a sharing policy, see Create a Sharing Policy.

For details about how to apply a sharing policy to users, see Apply a Sharing Policy to Mailboxes.

Requirements for Federated Sharing Policies

The following are required for sharing policies between federated domain organizations:

- An Exchange 2010 Client Access server exists in each Exchange organization.
- Each Exchange organization has created a federation trust with the Microsoft Federation Gateway.

- Each Exchange organization has configured a federated organization identifier. Domains used for generating users' e-mail addresses have been added to the organization identifiers.
- User mailboxes are located on Exchange 2010 Mailbox servers in each Exchange organization.
- Only Outlook 2010 and Outlook Web App users can create sharing invitations.

Requirements for Non-Federated Sharing Policies

The following are required for sharing policies with non-federated domain organizations or individual anonymous access:

- An Exchange 2010 Client Access server exists in the Exchange organization that's sharing user's calendar information.
- User mailboxes are located on Exchange 2010 Mailbox servers in the Exchange organization that's sharing user's calendar information.
- The Client Access server must be enabled for Outlook Web App access.

Comparing Organization Relationships and Sharing Policies

Although organization relationships and sharing policies allow sharing of free/busy information with external users, they're intended for different scenarios. Organization relationships are created to collaborate with external federated organizations and are limited to sharing only free/busy information. Sharing policies govern what calendar and contact information your users can share with users in external federated organizations, non-federated Exchange organizations, non-Exchange organizations, and anonymous users.

The following table lists the differences between organization relationships and sharing policies.

Organization relationships vs. sharing policies

Functionality	Organization relationship	Sharing policy
Requires a federation trust for your organization	Yes	Yes when sharing with other federated domain organizations. Not required for Internet sharing policies.
Recommends that the external domain be federated	Yes	Yes when sharing with other federated domain organizations. Not required for Internet sharing policies.
Allows sharing of free/busy information (including subject and location) with external organizations for a set of many users.	Yes	No
Allows sharing of Calendar folders with free/busy information	No	Yes
Allows sharing of Calendar folders with free/busy information, including subject and body	No	Yes
Allows sharing of contacts	No	Yes when sharing with other federated domain organizations. Not required for Internet sharing policies.

Requires users to send a sharing invitation to external recipients	No	Yes
Provides an access method	Your Client Access server accesses the Client Access server of the external organization and retrieves free/busy information for the external user when requested.	Your Client Access server accesses the Client Access server of the external organization and subscribes to the external user's Calendar or Contacts folder for federated domain organizations. For Internet sharing policies, external users access either a restricted or public URL on the Client Access server.
Can be applied to all external domains	No (a one-to-one relationship between two Exchange 2010 organizations)	Yes
Provides users with different sharing experiences with external recipients	No	Yes, based on the sharing policy that's applied
Disables sharing for some users	Yes, by specifying a security distribution group for the organization relationship	Yes, by disabling the sharing policy that's applied
Requires that the mailbox reside on an Exchange 2010 Mailbox server	No	Yes

Return to top

Firewall Considerations for Federated Delegation

Federated delegation features require that the Client Access servers in your organization have outbound access to the Internet by using HTTPS. You must allow outbound HTTPS access (port 443 for TCP) to all Exchange 2010 Client Access servers in the organization.

For an external organization to access your organization's free/busy information, you must publish one Client Access server to the Internet. This requires inbound HTTPS access from the Internet to the Client Access server. Client Access servers in Active Directory sites that don't have a Client Access server published to the Internet can use Client Access servers in other Active Directory sites that are accessible from the Internet. The Client Access servers that aren't published to the Internet must have the external URL of the Web services virtual directory set with the URL that's visible to external organizations.

Return to top

Coexistence with Exchange 2007

In organizations that contain both Exchange 2010 and Exchange 2007 servers, users who have a mailbox on an Exchange 2007 Mailbox server can use organization relationships to share free/busy information with recipients in external federated domain

organizations. The Mailbox server must be running Exchange 2007 SP2 or later, and you must have at least one Exchange 2010 Client Access server in the Exchange organization. You can use organization relationships by introducing a single Exchange 2010 Client Access server in the organization, providing a more robust solution than solutions that synchronize free/busy information and require GAL synchronization.

When using Outlook 2010 or Outlook Web App to scheduling a meeting on an Exchange 2007 server, a user who has a mailbox on an Exchange 2007 server can see free/busy information for a user in the external organization. Free/busy information for Exchange 2007 mailboxes is visible to recipients in the external organization.

Sharing policies are assigned to Exchange 2010 mailbox users. To use sharing policies, a mailbox must be located on an Exchange 2010 Mailbox server. Only Outlook 2010 and Outlook Web App clients can be used to generate or respond to sharing invitations.

Return to top

Coexistence with Exchange 2003

In organizations that contain both Exchange 2010 and Exchange 2003 servers, users who have a mailbox on an Exchange 2003 server can use organization relationships to share free/busy information with recipients in external federated domain organizations. The Mailbox server must be running Exchange Server 2003 SP2 or later, and you must have at least one Exchange 2010 Client Access and public folder server in the Exchange 2003 organization. The Client Access server acts as a proxy for all inbound and outbound free/busy requests and is used to configure organization relationship properties. The public folder server contains and manages a replica of Exchange 2003 public folder data for access of free/busy information by other federated Exchange 2010 organizations.

Internal and external Exchange mailbox users can view free/busy information in the Exchange 2003 organization by using Outlook 2003, Outlook 2007, Outlook 2010 or Outlook Web App. Sharing policies are assigned only to Exchange 2010 mailbox users. To use sharing policies, mailboxes must be located on an Exchange 2010 Mailbox server. You can't apply sharing policies to mailboxes located on Exchange 2003 servers.

Return to top

Establishing an Organization Relationship and a Sharing Policy

In this example, you're the administrator for Contoso, Ltd. Your organization entered into an agreement with Fabrikam, Inc. to develop a product that will be jointly marketed and sold by both organizations. To enable collaboration between the two organizations, users from the Marketing and Engineering departments of both organizations need to access each other's availability information. This collaboration should occur with minimal or no effort by users.

Contoso also collaborates with Litware, Inc. This collaboration is limited to a small subset of users. Users from both organizations should be able to establish sharing relationships with each other. Sharing of contacts and free/busy information should be allowed. No additional calendar information should be shared.

Additionally, Contoso users want to share their calendar information with family members to help coordinate outside activities that they manage in Outlook.

Lastly, sharing should occur without having to:

- Create any Active Directory forest or domain trusts.

- Exchange credentials between the organizations or individuals.
- Establish a VPN between the organizations or individuals.

To accomplish this scenario, take the following steps:

1. To configure federated delegation with Fabrikam and Litware, create a federation trust with the Microsoft Federation Gateway (if one hasn't already been created). This isn't required for sharing information with Contoso users' family members. This one-time procedure is required to use Exchange 2010 federation features. The process requires that an X.509 certificate be issued by a certification authority trusted by the Microsoft Federation Gateway. For details, see Create a Federation Trust.
2. Configure the federated organization identifier (if it isn't already configured). This process requires that you add the organization's accepted domains for which you want to enable federation to the organization identifier. This one-time procedure is required to use Exchange 2010 federation features. For details, see Manage Federation.
3. Create an organization relationship with Fabrikam, Inc. For details, see Create an Organization Relationship. Do the following:
   - To determine if the Fabrikam organization already has federation established, use the Get-FederationInformation cmdlet.
   - Select a distribution group that includes members from the Marketing and Engineering departments. Availability information for these users will be visible to Fabrikam users.
4. To allow users in both organizations to see availability information for each other, the administrator from Fabrikam, Inc. must also create an organization relationship with your organization.
5. Create a sharing policy for users who need to collaborate with users in the Litware.com domain. For details, see Create a Sharing Policy. Create the sharing policy with the following specifications:
   - To determine if the Litware organization already has federation established, use the Get-FederationInformation cmdlet.
   - Add the Litware.com domain to the sharing policy.
   - Select the **Calendar sharing with free/busy information only, Contacts sharing** action for the policy.
   - Assign the policy to users in your organization who need to collaborate with users from Litware. For details, see Apply a Sharing Policy to Mailboxes.
6. Create an anonymous sharing policy for Contoso users who need to collaborate with their family members. For details, see Create a Sharing Policy. Create the sharing policy with the following specifications:
   - Set the publishing virtual directory on the Client Access server. For details, see Set-OwaVirtualDirectory
   - Set the Webproxy URL for the Mailbox server. To do this, use the Set-ExchangeServer cmdlet with the *InternetWebProxy* parameter.
   - Enable the Client Access server virtual directory for anonymous publishing.

After you create the organization relationship with Fabrikam, Inc. and the sharing policy for Litware, Inc. and Contoso users, the following functionality will be available:

- All users will be able to view the availability information for users in the Marketing and Engineering departments of Fabrikam.
- Users in your organization who have the new sharing policy applied will be able send individual sharing invitations to users from Litware, Inc.
- Contoso users can invite their friends and family to view their calendar information by providing a link to their published calendar. Family members won't need special credentials to access the information.

Return to top

1.13.3 Trusted Root Certification Authorities for Federation Trusts

Trusted Root Certification Authorities for Federation Trusts

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-10-26*

To establish a federation trust between your Microsoft Exchange Server 2010 organization and the Microsoft Federation Gateway, you need a digital certificate installed on the Exchange server used to create the trust. We recommend using a self-signed certificate. A self-signed certificate is created and installed automatically when using the New Federation Trust wizard in the Exchange Management Console (EMC).

If you don't want to use the recommended self-signed certificate, you should request and install an X.509 Secure Sockets Layer (SSL) certificate from a certification authority (CA) trusted by Windows Live. Although certificates issued by other CAs may also be used to establish a federation trust with the Microsoft Federation Gateway, they aren't certified by Microsoft to date.

The following table lists CAs currently trusted by Windows Live. These CAs have been tested for use with Exchange 2010.

CA friendly name	Issued by	Intended purposes
Comodo	Comodo Certification Authority	Server authentication, client authentication
Digicert	Digicert Global Root Certification Authority	Server authentication, client authentication
Digicert High Assurance EV	Digicert Global Root Certification Authority	Server authentication, client authentication
Entrust	Entrust.net Secure Server Certification Authority	Server authentication, client authentication
Entrust (2048)	Entrust.net Secure Server Certification Authority	Server authentication, client authentication
Equifax	Equifax Secure Certification Authority	Server authentication, client authentication
GlobalSign	GlobalSign Certification Authority	Server authentication, client authentication
Go Daddy	Go Daddy Class 2 Certification Authority	Server authentication, client authentication
Network Solutions	Network Solutions Certification Authority	Server authentication, client authentication
PositiveSSL	Comodo Certification Authority	Server authentication, client authentication
UTN-UserFirst-Hardware	Comodo Certification Authority	Server authentication, client authentication
VeriSign	Class 3 Public Primary Certification Authority	Server authentication, client authentication

VeriSign	VeriSign Trust Network	Server authentication, client authentication

Are you successfully using a certificate for Federation with Exchange 2010 that isn't on this list? If so, you can assist in the CA verification process. Simply click **Click to Rate and Give Feedback** at the top of this topic and include the CA name and thumbprint information.

For more information about certificate requirements for Federation, see Understanding Federation.

1.13.4 Federation Terminology in Exchange 2010

Federation Terminology in Exchange 2010

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-03-06*

Federation is a technology in Microsoft Exchange Server 2010 that helps organizations share information with other Exchange organizations. Federation makes it easier to share free/busy (calendar availability) and contact information with users in other Exchange organizations. The following table defines the core components associated with federation in Exchange 2010.

account namespace domain

The combination of the first selected accepted domain namespace and a pre-defined string that's automatically added to the organization identifier (OrgID) as a federated domain. The account namespace domain is formatted as FYDIBOHF25SPDLT.< *your domain*>, is used in delegation tokens, and is unique to your Exchange organization.

application identifier (AppID)

A unique number generated by the Microsoft Federation Gateway to identify Exchange organizations. The AppID is generated when you create a federation trust with the Microsoft Federation Gateway.

delegation token

A Security Assertion Markup Language (SAML) token issued by the Microsoft Federation Gateway that allows users from one federated organization to be trusted by another federated organization. A delegation token contains the user's e-mail address, an immutable identifier, and information associated with the offer for which the token is issued for action.

external federated organization

An external Exchange organization that's established a federation trust with the Microsoft Federation Gateway.

federated delegation

A group of Exchange features that leverage a federation trust with the Microsoft Federation Gateway to work across Exchange organizations, including cross-premise Exchange deployments. Together, these features are used to make authenticated requests between servers on behalf of users across multiple Exchange organizations.

federated domain

An accepted authoritative domain that's added to the organization identifier (OrgID) for an Exchange organization.

domain proof encryption string

A cryptographically secure string used by an Exchange organization to provide proof that the organization owns the domain used with the Microsoft Federation Gateway. The string is generated by using the **Get-FederatedDomainProof** cmdlet.

federated sharing policy

An organization-level policy that enables and controls user-established, person-to-person sharing of both calendar and contact information.

federation

A trust-based agreement between two Exchange organizations to achieve a common purpose. With federation, both organizations want authentication assertions from one organization to be recognized by the other.

federation trust

A relationship with the Microsoft Federation Gateway that defines the following components for your Exchange organization:

- Account namespace
- Application identifier (AppID)
- Organization identifier (OrgID)
- Federated domains

To configure federated delegation with other federated Exchange organizations, a federation trust must be established with the Microsoft Federation Gateway.

Microsoft Federation Gateway

A free identity service that runs in the cloud (over the Internet and beyond a corporate network domain). The Microsoft Federation Gateway acts as the trust broker between federated Microsoft Exchange Server 2010 organizations. It's responsible for issuing delegation tokens to Exchange recipients when they request information from recipients in other federated Exchange organizations.

non-federated organization

Organizations that don't have a federation trust established with the Microsoft Federation Gateway.

organization identifier (OrgID)

Defines which of the authoritative accepted domains configured in an organization are enabled for federation. Only recipients that have e-mail addresses with federated domains configured in the OrgID are recognized by the Microsoft Federation Gateway and able to use federated delegation features.

organization relationship

A one-to-one relationship between two federated Exchange organizations that allows recipients to share free/busy (calendar availability) information. An organization relationship requires a federation trust with the Microsoft Federation Gateway and replaces the need to use Active Directory forest or domain trusts between Exchange organizations.

1.13.5 Managing Federation

Managing Federation

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-07-07*

Create a Federation Trust

Create a TXT Record for Federation

Manage Federation

Remove a Federation Trust

1.13.5.1 Create a Federation Trust

Create a Federation Trust

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-04-27*

A federation trust establishes a trust relationship between a Microsoft Exchange Server 2010 organization and the Microsoft Federation Gateway.

Note:

Creating a federation trust is one of several steps in setting up federated delegation in your Exchange organization. To review all the steps, see Configure Federated Delegation.

Looking for other management tasks related to federation? Check out Managing Federation.

Prerequisites

- The domain used for establishing a federation trust should be resolvable from the Internet. This requires that the domain be registered with a domain registrar and the Domain Name System (DNS) zone for the domain to be hosted on a DNS server accessible from the Internet. If the organization receives Internet e-mail for the domain, these requirements are already met.
- Both Exchange organizations in a federated delegation relationship must use the same Microsoft Federation Gateway instance for their federation trusts. This requirement applies when configuring federated delegation between two on-premises Exchange organizations or between an on-premises Exchange organization and an Exchange organization hosted by Microsoft Online Services or Microsoft Live@edu.
  When you create a federation trust with the Microsoft Federation Gateway for your Exchange organization, the federation trust will use either the business or consumer instance of the Microsoft Federation Gateway.
  The following Exchange organizations use the business instance of the Microsoft Federation Gateway by default:

- Exchange 2010 Service Pack 2 (SP2) organizations using self-signed certificates for a federation trust
- Exchange organizations hosted by Microsoft Online Services, such as the Exchange Online service offered in the Microsoft Business Productivity Online Standard Suite

The following Exchange organizations use the consumer instance of the Microsoft Federation Gateway by default:

- Release to manufacturing (RTM) version of Exchange 2010 organizations using certificates issued by third-party certification authorities
- Exchange organizations hosted by Microsoft Live@edu

We recommend that all Exchange organizations use the business instance of the Microsoft Federation Gateway for federation trusts. Before configuring federated delegation between the two organizations, you need to verify which Microsoft Federation Gateway instance each Exchange organization is using for any existing federation trusts. To determine which Microsoft Federation Gateway instance an Exchange organization is using for an existing federation trust, run the following Shell command.

```
Get-FederationInformation -DomainName <the hosted Exchange domain names
```

The business instance returns a value of **<uri:federation:MicrosoftOnline>** for the *TokenIssuerURIs* parameter.

The consumer instance returns a value of **<uri:WindowsLiveID>** for the *TokenIssuerURIs* parameter.

To configure federated delegation with an Exchange organization that has an existing federation trust that's using the business instance of the Microsoft Federation Gateway, follow the steps in Use the EMC to create a federation trust or Use the Shell to create a federation trust steps in this topic. These steps are all you need to perform to create federation trusts that can be used to enable federated delegation between two Exchange 2010 SP2 organizations.

To configure federated delegation between your Exchange 2010 SP2 organization and an Exchange organization that has an existing federation trust that's using the consumer instance of the Microsoft Federation Gateway, select from the following methods:

- **Recommended method** The Exchange organization using the consumer instance of the Microsoft Federation Gateway should install Exchange 2010 SP2. After installing SP2, the existing federated domains and federation trusts should be removed and re-created using the EMC. When the federation trusts are re-created, the business instance of the Microsoft Federation Gateway will be used. You should also test all existing organization relationships to verify that they're functioning properly. For details about how to remove federation trusts, see Remove a Federation Trust.
- **Alternative method** To create a federation trust using the consumer instance of the Microsoft Federation Gateway, the Exchange 2010 SP2 organization can use the procedure Use the Shell to create a federation trust that uses the consumer instance of the Microsoft Federation Gateway. This method should be used only when you need to enable federated delegation with another Exchange organization that can't install Exchange 2010 SP2.

What Do You Want to Do?

- Use the EMC to create a federation trust
- Use the Shell to create a federation trust
- Use the Shell to create a federation trust that uses the consumer instance of the Microsoft Federation Gateway

Use the EMC to create a federation trust

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

1. In the console tree, click **Organization Configuration**.
2. In the action pane, click **New Federation Trust**.
3. On the **New Federation Trust** page, click **New**. This automatically creates a self-signed certificate for the federation trust with the Microsoft Federation Gateway and deploys the self-signed certificate to the Exchange servers in your organization. The default name of the new federation trust is **Microsoft Federation Gateway**.
4. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Note:

The new federation trust appears on the **Federation Trust** tab.

Note:

To complete the federation configuration, you must add a text (TXT) record in DNS for the domain you want to use as the account namespace and for any other domain you want to add as a federated domain on the Microsoft Federation Gateway. After the TXT records are available in DNS, complete the federation trust configuration by using the Manage Federation wizard in the EMC or the Set-FederatedOrganizationIdentifier cmdlet in the Shell. For details, see Create a TXT Record for Federation or Managing Federation.

Use the Shell to create a federation trust

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

1. This example creates a unique subject key identifier to be used with the certificate.

```
$ski = [System.Guid]::NewGuid().ToString("N")
```

2. This example creates a self-signed certificate for the federation trust with the Microsoft Federation Gateway.

```
New-ExchangeCertificate -FriendlyName "Exchange Federated Delegation"
```

3. This example retrieves the self-signed certificate and creates the federation trust "Microsoft Federation Gateway". This automatically deploys the self-signed certificate to the Exchange servers in your organization.

```
Get-ExchangeCertificate | ?{$_.friendlyname -eq "Exchange Federated De
```

For detailed syntax and parameter information, see the following topics:

- New-ExchangeCertificate
- Get-ExchangeCertificate
- New-FederationTrust

Use the Shell to create a federation trust

that uses the consumer instance of the Microsoft Federation Gateway

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

Note:
You can't use the EMC to create a federation trust that uses the consumer instance of the Microsoft Federation Gateway.

Prerequisite

To create a federation trust that uses the consumer instance of the Microsoft Federation Gateway, you need a valid X.509 certificate that meets the requirements for federation trusts. The certificate must be issued by a certification authority (CA) trusted by the Microsoft Federation Gateway. This certificate will be deployed automatically to all Client Access and Hub Transport servers accessible by the federation trust task. For more details, see Trusted Root Certification Authorities for Federation Trusts.

1. This example gets a list of certificates and their thumbprints.

```
Get-ExchangeCertificate | where {$_.IsSelfSigned -eq $false} | Format-
```

`where` is an alias for the **Where-Object** cmdlet. It can also be replaced by the alias ? (question mark). To get a list of all aliases available in the Shell, run the **Get-Alias** cmdlet.
If there's only one certificate on the server that's not self-signed, you can simplify this task by combining commands from this step and the next step. You can pipeline results from the **Get-ExchangeCertificate** cmdlet to the **New-FederationTrust** cmdlet, as shown in this example.

```
Get-ExchangeCertificate | where {$_.IsSelfSigned -eq $false} | New-Fed
```

2. This example creates the federation trust Microsoft Federation Gateway.

```
New-FederationTrust -Name "Microsoft Federation Gateway" -Thumbprint 6
```

Important:
After you create a federation trust, the next step in configuring federation delegation is to create a separate TXT record in the DNS zone for both the federated delegation subdomain and each primary e-mail or SMTP proxy domain you want to federate. Because you've created a federation trust that uses the consumer instance of the Microsoft Federation Gateway, you must follow the steps outlined in the Exchange 2010 RTM version of the topic Create a TXT Record for Federation. After the TXT records are available in DNS, complete the federation trust configuration by using the Manage Federation wizard in the EMC or the Set-FederatedOrganizationIdentifier cmdlet in the Shell.

For detailed syntax and parameter information, see Get-ExchangeCertificate or New-FederationTrust.

Other Tasks

After you create a federation trust, you may also want to:

- Create a TXT Record for Federation
- Create an Organization Relationship
- Create a Sharing Policy

1.13.5.2 Create a TXT Record for Federation

Create a TXT Record for Federation

[This topic is in progress.]

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Microsoft Exchange Server 2010 uses Federation for federated delegation. Federation requires a federation trust with the Microsoft Federation Gateway. After you create the trust, you must configure the federated organization identifier with any accepted domains you want to federate.

To provide proof of ownership of the registered Internet domain, you must create a text (TXT) record in the Domain Name System (DNS) zone of each accepted domain you want to federate. The TXT record contains the federated domain proof encryption string generated when you run the Get-FederatedDomainProof cmdlet for each domain.

You can create a TXT record by using DNS Manager on a server running Windows Server 2008 that has the DNS server role installed. Your organization may use DNS server software from another vendor or use a service provider to host the DNS zone for the domain. Many Internet domain registrars host DNS zones for customers and most service providers offer Web-based management tools so that customers can manage DNS records for their domains. To learn more about the DNS server role, see DNS Server Role.

Note:

Creating a TXT record is one of several steps in setting up federated delegation in your Exchange 2010 organization. To review all the steps, see Configure Federated Delegation.

Looking for other management tasks related to Federation? Check out Managing Federation.

Prerequisites

- A federation trust has been created between your Exchange 2010 organization and the Microsoft Federation Gateway. For details, see Create a Federation Trust.
- Your Exchange organization uses one or more Internet domains registered with a domain registrar.
- The domains have a DNS zone accessible from the Internet.
- The DNS server role or the DNS Server service is installed. You can install the DNS server role by using Server Manager in Windows Server 2008. For information about using Server Manager, see Server Manager.

Step 1: Use the Shell to create the federated domain proof encryption strings

Run the **Get-FederatedDomainProof** cmdlet for any domains to be federated.

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

This example generates the domain proof string used for the TXT record for contoso.com.

```
Get-FederatedDomainProof -DomainName contoso.com
```

For detailed syntax and parameter information, see Get-FederatedDomainProof.

Step 2: Create a TXT record

Use DNS Manager

1. In DNS Manager, expand the DNS server you want, and then expand **Forward Lookup Zones**.
2. Select the forward lookup zone in which you want to create the TXT record.
3. From the menu bar, navigate to **Action** > **Other New Records**.
4. In **Resource Record Type**, select **Text (TXT)**, and then click **Create Record**.
5. In **New Resource Record**, complete the following fields:
   - **Record name (uses parent domain if left blank)** Leave this field blank, allowing it to create a record with the same name as the domain name.
   - **Fully qualified domain name type (FQDN)** This read-only field displays the FQDN created by concatenating the record name to the domain name.
   - **Text** Type the federated domain proof string that was generated when you ran the **Get-FederatedDomainProof** cmdlet. For example, if the federated domain proof string is `7Zyr2i/fE/M/T3AwCpitDbF30Fk/TdzXME6f7d1lDaKGthPdoS+UF94t43D2nU5hLNnIAP+5A3jJR2ik9HDPgg==`, you would enter the entire string in the **Text** field.

     Important:

     The federated domain proof is a string of alphanumeric characters. To avoid input errors, we recommend that you copy the string from the Shell, paste it into a text editor such as Notepad, copy it from the text editor to the Clipboard, and then paste it into the **Text** field of the TXT record. If the TXT record is created by using an incorrect federated domain proof string, the Microsoft Federation Gateway won't be able to verify proof of domain ownership, and you won't be able to add it to the federated organization identifier.
6. Click **OK**, and then click **Done** to create the record.

Use the DNSCmd command

This example creates a TXT record in the forward lookup zone `contoso.com` with the federated domain proof string `7Zyr2i/fE/M/T3AwCpitDbF30Fk/TdzXME6f7d1lDaKGthPdoS+UF94t43D2nU5hLNnIAP+5A3jJR2ik9HDPgg==` on DNS server NS1.

```
DNSCmd NS1 /RecordAdd contoso.com "@" TXT "7Zyr2i/fE/M/T3AwCpitDbF30Fk/TdzXME6f7d
```

For detailed syntax and parameter information, see Dnscmd.

Other Tasks

After you create a TXT record for Federation, you may also want to:

- Add a federated domain. For details, see Manage Federation.
- Create an Organization Relationship

1.13.5.3 Manage Federation

Manage Federation

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Use the Manage Federation wizard to manage certificates used for a federation trust, refresh the Microsoft Federation Gateway certificate and metadata, add or change the organization contact for federation, and disable or enable federation for the Exchange organization. In addition to the wizard in the EMC, you can also use the Shell to manage a federation trust.

Looking for other management tasks related to federation? Check out Managing Federation.

Prerequisites

Before you use the Manage Federation wizard or the corresponding cmdlets to modify a federation trust, a federated organization identifier, or federated domains, we recommend you understand how federation works and the impact of modifying federation configuration. For more information, see Understanding Federation.

What Do You Want to Do?

- Use the EMC to manage federation
- Use the Shell to manage federation

Use the EMC to manage federation

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

Note:

The Manage Federation wizard is a comprehensive way of managing the federation trust and its associated federated organization identifier. The wizard includes multiple tasks.

1. In the console tree, navigate to **Organization Configuration**.
2. In the result pane, click the **Federation Trust** tab, and then select the federation trust you want to manage. By default, the trust is named Microsoft Federation Gateway.
3. In the action pane, click **Manage Federation**.
4. On the **Manage Federation Certificate** page, information is displayed for the certificates used for the federation trust. This includes information for the current certificate, the next certificate, and the previous certificate. The current certificate is the active certificate used for the federation trust. The next certificate is a replacement certificate that will be used if the current certificate expires or needs to be replaced. The previous certificate is the certificate that was used for the federation trust immediately before the

current certificate. You can take the following actions:

- **Properties** Select the current, next, or previous certificate from the **Property Name** column, and then click **Properties** to view the certificate's properties.
- **Edit** Select the **Next Certificate** from the **Property Name** column, and then click **Edit** to select another certificate as the next certificate.
- **Show distribution state** Click this button to display the distribution state of the certificate in your Exchange organization.
- **Contact the Microsoft Federation Gateway to get its certificate and federation metadata** This check box is selected by default. When you use this option, Exchange retrieves the certificate and federation metadata from the Microsoft Federation Gateway. Clear this check box if you don't want to perform this refresh.
- **Roll certificate to mark the next certificate as the current certificate** Select this check box to configure the federation trust to use the next certificate as the current certificate.

Important:

Before you configure the federation trust to use the next certificate, you must make sure the certificate is installed on all Microsoft Exchange Server 2010 servers. To check the certificate status, click **Show distribution state**. The distribution state of the certificate is displayed in the **Distribution State** column. Expand the column width to display all text in the column.

5. On the **Manage Federated Domains** page, you can take the following actions:
   - **Add** Click this button to add a domain as a federated domain. The **Select Accepted Domain** dialog box displays all accepted domains in the Exchange 2010 organization.

     Note:

     To add an accepted domain to this list, use the New-AcceptedDomain cmdlet.

   - Select a domain from the **Domain** column, and then click this button to remove the domain.
   - **E-mail address of organization contact** Use this box to enter the e-mail address of the designated organization contact for federation.
   - **Enable Federation** Select this check box to enable federation. Clear this check box to disable federation for the Exchange organization.

   Note:

   Configuring domains is one of several steps in setting up federated delegation in your Exchange 2010 organization. To review all the steps, see Configure Federated Delegation.

6. On the **Manage Federation** page, review the **Configuration Summary**, and then click **Manage** to execute the changes.

7. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to manage federation

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

View federation certificates

This example displays the previous, current, and next certificates used by the federation trust MyFederationTrust.

```
Get-FederationTrust -Identity MyFederationTrust | Select Org*certificate
```

For detailed syntax and parameter information, see Get-FederationTrust.

Check federation certificate status

This example displays the state of federation certificates on all Hub Transport and Client Access servers in the organization.

```
Test-FederationTrustCertificate
```

For detailed syntax and parameter information, see Test-FederationTrustCertificate.

Configure the federation trust to use a certificate as the next certificate

This example configures the federation trust MyFederationTrust to use the certificate with the provided thumbprint as the next certificate. After the certificate is deployed to all Exchange servers in the organization, you can use the *PublishCertificate* switch to configure the trust to use this certificate as the current certificate.

```
Set-FederationTrust -Identity MyFederationTrust -Thumbprint AC00F35CBA8359953F412
```

For detailed syntax and parameter information, see Set-FederationTrust.

Configure the federation trust to use the next certificate as the current certificate

This example configures the federation trust MyFederationTrust to use the next certificate as the current certificate and publishes it to the Microsoft Federation Gateway.

```
Set-FederationTrust "MyFederationTrust" -PublishFederationCertificate
```

Caution:

Before configuring the federation trust to use the next certificate as the current federation certificate, make sure that the certificate is deployed on all Exchange servers in your organization. Use the Test-FederationTrustCertificate cmdlet or the Manage Federation wizard to check the deployment status of the certificate.

For detailed syntax and parameter information, see Set-FederationTrust.

Refresh federation metadata and certificate from the Microsoft Federation Gateway

This example refreshes the federation metadata and certificate of the Microsoft Federation Gateway for the federation trust MyFederationTrust.

```
Set-FederationTrust MyFederationTrust -RefreshMetadata
```

For detailed syntax and parameter information, see Set-FederationTrust.

View federated organization identifier and federated domains

This example displays the Exchange organization's federated organization identifier and related information, including federated domains and status.

```
Get-FederatedOrganizationIdentifier
```

For detailed syntax and parameter information, see Get-FederatedOrganizationIdentifier.

Add a domain as a federated domain

This example adds the domain contoso.co.uk as a federated domain. The domain must exist as an accepted domain in the Exchange organization.

```
Add-FederatedDomain contoso.co.uk
```

For detailed syntax and parameter information, see Add-FederatedDomain.

Remove a federated domain

This example removes the domain contoso.co.uk as a federated domain.

```
Remove-FederatedDomain contoso.co.uk
```

For detailed syntax and parameter information, see Remove-FederatedDomain.

Enable federation for the Exchange organization

This example enables federation for the Exchange organization.

```
Set-FederatedOrganizationIdentifier -Enabled $true
```

For detailed syntax and parameter information, see Set-FederatedOrganizationIdentifier.

Disable federation for the Exchange organization

This example disables federation for the Exchange organization.

```
Set-FederatedOrganizationIdentifier -Enabled $false
```

For detailed syntax and parameter information, see Set-FederatedOrganizationIdentifier.

1.13.5.4 Remove a Federation Trust

Remove a Federation Trust

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

Removing a federation trust disables Federation for the Exchange organization. All federated domains, including the domain used for the account namespace, should be removed. To retrieve the list of federated domains and the account namespace, use the Get-AcceptedDomain cmdlet. The federated domains are also listed in the Remove Federation Trust wizard in the Exchange Management Console (EMC).

Looking for other tasks related to Federation? Check out Managing Federation.

Use the EMC to remove a federation trust

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

1. In the console tree, click **Organization Configuration**.
2. In the result pane, select the federation trust you want to remove.
3. In the action pane, click **Remove Federation Trust**.

4. On the **Remove Federation Trust** page, review the federated domains configured to use the trust.
5. Click **Remove** to remove the trust.

6. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to remove a federation trust

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell Infrastructure Permissions topic.

This example removes the federated domain contoso.co.uk with the account namespace domain contoso.com.

```
Remove-FederatedDomain -DomainName contoso.co.uk
Remove-FederatedDomain -DomainName contoso.com
```

This example removes the federation trust Microsoft Federation Gateway.

```
Remove-FederationTrust "Microsoft Federation Gateway"
```

For detailed syntax and parameter information, see Remove-FederatedDomain or Remove-FederationTrust.

1.13.6.1 Configure Federated Delegation

Configure Federated Delegation

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can set up federated delegation (formerly known as federated sharing) in a Microsoft Exchange Server 2010 on-premises environment.

Using federated delegation, users in your on-premises Exchange organization can share information with recipients in other Exchange organizations that are also configured for federated delegation. This connection is established by creating organization relationships between the two organizations or by using a sharing policy, which allows users to create sharing relationships on an individual basis.

Federated delegation uses the Microsoft Federation Gateway, a cloud-based service offered by Microsoft, as the trust broker between your on-premises Exchange 2010 organization and other federated Exchange 2010 organizations.

Looking for other management tasks related to federated delegation? Check out Managing Federated Delegation.

Domain Namespace Requirements

To set up federated delegation for your on-premises Exchange 2010 organization, you must configure a domain proof of ownership record for any domains used for user e-mail accounts or for hosting user accounts in Microsoft Outlook Live or Microsoft Online Services.

Step 1: Create a federation trust with the Microsoft Federation Gateway

You can use the EMC or the Shell to create a federation trust. For detailed instructions, see Create a Federation Trust.

Step 2: Create TXT records for federated delegation

To provide proof of ownership of a registered Internet domain, you must create a text (TXT) record in the public Domain Name System (DNS) zone for each primary e-mail or SMTP proxy domain you want to federate. For example, if your primary SMTP domain is contoso.com, you would create a TXT record for contoso.com.

You can use DNS Manager or the **DNSCmd** command to create a TXT record for federation. For detailed instructions, see Create a TXT Record for Federation.

Step 3: Configure the domains for federated delegation

You also need to add the primary SMTP domain as a federated domain for your Exchange organization.

Note:
To participate in federated delegation, users who aren't using contoso.com as their e-mail address domain need to have contoso.com added as a proxy address domain to their account or have their e-mail address domain added as an additional federated domain.

This command uses the Shell to add the domain used in the contoso.com example.

```
Add-FederatedDomain -DomainName contoso.com
```

You can use the EMC or the Shell to configure domains for federated delegation. For detailed instructions, see Manage Federation.

Step 4: Create an Autodiscover DNS record

You need to add an alias canonical name (CNAME) resource record to your public-facing DNS. The new CNAME record should point to an Internet-facing Client Access server that's running the Autodiscover service.

In the previous Contoso example, the new CNAME record would specify autodiscover.contoso.com as the host name. For organizations using Microsoft DNS, you can add a CNAME record by using either DNS Manager or the **DNSCmd** command. For detailed instructions, see Add an Alias (CNAME) Resource Record to a Zone.

Step 5: Create an organization relationship

You can use the EMC or the Shell to create an organization relationship. For detailed instructions, see Create an Organization Relationship.

1.13.6.2 Create an Organization Relationship

Create an Organization Relationship

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-10*

You can create an organization relationship with an external federated Microsoft Exchange Server 2010 organization for the purpose of sharing calendar availability (free/busy) information.

Note:

Creating an organization relationship is one of several steps in setting up federated delegation in your Microsoft Exchange Server 2010 organization. To review all the steps, see Configure Federated Delegation.

Looking for other management tasks related to federated delegation? Check out Managing Federated Delegation.

Prerequisites

Before you can create an organization relationship, you must first set up a federation trust with the Exchange Federation Gateway. For more information, see Create a Federation Trust.

What Do You Want to Do?

- Use the EMC to create an organization relationship
- Use the Shell to create an organization relationship

Use the EMC to create an organization relationship

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Organization relationships" entry in the Mailbox Permissions topic.

1. In the console tree, click **Organization Configuration**.
2. In the action pane, click **New Organization Relationship**.
3. On the **Introduction** page, complete the following fields:
   - **Name** Type a name for the organization relationship.
   - **Enable this organization relationship** Select this check box to enable this organization relationship.
   - **Enable free/busy information access** Select this check box to specify whether this organization relationship should be used for retrieving free/busy information from the external Exchange organization.
   - **Specify free/busy data access level** If you selected the **Enable free/busy information access** check box, you can select one of the following options from this list to specify what type of free/busy information should be retrieved from the external Exchange organization:
     No free/busy access
     Free/busy access with time only
     Free/busy access with time, plus subject and location
   - **Specify a security distribution group that indicates what internal users free/busy data is accessible** Select this check box if you want to specify a distribution group to list your users who can have their free/busy information accessed by the external Exchange organization. Use the corresponding box to type the SMTP address of a security distribution group within your organization, or click **Browse** to search for the group.
4. On the **External Organization** page, complete the following fields:

- **Automatically discover configuration information** Click this button to have Exchange locate the configuration information of the external Exchange organization by using Autodiscover.
  Specify a federated domain of the external Exchange organization If you clicked **Automatically discover configuration information**, use this box to specify a federated domain of the external Exchange organization (for example, contoso.com). You can't specify more than one domain. Information about domains federated by the remote organization is published by using the Exchange Autodiscover Web service endpoints.
- **Manually enter the configuration information** Click this button if you want to manually provide the configuration information for the external Exchange organization.
  Federated domains of the external Exchange organization Use this box to type the federated domain names of the external Exchange organization. The organization you're establishing an organization relationship with may have more than one federated domain. After you type each name, click **Add** to add the name to the list of domains.
  Edit Select a federated domain name from the list, and then click **Edit** to modify the domain name.
   Select a federated domain name from the list, and then click this button to remove the domain.
  Application URI of the external Exchange organization Use this box to type the Uniform Resource Identifier (URI) of the external Exchange organization's application server (for example, mail.contoso.com). A URI is a string of characters used to identify or name a resource. In this case, the application URI is used when requesting a delegated token for the external Exchange organization to retrieve free/busy information.
  Autodiscover endpoint of the external Exchange organization Use this box to type the Autodiscover URL of the external Exchange organization's Exchange Web Services (for example, https://contoso.com/autodiscover/autodiscover.svc/wssecurity). Exchange uses the Autodiscover service to automatically detect the correct Client Access server endpoint.

5. On the **New Organization Relationship** page, review your configuration settings. Click **New** to create the organization relationship. Click **Back** to make changes.

6. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to create an organization relationship

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Organization relationships" entry in the Mailbox Permissions topic.

This example creates an organization relationship with Contoso, Ltd with the following

conditions:

- The organization relationship is enabled for contoso.com, northamerica.contoso.com, and europe.contoso.com.
- Free/busy access is enabled.
- The requesting organization receives free/busy time, subject, and location information from the target organization.

```
New-OrganizationRelationship -Name "Contoso" -DomainNames "contoso.com","northame
```

For detailed syntax and parameter information, see New-OrganizationRelationship.

This example attempts to automatically discover configuration information from the external Exchange organization Contoso.com by using the domain names provided in the **Get-FederationInformation** cmdlet. If you use this method to create your organization relationship, you must first make sure that you've created an organization identifier by using the Set-FederatedOrganizationIdentifier cmdlet.

```
Get-FederationInformation -DomainName Contoso.com | New-OrganizationRelationship
```

For detailed syntax and parameter information, see Get-FederationInformation and New-OrganizationRelationship.

This example creates an organization relationship with Fourth Coffee. In this example, the connection settings with the external Exchange organization are provided. The following conditions apply:

- The organization relationship is established by using “fourthcoffee.com” as the domain that has been set up as a federated domain by Fourth Coffee.
- If fourthcoffee.com is on Microsoft Exchange Server 2010 Service Pack 1 (SP1), the **ApplicationUri** property is exchangedelegation.fourthcoffee.com. If fourthcoffee.com is on Microsoft Exchange Server 2010 Service Pack 2 (SP2), the **ApplicationUri** property is FYDIBOHF25SPDLT.fourthcoffee.com.
- The Autodiscover URL is https://mail.fourthcoffee.com/autodiscover/autodiscover.svc/wssecurity.
- Free/busy access is enabled.
- The requesting organization only receives free/busy information with the time.

In Exchange 2010 SP1, run the following command:

```
New-OrganizationRelationship -Name "Fourth Coffee" -DomainNames "fourthcoffee.com
```

In Exchange 2010 SP2, run the following command:

```
New-OrganizationRelationship -Name "Fourth Coffee" -DomainNames "fourthcoffee.com
```

For detailed syntax and parameter information, see New-OrganizationRelationship.

1.13.6.3 Configure Organization Relationship Properties

Configure Organization Relationship Properties

Exchange Server 2010 > Federation > Managing Federated Delegation >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-07-21*

You can use organization relationships to securely share calendar availability (free/busy) information with recipients outside your Microsoft Exchange Server 2010 organization.

Looking for other management tasks related to federated delegation? Check out Managing Federated Delegation.

Prerequisites

Before organization relationships can work, you must first configure a federation trust with the Microsoft Federation Gateway. For more information, see Understanding Federation.

What Do You Want to Do?

- Use the EMC to configure organization relationship properties
- Use the Shell to configure organization relationship properties

Use the EMC to configure organization relationship properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Organization relationships" entry in the Mailbox Permissions topic.

1. In the console tree, click **Organization Configuration**.
2. In the result pane, click the **Organization Relationships** tab, and then select the organization relationship you want to configure.
3. In the action pane, under the organization relationship name, click **Properties**.
4. Use the **General** tab to view or modify general organization relationship settings:
   - **Name** This unlabeled box displays the name of the organization relationship. You can modify this name.
   - **Modified** This read-only field indicates the date and time when the organization policy was created or modified.
   - **Enable this organization relationship** Clear this check box to disable the organization relationship.
   - **Enable free/busy information access** Clear this check box to specify that this organization relationship shouldn't be used for retrieving free/busy information from the external Exchange organization.
   - **Specify free/busy data access level** If you selected the **Enable free/busy information access** check box, you can select one of the following options from this list to specify what type of free/busy information should be retrieved from the external Exchange organization:
     No free/busy access
     Free/busy access with time only
     Free/busy access with time, plus subject and location
   - **Specify a security distribution group that indicates what internal users free/busy data is accessible** Select this check box if you want to specify a distribution group to list your users who can have their free/busy information accessed by the external Exchange organization. Use the corresponding box to type the SMTP address of a security distribution group within your organization, or click **Browse** to search for the group.
5. Use the **External Organization** tab to view or modify the information required to set up the organization relationship with an external federated Exchange organization using the following fields:
   - **Automatically discover configuration information** Click this button to have Exchange locate the configuration information of the external

Exchange organization by using Autodiscover.

Specify a federated domain of the external Exchange organization If you clicked **Automatically discover configuration information**, use this box to specify a federated domain of the external Exchange organization (for example, contoso.com). You can't specify more than one domain. Information about domains federated by the remote organization is published by using the Exchange 2010 Autodiscover Web service endpoints.

- **Manually enter the configuration information** Click this button if you want to manually provide the configuration information for the external Exchange organization.

  Federated domains of the external Exchange organization Use this box to type the federated domain names of the external Exchange organization. The organization you're establishing an organization relationship with may have more than one federated domain. After you type each domain name, click **Add** to add the name to the list of domains. The organization relationship applies to only the federated domains listed on this tab.

  Edit Select a domain name from the list, and then click this button to modify it.

   Select a domain name from the list, and then click this button to remove it from the organization relationship.

  Application URI of the external Exchange organization Use this box to type the Uniform Resource Identifier (URI) of the external Exchange organization's application server (for example, mail.contoso.com). A URI is a string of characters used to identify or name a resource. In this case, the application URI is used when requesting a delegated token for the external Exchange organization to retrieve free/busy information.

  Autodiscover endpoint of the external Exchange organization Use this box to type the Autodiscover URL of the external Exchange organization's Exchange Web Services (for example, https://contoso.com/autodiscover/autodiscover.svc/wssecurity). Exchange uses the Autodiscover service to automatically detect the correct Client Access server endpoint.

Use the Shell to configure organization relationship properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Organization relationships" entry in the Mailbox Permissions topic.

This example adds the domain name woodgrovebank.co.uk to the organization relationship WoodgroveBank.

```
$domains = (Get-OrganizationRelationship WoodgroveBank).DomainNames
$domains += 'woodgrovebank.co.uk'
Set-OrganizationRelationship -Identity WoodgroveBank -DomainNames $domains
```

This example disables the organization relationship WoodgroveBank.

```
Set-OrganizationRelationship -Identity WoodgroveBank -Enabled $false
```

This example enables calendar availability (free/busy) information access for the organization relationship WoodgroveBank and sets the access level to **Free/busy access with time only**.

```
Set-OrganizationRelationship -Identity WoodgroveBank -FreeBusyAccessEnabled $true
```

For detailed syntax and parameter information, see Set-OrganizationRelationship and Get-OrganizationRelationship.

1.13.6.4 Remove an Organization Relationship

Remove an Organization Relationship

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Removing an organization relationship disables all features enabled for the relationship, including federated delegation.

Note:

To stop sharing information with a remote federated Exchange organization without removing the organization relationship, you can disable the organization relationship by using the EMC or the Set-OrganizationRelationship cmdlet in the Shell.

Looking for other management tasks related to federated delegation? Check out Managing Federated Delegation.

Use the EMC to remove an organization relationship

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Organization relationships" entry in the Mailbox Permissions topic.

1. In the console tree, click **Organization Configuration**.
2. In the result pane, select the **Organization Relationships** tab, and then select the organization relationship you want to remove.
3. In the action pane, click **Remove**.

Use the Shell to remove an organization relationship

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Organization relationships" entry in the Mailbox Permissions topic.

This example removes the organization relationship Contoso.

```
Remove-OrganizationRelationship -Identity "Contoso"
```

For detailed syntax and parameter information, see Remove-OrganizationRelationship.

1.13.6.5 Create a Sharing Policy

Create a Sharing Policy

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can use sharing policies to control how users in your organization can share calendar and contact information with users outside your Exchange organization. Sharing policies support the sharing of calendar and contact information with external federated organizations, external non-federated organizations, and individuals with Internet access. To configure recipients to use a specific sharing policy, see Apply a Sharing Policy to Mailboxes.

Note:

For sharing policies between federated organizations, only Microsoft Outlook 2010 and Microsoft Office Outlook Web App users can create sharing invitations.

Looking for other management tasks related to sharing policies? Check out Managing Federated Delegation.

Prerequisites for Sharing Policies Between Federated Organizations

- An Exchange 2010 Client Access server exists in each Exchange organization.
- A federation trust with the Microsoft Federation Gateway is established for each Exchange organization. For details, see Create a Federation Trust.
- The federated organization identifier is configured for each Exchange organization. Also, any primary and secondary SMTP domains used for generating users' e-mail addresses have been added to the Microsoft Federation Gateway as accepted domains for both Exchange organizations. For details, see Configure Federated Delegation.
- User mailboxes are on Exchange 2010 Mailbox servers in each Exchange organization.

Prerequisites for Sharing Policies Between Non-Federated Organizations or Individuals

- An Exchange 2010 Client Access server exists in the Exchange organization that's sharing user's calendar information.
- User mailboxes are on Exchange 2010 Mailbox servers in the Exchange organization that's sharing user's calendar information.
- The Client Access server is enabled for Outlook Web App access and a publishing virtual directory is enabled. For details, see Set-OwaVirtualDirectory.
- The Mailbox server's Web proxy URL is configured. For details, see Set-ExchangeServer.

What Do You Want to Do?

- Use the EMC to create a sharing policy

- Use the Shell to create a sharing policy

Use the EMC to create a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

1. In the console tree, expand the forest you want, and then navigate to **Organization Configuration** > **Mailbox**.
2. In the action pane, click **New Sharing Policy**.
3. On the **Introduction** page, complete the following fields:
   - **Name** Use this box to type a name for the new sharing policy.
   - **Add** Click this button to open the **Add Action to Sharing Policy Domain** dialog box. Use this dialog box to specify the domains and actions that this sharing policy applies to. Complete the following fields:
     Specify a domain of an external Exchange organization, or "*" for any domain Use this box to type the fully qualified domain name (FQDN) of an external Exchange organization, for example, **Contoso.com**.
     Specify the actions that apply to the federated domain Use this list to select one of the following sharing levels you want to enforce:
     Calendar sharing with free/busy information only
     Calendar sharing with free/busy information, plus subject and location
     Calendar sharing with free/busy information, plus subject, location, and body
     Contacts sharing
     Calendar sharing with free/busy information only, Contacts sharing
     Calendar sharing with free/busy information, plus subject and location, Contacts sharing
     Calendar sharing with free/busy information plus subject, location, and body, Contacts sharing
   - **Edit** Select a domain, and then click this button to edit the domain name or action.
   -  Select a domain, and then click this button to remove the domain from the sharing policy.
   - **Enable sharing policy** Select this check box to enable the sharing of calendar and contact information with recipients in the external domains that you specified in the policy. If you clear this check box, mailboxes assigned this policy won't be able to share calendar and contact information with the external domains or users specified in the policy. Additionally, existing shared calendar and contacts folders will no longer be shared with the external domains or users specified in the policy.
4. On the **Mailboxes** page, click **Add** to select the mailboxes to which you want to apply this sharing policy.

   Note:
   After creating the sharing policy, you can apply it to more mailboxes by using the **Mailboxes** tab in the sharing policy's property page or by using the **Mailbox Settings** tab in the mailbox's property page.
5. On the **New Sharing Policy** page, review your configuration settings. Click **New** to create the sharing policy. Click **Back** to make configuration changes.
6. On the **Completion** page, review the following, and then click **Finish** to close the wizard:

- A status of **Completed** indicates that the wizard completed the task successfully.
- A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to create a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

This example creates the sharing policy Contoso for the external federated domain contoso.com. This policy allows users in the contoso.com domain to see your user's detailed calendar availability (free/busy) information and contacts. By default, this policy is enabled.

```
New-SharingPolicy -Name "Contoso" -Domains contoso.com: CalendarSharingFreeBusyDe
```

This example creates the sharing policy SharingPolicy01 for two different federated domains (contoso.com and woodgrovebank.com) with different sharing actions configured for each domain. The policy is disabled.

```
New-SharingPolicy -Name "SharingPolicy01" -Domains 'contoso.com: CalendarSharingF
```

This example creates the sharing policy Anonymous for an Exchange organization with the Client Access server CAS01 and the Mailbox server MAIL01 with the sharing action configured for limited calendar free/busy availability information. This policy allows users in your Exchange organization to invite users with Internet access to view their calendar availability information by sending them a link. The policy is enabled.

1. Set the Web proxy URL for MAIL01.

   ```
   Set-ExchangeServer -Identity "Mail01" -InternetWebProxy "<Webproxy URL
   ```

2. Enable the publishing virtual directory on CAS01.

   ```
   Set-OwaVirtualDirectory -Identity "CAS01" -ExternalURL "<URL for CAS01
   ```

3. Create the sharing policy Anonymous and configure limited calendar information sharing.

   ```
   New-SharingPolicy -Name "Anonymous" -Domains 'Anonymous: CalendarShari
   ```

For detailed syntax and parameter information, see the following topics:

- New-SharingPolicy
- Set-ExchangeServer
- Set-OwaVirtualDirectory

1.13.6.6 Configure Sharing Policy Properties

Configure Sharing Policy Properties

Exchange Server 2010 > Federation > Managing Federated Delegation >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-03-19*

You can use sharing policies to control how users in your organization can share calendar and contact information with users outside your Exchange organization. Sharing policies

support the sharing of calendar and contact information with external federated organizations, external non-federated organizations, and individuals with Internet access.

Note:
For sharing policies between federated organizations, only Microsoft Outlook 2010 and Microsoft Office Outlook Web App users can create sharing invitations.

Looking for other management tasks related to sharing policies? Check out Managing Federated Delegation.

Prerequisites for Sharing Policies Between Federated Organizations

- An Exchange 2010 Client Access server exists in each Exchange organization.
- A federation trust with the Microsoft Federation Gateway is established for each Exchange organization. For details, see Create a Federation Trust.
- The federated organization identifier is configured for each Exchange organization. Also, any primary and secondary SMTP domains used for generating users' e-mail addresses have been added to the Microsoft Federation Gateway as accepted domains for both Exchange organizations. For details, see Configure Federated Delegation.
- User mailboxes are on Exchange 2010 Mailbox servers in each Exchange organization.

Prerequisites for Sharing Policies Between Non-Federated Organizations or Individuals

- An Exchange 2010 Client Access server exists in the Exchange organization that's sharing user's calendar information.
- User mailboxes are on Exchange 2010 Mailbox servers in the Exchange organization that's sharing user's calendar information.
- The Client Access server is enabled for Outlook Web App access, and a publishing virtual directory is enabled. For details, see Set-OwaVirtualDirectory.
- The Mailbox server's Web proxy URL is configured. For details, see Set-ExchangeServer.

What Do You Want to Do?

- Use the EMC to configure sharing policy properties
- Use the Shell to configure sharing policy properties

Use the EMC to configure sharing policy properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Sharing Policies** tab, and then click the sharing policy you want to view or configure.
3. In the action pane, under the sharing policy name, click **Properties**.

4. Use the **General** tab to view or modify the following sharing policy information.
   - **Name** This unlabeled box lists the name of the sharing policy. You can modify this field.
   - **Add** Click this button to open the **Add Action to Sharing Policy Domain** dialog box. Use this dialog box to specify the domains and actions that this sharing policy applies to. Complete the following fields:
     Specify a domain of an external Exchange organization, or "*" for any domain Use this box to type the fully qualified domain name (FQDN) of an external Exchange organization, for example Contoso.com.
     Specify the actions that apply to the federated domain Use this list to select one of the following sharing levels you want to enforce:
     Calendar sharing with free/busy information only
     Calendar sharing with free/busy information, plus subject and location
     Calendar sharing with free/busy information plus subject, location, and body
     Contacts sharing
     Calendar sharing with free/busy information only, Contacts sharing
     Calendar sharing with free/busy information, plus subject and location, Contacts sharing
     Calendar sharing with free/busy information plus subject, location, and body, Contacts sharing
   - **Edit** Select a domain, and then click this button to edit the domain name or action.
   -  Select a domain, and then click this button to remove the domain from the sharing policy.
   - **Enable sharing policy** Select this check box to enable the sharing of calendar and contact information with recipients in the external domains that you specified in the policy. If you clear this check box, mailboxes assigned this policy won't be able to share calendar and contact information with the external domains or users specified in the policy. Additionally, existing shared calendar and contacts folders will no longer be shared with the external domains or users specified in the policy.

5. Use the **Mailboxes** tab to add or remove the mailboxes in your organization that this sharing policy applies to.
   - **Add** Click this button to select the mailboxes to which you want to apply this sharing policy.

     Note:
     You can also apply the sharing policy to mailboxes by using the **Mailbox Settings** tab in the mailbox's property page.

   -  Select mailboxes from the list, and then click this button to remove the sharing policy from the specified mailboxes.

Use the Shell to configure sharing policy properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

This example modifies the sharing policy Contoso for the external federated domain contoso.com. This policy allows users in the Contoso domain to see your users' basic calendar availability (free/busy) information and contacts.

```
Set-SharingPolicy -Identity Contoso -Domains 'contoso.com: CalendarSharingFreeBus
```

This example adds a second federated domain to the sharing policy SharingPolicy01. When you add a domain to an existing policy, you must include any previously included domains.

```
Set-SharingPolicy -Identity SharingPolicy01 -Domains 'contoso.com: CalendarSharin
```

This example modifies the sharing policy for the non-federated Anonymous domain. This policy allows users in the Anonymous domain to see your users' detailed calendar availability (free/busy) information. The policy is enabled.

```
Set-SharingPolicy -Name "Anonymous" -Domains 'Anonymous: CalendarSharingFreeBusyD
```

For detailed syntax and parameter information, see Set-SharingPolicy.

1.13.6.7 Enable a Sharing Policy

Enable a Sharing Policy

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

You can enable a disabled sharing policy. You can also create a sharing policy in a disabled state, and then enable it when you want the policy to be applied to the recipients provisioned to use the policy. When you enable the sharing policy, users provisioned to use the policy won't be able to share information until the Sharing Policy Assistant runs. To specify how often the Sharing Policy Assistant runs, use the Set-MailboxServer cmdlet with the *SharingPolicySchedule* parameter.

Looking for other management tasks related to sharing policies? Check out Managing Federated Delegation.

Use the EMC to enable a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Sharing Policies** tab, and then select the disabled sharing policy that you want to enable.
3. In the action pane, click **Properties**.
4. On the **General** tab, select the **Enable sharing policy** check box.
5. Click **Apply** to apply the sharing policy.

Use the Shell to enable a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

This example enables the sharing policy Fabrikam.

```
Set-SharingPolicy -Identity "Fabrikam" -Enabled $true
```

For detailed syntax and parameter information, see Set-SharingPolicy.

1.13.6.8 Disable a Sharing Policy

Disable a Sharing Policy

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

When you disable a sharing policy, users who are provisioned to use the sharing policy won't be able to view or share calendar and contact information with the domains specified in the policy. However, you can't remove a sharing policy until all the users who are provisioned to use the policy have the sharing policy setting removed from their mailboxes.

Note:

When the sharing policy is disabled, users provisioned to use the policy will continue to share information until the Sharing Policy Assistant runs. To specify how often the Sharing Policy Assistant runs, use the Set-MailboxServer cmdlet with the *SharingPolicySchedule* parameter.

Looking for other management tasks related to sharing policies? Check out Managing Federated Delegation.

Use the EMC to disable a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Sharing Policies** tab, and then select the sharing policy you want to disable.
3. In the action pane, click **Properties**.
4. On the **General tab**, clear the **Enable sharing policy** check box.
5. Click **Apply** to disable the sharing policy.

Use the Shell to disable a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

This example disables the sharing policy Fabrikam.

```
Set-SharingPolicy -Identity "Fabrikam" -Enabled $False
```

1.13.6.9 Apply a Sharing Policy to Mailboxes

Apply a Sharing Policy to Mailboxes

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

After creating a sharing policy, you must apply the sharing policy to mailboxes so users

can create sharing relationships with users in other external federated Exchange organizations or with individuals in non-Exchange organizations.

Looking for other management tasks related to sharing policies? Check out Managing Federated Delegation.

Prerequisites

A sharing policy exists. For details, see Create a Sharing Policy.

Use the EMC to apply a sharing policy to a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying sharing policies" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Recipient Configuration** > **Mailbox**.
2. In the result pane, select the recipient that you want.
3. In the action pane, click **Properties**.
4. On the **Mailbox Settings** tab, select **Sharing**, and then click **Properties**.
5. In **Sharing**, click **Browse.**
6. In **Select Sharing Policy**, select the sharing policy you want to use, and then click **OK**.
7. In **Sharing**, click **OK**.
8. In **<Mailbox> Properties**, click **Apply**.

Use the Shell to apply a sharing policy to a mailbox

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying sharing policies" entry in the Mailbox Permissions topic.

This example applies the Fabrikam sharing policy to Tony's mailbox.

```
Set-Mailbox -Identity Tony -SharingPolicy "Fabrikam"
```

This example specifies that all user mailboxes in the Marketing department use the Contoso Marketing sharing policy.

```
Get-Mailbox -Filter {Department -eq "Marketing"} | Set-Mailbox -SharingPolicy "Co
```

For detailed syntax and parameter information, see Set-Mailbox and Get-Mailbox.

Use the Shell to retrieve mailboxes provisioned with a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Applying sharing policies" entry in the Mailbox Permissions topic.

This example returns all the mailboxes that have the Fabrikam sharing policy applied, and it sorts the users into a table that displays only their aliases and e-mail addresses.

```
Get-Mailbox -ResultSize unlimited | Where {$_.SharingPolicy -eq "Fabrikam" } | fo
```

For detailed syntax and parameter information, see Get-Mailbox.

1.13.6.10 Remove a Sharing Policy

Remove a Sharing Policy

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

When you remove a sharing policy, the policy object is permanently removed from Active Directory. If you want to prevent a sharing policy from being used but retain the policy definition, you can disable the policy instead of removing it. When you disable a sharing policy, users associated with the sharing policy won't be able to share calendar or contact information with recipients from the domains specified in the sharing policy.

Before you remove a sharing policy, you must remove the policy from all users who have the policy applied.

Note:

The default sharing policy applies to all mailbox users who don't have an explicit sharing policy applied. The default sharing policy is enabled by default and allows users to share limited calendar availability (free/busy) information with recipients in all external federated domains. For more information about how to remove a sharing policy from a user mailbox, see Set-Mailbox.

Looking for other management tasks related to sharing policies? Check out Managing Federated Delegation.

Prerequisites

Make sure no users are provisioned to use the sharing policy. You can use the **Get-Mailbox** cmdlet to retrieve mailboxes provisioned with a sharing policy. For details, see Apply a Sharing Policy to Mailboxes

Use the EMC to remove a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

1. In the console tree, navigate to **Organization Configuration** > **Mailbox**.
2. In the result pane, click the **Sharing Policies** tab, and then select the sharing policy you want to remove.
3. In the action pane, click **Remove**. A dialog box appears asking if you want to remove the sharing policy. Click **Yes**.

Use the Shell to remove a sharing policy

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Sharing policies" entry in the Mailbox Permissions topic.

This example removes the sharing policy Fabrikam.

```
Remove-SharingPolicy -Identity Fabrikam
```

This example removes the sharing policy Contoso and suppresses the confirmation that you want to remove the policy.

```
Remove-SharingPolicy -Identity Contoso -Confirm
```

For detailed syntax and parameter information, see Remove-SharingPolicy.

1.13.6.11 Configure Free/Busy Sharing Between Exchange Organizations

Configure Free/Busy Sharing Between Exchange Organizations

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP1*

Topic Last Modified: *2011-10-12*

Using federated delegation, users in your on-premises Exchange organization can share free/busy calendar information with recipients in other Exchange organizations that are also configured for federated delegation. Free/busy sharing can be enabled between two organizations running Exchange Server 2010 and also between organizations with a mixed Exchange deployment. For more information, see Understanding Federated Delegation.

This topic provides a summary of the requirements and configuration steps necessary to enable free/busy sharing between different types of the following common Exchange deployments:

- Two Exchange 2010 Service Pack 1 (SP1) organizations.
- An Exchange 2007 organization (or mixed Exchange 2007 and Exchange 2010 organization) and an Exchange 2010 organization.
- An Exchange Server 2003 organization (or mixed Exchange 2003 and Exchange 2007 organization) and an Exchange 2010 organization.

In addition, this topic discusses the limitations of sharing free/busy information between federated Exchange organizations.

Free/Busy Sharing Between Exchange 2010 Organizations

To configure free/busy sharing between two federated Exchange 2010 organizations, complete the steps in Configure Federated Delegation for both organizations.

Free/Busy Sharing Between Exchange 2007 and Exchange 2010 Organizations

To configure free/busy sharing between Exchange 2007 and Exchange 2010 organizations, follow the steps listed below for each Exchange organization.

1. **Add Exchange 2010 SP1 server** An Exchange 2010 SP1 server with the Client Access server (CAS) role must be installed in the Exchange 2007 organization. If you have other existing Exchange 2010 servers, they should also be updated to Exchange 2010 SP1. Learn more about installing Exchange 2010 in an Exchange 2007 organization at Exchange 2007 -

Planning Roadmap for Upgrade and Coexistence.

2. **Federated delegation** Configure federated delegation between the Exchange 2007 and Exchange 2010 organizations by completing the steps in Configure Federated Delegation for both organizations.
3. **Active Directory synchronization** Active Directory synchronization must be configured for all users that need to share free/busy information between the organizations. You can either configure the Active Directory synchronization manually or use an automated Active Directory synchronization service. Learn about Active Directory synchronization at Forefront Identity Management.
4. **Availability address space** Create a new availability address space for the remote Exchange 2010 organization that directs availability requests from Exchange 2007 mailbox users to the Exchange 2010 Client Access server in the Exchange 2007 organization. This setting enables user availability requests from Exchange 2007 users for users in the remote Exchange 2010 organization to be proxied through the Exchange 2010 CAS server in the Exchange 2007 organization. The Exchange 2010 Client Access server uses the federation trust and organization relationship to send the availability requests to the remote Exchange 2010 organization forest availability endpoint.
   Run the following command in the Exchange Management Shell on the Exchange 2010 Client Access server in the Exchange 2007 organization to configure the availability address space:

```
Add-AvailabilityAddressSpace -AccessMethod InternalProxy -ProxyUrl htt
```

Free/Busy Sharing Between Exchange 2003 and Exchange 2010 Organizations

To configure free/busy sharing between Exchange 2003 and Exchange 2010 organizations, follow the steps listed below for each Exchange organization.

1. **Add Exchange 2010 SP1 server** An Exchange 2010 SP1 server with the Client Access and Mailbox server roles must be installed in the Exchange 2003 organization. If you have other existing Exchange 2010 servers, they should also be updated to Exchange 2010 SP1. Learn more about installing Exchange 2010 in an Exchange 2003 organization at Exchange 2003 - Planning Roadmap for Upgrade and Coexistence.
2. **Configure federated delegation** Configure federated delegation between the Exchange 2003 and Exchange 2010 organizations by completing the steps in Configure Federated Delegation for both organizations.
3. **Configure Active Directory synchronization** Active Directory synchronization must be configured for all users that need to share free/busy information between the organizations. You can either configure the Active Directory synchronization manually or use an automated Active Directory synchronization service. Learn about Active Directory synchronization at Forefront Identity Management.

   Important:

   The **OU=EXTERNAL (FYDIBOHF25SPDLT)** public folder is only created on the Exchange 2010 CAS/Mailbox server if the option to create the public folders is selected during the Exchange 2010 setup. Additionally, this option is only presented during the setup process if the Exchange 2010 CAS/Mailbox server is the first Mailbox server installed in the organization. If the **OU=EXTERNAL (FYDIBOHF25SPDLT)** database wasn't created during setup, you will need to manually create this folder. Learn more at: How to troubleshoot Free/Busy issues when you use Exchange Federation in the Microsoft Office 365 for enterprises environment
4. Follow the steps below to configure public folders for free/busy sharing in your Exchange 2003 organization.
   4.a.In Exchange System Manager, navigate to **Administrative Groups** > **First**

Administrative Group > **Servers**.

4.b.Select your Exchange 2003 server and navigate to **First Storage Group** > **Public Folder Store** > **Public Folders** > **Schedule+ FREE BUSY**.

4.c.In the action pane, select the **OU=EXTERNAL (FYDIBOHF25SPDLT)** folder for the **First Administrative Group**.

4.d.Right-click the **OU=EXTERNAL (FYDIBOHF25SPDLT)** folder, and then click **Properties**.

4.e.In **OU=EXTERNAL (FYDIBOHF25SPDLT) Properties**, select the **Replication** tab.

4.f.To replicate the **OU=EXTERNAL (FYDIBOHF25SPDLT)** folder to the Exchange 2010 CAS/Mailbox server, click **Add**.

4.g.In **Select a Public Folder Store**, select the **Public Folder Database** for the Exchange 2010 CAS/Mailbox server and then click **OK**.

Note:

By default, Exchange uses the replication schedule set on the public folder database.

4.h.Click **OK** to close **OU=EXTERNAL (FYDIBOHF25SPDLT) Properties** and save your changes.

4.i.Complete the same steps above for the **OU=Exchange Administrative Group (FYDIBOHF23SPDLT)** folder.

Warning:

Depending on the size of your public folders, this replication could take several hours to complete.

4.j.After the **OU=EXTERNAL (FYDIBOHF25SPDLT)** and **OU=Exchange Administrative Group (FYDIBOHF23SPDLT)** public folders have replicated to the Exchange 2010 CAS/Mailbox server, you must remove the replicas for these public folders on the Exchange 2003 server.

5. **Modify the LegacyExchangeDN parameter** Modify the *LegacyExchangeDN* parameter on all mail-enabled objects in the Exchange 2003 organization that reference the remote Exchange 2010 organization. Change the existing organizational unit (OU) value for the mail-enabled object to External (FYDIBOHF25SPDLT). For example, LegacyExchangeDN=/o=First Organization/ou=External (FYDIBOHF25SPDLT)/cn=Recipients/cn=User Name

Limitations of Free/Busy Sharing

The following limitations apply when sharing free/busy information between federated Exchange organizations:

- **Outlook Web Access 2003** When a user in an Exchange 2003 organization uses Outlook Web Access to access free/busy for users in a remote Exchange 2010 organization, the request will fail. Outlook Web Access connections from Exchange 2003 can't make WebDAV (Web-based Distributed Authoring and Versioning) connections to a free/busy system folder to retrieve the free/busy information for remote users. Because Exchange 2010 does not support WebDAV connections, the Exchange 2003 server can't connect to External (FYDIBOHF25SPDLT) on the Exchange 2010 CAS/Mailbox server for Outlook Web Access requests. Outlook clients don't experience this limitation because they use MAPI instead of WebDAV when connecting to External (FYDIBOHF25SPDLT).
- **Wide Area Network (WAN) latency** In Exchange 2003 organizations, the replicas for all free/busy folders must reside on Exchange 2010 SP1 Mailbox servers. In environments where Exchange 2003 public folder databases are located in multiple physical sites, there may be excessive latency and performance issues if internal free/busy queries have to traverse WAN links to access Exchange 2010 public folder databases not located in the same physical site.
- **Free/busy information period** Free/busy information requests to an Exchange 2007 organization from an Exchange 2010 organization may fail due

to a mismatch in the requested free/busy information period. By default, Exchange 2007 accepts availability requests for 42 days of free/busy information and Exchange 2010 may request 62 days of free/busy information. If the request exceeds the default 42 limit imposed by Exchange 2007, the request will fail.
Follow the steps below to configure your Exchange 2007 CAS servers to accept longer period free/busy information requests:

.1.On all your Exchange 2007 CAS servers, open the following file with a text editor such as Notepad.
<Exchange Installation Path>\V14\ClientAccess\ExchWeb\EWS\web.config

Caution:
Before you make any changes to the web.config file, make a copy of the file and store it in a safe location.

.2.Locate the **appSettings** section in the web.config file.
.3.Add a new key "<add key="maximumQueryIntervalDays" value="62" />" and save the web.config file.

Note:
The maximumQueryIntervalDays value isn't present by default. When this value isn't present, Exchange 2007 uses the default interval of 42 days.

.4.Stop and restart the Microsoft Internet Information Services (IIS) on all the Exchange 2007 CAS servers.

- **Exchange organizations that have both on-premises and cloud users** If you configure federated delegation with another Exchange organization that is configured in a hybrid deployment with a cloud service such as Microsoft Office 365, free/busy availability lookups for cloud-based or remote users that have been moved to the cloud will fail. Because the organization relationship for your Exchange organization is with the remote on-premises Exchange organization, not the cloud-based Exchange organization, the free/busy request can't query the cloud-based users. Exchange 2010 doesn't support functionality to proxy these availability requests through the on-premises organization to the cloud service.

1.14 Hybrid Deployments

Hybrid Deployments

1.14.1 Understanding Hybrid Deployments with Exchange 2010 SP3

Understanding Hybrid Deployments with Exchange 2010 SP3

Applies to: *Exchange Server 2010 SP3*

Topic Last Modified: *2013-01-25*

A hybrid deployment offers organizations the ability to extend the feature-rich experience and administrative control of their existing on-premises Microsoft Exchange organization to the cloud. A hybrid deployment provides the seamless look and feel of a single Exchange organization between an on-premises Exchange organization and Exchange Online in Microsoft Office 365. In addition, a hybrid deployment can serve as an intermediate step to moving completely to an Exchange Online organization.

Hybrid Deployment Features

A hybrid deployment enables the following features:

- Secure mail routing between on-premises and Exchange Online organizations.
- Mail routing with a shared domain namespace. For example, both on-premises and cloud-based organizations use the @contoso.com SMTP domain.
- A unified global address list, also called a "shared address book".
- Free/busy and calendar sharing between on-premises and Exchange Online organizations.
- Centralized control of outbound mail flow. You can configure Exchange Online to route all messages to Internet recipients through the on-premises Exchange organization.
- A single Outlook Web App URL for both the on-premises and Exchange Online organizations.
- The ability to move existing on-premises mailboxes to the Exchange Online organization.
- Centralized mailbox management using the on-premises Exchange Management Console.
- Message tracking, MailTips, and multi-mailbox search between on-premises and Exchange Online organizations.
- Cloud-based message archiving for on-premises Exchange mailboxes. Exchange Online Archiving can be used with a hybrid deployment. For more information, see Understanding Exchange Online Archiving.

Hybrid Deployment Components

A hybrid deployment involves several different services and components:

- **Microsoft Office 365** Office 365 provides a cloud-based Exchange Online organization as a part of its subscription service. Organizations configuring a hybrid deployment must create and configure this cloud-based Exchange organization.
- **Hybrid Configuration wizard** Service Pack 3 (SP3) for Exchange Server 2010 includes Hybrid Configuration wizards which provide you with a streamlined process to configure a hybrid deployment between on-premises Exchange and Exchange Online organizations.
  Learn more at: Understanding the Hybrid Configuration Wizard
- **Hybrid server** When the Hybrid Configuration wizards complete the configuration of an Exchange 2010 SP3 server in your existing Exchange organization, that Exchange 2010 SP3 server is now referred to as a *hybrid server*. Hybrid servers are required for hybrid deployments. They enable messaging features and message delivery between your on-premises Exchange and Exchange Online organizations.
- **Microsoft Federation Gateway** The Microsoft Federation Gateway is a free cloud-based service offered by Microsoft that acts as the trust broker between your on-premises Exchange 2010 organization and the Exchange Online organization.
  On-premises organizations configuring a hybrid deployment must have a federation trust with the Microsoft Federation Gateway. The Hybrid Configuration wizard checks to see if there is an existing federation trust with the Microsoft Federation Gateway for the on-premises organization. If present, the existing federation trust is used to support the hybrid deployment. If not present, the wizard creates a federation trust for the on-premises organization with the Microsoft Federation Gateway. A federation trust with the Microsoft Federation Gateway for your Office 365 tenant is automatically configured when you activate your Office 365 service account.
  Learn more at: Microsoft Federation Gateway
- **Active Directory synchronization** Active Directory synchronization replicates on-premises Active Directory information for mail-enabled objects to the Office 365 organization to support the unified global address list (GAL).
  Organizations configuring a hybrid deployment must deploy Active Directory synchronization on a separate on-premises server.
  Learn more at: Active Directory synchronization: Roadmap

1.14.2 Understanding Upgrading Office 365 Tenants for Exchange 2010-based Hybrid Deployments

Understanding Upgrading Office 365 Tenants for Exchange 2010-based Hybrid Deployments

Topic Last Modified: *2013-02-21*

Organizations that have configured a hybrid deployment with Microsoft Office 365 using Microsoft Exchange Server 2010 servers need to consider several factors when upgrading an Office 365 tenant to the next service version. Organizations with an existing hybrid deployment should evaluate whether to remain configured as an Exchange 2010-based hybrid deployment or upgrade their on-premises organization to an Exchange 2013-based hybrid deployment.

Organizations with on-premises Exchange 2010-only hybrid deployments need to make

this evaluation, as well as Exchange Server 2007 and Exchange Server 2003 on-premises organizations that have added Exchange 2010 servers as part of the hybrid deployment configuration process. Organizations with existing Exchange 2010-based hybrid deployments should also be aware that some administrative tasks are necessary to ensure full hybrid feature functionality. This topic focuses on Exchange 2010-based hybrid deployments and the Office 365 tenant upgrade process.

Exchange Hybrid Deployment Types and Compatibility with Office 365

Hybrid deployments between your on-premises and Office 365 organizations can be configured using either Exchange 2013 or Exchange 2010 servers. Depending on which version of Exchange you deploy in your on-premises organization to configure hybrid, your hybrid deployment will be either an *Exchange 2010-based hybrid deployment* or an *Exchange 2013-based hybrid deployment*. Following is a brief description of each deployment type:

- **Exchange 2010-based hybrid deployment** Exchange 2010-based hybrid deployments use Exchange 2010 servers to connect to the Microsoft Exchange Online Protection (EOP) service (formerly known as Forefront Online Protection for Exchange) included with all Office 365 tenants. Exchange 2010-based hybrid deployments can either be on-premises organizations that are homogenous Exchange 2010 organizations, or Exchange 2003 and Exchange 2007 on-premises organizations that have added Exchange 2010 servers as part of configuring a hybrid deployment with Office 365. This includes adding servers with either the Exchange 2010 Client Access or Edge Transport server roles.

  Exchange 2010-based hybrid deployments are compatible with the newest version of Office 365, provided some requirements are met. Compatibility with Office 365 allows organizations to remain configured as Exchange 2010-based hybrid deployments if they choose not to use the new features of Exchange 2013.

- **Exchange 2013-based hybrid deployment** Exchange 2013-based hybrid deployments use Exchange 2013 servers to connect to the EOP service included with all Office 365 tenants. Exchange 2013-based hybrid deployments can either be on-premises organizations that are homogenous Exchange 2013 organizations, or Exchange 2007 and Exchange 2010 on-premises organizations that have added Exchange 2013 servers as part of configuring a hybrid deployment with Office 365. All on-premises Exchange 2013 servers must have installed Cumulative Update 1 (CU1) or greater for Exchange 2013 to support hybrid functionality with Office 365. For more information, see Cumulative Updates for Exchange 2013.

  Exchange 2013-based hybrid deployment also includes scenarios where on-premises organizations add servers with the Exchange 2010 SP3 Edge Transport server role to Exchange 2013 organizations to use the benefits of a perimeter network. For more information about Exchange 2013-based hybrid deployments, see Exchange Server 2013 Hybrid Deployments.

Important:

Exchange 2003 on-premises organizations can't configure a hybrid deployment using Exchange 2013 servers. These organizations must use Exchange 2010-based hybrid deployments to configure coexistence with Office 365.

Office 365 Tenant Upgrade Process

Microsoft initiates Office 365 tenant upgrades. When their Office 365 tenant is eligible for upgrade to the newest version of the service, Office 365 administrators receive an email notification from Microsoft. While the Office 365 tenant upgrade process is fully automated and doesn't require any additional deployment requirements for cloud-only organizations, organizations with Exchange 2010-based hybrid deployments do require a few basic checks and actions as part of the Office 365 upgrade process.

For more information, see Office 365 Service Upgrade Center for Enterprise.

Exchange 2010-based Hybrid Deployments and Office 365 Tenant Upgrades

As part of the Office 365 tenant upgrade process, administrators need to conduct two administrative steps in order for Exchange 2010-based organizations to be fully functional when the Office 365 tenant is upgraded to version v15:

- **Exchange 2010 Service Pack 3** Exchange Server 2010 SP3 is required for all Exchange 2010 Client Access and Hub Transport servers in an Exchange 2010-based hybrid deployment that are Internet-facing and connect to Office 365 tenant version v15 or higher. This requirement also includes any Exchange 2010 Edge Transport servers that are configured to connect with Office 365 as part of a hybrid deployment.

  We recommend installing Exchange 2010 SP3 on your Exchange 2010 servers and management workstations in your on-premises organization before you accept the Office 365 update invitation. Exchange 2010 SP3 contains updates to the Exchange Management Console (EMC) that allow it to connect to the remote Exchange Online organization, as well as updating the management experience for the remote Exchange Online organization.

  Important:
  If you don't install Exchange 2010 SP3 prior to your Office 365 tenant upgrading to version v15, don't worry. Your hybrid deployment-related features and secure mail between your on-premises and Exchange Online organizations will continue to function normally. You'll receive a prompt to upgrade to Exchange 2010 SP3 when you try to access the remote Exchange Online organization node in the EMC. If you need to manage the organization configuration setting for the Exchange Online organization prior to updating to Exchange 2010 SP3, you can use the Exchange admin center (EAC) in the Office 365 tenant.
  To learn more about hybrid management and the version v15 Office 365 tenant, see Understanding Hybrid Management in Exchange 2010 Hybrid Deployments.
  To learn more about other updates included with Exchange 2010 SP3, see What's New in Exchange 2010 SP3.

- **Hybrid Configuration wizard** After you've installed Exchange 2010 SP3 and completed the update to your Office 365 tenant, you must run the Hybrid Configuration wizard again. You don't need to make any hybrid configuration changes if there aren't any changes to be made, but the wizard still needs to run to properly update the *HybridConfiguration* Active Directory object.

Version Information for Office 365 and Exchange Online

The Exchange Online service included as part of an Office 365 tenant is based on Exchange Server. When the Office 365 tenant is upgraded and the tenant version changes, the version of Exchange Online also changes. Following is specific information about tenant versions currently available:

- **Office 365 tenant version v14** Office 365 tenant version 14 includes the Exchange Online service that is based on Exchange 2010. This tenant version is identified by version number 14.0.000.0 and higher.
- **Office 365 tenant version v15** Office 365 tenant version 15 includes the Exchange Online service that is based on Exchange 2013. This tenant version is identified by version number 15.0.000.0 and higher.

Note:

If you're unsure what version of the Office 365 tenant is configured as part of your hybrid deployment, see the Verify Office 365 tenant version and status section later in this topic.

The Office 365 tenant version and each Exchange-based hybrid deployment requirements are listed in the following table.

On-premises environment	Exchange 2010-based hybrid with tenant version v14	Exchange 2010-based hybrid with tenant version v15	Exchange 2013-based hybrid with tenant version v15
Exchange 2013 (CU1)	Not supported[1]	Not applicable	Supported
Exchange 2010 SP3	Supported	Supported	Supported[5]
Exchange 2010 SP2	Supported	Not supported[2]	Not supported
Exchange 2010 SP1	Supported	Not supported[2]	Not supported
Exchange 2007 SP3 RU10	Supported[3]	Supported[4]	Supported[5]
Exchange 2007 SP3	Supported[3]	Not Supported	Not supported
Exchange 2003 SP2	Supported[3]	Supported[4]	Not supported

Note:

[1] Blocked in Exchange 2013 setup
[2] Tenant upgrade notification provided in Exchange Management Console
[3] Requires at least one on-premises Exchange 2010 SP2 server
[4] Requires at least one on-premises Exchange 2010 SP3 server
[5] Requires at least one on-premises Exchange 2013 (CU1) or greater server

Verify Office 365 Tenant Version and Status

If you're not sure which version of the Office 365 tenant is currently configured with your hybrid deployment, follow the steps below to verify the version of your Office 365 tenant:

1. Connect to the Office 365 tenant using remote Windows PowerShell. For step-by-step connection instructions, see Connect Windows PowerShell to the Service.
2. After connecting to the Office 365 tenant, run the following command.

```
Get-OrganizationConfig | Format-List AdminDisplayVersion
```

   Note the version of your Office 365 tenant:
   - *AdminDisplayVersion* parameter value displays the current Office tenant version. For example, "0.10 (14.0.500.5)" for a v14 tenant or "0.20 (15.0.100.1)" for a v15 tenant.
3. Disconnect from the Office 365 tenant remote PowerShell session. For step-by-step disconnection instructions, see Connect Windows PowerShell to the Service.

1.14.3 Understanding Single Sign-On with Hybrid Deployments

Understanding Single Sign-On with Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-02-14*

Single sign-on enables users to access both the on-premises and Microsoft Office 365 organizations with a single user name and password. Single sign-on provides users with a familiar sign-on experience and allows administrators to easily control account policies for cloud-based organization mailboxes by using on-premises Active Directory management tools. Deploying single sign-on includes several components that configure the trust relationship between the on-premises Active Directory Federation Services (AD FS) server and the Microsoft Federation Gateway.

Although not a requirement for hybrid deployments, we strongly recommend deploying single sign-on in your on-premises organization to make the account authentication experience seamless and familiar for your users. In addition to users not having to sign in multiple times and having to remember additional passwords when accessing the Office 365 organization, single sign-on also offers the following benefits:

- **Exchange Online Archiving** When single sign-on is deployed in Exchange 2010 organizations, on-premises Microsoft Outlook users aren't prompted for their credentials when accessing archived content in the Exchange Online organization. If single sign-on isn't deployed in Exchange 2010 organizations and Exchange Online Archiving is enabled, the on-premises user principal name (UPN) must match their Exchange Online account. In this scenario, the user will be prompted for their on-premises credentials when initially accessing their archive. A user can temporarily avoid future credential prompting by choosing "save password", but the user will be prompted again when their on-premises account password is changed.
- **Policy control** The administrator can control account policies through Active Directory, which gives the administrator the ability to manage password policies, workstation restrictions, lock-out controls, and more, without having to perform additional tasks in the cloud.
- **Access control** The administrator can restrict access to Office 365 so that the services can be accessed through the corporate environment, through online servers, or both.
- **Reduced support calls** Forgotten passwords are a common source of support calls in all companies. If users have fewer passwords to remember, they are less likely to forget them.
- **Security** User identities and information are protected because all the servers and services used in single sign-on are administered and controlled on-premises.
- **Support for strong authentication** You can use strong authentication (also called two-factor authentication) with Office 365. However, if you use strong authentication, you must use single sign-on. There are restrictions on the use of strong authentication. For more information, see Configuring Advanced Options for AD FS 2.0 and Office 365.

Learn more at: Prepare for single sign-on

1.14.4 Understanding Certificate Requirements for Hybrid Deployments

Understanding Certificate Requirements for Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

Digital certificates are an important part of securing the communication between the on-premises Exchange organization and the Microsoft Office 365 service, other on-premises Exchange servers, and your clients. Certificates enable one entity to trust the identity of another. This helps to ensure that a client or server is communicating to the right source.

In a hybrid deployment, several services make use of certificates:

- **Active Directory Federation Services (AD FS)** A certificate issued by a trusted third-party certificate authority (CA) is used to establish a trust between Web clients and federation server proxies, to sign security tokens, and to decrypt security tokens.
  Learn more at: Certificates
- **Exchange federation** A self-signed certificate is used to create a secure connection between the on-premises Service Pack 3 (SP3) for Exchange Server 2010 servers configured for the hybrid deployment (that is, "hybrid servers") and the Microsoft Federation Gateway.
  Learn more at: Understanding Federated Delegation
- **Exchange services** Certificates issued by a trusted third-party CA are used to increase the security for Secure Sockets Layer (SSL) communication between Exchange servers and clients. Services that use certificates include Outlook Web App, Exchange ActiveSync, Outlook Anywhere, and message transport.
- **Existing Exchange servers** Your existing Exchange servers may make use of certificates to help secure Outlook Web App communication, message transport, and so on. Depending on how you use certificates on your Exchange servers, you might use self-signed certificates or certificates issued by a trusted third-party CA.
  Learn more at: Understanding Digital Certificates and SSL

Certificate Requirements for a Hybrid Deployment

When configure a hybrid deployment, you must configure certificates. You must purchase certificates from a trusted third-party CA. Multiple services, such as AD FS, Exchange 2010 federation, Exchange 2010 services, and Exchange, each require certificates. Depending on your organization, you may decide to do one of the following:

- Use a third-party certificate that's used by all services across multiple servers.
- Use a third-party certificate for each server that provides services.

Whether you choose to use the same certificate for all services, or dedicate a certificate for each service, depends on your organization and the service you're implementing. Here are some things to consider about each option:

- **Third-party certificate across multiple servers** Third-party certificates that are used by services across multiple servers may be slightly cheaper to obtain, but they may complicate renewal and replacement. The complication occurs

because, when a certificate needs replacement, you need to replace the certificate on every server where it's installed.

- **Third-party certificate for each server** Using a dedicated certificate for each server that hosts services allows you to configure the certificate specifically for the services on that server. If you need to replace the certificate or renew it, you only need to replace it on the server where the services are installed. Other servers aren't impacted.

We recommend that you use a dedicated third-party certificate for the AD FS server, another certificate for the Exchange services on your hybrid servers, and if needed, a certificate on your Exchange server. The on-premises federated trust configured as part of federated delegation uses a self-signed certificate by default. Unless you have specific requirements, there's no need to use a third-party certificate with the federation trust configured as part of federated delegation.

The services that are installed on a single server may require that you configure multiple fully qualified domain names (FQDNs) for the server. Purchase a certificate that allows for the required number of FQDNs. Certificates consistent of the subject, or principal, name, and one or more subject alternative names (SAN). The subject name is the FQDN that the certificate is issued to. SANs are additional FQDNs that can be added to a certificate in addition to the subject name. If you need a certificate to support five FQDNs, purchase a certificate that allows for five domains to be added to the certificate: one subject name and four SANs.

Service	Server	Suggested FQDN
Active Directory Federation Services (AD FS) (if you've chosen to configure AD FS)	ADFS	sts.contoso.com
Autodiscover	Hybrid servers	autodiscover.contoso.com
Transport	Hybrid servers	Label that matches the external FQDN of your Exchange 2010 SP3 hybrid servers, such as hybrid.contoso.com.
Outlook Anywhere	Hybrid servers	Label that matches the internal FQDN of your Exchange 2010 SP3 hybrid servers, such as Ex2010.corp.contoso.com. Label that matches the internal host name of your Exchange 2010 SP3 hybrid servers, such as Ex2010.
Outlook Web App (Exchange 2010)	Hybrid servers	owa.contoso.com
Outlook Web App (existing Exchange server)	Existing Exchange server	Label that matches the external FQDN of your existing Exchange server, such as mail.contoso.com.

1.14.5 Understanding Hybrid Deployment Permissions with Exchange 2010 SP3

Understanding Hybrid Deployment Permissions with Exchange 2010 SP3

Applies to: *Exchange Server 2010 SP3*

Topic Last Modified: *2011-11-09*

The Exchange Online in Microsoft Office 365 organization is based on Exchange 2010 and, like on-premises organizations, uses Role Based Access Control (RBAC) to control permissions. Administrators are granted permissions using management role groups, and end users are granted permissions using management role assignment policies.

Learn more about RBAC at: Understanding Permissions

Administrator Permissions

By default, the user that was used to create the Office 365 service is made a member of the Organization Management role group in the Exchange Online organization. This user can manage the entire Office 365 organization, including configuration of organization-level settings and management of Exchange Online recipients.

You can add additional administrators in the Office 365 organization, depending on the management that needs to take place. You can add additional organization administrators and recipient administrators enable specialist users to perform compliance tasks such as discovery, configure custom permissions, and more. All permissions management for Office 365 administrators must be performed in the Exchange Online organization using either the Exchange Control Panel (ECP) or remote PowerShell.

However, it's important to note that there is no transfer of permissions between the on-premises organization and the Office 365 organization. Any permissions that you've defined in the on-premises organization must be re-created in the Office 365 organization.

See the following topics for more information:

- Create a Role Group
- Add a Role to a Role Group
- Remove a Role from a Role Group
- Copy a Role Group
- Add Members to a Role Group
- Remove Members from a Role Group

End User Permissions

As with administrator permissions, end users in Exchange Online can be granted permissions. By default, end users are granted permissions via the default role assignment policy. This policy is applied to every mailbox in the Exchange Online organization. If the permissions granted by default are sufficient, you don't need to change anything.

If you do want to customize end user permissions, you can either modify the existing default role assignment policy, or you can create new assignment policies. If you create multiple assignment policies, you can assign different policies to different groups of mailboxes, enabling you to control permissions granted to each group depending on their requirements. All permissions management for cloud-based end users must be performed in the Exchange Online organization using either the ECP or remote PowerShell.

Like administrator permissions, end user permissions aren't transferred between the on-premises organization and the Exchange Online organization. Any permissions that you've defined in the on-premises organization must be re-created in the Exchange Online organization.

The following table lists the permissions granted by the default role assignment policies in the Exchange Online organization.

Default role assignment policy permissions

Management role	Description
MyBaseOptions	The `MyBaseOptions` management role enables individual users to view and modify the basic configuration of their own mailbox and associated settings.
MyContactInformation	The `MyContactInformation` management role enables individual users to modify their contact information, including address and phone numbers.
MyDistributionGroupMembership	The `MyDistributionGroupMembership` management role enables individual users to view and modify their membership in distribution groups in an organization, provided that those distribution groups allow manipulation of group membership.
MyDistributionGroups	The `MyDistributionGroups` management role enables individual users to create, modify, and view distribution groups, and to modify, view, remove, and add members to distribution groups they own.
MyMailSubscription	The `MyMailSubscription` role enables individual users to view and modify their e-mail subscription settings such as message format and protocol defaults.
MyProfileInformation	The `MyProfileInformation` management role enables individual users to modify their name.
MyRetentionPolicies	The `MyRetentionPolicies` management role enables individual users to view their retention tags, and to view and modify their retention tag settings and defaults.
MyTextMessaging	The `MyTextMessaging` management role enables individual users to create, view, and modify their text messaging settings.
MyVoiceMail	The `MyVoiceMail` management role enables individual users to view and modify their voice mail settings.

See the following topics for more information:

- Add an Assignment Policy
- Remove an Assignment Policy

- Add a Role to an Assignment Policy
- Remove a Role from an Assignment Policy
- Change the Assignment Policy on a Mailbox
- Change the Default Assignment Policy

1.14.6 Understanding Cloud-Only Deployments with Exchange 2010 SP3

Understanding Cloud-Only Deployments with Exchange 2010 SP3

Applies to: *Exchange Server 2010 SP3*

Topic Last Modified: *2011-11-09*

A cloud-only deployment is one where your organization in the Exchange Online service isn’t connected with your on-premises directory and Exchange organization in a hybrid deployment. Exchange Online is part of Microsoft Office 365 . In a cloud-only deployment:

- If you have an on-premises Exchange organization, the Exchange Online organization looks like an external mail system.
- Users need to use different credentials to access their Exchange Online-based mailboxes.
- Your on-premises directory isn't synchronized with the Office 365 organization. Exchange Online mailboxes and distribution groups are managed separately from on-premises mailboxes and distribution groups.

A cloud-only deployment is most often used when you want to migrate from your existing on-premises e-mail system to Exchange Online. If you've already signed up for Office 365, you can click the **Cloud Only** button in the Exchange Server Deployment Assistant. If you haven't chosen to sign up for Office 365 yet, here's planning information that may help you: Exchange Hybrid Deployment and Migration with Office 365.

If you don’t want any of the functionality mentioned in the list above, you need to configure a hybrid deployment between your on-premises Exchange organization and the Exchange Online organization. With a hybrid deployment, you get the following capabilities:

- Active Directory synchronization
- Single sign-on
- Transport Layer Security (TLS) transport
- Free/busy and calendar sharing
- And more.

If you want to learn more about hybrid deployments, see Understanding Hybrid Deployments with Exchange 2010 SP3.

1.14.7 Hybrid Deployments with the Hybrid Configuration Wizard

Hybrid Deployments with the Hybrid Configuration Wizard

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-11-02*

Service Pack 2 (SP2) for Microsoft Exchange Server 2010 includes the *New Hybrid Configuration* and *Manage Hybrid Configuration* wizards, new components designed to help you configure hybrid deployments. These wizards provide Exchange administrators with a streamlined process to create and configure a hybrid deployment between on-premises Exchange and Microsoft Office 365 organizations.

When configuring a new hybrid deployment for your Exchange organization, follow these general deployment and configuration steps:

1. Read Understanding the Hybrid Configuration Wizard.
2. Configure all hybrid deployment prerequisites listed in Hybrid Configuration Wizard Prerequisites.
3. Create a new `HybridConfiguration` Active Directory object by following the steps in Create a New Hybrid Deployment.
4. Configure the options and properties of your hybrid deployment by following the steps in Manage a Hybrid Deployment.

1.14.7.1 Understanding the Hybrid Configuration Wizard

Understanding the Hybrid Configuration Wizard

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-12-13*

This topic gives you an overview of the Hybrid Configuration wizards, the hybrid deployment configuration process, and the Hybrid Configuration Engine.

For more information about hybrid deployments, check out Understanding Hybrid Deployment. Looking for management tasks related to hybrid deployments? See Hybrid Deployments with the Hybrid Configuration Wizard.

Contents

Hybrid Configuration Process

Creating and configuring your hybrid deployment with the Hybrid Configuration Wizards is

a two-step process. To begin, you use the New Hybrid Configuration wizard to create the foundation for the hybrid deployment. Then, you use the Manage Hybrid Configuration wizard to configure your Exchange organization for the hybrid deployment.

In the first step of the hybrid configuration process, the New Hybrid Configuration wizard creates the **HybridConfiguration** object in your on-premises Active Directory. This Active Directory object stores the hybrid configuration information for the hybrid deployment and is updated using the Manage Hybrid Configuration wizard.

In the second step of the hybrid configuration process, the Manage Hybrid Configuration wizard gathers existing Exchange and Active Directory topology configuration data, defines several organization parameters, and then runs an extensive sequence of configuration tasks. The general phases of the process run in the following order:

1. **Test account credentials** Designated on-premises and cloud organization hybrid management accounts access the on-premises and cloud organizations to gather prerequisite verification information and to make organization parameter configuration changes to enable hybrid deployment functionality. The Manage Hybrid Configuration wizard checks that the accounts have the appropriate credentials and can connect to the on-premises and Exchange Online organizations. The hybrid deployment management accounts for the on-premises and cloud organizations must be members of the Organization Management role group for the Hybrid Configuration wizard to complete these tasks successfully.
2. **Verify prerequisites and perform topology checks** The Manage Hybrid Configuration wizard verifies that your on-premises and cloud organizations can support a hybrid deployment. Some of the items that the wizard verifies and checks are Exchange server versions, the presence of Active Directory synchronization in the on-premises organization, and the presence of registered domains on the Office 365 service.
3. **Run the hybrid configuration changes** After testing the hybrid management accounts, conducting the verification and topology checks, and gathering configuration information defined by the Exchange administrator in the wizard process, the Manage Hybrid Configuration wizard makes the configuration changes to create and enable the hybrid deployment. All changes to the hybrid configuration are automatically logged in the hybrid configuration log. By default, the hybrid configuration log is located at C:\Program Files \Microsoft\Exchange Server\V14\Logging\Update-HybridConfiguration. The table below outlines the main areas that the Hybrid Configuration wizards modify and configure.

Configuration area	Description
Recipients	The wizard adds an accepted domain to the on-premises organization for hybrid mail flow and Autodiscover requests for the cloud organization. This domain, referred to as the "coexistence domain", is added as a secondary proxy domain to any e-mail address policies which have *PrimarySmtpAddress* templates for domains selected in the Hybrid Configuration wizard. By default, this domain is <domain>.mail.onmicrosoft.com. You can view the accepted domain by running the following command in the Shell on the cloud organization. `Get-AcceptedDomain | FL DomainName, IsCoexistenceDomain`
Exchange federation	The wizard checks to see if there is an existing federation trust with the Microsoft Federation Gateway for the on-premises organization. If present, the existing federation trust is used to support the hybrid deployment. If not present, the wizard creates a federation trust for the on-premises organization with the Microsoft Federation

	Gateway. The wizard also adds any domains selected within the hybrid configuration wizard to the federation trust. In addition to the federation trust configuration, the wizard also creates and configures organizational relationships for both the on-premises and cloud organizations. These organization relationships allow the wizard to enable several hybrid deployment features, including free/busy sharing, Outlook Web App redirection, message tracking, and MailTips.
Mailbox moves	The wizard enables the Mailbox Replication Service (MRS) proxy on the on-premises Client Access servers included in the hybrid deployment to enable mailbox moves from the on-premises organization to the cloud organization.
Mail flow	The wizard configures on-premises Hub Transport servers and Forefront Online Protection for Exchange (FOPE) on your Office 365 organization for hybrid mail routing. By configuring new and existing Send and Receive connectors in the on-premises organization and Inbound and Outbound connectors in FOPE, the wizard allows you to choose whether outbound messages delivered to the Internet from the Office 365 organization will be sent directly to external mail recipients or routed through your on-premises Hub Transport servers included in the hybrid deployment. Learn more at: • For Exchange 2003 hybrid deployments: Understanding Transport Options • For Exchange 2007 hybrid deployments: Understanding Transport Options for an Exchange 2007 Hybrid Deployment • For Exchange 2010 hybrid deployments: Understanding Transport Options for an Exchange 2010 Hybrid Deployment

Important:

Inbound mail flow is controlled by your organization's MX record. Inbound Internet e-mail for a hybrid deployment isn't configured by the Hybrid Configuration wizard.

Hybrid Configuration Features

The Manage Hybrid Configuration wizard automatically enables all hybrid deployment features by default. If you want to enable or disable specific hybrid configuration features, you can run the Manage Hybrid Configuration wizard again, or use the Exchange Management Console and the Exchange Management Shell to update hybrid deployment parameters. The following hybrid deployment features are enabled by default by the wizard:

- **Free/busy sharing** The free/busy sharing feature enables calendar information to be shared between on-premises and cloud-based organization users. Free/busy sharing is enabled as part of the federated delegation and organization relationship configuration for the on-premises and cloud-based Exchange organizations. Learn more at Understanding Federated Delegation.
- **Mailbox moves** The mailbox move feature enables on-premises mailboxes to be moved to the cloud organization while preserving user's Microsoft Office Outlook profiles and offline .ost folders. Mailbox move also enables moving cloud mailboxes to the on-premises organization.
- **Message tracking** The message tracking feature records the SMTP transport activity of all messages transferred to and from the hybrid Hub Transport servers between the on-premises and cloud-based organizations. You can use message tracking logs for message forensics, mail flow analysis, reporting, and troubleshooting. Learn more at Understanding Message Tracking.

- **MailTips** MailTips are informative messages displayed to users while they're composing a message. By enabling MailTips in the hybrid deployment, on-premises and cloud-based senders can adjust messages they're composing to avoid undesirable situations or non-delivery reports (NDRs) between the organizations. Learn more at Understanding MailTips.
- **Online archiving** Online archiving enables the cloud-based organization to host user e-mail archives for both on-premises and cloud-based users. Learn more at Configure Exchange Online Archiving.
- **Outlook Web App redirection** Outlook Web App redirection provides a single, common URL to access both on-premises and cloud-based Exchange mailboxes. The hybrid server automatically redirects Outlook Web App requests to the on-premises mailbox server or provides a link to users for their mailbox in the cloud-based organization. Learn more at:
  - For Exchange 2003 hybrid deployments: Understanding Access to Outook Web App with a Single URL
  - For Exchange 2007 hybrid deployments: Understanding Access to Outlook Web App with a Single URL for an Exchange 2007 Hybrid Deployment
  - For Exchange 2010 hybrid deployments: Understanding Access to Outlook Web App with a Single URL for an Exchange 2010 Hybrid Deployment
- **Secure mail** Secure mail enables secure message delivery between the on-premises and cloud organization via Transport Layer Security (TLS) protocol. The on-premises and cloud organizations are mutually authenticated through digital certificate subjects and e-mail headers and rich-text message formatting are preserved across the organizations.

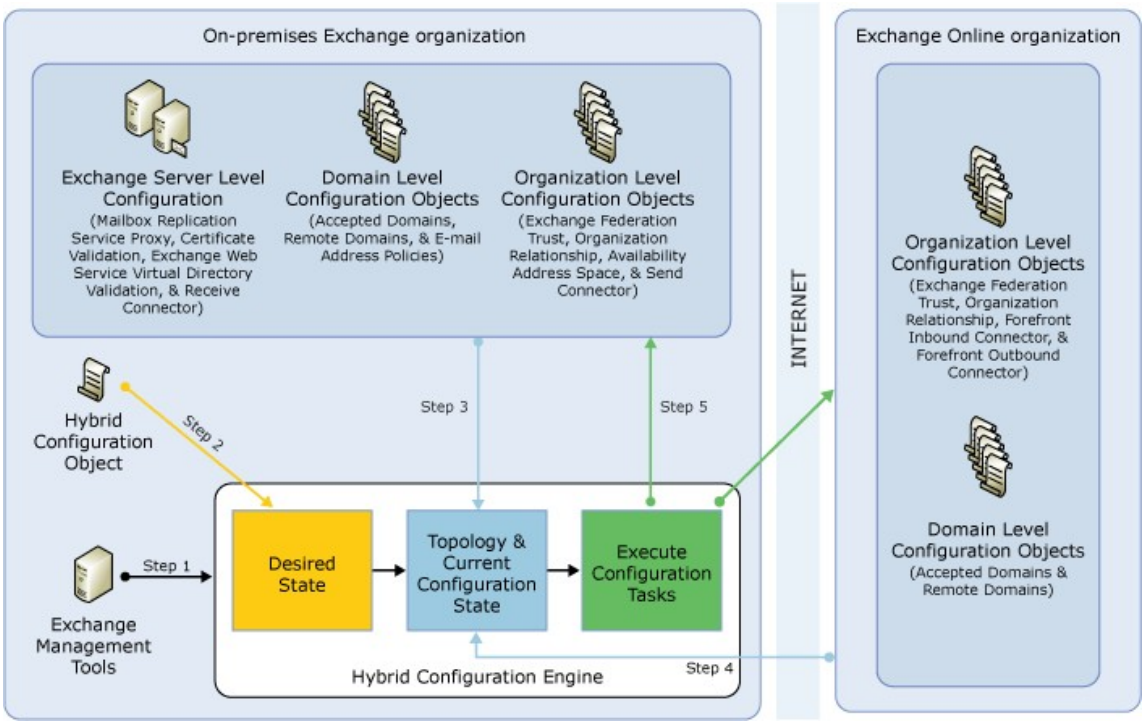
Hybrid Configuration Engine

The Hybrid Configuration Engine executes the core actions necessary for configuring and updating a hybrid deployment. Responsible for processing the `Update-HybridConfiguration` cmdlet actions, the Hybrid Configuration Engine compares the state of the *HybridConfiguration* Active Directory object with current on-premises Exchange and Exchange Online configuration settings and then executes tasks to match the deployment configuration settings to the parameters defined in the *HybridConfiguration* Active Directory object. If the current on-premises Exchange and Exchange Online deployment configuration states already match the settings defined in the *HybridConfiguration* Active Directory object, no changes are made by the Hybrid Configuration Engine to either the on-premises or Exchange Online organizations.

When updating an existing hybrid deployment, the Hybrid Configuration Engine performs the following steps:

- **Step 1** The *Update-HybridConfiguration* cmdlet triggers the Hybrid Configuration Engine to start.
- **Step 2** The Hybrid Configuration Engine reads the "desired state" stored on the `HybridConfiguration` Active Directory object.
- **Step 3** The Hybrid Configuration Engine discovers topology data and current configuration from the on-premises Exchange organization.
- **Step 4** The Hybrid Configuration Engine discovers topology data and current configuration from the Exchange Online organization.
- **Step 5** Based on the desired state, topology data, and current configuration, across both the on-premises Exchange and Exchange Online organizations, the Hybrid Configuration Engine establishes the "difference" and then executes configuration tasks to establish the "desired state."

The following figure shows a summary of how the Hybrid Configuration Engine retrieves and modifies on-premises Exchange server and Exchange Online in Office 365 configuration settings during the hybrid deployment process.



1.14.7.2 Hybrid Configuration Wizard Prerequisites

Hybrid Configuration Wizard Prerequisites

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-02-21*

Before you create and configure a hybrid deployment using the Hybrid Configuration wizards, your existing on-premises Exchange organization must meet certain requirements. If you don't meet these requirements, you won't be able to complete the steps within the Hybrid Configuration wizards and you won't be able to configure a hybrid deployment between your on-premises Exchange organization and the Exchange Online organization in Microsoft Office 365.

Prerequisites for Hybrid Deployment

The following prerequisites are required for configuring a hybrid deployment:

1. **On-premises Exchange organization** On-premises Exchange 2003-based organizations or later are required for a hybrid deployment. For Exchange 2003 and Exchange 2007 organizations, at least one Exchange 2010 Service Pack 2 (SP2) server must be installed in the on-premises organization to run the Hybrid Configuration wizards and support hybrid deployment functionality. All other on-premises Exchange servers must have the latest service packs installed.
   Learn more at: What's New in Exchange 2010 SP2.
2. **Install Exchange rollup packages** You must install the latest Exchange 2010 SP2 rollup packages on all hybrid servers to properly configure and avoid problems when configuring a hybrid deployment. Microsoft releases

update rollup packages approximately every six to eight weeks. The rollup packages are available via Microsoft Update and also through the Microsoft Download Center. In the Search box on the Microsoft Download Center, type "Exchange 2010 SP2 update rollup" to find links to the Exchange 2010 SP2 rollup packages.
Find update rollup packages at: Microsoft Download Center

3. **Office 365 for enterprises** An Office 365 for enterprises tenant and administrator account and user licenses available on the cloud service to configure a hybrid deployment.
   Learn more at: Sign up for Office 365
4. **Custom domains** Register any custom domains you want to use in your hybrid deployment with Office 365. You can do this by using the Office 365 Administrative portal, or by optionally configuring Active Directory Federation Services (AD FS) in your on-premises organization.
   Learn more at: Add your domain to Office 365
5. **Active Directory synchronization** Deploy Office 365 Active Directory synchronization in your on-premises organization.

   Important:
   If you signed up for your Office 365 tenant organization during the Office 365 beta program and enabled Active Directory synchronization, you must run the following Shell command in your Office 365 organization to create a coexistence domain (<domain>.mail.onmicrosoft.com) for your organization.
   ```
   Set-MsolDirsyncEnabled -EnableDirsync $true
   ```

   Learn more at: Active Directory synchronization: Roadmap
6. **Client Access and Hub Transport servers** Install one or more Exchange 2010 SP2 Client Access and Hub Transport servers in your on-premises organization. If you're configuring a hybrid deployment for an Exchange 2003 on-premises organization, you must also install the Mailbox Server role on at least one Exchange 2010 SP2 server added for the hybrid deployment.
7. **Autodiscover DNS records** Configure the Autodiscover public DNS records for your existing SMTP domains to point to an on-premises Exchange 2010 SP2 Client Access server.
8. **Office 365 organization in the Exchange Management Console (EMC)** Add the Office 365 organization to the EMC. This will allow you to manage both the on-premises and cloud Exchange organizations from a single management console. Learn more at: Add an Exchange Forest
9. **Exchange Web Services** Configure the *ExternalURL* parameter for the default Exchange Web Services (EWS) virtual directory with the externally accessible, fully qualified domain name (FQDN) of the hybrid Exchange 2010 SP2 Client Access server included in your hybrid deployment. Learn more at: Understanding Exchange Web Services Virtual Directories

   Important:
   Pre-authentication connections to the /EWS/exchange.asmx/wssecurity, /autodiscover/autodiscover.svc/wssecurity, and /EWS/MRSProxy.svc/wssecurity virtual directories must be turned off. Authentication for these virtual directories must use the Exchange federation trust certificate and federation claims.
10. **Certificates** Install and assign Exchange services to a valid digital certificate purchased from a trusted certificate authority (CA). Although self-signed certificates can be used for the on-premises federation trust with the Microsoft Federation Gateway, self-signed certificates can't be used for Exchange services in a hybrid deployment. The Internet Information Services (IIS) instance on the Client Access servers configured in the hybrid deployment must have a valid digital certificate purchased from a trusted certificate authority (CA). Additionally, the EWS external URL and the Autodiscover endpoint specified in your public DNS must be listed in Subject Alternative Name (SAN) of the certificate. The Hub Transport servers used for mail transport in the hybrid deployment must all use the same certificate (have matching certificate thumbprints).

After you've made sure your Exchange organization meets these requirements, you're ready to use the New Hybrid Deployment wizard. For detailed guidance, see Create a New Hybrid Deployment.

Recommended Tools and Services

In addition to the required prerequisites described earlier, other tools and services are beneficial when you're configuring hybrid deployments with the Hybrid Configuration wizards:

- **Remote Connectivity Analyzer tool** The Microsoft Remote Connectivity Analyzer tool checks the external connectivity of your on-premises Exchange organization and makes sure that you're ready to configure your hybrid deployment. We strongly recommend that you check your on-premises organization with the Remote Connectivity Analyzer tool prior to configuring your hybrid deployment with the Hybrid Configuration wizard.
  Learn more at: Remote Connectivity Analyzer Tool
- **Single sign-on** Although not a requirement for hybrid deployments, single sign-on enables users to access both the on-premises and cloud-based organizations with a single user name and password. Single sign-on provides users with a familiar sign-on experience and allows administrators to easily control account policies for cloud-based organization mailboxes by using on-premises Active Directory management tools. If you decide to deploy single sign-on with your hybrid deployment, we recommend that you deploy it in conjunction with Active Directory synchronization and before using the Hybrid Configuration wizards.
  Learn more at: Prepare for single sign-on

1.14.7.3 Create a New Hybrid Deployment

Create a New Hybrid Deployment

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-11-23*

A hybrid deployment offers organizations the ability to extend the feature-rich experience and administrative control they have with their existing on-premises Microsoft Exchange organization to the cloud. A hybrid deployment provides the seamless look and feel of a single Exchange organization between an on-premises organization and a cloud-based organization. The New Hybrid Configuration wizard helps simplify the creation of a hybrid deployment between your on-premises and Microsoft Office 365 Exchange organizations. After you have created a hybrid deployment, see Manage a Hybrid Deployment, which describes how to use the Manage Hybrid Deployment wizard.

Important:

Creating a hybrid deployment requires careful planning and affects several areas of your on-premises and cloud-based organizations. We strongly recommend that you review Hybrid Deployments with the Hybrid Configuration Wizard and Hybrid Configuration Wizard Prerequisites prior to creating your hybrid deployment using the New Hybrid Configuration Wizard.

Use the EMC to create a hybrid deployment

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Hybrid configuration" entry in the Exchange and Shell Infrastructure Permissions topic.

1. In the console on-premises organization tree, select the **Organization Configuration** node and then select the **Hybrid Configuration** tab.
2. In the action pane, click **New Hybrid Configuration**.
3. In the **New Hybrid Configuration** wizard, click **New**. The wizard creates the *HybridConfiguration* object. The default name of the new hybrid configuration is **Hybrid Configuration**.
4. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
   - A status of **Completed** indicates that the wizard completed the task successfully.
   - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Now that you've finished these steps, you're ready to complete the hybrid deployment configuration by following the steps described in Manage a Hybrid Deployment.

Use the Shell to create a hybrid deployment

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Hybrid configuration" entry in the Exchange and Shell Infrastructure Permissions topic.

Run the following command in the Shell to create the *HybridConfiguration* object in Active Directory in the on-premises organization.

```
New-HybridConfiguration
```

Important:

If there is already an existing federation trust with the Microsoft Federation Gateway configured for your on-premises Exchange organization, the Hybrid Configuration wizard will use the existing federation trust for your hybrid deployment configuration. If there isn't an existing federation trust, you must manually create a new federation trust before the hybrid deployment configuration process can continue. Learn more at Create a Federation Trust.

Now that you've finished this step, you're ready to complete the hybrid deployment configuration by following the steps described in Manage a Hybrid Deployment.

1.14.7.4 Manage a Hybrid Deployment

Manage a Hybrid Deployment

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with the Hybrid Configuration Wizard >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-04-12*

You can use a hybrid deployment to extend the feature-rich experience and administrative control for an existing on-premises Microsoft Exchange organization to the cloud. A hybrid deployment provides the seamless look and feel of a single Exchange organization between an on-premises organization and an Exchange Online organization.

For more information about hybrid deployments, see Hybrid Deployments with the Hybrid Configuration Wizard and Hybrid Deployments.

Prerequisites

A hybrid configuration for your on-premises and cloud-based organizations, created with the New Hybrid Configuration wizard. The wizard creates a **HybridConfiguration** object that must be accessible to manage and configure changes in your hybrid deployment. For more information, see Create a New Hybrid Deployment.

Use the EMC to configure hybrid configuration properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Hybrid configuration" entry in the Exchange and Shell Infrastructure Permissions topic.

1. In the console on-premises organization tree, select the **Organization Configuration** node and then select the **Hybrid Configuration** tab.
2. In the **Organization Configuration** pane on the **Hybrid Configuration** tab, select the **Hybrid Configuration** object.
3. In the action pane, click **Manage Hybrid Configuration**.
4. On the **Introduction** page of the **Manage Hybrid Configuration** wizard, click **Next**.
5. On the **Credentials** page, complete the following fields:
   - For the on-premises organization:
     - **Username** Type the domain and user name for an account that is a member of the Organization Management role group in the on-premises organization. For example, "corp\administrator".
     - **Password** Type the password for the on-premises account you entered in the **Username** text box.
     - **Remember my credentials** Select this check box to allow the wizard to automatically use this on-premises account while configuring the hybrid deployment. If you do not select this check box, you'll have to manually enter the on-premises account credentials later when the hybrid configuration changes are executed.
   - For the Microsoft Office 365 organization:
     - **Username** Type the new domain and user name for an account that is a member of the Organization Management role group in the Office 365 organization. For example, "administrator@contoso.onmicrosoft.com".
     - **Password** Type the password for the Office 365 account you entered in the previous step.
     - **Remember my credentials** Select this check box to allow the wizard to automatically use this Office 365 account while configuring the hybrid deployment. If you do not select this check box, you'll have to manually enter the Office 365 account credentials later when the hybrid

configuration changes are executed.

6. Click **Next**.

7. On the **Domains** page, complete the following fields:
   - Click **Add** to add hybrid domains for your organization.
   - In the **Select Accepted Domain** dialog box, select accepted domains for the hybrid configuration. You should select the primary SMTP domain for your organization and any other accepted domains that will be used in the hybrid deployment. For example, select "contoso.com" and "sales.contoso.com".
   - Click **OK** on the **Select Accepted Domain** dialog box.
   -  To remove a domain from the hybrid configuration, select a hybrid domain name from the list and then click this button to remove it from the hybrid configuration.

   Note:
   At least one domain is required in a hybrid deployment.

8. Click **Next**.

9. On the **Domain Proof of Ownership** page, note the values listed in the **Record Value** field for each of the new hybrid domains you selected in the previous step. You must create a TXT record for each new domain in your public DNS so that the domain can be added to the Exchange federation trust for your organization. If you have kept a domain from your previous hybrid configuration and the TXT record for this domain has already been created on your public DNS, you don't need to re-create the TXT record on your public DNS. For example, you would only need to create additional TXT records in your public DNS for the new domains similar to the following:

Domain	DNS record type	Text
contoso.com	TXT	7Zyr2i/fE/M/T3AwCpitDbF30Fk/TdzXME6f7d1lDaKGthPdoS+UF94t43D2nU5hLNnIAP+5A3jJR2ik9HDPgg==
sales.contoso.com	TXT	Eh/po5qT098GMPklJU2DShrYO9mPseTn5i9wWKOKebmceLPuLCpaejYj83W53H/YcuzPy2VSo621BHO4DNS7jg==

Warning:
The federated domain proof is a lengthy string of alphanumeric characters. To avoid input errors, we recommend that you copy the domain string from the wizard by pressing CTRL+C, paste it into a text editor such as Notepad, copy it from the text editor to the Clipboard, and then paste the string into the **Text** field of the TXT record. If the TXT record is created with an incorrect federated domain proof string, the Microsoft Federation Gateway won't be able to verify proof of domain ownership, and you won't be able to add it to the federated organization identifier or complete the hybrid configuration.

After you have created the TXT records for the new hybrid domains in your public DNS and the DNS zone file has replicated, select the **Check to confirm that the TXT records have been created in public DNS for the domains above** check box.

10. Click **Next**.

11. On the **Servers** page, complete the following fields:
    - For the Client Access servers:
      - Click **Add** to select the Client Access servers in your on-premises organization that will be configured for your hybrid deployment.
      - In the **Select Client Access Server** dialog box, select one or more servers that have the Exchange 2010 SP2 Client Access server role installed.
      - Click **OK** on the **Select Client Access Server** dialog box.
      -  To remove a Client Access server from the hybrid configuration, select the Client Access server from the list and then click this button to remove it from the hybrid configuration.

        Note:
        At least one Exchange 2010 SP2 Client Access server is required in a hybrid deployment.
    - For the Hub Transport servers:
      - Click **Add** to select the Hub Transport servers in your on-premises organization that will be configured for mail flow in your hybrid deployment.
      - In the **Select Hub Transport Server** dialog box, select one or more servers that have the Exchange 2010 SP2 Hub Transport server role installed.
      - Click **OK** on the **Select Hub Transport Server** dialog box.
      -  To remove a Hub Transport server from the hybrid configuration, select the Hub Transport server from the list and then click this button to remove it from the hybrid configuration.

        Note:
        At least one Exchange 2010 SP2 Hub Transport server is required in a hybrid deployment.
12. Click **Next**.

13. On the **Mail Flow Settings** page, complete the following fields:
    - For the Forefront Online Protection for Exchange inbound connector:
      - Click **Add** and enter the publicly accessible IP address for a Hub Transport server in your hybrid deployment. Repeat this step to enter IP addresses for multiple Hub Transport servers in your hybrid deployment.

        Note:
        If you're using a network firewall device in your on-premises organization, you may have to enter the external IP address of the firewall for the FOPE inbound connector instead of the external IP address of you hybrid Hub Transport servers. FOPE examines the sending IP address for messaging traffic originating from the on-premises organization and verifies that it matches the IP addresses configured for this inbound connector. If these IP addresses don't match, FOPE refuses the message traffic and messages sent from recipients in the on-premises organization to recipients in the Exchange Online organization aren't delivered. Additionally, be sure to use IPv4-based IP addresses because IPv6-based IP addresses aren't supported.
    - For the Forefront Online Protection for Exchange outbound connector:
      - In the **Specify the FQDN of the on-premises hybrid Hub Transport servers** field, enter the FQDN of a Hub Transport server in your hybrid deployment. For example, enter "mail.contoso.com".
14. Click **Next**.

15. On the **Mail Flow Security** page, complete the following fields:
    - For **Select Transport Certificate**, select the drop-down arrow for the **Select transport certificate** field and then select a valid digital certificate from a trusted certificate authority (CA) that has been installed on all Hub Transport servers in your hybrid deployment.
    - For **Mail Flow Path**, select one of the following hybrid mail routing options for outbound messages for your Office 365-based mailboxes:
        - **Deliver Internet-bound messages directly using the external recipient's DNS settings** Select this option if you want Office 365 to bypass your on-premises transport servers when routing outbound messages to external recipients.
        - **Route all Internet-bound messages through your on-premises Exchange servers** Select this option if you want Office 365 to send all outbound messages to external recipients to your on-premises transport servers. The on-premises hybrid transport servers will be responsible for delivering the messages to external recipients.

16. On the **Progress** page, review the properties for the hybrid configuration changes. Click **Manage** to update the hybrid configuration.

17. On the **Completion** page, review the following, and then click **Finish** to close the wizard:
    - A status of **Completed** indicates that the wizard completed the task successfully.
    - A status of **Failed** indicates that the task wasn't completed. If the task fails, review the summary for an explanation, and then click **Back** to make any configuration changes.

Use the Shell to configure hybrid deployment properties

You need to be assigned permissions before you can perform this procedure. To see what permissions you need, see the "Hybrid configuration" entry in the Exchange and Shell Infrastructure Permissions topic.

This example updates a default hybrid deployment and disables the secure mail and centralized transport hybrid deployment features. All other default hybrid deployment features, such as free/busy sharing, MailTips, and message tracking, remain enabled.

1. Use the following command to disable the secure mail and centralized transport hybrid deployment features.

```
Set-HybridConfiguration -Features FreeBusy,MoveMailbox,MailTips,OWARed
```

2. Use the following command to specify your on-premises credentials. For example, run this command and then enter "admin@contoso.com" and the associated account password in the credentials dialog when prompted.

```
$OnPremisesCreds = Get-Credential
```

3. Use the following command to specify your cloud-based service credentials. For example, run this command and then enter "admin@contoso.onmicrosoft.com"and the associated account password in the credentials dialog when prompted.

```
$TenantCreds = Get-Credential
```

4. Use the following command to define the specified credentials that will be used when updating the hybrid configuration object and connecting to the cloud-based service.

```
Update-HybridConfiguration -OnPremisesCredentials $OnPremisesCreds -Te
```

For more information about these hybrid deployment cmdlets, see Set-HybridConfiguration and Update-HybridConfiguration.

Understanding Hybrid Servers in Exchange 2003 Hybrid Deployments

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 and Exchange 2003 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

When configuring a hybrid deployment, you have to install at least one hybrid server in your existing Exchange organization. Hybrid servers are additional servers configured with Exchange 2010 SP3 server roles that coordinate communication between your existing Exchange 2003 organization and the Exchange Online organization. This communication includes message transport and messaging features between the on-premises and Exchange Online organizations. We highly recommend installing more than one hybrid server in your on-premises organization to help increase reliability and availability of hybrid deployment features.

Hybrid Deployment Server Roles

Depending on the hybrid deployment configuration that you want, a hybrid server requires one or more of the following Exchange 2010 server roles to be installed. If you choose to install a single hybrid server in your on-premises organization, you'll need to

install all the following server roles on the single hybrid server. If you choose to install more than one hybrid server in your on-premises organization, you may choose to install the server roles on separate servers in your on-premises organization. For example, you could install one hybrid server that has both the Client Access and Mailbox server roles installed and install another hybrid server that only has the Hub Transport server role installed. However, the best practice and recommended hybrid server configuration is to install the Client Access, Mailbox, and Hub Transport servers on each hybrid server deployed in your on-premises organization.

Here is a quick overview of the server roles in a hybrid deployment:

- **Client Access server role** The Client Access server role on a hybrid server provides the functionality typically provided by a front-end server in Exchange 2003. All client connectivity, including Outlook client access, Outlook Web App, and Outlook Anywhere goes through the Client Access server role. Organization relationship features between the on-premises and Exchange Online organizations, such as free/busy sharing, are also handled by the Client Access server role.
  Learn more at: Understanding Client Access
- **Hub Transport server role** The Hub Transport server role on a hybrid server handles all mail flow between the on-premises and Exchange Online organizations and between the on-premises organization and the Internet. It helps to secure transport communication between the on-premises and Exchange Online organizations, as well as handling transport rules, journaling policies, and message delivery to user mailboxes in a hybrid deployment.
  Learn more at: Overview of the Hub Transport Server Role
- **Mailbox server role** The Mailbox server role on a hybrid server hosts a replica of the **OU=EXTERNAL (FYDIBOHF25SPDLT)** public folder that enables calendar free/busy information sharing between the on-premises and Exchange Online organizations. Mailboxes should not be created on a hybrid server in a typical hybrid deployment between an on-premises Exchange 2003 organization and an Exchange Online organization.
  Learn more at: Overview of the Mailbox Server Role

Hybrid Server Functionality

A hybrid server provides several important functions for your on-premises organization in a hybrid deployment:

- **Federation** Hybrid servers enable you to create a federation trust for your on-premises organization with the Microsoft Federation Gateway. The Microsoft Federation Gateway is a free, cloud-based service offered by Microsoft that acts as the trust broker between your on-premises organization and the Office 365 tenant organization. Federation is a requirement for creating an organization relationship between the on-premises and the Exchange Online organizations.
  Learn more at: Understanding Federation
- **Organization relationships** Hybrid Client Access servers enable you to create organization relationships between the on-premises and Exchange Online organizations. Organization relationships are required for many other services in a hybrid deployment, including calendar free/busy information sharing, message tracking, and mailbox moves between the on-premises and Exchange Online organizations.
  Learn more at: Understanding Federated Delegation
- **Message transport** Hybrid Hub Transport servers are responsible for message transport in a hybrid deployment. Using Send and Receive connectors, they replace the on-premises Exchange 2003 server as the connection endpoint for incoming external messages and also provide outbound message delivery to the Internet and the Exchange Online organization.
  Learn more at: Understanding Transport
- **Message transport security** Hybrid Hub Transport servers help to secure

message communication between the on-premises and Exchange Online organizations by using the Domain Security functionality in Exchange 2010. Security can be increased by using mutual transport layer security authentication and encryption for message communications.
Learn more at: Understanding Domain Security

- **Outlook Web App** Hybrid Client Access servers support configuring a single URL endpoint for external connections to on-premises and Exchange Online mailboxes. For on-premises mailboxes, hybrid Client Access servers are configured to automatically redirect user Outlook Web App requests to your Exchange 2003 mailbox server. For Exchange Online organization mailboxes, hybrid Client Access servers are configured to automatically display a link to the Outlook Web App endpoint on the Exchange Online organization.
- Learn more at: Understanding Outlook Web App

Hybrid Server Topology

A hybrid server is deployed much like an Exchange 2010 server would be deployed to your existing Exchange 2003 organization. Using the Client Access, Mailbox, and Hub Transport server roles, hybrid servers are responsible for many services for your on-premises organization that are currently provided by your existing Exchange 2003 server. The following table describes briefly the changes in services after configuring a hybrid deployment.

Service	Before hybrid server deployment	After hybrid server deployment	Description
Message transport (inbound and outbound)	Exchange 2003 server	Hybrid Hub Transport server(s)	The MX (mail exchanger) record for the domain may be updated to point to hybrid Hub Transport servers.
OU=EXTERNAL (FYDIBOHF25SPDLT) public folder replica	Exchange 2003 server	Hybrid Mailbox server (s)	All other public folder replicas remain on the Exchange 2003 server.
Outlook Web App public URL	Exchange 2003 server	Hybrid Client Access server(s)	Hybrid Client Access servers redirect Outlook Web App requests to the publicly accessible endpoint on the Exchange 2003 server.

Hybrid Server Software

Service Pack 3 (SP3) for Exchange Server 2010 enables hybrid deployment functionality with the Hybrid Configuration wizards. You can use any Exchange 2010 SP3 media when installing the hybrid server.

Additionally, we recommend that you install future Update Rollups for Exchange 2010 SP3 on all your hybrid servers. Microsoft releases update rollup packages approximately every six to eight weeks. The rollup packages are available via Microsoft Update and the Microsoft Download Center. In the Search box on the Microsoft Download Center, type "Exchange 2010 SP3 update rollup" to find links to the rollup packages for Exchange 2010 SP3.

Download Exchange Server 2010 SP3 at: Exchange 2010 Service Pack 3 (SP3)

Important:
You need to provide an Exchange 2010 Hybrid Edition product key on the hybrid server when you configure a hybrid deployment with Office 365. To obtain a Hybrid Edition product key, contact Office 365 support.

1.14.8.2 Understanding Prerequisites for Exchange 2003 Hybrid Deployments

Understanding Prerequisites for Exchange 2003 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Before you can really start to use the Deployment Assistant, your system and servers must meet requirements. If they don't meet these requirements, you won't be able to complete the steps within the tool and you won't be able to configure a hybrid deployment between your on-premises Exchange 2003 and Exchange Online organizations. This topic provides information about the following:

- The Exchange Pre-Deployment Analyzer
- Permissions needed to install and manage Exchange 2010
- Requirements for directory servers, hardware, software, clients, and other elements, including:
  - Windows Server 2008 Service Pack 2 (SP2) or later or Windows Server 2008 R2 operating system prerequisites that are required for all Exchange 2010 server roles
- Language support for Exchange 2010
- The Exchange Management Shell, the command-line interface for Exchange 2010, and the Exchange Management Console, the GUI management tool for Exchange 2010

Note:
Before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Exchange Pre-Deployment Analyzer

You can use the Exchange Pre-Deployment Analyzer (ExPDA) to perform an overall topology readiness scan of your environment. This scan focuses on overall topology readiness and not the ability to run Exchange 2010 on the local computer. ExPDA provides a detailed report that will alert you if there are any issues within your organization, which could prevent you from deploying Exchange 2010. For example, ExPDA will notify you if you haven't deployed the minimum required Exchange service pack on all your Exchange servers. If your organization passes the ExPDA readiness scan, you can go ahead and use the Exchange Deployment Assistant.

To get ExPDA from the Microsoft Download Center, see: Exchange Pre-Deployment Analyzer

Permissions to Install and Manage

Exchange 2010

Exchange 2010 requires different permissions to install and to manage your server roles. When you're installing Exchange 2010 servers in your organization, the account you use might not be the same account that you use for administering and managing your server roles. To manage your server roles, Exchange 2010 uses the Role Based Access Control (RBAC) permissions model.

Exchange 2010 uses RBAC to manage permissions on the Exchange 2010 hybrid server. With RBAC, you can control what resources administrators can configure and what features users can access. The RBAC model in Exchange 2010 is flexible and provides you with several ways to customize the default permissions.

RBAC has two primary ways of assigning permissions to users in your organization, depending on whether the user is an administrator or specialist user, or an end-user: management role groups and management role assignment policies. Each method associates users with the permissions they need to perform their jobs. The following sections list the tasks found in the Deployment Assistant and the permissions required to complete the task.

Note:

Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Installation Permissions

By default, the account that's used to install Exchange 2010 in the organization is added as a member of the Organization Management role group.

When you install the first hybrid server into your Exchange 2003 organization, Exchange Setup will prepare your Active Directory schema if you have the correct permissions. If you want to separate your Active Directory schema preparation from a hybrid server installation, see: Prepare Active Directory and Domains

For information about how to add permissions, see: Add Members to a Role Group

The following permissions are required to install the hybrid server in your organization:

- Local Administrator on the server on which Exchange 2010 will be installed
- Enterprise Administrator in the Active Directory forest where Exchange 2010 will be installed
- Schema Administrator in the Active Directory forest where Exchange 2010 will be installed

Exchange Management Permissions

The table below lists the configuration permissions that you need to successfully use the Deployment Assistant and the Hybrid Configuration wizards. Some tasks need to be performed only in the on-premises organization while some tasks also need to be performed in the Office 365 tenant organization. If a task needs to be performed in the Office 365 tenant organization, you must ensure that you have the required permissions in that organization. Permissions in the on-premises organization aren't replicated to the Office 365 tenant organization.

Note:

The user account used to create the Office 365 tenant organization has all the permissions required to perform the tasks in this checklist.

Learn more at: Understanding Hybrid Deployment Permissions

Some procedures require you to perform tasks on your Exchange 2003 servers. For

information about how to manage permissions in an organization with Exchange 2003 and Exchange 2010 installed, see: Understanding Permissions Coexistence with Exchange 2003

Task	Permissions required	On-premises or Office 365 tenant organization
Import digital certificates	Local Administrator	On-premises organization
Configure settings on virtual directories	Server Management	On-premises organization
Configure virtual directories	Organization Management Server Management	On-premises organization
Create accepted domains	Organization Management	On-premises and Office 365 tenant organization
Create and modify Send and Receive connectors	Organization Management	On-premises organization
Create routing group connectors	Organization Management Server Management	On-premises organization
Create a federation trust	Organization Management	On-premises organization
Create organization relationships	Organization Management	On-premises and Exchange Online organization
Configure Mailbox Replication Service (MRS) proxy	Local Administrator	On-premises organization
Move mailboxes	Organization Management Recipient Management	On-premises and Exchange Online organization
Configure Exchange 2003 authentication	Local Administrator	On-premises organization
Configure Exchange 2003 e-mail address policies	Exchange Administrator	On-premises organization

Directory Servers

Here are the requirements for the directory servers in your organization:

- **Schema master** The latest 32-bit or 64-bit edition of the Windows Server 2003 SP2 Standard or Enterprise operating system or the Windows Server 2008 Standard or Enterprise operating system.
- **Global catalog server** In every Active Directory site where you plan to install Exchange 2010, you must have at least one global catalog server that is either the latest 32-bit or 64-bit edition of: Windows Server 2003 SP2 Standard or Enterprise; Windows Server 2008 Standard or Enterprise; or Windows Server 2008 R2 Standard or Enterprise.
- **Active Directory Forest** The Active Directory forest must be Windows Server 2003 forest functional mode or higher.
- **Domain Controller** You must have the latest 32-bit or 64-bit Windows Server 2003 Standard Edition or Enterprise Edition with Service Pack 2 (SP2) operating system or the latest 32-bit or 64-bit edition of the Windows Server

2008 Standard or Enterprise operating system or the Windows Server 2008 R2 Standard or Enterprise operating system.

Hardware

The recommended hardware requirements for Exchange 2010 servers vary depending on several factors including the server role(s) that are installed and the anticipated load that will be placed on the servers.

- **Processor** x64 architecture-based computer with processor that supports 64-bit architecture
- **Memory** Minimum 4GB with a recommended maximum of 2GB per core (8GB minimum). Learn more at: Understanding Memory Configurations and Exchange Performance
- **Disk space** At least 1.2 GB on the drive on which you install Exchange and additional 200 MB of available space on the system drive.
- **Drive** DVD-ROM drive, local or network accessible
- **File format** Disk partitions formatted as NTFS file systems

Operating System

Here are the supported operating systems for Exchange 2010:

- 64-bit edition of Windows Server 2008 Standard Service Pack 2
- 64-bit edition of Windows Server 2008 Enterprise Service Pack 2
- 64-bit edition of Windows Server 2008 Standard R2
- 64-bit edition of Windows Server 2008 Enterprise R2

Exchange 2010 Management tools can use the operating systems listed above plus:

- 64-bit edition of Windows Vista
- 64-bit edition of Windows 7

Install Hotfixes for Windows Server 2008 SP2

The following hotfixes are required for Windows Server 2008 SP2:

- Install the update described in Microsoft Knowledge Base article 977624, AD RMS clients do not authenticate federated identity providers in Windows Server 2008 or in Windows Vista. Without this update, Active Directory Rights Management Services (AD RMS) features may stop working.
- Install the update described in Knowledge Base article 979744, A .NET Framework 2.0-based Multi-AppDomain application stops responding when you run the application.
- Install the update described in Knowledge Base article 979917, Two issues occur when you deploy an ASP.NET 2.0-based application on a server that is running IIS 7.0 or IIS 7.5 in Integrated mode. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB979917 - QFE for Sharepoint issues - Perf Counter fix & User Impersonation.
  - For the available downloads, see KB979917 - QFE for Sharepoint issues - Perf Counter fix & User Impersonation.
- Install the update described in Knowledge Base article 973136, FIX: ArgumentNullException exception error message when a .NET Framework 2.0 SP2-based application tries to process a response with zero-length content to an asynchronous ASP.NET Web service request: "Value cannot be null".
- Install the update described in Knowledge Base article 977592, RPC over HTTP clients cannot connect to the Windows Server 2008 RPC over HTTP servers that have RPC load balancing enabled.

Install Hotfixes for Windows Server 2008 R2

The following hotfixes are required for Windows Server 2008 R2:

Important:
The following hotfixes only apply to Windows Server 2008 R2 RTM. If you're installing Exchange on Windows Server 2008 R2 SP1, you don't need to apply these hotfixes.

- Install the update described in Knowledge Base article 979099, An update is available to remove the application manifest expiry feature from AD RMS clients. Without this update, the AD RMS features may stop working.
- Install the update described in Knowledge Base article 979744, A .NET Framework 2.0-based Multi-AppDomain application stops responding when you run the application.
- Install the update described in Knowledge Base article 983440, An ASP.NET 2.0 hotfix rollup package is available for Windows 7 and for Windows Server 2008 R2. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB983440 - Win7 rollup package (PR for QFE 810219).
  - For the available downloads, see KB983440 - Win7 rollup package (PR for QFE 810219).
- Install the update described in Knowledge Base article 977020, FIX: An application that is based on the Microsoft .NET Framework 2.0 Service Pack 2 and that invokes a Web service call asynchronously throws an exception on a computer that is running Windows 7.

Install Hotfixes for Windows 7 and Windows Vista

The following hotfixes are required for Windows 7 and Windows Vista computers where you install the Exchange Management Console

- Install the update described in Knowledge Base article 977020, FIX: An application that is based on the Microsoft .NET Framework 2.0 Service Pack 2 and that invokes a Web service call asynchronously throws an exception on a computer that is running Windows 7.
- Install the update described in Knowledge Base article 983440, An ASP.NET 2.0 hotfix rollup package is available for Windows 7 and for Windows Server 2008 R2. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB983440 - Win7 rollup package (PR for QFE 810219).
  - For the available downloads, see KB983440 - Win7 rollup package (PR for QFE 810219).

Install the Windows Server 2008 SP2 prerequisites

1. Install the Microsoft Filter Pack. For details, see: 2007 Office System Converter: Microsoft Filter Pack
2. Open an elevated command prompt, navigate to the Scripts folder on the Exchange 2010 installation media and use the following command to install the necessary operating system components:

```
sc config NetTcpPortSharing start= auto
ServerManagerCmd -ip Exchange-Typical.xml -Restart
```

Install the Exchange 2010 SP1 Hotfixes for Windows Server 2008 SP2

The following hotfix is required for Windows Server 2008 SP2 and must be installed after the operating system prerequisites have been installed:

- Install the hotfix described in Knowledge Base article 982867, WCF services that are hosted by computers together with a NLB fail in .NET Framework 3.5 SP1. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.
  - For the available downloads, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.

After installing the preceding prerequisites and hotfix, and before installing Exchange

2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Install the Windows Server 2008 R2 prerequisites

1. Install the Microsoft Filter Pack. For details, see: 2007 Office System Converter: Microsoft Filter Pack
2. On the Start Menu, navigate to **All Programs**, then **Accessories**, then **Windows PowerShell**. Open an elevated Windows PowerShell console, and run the following command:

```
Import-Module ServerManager
```

3. Use the **Add-WindowsFeature** cmdlet to install the necessary operating system components using the following command:

```
Add-WindowsFeature NET-Framework,RSAT-ADDS,Web-Server,Web-Basic-Auth,W
```

4. After the system has restarted, log on as an administrator, open an elevated Windows PowerShell console, and configure the Net.Tcp Port Sharing Service for Automatic startup by running the following command:

```
Set-Service NetTcpPortSharing -StartupType Automatic
```

Install the Exchange 2010 SP1 Hotfixes for Windows Server 2008 R2

The following hotfix is required for Windows Server 2008 R2 and must be installed after the operating system prerequisites have been installed:

- Install the hotfix described in Knowledge Base article 982867, WCF services that are hosted by computers together with a NLB fail in .NET Framework 3.5 SP1. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.
  - For the available downloads, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.

After installing the preceding prerequisites and hotfix, and before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Windows Management Framework

- Windows PowerShell V2.0
- Windows Remote Management V2.0
- .NET Framework 3.5 SP1
- Internet Information Services (IIS)

Language Support

An Exchange 2010 SP2 language pack contains the necessary resources for a supported Exchange language. Language packs are installed automatically during deployment of Exchange 2010 SP2. Client and server language packs come grouped into a single bundle containing both client and server resource and support files. There are no performance issues with installing all the languages because they're just stored when not in use.

Learn more at: Exchange 2010 Language Support

Exchange Management Shell

The Exchange Management Shell, built on Windows PowerShell technology, provides a powerful command-line interface for Exchange 2010 that enables automation of

administrative tasks.

With the Shell, you can manage every aspect of Exchange 2010; the Shell can perform every task that can be performed by the Exchange Management Console (EMC) and the Exchange Control Panel (ECP) in addition to tasks that can't be performed in those interfaces. In fact, when a task is performed in the EMC or the ECP, those interfaces use the Shell to perform the task.

Learn more at: Overview of Exchange Management Shell

Exchange Management Console

The Exchange Management Console (EMC) is a Microsoft Management Console (MMC) 3.0-based tool that provides you with a GUI to manage the configuration of your Exchange 2010 organization. You can also add the EMC snap-in to custom MMC-based tools.

Learn more at: Exchange Management Console

1.14.8.3 Understanding Hybrid Management in Exchange 2003 Hybrid Deployments

Understanding Hybrid Management in Exchange 2003 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-31*

Both your on-premises organization and the Exchange Online organization are based on Microsoft Exchange. In particular, hybrid servers in your on-premises organization are based on Microsoft Exchange Server 2010 and the Exchange Online organization Exchange servers are based on Exchange Server 2013. Service Pack 3 (SP3) for Exchange 2010 enables hybrid features to function correctly between these two types of hybrid deployment servers.

When you install a hybrid server, Exchange 2010 management tools are automatically installed on the server. You'll use the management tools to configure and manage both the hybrid server(s) and some recipient management features for the Exchange Online organization. These tools include the Exchange Management Console (EMC), a graphical administrative interface, and the Exchange Management Shell, a Windows PowerShell-based command-line interface. You'll also use the Exchange Administration Center (EAC) in the Exchange Online section of the Office 365 management portal to manage most of the properties of the Exchange Online recipients and organization.

Exchange Management Console

The EMC enables you to perform many deployment tasks and most common day-to-day administrative tasks. Additionally, the EMC allows you to administer both the on-premises hybrid servers and some recipient management features for mailboxes in the Exchange Online organization. It's installed by default on every Exchange 2010 server, but you can also install it on a computer running any of the following 64-bit operating systems:

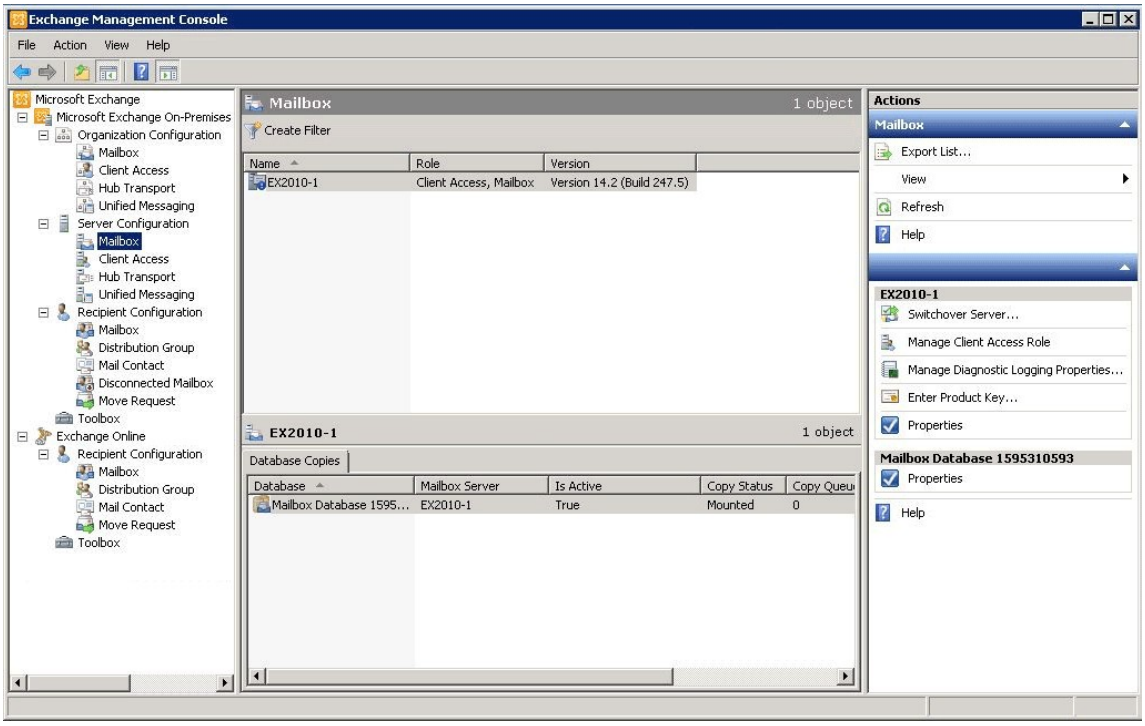
- Windows Server 2008 SP2 Standard and Enterprise
- Windows Server 2008 R2 Standard and Enterprise
- Windows 8

- Windows 7
- Windows Vista Service Pack (SP) 2

Adding the Exchange Online organization to the EMC is similar to adding another Exchange 2010 forest to the EMC. When the Exchange Online organization is added to the EMC, it appears as another node in the navigation tree. From there you can select the Exchange Online organization and configure some properties of Exchange Online recipient objects. To fully manage organization-level features and objects for the Exchange Online organization, you'll be redirected by the EMC and provided a link to connect to the EAC in the Office 365 management portal.

The following screenshot shows the on-premises organization and Exchange Online organization in the same console.

Exchange on-premises and Exchange Online organizations in the Exchange Management Console



Important:

You can't use the EMC to administer Exchange 2003 servers or recipients. For more information, see "Administering Exchange 2003" later in this topic.

Learn more at: Exchange Management Console

Exchange Management Shell

The Shell enables you to perform any task that the EMC does and some additional tasks that can only be performed in the Shell. The Shell is a collection of Windows PowerShell scripts and cmdlets that are installed on a computer when the Exchange 2010 management tools are installed. These scripts and cmdlets are only loaded when you open the Shell using the Exchange Management Shell icon. If you open Windows PowerShell directly, the Exchange scripts and cmdlets aren't loaded and you won't be able to manage your on-premises organization.

Note:
You can create a manual Windows PowerShell connection to your local on-premises organization, similar to how you manually connect to the Exchange Online organization below. However, we strongly recommend that you use the Exchange Management Shell icon to open the Shell to manage your on-premises hybrid servers.

When you open the Shell using the Exchange Management Shell icon on a computer that has the management tools installed, you can manage your on-premises organization. However, you can't manage the Exchange Online organization when you open the Shell using this icon. This is because opening the Shell using the Exchange Management Shell icon automatically connects you to a local hybrid server.

If you want to manage the Exchange Online organization using Windows PowerShell, you must open Windows PowerShell directly and not via the Exchange Management Shell icon. When you open Windows PowerShell, you can then manually specify where you want to connect. When you create a manual connection, you specify an administrator account in the Office 365 tenant organization, and then you run a command to create a connection. When the connection is established, the Exchange cmdlets you have permissions to run are made available to you.

Learn more at: Use Windows PowerShell

If you're new to the Shell, check out the following topic to learn the basics about how the Shell works, command syntax, and more.

Learn more at: Exchange Management Shell

You can't use the Shell to administer Exchange 2003 servers or recipients. For more information, see "Administering Exchange 2003" later in this topic.

Administering Exchange 2003

You can't use the EMC or the Shell to administer Exchange 2003 servers or recipients. To manage Exchange 2003 servers, use Exchange System Manager on a computer that has Exchange 2003 installed. To manage Exchange 2003 recipients, use Active Directory Users and Computers on a computer that has Exchange 2003 installed.

1.14.8.4 Understanding Edge Transport Servers in Exchange 2003 Hybrid Deployments

Understanding Edge Transport Servers in Exchange 2003 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

Edge Transport servers in Exchange 2010 are deployed in your organization's on-premises perimeter network. They're non-domain-joined computers that handle Internet-facing mail flow and act as an SMTP relay and smart host for Exchange servers in your internal network. In hybrid deployments, you have the option of deploying Edge Transport servers running Service Pack 3 (SP3) for Exchange 2010 if you don't want to expose internal hybrid Hub Transport servers directly to the Internet.

Learn more at: Overview of the Edge Transport Server Role

Adding an Edge Transport Server to a Hybrid Deployment

Deploying an Edge Transport server in your on-premises organization when you configure a hybrid deployment is an optional step. During the initial run of the Manage Hybrid Configuration wizard, the wizard requires that you select one or more Hub Transport servers. However, after the initial run of the wizard, you can add an Edge Transport server to your organization, configure it, run the Manage Hybrid Configuration wizard again, and then manually update the on-premises Send connectors and Edge Transport Receive connector to add it to the hybrid deployment.

When you add an Edge Transport server to your hybrid deployment, it communicates with Microsoft Exchange Online Protection (EOP) on behalf of the internal hybrid Hub Transport servers. The Edge Transport server acts as a relay between the on-premises hybrid Hub Transport server and EOP. All connection security previously handled by the hybrid Hub Transport server is handled by the Edge Transport server. Recipient lookup, compliance policies, and other message inspection, continue to be done on the hybrid Hub Transport servers.

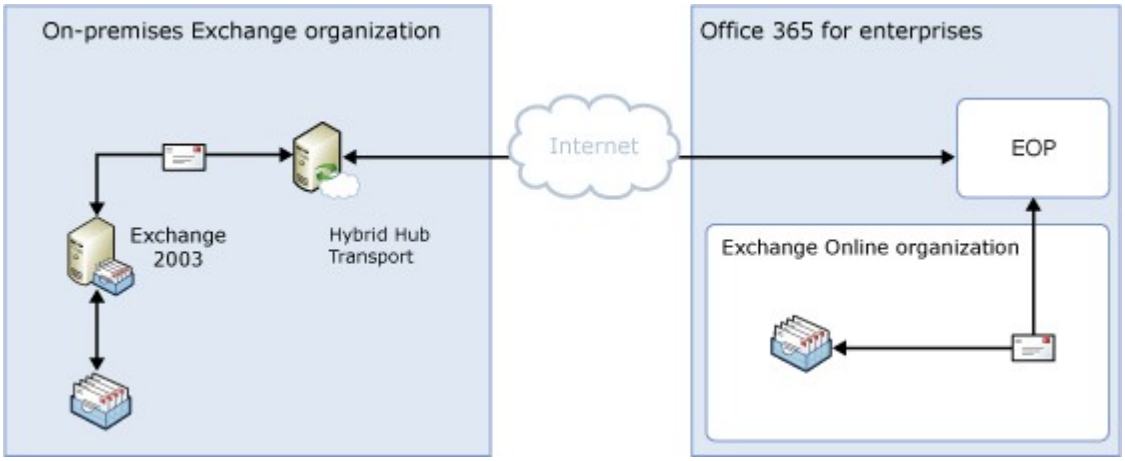
If you add an Edge Transport server to your hybrid deployment, you don't need to route mail sent between on-premises users and Internet recipients through it. Only messages sent between the on-premises and Exchange Online organizations will be routed through the Edge Transport server.

Mail Flow without an Edge Transport Server

The following process and diagram describe the path messages take between an on-premises organization and Exchange Online when there is no Edge Transport server deployed:

1. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from the Exchange 2003 server to a hybrid Hub Transport server.
2. The Hub Transport server sends the message directly to the Exchange Online EOP company.
3. EOP delivers the message to the Exchange Online organization.
4. Messages sent from the Exchange Online organization to recipients in the on-premises organization follow the reverse route.

Mail flow in a hybrid deployment without an Edge Transport server deployed

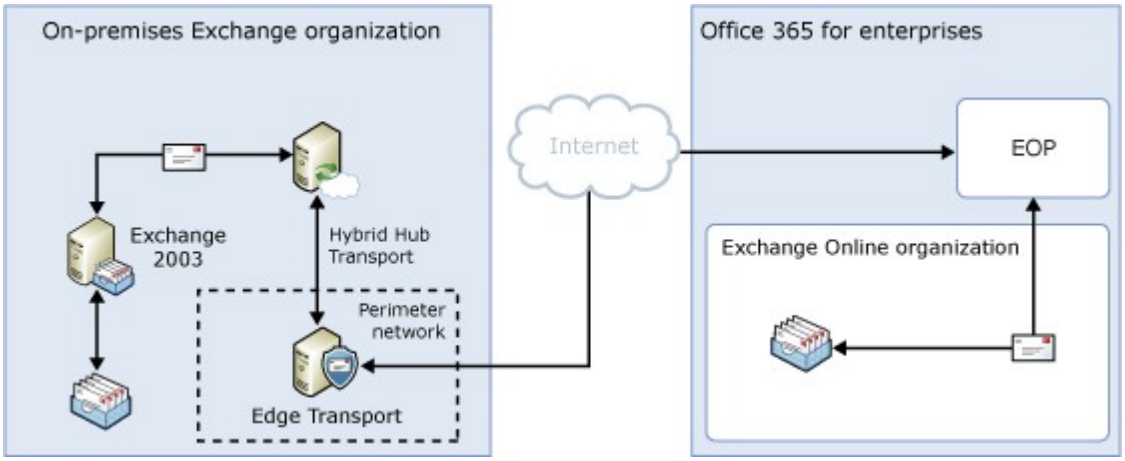


Mail Flow with an Edge Transport Server

The following diagram shows the path messages take between an on-premises organization and Exchange Online when there is an Edge Transport server deployed. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from the Exchange 2003 server:

1. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from the Exchange 2003 server to a hybrid Hub Transport server.
2. The Hub Transport server sends the message to an Edge Transport server.
3. The Edge Transport server sends the message to the Exchange Online EOP company.
4. EOP delivers the message to the Exchange Online organization.
5. Messages sent from the Exchange Online organization to recipients in the on-premises organization follow the reverse route.

Mail flow in a hybrid deployment with an Edge Transport server deployed



1.14.8.5 Understanding Shared Free/Busy in Exchange 2003 Hybrid Deployments

Understanding Shared Free/Busy in Exchange 2003 Hybrid Deployments

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 and Exchange 2003 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

Sharing free/busy (calendar availability) information between users located on-premises and in the Microsoft Exchange Online organization is one of the primary benefits of a hybrid deployment. Users in both organizations can view each other's calendars just as if they were located in the same physical organization. This makes scheduling meetings and resources easy and efficient.

Several components in a hybrid deployment are required to enable the shared free/busy feature in a Microsoft Exchange Server 2003 deployment:

- **Federation trust** Both the on-premises and Microsoft Office 365 service organizations need to have a federation trust established with the Microsoft Federation Gateway. A federation trust is a one-to-one relationship with the Microsoft Federation Gateway that defines parameters for your Exchange organization. The gateway uses these parameters when acting as a trust broker between your on-premises and Office 365 service organization to

exchange free/busy information between on-premises and Exchange Online organization users.
By default, a federation trust with the gateway is automatically configured for your Office 365 service organization when the account is created. The Manage Hybrid Configuration wizard automatically checks to see if there is an existing federation trust with the Microsoft Federation Gateway for the on-premises organization. If present, the existing federation trust is used to support the hybrid deployment. If not present, the wizard creates a federation trust for the on-premises organization with the Microsoft Federation Gateway. The wizard also adds any domains selected within the Manage Hybrid Configuration wizard to the on-premises organization federation trust.
Learn more at: Understanding Federated Delegation

- **Organization relationships** Organization relationships are needed for both the on-premises and Exchange Online organization and are configured automatically by the Manage Hybrid Configuration wizard. An organization relationship defines the level of free/busy information shared for an organization.
  By default, the free/busy data access sharing level is **Free/busy access with time, plus subject and location** for both the on-premises and Exchange Online organization relationships. If you want to modify the free/busy sharing access between your on-premises and Exchange Online organization users, you can manually configure the organization relationship access level after the Manage Hybrid Configuration wizard has completed.
  Learn more at: Understanding Federated Delegation
- **Hybrid Mailbox server** Exchange 2003 organizations must have a hybrid server with the Service Pack 3 (SP3) for Exchange 2010 Mailbox server role installed to support free/busy sharing between on-premises and Exchange Online mailboxes. Free/busy information for Exchange 2003 mailboxes is stored in public folders and the free/busy information in your existing public folders must be replicated to the hybrid Mailbox servers. Client requests for free/busy information are automatically directed to the hybrid Mailbox servers for processing for both on-premises and Exchange Online organization users after the hybrid deployment is configured by the Manage Hybrid Configuration wizard. To avoid a single point of failure for these public folder replicas, you should consider adding more than one hybrid Mailbox server to your on-premises organization for redundancy.

When configuring your organization for a hybrid deployment, configuring shared free/busy calendar access is automatically configured by the Manage Hybrid Configuration wizard in all scenarios. Creating a federation trust with the Microsoft Federation Gateway and configuring organization relationships for the on-premises and Exchange Online organization are hybrid deployment requirements. If you don't want to allow free/busy sharing between your on-premises and Exchange Online organization users in the hybrid deployment, you can manually disable free/busy sharing by using the Shell and the Set-HybridConfiguration cmdlet after the Manage Hybrid Configuration wizard has completed.

The hybrid deployment features shown in the following table have a dependency on federation trusts and organization relationships.

Messaging area	Feature
E-mail client	• Message tracking • MailTips • Multi-mailbox search
Transport	• Mailbox moves • Secure intra-organization message delivery
Compliance	• Exchange Online Archiving

1.14.8.6 Understanding Transport Options in Exchange 2003 Hybrid Deployments

Understanding Transport Options in Exchange 2003 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

In hybrid deployments, you can have mailboxes that reside in your on-premises organization and also in an Exchange Online organization. A critical component of making these two separate organizations appear as one combined organization to users and messages exchanged between them is hybrid transport. With hybrid transport, messages sent between recipients in either organization are authenticated, transferred using Transport Layer Security (TLS), and appear as "internal" to Exchange components such as transport rules, journaling, and anti-spam policies. Hybrid transport is automatically configured by the Manage Hybrid Configuration wizard in Service Pack 3 (SP3) for Exchange 2010.

For hybrid transport configuration to work with the Manage Hybrid Configuration wizard, the on-premises SMTP endpoint that accepts connections from Exchange Online Protection (EOP), which handles transport for the Exchange Online organization, must be an Exchange 2010 SP3 Hub Transport or Edge Transport server. Hybrid transport makes use of new features provided in Exchange 2010 SP3 to secure messages and make them appear as "internal." While an on-premises Exchange 2010 SP3 server is required for hybrid transport between the on-premises and Exchange Online organizations, you don't need to route the mail to and from on-premises mailboxes and Internet recipients through an Exchange 2010 server.

Important:

There can be no other SMTP hosts, services, or appliances between the on-premises Exchange 2010 SP3 Hub Transport or Edge Transport server and EOP. Information added to messages that enables hybrid transport features is removed when they pass through a non-Exchange 2010 SP3 server or SMTP host. This includes earlier versions of Exchange.
Hub Transport and Edge Transport servers must run Exchange 2010 SP3 to use the Manage Hybrid Deployment wizard for hybrid deployment configuration.

Inbound messages sent to recipients in both organizations from external Internet senders follow a common inbound route. Outbound messages sent from the organizations to external Internet recipients can either follow a common outbound route or can be sent via independent routes.

You'll need to choose how to route inbound and outbound mail when you configure your hybrid deployment. The route taken by inbound and outbound messages sent to and from recipients in the on-premises and Exchange Online organizations depends on the following:

- Do you want to route inbound Internet mail for both your on-premises and Exchange Online mailboxes through Microsoft Office 365 and EOP or through your on-premises organization?
  You can choose to route inbound Internet mail for both organizations through your on-premises organization or through EOP and the Exchange Online organization. The route that inbound messages for both organizations take depends on whether you enable centralized mail transport in your hybrid deployment.
- Do you want to route outbound mail to external recipients from your Exchange Online organization through your on-premises organization (centralized mail

transport), or do you want to route it directly to the Internet?
Known as centralized mail transport, you can route all mail from mailboxes in the Exchange Online organization through the on-premises organization before they're delivered to the Internet. This approach is helpful in compliance scenarios where all mail to and from the Internet must be processed by on-premises servers. Alternately, you can configure Exchange Online to deliver messages for external recipients directly to the Internet.

Note:
Centralized mail transport is only recommended for organizations with specific compliance-related transport needs. Our recommendation for typical Exchange organizations is not to enable centralized mail transport.

- Do you want to deploy an Edge Transport server in your on-premises organization?
  If you don't want to expose your domain-joined internal hybrid Hub Transport servers directly to the Internet, you can deploy Edge Transport servers in your perimeter network. For more information about adding an Edge Transport server to your hybrid deployment: see: Understanding Edge Transport Servers in Exchange 2003 Hybrid Deployments

Regardless of how you route messages to and from the Internet, all messages sent between the on-premises and Exchange Online organizations are sent using secure transport. For more information, see "Trusted Communication" later in this topic.

To learn more about how these options affect message routing in your organization, see Understanding Transport Routing in Exchange 2003 Hybrid Deployments.

Exchange Online Protection in Hybrid Deployments

EOP is an online service provided by Microsoft that's used by many companies to protect their on-premises organizations from viruses, spam, phishing scams, and policy violations. In Office 365, EOP is used to protect Exchange Online organizations from the same threats. When you sign up for Office 365, an EOP company is automatically created that's tied to your Exchange Online organization.

An EOP company contains several of the mail transport settings that can be configured for your Exchange Online organization. You can specify which SMTP domains must come from specific IP addresses, require a TLS and a Secure Sockets Layer (SSL) certificate, can bypass anti-spam filtering or compliance policies, and more. EOP is the front door to your Exchange Online organization. All messages, regardless of their origin, must pass through EOP before they reach mailboxes in your Exchange Online organization. And, all messages sent from your Exchange Online organization must go through EOP before they reach the Internet.

When you configure a hybrid deployment with the Manage Hybrid Configuration wizard, all transport settings are automatically configured in your on-premises organization and in the EOP company set up for your Exchange Online organization. The Manage Hybrid Configuration wizard configures all inbound and outbound connectors and other settings in this EOP company to secure messages sent between the on-premises and Exchange Online organizations and route messages to the right destination. If you want to configure custom transport settings for your Exchange Online organization, you'll configure them in this EOP company also.

Trusted Communication

To help protect recipients in both the on-premises and Exchange Online organizations, and to help ensure that messages sent between the organizations aren't intercepted and

read, transport between the on-premises organization and EOP is configured to use forced TLS. TLS transport uses Secure Sockets Layer (SSL) certificates provided by a trusted third-party Certificate Authority (CA). Messages between FOPE and the Exchange Online organization also use TLS.

When using forced TLS transport, the sending and receiving servers examine the certificate configured on the other server. The subject name, or one of the subject alternative names (SANs), configured on the certificates must match the FQDN that an administrator has explicitly specified on the other server. For example, if EOP is configured to accept and secure messages sent from the hybrid.contoso.com FQDN, the sending on-premises hybrid server must have an SSL certificate with hybrid.contoso.com in either the subject name or SAN. If this requirement isn't met, the connection is refused.

Note:

The FQDN used doesn't need to match the e-mail domain name of the recipients. The only requirement is that the FQDN in the certificate subject name or SAN must match the FQDN that the receiving or sending servers are configured to accept.

In addition to using TLS, messages between the organizations are treated as "internal". This approach allows messages to bypass anti-spam settings and other services.

Learn more about SSL certificates and domain security at: Understanding Certificate Requirements for Hybrid Deployments, Understanding TLS Certificates

1.14.8.7 Understanding Transport Routing in Exchange 2003 Hybrid Deployments

Understanding Transport Routing in Exchange 2003 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-29*

This topic discusses your routing options for inbound messages from the Internet and outbound messages to the Internet.

Note:

The examples in this topic don't include the addition of Edge Transport servers into the hybrid deployment. The routes messages take between the on-premises organization, the Exchange Online organization, and the Internet don't change with the addition of an Edge Transport server. The routing only changes within the on-premises organization. For more information about adding Edge Transport servers to a hybrid deployment, see Understanding Edge Transport Servers in Exchange 2003 Hybrid Deployments.

Inbound Messages from the Internet

As part of planning and configuring your hybrid deployment, you need to decide whether you want all messages from Internet senders to be routed through your on-premises organization or through the Exchange Online organization. All messages from Internet senders will initially be delivered to the organization you select and then routed according to where the recipient's mailbox is located. Whether you choose to have messages routed through your on-premises organization or the Exchange Online organization depends on various factors, including whether you want to apply compliance policies to all messages sent to both organizations, how many mailboxes are in each organization, and so on.

The path messages sent to recipients in your on-premises and Exchange Online organizations take depends on how you decide to configure your MX record in your hybrid deployment. The Manage Hybrid Configuration wizard doesn't configure the routing for inbound Internet messages for either the on-premises or Exchange Online organizations. You must manually configure your MX record if you want to change how your inbound Internet mail is delivered.

- If you keep your MX record pointed to your on-premises organization: All messages sent to any recipient in either organization will be routed through your on-premises organization first. A message addressed to a recipient that's located in Exchange Online will be routed first through your on-premises organization and then delivered to the recipient in Exchange Online. This route can be helpful for organizations where you have compliance policies that require messages sent to and from an organization be examined by a journaling solution. This route is also recommended if you have more recipients in your on-premises organization than in your Exchange Online organization.
- If you decide to change your MX record to point to the Microsoft Exchange Online Protection (EOP) service in Office 365: All messages sent to any recipient in either organization will be routed through the Exchange Online organization first. A message addressed to a recipient that's located in your on-premises organization will be routed first through your Exchange Online organization and then delivered to the recipient in your on-premises organization. This route is recommended if you have more recipients in your Exchange Online organization than in your on-premises organization.

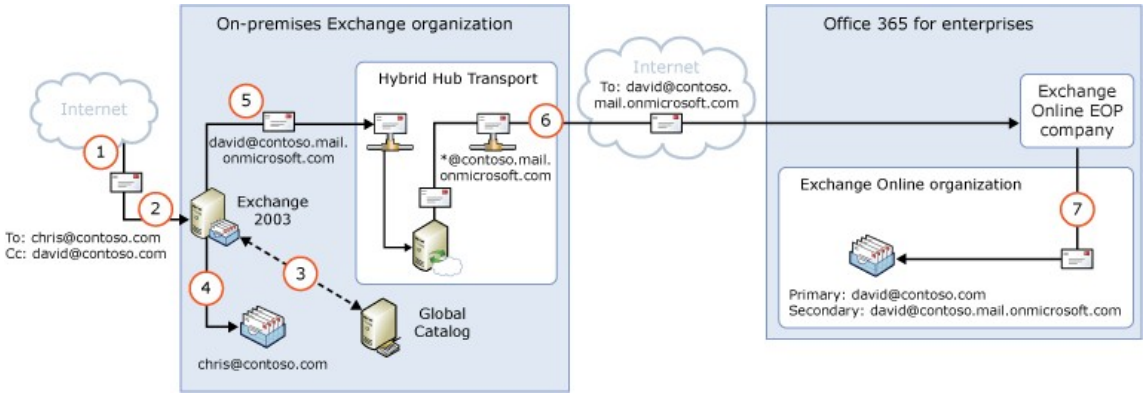
Read the section below that matches how you plan to route messages sent from Internet recipients to your on-premises and Exchange Online recipients.

Route Incoming Internet Messages Through Your On-Premises Organization

The following steps and diagram illustrate the inbound Internet message path that will occur in your hybrid deployment if you decide to keep your MX record pointed to your on-premises organization.

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2003 server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to the on-premises organization, the message is delivered to an Exchange 2003 server.
3. The Exchange 2003 server performs a lookup for each recipient using an on-premises global catalog server. Through the global catalog lookup, it determines that Chris's mailbox is located on the Exchange 2003 server while David's mailbox is located in the Exchange Online organization and has a hybrid routing address of david@contoso.mail.onmicrosoft.com.
4. The Exchange 2003 server splits the message into two copies. One copy of the message is delivered to Chris's mailbox.
5. The second copy of the message is sent through the routing group connector that's configured between the hybrid servers and the Exchange 2003 server.
6. A hybrid Hub Transport server sends the message to EOP, which receives messages sent to the Exchange Online organization, using a Send connector configured to use TLS.
7. EOP sends the message to the Exchange Online organization where the message is scanned for viruses and delivered to David's mailbox.

Route mail through the on-premises organization for both on-premises and Exchange Online organizations



Route Incoming Internet Messages Through the Exchange Online Organization

The following steps and diagrams illustrate the inbound message path that occur in your hybrid deployment if you decide to point your MX record to the EOP service in the Office 365 organization. The message path differs depending on whether you choose to enable centralized mail transport.

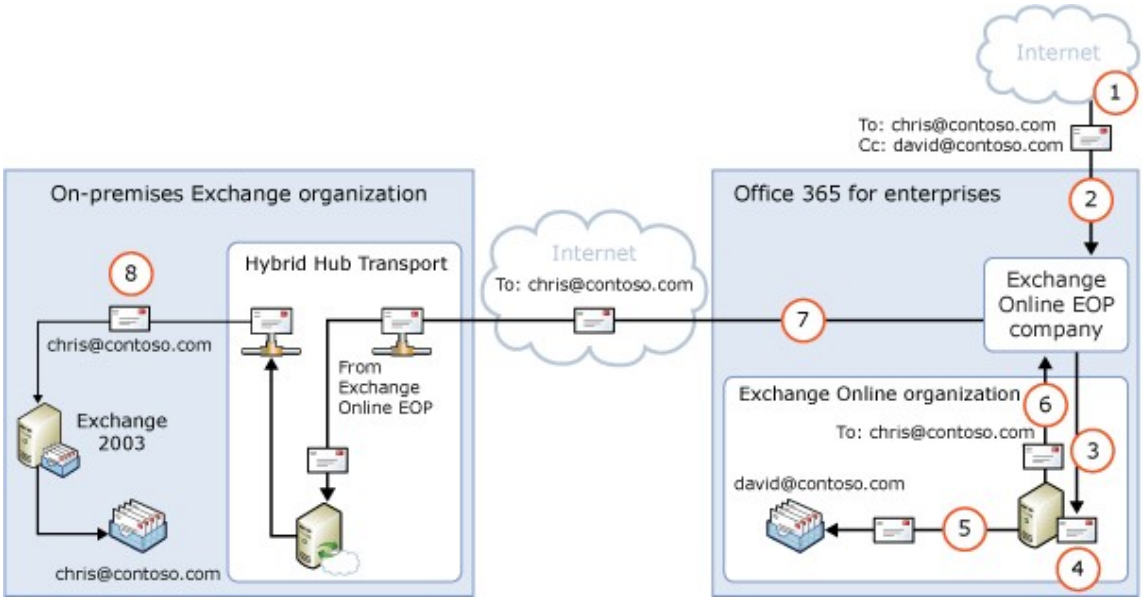
Important:

You may need to purchase EOP licenses for each on-premises mailbox that receives messages that are first delivered to EOP and then routed through the Exchange Online organization. Contact your Microsoft reseller for more information.

When centralized mail transport is *disabled* (default configuration), incoming Internet messages are routed as follows in a hybrid deployment:

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2003 server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to EOP, the message is delivered to EOP.
3. EOP routes the messages for both recipients to Exchange Online.
4. Exchange Online scans the messages for viruses and performs a lookup for each recipient. Through the lookup, it determines that Chris's mailbox is located in the on-premises organization while David's mailbox is located in the Exchange Online organization.
5. Exchange Online splits the message into two copies. One copy of the message is delivered to David's mailbox.
6. The second copy is sent from Exchange Online back to EOP.
7. EOP sends the message to the hybrid Exchange 2010 Hub Transport servers in the on-premises organization.
8. A hybrid Hub Transport server sends the message through th routing group connector that’s configured between the hybrid servers and the Exchange 2003 server where it’s delivered to Chris's mailbox.

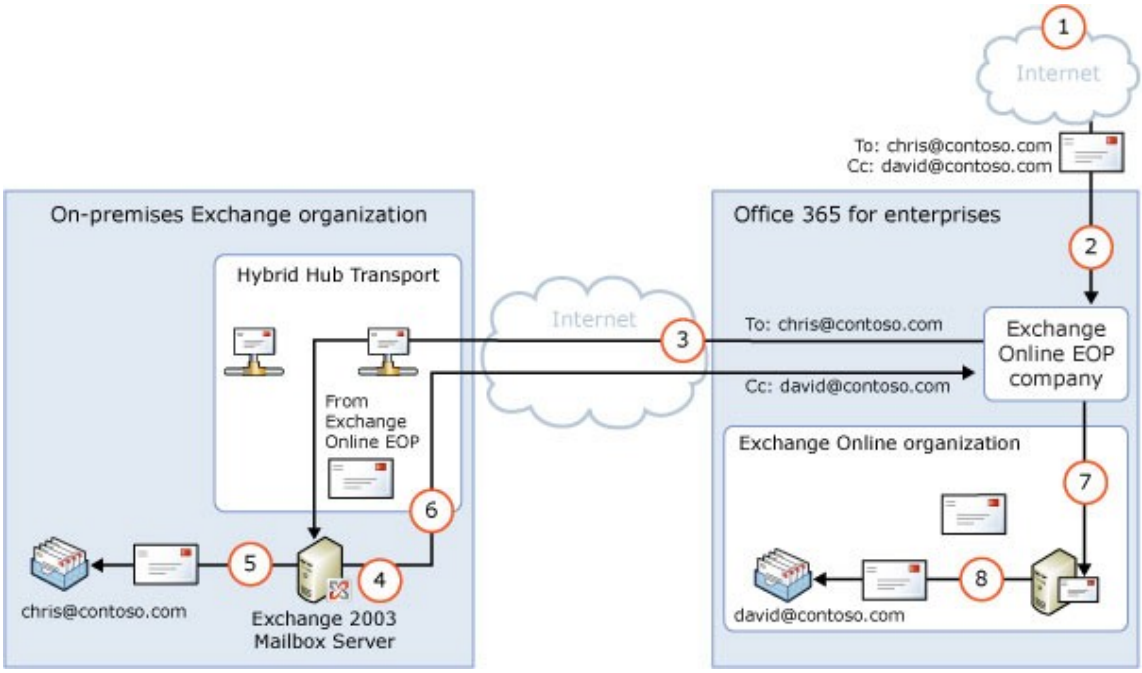
Route mail through the Exchange Online organization for both on-premises and Exchange Online organizations with centralized mail transport disabled (default configuration)



When centralized mail transport is *enabled*, incoming Internet messages are routed as follows in a hybrid deployment:

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2003 server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to EOP, the message is delivered to EOP and scanned for viruses.
3. Since centralized mail transport is enabled, EOP routes the messages for both recipients to the on-premises hybrid Exchange 2010 Hub Transport server.
4. The hybrid Hub Transport server performs a lookup for each recipient. Through the lookup, it determines that Chris's mailbox is located in the on-premises organization while David's mailbox is located in the Exchange Online organization.
5. The hybrid Hub Transport server splits the message into two copies. One copy of the message is delivered to Chris’s mailbox in the on-premises Exchange 2003 server.
6. The second copy is sent from the hybrid Hub Transport server back to EOP.
7. EOP sends the message to Exchange Online.
8. Exchange delivers the message to David's mailbox.

Route mail through the Exchange Online organization for both on-premises and Exchange Online organizations with centralized mail transport enabled



Outbound Messages to the Internet

In addition to choosing how inbound messages addressed to recipients to your organizations are routed, you can also choose how outbound messages sent from Exchange Online recipients are routed. When you run the Hybrid Configuration wizard, you can select one of two options:

- **Enable centralized mail transport** Selecting this option routes outbound messages sent from the Exchange Online organization through your on-premises organization. Except for messages sent to other recipients in the same Exchange Online organization, all messages sent from recipients in the Exchange Online organization are sent through the on-premises organization. This enables you to apply compliance rules to these messages and any other processes or requirements that must be applied to all of your recipients, regardless of whether they're located in the Exchange Online organization or the on-premises organization.

  Note:
  Centralized mail transport is only recommended for organizations with specific compliance-related transport needs. Our recommendation for typical Exchange organizations is not to enable centralized mail transport.

- **Don’t enable centralized mail transport** Selected by default in the Manage Hybrid Configuration wizard, this option routes outbound messages sent from the Exchange Online organization directly to the Internet. Use this option if you don't need to apply any on-premises compliance policies or other processing rules to messages that are sent from recipients in the Exchange Online organization.

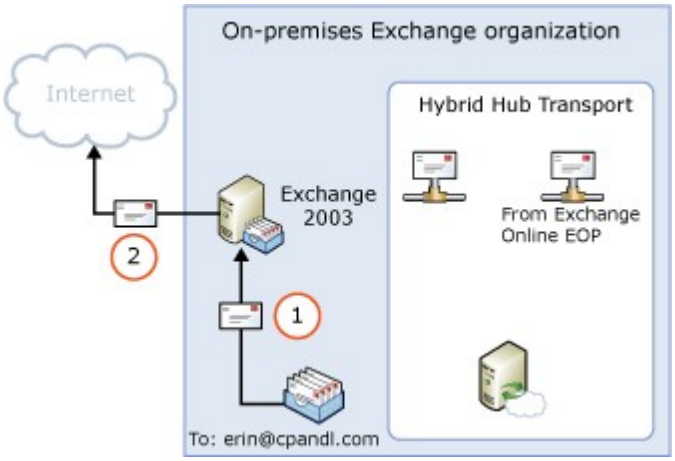
Messages sent from on-premises recipients are always sent to directly to Internet recipients using DNS regardless of which of the above choices you select in the Manage Hybrid Configuration wizard.

The following steps and diagram illustrate the outbound message path for messages sent from on-premises recipients.

1. Chris, who has a mailbox on the on-premises Exchange 2003 server, sends a message to an external Internet recipient, erin@cpandl.com.

2. The Exchange 2003 server looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Messages from on-premises senders to Internet recipients



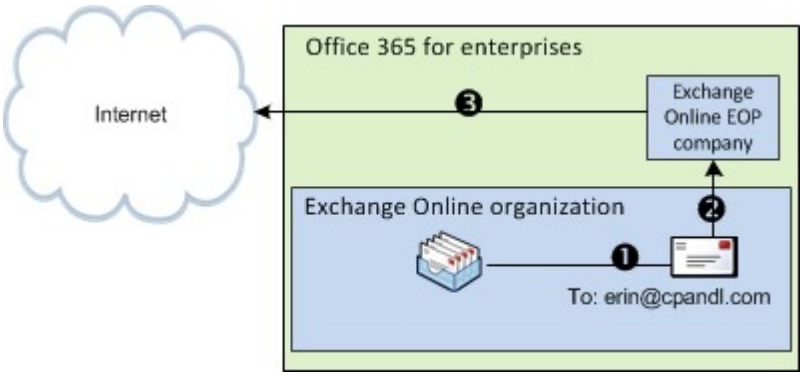
Read the section below that matches how you plan to route messages sent from recipients in the Exchange Online organization to Internet recipients.

Deliver Internet-bound Messages from Exchange Online using DNS (Centralized Mail Transport Disabled)

The following steps and diagram illustrate the outbound message path for messages sent from Exchange Online recipients to an Internet recipient that occur when **Enable centralized mail transport** is not selected in the Manage Hybrid Configuration wizard, which is the default configuration.

1. David, who has a mailbox in the Exchange Online organization, sends a message to an external Internet recipient, erin@cpandl.com.
2. Exchange Online scans the message for viruses and sends the message to the Exchange Online EOP company.
3. EOP looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Mail from Exchange Online senders routed directly to the Internet with centralized mail transport disabled (default configuration)



Route Internet-bound messages from Exchange Online Through Your on-Premises Organization (Centralized Mail Transport Enabled)

The following steps and diagram illustrate the outbound message path for messages sent from Exchange Online recipients to an Internet recipient that occur when you select

Enable centralized mail transport in the Manage Hybrid Configuration wizard.

1. David, who has a mailbox in the Exchange Online organization, sends a message to an external Internet recipient, erin@cpandl.com.
2. Exchange Online scans the message for viruses and sends the message to EOP.
3. EOP is configured to send all Internet-bound messages to an on-premises server, so the message is routed to a hybrid Hub Transport server. The message is sent using TLS.
4. An hybrid Hub Transport server performs compliance and any other processes configured by the administrator on David's message.
5. The hybrid Hub Transport server looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Mail from Exchange Online senders routed through on-premises organization with centralized mail transport enabled

Understanding Hybrid Servers in Exchange 2007 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

When configuring a hybrid deployment, you have to install at least one hybrid server in your existing Microsoft Exchange organization. Hybrid servers are additional servers configured with Service Pack 3 (SP3) for Exchange Server 2010 server roles that coordinate communication between your existing Exchange 2007 organization and the Exchange Online organization. This communication includes message transport and messaging features between the on-premises and Exchange Online organizations. We highly recommend installing more than one hybrid server in your on-premises organization to help increase reliability and availability of hybrid deployment features.

Server Roles in a Hybrid Deployment

Here is a quick overview of the Exchange 2010 server roles in a hybrid deployment:

- **Client Access server role** The Client Access server role on a hybrid server provides essentially the same functionality typically provided by other Client Access servers in your Exchange 2007 organization with a few additions required to support a hybrid deployment. All client connectivity, including Outlook client access, Outlook Web App, and Outlook Anywhere goes through the hybrid Client Access server role. Organization relationship features between the on-premises and Exchange Online organizations, such as free/busy sharing, are also handled by the hybrid Client Access server role. Learn more at: Understanding Client Access
- **Hub Transport server role** The Hub Transport server role on a hybrid server handles all mail flow between the on-premises and Exchange Online organizations and between the on-premises organization and the Internet. It helps to secure transport communication between the on-premises and Exchange Online organizations, as well as handling transport rules, journaling policies, and message delivery to user mailboxes in a hybrid deployment. Learn more at: Overview of the Hub Transport Server Role

Depending on the hybrid deployment configuration that you want, a hybrid server requires one or more of the server roles to be installed on it:

- **Single hybrid server** If you choose to install a single hybrid server in your on-premises organization, you'll need to install the Client Access and Hub Transport server roles on the single hybrid server.
- **More than one hybrid server** If you choose to install more than one hybrid server in your on-premises organization, you can install the server roles on separate servers in your on-premises organization. For example, you could install one hybrid server that has the Client Access role installed and also install another hybrid server that has only the Hub Transport server role installed. However, the best practice and recommended hybrid server configuration is to install the Client Access and Hub Transport servers on *each* hybrid server deployed in your on-premises organization.

If you also decide to install the optional Exchange 2010 Mailbox server role in your hybrid deployment, you should add the Mailbox server role to each hybrid server that has the Client Access and Hub Transport server roles installed. Learn more about the Mailbox server role at: Overview of the Mailbox Server Role

Hybrid Server Functionality

A hybrid server provides several important functions for your on-premises organization in a hybrid deployment:

- **Federation** Hybrid servers enable you to create a federation trust for your on-premises organization with the Microsoft Federation Gateway. The Microsoft Federation Gateway is a free, cloud-based service offered by Microsoft that acts as the trust broker between your on-premises organization and the Office 365 tenant organization. Federation is a requirement for creating an organization relationship between the on-premises and the Exchange Online organizations.
  Learn more at: Understanding Federation
- **Organization relationships** Hybrid Client Access servers enable the creation of organization relationships between the on-premises and Exchange Online organizations. Organization relationships are required for many other services in a hybrid deployment, including calendar free/busy information sharing, message tracking, and mailbox moves between the on-premises and Exchange Online organizations.
  Learn more at: Understanding Federated Delegation
- **Message transport** Hybrid Hub Transport servers are responsible for message transport in a hybrid deployment. Using Send and Receive connectors, they replace the on-premises Exchange 2007 Hub Transport server as the connection endpoint for incoming external messages and also provide outbound message delivery to the Internet and the Exchange Online organization.
  Learn more at: Understanding Transport
- **Message transport security** Hybrid Hub Transport servers help to secure message communication between the on-premises and Exchange Online organizations by using the Domain Security functionality in Exchange 2010. Security can be increased by using mutual transport layer security authentication and encryption for message communications.
  Learn more at: Understanding Domain Security
- **Outlook Web App** Hybrid Client Access servers support configuring a single URL endpoint for external connections to on-premises and Exchange Online mailboxes. For on-premises mailboxes, hybrid Client Access servers are configured to automatically redirect user Outlook Web App requests to your Exchange 2007 Client Access server. For Exchange Online organization mailboxes, hybrid Client Access servers are configured to automatically display a link to the Outlook Web App endpoint on the Exchange Online organization.
- Learn more at: Understanding Outlook Web App

Hybrid Server Topology

A hybrid server is deployed much like an Exchange 2010 server would be deployed to your existing Exchange 2007 organization. Using the Client Access, Mailbox, and Hub Transport server roles, hybrid servers are responsible for many services for your on-premises organization that are currently provided by your existing Exchange 2007 servers. The following table describes briefly the changes in services after configuring a hybrid deployment.

Service	Before hybrid server deployment	After hybrid server deployment	Description
Message transport (inbound and outbound)	Exchange 2007 Client Access server	Hybrid Hub Transport server(s)	The MX (mail exchanger) record for the domain may be updated to point to hybrid Hub Transport

			servers.
Outlook Web App public URL	Exchange 2007 Client Access server	Hybrid Client Access server(s)	Hybrid Client Access servers redirect Outlook Web App requests to the publicly accessible endpoint on the Exchange 2007 Client Access server.

Hybrid Server Software

Service Pack 3 (SP3) for Exchange Server 2010 enables hybrid deployment functionality with the Hybrid Configuration wizards. You can use any Exchange 2010 SP3 media when installing the hybrid server.

Additionally, we recommend that you install future Update Rollups for Exchange 2010 SP3 on all your hybrid servers. Microsoft releases update rollup packages approximately every six to eight weeks. The rollup packages are available via Microsoft Update and the Microsoft Download Center. In the Search box on the Microsoft Download Center, type "Exchange 2010 SP3 update rollup" to find links to the rollup packages for Exchange 2010 SP3.

Download Exchange Server 2010 SP3 at: Exchange 2010 Service Pack 3 (SP3)

Find update rollup packages at: Microsoft Download Center

Important:
You need to provide an Exchange 2010 Hybrid Edition product key on the hybrid server when you configure a hybrid deployment with Office 365. To obtain a Hybrid Edition product key, contact Office 365 support.

1.14.9.2 Understanding Prerequisites for Exchange 2007 Hybrid Deployments

Understanding Prerequisites for Exchange 2007 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Before you can really start to use the Deployment Assistant, your system and servers must meet requirements. If they don't meet these requirements, you won't be able to complete the steps within the tool and you won't be able to configure a hybrid deployment between your on-premises Exchange 2007 and Exchange Online organizations. This topic provides information about the following:

- The Exchange Pre-Deployment Analyzer
- Permissions needed to install and manage Exchange 2010
- Requirements for directory servers, hardware, software, clients, and other elements, including:
  - Windows Server 2008 Service Pack 2 (SP2) or later or Windows Server 2008 R2 operating system prerequisites that are required for all Exchange 2010 server roles

- Language support for Exchange 2010
- The Exchange Management Shell, the command-line interface for Exchange 2010, and the Exchange Management Console, the GUI management tool for Exchange 2010

Note:
Before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Exchange Pre-Deployment Analyzer

You can use the Exchange Pre-Deployment Analyzer (ExPDA) to perform an overall topology readiness scan of your environment. This scan focuses on overall topology readiness and not the ability to run Exchange 2010 on the local computer. ExPDA provides a detailed report that will alert you if there are any issues within your organization, which could prevent you from deploying Exchange 2010. For example, ExPDA will notify you if you haven't deployed the minimum required Exchange service pack on all your Exchange servers. If your organization passes the ExPDA readiness scan, you can go ahead and use the Exchange Deployment Assistant.

To get ExPDA from the Microsoft Download Center, see: Exchange Pre-Deployment Analyzer

Permissions to Install and Manage Exchange 2010

Exchange 2010 requires different permissions to install and to manage your server roles. When you're installing Exchange 2010 servers in your organization, the account you use might not be the same account that you use for administering and managing your server roles. To manage your server roles, Exchange 2010 uses the Role Based Access Control (RBAC) permissions model.

Exchange 2010 uses RBAC to manage permissions on the Exchange 2010 hybrid server. With RBAC, you can control what resources administrators can configure and what features users can access. The RBAC model in Exchange 2010 is flexible and provides you with several ways to customize the default permissions.

RBAC has two primary ways of assigning permissions to users in your organization, depending on whether the user is an administrator or specialist user, or an end-user: management role groups and management role assignment policies. Each method associates users with the permissions they need to perform their jobs. The following sections list the tasks found in the Deployment Assistant and the permissions required to complete the task.

Note:
Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Installation Permissions

By default, the account that's used to install Exchange 2010 in the organization is added as a member of the Organization Management role group.

When you install the first hybrid server into your Exchange 2007 organization, Exchange Setup will prepare your Active Directory schema if you have the correct permissions. If you want to separate your Active Directory schema preparation from a hybrid server installation, see: Prepare Active Directory and Domains

For information about how to add permissions, see: Add Members to a Role Group

The following permissions are required to install the hybrid server in your organization:

- Local Administrator on the server on which Exchange 2010 will be installed
- Enterprise Administrator in the Active Directory forest where Exchange 2010 will be installed
- Schema Administrator in the Active Directory forest where Exchange 2010 will be installed

Exchange Management Permissions

The table below lists the configuration permissions that you need to successfully use the Deployment Assistant and the Hybrid Configuration wizards. Some tasks need to be performed only in the on-premises organization while some tasks also need to be performed in the Office 365 tenant organization. If a task needs to be performed in the Office 365 tenant organization, you must ensure that you have the required permissions in that organization. Permissions in the on-premises organization aren't replicated to the Office 365 tenant organization.

Note:

The user account used to create the Office 365 tenant organization has all the permissions required to perform the tasks in this checklist.

Learn more at: Understanding Hybrid Deployment Permissions with Exchange 2010 SP3

Some procedures require you to perform tasks on your Exchange 2007 servers. For information about how to manage permissions in an organization with Exchange 2007 and Exchange 2010 installed, see: Understanding Permissions Coexistence with Exchange 2007

Task	Permissions required	On-premises or Office 365 tenant organization
Import digital certificates	Local Administrator	On-premises organization
Configure settings on virtual directories	Server Management	On-premises organization
Configure virtual directories	Organization Management Server Management	On-premises organization
Create accepted domains	Organization Management	On-premises and Office 365 tenant organization
Create and modify Send and Receive connectors	Organization Management	On-premises organization
Create routing group connectors	Organization Management Server Management	On-premises organization
Create a federation trust	Organization Management	On-premises organization
Create organization relationships	Organization Management	On-premises and Exchange Online organization
Configure Mailbox Replication Service (MRS) proxy	Local Administrator	On-premises organization
Move mailboxes	Organization Management	On-premises and Exchange Online organization

	Recipient Management	
Configure Exchange 2007 authentication	Local Administrator	On-premises organization
Configure Exchange 2007 e-mail address policies	Exchange Administrator	On-premises organization

Directory Servers

Here are the requirements for the directory servers in your organization:

- **Schema master** The latest 32-bit or 64-bit edition of the Windows Server 2003 SP2 Standard or Enterprise operating system or the Windows Server 2008 Standard or Enterprise operating system.
- **Global catalog server** In every Active Directory site where you plan to install Exchange 2010, you must have at least one global catalog server that is either the latest 32-bit or 64-bit edition of: Windows Server 2003 SP2 Standard or Enterprise; Windows Server 2008 Standard or Enterprise; or Windows Server 2008 R2 Standard or Enterprise.
- **Active Directory Forest** The Active Directory forest must be Windows Server 2003 forest functional mode or higher.
- **Domain Controller** You must have the latest 32-bit or 64-bit Windows Server 2003 Standard Edition or Enterprise Edition with Service Pack 2 (SP2) operating system or the latest 32-bit or 64-bit edition of the Windows Server 2008 Standard or Enterprise operating system or the Windows Server 2008 R2 Standard or Enterprise operating system.

Hardware

The recommended hardware requirements for Exchange 2010 servers vary depending on several factors including the server role(s) that are installed and the anticipated load that will be placed on the servers.

- **Processor** x64 architecture-based computer with processor that supports 64-bit architecture
- **Memory** Minimum 4GB with a recommended maximum of 2GB per core (8GB minimum). Learn more at: Understanding Memory Configurations and Exchange Performance
- **Disk space** At least 1.2 GB on the drive on which you install Exchange and additional 200 MB of available space on the system drive.
- **Drive** DVD-ROM drive, local or network accessible
- **File format** Disk partitions formatted as NTFS file systems

Operating System

Here are the supported operating systems for Exchange 2010:

- 64-bit edition of Windows Server 2008 Standard Service Pack 2
- 64-bit edition of Windows Server 2008 Enterprise Service Pack 2
- 64-bit edition of Windows Server 2008 Standard R2
- 64-bit edition of Windows Server 2008 Enterprise R2

Exchange 2010 Management tools can use the operating systems listed above plus:

- 64-bit edition of Windows Vista
- 64-bit edition of Windows 7

Install Hotfixes for Windows Server 2008 SP2

The following hotfixes are required for Windows Server 2008 SP2:

- Install the update described in Microsoft Knowledge Base article 977624, AD RMS clients do not authenticate federated identity providers in Windows Server 2008 or in Windows Vista. Without this update, Active Directory Rights Management Services (AD RMS) features may stop working.
- Install the update described in Knowledge Base article 979744, A .NET Framework 2.0-based Multi-AppDomain application stops responding when you run the application.
- Install the update described in Knowledge Base article 979917, Two issues occur when you deploy an ASP.NET 2.0-based application on a server that is running IIS 7.0 or IIS 7.5 in Integrated mode. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB979917 - QFE for Sharepoint issues - Perf Counter fix & User Impersonation.
  - For the available downloads, see KB979917 - QFE for Sharepoint issues - Perf Counter fix & User Impersonation.
- Install the update described in Knowledge Base article 973136, FIX: ArgumentNullException exception error message when a .NET Framework 2.0 SP2-based application tries to process a response with zero-length content to an asynchronous ASP.NET Web service request: "Value cannot be null".
- Install the update described in Knowledge Base article 977592, RPC over HTTP clients cannot connect to the Windows Server 2008 RPC over HTTP servers that have RPC load balancing enabled.

Install Hotfixes for Windows Server 2008 R2

The following hotfixes are required for Windows Server 2008 R2:

Important:

The following hotfixes only apply to Windows Server 2008 R2 RTM. If you're installing Exchange on Windows Server 2008 R2 SP1, you don't need to apply these hotfixes.

- Install the update described in Knowledge Base article 979099, An update is available to remove the application manifest expiry feature from AD RMS clients. Without this update, the AD RMS features may stop working.
- Install the update described in Knowledge Base article 979744, A .NET Framework 2.0-based Multi-AppDomain application stops responding when you run the application.
- Install the update described in Knowledge Base article 983440, An ASP.NET 2.0 hotfix rollup package is available for Windows 7 and for Windows Server 2008 R2. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB983440 - Win7 rollup package (PR for QFE 810219).
  - For the available downloads, see KB983440 - Win7 rollup package (PR for QFE 810219).
- Install the update described in Knowledge Base article 977020, FIX: An application that is based on the Microsoft .NET Framework 2.0 Service Pack 2 and that invokes a Web service call asynchronously throws an exception on a computer that is running Windows 7.

Install Hotfixes for Windows 7 and Windows Vista

The following hotfixes are required for Windows 7 and Windows Vista computers where you install the Exchange Management Console

- Install the update described in Knowledge Base article 977020, FIX: An application that is based on the Microsoft .NET Framework 2.0 Service Pack 2 and that invokes a Web service call asynchronously throws an exception on a computer that is running Windows 7.
- Install the update described in Knowledge Base article 983440, An ASP.NET 2.0 hotfix rollup package is available for Windows 7 and for Windows Server 2008 R2. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB983440 - Win7 rollup package (PR for QFE 810219).

- For the available downloads, see KB983440 - Win7 rollup package (PR for QFE 810219).

Install the Windows Server 2008 SP2 prerequisites

1. Install the Microsoft Filter Pack. For details, see: 2007 Office System Converter: Microsoft Filter Pack
2. Open an elevated command prompt, navigate to the Scripts folder on the Exchange 2010 installation media and use the following command to install the necessary operating system components:

```
sc config NetTcpPortSharing start= auto
ServerManagerCmd -ip Exchange-Typical.xml -Restart
```

Install the Exchange 2010 SP1 Hotfixes for Windows Server 2008 SP2

The following hotfix is required for Windows Server 2008 SP2 and must be installed after the operating system prerequisites have been installed:

- Install the hotfix described in Knowledge Base article 982867, WCF services that are hosted by computers together with a NLB fail in .NET Framework 3.5 SP1. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.
  - For the available downloads, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.

After installing the preceding prerequisites and hotfix, and before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Install the Windows Server 2008 R2 prerequisites

1. Install the Microsoft Filter Pack. For details, see: 2007 Office System Converter: Microsoft Filter Pack
2. On the Start Menu, navigate to **All Programs**, then **Accessories**, then **Windows PowerShell**. Open an elevated Windows PowerShell console, and run the following command:

```
Import-Module ServerManager
```

3. Use the **Add-WindowsFeature** cmdlet to install the necessary operating system components using the following command:

```
Add-WindowsFeature NET-Framework,RSAT-ADDS,Web-Server,Web-Basic-Auth,W
```

4. After the system has restarted, log on as an administrator, open an elevated Windows PowerShell console, and configure the Net.Tcp Port Sharing Service for Automatic startup by running the following command:

```
Set-Service NetTcpPortSharing -StartupType Automatic
```

Install the Exchange 2010 SP1 Hotfixes for Windows Server 2008 R2

The following hotfix is required for Windows Server 2008 R2 and must be installed after the operating system prerequisites have been installed:

- Install the hotfix described in Knowledge Base article 982867, WCF services that are hosted by computers together with a NLB fail in .NET Framework 3.5 SP1. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.
  - For the available downloads, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.

After installing the preceding prerequisites and hotfix, and before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Windows Management Framework

- Windows PowerShell V2.0
- Windows Remote Management V2.0
- .NET Framework 3.5 SP1
- Internet Information Services (IIS)

Language Support

An Exchange 2010 SP2 language pack contains the necessary resources for a supported Exchange language. Language packs are installed automatically during deployment of Exchange 2010 SP2. Client and server language packs come grouped into a single bundle containing both client and server resource and support files. There are no performance issues with installing all the languages because they're just stored when not in use.

Learn more at: Exchange 2010 Language Support

Exchange Management Shell

The Exchange Management Shell, built on Windows PowerShell technology, provides a powerful command-line interface for Exchange 2010 that enables automation of administrative tasks.

With the Shell, you can manage every aspect of Exchange 2010; the Shell can perform every task that can be performed by the Exchange Management Console (EMC) and the Exchange Control Panel (ECP) in addition to tasks that can't be performed in those interfaces. In fact, when a task is performed in the EMC or the ECP, those interfaces use the Shell to perform the task.

Learn more at: Overview of Exchange Management Shell

Exchange Management Console

The Exchange Management Console (EMC) is a Microsoft Management Console (MMC) 3.0-based tool that provides you with a GUI to manage the configuration of your Exchange 2010 organization. You can also add the EMC snap-in to custom MMC-based tools.

Learn more at: Exchange Management Console

1.14.9.3 Understanding Hybrid Management in Exchange 2007 Hybrid Deployments

Understanding Hybrid Management in Exchange 2007 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-02-01*

Both your on-premises organization and the Exchange Online organization are based on Microsoft Exchange. In particular, hybrid servers in your on-premises organization are based on Microsoft Exchange Server 2010 and the Exchange Online organization

Exchange servers are based on Exchange Server 2013. Service Pack 3 (SP3) for Exchange 2010 enables hybrid features to function correctly between these two types of hybrid deployment servers.

When you install a hybrid server, Exchange 2010 management tools are automatically installed on the server. You'll use the management tools to configure and manage both the hybrid server(s) and some recipient management features for the Exchange Online organization. These tools include the Exchange Management Console (EMC), a graphical administrative interface, and the Exchange Management Shell, a Windows PowerShell-based command-line interface. You'll also use the Exchange Administration Center (EAC) in the Exchange Online section of the Office 365 management portal to manage most of the properties of the Exchange Online recipients and organization.

Exchange Management Console

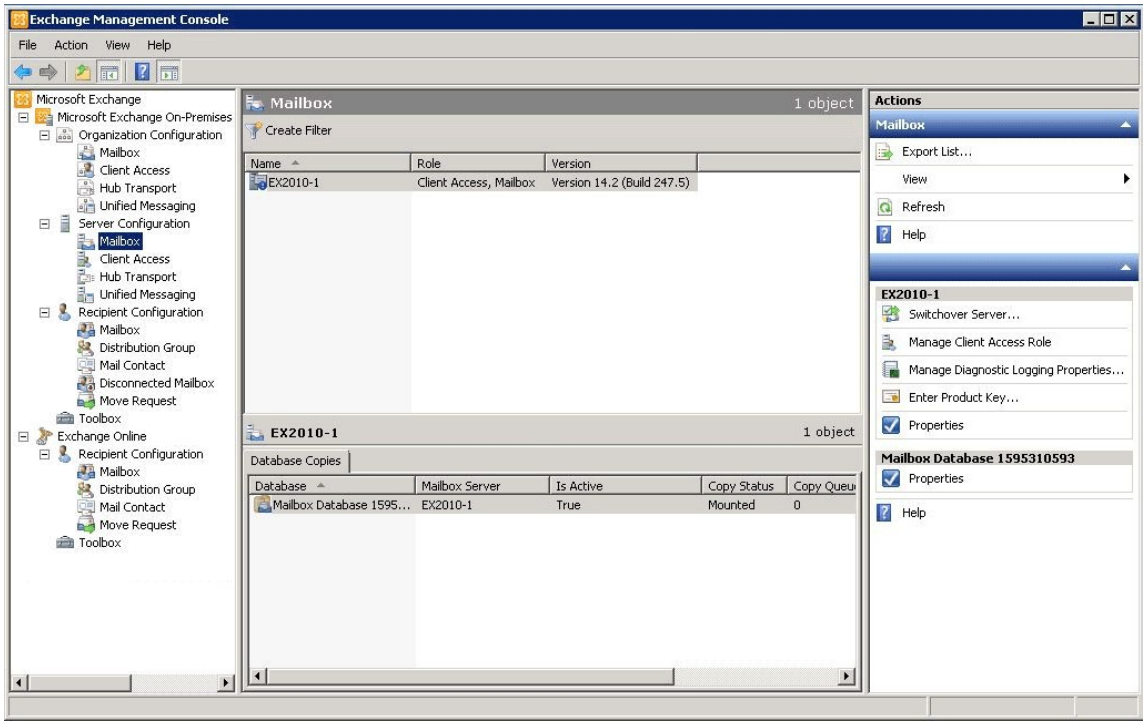
The EMC enables you to perform many deployment tasks and most common day-to-day administrative tasks. Additionally, the EMC allows you to administer both the on-premises hybrid servers and some recipient management features for mailboxes in the Exchange Online organization. It's installed by default on every Exchange 2010 server, but you can also install it on a computer running any of the following 64-bit operating systems:

- Windows Server 2008 SP2 Standard and Enterprise
- Windows Server 2008 R2 Standard and Enterprise
- Windows 8
- Windows 7
- Windows Vista Service Pack (SP) 2

Adding the Exchange Online organization to the EMC is similar to adding another Exchange 2010 forest to the EMC. When the Exchange Online organization is added to the EMC, it appears as another node in the navigation tree. From there you can select the Exchange Online organization and configure some properties of Exchange Online recipient objects. To fully manage organization-level features and objects for the Exchange Online organization, you'll be redirected by the EMC and provided a link to connect to the EAC in the Office 365 management portal.

The following screenshot shows the on-premises organization and Exchange Online organization in the same console.

Exchange on-premises and Exchange Online organizations in the Exchange Management Console



Learn more at: Exchange Management Console

Exchange Management Shell

The Shell enables you to perform any task that the EMC does and some additional tasks that can only be performed in the Shell. The Shell is a collection of Windows PowerShell scripts and cmdlets that are installed on a computer when the Exchange 2010 management tools are installed. These scripts and cmdlets are only loaded when you open the Shell using the Exchange Management Shell icon. If you open Windows PowerShell directly, the Exchange scripts and cmdlets aren't loaded and you won't be able to manage your on-premises organization.

Note:

You can create a manual Windows PowerShell connection to your local on-premises organization, similar to how you manually connect to the Exchange Online organization below. However, we strongly recommend that you use the Exchange Management Shell icon to open the Shell to manage your on-premises hybrid servers.

When you open the Shell using the Exchange Management Shell icon on a computer that has the management tools installed, you can manage your on-premises organization. However, you can't manage the Exchange Online organization when you open the Shell using this icon. This is because opening the Shell using the Exchange Management Shell icon automatically connects you to a local hybrid server.

If you want to manage the Exchange Online organization using Windows PowerShell, you must open Windows PowerShell directly and not via the Exchange Management Shell icon. When you open Windows PowerShell, you can then manually specify where you want to connect. When you create a manual connection, you specify an administrator account in the Office 365 tenant organization, and then you run a command to create a connection. When the connection is established, the Exchange cmdlets you have permissions to run are made available to you.

Learn more at: Use Windows PowerShell

If you're new to the Shell, check out the following topic to learn the basics about how the Shell works, command syntax, and more.

Learn more at: Exchange Management Shell

1.14.9.4 Understanding Edge Transport Servers in Exchange 2007 Hybrid Deployments

Understanding Edge Transport Servers in Exchange 2007 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

Edge Transport servers in Exchange 2010 are deployed in your organization's on-premises perimeter network. They're non-domain-joined computers that handle Internet-facing mail flow and act as an SMTP relay and smart host for Exchange servers in your internal network. In hybrid deployments, you have the option of deploying Edge Transport servers running Service Pack 3 (SP3) for Exchange 2010 if you don't want to expose internal hybrid Hub Transport servers directly to the Internet. If you have Exchange 2007 Edge Transport servers and want to use them for hybrid transport, you need to upgrade them to Exchange 2010 SP2.

Learn more at: Overview of the Edge Transport Server Role

Exchange 2007 Edge Transport Servers

Messages routed between on-premises and Exchange Online organizations require that Exchange Online Protection (EOP), on behalf of Exchange Online, connects directly to on-premises Hub Transport or Edge Transport servers that run Exchange 2010 SP2. If you've deployed Exchange 2007 Edge Transport servers, you must upgrade the servers you want to use for hybrid transport to Exchange 2010 SP3. Only the Edge Transport servers that handle hybrid transport between the on-premises organization and Exchange Online need to be upgraded to Exchange 2010 SP3. If you have other Edge Transport servers in other locations that won't handle hybrid transport, they don't need to be upgraded to Exchange 2010 SP3. If, in the future, you want EOP to connect to additional Edge Transport servers for hybrid transport, they must be upgraded to Exchange 2010 SP3.

Important:

If you keep Exchange 2007 Edge Transport servers in your organization, make sure that EOP connects to an on-premises Exchange 2010 SP3 Hub Transport or Edge Transport server for hybrid transport. If EOP connects to a server running a version other than Exchange 2010 SP3, messages may not be handled correctly. For more information, see: Understanding Transport Options in Exchange 2007 Hybrid Deployments

Upgrading an existing Exchange 2007 Edge Transport server isn't covered in the Exchange Server Deployment Assistant. For more information about upgrading an Edge Transport server from Exchange 2007 to Exchange 2010 SP3, see: Upgrade from Exchange 2007 Transport

Adding an Edge Transport Server to a

Hybrid Deployment

Deploying an Edge Transport server in your on-premises organization when you configure a hybrid deployment is an optional step. During the initial run of the Manage Hybrid Configuration wizard, the wizard requires that you select one or more Hub Transport servers. However, after the initial run of the wizard, you can add an Edge Transport server to your organization, configure it, run the Manage Hybrid Configuration wizard again, and then manually update the on-premises Send connectors and Edge Transport Receive connector to add it to the hybrid deployment.

When you add an Edge Transport server to your hybrid deployment, it communicates with EOP on behalf of the internal hybrid Hub Transport servers. The Edge Transport server acts as a relay between the on-premises hybrid Hub Transport server and EOP. All connection security previously handled by the hybrid Hub Transport server is handled by the Edge Transport server. Recipient lookup, compliance policies, and other message inspection, continue to be done on the hybrid Hub Transport servers.

If you add an Edge Transport server to your hybrid deployment, you don't need to route mail sent between on-premises users and Internet recipients through it. Only messages sent between the on-premises and Exchange Online organizations will be routed through the Edge Transport server.

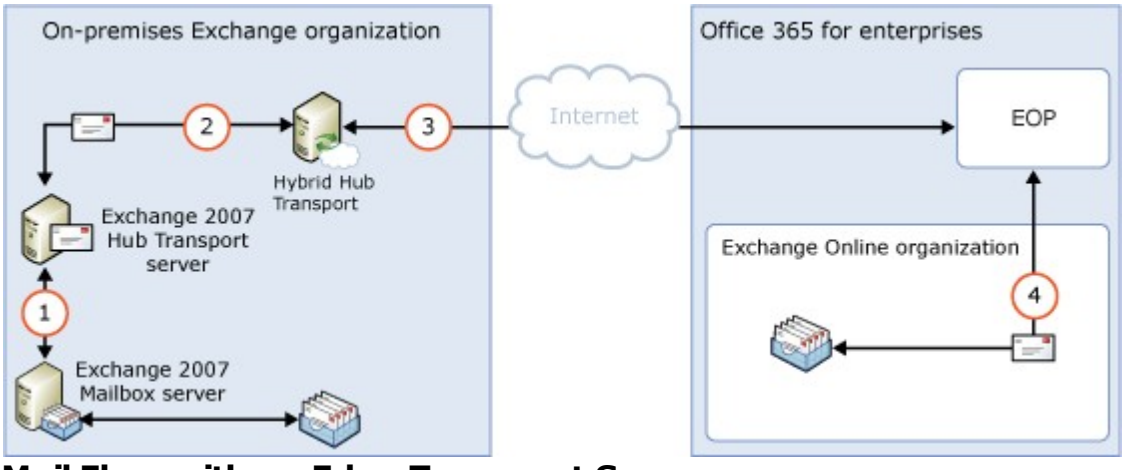
Mail Flow without an Edge Transport Server

The following process and diagram describe the path messages take between an on-premises organization and Exchange Online when there is no Edge Transport server deployed:

1. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from an Exchange 2007 Mailbox server to an Exchange 2007 Hub Transport server.
2. The Exchange 2007 Hub Transport server sends the message to an Exchange 2010 hybrid Hub Transport server.
3. The Hub Transport server sends the message directly to the Exchange Online EOP company.
4. EOP delivers the message to the Exchange Online organization.

Messages sent from the Exchange Online organization to recipients in the on-premises organization follow the reverse route.

Mail flow in a hybrid deployment without an Edge Transport server deployed



Mail Flow with an Edge Transport Server

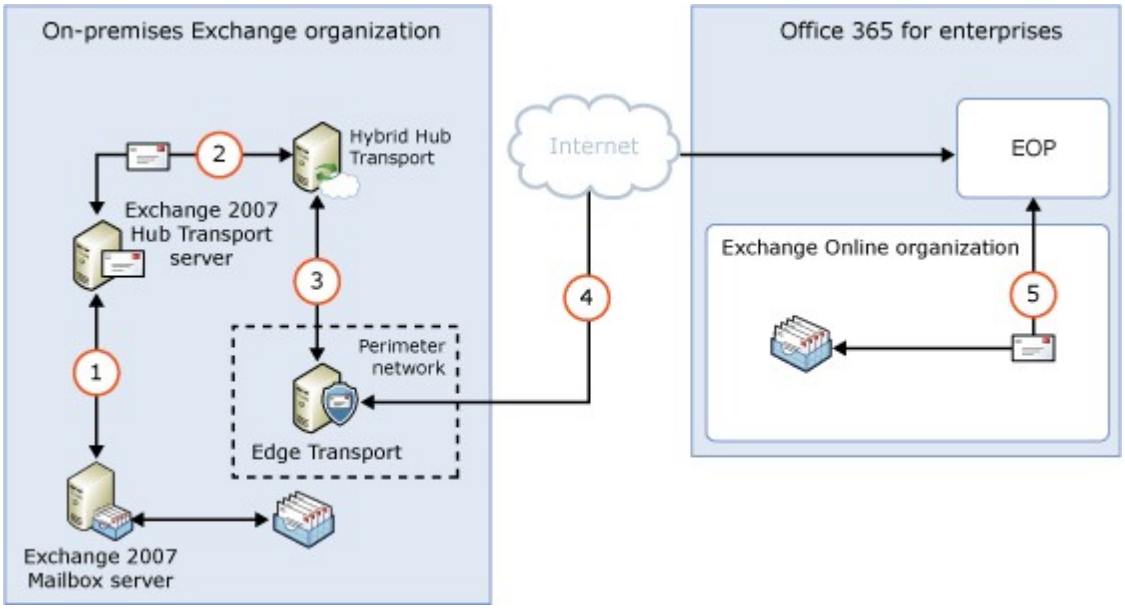
The following diagram shows the path messages take between an on-premises organization and Exchange Online when there is an Edge Transport server deployed.

Messages from the on-premises organization to recipients in the Exchange Online organization are sent from the Exchange 2007 server:

1. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from an Exchange 2007 Mailbox server to an Exchange 2007 Hub Transport server.
2. The Exchange 2007 Hub Transport server sends the message to an Exchange 2010 hybrid Hub Transport server.
3. The hybrid Hub Transport server sends the message to an Exchange 2010 Edge Transport server.
4. The Edge Transport server sends the message to the Exchange Online EOP company.
5. EOP delivers the message to the Exchange Online organization.

Messages sent from the Exchange Online organization to recipients in the on-premises organization follow the reverse route.

Mail flow in a hybrid deployment with an Edge Transport server deployed



1.14.9.5 Understanding Shared Free/Busy in Exchange 2007 Hybrid Deployments

Understanding Shared Free/Busy in Exchange 2007 Hybrid Deployments

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 and Exchange 2007 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-04-05*

Sharing free/busy (calendar availability) information between users located on-premises and in the Exchange Online organization is one of the primary benefits of a hybrid deployment. Users in both organizations can view each other's calendars just as if they were located in the same physical organization. This makes scheduling meetings and resources easy and efficient.

Several components in a hybrid deployment are required to enable the shared free/busy

feature in an Exchange 2007 deployment:

- **Federation trust** Both the on-premises and Microsoft Office 365 service organizations need to have a federation trust established with the Microsoft Federation Gateway. A federation trust is a one-to-one relationship with the Microsoft Federation Gateway that defines parameters for your Exchange organization. The gateway uses these parameters when acting as a trust broker between your on-premises and Office 365 service organization to exchange free/busy information between on-premises and Exchange Online organization users.
  By default, a federation trust with the gateway is automatically configured for your Office 365 service organization when the account is created. The Manage Hybrid Configuration wizard automatically checks to see if there is an existing federation trust with the Microsoft Federation Gateway for the on-premises organization. If present, the existing federation trust is used to support the hybrid deployment. If not present, the wizard creates a federation trust for the on-premises organization with the Microsoft Federation Gateway. The wizard also adds any domains selected within the Manage Hybrid Configuration wizard to the on-premises organization federation trust.
  Learn more at: Understanding Federated Delegation
- **Organization relationships** Organization relationships are needed for both the on-premises and Exchange Online organization and are configured automatically by the Manage Hybrid Configuration wizard. An organization relationship defines the level of free/busy information shared for an organization.
  By default, the free/busy data access sharing level is **Free/busy access with time, plus subject and location** for both the on-premises and Exchange Online organization relationships. If you want to modify the free/busy sharing access between your on-premises and Exchange Online organization users, you can manually configure the organization relationship access level after the Manage Hybrid Configuration wizard has completed.
  Learn more at: Understanding Federated Delegation

When configuring your organization for a hybrid deployment, configuring shared free/busy calendar access is automatically configured by the Manage Hybrid Configuration wizard in all scenarios. Creating a federation trust with the Microsoft Federation Gateway and configuring organization relationships for the on-premises and Exchange Online organization are hybrid deployment requirements. If you don't want to allow free/busy sharing between your on-premises and Exchange Online organization users in the hybrid deployment, you can manually disable free/busy sharing by using the Shell and the Set-HybridConfiguration cmdlet after the Manage Hybrid Configuration wizard has completed.

The hybrid deployment features shown in the following table have a dependency on federation trusts and organization relationships.

Messaging area	Feature
E-mail client	• Message tracking • MailTips • Multi-mailbox search
Transport	• Mailbox moves • Secure intra-organization message delivery
Compliance	• Exchange Online Archiving

1.14.9.6 Understanding Transport Options in Exchange 2007 Hybrid Deployments

Understanding Transport Options in Exchange 2007 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

In hybrid deployments, you can have mailboxes that reside in your on-premises organization and also in an Exchange Online organization. A critical component of making these two separate organizations appear as one combined organization to users and messages exchanged between them is hybrid transport. With hybrid transport, messages sent between recipients in either organization are authenticated, transferred using Transport Layer Security (TLS), and appear as "internal" to Exchange components such as transport rules, journaling, and anti-spam policies. Hybrid transport is automatically configured by the Manage Hybrid Configuration wizard in Service Pack 3 (SP3) for Exchange 2010.

For hybrid transport configuration to work with the Manage Hybrid Configuration wizard, the on-premises SMTP endpoint that accepts connections from Exchange Online Protection (EOP), which handles transport for the Exchange Online organization, must be an Exchange 2010 SP3 Hub Transport or Edge Transport server. Hybrid transport makes use of new features provided in Exchange 2010 SP3 to secure messages and make them appear as "internal." While an on-premises Exchange 2010 SP3 server is required for hybrid transport between the on-premises and Exchange Online organizations, you don't need to route the mail to and from on-premises mailboxes and Internet recipients through an Exchange 2010 server.

Important:

There can be no other SMTP hosts, services, or appliances between the on-premises Exchange 2010 SP3 Hub Transport or Edge Transport server and EOP. Information added to messages that enables hybrid transport features is removed when they pass through a non-Exchange 2010 SP3 server or SMTP host. This includes earlier versions of Exchange. If you have Exchange 2007 Edge Transport servers deployed in your organization, and you want to use them for hybrid transport, they must be upgraded to Exchange 2010 SP3.
Hub Transport and Edge Transport servers must run Exchange 2010 SP3 to use the Manage Hybrid Deployment wizard for hybrid deployment configuration.

Inbound messages sent to recipients in both organizations from external Internet senders follow a common inbound route. Outbound messages sent from the organizations to external Internet recipients can either follow a common outbound route or can be sent via independent routes.

You'll need to choose how to route inbound and outbound mail when you configure your hybrid deployment. The route taken by inbound and outbound messages sent to and from recipients in the on-premises and Exchange Online organizations depends on the following:

- Do you want to route inbound Internet mail for both your on-premises and Exchange Online mailboxes through Microsoft Office 365 and EOP or through your on-premises organization?
  You can choose to route inbound Internet mail for both organizations through your on-premises organization or through EOP and the Exchange Online organization. The route that inbound messages for both organizations take depends on whether you enable centralized mail transport in your hybrid deployment.

- Do you want to route outbound mail to external recipients from your Exchange Online organization through your on-premises organization (centralized mail transport), or do you want to route it directly to the Internet?
  Known as centralized mail transport, you can route all mail from mailboxes in the Exchange Online organization through the on-premises organization before they're delivered to the Internet. This approach is helpful in compliance scenarios where all mail to and from the Internet must be processed by on-premises servers. Alternately, you can configure Exchange Online to deliver messages for external recipients directly to the Internet.

  Note:
  Centralized mail transport is only recommended for organizations with specific compliance-related transport needs. Our recommendation for typical Exchange organizations is not to enable centralized mail transport.

- Do you want to deploy an Edge Transport server in your on-premises organization?
  If you don't want to expose your domain-joined internal hybrid Hub Transport servers directly to the Internet, you can deploy Edge Transport servers in your perimeter network. For more information about adding an Edge Transport server to your hybrid deployment: see: Understanding Edge Transport Servers in Exchange 2007 Hybrid Deployments

Regardless of how you route messages to and from the Internet, all messages sent between the on-premises and Exchange Online organizations are sent using secure transport. For more information, see "Trusted Communication" later in this topic.

To learn more about how these options affect message routing in your organization, see Understanding Transport Routing in Exchange 2007 Hybrid Deployments.

Exchange Online Protection in Hybrid Deployments

EOP is an online service provided by Microsoft that's used by many companies to protect their on-premises organizations from viruses, spam, phishing scams, and policy violations. In Office 365, EOP is used to protect Exchange Online organizations from the same threats. When you sign up for Office 365, an EOP company is automatically created that's tied to your Exchange Online organization.

An EOP company contains several of the mail transport settings that can be configured for your Exchange Online organization. You can specify which SMTP domains must come from specific IP addresses, require a TLS and a Secure Sockets Layer (SSL) certificate, can bypass anti-spam filtering or compliance policies, and more. FOPE is the front door to your Exchange Online organization. All messages, regardless of their origin, must pass through EOP before they reach mailboxes in your Exchange Online organization. And, all messages sent from your Exchange Online organization must go through EOP before they reach the Internet.

When you configure a hybrid deployment with the Manage Hybrid Configuration wizard, all transport settings are automatically configured in your on-premises organization and in the EOP company set up for your Exchange Online organization. The Manage Hybrid Configuration wizard configures all inbound and outbound connectors and other settings in this EOP company to secure messages sent between the on-premises and Exchange Online organizations and route messages to the right destination. If you want to configure custom transport settings for your Exchange Online organization, you'll configure them in this EOP company also.

Trusted Communication

To help protect recipients in both the on-premises and Exchange Online organizations, and to help ensure that messages sent between the organizations aren't intercepted and read, transport between the on-premises organization and EOP is configured to use forced TLS. TLS transport uses Secure Sockets Layer (SSL) certificates provided by a trusted third-party Certificate Authority (CA). Messages between EOP and the Exchange Online organization also use TLS.

When using forced TLS transport, the sending and receiving servers examine the certificate configured on the other server. The subject name, or one of the subject alternative names (SANs), configured on the certificates must match the FQDN that an administrator has explicitly specified on the other server. For example, if EOP is configured to accept and secure messages sent from the hybrid.contoso.com FQDN, the sending on-premises hybrid server must have an SSL certificate with hybrid.contoso.com in either the subject name or SAN. If this requirement isn't met, the connection is refused.

Note:

The FQDN used doesn't need to match the e-mail domain name of the recipients. The only requirement is that the FQDN in the certificate subject name or SAN must match the FQDN that the receiving or sending servers are configured to accept.

In addition to using TLS, messages between the organizations are treated as “internal”. This approach allows messages to bypass anti-spam settings and other services.

Learn more about SSL certificates and domain security at: Understanding Certificate Requirements for Hybrid Deployments, Understanding TLS Certificates

1.14.9.7 Understanding Transport Routing in Exchange 2007 Hybrid Deployments

Understanding Transport Routing in Exchange 2007 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-29*

This topic discusses your routing options for inbound messages from the Internet and outbound messages to the Internet.

Note:

The examples in this topic don’t include the addition of Edge Transport servers into the hybrid deployment. The routes messages take between the on-premises organization, the Exchange Online organization, and the Internet don’t change with the addition of an Edge Transport server. The routing only changes within the on-premises organization. For more information about adding Edge Transport servers to a hybrid deployment, see Understanding Edge Transport Servers in Exchange 2007 Hybrid Deployments.

Inbound Messages from the Internet

As part of planning and configuring your hybrid deployment, you need to decide whether you want all messages from Internet senders to be routed through your on-premises organization or through the Exchange Online organization. All messages from Internet senders will initially be delivered to the organization you select and then routed according to where the recipient’s mailbox is located. Whether you choose to have messages routed through your on-premises organization or the Exchange Online organization depends on various factors, including whether you want to apply compliance policies to all

messages sent to both organizations, how many mailboxes are in each organization, and so on.

The path messages sent to recipients in your on-premises and Exchange Online organizations take depends on how you decide to configure your MX record in your hybrid deployment. The Manage Hybrid Configuration wizard doesn't configure the routing for inbound Internet messages for either the on-premises or Exchange Online organizations. You must manually configure your MX record if you want to change how your inbound Internet mail is delivered.

- If you keep your MX record pointed to your on-premises organization: All messages sent to any recipient in either organization will be routed through your on-premises organization first. A message addressed to a recipient that's located in Exchange Online will be routed first through your on-premises organization and then delivered to the recipient in Exchange Online. This route can be helpful for organizations where you have compliance policies that require messages sent to and from an organization be examined by a journaling solution. This route is also recommended if you have more recipients in your on-premises organization than in your Exchange Online organization.
- If you decide to change your MX record to point to the Microsoft Exchange Online Protection (EOP) service in Office 365: All messages sent to any recipient in either organization will be routed through the Exchange Online organization first. A message addressed to a recipient that's located in your on-premises organization will be routed first through your Exchange Online organization and then delivered to the recipient in your on-premises organization. This route is recommended if you have more recipients in your Exchange Online organization than in your on-premises organization.

Read the section below that matches how you plan to route messages sent from Internet recipients to your on-premises and Exchange Online recipients.

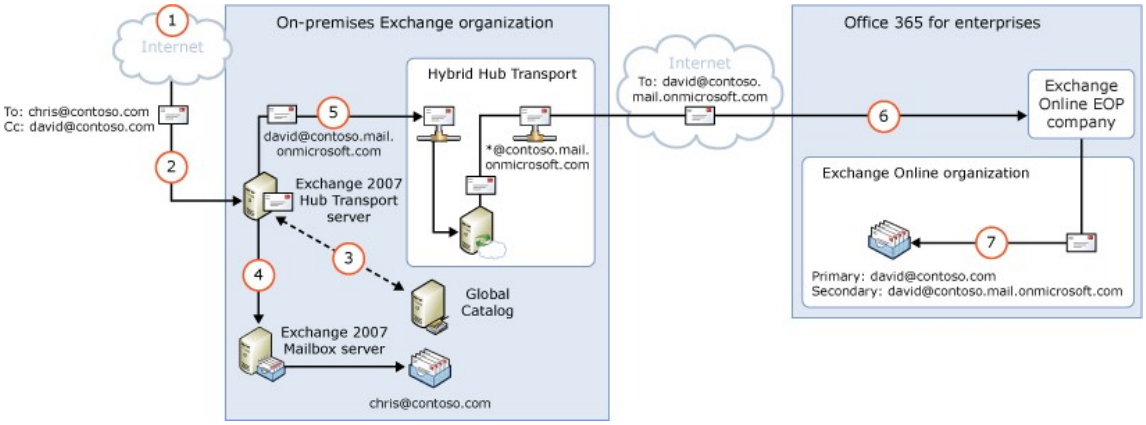
Route Incoming Internet Messages Through Your On-Premises Organization

The following steps and diagram illustrate the inbound Internet message path that will occur in your hybrid deployment if you decide to keep your MX record pointed to your on-premises organization.

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2007 Mailbox server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to the on-premises organization, the message is delivered to an Exchange 2007 Mailbox server.
3. The Exchange 2007 Mailbox server performs a lookup for each recipient using an on-premises global catalog server. Through the global catalog lookup, it determines that Chris's mailbox is located on the Exchange 2007 Mailbox server while David's mailbox is located in the Exchange Online organization and has a hybrid routing address of david@contoso.mail.onmicrosoft.com.
4. The Exchange 2007 Mailbox server splits the message into two copies. One copy of the message is delivered to Chris's mailbox.
5. The second copy of the message is sent through the routing group connector that's configured between the hybrid servers and the Exchange 2007 server.
6. A hybrid Hub Transport server sends the message to EOP, which receives messages sent to the Exchange Online organization, using a Send connector configured to use TLS.
7. EOP sends the message to the Exchange Online organization where the message is scanned for viruses and delivered to David's mailbox.

Route mail through the on-premises organization for both on-premises and Exchange

Online organizations



Route Incoming Internet Messages Through the Exchange Online Organization

The following steps and diagrams illustrate the inbound message path that occur in your hybrid deployment if you decide to point your MX record to the EOP service in the Office 365 organization. The message path differs depending on whether you choose to enable centralized mail transport.

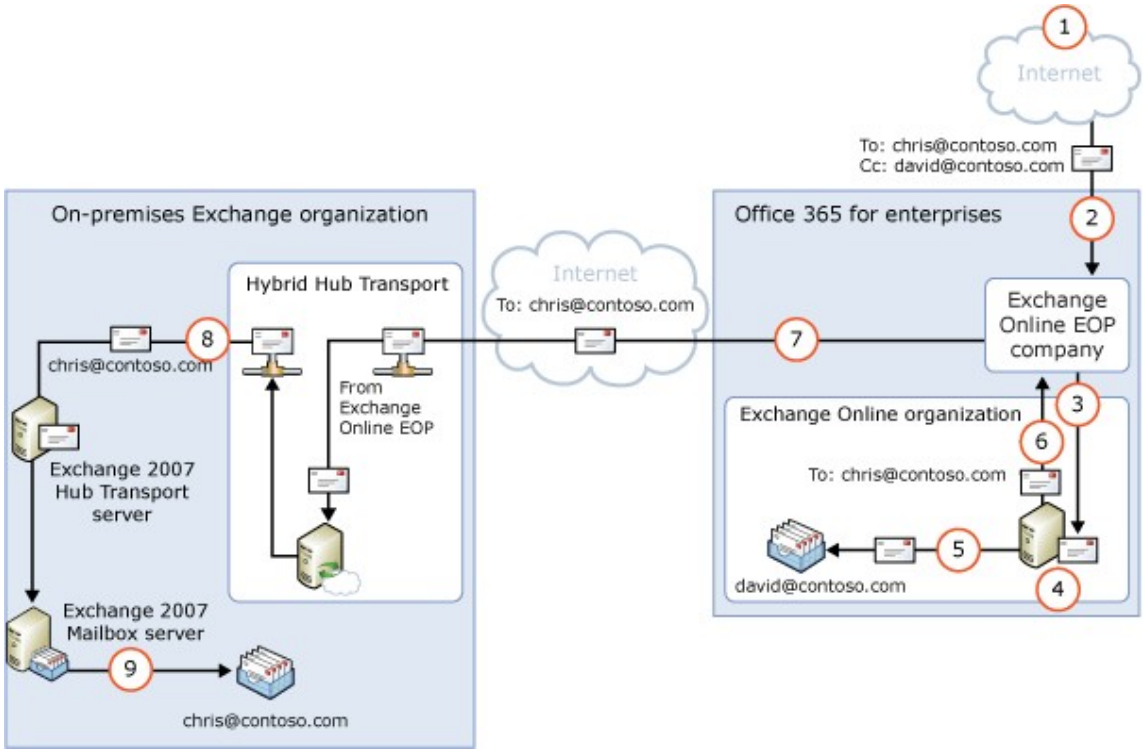
Important:

You may need to purchase EOP licenses for each on-premises mailbox that receives messages that are first delivered to EOP and then routed through the Exchange Online organization. Contact your Microsoft reseller for more information.

When centralized mail transport is *disabled* (default configuration), incoming Internet messages are routed as follows in a hybrid deployment:

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2007 Mailbox server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to EOP, the message is delivered to EOP.
3. EOP routes the messages for both recipients to Exchange Online.
4. Exchange Online scans the messages for viruses and performs a lookup for each recipient. Through the lookup, it determines that Chris's mailbox is located in the on-premises organization while David's mailbox is located in the Exchange Online organization.
5. Exchange Online splits the message into two copies. One copy of the message is delivered to David's mailbox.
6. The second copy is sent from Exchange Online back to EOP.
7. EOP sends the message to the hybrid Exchange 2010 Hub Transport servers in the on-premises organization.
8. A hybrid Hub Transport server sends the message through the routing group connector that’s configured between the hybrid servers and the Exchange 2007 server to the Exchange 2007 Mailbox server.
9. The Exchange 2007 server delivers the message to Chris's mailbox.

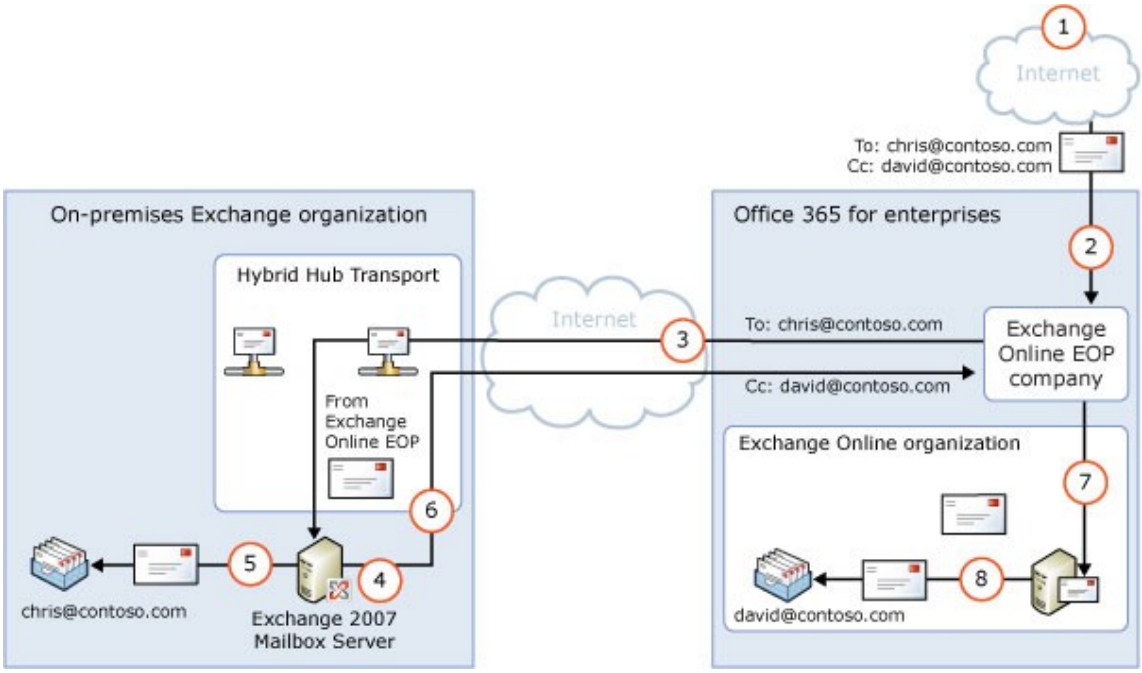
Route mail through the Exchange Online organization for both on-premises and Exchange Online organizations with centralized mail transport disabled (default configuration)



When centralized mail transport is *enabled*, incoming Internet messages are routed as follows in a hybrid deployment:

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2007 Mailbox server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to EOP, the message is delivered to EOP and scanned for viruses.
3. Since centralized mail transport is enabled, EOP routes the messages for both recipients to the on-premises hybrid Exchange 2010 Hub Transport server.
4. The hybrid Hub Transport server performs a lookup for each recipient. Through the lookup, it determines that Chris's mailbox is located in the on-premises organization while David's mailbox is located in the Exchange Online organization.
5. The hybrid Hub Transport server splits the message into two copies. One copy of the message is delivered to Chris’s mailbox in the on-premises Exchange 2007 server.
6. The second copy is sent from the hybrid Hub Transport server back to EOP.
7. EOP sends the message to Exchange Online.
8. Exchange delivers the message to David's mailbox.

Route mail through the Exchange Online organization for both on-premises and Exchange Online organizations with centralized mail transport enabled



Outbound Messages to the Internet

In addition to choosing how inbound messages addressed to recipients to your organizations are routed, you can also choose how outbound messages sent from Exchange Online recipients are routed. When you run the Hybrid Configuration wizard, you can select one of two options:

- **Enable centralized mail transport** Selecting this option routes outbound messages sent from the Exchange Online organization through your on-premises organization. Except for messages sent to other recipients in the same Exchange Online organization, all messages sent from recipients in the Exchange Online organization are sent through the on-premises organization. This enables you to apply compliance rules to these messages and any other processes or requirements that must be applied to all of your recipients, regardless of whether they're located in the Exchange Online organization or the on-premises organization.

  Note:
  Centralized mail transport is only recommended for organizations with specific compliance-related transport needs. Our recommendation for typical Exchange organizations is not to enable centralized mail transport.

- **Don’t enable centralized mail transport** Selected by default in the Manage Hybrid Configuration wizard, this option routes outbound messages sent from the Exchange Online organization directly to the Internet. Use this option if you don't need to apply any on-premises compliance policies or other processing rules to messages that are sent from recipients in the Exchange Online organization.

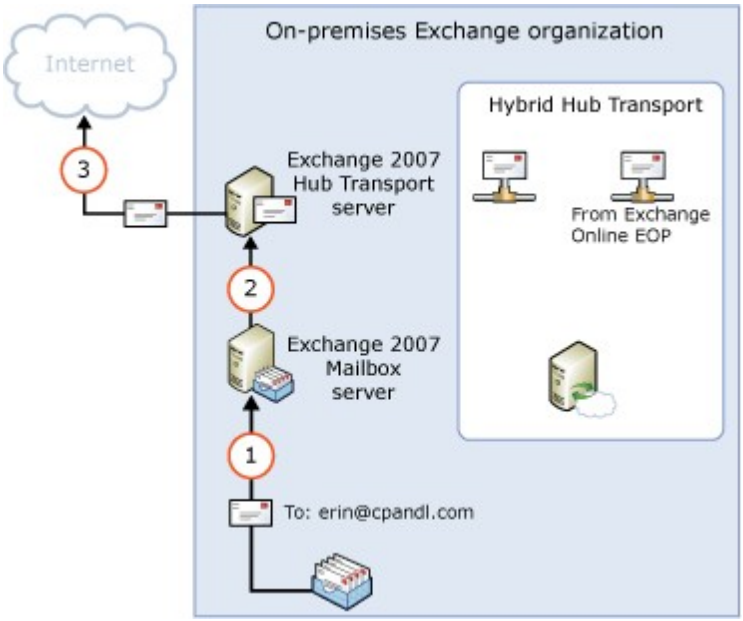
Messages sent from on-premises recipients are always sent to directly to Internet recipients using DNS regardless of which of the above choices you select in the Manage Hybrid Configuration wizard.

The following steps and diagram illustrate the outbound message path for messages sent from on-premises recipients.

1. Chris, who has a mailbox on the on-premises Exchange 2007 Mailbox server, sends a message to an external Internet recipient, erin@cpandl.com.

2. The Exchange 2007 server looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Messages from on-premises senders to Internet recipients



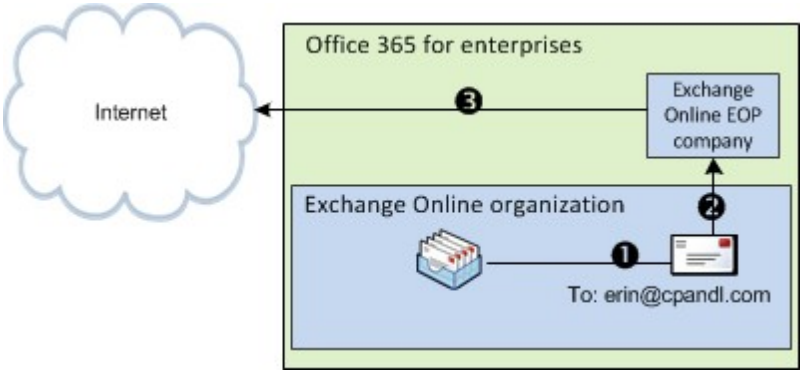
Read the section below that matches how you plan to route messages sent from recipients in the Exchange Online organization to Internet recipients.

Deliver Internet-Bound Messages from Exchange Online Using DNS (Centralized Mail Transport Disabled)

The following steps and diagram illustrate the outbound message path for messages sent from Exchange Online recipients to an Internet recipient that occur when **Enable centralized mail transport** is not selected in the Manage Hybrid Configuration wizard, which is the default configuration.

1. David, who has a mailbox in the Exchange Online organization, sends a message to an external Internet recipient, erin@cpandl.com.
2. Exchange Online scans the message for viruses and sends the message to the Exchange Online EOP company.
3. EOP looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Mail from Exchange Online senders routed directly to the Internet with centralized mail transport disabled (default configuration)

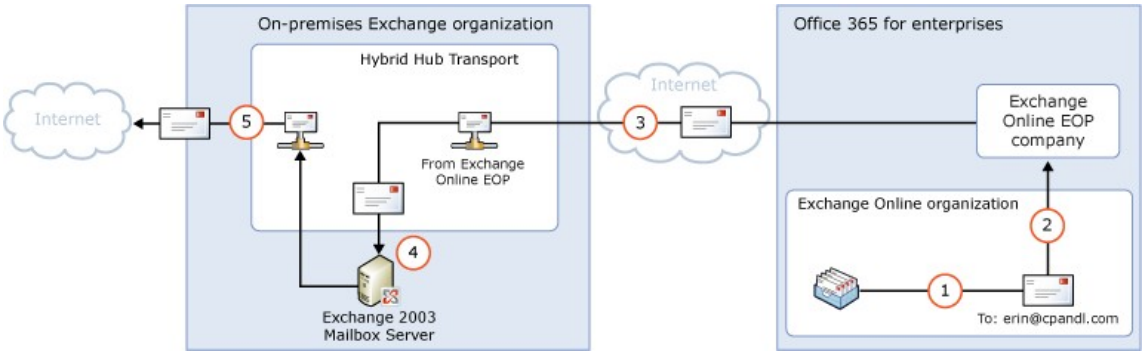


Route Internet-Bound Messages from Exchange Online Through Your On-Premises Organization (Centralized Mail Transport Enabled)

The following steps and diagram illustrate the outbound message path for messages sent from Exchange Online recipients to an Internet recipient that occur when you select **Enable centralized mail transport** in the Manage Hybrid Configuration wizard.

1. David, who has a mailbox in the Exchange Online organization, sends a message to an external Internet recipient, erin@cpandl.com.
2. Exchange Online scans the message for viruses and sends the message to EOP.
3. EOP is configured to send all Internet-bound messages to an on-premises server, so the message is routed to a hybrid Hub Transport server. The message is sent using TLS.
4. A hybrid Hub Transport server performs compliance and any other processes configured by the administrator on David's message.
5. The hybrid Hub Transport server looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Mail from Exchange Online senders routed through on-premises organization with centralized mail transport enabled



1.14.9.8 Understanding IRM in Exchange 2007 Hybrid Deployments

Understanding IRM in Exchange 2007 Hybrid Deployments

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 and Exchange 2007 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-04-05*

Information Rights Management (IRM) helps you to protect against leakage of sensitive information by providing persistent online and offline protection of e-mail messages and attachments. Both Exchange 2007, in your on-premises organization, and Exchange Online, in Office 365 for Enterprises, support IRM. However, there are differences between the two implementations, and you must configure IRM in the Exchange Online organization before users in that organization can use it.

IRM uses Active Directory Rights Management Services (AD RMS), which is a component of Windows Server 2008 R2. AD RMS allows users to create rights-protected content, such as e-mail messages and attachments, and then control how that content is used, and to whom it’s distributed. Users can specify templates that determine how content can be used. For example, a user may specify that an e-mail message can't be forwarded to other recipients or that information in the message can't be copied.

Learn more about IRM in Exchange 2007 at: Understanding the AD RMS Prelicensing Agent

Learn more about IRM in Exchange 2010 at: Understanding Information Rights Management

Learn more about AD RMS at: Active Directory Rights Management Services Overview

Learn more about configuring IRM at: Configure IRM in Exchange 2007 Hybrid Deployments

Differences between IRM in Exchange 2007 and Exchange Online

Exchange Online is based on Exchange 2010, which includes several new IRM features. IRM functionality that's available in your on-premises Exchange 2007 organization is different than the functionality available in your Exchange Online organization. The following table provides a summary of features and functionality available in each organization. (Learn more about these features at: Understanding Information Rights Management)

Available IRM features

Feature	Available in Exchange 2007	Available in Exchange Online
Manual protection of messages in Outlook	Yes	Yes
Manual protection of messages in Outlook Web App	No	Yes
View IRM-protected messages in Outlook	Yes	Yes
View IRM-protected messages in Outlook Web App	Yes*	Yes
IRM Pre-licensing agent	Yes	Yes
RMS policy templates	No	Yes
Transport decryption	No	Yes
Journal report decryption	No	Yes
Exchange Search and discovery decryption	No	Yes
Automatic Outlook protection rules	No	Yes
Automatic transport protection rules	No	Yes

* Internet Explorer with Rights Management add-in required

IRM in Hybrid Deployments

Exchange uses AD RMS servers in the Active Directory forest in which the Exchange server is installed. For your on-premises Exchange 2007 servers, the on-premises AD RMS server is used. For your Exchange Online organization, AD RMS servers that are maintained within the Microsoft Office 365 datacenters are used. The AD RMS configuration that each Exchange organization uses is independent of any other AD RMS deployment.

AD RMS configuration, and therefore IRM configuration, isn't automatically replicated between your on-premises Exchange organization and the Exchange Online organization. Any AD RMS templates that you've defined aren't automatically copied to the Exchange Online organization. If you want the same AD RMS templates to be available in the Exchange Online organization, you must manually export the templates from your on-premises organization and apply them to the cloud-based organization. See the IRM Configuration in Hybrid Deployments section later in this topic.

User Experience

The IRM configuration that's applied to a user depends on the client the user uses and the location of the user's mailbox. The following table shows the AD RMS server a user will use.

Active AD RMS server

Client	On-premises mailbox	Cloud-based mailbox
Outlook 2007 or Outlook 2010	On-premises AD RMS	On-premises AD RMS
Outlook Web App	On-premises AD RMS	Exchange Online AD RMS
ActiveSync device	On-premises AD RMS	Exchange Online AD RMS

It's possible that, depending on the AD RMS configuration you configure in your on-premises and Exchange Online organizations, a user who uses Outlook 2007 and Outlook Web App may see different AD RMS templates. For this reason, we strongly recommend that you apply the same templates to both your on-premises and Exchange Online organizations.

There should be no difference in the IRM experience for Outlook client users, regardless of whether their mailbox is located in the on-premises or Exchange Online organization.

An Outlook Web App user whose mailbox is located on an Exchange 2007 server can only open rights-protected messages after installing the Rights Management for Internet Explorer add-in. They can't reply to or create new rights-protected messages.

An Outlook Web App user whose mailbox is located in Exchange Online can open rights-protected messages without any additional software and can reply to, and create, new rights-protected messages.

Server Functionality

On-premises Exchange 2007 servers use the AD RMS pre-licensing agent to decrypt rights-protected messages so that users don't need to supply credentials when they open those messages. The on-premises Exchange 2007 server contacts the on-premises AD RMS server to check usage policies and rights, and to request authorization to decrypt the message.

The Exchange Online organization provides several additional IRM-related features that make use of Exchange Online AD RMS. These features, such as journal report decryption, make the content of right-protected messages available to Exchange services for

additional processing. For example, the decrypted contents of a journaled message can be saved, along with the original rights-protected message, to allow for easier discovery. Additionally, IRM templates can automatically be applied to messages using either Outlook protection rules or transport rules to ensure that messages adhere to organization policies regarding information protection.

IRM Configuration in Hybrid Deployments

IRM in Exchange relies on AD RMS being deployed in the Active Directory forest in which the Exchange server resides. AD RMS configuration isn't automatically synchronized between the on-premises and Exchange Online organizations. You must manually export the AD RMS configuration, known as a trusted publishing domain (TPD), from your on-premises AD RMS server, and import that configuration into the Exchange Online organization. The TPD contains the AD RMS configuration, including templates, which the Exchange Online organization needs to use IRM.

Learn more at: AD RMS Trusted Publishing Domain Considerations

In addition to applying your on-premises AD RMS configuration to the Exchange Online organization, you must ensure that your AD RMS servers can be contacted by Outlook and ActiveSync clients outside of your on-premises network. You must do this if you want these clients to access rights-protected messages outside of your on-premises network.

After you've configured your on-premises network and exported the TPD data, you need to configure the Exchange Online organization by importing the TPD data and enabling IRM.

Note:

Any time you modify your on-premises AD RMS configuration, you must manually apply the new configuration in the Exchange Online organization. To do so, export the TPD data from your on-premises AD RMS server and import it into the Exchange Online organization.

Learn more at: Configure IRM in Exchange 2007 Hybrid Deployments

1.14.9.8.1 Configure IRM in Exchange 2007 Hybrid Deployments

Configure IRM in Exchange 2007 Hybrid Deployments

Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 and Exchange 2007 > Understanding IRM in Exchange 2007 Hybrid Deployments >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

If you use Information Rights Management (IRM) in your on-premises Exchange organization and you want your Exchange Online users to also use IRM, you need to do the following:

1. Configure your on-premises Active Directory Rights Management Services (AD RMS) server.
2. Enable IRM in your Exchange Online organization.
3. Distribute the imported AD RMS templates to users in the Exchange Online organization.

Learn more at: Understanding IRM in an Exchange 2007 Hybrid Deployment

How do I configure on-premises AD RMS servers?

To configure IRM in a hybrid deployment, you need to use Windows PowerShell to access your on-premises AD RMS server. Learn more at: Using Windows PowerShell to Administer AD RMS

Do the following to export trusted publishing domain (TPD) data from your on-premises AD RMS server and then configure access to the AD RMS server for external clients.

1. Export TPD data from your on-premises organization. Learn more at: Exporting a Trusted Publishing Domain
2. Configure access to AD RMS servers from external clients. Learn more at: Adding an Extranet Cluster URL

How do I enable IRM in the Exchange Online organization?

After you export the TPD data from your on-premises AD RMS servers, you need to import that data into the Exchange Online organization and then enable IRM.

1. In the Exchange Online organization, import the TPD data.

```
Import-RMSTrustedPublishingDomain -FileData $( [Byte[]] (Get-Content -
```

2. Enable IRM in the Exchange Online organization.

```
Set-IRMConfiguration -InternalLicensingEnabled $True
```

How do I distribute AD RMS templates in the Exchange Online organization?

After you've enabled IRM in the Exchange Online organization, you must distribute the imported AD RMS templates. The following Exchange Online users and features use AD RMS templates:

- Outlook Web App users
- Exchange ActiveSync users
- Transport rules
- Journal report decryption
- Outlook protection rules

1. In the Exchange Online organization, retrieve a list of AD RMS templates.

```
Get-RMSTemplate -Type All
```

2. Distribute the AD RMS templates to users and features in the Exchange Online organization.

```
Set-RMSTemplate <template name> -Type Distributed
```

Note:
You can't modify the "Do Not Forward" AD RMS template.

3. Repeat step 2 for each AD RMS template you want to distribute.

How do I know this worked?

Outlook Web App users should be able to apply AD RMS templates to new messages. Outlook Web App and Exchange ActiveSync users should be able to read messages that have AD RMS templates applied to them. In addition, all the AD RMS templates that were imported from your on-premises organization should be listed when you run the **Get-**

RMSTemplate cmdlet.

Run the following command in the Exchange Online organization.

```
Get-RMSTemplate
```

Topic Last Modified: *2013-01-25*

When configuring a hybrid deployment in an Exchange 2010 organization, you aren't required to install additional Exchange servers in your existing Exchange organization. As long as your Client Access and Hub Transport servers are updated to Exchange 2010 Service Pack 3 (SP3) with the latest update roll up, these servers can coordinate communications between your existing Exchange 2010 organization and the Exchange Online organization. This communication includes message transport and messaging features between the on-premises and Exchange Online organizations. We highly

recommend installing more than one Exchange server in your on-premises organization to help increase reliability and availability of hybrid deployment features.

Server Roles in a Hybrid Deployment

Here is a quick overview of the Exchange 2010 server roles in a hybrid deployment:

- **Client Access server role** The Client Access server role continues to provide essentially the same functionality typically provided by Client Access servers in your Exchange 2010 organization with a few additions required to support a hybrid deployment. All client connectivity, including Outlook client access, Outlook Web App, and Outlook Anywhere goes through the Client Access server role. Organization relationship features between the on-premises and Exchange Online organizations, such as free/busy sharing, are also handled by the Client Access server role.
  Learn more at: Understanding Client Access
- **Hub Transport server role** The Hub Transport server role handles all mail flow between the on-premises and Exchange Online organizations and between the on-premises organization and the Internet. It helps to secure transport communication between the on-premises and Exchange Online organizations, as well as handling transport rules, journaling policies, and message delivery to user mailboxes in a hybrid deployment.
  Learn more at: Overview of the Hub Transport Server Role

Depending on the hybrid deployment configuration that you want, an Exchange 2010 SP3 server requires one or more of the server roles to be installed on it:

- **Single Exchange server** If you choose to install a single Exchange server in your on-premises organization, you'll need to install the Mailbox, Client Access, and Hub Transport server roles on the single server.
- **More than one Exchange server** If you choose to install more than one Exchange server in your on-premises organization, you can install the server roles on separate servers in your on-premises organization. For example, you could install one Exchange server that has the Mailbox and Client Access roles installed and also install another Exchange server that has only the Hub Transport server role installed. However, the best practice and recommended server configuration is to install the Client Access and Hub Transport servers on *each* server deployed in your on-premises organization.

If you also decide to install the optional Exchange 2010 Mailbox server role in your hybrid deployment, you should add the Mailbox server role to each Exchange server that has the Client Access and Hub Transport server roles installed. Learn more about the Mailbox server role at Overview of the Mailbox Server Role and learn more about Exchange capacity planning at Understanding Multiple Server Role Configurations in Capacity Planning.

Exchange Server Functionality in Hybrid Deployments

A hybrid Exchange server provides several important functions for your on-premises organization in a hybrid deployment:

- **Federation** Exchange servers enable you to create a federation trust for your on-premises organization with the Microsoft Federation Gateway. The Microsoft Federation Gateway is a free, cloud-based service offered by Microsoft that acts as the trust broker between your on-premises organization and the Office 365 tenant organization. Federation is a requirement for creating an organization relationship between the on-premises and the Exchange Online organizations.

Learn more at: Understanding Federation

- **Organization relationships** Exchange servers with the Client Access server role enable the creation of organization relationships between the on-premises and Exchange Online organizations. Organization relationships are required for many other services in a hybrid deployment, including calendar free/busy information sharing, message tracking, and mailbox moves between the on-premises and Exchange Online organizations.
  Learn more at: Understanding Federated Delegation
- **Message transport** Exchange servers with the Hub Transport server role are responsible for message transport in a hybrid deployment. Using Send and Receive connectors, they serve as the connection endpoint for incoming external messages and also provide outbound message delivery to the Internet and the Exchange Online organization.
  Learn more at: Understanding Transport
- **Message transport security** Exchange servers with the Hub Transport server role help to secure message communication between the on-premises and Exchange Online organizations by using the Domain Security functionality in Exchange 2010. Security can be increased by using mutual transport layer security authentication and encryption for message communications.
  Learn more at: Understanding Domain Security
- **Outlook Web App** Exchange servers with the Client Access server role support configuring a single URL endpoint for external connections to on-premises and Exchange Online mailboxes. For on-premises mailboxes, Client Access servers are configured to service Outlook Web App requests.. For Exchange Online organization mailboxes, Client Access servers are configured to automatically display a link to the Outlook Web App endpoint on the Exchange Online organization.
  Learn more at: Understanding Outlook Web App

Exchange Server Topology

If you choose to add additional Exchange servers to support your hybrid deployment, the Exchange server would be deployed much like any other Exchange 2010 server would be deployed to your existing Exchange 2010 organization. Configuring your existing on-premises Exchange 2010 organization for a hybrid deployment doesn't require any special Exchange server topology. The following table describes briefly the changes in services after configuring a hybrid deployment.

Service	Before hybrid server deployment	After hybrid server deployment	Description
Message transport (inbound and outbound)	Exchange 2010 Hub Transport server	Exchange 2010 Hub Transport server or Exchange Online Protection (EOP) included with Office 365	The MX (mail exchanger) record for the domain may remain unchanged or be updated to point to EOP.
Outlook Web App public URL	Exchange 2010 Client Access server	Exchange 2010 Client Access server	Client Access servers continue to handle Outlook Web App requests for on-premises mailboxes. Outlook Web App requests for mailboxes hosted on Exchange Online are provided with a link to the Exchange Online Outlook Web App

			URL.

Exchange Server Software

Exchange 2010 SP3 enables hybrid deployment functionality with the Hybrid Configuration wizards. You can use any Exchange 2010 SP3 media when installing additional Exchange 2010 servers.

Additionally, we recommend installing future Update Rollups 4 for Exchange 2010 SP3 on all your hybrid servers. Microsoft releases update rollup packages approximately every six to eight weeks. The rollup packages are available via Microsoft Update and the Microsoft Download Center. In the Search box on the Microsoft Download Center, type "Exchange 2010 SP3 update rollup" to find links to the rollup packages for Exchange 2010 SP3.

Download Exchange Server 2010 SP3 at: Exchange 2010 Service Pack 3 (SP3)

Find update rollup packages at: Microsoft Download Center

Important:

You need to provide an Exchange 2010 Hybrid Edition product key on the hybrid server when you configure a hybrid deployment with Office 365. To obtain a Hybrid Edition product key, contact Office 365 support.

1.14.10.2 Understanding Prerequisites for Exchange 2010 Hybrid Deployments

Understanding Prerequisites for Exchange 2010 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

Before you can really start to use the Deployment Assistant, your system and servers must meet requirements. If they don't meet these requirements, you won't be able to complete the steps within the tool and you won't be able to configure a hybrid deployment between your on-premises Exchange 2010 and Exchange Online organizations. This topic provides information about the following:

- The Exchange Pre-Deployment Analyzer
- Permissions needed to install and manage Exchange 2010
- Requirements for directory servers, hardware, software, clients, and other elements, including:
  - Windows Server 2008 Service Pack 2 (SP2) or later or Windows Server 2008 R2 operating system prerequisites that are required for all Exchange 2010 server roles
- Language support for Exchange 2010
- The Exchange Management Shell, the command-line interface for Exchange 2010, and the Exchange Management Console, the GUI management tool for Exchange 2010

Note:

Before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Exchange Pre-Deployment Analyzer

You can use the Exchange Pre-Deployment Analyzer (ExPDA) to perform an overall topology readiness scan of your environment. This scan focuses on overall topology readiness and not the ability to run Exchange 2010 on the local computer. ExPDA provides a detailed report that will alert you if there are any issues within your organization, which could prevent you from deploying Exchange 2010. For example, ExPDA will notify you if you haven't deployed the minimum required Exchange service pack on all your Exchange servers. If your organization passes the ExPDA readiness scan, you can go ahead and use the Exchange Deployment Assistant.

To get ExPDA from the Microsoft Download Center, see: Exchange Pre-Deployment Analyzer

Permissions to Install and Manage Exchange 2010

Exchange 2010 requires different permissions to install and to manage your server roles. When you're installing Exchange 2010 servers in your organization, the account you use might not be the same account that you use for administering and managing your server roles. To manage your server roles, Exchange 2010 uses the Role Based Access Control (RBAC) permissions model.

Exchange 2010 uses RBAC to manage permissions on an Exchange 2010 server. With RBAC, you can control what resources administrators can configure and what features users can access. The RBAC model in Exchange 2010 is flexible and provides you with several ways to customize the default permissions.

RBAC has two primary ways of assigning permissions to users in your organization, depending on whether the user is an administrator or specialist user, or an end-user: management role groups and management role assignment policies. Each method associates users with the permissions they need to perform their jobs. The following sections list the tasks found in the Deployment Assistant and the permissions required to complete the task.

Note:

Some features may require that you have local administrator permissions on the server you want to manage. To manage these features, you must be a member of the Local Administrators group on that server.

Installation Permissions

By default, the account that's used to install Exchange 2010 in the organization is added as a member of the Organization Management role group.

For information about how to add permissions, see: Add Members to a Role Group

The following permissions are required to install the hybrid server in your organization:

- Local Administrator on the server on which Exchange 2010 will be installed
- Enterprise Administrator in the Active Directory forest where Exchange 2010 will be installed
- Schema Administrator in the Active Directory forest where Exchange 2010 will be installed

Exchange Management Permissions

The table below lists the configuration permissions that you need to successfully use the Deployment Assistant and the Hybrid Configuration wizards. Some tasks need to be performed only in the on-premises organization while some tasks also need to be

performed in the Office 365 tenant organization. If a task needs to be performed in the Office 365 tenant organization, you must ensure that you have the required permissions in that organization. Permissions in the on-premises organization aren't replicated to the Office 365 tenant organization.

Note:

The user account used to create the Office 365 tenant organization has all the permissions required to perform the tasks in this checklist. Additionally, you must use an on-premises account that's a member of the Organization Management role group for the on-premises section in the Credentials page in the Manage Hybrid Configuration wizard for these tasks to complete successfully.

Learn more at: Understanding Hybrid Deployment Permissions with Exchange 2010 SP3

Task	Permissions required	On-premises or Office 365 tenant organization
Import digital certificates	Local Administrator	On-premises organization
Configure settings on virtual directories	Server Management	On-premises organization
Configure virtual directories	Organization Management Server Management	On-premises organization
Create accepted domains	Organization Management	On-premises and Office 365 tenant organization
Create and modify Send and Receive connectors	Organization Management	On-premises organization
Create routing group connectors	Organization Management Server Management	On-premises organization
Create a federation trust	Organization Management	On-premises organization
Create organization relationships	Organization Management	On-premises and Exchange Online organization
Move mailboxes	Organization Management Recipient Management	On-premises and Exchange Online organization
Configure Exchange 2010 authentication	Local Administrator	On-premises organization
Configure Exchange 2010 e-mail address policies	Exchange Administrator	On-premises organization

Directory Servers

Here are the requirements for the directory servers in your organization:

- **Schema master** The latest 32-bit or 64-bit edition of the Windows Server 2003 SP2 Standard or Enterprise operating system or the Windows Server 2008 Standard or Enterprise operating system.
- **Global catalog server** In every Active Directory site where you plan to install Exchange 2010, you must have at least one global catalog server that is either the latest 32-bit or 64-bit edition of: Windows Server 2003 SP2 Standard or Enterprise; Windows Server 2008 Standard or Enterprise; or

Windows Server 2008 R2 Standard or Enterprise.

- **Active Directory Forest** The Active Directory forest must be Windows Server 2003 forest functional mode or higher.
- **Domain Controller** You must have the latest 32-bit or 64-bit Windows Server 2003 Standard Edition or Enterprise Edition with Service Pack 2 (SP2) operating system or the latest 32-bit or 64-bit edition of the Windows Server 2008 Standard or Enterprise operating system or the Windows Server 2008 R2 Standard or Enterprise operating system.

Hardware

The recommended hardware requirements for Exchange 2010 servers vary depending on several factors including the server role(s) that are installed and the anticipated load that will be placed on the servers.

- **Processor** x64 architecture-based computer with processor that supports 64-bit architecture
- **Memory** Minimum 4GB with a recommended maximum of 2GB per core (8GB minimum). Learn more at: Understanding Memory Configurations and Exchange Performance
- **Disk space** At least 1.2 GB on the drive on which you install Exchange and additional 200 MB of available space on the system drive.
- **Drive** DVD-ROM drive, local or network accessible
- **File format** Disk partitions formatted as NTFS file systems

Operating System

Here are the supported operating systems for Exchange 2010:

- 64-bit edition of Windows Server 2008 Standard Service Pack 2
- 64-bit edition of Windows Server 2008 Enterprise Service Pack 2
- 64-bit edition of Windows Server 2008 Standard R2
- 64-bit edition of Windows Server 2008 Enterprise R2

Exchange 2010 Management tools can use the operating systems listed above plus:

- 64-bit edition of Windows Vista
- 64-bit edition of Windows 7

Install Hotfixes for Windows Server 2008 SP2

The following hotfixes are required for Windows Server 2008 SP2:

- Install the update described in Microsoft Knowledge Base article 977624, AD RMS clients do not authenticate federated identity providers in Windows Server 2008 or in Windows Vista. Without this update, Active Directory Rights Management Services (AD RMS) features may stop working.
- Install the update described in Knowledge Base article 979744, A .NET Framework 2.0-based Multi-AppDomain application stops responding when you run the application.
- Install the update described in Knowledge Base article 979917, Two issues occur when you deploy an ASP.NET 2.0-based application on a server that is running IIS 7.0 or IIS 7.5 in Integrated mode. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB979917 - QFE for Sharepoint issues - Perf Counter fix & User Impersonation.
  - For the available downloads, see KB979917 - QFE for Sharepoint issues - Perf Counter fix & User Impersonation.
- Install the update described in Knowledge Base article 973136, FIX: ArgumentNullException exception error message when a .NET Framework 2.0 SP2-based application tries to process a response with zero-length content to an asynchronous ASP.NET Web service request: "Value cannot be null".
- Install the update described in Knowledge Base article 977592, RPC over HTTP

clients cannot connect to the Windows Server 2008 RPC over HTTP servers that have RPC load balancing enabled.

Install Hotfixes for Windows Server 2008 R2

The following hotfixes are required for Windows Server 2008 R2:

Important:
The following hotfixes only apply to Windows Server 2008 R2 RTM. If you're installing Exchange on Windows Server 2008 R2 SP1, you don't need to apply these hotfixes.

- Install the update described in Knowledge Base article 979099, An update is available to remove the application manifest expiry feature from AD RMS clients. Without this update, the AD RMS features may stop working.
- Install the update described in Knowledge Base article 979744, A .NET Framework 2.0-based Multi-AppDomain application stops responding when you run the application.
- Install the update described in Knowledge Base article 983440, An ASP.NET 2.0 hotfix rollup package is available for Windows 7 and for Windows Server 2008 R2. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB983440 - Win7 rollup package (PR for QFE 810219).
  - For the available downloads, see KB983440 - Win7 rollup package (PR for QFE 810219).
- Install the update described in Knowledge Base article 977020, FIX: An application that is based on the Microsoft .NET Framework 2.0 Service Pack 2 and that invokes a Web service call asynchronously throws an exception on a computer that is running Windows 7.

Install Hotfixes for Windows 7 and Windows Vista

The following hotfixes are required for Windows 7 and Windows Vista computers where you install the Exchange Management Console

- Install the update described in Knowledge Base article 977020, FIX: An application that is based on the Microsoft .NET Framework 2.0 Service Pack 2 and that invokes a Web service call asynchronously throws an exception on a computer that is running Windows 7.
- Install the update described in Knowledge Base article 983440, An ASP.NET 2.0 hotfix rollup package is available for Windows 7 and for Windows Server 2008 R2. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB983440 - Win7 rollup package (PR for QFE 810219).
  - For the available downloads, see KB983440 - Win7 rollup package (PR for QFE 810219).

Install the Windows Server 2008 SP2 prerequisites

1. Install the Microsoft Filter Pack. For details, see: 2007 Office System Converter: Microsoft Filter Pack
2. Open an elevated command prompt, navigate to the Scripts folder on the Exchange 2010 installation media and use the following command to install the necessary operating system components:

```
sc config NetTcpPortSharing start= auto
ServerManagerCmd -ip Exchange-Typical.xml -Restart
```

Install the Exchange 2010 SP1 Hotfixes for Windows Server 2008 SP2

The following hotfix is required for Windows Server 2008 SP2 and must be installed after the operating system prerequisites have been installed:

- Install the hotfix described in Knowledge Base article 982867, WCF services that are hosted by computers together with a NLB fail in .NET Framework 3.5 SP1. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB982867 - WCF: Enable

WebHeader settings on the RST/SCT.
- For the available downloads, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.

After installing the preceding prerequisites and hotfix, and before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Install the Windows Server 2008 R2 prerequisites

1. Install the Microsoft Filter Pack. For details, see: 2007 Office System Converter: Microsoft Filter Pack
2. On the Start Menu, navigate to **All Programs**, then **Accessories**, then **Windows PowerShell**. Open an elevated Windows PowerShell console, and run the following command:

```
Import-Module ServerManager
```

3. Use the **Add-WindowsFeature** cmdlet to install the necessary operating system components using the following command:

```
Add-WindowsFeature NET-Framework,RSAT-ADDS,Web-Server,Web-Basic-Auth,W
```

4. After the system has restarted, log on as an administrator, open an elevated Windows PowerShell console, and configure the Net.Tcp Port Sharing Service for Automatic startup by running the following command:

```
Set-Service NetTcpPortSharing -StartupType Automatic
```

Install the Exchange 2010 SP1 Hotfixes for Windows Server 2008 R2

The following hotfix is required for Windows Server 2008 R2 and must be installed after the operating system prerequisites have been installed:

- Install the hotfix described in Knowledge Base article 982867, WCF services that are hosted by computers together with a NLB fail in .NET Framework 3.5 SP1. For more information, see these MSDN Code Gallery pages:
  - For additional background information, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.
  - For the available downloads, see KB982867 - WCF: Enable WebHeader settings on the RST/SCT.

After installing the preceding prerequisites and hotfix, and before installing Exchange 2010, we recommend that you install any critical or recommended updates from Microsoft Update.

Windows Management Framework

- Windows PowerShell V2.0
- Windows Remote Management V2.0
- .NET Framework 3.5 SP1
- Internet Information Services (IIS)

Language Support

An Exchange 2010 SP2 language pack contains the necessary resources for a supported Exchange language. Language packs are installed automatically during deployment of Exchange 2010 SP2. Client and server language packs come grouped into a single bundle containing both client and server resource and support files. There are no performance issues with installing all the languages because they're just stored when not in use.

Learn more at: Exchange 2010 Language Support

Exchange Management Shell

The Exchange Management Shell, built on Windows PowerShell technology, provides a powerful command-line interface for Exchange 2010 that enables automation of administrative tasks.

With the Shell, you can manage every aspect of Exchange 2010; the Shell can perform every task that can be performed by the Exchange Management Console (EMC) and the Exchange Control Panel (ECP) in addition to tasks that can't be performed in those interfaces. In fact, when a task is performed in the EMC or the ECP, those interfaces use the Shell to perform the task.

Learn more at: Overview of Exchange Management Shell

Exchange Management Console

The Exchange Management Console (EMC) is a Microsoft Management Console (MMC) 3.0-based tool that provides you with a GUI to manage the configuration of your Exchange 2010 organization. You can also add the EMC snap-in to custom MMC-based tools.

Learn more at: Exchange Management Console

1.14.10.3 Understanding Hybrid Management in Exchange 2010 Hybrid Deployments

Understanding Hybrid Management in Exchange 2010 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-02-01*

Both your on-premises organization and the Exchange Online organization are based on Exchange. In particular, hybrid servers in your on-premises organization are based on Microsoft Exchange Server 2010 and the Exchange Online organization Exchange servers are based on Exchange Server 2013. Service Pack 3 (SP3) for Exchange 2010 enables hybrid features to function correctly between these two types of hybrid deployment servers.

When you install a hybrid server, Exchange 2010 management tools are automatically installed on the server. You'll use the management tools to configure and manage both the hybrid server(s) and some recipient management features for the Exchange Online organization. These tools include the Exchange Management Console (EMC), a graphical administrative interface, and the Exchange Management Shell, a Windows PowerShell-based command-line interface. You'll also use the Exchange Administration Center (EAC) in the Exchange Online section of the Office 365 management portal to manage most of the properties of the Exchange Online recipients and organization.

Exchange Management Console

The EMC enables you to perform many deployment tasks and most common day-to-day administrative tasks. Additionally, the EMC allows you to administer both the on-premises hybrid servers and some recipient management features for mailboxes in the Exchange Online organization. It's installed by default on every Exchange 2010 server, but you can

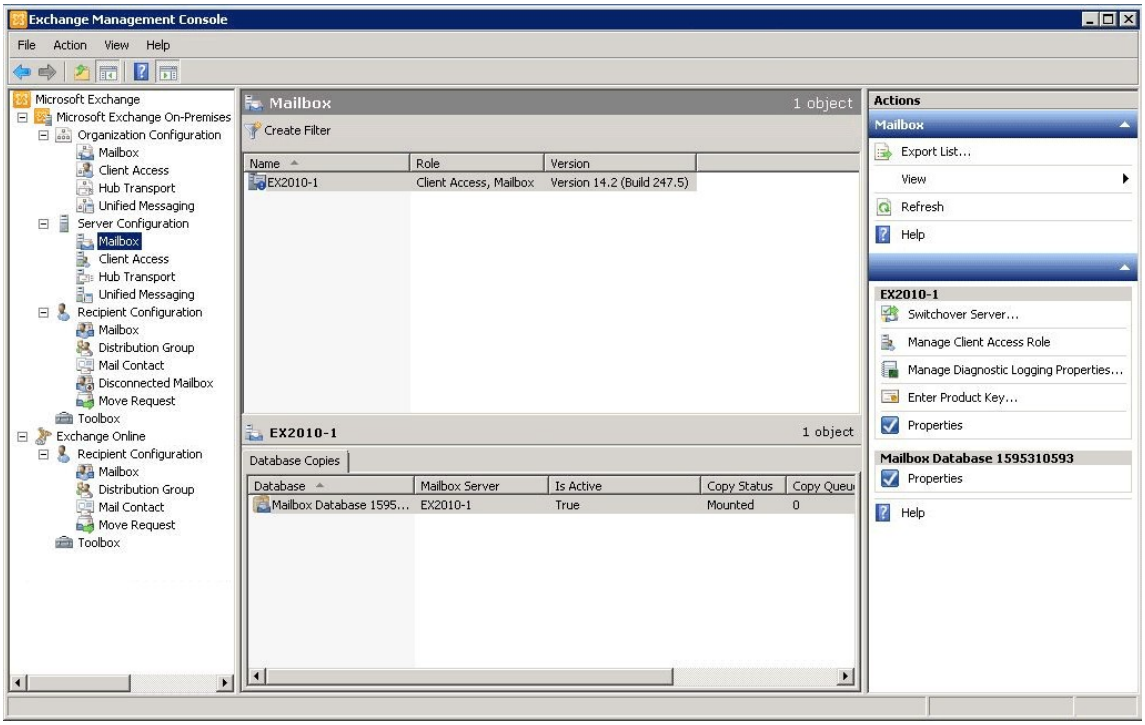
also install it on a computer running any of the following 64-bit operating systems:

- Windows Server 2008 SP2 Standard and Enterprise
- Windows Server 2008 R2 Standard and Enterprise
- Windows 8
- Windows 7
- Windows Vista Service Pack (SP) 2

Adding the Exchange Online organization to the EMC is similar to adding another Exchange 2010 forest to the EMC. When the Exchange Online organization is added to the EMC, it appears as another node in the navigation tree. From there you can select the Exchange Online organization and configure some properties of Exchange Online recipient objects. To fully manage organization-level features and objects for the Exchange Online organization, you'll be redirected by the EMC and provided a link to connect to the EAC in the Office 365 management portal.

The following screenshot shows the on-premises organization and Exchange Online organization in the same console.

Exchange on-premises and Exchange Online organizations in the Exchange Management Console



Learn more at: Exchange Management Console

Exchange Management Shell

The Shell enables you to perform any task that the EMC does and some additional tasks that can only be performed in the Shell. The Shell is a collection of Windows PowerShell scripts and cmdlets that are installed on a computer when the Exchange 2010 management tools are installed. These scripts and cmdlets are only loaded when you open the Shell using the Exchange Management Shell icon. If you open Windows PowerShell directly, the Exchange scripts and cmdlets aren't loaded and you won't be able to manage your on-premises organization.

Note:
You can create a manual Windows PowerShell connection to your local on-premises organization, similar to how you manually connect to the Exchange Online organization below. However, we strongly recommend that you use the Exchange Management Shell icon to open the Shell to manage your on-premises Exchange servers.

When you open the Shell using the Exchange Management Shell icon on a computer that has the management tools installed, you can manage your on-premises organization. However, you can't manage the Exchange Online organization when you open the Shell using this icon. This is because opening the Shell using the Exchange Management Shell icon automatically connects you to a local Exchange server.

If you want to manage the Exchange Online organization using Windows PowerShell, you must open Windows PowerShell directly and not via the Exchange Management Shell icon. When you open Windows PowerShell, you can then manually specify where you want to connect. When you create a manual connection, you specify an administrator account in the Office 365 tenant organization, and then you run a command to create a connection. When the connection is established, the Exchange cmdlets you have permissions to run are made available to you.

Learn more at: Use Windows PowerShell

If you're new to the Shell, check out the following topic to learn the basics about how the Shell works, command syntax, and more.

Learn more at: Exchange Management Shell

1.14.10.4 Understanding Edge Transport Servers in Exchange 2010 Hybrid Deployments

Understanding Edge Transport Servers in Exchange 2010 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3*

Topic Last Modified: *2013-01-25*

Edge Transport servers in Exchange 2010 are deployed in your organization's on-premises perimeter network. They're non-domain-joined computers that handle Internet-facing mail flow and act as an SMTP relay and smart host for Exchange servers in your internal network. In hybrid deployments, you have the option of deploying Edge Transport servers running Service Pack 3 (SP3) for Exchange 2010 if you don't want to expose internal Hub Transport servers directly to the Internet.

Learn more at: Overview of the Edge Transport Server Role

Exchange 2010 Edge Transport Servers

Messages routed between on-premises and Exchange Online organizations require that Exchange Online Protection (EOP), on behalf of Exchange Online, connects directly to on-premises Hub Transport or Edge Transport servers that run Exchange 2010 SP3. If you've deployed Exchange 2010 SP2 Edge Transport servers, you must upgrade the Edge Transport servers you want to use for hybrid transport to Exchange 2010 SP3. Only the Edge Transport servers that handle hybrid transport between the on-premises organization and Exchange Online need to be upgraded to Exchange 2010 SP3.

If you have other Edge Transport servers in other locations that won't handle hybrid transport, they don't need to be upgraded to Exchange 2010 SP3. If, in the future, you want EOP to connect to additional Edge Transport servers for hybrid transport, they must be upgraded to Exchange 2010 SP3.

Important:

If you prefer to keep Exchange 2010 SP2 Edge Transport servers in your organization, make sure that EOP connects to an on-premises Exchange 2010 SP3 Hub Transport or Edge Transport server for hybrid transport. If EOP connects to a server running a version other than Exchange 2010 SP3, messages may not be handled correctly. For more information, see: Understanding Transport Options in Exchange 2010 Hybrid Deployments

Adding an Edge Transport Server to a Hybrid Deployment

Deploying an Edge Transport server in your on-premises organization when you configure a hybrid deployment is an optional step. During the initial run of the Manage Hybrid Configuration wizard, the wizard requires that you select one or more Hub Transport servers. However, after the initial run of the wizard, you can add an Edge Transport server to your organization, configure it, run the Manage Hybrid Configuration wizard again, and then manually update the on-premises Send connectors and Edge Transport Receive connector to add it to the hybrid deployment.

When you add an Edge Transport server to your hybrid deployment, it communicates with EOP on behalf of the internal Hub Transport servers. The Edge Transport server acts as a relay between the on-premises Hub Transport server and EOP. All connection security previously handled by the Hub Transport server is handled by the Edge Transport server. Recipient lookup, compliance policies, and other message inspection, continue to be done on the Hub Transport servers.

If you add an Edge Transport server to your hybrid deployment, you don't need to route mail sent between on-premises users and Internet recipients through it. Only messages sent between the on-premises and Exchange Online organizations will be routed through the Edge Transport server.

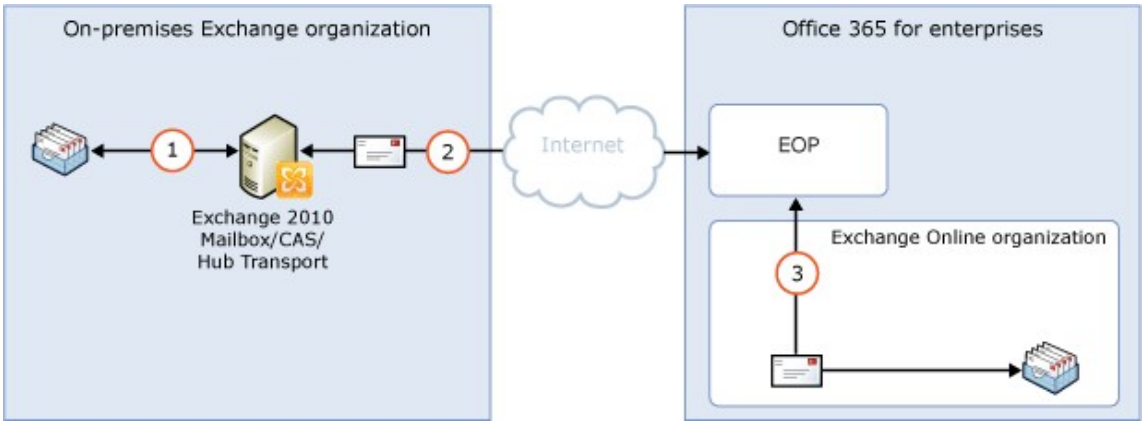
Mail Flow without an Edge Transport Server

The following process and diagram describe the path messages take between an on-premises organization and Exchange Online when there is no Edge Transport server deployed:

1. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from an Exchange 2010 Mailbox server to an Exchange 2010 Hub Transport server. In this example, the Mailbox and Hub Transport server roles are installed on the same Exchange 2010 server.
2. The Hub Transport server sends the message directly to the Exchange Online EOP company.
3. EOP delivers the message to the Exchange Online organization.

Messages sent from the Exchange Online organization to recipients in the on-premises organization follow the reverse route.

Mail flow in a hybrid deployment without an Edge Transport server deployed



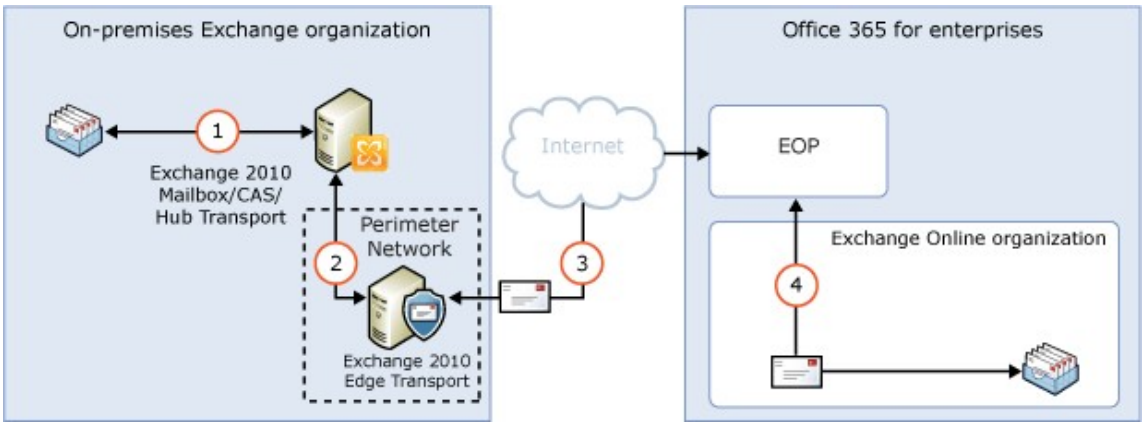
Mail Flow with an Edge Transport Server

The following diagram shows the path messages take between an on-premises organization and Exchange Online when there is an Edge Transport server deployed. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from the Exchange 2010 servers:

1. Messages from the on-premises organization to recipients in the Exchange Online organization are sent from an Exchange 2010 Mailbox server to an Exchange 2010 Hub Transport server. In this example, the Mailbox and Hub Transport server roles are installed on the same Exchange 2010 server.
2. The Exchange 2010 Hub Transport server sends the message to an Exchange 2010 Edge Transport server.
3. The Edge Transport server sends the message to the Exchange Online EOP company.
4. EOP delivers the message to the Exchange Online organization.

Messages sent from the Exchange Online organization to recipients in the on-premises organization follow the reverse route.

Mail flow in a hybrid deployment with an Edge Transport server deployed



1.14.10.5 Understanding Shared Free/Busy in Exchange 2010 Hybrid Deployments

Understanding Shared Free/Busy in Exchange 2010 Hybrid Deployments

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-05-11*

Sharing free/busy (calendar availability) information between users located on-premises and in the Exchange Online organization is one of the primary benefits of a hybrid deployment. Users in both organizations can view each other's calendars just as if they were located in the same physical organization. This makes scheduling meetings and resources easy and efficient.

Several components in a hybrid deployment are required to enable the shared free/busy feature in an Exchange 2010 deployment:

- **Federation trust** Both the on-premises and Microsoft Office 365 service organizations need to have a federation trust established with the Microsoft Federation Gateway. A federation trust is a one-to-one relationship with the Microsoft Federation Gateway that defines parameters for your Exchange organization. The gateway uses these parameters when acting as a trust broker between your on-premises and Office 365 service organization to exchange free/busy information between on-premises and Exchange Online organization users.
  By default, a federation trust with the gateway is automatically configured for your Office 365 service organization when the account is created. The Manage Hybrid Configuration wizard automatically checks to see if there is an existing federation trust with the Microsoft Federation Gateway for the on-premises organization. If present, the existing federation trust is used to support the hybrid deployment. If not present, the wizard creates a federation trust for the on-premises organization with the Microsoft Federation Gateway. The wizard also adds any domains selected within the Manage Hybrid Configuration wizard to the on-premises organization federation trust.
  Learn more at: Understanding Federated Delegation
- **Organization relationships** Organization relationships are needed for both the on-premises and Exchange Online organization and are configured automatically by the Manage Hybrid Configuration wizard. An organization relationship defines the level of free/busy information shared for an organization.
  By default, the free/busy data access sharing level is **Free/busy access with time, plus subject and location** for both the on-premises and Exchange Online organization relationships. If you want to modify the free/busy sharing access between your on-premises and Exchange Online organization users, you can manually configure the organization relationship access level after the Manage Hybrid Configuration wizard has completed.
  Learn more at: Understanding Federated Delegation

When configuring your organization for a hybrid deployment, configuring shared free/busy calendar access is automatically configured by the Manage Hybrid Configuration wizard in all scenarios. Creating a federation trust with the Microsoft Federation Gateway and configuring organization relationships for the on-premises and Exchange Online organization are hybrid deployment requirements. If you don't want to allow free/busy sharing between your on-premises and Exchange Online organization users in the hybrid deployment, you can manually disable free/busy sharing by using the Shell and the Set-HybridConfiguration cmdlet after the Manage Hybrid Configuration wizard has completed.

The hybrid deployment features shown in the following table have a dependency on federation trusts and organization relationships.

Messaging area	Feature
E-mail client	• Message tracking • MailTips • Multi-mailbox search
Transport	• Mailbox moves • Secure intra-organization message

	delivery
Compliance	• Exchange Online Archiving

1.14.10.6 Understanding Transport Options in Exchange 2010 Hybrid Deployments

Understanding Transport Options in Exchange 2010 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-01-25*

In hybrid deployments, you can have mailboxes that reside in your on-premises organization and also in an Exchange Online organization. A critical component of making these two separate organizations appear as one combined organization to users and messages exchanged between them is hybrid transport. With hybrid transport, messages sent between recipients in either organization are authenticated, transferred using Transport Layer Security (TLS), and appear as "internal" to Exchange components such as transport rules, journaling, and anti-spam policies. Hybrid transport is automatically configured by the Manage Hybrid Configuration wizard in Service Pack 3 (SP3) for Exchange 2010.

For hybrid transport configuration to work with the Manage Hybrid Configuration wizard, the on-premises SMTP endpoint that accepts connections from Exchange Online Protection (EOP), which handles transport for the Exchange Online organization, must be an Exchange 2010 SP3 Hub Transport or Edge Transport server. Hybrid transport makes use of new features provided in Exchange 2010 SP3 to secure messages and make them appear as "internal."

Important:

There can be no other SMTP hosts, services, or appliances between the on-premises Exchange 2010 SP3 Hub Transport or Edge Transport server and EOP. Information added to messages that enables hybrid transport features is removed when they pass through a non-Exchange 2010 SP3 server or SMTP host. This includes earlier versions of Exchange.
Hub Transport and Edge Transport servers must run Exchange 2010 SP3 to use the Manage Hybrid Deployment wizard for hybrid deployment configuration.

Inbound messages sent to recipients in both organizations from external Internet senders follow a common inbound route. Outbound messages sent from the organizations to external Internet recipients can either follow a common outbound route or can be sent via independent routes.

You'll need to choose how to route inbound and outbound mail when you configure your hybrid deployment. The route taken by inbound and outbound messages sent to and from recipients in the on-premises and Exchange Online organizations depends on the following:

- Do you want to route inbound Internet mail for both your on-premises and Exchange Online mailboxes through Microsoft Office 365 and EOP or through your on-premises organization?
  You can choose to route inbound Internet mail for both organizations through your on-premises organization or through EOP and the Exchange Online organization. The route that inbound messages for both organizations take depends on whether you enable centralized mail transport in your hybrid deployment.

- Do you want to route outbound mail to external recipients from your Exchange Online organization through your on-premises organization (centralized mail transport), or do you want to route it directly to the Internet?
  Known as centralized mail transport, you can route all mail from mailboxes in the Exchange Online organization through the on-premises organization before they're delivered to the Internet. This approach is helpful in compliance scenarios where all mail to and from the Internet must be processed by on-premises servers. Alternately, you can configure Exchange Online to deliver messages for external recipients directly to the Internet.

  Note:
  Centralized mail transport is only recommended for organizations with specific compliance-related transport needs. Our recommendation for typical Exchange organizations is not to enable centralized mail transport.

- Do you want to deploy an Edge Transport server in your on-premises organization?
  If you don't want to expose your domain-joined internal hybrid Hub Transport servers directly to the Internet, you can deploy Edge Transport servers in your perimeter network. For more information about adding an Edge Transport server to your hybrid deployment: see: Understanding Edge Transport Servers in Exchange 2010 Hybrid Deployments

Regardless of how you route messages to and from the Internet, all messages sent between the on-premises and Exchange Online organizations are sent using secure transport. For more information, see "Trusted Communication" later in this topic.

To learn more about how these options affect message routing in your organization, see Understanding Transport Routing in Exchange 2010 Hybrid Deployments.

Exchange Online Protection in Hybrid Deployments

EOP is an online service provided by Microsoft that's used by many companies to protect their on-premises organizations from viruses, spam, phishing scams, and policy violations. In Office 365, EOP is used to protect Exchange Online organizations from the same threats. When you sign up for Office 365, an EOP company is automatically created that's tied to your Exchange Online organization.

An EOP company contains several of the mail transport settings that can be configured for your Exchange Online organization. You can specify which SMTP domains must come from specific IP addresses, require a TLS and a Secure Sockets Layer (SSL) certificate, can bypass anti-spam filtering or compliance policies, and more. EOP is the front door to your Exchange Online organization. All messages, regardless of their origin, must pass through EOP before they reach mailboxes in your Exchange Online organization. And, all messages sent from your Exchange Online organization must go through EOP before they reach the Internet.

When you configure a hybrid deployment with the Manage Hybrid Configuration wizard, all transport settings are automatically configured in your on-premises organization and in the EOP company set up for your Exchange Online organization. The Manage Hybrid Configuration wizard configures all inbound and outbound connectors and other settings in this EOP company to secure messages sent between the on-premises and Exchange Online organizations and route messages to the right destination. If you want to configure custom transport settings for your Exchange Online organization, you'll configure them in this EOP company also.

Trusted Communication

To help protect recipients in both the on-premises and Exchange Online organizations, and to help ensure that messages sent between the organizations aren't intercepted and read, transport between the on-premises organization and EOP is configured to use forced TLS. TLS transport uses Secure Sockets Layer (SSL) certificates provided by a trusted third-party Certificate Authority (CA). Messages between EOP and the Exchange Online organization also use TLS.

When using forced TLS transport, the sending and receiving servers examine the certificate configured on the other server. The subject name, or one of the subject alternative names (SANs), configured on the certificates must match the FQDN that an administrator has explicitly specified on the other server. For example, if EOP is configured to accept and secure messages sent from the hybrid.contoso.com FQDN, the sending on-premises hybrid server must have an SSL certificate with hybrid.contoso.com in either the subject name or SAN. If this requirement isn't met, the connection is refused.

Note:

The FQDN used doesn't need to match the e-mail domain name of the recipients. The only requirement is that the FQDN in the certificate subject name or SAN must match the FQDN that the receiving or sending servers are configured to accept.

In addition to using TLS, messages between the organizations are treated as "internal". This approach allows messages to bypass anti-spam settings and other services.

Learn more about SSL certificates and domain security at: Understanding Certificate Requirements for Hybrid Deployments, Understanding TLS Certificates

1.14.10.7 Understanding Transport Routing in Exchange 2010 Hybrid Deployments

Understanding Transport Routing in Exchange 2010 Hybrid Deployments

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2013-02-01*

This topic discusses your routing options for inbound messages from the Internet and outbound messages to the Internet.

Note:

The examples in this topic don't include the addition of Edge Transport servers into the hybrid deployment. The routes messages take between the on-premises organization, the Exchange Online organization, and the Internet don't change with the addition of an Edge Transport server. The routing only changes within the on-premises organization. For more information about adding Edge Transport servers to a hybrid deployment, see Understanding Edge Transport Servers in Exchange 2010 Hybrid Deployments.

Inbound Messages from the Internet

As part of planning and configuring your hybrid deployment, you need to decide whether you want all messages from Internet senders to be routed through your on-premises organization or through the Exchange Online organization. All messages from Internet senders will initially be delivered to the organization you select and then routed according to where the recipient's mailbox is located. Whether you choose to have messages routed through your on-premises organization or the Exchange Online organization depends on various factors, including whether you want to apply compliance policies to all messages sent to both organizations, how many mailboxes are in each organization, and

so on.

The path messages sent to recipients in your on-premises and Exchange Online organizations take depends on how you decide to configure your MX record in your hybrid deployment. The Manage Hybrid Configuration wizard doesn't configure the routing for inbound Internet messages for either the on-premises or Exchange Online organizations. You must manually configure your MX record if you want to change how your inbound Internet mail is delivered.

- If you keep your MX record pointed to your on-premises organization: All messages sent to any recipient in either organization will be routed through your on-premises organization first. A message addressed to a recipient that's located in Exchange Online will be routed first through your on-premises organization and then delivered to the recipient in Exchange Online. This route can be helpful for organizations where you have compliance policies that require messages sent to and from an organization be examined by a journaling solution. This route is also recommended if you have more recipients in your on-premises organization than in your Exchange Online organization.
- If you decide to change your MX record to point to the Microsoft Exchange Online Protection (EOP) service in Office 365: All messages sent to any recipient in either organization will be routed through the Exchange Online organization first. A message addressed to a recipient that's located in your on-premises organization will be routed first through your Exchange Online organization and then delivered to the recipient in your on-premises organization. This route is recommended if you have more recipients in your Exchange Online organization than in your on-premises organization.

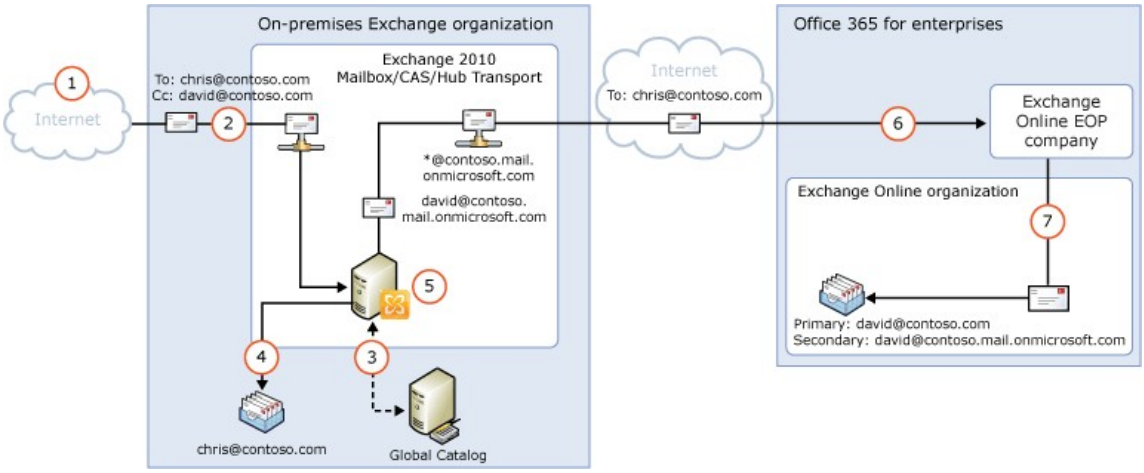
Read the section below that matches how you plan to route messages sent from Internet recipients to your on-premises and Exchange Online recipients.

Route Incoming Internet Messages Through Your On-Premises Organization

The following steps and diagram illustrate the inbound Internet message path that will occur in your hybrid deployment if you decide to keep your MX record pointed to your on-premises organization.

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2010 Mailbox server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to the on-premises organization, the message is delivered to an Exchange 2010 Mailbox server.
3. The Exchange 2010 Mailbox server performs a lookup for each recipient using an on-premises global catalog server. Through the global catalog lookup, it determines that Chris's mailbox is located on the Exchange 2010 Mailbox server while David's mailbox is located in the Exchange Online organization and has a hybrid routing address of david@contoso.mail.onmicrosoft.com.
4. The Exchange 2010 Mailbox server splits the message into two copies. One copy of the message is delivered to Chris's mailbox.
5. The second copy of the message is sent through the routing group connector that's configured between the hybrid servers and the Exchange 2010 server.
6. A hybrid Hub Transport server sends the message to EOP, which receives messages sent to the Exchange Online organization, using a Send connector configured to use TLS.
7. EOP sends the message to the Exchange Online organization where the message is scanned for viruses and delivered to David's mailbox.

Route mail through the on-premises organization for both on-premises and Exchange Online organizations



Route Incoming Internet Messages Through the Exchange Online Organization

The following steps and diagrams illustrate the inbound message path that occurs in your hybrid deployment if you decide to point your MX record to the EOP service in the Office 365 organization. The message path differs depending on whether you choose to enable centralized mail transport.

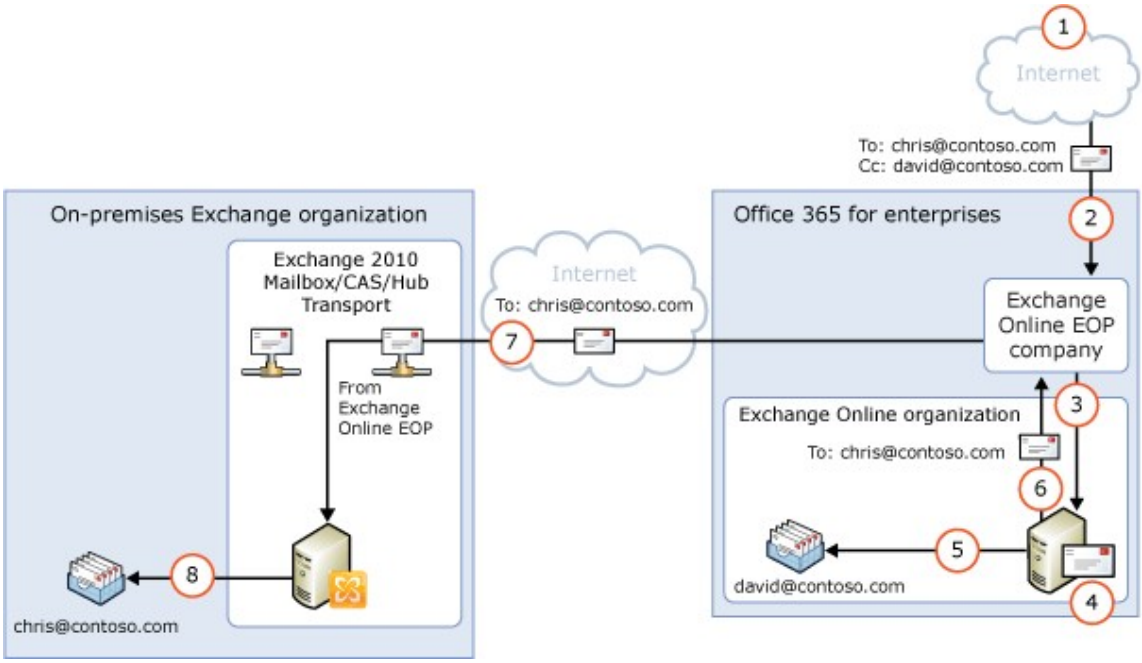
Important:

You may need to purchase EOP licenses for each on-premises mailbox that receives messages that are first delivered to EOP and then routed through the Exchange Online organization. Contact your Microsoft reseller for more information.

When centralized mail transport is *disabled* (default configuration), incoming Internet messages are routed as follows in a hybrid deployment:

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2010 Mailbox server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to EOP, the message is delivered to EOP.
3. EOP routes the messages for both recipients to Exchange Online.
4. Exchange Online scans the messages for viruses and performs a lookup for each recipient. Through the lookup, it determines that Chris's mailbox is located in the on-premises organization while David's mailbox is located in the Exchange Online organization.
5. Exchange Online splits the message into two copies. One copy of the message is delivered to David's mailbox.
6. The second copy is sent from Exchange Online back to EOP.
7. EOP sends the message to the hybrid Exchange 2010 Hub Transport servers in the on-premises organization.
8. A hybrid Hub Transport server sends the message through the routing group connector that’s configured between the hybrid servers and the Exchange 2010 Mailbox server delivers the message to Chris's mailbox.

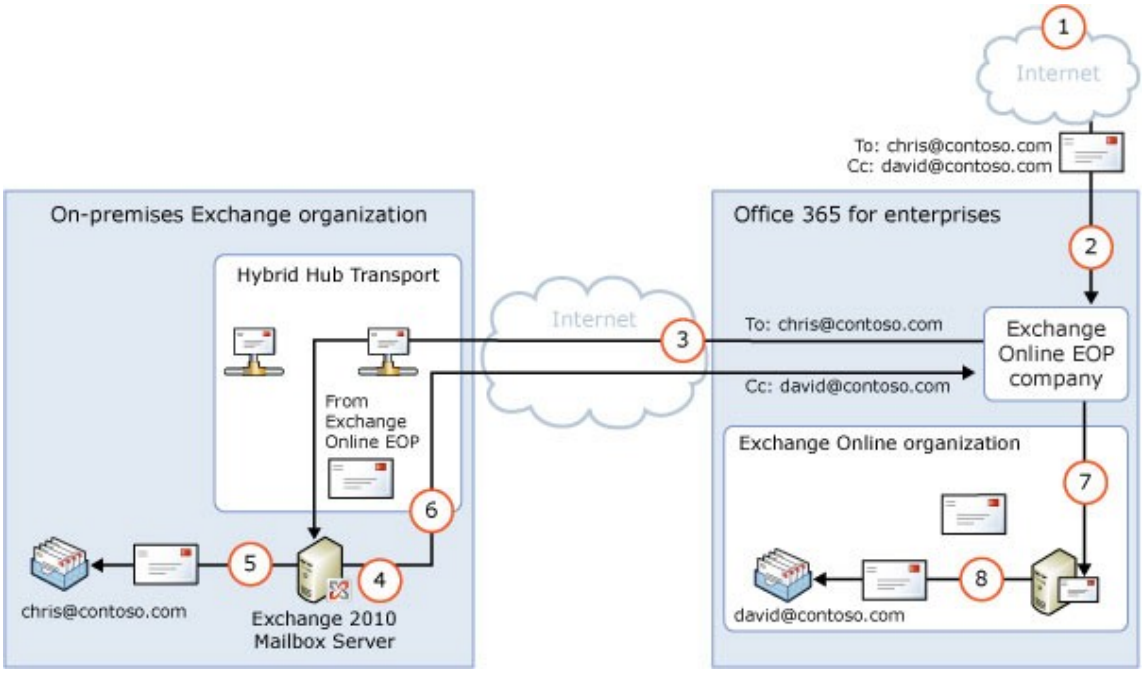
Route mail through the Exchange Online organization for both on-premises and Exchange Online organizations with centralized mail transport disabled (default configuration)



When centralized mail transport is *enabled*, incoming Internet messages are routed as follows in a hybrid deployment:

1. An inbound message is sent from an Internet sender to the recipients chris@contoso.com and david@contoso.com. Chris's mailbox is located on an Exchange 2010 Mailbox server in the on-premises organization. David's mailbox is located in Exchange Online.
2. Because the recipients both have contoso.com email addresses, and the MX record for contoso.com points to EOP, the message is delivered to EOP and scanned for viruses.
3. Since centralized mail transport is enabled, EOP routes the messages for both recipients to the on-premises hybrid Exchange 2010 Hub Transport server.
4. The hybrid Hub Transport server performs a lookup for each recipient. Through the lookup, it determines that Chris's mailbox is located in the on-premises organization while David's mailbox is located in the Exchange Online organization.
5. The hybrid Hub Transport server splits the message into two copies. One copy of the message is delivered to Chris’s mailbox in the on-premises Exchange 2010 server.
6. The second copy is sent from the hybrid Hub Transport server back to EOP.
7. EOP sends the message to Exchange Online.
8. Exchange delivers the message to David's mailbox.

Route mail through the Exchange Online organization for both on-premises and Exchange Online organizations with centralized mail transport enabled



Outbound Messages to the Internet

In addition to choosing how inbound messages addressed to recipients to your organizations are routed, you can also choose how outbound messages sent from Exchange Online recipients are routed. When you run the Hybrid Configuration wizard, you can select one of two options:

- **Enable centralized mail transport** Selecting this option routes outbound messages sent from the Exchange Online organization through your on-premises organization. Except for messages sent to other recipients in the same Exchange Online organization, all messages sent from recipients in the Exchange Online organization are sent through the on-premises organization. This enables you to apply compliance rules to these messages and any other processes or requirements that must be applied to all of your recipients, regardless of whether they're located in the Exchange Online organization or the on-premises organization.

  Note:
  Centralized mail transport is only recommended for organizations with specific compliance-related transport needs. Our recommendation for typical Exchange organizations is not to enable centralized mail transport.

- **Don’t enable centralized mail transport** Selected by default in the Manage Hybrid Configuration wizard, this option routes outbound messages sent from the Exchange Online organization directly to the Internet. Use this option if you don't need to apply any on-premises compliance policies or other processing rules to messages that are sent from recipients in the Exchange Online organization.

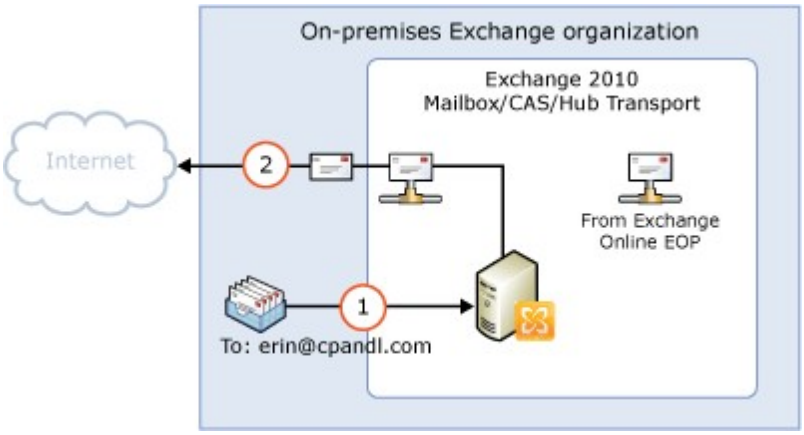
Messages sent from on-premises recipients are always sent to directly to Internet recipients using DNS regardless of which of the above choices you select in the Manage Hybrid Configuration wizard.

The following steps and diagram illustrate the outbound message path for messages sent from on-premises recipients.

1. Chris, who has a mailbox on the on-premises Exchange 2007 Mailbox server, sends a message to an external Internet recipient, erin@cpandl.com.

2. The Exchange 2010 server looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Messages from on-premises senders to Internet recipients



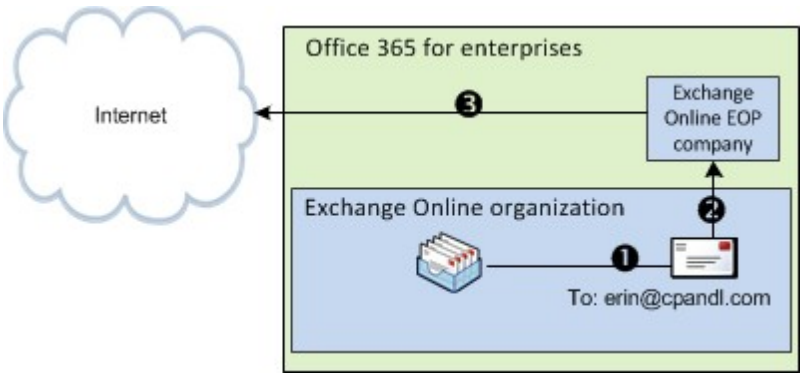
Read the section below that matches how you plan to route messages sent from recipients in the Exchange Online organization to Internet recipients.

Deliver Internet-Bound Messages from Exchange Online using DNS (Centralized Mail Transport Disabled)

The following steps and diagram illustrate the outbound message path for messages sent from Exchange Online recipients to an Internet recipient that occur when **Enable centralized mail transport** is not selected in the Manage Hybrid Configuration wizard, which is the default configuration.

1. David, who has a mailbox in the Exchange Online organization, sends a message to an external Internet recipient, erin@cpandl.com.
2. Exchange Online scans the message for viruses and sends the message to the Exchange Online EOP company.
3. EOP looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Mail from Exchange Online senders routed directly to the Internet with centralized mail transport disabled (default configuration)

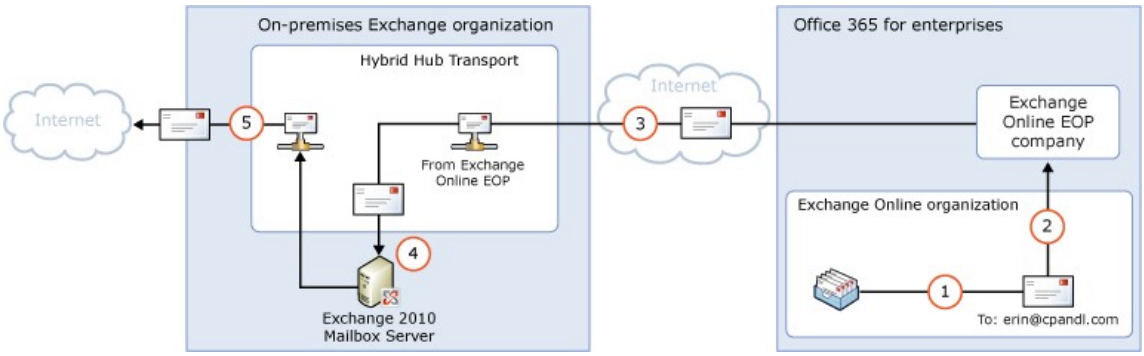


Route Internet-Bound Messages from Exchange Online Through Your On-Premises Organization (Centralized Mail Transport Enabled)

The following steps and diagram illustrate the outbound message path for messages sent from Exchange Online recipients to an Internet recipient that occur when you select **Enable centralized mail transport** in the Manage Hybrid Configuration wizard.

1. David, who has a mailbox in the Exchange Online organization, sends a message to an external Internet recipient, erin@cpandl.com.
2. Exchange Online scans the message for viruses and sends the message to EOP.
3. EOP is configured to send all Internet-bound messages to an on-premises server, so the message is routed to a hybrid Hub Transport server. The message is sent using TLS.
4. An hybrid Hub Transport server performs compliance and any other processes configured by the administrator on David's message.
5. The hybrid Hub Transport server looks up the MX record for cpandl.com and sends the message to the cpandl.com mail servers located on the Internet.

Mail from Exchange Online senders routed through on-premises organization with centralized mail transport enabled



1.14.10.8 Understanding IRM in Exchange 2010 Hybrid Deployments

Understanding IRM in Exchange 2010 Hybrid Deployments

Exchange Server 2010 > Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-05-18*

Information Rights Management (IRM) helps you to protect against leakage of sensitive information by providing persistent online and offline protection of e-mail messages and attachments. Both Exchange 2010, in your on-premises organization, and Exchange Online, in Office 365 for enterprises, support IRM. However, there are differences between the two implementations, and you must configure IRM in the Exchange Online organization before users in that organization can use it.

IRM uses Active Directory Rights Management Services (AD RMS), which is a component of Windows Server 2008 R2. AD RMS allows users to create rights-protected content, such as e-mail messages and attachments, and then control how that content is used, and to whom it's distributed. Users can specify templates that determine how content can be used. For example, a user may specify that an e-mail message can't be forwarded to other recipients or that information in the message can't be copied.

Learn more about IRM in Exchange 2010 at: Understanding Information Rights Management

Learn more about AD RMS at: Active Directory Rights Management Services Overview

Learn more about configuring IRM at: Configure IRM in Exchange 2010 Hybrid Deployments

IRM in Hybrid Deployments

Exchange uses AD RMS servers in the Active Directory forest in which the Exchange server is installed. For your on-premises Exchange 2010 servers, the on-premises AD RMS server is used. For your Exchange Online organization, AD RMS servers that are maintained within the Microsoft Office 365 datacenters are used. The AD RMS configuration that each Exchange organization uses is independent of any other AD RMS deployment.

AD RMS configuration, and therefore IRM configuration, isn't automatically replicated between your on-premises Exchange organization and the Exchange Online organization. Any AD RMS templates that you've defined aren't automatically copied to the Exchange Online organization. If you want the same AD RMS templates to be available in the Exchange Online organization, you must manually export the templates from your on-premises organization and apply them to the cloud-based organization. See the IRM Configuration in Hybrid Deployments section later in this topic.

User Experience

The IRM configuration that's applied to a user depends on the client the user uses and the location of the user's mailbox. The following table shows the AD RMS server a user will use.

Active AD RMS server

Client	On-premises mailbox	Cloud-based mailbox
Outlook 2007 or Outlook 2010	On-premises AD RMS	On-premises AD RMS
Outlook Web App	On-premises AD RMS	Exchange Online AD RMS
ActiveSync device	On-premises AD RMS	Exchange Online AD RMS

It's possible that, depending on the AD RMS configuration you configure in your on-premises and Exchange Online organizations, a user who uses Outlook 2007 and Outlook Web App may see different AD RMS templates. For this reason, we strongly recommend that you apply the same templates to both your on-premises and Exchange Online organizations.

There should be no difference in the IRM experience for Outlook client users, regardless of whether their mailbox is located in the on-premises or Exchange Online organization.

An Outlook Web App user whose mailbox is located on an Exchange 2010 server can only open rights-protected messages after installing the Rights Management for Internet Explorer add-in. They can't reply to or create new rights-protected messages.

An Outlook Web App user whose mailbox is located in Exchange Online can open rights-protected messages without any additional software and can reply to, and create, new rights-protected messages.

Server Functionality

On-premises Exchange 2010 servers use the AD RMS pre-licensing agent to decrypt rights-protected messages so that users don't need to supply credentials when they open those messages. The on-premises Exchange 2010 server contacts the on-premises AD RMS server to check usage policies and rights, and to request authorization to decrypt the message.

The Exchange Online organization provides several additional IRM-related features that make use of Exchange Online AD RMS. These features, such as journal report decryption, make the content of right-protected messages available to Exchange services for

additional processing. For example, the decrypted contents of a journaled message can be saved, along with the original rights-protected message, to allow for easier discovery. Additionally, IRM templates can automatically be applied to messages using either Outlook protection rules or transport rules to ensure that messages adhere to organization policies regarding information protection.

IRM Configuration in Hybrid Deployments

IRM in Exchange relies on AD RMS being deployed in the Active Directory forest in which the Exchange server resides. AD RMS configuration isn't automatically synchronized between the on-premises and Exchange Online organizations. You must manually export the AD RMS configuration, known as a trusted publishing domain (TPD), from your on-premises AD RMS server, and import that configuration into the Exchange Online organization. The TPD contains the AD RMS configuration, including templates, which the Exchange Online organization needs to use IRM.

Learn more at: AD RMS Trusted Publishing Domain Considerations

In addition to applying your on-premises AD RMS configuration to the Exchange Online organization, you must ensure that your AD RMS servers can be contacted by Outlook and ActiveSync clients outside of your on-premises network. You must do this if you want these clients to access rights-protected messages outside of your on-premises network.

After you've configured your on-premises network and exported the TPD data, you need to configure the Exchange Online organization by importing the TPD data and enabling IRM.

Note:

Any time you modify your on-premises AD RMS configuration, you must manually apply the new configuration in the Exchange Online organization. To do so, export the TPD data from your on-premises AD RMS server and import it into the Exchange Online organization.

Learn more at: Configure IRM in Exchange 2010 Hybrid Deployments

1.14.10.8.1 Configure IRM in Exchange 2010 Hybrid Deployments

Configure IRM in Exchange 2010 Hybrid Deployments

Hybrid Deployments > Hybrid Deployments with Exchange 2010 SP3 > Understanding IRM in Exchange 2010 Hybrid Deployments >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

If you use Information Rights Management (IRM) in your on-premises Exchange organization and you want your Exchange Online users to also use IRM, you need to do the following:

1. Configure your on-premises Active Directory Rights Management Services (AD RMS) server.
2. Enable IRM in your Exchange Online organization.
3. Distribute the imported AD RMS templates to users in the Exchange Online organization.

Learn more at: Understanding IRM in Exchange 2010 Hybrid Deployments

How do I configure on-premises AD RMS servers?

To configure IRM in a hybrid deployment, you need to use Windows PowerShell to access your on-premises AD RMS server. Learn more at: Using Windows PowerShell to Administer AD RMS

Do the following to export trusted publishing domain (TPD) data from your on-premises AD RMS server and then configure access to the AD RMS server for external clients.

1. Export TPD data from your on-premises organization. Learn more at: Exporting a Trusted Publishing Domain
2. Configure access to AD RMS servers from external clients. Learn more at: Adding an Extranet Cluster URL

How do I enable IRM in the Exchange Online organization?

After you export the TPD data from your on-premises AD RMS servers, you need to import that data into the Exchange Online organization and then enable IRM.

1. In the Exchange Online organization, import the TPD data.

```
Import-RMSTrustedPublishingDomain -FileData $( [Byte[]] (Get-Content -
```

2. Enable IRM in the Exchange Online organization.

```
Set-IRMConfiguration -InternalLicensingEnabled $True
```

How do I distribute AD RMS templates in the Exchange Online organization?

After you've enabled IRM in the Exchange Online organization, you must distribute the imported AD RMS templates. The following Exchange Online users and features use AD RMS templates:

- Outlook Web App users
- Exchange ActiveSync users
- Transport rules
- Journal report decryption
- Outlook protection rules

1. In the Exchange Online organization, retrieve a list of AD RMS templates.

```
Get-RMSTemplate -Type All
```

2. Distribute the AD RMS templates to users and features in the Exchange Online organization.

```
Set-RMSTemplate <template name> -Type Distributed
```

Note:
You can't modify the "Do Not Forward" AD RMS template.

3. Repeat step 2 for each AD RMS template you want to distribute.

How do I know this worked?

Outlook Web App users should be able to apply AD RMS templates to new messages. Outlook Web App and Exchange ActiveSync users should be able to read messages that have AD RMS templates applied to them. In addition, all the AD RMS templates that were imported from your on-premises organization should be listed when you run the **Get-**

RMSTemplate cmdlet.

Run the following command in the Exchange Online organization.

```
Get-RMSTemplate
```

Learn more at: Understanding Information Rights Management in Outlook Web App

Having problems? Ask for help in the Office 365 forums. To access the forums, you'll need to sign in using an account that's granted administrator access to your cloud-based service. Visit the forums at: Office 365 Forums

1.15 Performance and Scalability

Performance and Scalability

Exchange Server 2010 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-04-28*

Understanding performance and scalability is critical to designing and maintaining a high performance messaging infrastructure with Microsoft Exchange Server 2010. The topics in this section will help you understand the considerations that you should evaluate when designing, deploying, and maintaining your Exchange 2010 infrastructure.

Understanding Exchange Performance

Learn about all the variables that affect your system's performance, including user profile, architecture, and hardware.

Tools for Performance and Scalability Evaluation

Learn about using the Microsoft Exchange Jetstress and the Microsoft Exchange Load Generator tools to manage user load on your system.

Performance and Scalability Counters and Thresholds

Learn about performance and scalability counters that you can use to monitor your Exchange organization.

1.15.1 Understanding Exchange Performance

Understanding Exchange Performance

Exchange Server 2010 > Performance and Scalability >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-05-02*

Tuning a system for optimum performance is an iterative process. You must take the time to understand all the variables that affect your system, including user profile, architecture, and hardware. With this knowledge, you can establish baseline metrics for your systems and make adjustments to improve system performance.

Generally, the maximum level performance for a server is determined by the component that has the lowest performance—the bottleneck in the system. The key to improving

performance is being able to identify bottlenecks, determine their cause, and take the appropriate corrective action.

As you plan your Microsoft Exchange Server 2010 deployment, you can use the topics in this section to help design and optimize your environment for high performance:

- Understanding Processor Configurations and Exchange Performance
- Understanding Memory Configurations and Exchange Performance
- Understanding Server Role Ratios and Exchange Performance
- Understanding Multiple Server Role Configurations in Capacity Planning
- Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning
- Calculate Megahertz Per User and IOPS Per User

The concept of performance is closely related to the concept of scalability. When you have a solid understanding of the factors influencing the performance of system components, you can deploy components in a way that scales to support periods of high demand.

This topic provides information about:

- Measuring performance
- Hardware performance

Measuring Performance

Several tools for measuring performance are available for use with Exchange 2010, including Jetstress and Load Generator (LoadGen). The Windows Server 2008 operating system also includes some general performance tools including Windows Performance Monitor.

In addition to these tools, you should analyze your current user loads to establish a minimum server requirements baseline. Understanding how your users use the system is one of your biggest challenges. After you determine your hardware requirements, you should conduct a pilot test to make sure performance levels are acceptable.

For more information, see Tools for Performance and Scalability Evaluation.

Hardware Performance

When selecting hardware for your Exchange servers you must consider many factors. The hardware that you select for your Exchange deployment has the greatest effect on performance. Two of the most critical resources to evaluate are processor and memory. Because of the large number of variables that affect performance, it's difficult to predict the effects of high server utilization on the performance of any particular hardware component. The following definitions apply to the terms minimum, maximum, and recommended:

Minimum This is the minimum processor and memory configuration suitable for specific Exchange 2010 server roles (also defined in system requirements). Minimum hardware requirements must be met to receive Microsoft Customer Service and Support.

Maximum This is the maximum recommended processor and memory configuration for specific Exchange 2010 server roles. Maximum is defined as the upper bound of viable processor and memory configurations for Exchange 2010 based on price and performance. Maximum is a guideline and not a support criterion. It doesn't take into account the resource requirements of third-party applications. The recommended maximum may change over time based on price changes and technology advancements.

Recommended This is the recommended processor and memory configuration for specific

Exchange 2010 server roles. Recommended can be defined as the best configuration based on price and performance. The recommended configuration also provides a balance between processor and memory capacity. The goal is to match the memory configuration to the processor configuration so the system will effectively utilize the processors without becoming bottlenecked on memory or vice versa.

Processor Performance

Exchange 2010 benefits significantly when running on multi-core processors. The performance benefit for Exchange from multi-core technology depends upon the specific processor utilized. Multi-core processors are an attractive option for Exchange 2010 servers based on price and performance. It's important to consult with your server hardware vendor about multi-core benefits for Exchange, specific to a given hardware architecture.

The processor usage on a server should maintain a load of about 60 percent during peak working hours. This percentage level allows room for periods of extreme load. If the processor usage is consistently greater than 75 percent, processor performance is considered a bottleneck.

There are several factors by which the CPU in a server affects performance. These include:

- The processor clock speed, measured in megahertz (MHz) or gigahertz (GHz)
- The number of processors
- The type of processor

For performance, selecting the fastest processor yields the best results. However, budget and cost dictate most companies' choices.

Exchange can fully use multiple processors, and using servers with more processors improves performance. However, the relationship between the number of processors, number of processor cores, and performance is complex. The optimum number of processors and cores is partly determined by the Exchange role deployed on the server.

For more information about how different processors perform, see Understanding Processor Configurations and Exchange Performance.

Memory Performance

After the required number of processor cores has been estimated for a specific server role, baseline memory recommendations can be applied. Exchange 2010 on the 64-bit editions of the Windows Server 2008 operating system can efficiently utilize upwards of 64 GB of memory (Mailbox server role).

With effective planning and an understanding of the basic processor and memory requirements for specific Exchange 2010 server roles, a balanced and cost-effective topology can be attained.

For more information about how different memory configurations perform, see Understanding Memory Configurations and Exchange Performance.

Network Performance

Much of the network interface subsystem is tuned automatically. Server-based network adapters are capable of detecting the type and level of traffic passing through the network interface, and they self-tune to reflect this information. We recommend that you have operational practices in place to ensure that the latest device drivers are maintained on the server.

For Mailbox servers, gigabit Ethernet (1,000 megabits per second (Mbps) or 1 gigabit per second (Gbps)) is recommended.

Multiple switched fast Ethernet networks of gigabit Ethernet connections are recommended.

Performance-related issues may arise because your hardware, firmware, or software drivers aren't designed to work in your configuration. For more information, see the Windows Hardware Development Web site.

Storage Performance

As storage requirements increase and companies consolidate servers, you must balance cost, availability, and performance when you design a storage system. Take time to invest in good storage design before you implement it. Unlike processors and memory, which you can scale while the network is active, storage redesign requires network downtime to implement. Tuning your Exchange storage becomes a critical component in the overall performance of your Exchange environment.

There are a few guidelines that can be followed for selecting a storage configuration that provides good performance and a strong platform for Exchange 2010. Capacity and performance are often at odds with each other when it comes to selecting a storage solution, and both must be considered before making a purchase. Generally, the decision involves analysis of the following factors:

- Making sure there will be enough space to store all of the data. Determining your capacity needs is a relatively straightforward process.
- Making sure the solution provides acceptable disk latency and a responsive user experience. This is determined by measuring or predicting transactional input/output (I/O) delivered by the solution.
- Making sure that non-transactional I/O has both enough time to complete and enough disk throughput to meet your service level agreements (SLAs).

The goal is to find a balance of these factors so that you can design the actual hardware solution for your servers.

For more information about choosing a storage solution for Exchange 2010, see Mailbox Server Storage Design.

1.15.1.1 Understanding Processor Configurations and Exchange Performance

Understanding Processor Configurations and Exchange Performance

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-02-10*

Three of the most critical factors to consider when selecting hardware for use by Microsoft Exchange Server 2010 are choice of processor, amount of memory, and selection of storage. This topic provides guidelines for processor configurations that provide good performance and a strong platform for Exchange.

For detailed guidance and recommended configurations for memory, see Understanding Memory Configurations and Exchange Performance. For more information about selecting storage, see Understanding Storage Configuration.

Contents

Selecting the Appropriate Processor

For production environments, you must choose a processor that works with the 64-bit edition of the Windows Server operating system.

The release to manufacturing (RTM) version of Exchange 2010 is only supported in production environments when the x64 version of Exchange 2010 is installed on a computer with x64-compatible processors running 64-bit editions of Windows Server 2008 or Windows Server 2008 R2.

You can select processors from Intel that support Intel Extended Memory 64 Technology or processors from AMD that support AMD64. For more information about these processor options, see the Intel 64 Architecture Web site or the AMD Opteron Processor Family Web site at http://www.amd.com/us-en/Processors/ProductInformation/0,,30_118_8825,00.htm.

Exchange 2010 is designed to run only on x64-capable processors such as those listed previously, and it doesn't run on Itanium-based systems.

Regardless of which processor you choose, the server product must have the Designed for Windows logo to be supported. For more information, see Windows Logo Program: Overview. To ensure support, you must select a server listed in the Windows Server Catalog. If your server isn't listed, you should verify with the hardware vendor that testing is in progress.

Return to top

Hyperthreading

Hyperthreading causes capacity planning and monitoring challenges, and as a result, the expected gain in CPU overhead is likely not justified. Hyperthreading should be disabled by default for production Exchange servers and only enabled if absolutely necessary as a temporary measure to increase CPU capacity until additional hardware can be obtained.

Return to top

Recommended Processor Configurations

You can use the following table to assist you in purchasing server hardware for Exchange 2010. This table provides minimum requirements and recommended maximum configurations for Exchange 2010 based on the following definitions:

- **Minimum** This is the minimum processor and memory configuration suitable for specific server roles. The minimum hardware requirements must be met to receive support from Microsoft Customer Service and Support.
- **Recommended maximum populated processor sockets** This is the recommended maximum number of motherboard processor sockets that should be used for the roles listed, based on price and expected performance. The recommended maximum configuration is a guideline and may change over time based on price changes and technology advancements. It isn't a support

criterion.

- **Example recommended maximum processor cores (assuming 6 core processors)** This is the example maximum recommended processor and memory configuration for specific server roles. Maximum is defined as the upper bound of viable memory configurations based on price and performance. The recommended maximum configuration is a guideline. It isn't a support criterion, and it doesn't take into account the resource requirements of third-party applications that might access or be installed on the server. The recommended maximum configuration may change over time based on price changes and technology advancements.

Note:
The following guidance assumes an average concurrency profile. Concurrency is defined as the percentage of the total number of users on a server that are connected and using the server at a specific peak period of time. For a fully utilized server, concurrency is generally in the 75 to 80 percent range.

Processor configurations for Exchange 2010 server roles

Exchange 2010 server role	Minimum	Recommended maximum populated processor sockets	Example recommended maximum processor cores (assuming 6 core processors)
Edge Transport	1 x processor core	2	12 x processor cores
Hub Transport	1 x processor core	2	12 x processor cores
Client Access	2 x processor core	2	12 x processor cores
Unified Messaging **Note:** Recommendations based on Unified Messaging being deployed with the default configuration that includes Voice Mail Preview enabled.	2 x processor core	2	12 x processor cores
Mailbox	2 x processor core	2	12 x processor cores
Client Access/Hub Transport combined (Client Access and Hub Transport roles running on the same physical server)	2 x processor core	2	12 x processor cores
Multiple (Client Access, Hub Transport, and Mailbox server roles running on the same physical server)	2 x processor cores	4	24 x processor cores

Important:
Some server virtualization platforms may not support the maximum number of processors identified in the preceding table. If you're planning to deploy Exchange server roles on a virtualization platform, check the documentation for that platform to determine the maximum number of supported virtual processors.

Note:
Ratings available at the Standard Performance Evaluation Corporation Web site may be used to rationalize unlike processor and server configurations.

Hub Transport Server Role

We recommend a configuration for the Hub Transport server role of 8 x processor cores in organizations where Hub Transport servers are deployed with several Mailbox servers and thousands of mailboxes. Servers with larger processor cores can be efficiently used when the Hub Transport server is configured to use antivirus and anti-spam tools. Processor utilization is based on several factors such as message rate, average message size, number of enabled transport agents, antivirus configuration, and third-party applications.

Client Access Server Role

In Exchange 2010 architecture, most of the client-specific functions have been moved from the Mailbox server to the Client Access server. In Exchange 2010, messages are converted on the Client Access server when they're accessed by a non-MAPI client (for example, POP3 and IMAP4 clients). In addition, rendering for Microsoft Office Outlook Web App is performed on the Client Access server, as opposed to the Microsoft Exchange Information Store service in previous versions of Exchange.

These architectural changes allow the Client Access server to offload significant processing from the Mailbox server and to effectively utilize 8 x processor cores. Servers with 2 x processor cores can be utilized for Client Access servers in organizations where there aren't enough mailboxes or insufficient non-MAPI client traffic to warrant using 4 x processor core servers.

Unified Messaging Server Role

We recommend a configuration for the Unified Messaging server role of 8 x processor cores. Multiple cores are used on the Unified Messaging server for several architectural functions such as .wav to Microsoft Windows Media Audio (WMA) conversions for voice mail messages. Servers with 2 x processor cores can be used for Unified Messaging servers in organizations where there aren't enough mailboxes or insufficient Unified Messaging server activity to warrant using 4 x processor core servers.

Mailbox Server Role

We recommend a configuration for the Mailbox server role based predominantly on mailbox count and user profile. A 4 x processor core server provides a good balance between price and performance, and it should be able to host several thousand mailboxes. Sizing for the Mailbox server requires an understanding of the average client user profile. This profile can be collected using transport performance counters that indicate overall message throughput within an Exchange system. You can also use third-party tools.

For more information about processor requirements for specific user profiles (based on message throughput), see Mailbox Server Processor Capacity Planning.

Multiple Role Server

As a general guideline, a multiple role server should be sized to use half of the available processor cores for the Mailbox server role and the other half for the Client Access and Hub Transport server roles. The maximum recommended processor core configuration is listed at 24 x processor cores for the multiple server roles configuration to indirectly provide guidance on the maximum number of users that should be hosted on a multiple role server. Although this configuration can use more than 24 x processor cores, we don't recommend it. For more information, see Understanding Multiple Server Role Configurations in Capacity Planning. For more information about the combined Hub Transport and Client Access server roles, see Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning.

Return to top

Virtual Deployments

The CPU overhead associated with running a guest operating system in a virtual machine was found in testing to range from 9 percent through 12 percent. For example, a guest operating system running on a virtual machine typically had available 88 percent to 91 percent of the CPU resources available to an equivalent operating system running on physical hardware. We recommend reducing the user capacity of Mailbox servers by 10 percent to account for hypervisor processor overhead.

Return to top

1.15.1.2 Understanding Memory Configurations and Exchange Performance

Understanding Memory Configurations and Exchange Performance

Exchange Server 2010 > Performance and Scalability > Understanding Exchange Performance >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-04-23*

This topic provides guidelines for memory configurations that provide good performance and a strong platform for Microsoft Exchange Server 2010. For detailed guidance and recommended configurations for processors, see Understanding Processor Configurations and Exchange Performance.

When selecting hardware for Exchange 2010, we recommend that you consider the server maximum memory configuration. Different server architectures have different memory limits. We recommend that you check the following technical specifications of the server to determine the most cost-efficient maximum memory configuration for your servers:

- **Memory speed** Some server architectures require slower memory modules to scale to the maximum supported amount of memory in a specific server. For example, maximum server memory could be limited to 32 GB with PC3 10666 (DDR3 1333) or 128 GB using PC2 6400 (DDR2 800). You should check with the manufacturer to ensure that the memory configuration target for Exchange 2010 is compatible in terms of speed.
- **Memory module size** Consider the largest memory module size that the server will support. Generally, the larger the memory module, the more expensive. For example, two 2 GB DDR SDRAM memory modules generally cost much less than one 4GB DDR SDRAM memory module and two 4 GB DDR SDRAM memory modules generally cost much less than one 8GB DDR SDRAM memory module. Make sure the maximum memory module size allows you to meet your target memory requirements for Exchange 2010.
- **Total number of memory slots** Consider how many memory modules that a specific server will support. The total number of slots multiplied by the maximum memory module size provides the maximum memory configuration for the server. Keep in mind that memory modules must sometimes be installed in pairs.

Be aware that some servers experience a performance improvement when more memory slots are filled, while others experience a reduction in performance. Check with your hardware vendor to understand this effect on your server architecture.

Recommended Memory Configurations

After the number of processor cores estimated to be required per server role is understood, baseline memory recommendations can be applied. The following table illustrates the minimum supported and recommended memory configurations for Exchange 2010 server roles.

The following describes the minimum requirements and recommended maximum configurations:

Minimum Supported This is the minimum memory configuration suitable for Exchange 2010 servers. The minimum hardware requirements must be met to receive support from Microsoft Customer Service and Support.

Recommended Maximum This is the recommended memory configuration for specific server roles. Recommended maximum is defined as the upper limit of viable processor and memory configurations based on price and performance. The recommended maximum configuration is a guideline. It isn't a support criterion, and it doesn't take into account the resource requirements of third-party applications that might access or be installed on the server. The recommended maximum configuration may change over time based on price changes and technology advancements.

The following table shows the minimum supported and recommended maximum memory configurations for Exchange 2010.

Memory configurations for Exchange 2010 servers based on installed server roles

Exchange 2010 server role	Minimum supported	Recommended maximum
Edge Transport	4 GB	1 GB per core (4 GB minimum)
Hub Transport	4 GB	1 GB per core (4 GB minimum)
Client Access	4 GB	2 GB per core (8 GB minimum)
Unified Messaging	4 GB	2 GB per core (4 GB minimum)
Mailbox	4 GB	4 GB base plus additional memory based on the user profile and database cache size. For more information about how to determine the total required memory, see Understanding the Mailbox Database Cache.
Client Access/Hub Transport combined role (Client Access and Hub Transport server roles running on the same physical server)	4 GB	2 GB per core (8 GB minimum)
Multiple roles (combinations of Hub Transport, Client Access, and Mailbox server roles)	8 GB	4 GB plus 3-30 MB additional memory per mailbox: The total required memory is based on the user profile and database cache size. For

		more information about how to determine the total required memory, see Understanding the Mailbox Database Cache.

Edge Transport and Hub Transport Server Roles

The Edge Transport and Hub Transport server roles don't require substantial quantities of memory to perform well in optimal conditions. Generally, 1 GB of RAM per processor core (4 GB minimum total) is sufficient to handle all but the most demanding loads. Most deployments will be optimally configured with the recommended memory configuration of 1 GB per processor core (4 GB minimum total).

Client Access Server Role

In general, memory utilization on Client Access servers has a linear relationship with the number of client connections and the transaction rate. Based on the current recommendations of 2 GB per core processor and memory configurations, a Client Access server will be balanced in terms of memory and processor utilization, and it will become processor-bound at approximately the same time it becomes memory- bound.

These recommendations are based on the Exchange 2010 feature, RPC Client Access. This feature requires a larger memory and processor configuration to manage the increased loads placed on the Client Access server role.

Mailbox Server Role

The memory configuration process for the Mailbox server role is more complex than the other roles because the optimal memory configuration depends upon the server roles installed, the mailbox count, the client profile (similar to estimating processor core requirements), and the number of active databases.

Memory sizing for the Mailbox server role is critical to reducing disk input/output (I/O) on the server. The more memory you add to the Mailbox server, the less disk I/O will be generated by Exchange. There is, however, a point of diminishing returns at which adding memory to the server may not be justifiable based on price and performance. The recommendations discussed in "Recommended Memory Configurations" earlier in this topic consider this point of diminishing returns and are based on current memory prices and performance metrics.

For more information about how to perform appropriate memory sizing for the Mailbox server role, see the following topics:

- Mailbox Server Storage Design
- Understanding the Mailbox Database Cache

Multiple Server Roles

When determining memory requirements for multiple role server configurations, you need to consider the requirements of Hub Transport, Client Access, and Mailbox server roles. To assist you, we have provided the calculated memory requirements in the preceding table. For additional information, see the following:

- "Memory Recommendations for Multiple Role Servers" in Understanding Multiple Server Role Configurations in Capacity Planning
- Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning

1.15.1.3 Understanding Server Role Ratios and Exchange Performance

Understanding Server Role Ratios and Exchange Performance

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-01-26*

After you've determined your optimal processor, memory, and disk configurations, you should determine how many server roles of each type are required for your deployment. Every environment is different, so consider these recommendations as starting points that can be tailored to your environment.

Contents

Server Role Ratios

The following table shows recommended server role ratios that are based on the processor core guidance in the topic Understanding Processor Configurations and Exchange Performance. Also, the Mailbox server role is the basis for the processor core ratios. Hub Transport and Client Access server roles relate to the Mailbox server role with regard to the recommendation.

Note:
You can also use the ratings available at Standard Performance Evaluation Corporation to rationalize different processor and server configurations.

Recommended processor core ratio based on server role configuration

Server role configuration	Recommended processor core ratio
Mailbox:Hub Transport	7:1 (no antivirus scanning on Hub Transport server) 5:1 (with antivirus scanning on Hub Transport server)
Mailbox:Client Access	4:3
Mailbox:Client Access and Hub Transport combined role	1:1

Important:
The recommended Mailbox to Client Access server role ratios are based on the use of the Exchange 2010 feature, RPC Client Access. This feature requires a larger memory and processor configuration to manage the increased loads placed on the Client Access server role. The RPC Client Access feature is enabled by default. For more information, see Understanding RPC Client Access.

When considering these recommendations, be aware of the following:

- The preceding ratios are a general rule (not definitive), and they may not be valid for every topology. A general rule means that the ratios aren't a requirement for support.
- Ratios can change dramatically based on user profiles. A user that creates a larger than expected load against the Mailbox server role rather than the Hub Transport server role will increase the Mailbox:Hub Transport ratio, and vice versa.
- These recommendations are derived from the internal deployment of Mailbox servers at Microsoft, which is based on approximately 750 heavy users per processor core.
- These ratios assume that Mailbox servers are at greater than 60 percent processor utilization during peak periods, with corresponding processor utilization on Hub Transport or Client Access servers.
- For these recommendations, the processors used on Mailbox, Hub Transport, and Client Access server roles were the same type and speed.
- A minimum of two Hub Transport and two Client Access servers should be deployed for redundancy and to ensure uninterrupted service in case of planned or unplanned server downtime.
- The Hub Transport server role ratio that includes antivirus scanning was obtained using Microsoft Forefront Security for Exchange Server with five active scanning engines.
- The Client Access server role ratio includes using Secure Sockets Layer (SSL) for all access protocols.

It's not possible to provide a ratio for the Unified Messaging server role because its utilization isn't directly tied to the Mailbox server role. For more information about Unified Messaging server capacity planning, see Understanding Unified Messaging Availability.

Return to top

Edge Transport Server Ratio

To determine how many Edge Transport servers are required, you must measure or estimate the following metrics during peak periods:

- Connections per second
- Messages per second
- Average message size

Sizing is based on the number of connections and messages processed, with average message size being a secondary factor. Because every SMTP connection doesn't become an SMTP message, and because every accepted message won't survive antivirus and anti-spam scanning, it's difficult to provide a simple sizing methodology based on message rate. Edge Transport server utilization depends on several factors that are unique to each organization.

Note:
A minimum of two Edge Transport servers should be deployed for redundancy and to ensure uninterrupted service in case of planned or unplanned server downtime.

The following table provides performance data values for key metrics from internal deployment at Microsoft. You can use the metrics and their values to help you understand the performance characteristics of an Edge Transport server.

Performance metrics from internal deployment of Edge Transport servers at Microsoft

Performance metric	Value
SMTP Connections/Sec	55

% Connections Accepted	80 %
SMTP Messages IMF Scanned/Sec	3.7
% SMTP Messages passed IMF Scanning	80 %
SMTP Messages A/V Scanned/Sec	3
Avg. Message Size	70 KB
CPU Utilization	20 %**

** System included a 2-socket, dual-core AMD Opteron 275 2.2 gigahertz (GHz) processor

A significant percentage of the server processing is associated with the overhead of analyzing connections and scanning accepted messages. For this reason, it's not possible to provide a sizing metric based solely on the number of messages sent and received per second because antivirus and anti-spam operations are significant processor utilization functions of the Edge Transport server role.

Return to top

Active Directory Server and Mailbox Server Ratios

The recommended number of Active Directory directory servers in each site containing Exchange 2010 Mailbox servers or users depends on the number of processor cores in each computer running the Exchange 2010 Mailbox server role and the hardware platform on which Active Directory is running. Specifically, consider the following scenarios:

- If Active Directory is running on the x86 platform (32-bit), the recommended ratio of Active Directory directory server processor cores to Exchange 2010 Mailbox server processor cores is 1:4.
- If Active Directory is running on the x64 platform (64-bit), the recommended ratio of Active Directory directory server processor cores to Exchange 2010 Mailbox server processor cores is 1:8. To achieve the 1:8 ratio, you must have enough memory installed on the directory server to cache the entire Active Directory database in memory. To check the size of your Active Directory database, examine the NTDS.DIT file on a global catalog server. By default, this file is located in %WINDIR%\NTDS.

In the preceding ratios, it's important to note that this is a ratio of processor *cores* and not processors. Thus, a dual-core processor counts as 2 when calculating the ratio. The ratio difference between 32-bit and 64-bit is due to the larger amount of memory that a 64-bit operating system can support as compared to a 32-bit operating system.

For Exchange 2010, we recommend that you deploy one 32-bit global catalog server processor core for every four Exchange 2010 Mailbox server processor cores, or one 64-bit global catalog server processor core for every eight Exchange 2010 Mailbox server processor cores. Although other server roles will influence the number of global catalog processor cores required, the Mailbox servers that are deployed influences the deployment of each of the other roles, so basing the number of global catalog processor cores on Mailbox server processor cores will suffice.

For additional guidance about Active Directory directory server sizing and ratios, see Planning Active Directory.

1.15.1.4 Understanding Multiple Server Role Configurations in Capacity Planning

Understanding Multiple Server Role Configurations in Capacity Planning

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-09-14*

Several trends in server hardware apply to the Microsoft Exchange Server 2010 timeframe. One trend is a significant increase in processor performance and an increasing number of processor cores supported on a physical processor. This means that deploying a single Exchange server role on a standard commodity server with multi-core processors might leave a large portion of available CPU underutilized. Some customers expect server virtualization to more effectively utilize server CPU resources. Other customers want to combine Exchange server roles on the same physical server. Both are valid solutions.

Another trend is the availability of server models with multi-core processors and 10 to 16 internal disks. If you consider the number of mailboxes that can be supported by the input/output transactions per second (IOPS) provided by 10 to 16 disks, the Mailbox server role by itself generally won't utilize more than half of the available CPU resources. Adding the Client Access server role and the Hub Transport server role to this server will more effectively utilize the capacity of the server.

You can use the information in this topic as guidance for when to deploy multiple-role server configurations and how to correctly plan for multiple-role server configurations. An example illustrates the server sizing process for multiple-role servers.

Contents

Why Multiple-Role Configurations are Recommended

First, and foremost, the hardware you can procure today has processors that are extremely fast, yielding 5,000-6,000 megacycles when compared to our baseline processor configuration. That configuration consists of 2 x 4 core Intel Xeon x5470 3.33-GHz processors. (You can read more about our baseline processor configuration in the section "Example of Capacity Planning for a Mailbox Server" in Mailbox Server Processor Capacity Planning.) If you were to replace the processor architecture in your environment with processors on the market today, while keeping all other environmental factors the same, you would see a significant decrease in processor utilization.

To effectively lower the total cost of ownership on the servers you purchase, you should ensure efficient utilization of the system, which means the system must achieve and sustain near-80 percent CPU utilization during the worst failure mode at peak load. Here are four ways you can efficiently utilize the processors available today:

- Increase the workload, by deploying more active mailboxes per server.
- Introduce a virtualization layer, and deploy the mailbox role as a guest machine, along with additional guest machines.
- Deploy additional Exchange server roles onto the system.
- Use a combination of the above methodologies to find the optimal configuration that utilizes the hardware as efficiently as possible.

Deploying Exchange 2010 with a multiple-role architecture provides several benefits:

- The multiple-role architecture becomes a building block-based architecture. With the multiple-role architecture, all servers in the Exchange environment (excluding Unified Messaging and Edge Transport) are exactly the same—the same hardware, the same configuration, and so forth. This uniformity simplifies ordering the hardware, as well as performing maintenance and management of the servers.
  - From a cost perspective, the overall goal is to ensure that the architecture is balanced from both a CPU perspective and from a disk perspective. Deploying server roles on separate machines can result in long-term cost disadvantages as you may purchase more CPU, disk, and memory resources than you will actually use. For example, consider a server that hosts only the Client Access server role. Many servers enable you to add a given number of disks in a very economical fashion—when you are deploying that number of disks and, more importantly utilizing them, the cost is essentially zero. But if you deploy a server role that uses far less than the given number of disks, you're paying for a disk controller that is either under-utilized or not utilized at all.
- In many cases, using a multiple-role architecture enables you to have fewer physical Exchange servers in the environment. Fewer physical servers mean lower costs for a variety of reasons:
  - Operational expenditures are almost always higher than the capital expenditures. It costs more to manage a server over its lifetime than it does to purchase it.
  - You purchase fewer Exchange server licenses. A multiple-role server only requires a license for one Exchange server and one operating system, while breaking out the roles requires multiple Exchange server licenses and possibly multiple operating system licenses. For more information, see About Licensing: Licensing for Virtual Environments.
  - Deploying fewer servers has a trickle-down effect across the rest of the infrastructure. For example, deploying fewer physical servers may reduce the total rack and floor space required for the Exchange infrastructure, which in turn reduces power and cooling costs.
- A multi-role architecture ultimately distributes the load across a greater number of servers than deploying single-role servers because all Mailbox servers also become Hub Transport servers and Client Access servers. This architecture provides two benefits:
  - From a scalability perspective, you're distributing the load across a greater number of physical machines. During a failure event, the increased load on the remaining servers only increases incrementally, which ensures the other functions the server is performing aren't adversely affected.
  - From a resiliency perspective, the solution can survive a greater number of Hub Transport and Client Access role (or service) failures and still provide service.

For these reasons, the deployment strategy we recommend for Exchange 2010 is a multiple-role server configuration for most scenarios.

When Multiple-Role Configurations are Recommended

Multiple-role configurations are recommended for most scenarios for the following reasons:

- **Simple unit of scale** Organizations that anticipate regular growth in the number of mailboxes should consider deploying multiple-role servers. Because each multiple-role server represents a building block, this model allows the easy addition of building blocks to support the need for increased capacity.
- **Large-scale deployments that want to leverage modern processors** Based on scalability testing performed prior to the release-to-manufacturing (RTM) version of Exchange 2010, multiple-role servers can effectively utilize hex core (or more) processors in a single server. This capability allows large organizations to reduce the number of servers by combining the Mailbox, Hub Transport, and Client Access server roles instead of deploying these roles separately on servers with fewer processor cores. This approach leverages the building block model described earlier to provide a platform for large-scale deployments while reducing the overall number of servers required. Scalability of the multiple-role configuration on larger core count systems should be validated with lab testing prior to production deployment.
- **Server deployments with internal storage** Many servers available today have two physical multi-core processors and 10 to 16 internal disks. Several improvements in Exchange 2010 reduce I/O requirements, making these servers a cost-effective solution. Depending on user profile and disk type, these servers generally support up to 4,000 mailboxes. We recommend adding the Client Access and Hub Transport server roles to these servers to utilize the additional CPU and make these servers self-contained building blocks.
- **Risk mitigation scenarios where the number of mailboxes hosted on a Mailbox server is limited** Multiple-role servers are a solution for deployments where risk management policies limit the number of mailboxes that can be deployed on a Mailbox server. For example, say an organization with 10,000 mailboxes has a policy that a single server outage can't affect more than 25 percent of the mailboxes in the environment. This requirement limits the number of mailboxes per Mailbox server to 2,500. The additional capacity on that server could be utilized by adding the Client Access and Hub Transport server roles to the server.
- **Small organizations and branch office deployments** Except as noted below when Windows Network Load Balancing is used, a multiple-role deployment is a recommended solution for deployments where the primary goals are to minimize the number of physical servers, operating system instances, and Exchange servers to manage. Running the Client Access, Hub Transport, and Mailbox server roles on the same physical server provides the necessary role redundancy with a minimum requirement of two or three physical servers.

Return to top

When Multiple-Role Configurations Aren't Recommended

Multiple-role configurations aren't recommended for the following scenarios:

- **Small organizations, or branch office deployments, that want to use Windows Network Load Balancing (NLB)** Multiple-role servers may not work well for small deployments where two or three multiple-role servers are being deployed as members of a database availability group (DAG). For more

information about DAGs, see Managing Database Availability Groups. The clustering component added to Mailbox servers that are members of a DAG prevents NLB from being installed on the server. For more information about load balancing recommendations, see Understanding Load Balancing in Exchange 2010. However, there's still a requirement to load balance inbound traffic to the Client Access servers. In this case, there are two main options:

- Purchase a hardware load balancing appliance. Although there are some entry-level NLB appliances, this option can be costly, especially for smaller environments.
- Virtualize the Exchange server roles. In some environments, a limited number of servers results in having to deploy domain controllers, file and print servers, and other applications on the same physical hardware as the Exchange 2010 servers. We recommend that you implement the physical servers as host servers and isolate applications inside a virtual environment. With this isolation, you can run NLB for Client Access servers running on virtual machines.

- **Virtualization** The maximum number of active mailboxes that can be hosted by a virtual machine may be reduced based on the combination of message profile and running in a multi-role configuration. If you have light messaging users, co-locating server roles in a virtual machine may make sense. However, if you have heavy messaging users, you may be limited for resources in a virtual machine, and thus you may need to either reduce the number of mailboxes per Mailbox virtual machine or split out the roles into separate virtual machines. In these cases, it may be more efficient to deploy a single Exchange server role in each virtual machine, or to deploy one combined Client Access and Hub Transport virtual machine for every Mailbox server virtual machine.

Note:
You can’t install an Exchange server role on the hypervisor host server. Only management software (for example, antivirus software, backup software, or virtual machine management software) can be deployed on host servers. No other server-based applications should be installed on the host server (for example, Exchange, Microsoft SQL Server, or Active Directory). The host servers should be dedicated to running guest virtual machines.

For more information, see Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning.

Return to top

Hardware Recommendations for Multiple-Role Servers

As a general guideline, a multiple-role server should be sized to use half of the available processor cores for the Mailbox server role and the remaining half for the Client Access and Hub Transport server roles. Microsoft doesn't specify a maximum number of recommended processor cores for multiple-role servers. Instead, a maximum number of populated processor sockets are provided. This refers to the number of processor sockets on the motherboard where multi-core processors are connected. For more information, see Understanding Processor Configurations and Exchange Performance.

In addition to sizing the processor architecture, the memory must also be sized correctly for deploying a multiple-role configuration. For more information, see Understanding Memory Configurations and Exchange Performance.

Deploying a Multiple-Role Server in a DAG

When you're deploying single-role Mailbox servers in a DAG, consider capacity planning for single and multiple server failures in relationship to Mailbox server load. If you have four Mailbox servers in a DAG, size the Mailbox servers at 50 percent capacity so that they can accommodate double the number of active users, in the event of simultaneous failure of two Mailbox servers. Because the Hub Transport and Client Access servers are on different physical servers, the load on those servers isn't impacted much by the loss of one or two Mailbox servers.

When you're deploying multiple-role servers in a DAG, think about capacity planning for Client Access, Hub Transport, and Mailbox server load. If you have four multiple-role servers in a DAG, make sure there is sufficient capacity to accommodate a potential doubling of Hub Transport and Client Access server load. Because the multiple-role configuration aligns with the recommended processor core ratios for server roles, if you correctly size the maximum active databases for the Mailbox server role, Hub Transport and Client Access servers should meet the performance objectives for this scenario.

Return to top

Example of Sizing for an Exchange 2010 Multiple-Role Scenario

The following example illustrates the server sizing process for multiple-role servers. The example has the following design assumptions:

- **Total mailbox count** 24,000
- **Mailbox profile** 100 messages per day (for example, 20 sent and 80 received)
- **Database cache per mailbox** 6 MB (based on a 100 message per day profile)
- **Availability requirements** Mailbox resiliency within a single site; protection against simultaneous failure of three database copies and two servers
- **Database requirements** 120 databases in the DAG, 200 mailboxes per database
- **Server platform** 2 x 6 core 2.26 gigahertz (GHz) processor-based (X5650) server (12 cores)

The following process applies:

1. **Calculate server count** A four-node DAG is required to protect against the simultaneous failure of two servers. However, the customer has decided to deploy six servers to control the maximum number of active mailboxes during a double server failure event. Therefore, the design begins with six Mailbox servers within the DAG.
2. **Calculate maximum active mailboxes per server based on the activation model** Assuming the active databases are equally distributed across the nodes, each server ideally hosts 4,000 active mailboxes (24,000 ÷ 6). To calculate the active mailbox count after a double-node failure (based on this example), the mailbox count is divided by the remaining four nodes, which equals 6,000 active mailboxes per node (24,000 ÷ 4).
   In this example, the *MaximumActiveDatabases* parameter on the **Set-MailboxServer** cmdlet is configured for 30 to ensure that no more than 40 percent of the databases become active on a single server.
3. **Calculate active mailbox CPU requirements** Multiply the maximum number of active mailboxes on a server by the megacycles per active mailbox (6,000 × 2 megacycles = 12,000 megacycles), based on the **Estimated IOPS per mailbox based on message activity and mailbox database cache** table in Understanding the Mailbox Database Cache. Multiply this value by 10 percent

for each additional database copy.
In this example, there's one active copy and three passive copies for every database, so the 12,000 megacycles is increased by 30 percent (12,000 × 1.3 = 15,600 megacycles). For more information, see "Database Cache Metrics" in Understanding the Mailbox Database Cache.

4. **Calculate passive mailbox CPU requirements** Multiply the number of passive mailboxes (when a server is hosting the maximum number of active mailboxes) by the megacycles per passive mailbox (10,000 × 0.3 megacycles = 3,000 megacycles), based on the **Estimated IOPS per mailbox based on message activity and mailbox database cache** table in Understanding the Mailbox Database Cache. For more information, see "Database Cache Metrics" in Understanding the Mailbox Database Cache.
5. **Add active and passive CPU requirements to get total CPU requirement** In this example, 15,600 active mailbox megacycles + 3,000 passive mailbox megacycles = 18,600 megacycles total CPU requirement.
6. **Apply Mailbox CPU requirement to hardware platform** This example uses a 2 x 6 core 2.26-GHz processor-based (x5650) server. Based on the guidance in Mailbox Server Processor Capacity Planning, this equates to 60,083 megacycles. Divide the required megacycles by the available megacycles based on the server platform to estimate the CPU utilization at peak period after a double-node failure (18,600 ÷ 60,083 = 31 percent predicted CPU utilization).
   We recommend that the Mailbox server role portion of multiple-role configurations be designed to not exceed 40 percent utilization during peak periods (for example, simultaneous failure of two nodes). This design allows sufficient space to accommodate CPU utilization of Client Access and Hub Transport server roles while maintaining total server CPU utilization at less than 80 percent during peak periods (for example, simultaneous failure of two nodes).
7. **Calculate active mailbox memory requirements** Multiply the number of active mailboxes by the required database cache per mailbox. In this example, with a double server failure, the remaining servers will host 6,000 active mailboxes (6,000 × 6 MB) ÷ 1,024 = 35.1 GB. The database cache requirements are based on the mailbox profile. For more information, see "Database Cache Metrics" in Understanding the Mailbox Database Cache.
8. **Apply total memory requirements to hardware platform** The total memory required is based on the database cache requirements and the server design (dedicated or multi-role). For more information, see the **Default mailbox database cache sizes** table in Understanding the Mailbox Database Cache. The total memory requirement for the multi-role server in this example is 52.2 GB ((4 GB + 35.1 GB) ÷ 0.75). Because 52.2 GB isn't a standard memory configuration, round up to 64 GB or the closest memory configuration that your server supports.

1.15.1.5 Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning

Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning

Exchange Server 2010 > Performance and Scalability > Understanding Exchange Performance >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-09-21*

A common trend in server hardware is a significant increase in processor performance and an increasing number of processor cores supported on a physical processor. This means that deploying a single Exchange server role on a standard commodity server with two physical processors may leave a portion of available CPU underutilized. Some customers expect server virtualization to more effectively use server CPU resources. Other customers want to combine Exchange server roles on the same physical server. Both can be valid solutions if implemented according to deployment recommendations and best practices.

You can use the information in this topic to help determine when you should deploy the Client Access server role and the Hub Transport server role on the same physical server, and how to properly plan for the combined role configuration. For information about deploying the Client Access, Hub Transport, and Mailbox server roles on the same physical server, see Understanding Multiple Server Role Configurations in Capacity Planning.

Contents

When Client Access and Hub Transport Combined Role Configurations Are Recommended

We recommend that you deploy the Client Access and Hub Transport server roles on the same physical server if you're considering the following:

- **Server consolidation** For deployments where the primary goals are to minimize the number of physical servers, operating system instances, and Exchange servers to manage, a Client Access and Hub Transport combined role deployment is a recommended solution. Running the Client Access and Hub Transport server roles on the same physical server provides the necessary role redundancy with a minimum requirement of two physical servers.
- **Virtualization** For deployments where virtualization host servers have processor counts divisible by 8 (8, 16, 24, 32, or 48), deploying Client Access and Hub Transport combined role servers in a 1:1 processor core ratio with single role Mailbox servers ensures a well-balanced virtual machine placement regardless of host server size.

Return to top

Processor Recommendations for Client

Access and Hub Transport Combined-Role Servers

The maximum recommended processor core configuration is 12 processor cores for the Client Access and Hub Transport combined role servers. Although the Client Access and Hub Transport combined role configuration can be deployed on servers with more than 12 processor cores, we don't recommend it.

The following describes the minimum requirements and recommended maximum configurations:

- **Minimum** This is the minimum processor and memory configuration suitable for the Client Access and Hub Transport combined role server. The minimum hardware requirements must be met to receive support from Microsoft Customer Service and Support.
- **Recommended maximum** This is the maximum recommended processor and memory configuration for the Client Access and Hub Transport combined role server. Recommended maximum is defined as the upper limit of viable processor and memory configurations based on price and performance. The recommended maximum configuration is a guideline. It isn't a support criterion, and it doesn't include the resource requirements of third-party applications that might access or be installed on the server. The recommended maximum configuration may change over time based on price changes and technology advancements.

The following table shows the minimum and recommended maximum processor cores for Microsoft Exchange Server 2010 combined role servers.

Processor configurations for Exchange 2010 Client Access and Hub Transport combined role servers

Exchange 2010 server role	Minimum	Recommended maximum
Client Access and Hub Transport combined role servers	2 x processor cores	12 x processor cores

Important:

Some server virtualization platforms may not support the maximum number of processors identified in the table above. If you're planning to deploy Exchange server roles on a virtualization platform, please check the documentation for that platform to determine the maximum number of supported virtual processors.

Return to top

Client Access and Hub Transport Combined Role Server Configuration Alignment with Recommended Processor Core Ratios

The following table outlines the recommended number of processor cores deployed for the Client Access and Hub Transport server roles relative to the number of processor cores deployed for the Mailbox server role. The standard core ratios don't align well to the number of processor cores available on systems today. Unless you have a large organization with many Client Access, Hub Transport, and Mailbox servers, your

deployment probably won't match the desired processor core ratios.

Client Access and Hub Transport combined role server configurations can solve this problem and should result in more optimal hardware utilization. For example, if you have a server with four processor cores, the Client Access server role uses approximately three cores, and the Hub Transport server role uses approximately one core. If you deploy this in combination with four core Mailbox servers, the result is a 4:1 Mailbox to Hub Transport server role core ratio and a 4:3 Mailbox to Client Access server role core ratio. This closely aligns with the recommended processor core ratio guidance.

The following table shows the recommended server role ratios based on processor core for combined role servers.

Processor configurations for Exchange 2010 Client Access and Hub Transport combined role servers

Server role ratio	Recommended processor core ratio
Mailbox:Hub Transport	7:1 (with no antivirus application scanning on the Hub Transport server) 5:1 (with an antivirus application scanning on the Hub Transport server)
Mailbox:Client Access	4:3
Mailbox:Client Access and Hub Transport combined role server	1:1

Return to top

Memory Recommendations for Client Access and Hub Transport Combined Role Servers

The following table illustrates the minimum and recommended maximum memory configurations for Exchange 2010 combined role server configurations.

Memory configuration for Exchange 2010 combined role servers

Exchange 2010 server role	Minimum	Recommended maximum
Client Access and Hub Transport combined role servers	4 GB	2 GB per core

Return to top

Determining Client Access and Hub Transport Combined Role Server Hardware Requirements

To determine the hardware requirements for the Client Access and Hub Transport combined role server, you first need to determine the hardware requirements for the Mailbox server role. For more information, see Mailbox Server Processor Capacity

Planning.

Use the number of processor cores that will be deployed for the Mailbox server role and deploy an equal number of processor cores for the Client Access and Hub Transport combined role server. For example, for every Mailbox server with eight processor cores, deploy a Client Access and Hub Transport combined role server with eight processor cores. Then apply memory configuration guidelines to the processor core count. For example, if your Client Access and Hub Transport combined role server has eight processor cores, you will need 2 GB per core or 16 GB of memory per server.

Return to top

Client Access and Hub Transport Combined Role Servers and Virtualization

If you plan to virtualize Exchange, using Client Access and Hub Transport combined role servers can make the planning process easier. The recommended sizing for virtual machines is summarized in the following table.

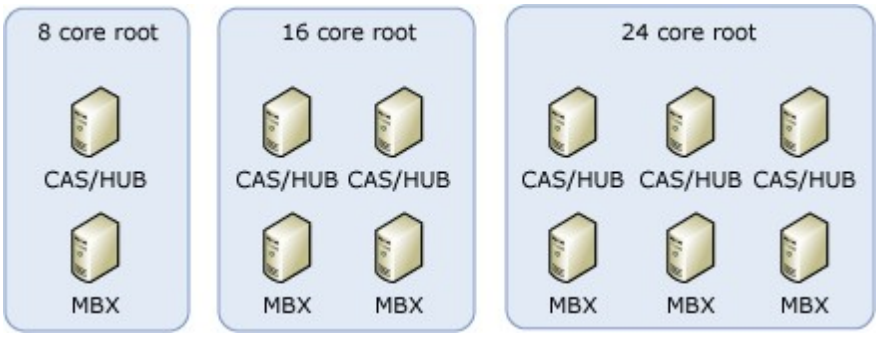
Recommended sizing for virtual machines for Exchange 2010 Client Access and Hub Transport combined role servers

Virtual machine role	Recommended number of virtual processors	Recommended memory
Client Access and Hub Transport combined role servers	4 x processor core	8 GB
Mailbox server role	4 x processor core	4 GB plus 3-30 megabytes (MBs) per mailbox. This variable is based on the user profile. For details, see "Recommended Memory Configurations" in Understanding Memory Configurations and Exchange Performance.

Note:
Not all server virtualization platforms support the same number of maximum virtual processors. If you plan to deploy Exchange server roles on a virtualization platform, check the documentation for that platform to determine the maximum number of supported virtual processors.

We recommend that you deploy these virtual machines in a 1:1 ratio (for example, deploy one Client Access and Hub Transport combined role virtual machine for every Mailbox server role virtual machine).

If you're using virtualization servers dedicated to hosting Exchange virtual machines and the processor core count is divisible by 8 (8, 16, 24, 32, or 48), placement of virtual machines is straightforward. For example, if your virtualization root server has eight processor cores, deploy one Client Access and Hub Transport combined role virtual machine and one Mailbox server role virtual machine. If your virtualization root server has 16 processor cores, deploy two of each. If your root server has 24 cores, deploy 3 of each, as shown in the following figure.



With this design, you can maintain Exchange role redundancy across root servers and balance Exchange workloads for effective utilization of root server resources. The following table provides a summary of recommended sizing guidance for root servers hosting Client Access and Hub Transport combined role virtual machines.

Recommended sizing for virtual machines for Exchange 2010 Client Access and Hub Transport combined role servers

Root server processor cores (root servers with 12 x processor cores don't fit this model)	Root server memory requirements	Recommended memory configuration	Number of Client Access and Hub Transport combined role virtual machines	Number of Mailbox server role virtual machines
8	26 - 34 GB	32 GB	1	1
16	53 - 69 GB	64 GB	2	2
24	76 - 100 GB	96 GB	3	3
32	131 - 143 GB	160 GB	4	4
48	152 - 200 GB	192 GB	6	6

Note:
Root server memory recommendations are based on root operating system requirements, plus virtual machine requirements. Mailbox virtual machine requirements are dependent on mailbox profiles. For more information, see "Recommended Memory Configurations" in Understanding Memory Configurations and Exchange Performance.

Note:
Costs should be considered when purchasing memory. You may have to reduce the number of active mailboxes hosted on each Mailbox server virtual machine to align root server memory requirements with the purchased memory configuration.

1.15.1.6 Calculate Megahertz Per User and IOPS Per User

Calculate Megahertz Per User and IOPS Per User

Exchange Server 2010 > Performance and Scalability > Understanding Exchange Performance >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010*

Topic Last Modified: *2012-07-23*

Knowing how to estimate the resource consumption of an Exchange user helps you with hardware and capacity planning. You can use the procedures in this topic to determine the megacycles and input/output per second (IOPS) per user for Microsoft Exchange Server 2010. For more information related to your hardware and capacity planning, see the following topics:

- Understanding Processor Configurations and Exchange Performance
- Understanding Multiple Server Role Configurations in Capacity Planning
- Understanding Client Access and Hub Transport Combined Role Configurations in Capacity Planning

You'll need to understand the following terms to perform the procedures discussed in this topic:

- **Megahertz/user** This term refers to the megacycles per second per user, which is the raw processor usage required per user measured during the peak (two-hour) period on a production server.
- **IOPS/Total number of active mailboxes** This term refers to the input/output (I/O) per second per active mailbox, which is the raw database disk usage (IOPS) required per user measured during the peak period on a production server. This metric doesn't include either transaction log I/O operations or I/O to passive database copies. It also excludes I/O to content indexing files.

Prerequisites

If the active mailboxes in a company have diverse usage requirements, you may want to measure usage profiles separately for different groups of users. For example, sales engineers may have a different usage profile than the marketing group. However, be aware that separate measurements are helpful only if the groups of users have significantly different requirements.

To accurately measure the megacycles and IOPS of the different types of users, you need to:

- Isolate the user groups on distinct databases and Mailbox servers.
- Associate those Mailbox servers with distinct Hub Transport and Client Access servers.
- Create unique namespaces for each profile.

You can then use the values of the following counters to determine the relative weight of the users:

- MSExchangeIS Mailbox\Messages Delivered/sec
- MSExchangeIS Mailbox\Messages Sent/sec

For an example, consider the following calculation. If the database with 100 sales engineers receives 0.5 messages per second and sends 0.3 messages per second, while the database with 50 marketing employees receives 0.1 messages per second and sends 0.1 messages per second, the resulting value of 2.0 indicates that one sales engineer generates twice the megacycles and IOPS on all roles as one marketing employee.

$$\frac{\text{cost of Sales Engineer}}{\text{cost of Marketer}} = \frac{\frac{0.5\ \text{messages/sec.} + 0.3\ \text{messages/sec.}}{\text{100 engineers}}}{\frac{0.5\ \text{messages/sec.} + 0.1\ \text{messages/sec.}}{\text{50 marketers}}} = 2.0$$

Calculate total megacycles per user for

the Client Access, Hub Transport, and Mailbox server roles without mailbox resiliency

You can use the example in this section to help you calculate megacycles for your server roles.

The total megacycles consumed per second is the product of the (percent total CPU) × (number of cores) × (speed of each core in megahertz (MHz)).

To calculate the MHz per mailbox, perform the following steps:

1. Select a production server with a typical user load.
2. Use Performance Monitor (Perfmon.exe) to monitor the Processor\% Processor Time_Total counter over the peak hours of server activity.
3. Calculate the average CPU usage (percent) from the data you obtain in step 2.
4. Calculate your current MHz per user as described in the following formula:

   MHz per mailbox = ((average CPU usage) × (number of processors × number of cores per processor) × (speed of processors in MHz)) ÷ (number of mailboxes)

For example, let's assume the following values for a Mailbox server:

- Average CPU usage = 30 percent of total CPU during the user peak period
- Number of processors = 2
- Number of cores per processor = 4
- Speed of processors in megacycles = 3,000 MHz
- Number of active mailboxes = 6,000

Given these values, and using the formula described earlier in step 4 of this section, we find that the CPU cost per mailbox is:

30% × (2 processors × 4 cores) × (3,000 MHz) ÷ 6,000

= 1.2 megacycles per mailbox

Calculate the total megahertz per user for the Mailbox server role with mailbox resiliency

If mailbox resiliency is enabled, you should identify the costs of supporting the database copies. For example, estimate that a passive user's mailbox consumes 15 percent less megahertz than an active user's mailbox, and additionally that each passive copy hosted elsewhere adds 10 percent to the user's CPU footprint on the active server.

Use the following equation to calculate megahertz consumed with mailbox resiliency enabled:

Megahertz consumed = (active users) × (megacycles per user) + (0.1) × (active users) × (number of passive copies) × (megacycles per user) + (0.15) × (passive users) × (megacycles per user)

Combine the preceding equation with the following:

Megahertz consumed = %_Total CPU × (number of cores) × (speed of a core)

The following figure shows the solution for the preceding equations.

$$\frac{\text{Megacycles}}{\text{user}} = \frac{\%(\square_{\text{Total}}\text{CPU}) * (\text{number of cores}) * \left(\frac{\text{MHzMHz}}{\text{core}}\right)}{((\text{Active Users}) * (1+(0.1*\text{passive copies}))) + (0.15*\text{Passive Users})}$$

$$\frac{\text{Megacycles}}{\text{user}} = \frac{(30\%) * \left(2 \text{ proc x } 4\frac{\text{cores}}{\text{proc}}\right) * \left(3000\frac{\text{MHzMHz}}{\text{core}}\right)}{((3000)3000*(1+(0.1*2))) + (0.15*2000)} = 1.8\ \frac{\text{Megacycles}}{\text{user}}$$

For example, assume the following values for the Mailbox server:

- Average CPU usage = 30 percent of total CPU during the user peak period
- Number of processors = 2
- Number of cores per processor = 4
- Speed of processors in megacycles = 3,000 MHz
- Number of active mailboxes = 3,000
- Number of passive mailboxes = 2,000
- Number of database copies = 2

Given these values, the CPU cost per user is 1.8, as shown in the preceding figure.

Therefore, to calculate megacycles per mailbox for a Mailbox server with mailbox resiliency, perform the following steps:

1. Select a production server with a typical user load.
2. Use System Monitor to monitor the Processor\% Processor Time_Total counter over the peak two hours of server activity.
3. Calculate the average CPU usage (percent) from the data you obtain in step 2.
4. Calculate your current MHz per user as described in the following formula: MHz per mailbox = ((average CPU usage) × (number of processors × number of cores per processor) × (speed of processors in megacycles)) ÷ [(number of active mailboxes)(1 + 0.1) × (number of database copies) + (0.15) × (number of passive mailboxes)]

Calculate the mailbox disk IOPS per user

Random database reads and writes are a concern when considering mailbox disk IOPS per mailbox. However, sequential log writes are lower cost and rarely a problem. To find the number of IOPS on an active database, add the values of the following MSExchange database counters at the peak load period:

- Instances\I/O Database Reads/sec (Information Store\database)
- Instances \I/O Database Writes/sec (Information Store\database)

To measure IOPS per mailbox, perform the following steps:

1. Select a production server with a typical user load.
2. Use System Monitor to monitor the following counters over the peak two hours of server activity:
   - MSExchange Database Instances\I/O Database Reads/sec (Information Store\database)
   - MSExchange Database Instances\I/O Database Writes/sec (Information Store\database)
3. Calculate current mailbox disk IOPS per mailbox as described in the following formula:

   Mailbox disk IOPS per mailbox = (MSExchange Database Instances\I/O Database Reads/sec (Information Store\database)) + MSExchange Database

Instances\I/O Database Writes/sec (Information Store\database) ÷ (number of mailboxes on that database)

For example, assume the following values for a database:

- MSExchange Database Instances\I/O Database Reads/sec (Information Store \database) = 7
- MSExchange Database Instances\I/O Database Writes/sec (Information Store \database) = 8
- Number of mailboxes = 250

Given these values, the following determines the IOPS per mailbox:

(7 + 8) ÷ 250 = 0.06 IOPS per user

For more information, see the values recommended for planning a topology in Mailbox Server Processor Capacity Planning.

Estimates of Mailbox Database Cache, IOPS, and CPU Usage

The following table provides data estimates that you can use to determine the megacycles and IOPS per user for your Exchange 2010 system.

In the table, the megacycles estimate is based on the measurement of Intel Xeon x5470 3.33 gigahertz (GHz) processors (2 × 4 core arrangement). A 3.33 GHz processor core provides 3300 megacycles of performance throughput. You can consider other processor configurations by comparing this measured platform to server platforms tested by the Standard Performance Evaluation Corporation (SPEC) at SPEC CPU2006.

Note:

You must increase the megacycles per active mailbox by 10 percent for each additional database copy after the one active copy.

Per mailbox database cache, IOPS, and CPU estimates based on message activity

Messages sent or received per mailbox per day	Database cache per mailbox in megabytes (MB)	Single database copy (stand-alone) with estimated IOPS per mailbox	Multiple database copies (mailbox resiliency) with estimated IOPS per mailbox	Megacycles for active mailbox or stand-alone mailbox	Megacycles for passive mailbox
50	3	0.06	0.05	1	0.15
100	6	0.12	0.1	2	0.3
150	9	0.18	0.15	3	0.45
200	12	0.24	0.2	4	0.6
250	15	0.3	0.25	5	0.75
300	18	0.36	0.3	6	0.9

350	21	0.42	0.35	7	1.05
400	24	0.48	0.4	8	1.2
450	27	0.54	0.45	9	1.35
500	30	0.6	0.5	10	1.5

1.15.2 Tools for Performance and Scalability Evaluation

Tools for Performance and Scalability Evaluation

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-09-21*

When evaluating the scalability and performance of Exchange in a lab environment, you can use tools provided by Microsoft to generate a simulated Exchange workload on your system and analyze the effect of that workload.

To determine how many Exchange 2010 servers are required to manage user load, use the following capacity planning tools:

- Microsoft Exchange Jetstress
- Microsoft Exchange Load Generator

Important:

Microsoft Exchange Jetstress should be used on systems prior to placing production data on the server. Jetstress should not be used on systems containing production data. Exchange Load Generator is intended for use in test environments, not in production environments.

Exchange Server Jetstress 2010

The Jetstress tool is designed to simulate Exchange I/O at the database level by interacting directly with the database technology of the Extensible Storage Engine (ESE), also known as Jet, that Exchange is built on. Jetstress can be configured to test the maximum I/O throughput available to your disk subsystem within the required performance constraints of Exchange, or it can accept a desired profile of user count and I/Os per second per user and validate that the disk subsystem is capable of maintaining an acceptable level of performance with such a profile. Jetstress testing can be used to validate storage reliability and performance prior to the deployment of Exchange servers. You should run Jetstress if you are concerned about your storage subsystem performance or if you need to determine a system's I/O capacity.

The documentation for Jetstress describes how to configure and execute an I/O validation or evaluation on your server hardware. You can download Jetstress from Microsoft Exchange Server Jetstress 2010 (64 bit) and Microsoft Exchange Server Jetstress 2010 (32 bit).

For more information, see Microsoft Exchange Server Jetstress 2010.

Exchange Server Load Generator 2010

The Load Generator (LoadGen) tool is designed to produce a simulated client workload

against a test Exchange deployment. This workload can be used to evaluate how Exchange performs, and can also be used to analyze the effect of various configuration changes on Exchange behavior and performance while the system is under load. The documentation for LoadGen describes how to configure and execute a load test against an Exchange server. LoadGen is capable of simulating Microsoft Office Outlook 2003 (online and cached), Outlook 2007 (online and cached), POP3, IMAP4, SMTP, ActiveSync, and Outlook Web App client activity. It can be used to generate a single-protocol workload, or these client protocols can be combined in some form to generate a multi-protocol workload.

Use the output from these tests in the following ways:

- Validate deployments
- Calculate the client computer response time for the server configuration under client load
- Estimate the number of users per server
- Identify bottlenecks on the server

You can download LoadGen at Exchange Load Generator 2010 (64 bit) and Exchange Load Generator 2010 (32 bit).

When to Use Performance and Scalability Tools

Jetstress and LoadGen are typically used as part of the pre-deployment process, either to provide data for hardware sizing requirements prior to hardware purchasing, or to analyze the stability and performance of a system prior to placing it into production.

Whenever possible, you should run a Jetstress test prior to placing a mailbox server into production. Jetstress testing is straightforward and can be accomplished with little additional work beyond the hardware setup and operating system configuration that would already be necessary prior to the installation of Exchange.

LoadGen testing is much more involved and should be considered and planned carefully. Set a realistic goal for the information to be obtained as a result of the test, and always remember that LoadGen doesn't provide a 100 percent accurate simulation of all client activity. Therefore, any measurements generated by Loadgen testing should be used as a part of your decision-making process and should not be the only data points used to make a final decision for server sizing or configuration changes.

Important:

Test tools like LoadGen are not designed to be run in a production environment and should never be run against a live production system or in an environment that has any connection to a live production system. Additionally, you should use extreme caution when running LoadGen against a test environment that contains copies of actual data, as it may be possible for LoadGen to act on messages in your test environment in such a way that outgoing mail leaves your test environment and ends up in a production mailbox (depending on the message routing configuration of your test environment).

Evaluating Test Results

Both Jetstress and LoadGen produce a test report at the conclusion of any test activity. The test report contains a high-level pass/fail metric that you can use to determine if the other reported values will be usable for server sizing or pre-deployment validation. Both tools also provide various performance metrics. In addition to the values provided in the test reports, you should read the tool documentation for additional suggestions about server performance counters that should be monitored during the test to evaluate system health and performance.

1.15.3 Performance and Scalability Counters and Thresholds

Performance and Scalability Counters and Thresholds

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-09-01*

The topics in this section describe the performance and scalability counters you can use to monitor Microsoft Exchange Server 2010 server roles. You can use Performance Monitor to automatically collect performance data from local or remote Exchange 2010 servers. You can define start and stop times for automatic log generation, manage multiple logging sessions from a single console window, and set an alert on a computer that enables a message to be sent or a log to be started when your criteria are met. The Windows Server 2008 operating system defines the performance data collected with regard to objects, counters, and instances. By using the performance tool and performance logs and alerts, you can select performance objects, counters, and instances to collect, and then present data about the performance of system components or installed software. For more information about performance monitoring, see the Performance Monitoring Getting Started Guide.

This section contains the following topics:

Common Counters

Virtualization Counters

Client Access Server Counters

Mailbox Server Counters

Transport Server Counters

Unified Messaging Counters

You can also use the Microsoft Operations Framework (MOF) to help with managing and maintaining your organization. MOF is a collection of best practices, principles, and models that give you technical guidance about the management of IT projects such as daily Exchange operations. The MOF Technology Library provides guidance and best practices to help IT pros better understand how to use MOF with Microsoft technologies. The first component of the library is a new series of reliability workbooks. These resources provide the knowledge, specific tasks, and schedules needed to keep technologies running smoothly so IT can deliver the services an organization expects. For more information about MOF, see the MOF Technology Library. From there, you can download workbooks related to many aspects of Microsoft Exchange.

1.15.3.1 Common Counters

Common Counters

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

This topic provides information about counters common to all server roles in Microsoft Exchange Server 2010. You can use Performance Monitor (perfmon.exe) to monitor these counters. For more information, see Performance Monitor Getting Started Guide. For information about other counters relevant to Exchange 2010, see Performance and Scalability Counters and Thresholds.

Processor and Process Counters

The following table provides information about processor and process counters.

Counter	Description	Threshold	Troubleshooting
Processor(_Total)\% Processor Time	Shows the percentage of time that the processor is executing application or operating system processes. This is when the processor isn't idle.	Should be less than 75% on average.	
Processor(_Total)\% User Time	Shows the percentage of processor time spent in user mode. User mode is a restricted processing mode designed for applications, environment subsystems, and integral subsystems.	Should remain below 75%.	
Processor(_Total)\% Privileged Time	Shows the percentage of processor time spent in privileged mode. Privileged mode is a processing mode designed for operating system components and hardware-manipulating drivers. It allows direct access to hardware and all memory.	Should remain below 75%.	If total processor time is high, use this counter to determine which process is causing high CPU.
Process(*)\% Processor Time	Shows the percentage of elapsed processor time that all process threads used to execute instructions. An instruction is the basic unit of execution in a computer. A thread is the object that executes instructions,		If total processor time is high, use this counter to determine which process is causing high CPU.

	and a process is the object created when a program is run. Code executed to handle some hardware interruptions and trap conditions are included in this count.		
System\Processor Queue Length (all instances)	Indicates the number of threads each processor is servicing. Processor Queue Length can be used to identify if processor contention or high CPU utilization is caused by the processor capacity being insufficient to handle the workloads assigned to it. Processor Queue Length shows the number of threads that are delayed in the Processor Ready Queue and are waiting to be scheduled for execution. The value listed is the last observed value at the time the measurement was taken.	Shouldn't be greater than 5 per processor.	On a computer with a single processor, observations where the queue length is greater than 5 are a warning that there is frequently more work available than the processor can handle readily. When this number is greater than 10, it's a strong indicator that the processor is at capacity, particularly when coupled with high CPU utilization. On systems with multiprocessors, divide the queue length by the number of physical processors. A multiprocessor system configured using hard processor affinity (processes are assigned to specific CPU cores), which have large values for the queue length, can indicate that the configuration is unbalanced. Although Processor Queue Length typically isn't used for capacity planning, it can be used to identify if systems within the environment are capable of running the loads or if additional processors or faster processors should be purchased

			for future servers.

Memory Counters

The following table shows common memory counters.

Counter	Description	Threshold	Troubleshooting
Memory\Available Mbytes	Shows the amount of physical memory, in megabytes (MB), immediately available for allocation to a process or for system use. It's equal to the sum of memory assigned to the standby (cached), free, and zero page lists. For a full explanation of the memory manager, refer to Microsoft Developer Network (MSDN) or "System Performance and Troubleshooting Guide" in the Windows Server 2003 Resource Kit.	Should remain above 100 MB at all times.	
Memory\Pool Nonpaged bytes	Consists of system virtual addresses guaranteed to be resident in physical memory at all times and can thus be accessed from any address space without incurring paging input/output (I/O). Like paged pool, nonpaged pool is created during system initialization and is used by kernel-mode components to allocate system memory.	Not applicable.	
Memory\Pool Paged bytes	Shows the portion of shared system memory that can be paged to the disk paging file. Paged pool is created during system initialization and is used by kernel-	Not applicable.	Monitor for increases in pool paged bytes indicating a possible memory leak.

	mode components to allocate system memory.		
Memory\Cache Bytes	Shows the current size, in bytes, of the file system cache. By default, the cache uses up to 50% of available physical memory. The counter value is the sum of Memory\System Cache Resident Bytes, Memory \System Driver Resident Bytes, Memory\System Code Resident Bytes, and Memory\Pool Paged Resident Bytes.	Not applicable.	Should remain steady after applications cache their memory usage. Check for large dips in this counter, which could be attributed to working set trimming and excessive paging. Used by the content index catalog and continuous replication log copying.
Memory\Committed Bytes	Shows the amount of committed virtual memory, in bytes. Committed memory is the physical memory that has space reserved on the disk paging files. There can be one or more paging files on each physical drive. This counter displays the last observed value only; it isn't an average.	Not applicable.	Determines the amount of committed bytes in use.
Memory\%Committed Bytes in Use	Shows the ratio of Memory\Committed Bytes to the Memory \Commit Limit. Committed memory is the physical memory in use for which space has been reserved in the paging file should it need to be written to disk. The commit limit is determined by the size of the paging file. If the paging file is enlarged, the commit limit increases, and the ratio is reduced. This counter displays the current percentage value only; it isn't an	Not applicable.	If this value is high (more than 90%), you may begin to see commit failures. This is a clear indication that the system is under memory pressure.

	average.		

Memory Paging Counters

The following table shows common memory paging counters.

Counter	Description	Threshold	Troubleshooting
Memory->Transition Pages Repurposed/sec	Indicates system cache pressure.	Should be less than 100 on average. Spikes should be less than 1,000.	
Memory\Page Reads/sec	Indicates data must be read from the disk instead of memory. Indicates there isn't enough memory and paging is beginning. A value of more than 30 per second means the server is no longer keeping up with the load.	Should be less than 100 on average.	
Memory\Pages/Sec	Shows the rate at which pages are read from or written to disk to resolve hard page faults. This counter is a primary indicator of the kinds of faults that cause system-wide delays. It's the sum of Memory\Pages Input/sec and Memory\Pages Output/sec. It's counted in numbers of pages, so it can be compared to other counts of pages, such as Memory\Page Faults/sec, without conversion. It includes pages retrieved to satisfy faults in the file system cache (usually requested by applications) and non-cached mapped memory files.	Should be below 1,000 on average.	The values returned by this counter may be more than you expect. These values may not be related to either paging file activity or cache activity. Instead, these values may be caused by an application that is sequentially reading a memory-mapped file. Use Memory\Pages Input/sec and Memory\Pages Output/sec to determine page file I/O.
Memory\Pages Input/sec	Shows the rate at which pages are read from disk to resolve hard page faults. Hard page faults	Should be below 1,000 on average.	

	occur when a process refers to a page in virtual memory that isn't in its working set or elsewhere in physical memory, and must be retrieved from disk. When a page is faulted, the system tries to read multiple contiguous pages into memory to maximize the benefit of the read operation. Compare the value of Memory\Pages Input/sec to the value of Memory\Page Reads/sec to determine the average number of pages read into memory during each read operation.		
Memory\Pages Output/sec	Shows the rate at which pages are written to disk to free space in physical memory. Pages are written back to disk only if they are changed in physical memory, so they are likely to hold data, and not code. A high rate of pages output might indicate a memory shortage. Microsoft Windows writes more pages back to disk to free up space when physical memory is in short supply. This counter shows the number of pages, and can be compared to other counts of pages, without conversion.	Should be below 1,000 on average.	

Memory Consumption Counters

The following table shows common process memory consumption counters.

Counter	Description	Threshold	Troubleshooting
Process(*)\Private Bytes	Shows the current number of bytes this	Not applicable.	This counter can be used for determining any memory leaks

	process has allocated that can't be shared with other processes.		against processes. For the information store process, compare this counter value with database cache size to determine if there is a memory leak in the information store process. An increase in information store private bytes, together with the same increase in database cache, equals correct behavior (no memory leak).
Process(*)\Virtual Bytes	Represents (in bytes) how much virtual address space the process is currently consuming.	Not applicable.	Used to determine if processes are consuming a large amount of virtual memory.

Process Working Set Counter

The following table shows a common process working set counter.

Counter	Description	Threshold	Troubleshooting
Process(_Total) \Working Set	Shows the current size, in bytes, of the working set of this process. The working set is the set of memory pages touched recently by the threads in the process. If free memory in the computer is above a threshold, pages are left in the working set of a process event if they aren't in use. When free memory falls below a threshold, pages are trimmed from working sets. If they are needed, they will be soft-faulted back to the working set before leaving main memory.	Not applicable.	Large increases or decreases in working sets cause paging. Ensure that the paging file is set to the recommended value of RAM+10. If working sets are being trimmed, add Process(*)\Working Set to determine what processes are affected. This counter could indicate either system-wide or process-wide issues. Cross-reference this counter with Memory \System Cache Resident Bytes to determine if system-wide working set trimming is occurring.

Process Handle Counter

The following table shows a common process handle counter.

Counter	Description	Threshold	Troubleshooting
Process(*)\Handle Count	Shows the total number of handles currently open by this process. This number is the sum of the handles currently open by each thread in this process.	Not applicable.	An increase in handle counts for a particular process may be the symptom of a faulty process with handle leaks, which is causing performance issues on the server. This isn't necessarily a problem, but is something to monitor over time to determine if a handle leak is occurring.

.NET Framework Counters

The following table shows Microsoft .NET Framework counters.

Counter	Description	Threshold	Troubleshooting
.NET CLR Memory(*)\ % Time in GC	Shows when garbage collection has occurred. When the counter exceeds the threshold, it indicates that CPU is cleaning up and isn't being used efficiently for load. Adding memory to the server would improve this situation.	Should be below 10% on average.	If this counter increases to a high value, there might be some objects that are surviving Gen 1 garbage collections and being promoted to Gen 2. Gen 2 collections require a full global catalog for clean up. Add other .NET Framework memory counters to determine if this is the case.
.NET CLR Exceptions (*)\# of Excepts Thrown / sec	Displays the number of exceptions thrown per second. These include both .NET Framework exceptions and unmanaged exceptions that get converted into .NET Framework exceptions. For example, the null pointer reference exception in unmanaged code would get thrown	Should be less than 5% of total requests per second (RPS) (Web Server(_Total) \Connection Attempts/sec * .05).	Exceptions should only occur in rare situations and not in the normal control flow of the program. This counter was designed as an indicator of potential performance problems due to a large (>100 sec) rate of exceptions thrown. This counter isn't an average over time. It displays the difference between

	again in managed code as a .NET Framework System.NullReference Exception. This counter includes both handled and unhandled exceptions.		the values observed in the last two samples divided by the duration of the sample interval.
.NET CLR Memory(*) \# Bytes in all Heaps	Shows the sum of four other counters: Gen 0 Heap Size, Gen 1 Heap Size, Gen 2 Heap Size, and Large Object Heap Size. This counter indicates the current memory allocated in bytes on the GC Heaps.	Not applicable.	These regions of memory are of type MEM_COMMIT. The value of this counter is always less than the value of Process \Private Bytes, which counts all MEM_COMMIT regions for the process. Private bytes minus # bytes in all heaps is the number of bytes committed by unmanaged objects. Used to monitor possible memory leaks or excessive memory usage of managed or unmanaged objects.

Network Counters

The following table shows common network counters.

Counter	Description	Threshold	Troubleshooting
Network Interface(*) \Bytes Total/sec	Indicates the rate at which the network adapter is processing data bytes. This counter includes all application and file data, in addition to protocol information such as packet headers.	For a 100-megabytes per second (MBps) network adapter, should be below 6–7 MBps. For a 1000-megabits per second (Mbps) network adapter, should be below 60–70 Mbps.	
Network Interface(*) \Packets Outbound Errors	Indicates the number of outbound packets that couldn't be transmitted because of errors.	Should be 0 at all times.	
TCPv4\Connections Established	Shows the number of TCP connections for	Not applicable.	Determines current user load.

	which the current state is either ESTABLISHED or CLOSE-WAIT. The number of TCP connections that can be established is constrained by the size of the nonpaged pool. When the nonpaged pool is depleted, no new connections can be established.		
TCPv6\Connection Failures	Shows the number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT. The number of TCP connections that can be established is constrained by the size of the nonpaged pool. When the nonpaged pool is depleted, no new connections can be established.	Not applicable.	Determines current user load.
TCPv4\Connections Reset	Shows the number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.	An increasing number of resets or a consistently increasing rate of resets can indicate a bandwidth shortage.	Some browsers send TCP reset (RST) packets, so be cautious when using this counter to determine reset rate.
TCPv6\Connections Reset	Shows the number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.	An increasing number of resets or a consistently increasing rate of resets can indicate a bandwidth shortage.	Some browsers send TCP reset (RST) packets, so be cautious when using this counter to determine reset rate.

Exchange Domain Controllers Connectivity Counters

The following table shows Exchange domain controllers connectivity counters.

Counter	Description	Threshold	Troubleshooting
MSExchange ADAccess Caches(*) \LDAP Searches/Sec	Shows the number of LDAP search requests issued per second.	Not applicable.	Used to determine current LDAP search rate.
MSExchange ADAccess Domain Controllers(*)\LDAP Read Time	Shows the time in milliseconds (ms) to send an LDAP read request to the specified domain controller and receive a response.	Should be below 50 ms on average. Spikes (maximum values) shouldn't be higher than 100 ms.	
MSExchange ADAccess Domain Controllers(*)\LDAP Search Time	Shows the time (in ms) to send an LDAP search request and receive a response.	Should be below 50 ms on average. Spikes (maximum values) shouldn't be higher than 100 ms.	
MSExchange ADAccess Processes (*)\LDAP Read Time	Shows the time (in ms) to send an LDAP read request to the specified domain controller and receive a response.	Should be below 50 ms on average. Spikes (maximum values) shouldn't be higher than 100 ms.	
MSExchange ADAccess Processes (*)\LDAP Search Time	Shows the time (in ms) to send an LDAP search request and receive a response.	Should be below 50 ms on average. Spikes (maximum values) shouldn't be higher than 100 ms.	
MSExchange ADAccess Domain Controllers(*)\LDAP Searches timed out per minute	Shows the number of LDAP searches that returned LDAP_Timeout during the last minute.	Should be below 10 at all times for all roles. Higher values may indicate issues with Active Directory resources.	
MSExchange ADAccess Domain Controllers(*)\Long running LDAP operations/Min	Shows the number of LDAP operations on this domain controller that took longer than the specified threshold per minute. (Default threshold is 15 seconds.)	Should be less than 50 at all times.	Higher values may indicate issues with Active Directory resources.

1.15.3.2 Virtualization Counters

Virtualization Counters

Exchange Server 2010 > Performance and Scalability > Performance and Scalability Counters and Thresholds >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

This topic provides information about virtualization counters in Microsoft Exchange Server 2010. You can use Performance Monitor (perfmon.exe) to monitor these counters. For more information, see Performance Monitor Getting Started Guide. For information about other counters relevant to Exchange 2010, see Performance and Scalability Counters and Thresholds.

Hyper-V Counters

The following table shows Microsoft Hyper-V counters.

Counter	Description	Threshold	Troubleshooting
Hyper-V Virtual Machine Health Summary\Health OK	Shows that the host server is running as expected.	Should be 1 at all times.	
Hyper-V Virtual Machine Health Summary\Health Critical	Shows the percentage of processor time spent in guest code. This is used to measure the total processor utilization for all virtual machines (VMs) running on the host server. This value is equal to the sum of the Hyper-V Hypervisor Root Virtual Processor\% Guest Run Time and Hyper-V Hypervisor Virtual Processor\% Guest Run Time counters.	Should remain below 65%.	If you see a value of 1, the server is in a critical state, and you should investigate further to determine the exact issue.

Hyper-V Processor Counters

The following table shows Hyper-V processor counters.

Counter	Description	Threshold	Troubleshooting
Hyper-V Hypervisor Logical Processor\% Guest Run Time	Shows the percentage of processor time spent in guest code. This is used to measure the total processor utilization for all VMs running on the host server. This value is equal to the sum of the Hyper-V Hypervisor Root Virtual Processor\% Guest Run Time and Hyper-V Hypervisor Virtual Processor\% Guest Run Time	Should remain below 65%.	There is one logical processor that carries more load than the rest and that is LP0. This logical processor is where all interrupts in the system are directed. If there is too much load, this logical processor may reach 100%, which likely means input/ output (I/O) is a bottleneck in the system. There are some technologies in Windows Server 2008

	counters.		R2 that help reduce the load for networking. These technologies include Virtual Machine Queue (VMQ), VM Chimney, and RSS. There is no RSS support in guest VMs.
Hyper-V Hypervisor Logical Processor\% Hypervisor Run Time	Shows the percentage of processor time spent in hypervisor code. This is used to measure the total processor utilization of the hypervisor for the entire system.	Should remain below 5%.	
Hyper-V Hypervisor Logical Processor\% Idle Run Time	Shows the percentage of processor time spent in an idle state. This is used to measure the idle processor for the entire system.	Should remain above 30%.	
Hyper-V Hypervisor Logical Processor\% Total Run Time	Shows the percentage of processor time spent in guest and hypervisor code. This is used to measure the total processor utilization for hypervisor and all VMs running on the host server.	Should remain below 70%.	
Hyper-V Hypervisor Virtual Processor\% Guest Run Time	Shows the percentage of virtual processor time spent in guest code for a specific VM.	Should remain below 65%.	
Hyper-V Hypervisor Virtual Processor\% Hypervisor Run Time	Shows the percentage of processor time spent in hypervisor code for a specific VM.	Should remain below 5%.	
Hyper-V Hypervisor Virtual Processor\% Idle Run Time	Shows the percentage of processor time spent in an idle state for a specific VM.	Should remain above 30%.	
Hyper-V Hypervisor Virtual Processor\%	Shows the percentage of	Should remain below 70%.	

Total Run Time	processor time spent in guest and hypervisor code for a specific VM.		
Hyper-V Hypervisor Root Virtual Processor \% Guest Run Time	Shows the percentage of time used by the virtual processor in guest code. This is used to determine the processor utilization of the virtualization stack on the host server.	Should remain below 5%.	
Hyper-V Hypervisor Virtual Processor\% Hypervisor Run Time	Shows the percentage of time used by the virtual processor in hypervisor code. This is used to determine the processor unitization by the hypervisor used by the host (and isn't specific to any VMs).	Should remain below 5%.	

Hyper-V Memory Counters

The following table shows common Hyper-V memory counters.

Counter	Description	Threshold	Troubleshooting
Memory\Available MBytes	Available megabytes (MB) is the amount of physical memory, in megabytes, immediately available for allocation to a process or for system use. This shows how much memory is remaining for guests. There is a reserve of 256 MB, 512 MB, or 2,048 bytes that the root will always leave outside of guest memory. The exact amount varies depending on the Hyper-V release. If a VM won't start, it may be because there are too few available bytes to satisfy the reserve.	Should be greater than 2 MB.	

Memory\Pages/sec	Pages/sec is the rate at which pages are read from or written to disk, to resolve hard page faults. This is a measure of memory pressure because it tracks hard faults. Hard faults are page faults that require disk access. Usually, the number spikes when there are too few available bytes available on the system, and processes are competing with each other for physical RAM.	Not applicable.	
Hyper-V VM Vid Partition\Physical Pages Allocated	Shows the total number of guest pages and Virtual Infrastructure Driver (VID) pages needed to manage the VM.	Not applicable.	
Hyper-V VM Vid Partition\Remote Pages Allocated	On non-uniform memory access (NUMA)-based systems, this shows whether a VM is spanning multiple nodes.	Not applicable.	You want to avoid this whenever possible. You can require a VM to start from a particular node by using the API described in Looking for that last ounce of performance? Then try affinitizing your VM to a NUMA node. Another way is to stop and restart the VM. If possible, Hyper-V will allocate all memory on a single NUMA node. **Note** The content of each blog and its URL are subject to change without notice. The content within each blog is provided "AS IS" with no warranties, and confers no rights. Use of included script samples or code is subject to the terms specified in the

			Microsoft Terms of Use.
Hyper-V Hypervisor [ROOT] Partition\1G GPA Pages	Shows the number of 1G pages present in the Guest Physical Address (GPA) space of the partition. This indicates whether a VM is using large pages, which improves overall VM performance.	Not applicable.	Large pages are only used on systems that have vTLB hardware support. T learn more about vTLB, see Why does my desktop box slowdown when I install Hyper-V. **Note** The content of each blog and its URL are subject to change without notice. The content within each blog is provided "AS IS" with no warranties, and confers no rights. Use of included script samples or code is subject to the terms specified in the Microsoft Terms of Use.
Hyper-V Hypervisor [ROOT] Partition\2M GPA Pages	Shows the number of 2M pages present in the GPA space of the partition. This indicates whether a VM is using large pages, which improves overall VM performance.	Not applicable.	Large pages are only used on systems that have vTLB hardware support. To learn more about vTLB, see Why does my desktop box slowdown when I install Hyper-V. **Note** The content of each blog and its URL are subject to change without notice. The content within each blog is provided "AS IS" with no warranties, and confers no rights. Use of included script samples or code is subject to the terms specified in the Microsoft Terms of Use.
Hyper-V Hypervisor [ROOT] Partition \Deposited Pages	Shows the number of pages deposited into the partition. This indicates how much	Not applicable.	

	memory the hypervisor is using for managing the VM.		

Hyper-V Network Counters

The following table shows common Hyper-V network counters.

Counter	Description	Threshold	Troubleshooting
Network Interface(*) \Bytes Total/sec	Indicates the rate at which the network adapter is processing data bytes. This counter includes all application and file data, in addition to protocol information such as packet headers.	For a 100-megabytes per second (MBps) network adapter, should be below 6–7 MBps. For a 1000-megabits per second (Mbps) network adapter, should be below 60–70 Mbps.	
Network Interface(*) \Packets Outbound Errors	Indicates the number of outbound packets that couldn't be transmitted because of errors.	Should be 0 at all times.	
TCPv4\Connection Failures	Shows the number of times TCP connections have made a direct transition to the CLOSED state from the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.	An increasing number of failures, or a consistently increasing rate of failures, can indicate a bandwidth shortage.	
TCPv6\Connection Failures	Shows the number of times TCP connections have made a direct transition to the CLOSED state from the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.	An increasing number of failures, or a consistently increasing rate of failures, can indicate a bandwidth shortage.	

TCPv4\Connections Reset	Shows the number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.	An increasing number of resets, or a consistently increasing rate of resets, can indicate a bandwidth shortage.	Some browsers send TCP reset (RST) packets, so be cautious when using this counter to determine reset rate.
TCPv6\Connections Reset	Shows the number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.	An increasing number of resets, or a consistently increasing rate of resets, can indicate a bandwidth shortage.	Some browsers send TCP reset (RST) packets, so be cautious when using this counter to determine reset rate.
Hyper-V Virtual Switch \Bytes/sec	This counter represents the total number of bytes that have traversed the network adapter.	Not applicable.	
Hyper-V Virtual Switch \Packets/sec	This counter represents the total number of bytes received per second by the network adapter.	Not applicable.	
Hyper-V Virtual Network Adapter \Bytes/sec	This counter represents the total number of bytes per second traversing the virtual switch.	For a 100-MBps network adapter, should be below 6–7 MBps. For a 1000-Mbps network adapter, should be below 60–70 Mbps.	
Hyper-V Virtual Network Adapter \Packets/sec	This counter represents the total number of packets per second traversing the virtual switch.	Not applicable.	

1.15.3.3 Client Access Server Counters

Client Access Server Counters

Exchange Server 2010 > Performance and Scalability > Performance and Scalability Counters and Thresholds >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

This topic provides information about counters relevant to the Client Access server role in Microsoft Exchange Server 2010. You can use Performance Monitor (perfmon.exe) to monitor these counters. For more information, see Performance Monitor Getting Started Guide. For information about other counters relevant to Exchange 2010, see Performance and Scalability Counters and Thresholds.

Outlook Web App Counter

The following table shows a Microsoft Office Outlook Web App counter.

Counter	Description	Threshold
MSExchange OWA\Average Search Time	Shows the average time that elapsed while waiting for a search to complete.	Should be less than 5,000 milliseconds (ms) at all times.

ASP.NET Counters

The following table shows ASP.NET counters.

Counter	Description	Threshold	Troubleshooting
ASP.NET\Application Restarts	Shows the number of times the application has been restarted during the Web server's lifetime.	Should be 0 at all times.	
ASP.NET\Worker Process Restarts	Shows the number of times a worker process has restarted on the computer.	Should be 0 at all times.	
ASP.NET\Request Wait Time	Shows the number of ms the most recent request was waiting in the queue.	Should be 0 at all times.	Values greater than 0 should be investigated.
ASP.NET Applications (*)\Requests In Application Queue	Shows the number of requests in the application request queue.	Should be 0 at all times.	Values greater than 0 should be investigated.

Availability Service Counter

The following table shows an availability service counter.

Counter	Description	Threshold
MSExchange Availability Service\Average Time to Process a Free Busy Request	Shows the average time to process a free/busy request in seconds. One request may contain multiple mailboxes. Free/busy responses don't have meeting suggestions.	Should always be less than 5.

ActiveSync Service Counters

The following table shows ActiveSync service counters.

Counter	Description	Threshold
MSExchange ActiveSync\Ping Commands Pending	Shows the number of ping commands currently pending on the server.	Ping Commands Pending and Sync Commands Pending are the number of hanging requests, which should be almost equal to the number of Direct Push and hanging sync users.
MSExchange ActiveSync\Sync Commands Pending	Shows the number of sync commands currently pending on the server.	Ping Commands Pending and Sync Commands Pending are the number of hanging requests, which should be almost equal to the number of Direct Push and hanging sync users.
MSExchange ActiveSync \Current Requests	Shows the number of HTTP requests waiting to be assigned to a thread.	Average of 50–100.

RPC/HTTP Proxy Counters (Windows Server 2008 Only)

The following table shows Windows Server 2008 RPC/HTTP proxy counters.

Counter	Description	Threshold
RPC/HTTP Proxy\Number of Failed Back-End Connection attempts per Second	Shows the rate at which the RPC proxy attempts are occurring but failing to establish a connection to a back-end server.	Should be 0 at all times.
RPC/HTTP Proxy\Current Number of Incoming RPC over HTTP Connections	Shows the current number of front-end HTTP connections. Determines current user load.	Not applicable.
RPC/HTTP Proxy\Current Number of Unique Users	Shows the number of unique users currently connected to a back-end server via RPC/HTTP. Determines current user load.	Not applicable.
RPC/HTTP Proxy\RPC/HTTP Requests per Second	Shows the rate of RPC/HTTP requests sent to the back-end servers. Determines current Microsoft Outlook Anywhere load.	Not applicable.

RPC Client Access Counters

The following table shows RPC Client Access counters.

Counter	Description	Threshold
MSExchange RpcClientAccess \RPC Averaged Latency	Shows the latency, in ms, averaged for the past 1,024 packets.	Should be below 250 ms.
MSExchange RpcClientAccess \RPC Operations/sec	Shows the rate at which RPC operations occur, per second.	
MSExchange RpcClientAccess \RPC Requests	Shows the number of client requests currently being processed by the RPC Client Access service.	Shouldn't be over 40.

Address Book Service Counters

The following table shows Exchange 2010 address book service counters.

Counter	Description	Threshold
MSExchangeAB\NSPI RPC Browse Requests Average Latency	Shows the average time, in ms, that Name Service Provider Interface (NSPI) browse requests took to complete during the sampling period.	Should be below 1,000 ms.
MSExchangeAB\NSPI RPC Requests Average Latency	Shows the average time, in ms, that NSPI requests took to complete during the sampling period.	Should be below 1,000 ms.
MSExchangeAB\Referral RPC Requests Average Latency	Shows the average time, in ms, that referral requests took to complete during the sampling period.	Should be below 1,000 ms.

Control Panel Counters

The following table shows Exchange 2010 Control Panel counters.

Counter	Description	Threshold
MSExchange Control Panel \Outbound Proxy Requests - Average Response Time	Shows the average time (in ms) that requests sent to a secondary Client Access server took to complete during the sampling period.	The average should be under 6,000 ms.
MSExchange Control Panel \Requests - Average Response Time	Shows the average time (in ms) the Exchange Control Panel took to respond to a request during the sampling period.	The average should be under 6,000 ms.

Client Access Server OAB Download

Counters

The following table shows Client Access server offline address book (OAB) download counters.

Counter	Description	Threshold	Troubleshooting
MSExchangeFDS:OAB (*)\Download Task Queued	Shows the number of OAB download tasks queued since the File Distribution service started.	Should be 0 at all times.	Values greater than 0 indicate a failure to copy OAB data files from Mailbox servers.
MSExchangeFDS:OAB (*)\Download Tasks Completed	Shows the number of OAB download tasks completed since the File Distribution service started. The default value is every 480 minutes or 8 hours.	Should be less than or equal to 3 per day.	Values greater than 3 per day indicate the schedule for the Client Access server to download updated OAB files isn't a default schedule.

Client Activity Counters

The following table shows client activity counters.

Counter	Description	Threshold
MSExchangeIS\RPC Client Backoff/sec	Indicates the rate at which client backoffs are occurring. Higher values may indicate that the server may be incurring a higher load resulting in an increase in overall averaged RPC latencies, causing client throttling to occur. This can also occur when certain client user actions are being performed. Depending on what the client is doing and the rate at which RPC operations are occurring, it may be normal to see backoffs occurring.	Not applicable.

Client Access Server Counters

The following table shows some common Client Access server counters for determining load on your servers.

Counter	Description	Threshold
MSExchange ActiveSync \Requests/sec	Shows the number of HTTP requests received from the client via ASP.NET per second. Determines the current Exchange ActiveSync request rate.	Not applicable.

MSExchange ActiveSync\Ping Commands Pending	Shows the number of ping commands currently pending in the queue.	Not applicable.
MSExchange ActiveSync \Requests/sec	Shows the number of HTTP requests received from the client via ASP.NET per second. Used only to determine current user load.	Not applicable.
MSExchange ActiveSync\Sync Commands/sec	Shows the number of sync commands processed per second. Clients use this command to synchronize items within a folder.	Not applicable.
MSExchange Availability Service\Availability Requests (sec)	Shows the number of requests serviced per second. The request can be only for free/ busy information or include suggestions. One request may contain multiple mailboxes. Determines the rate at which Availability service requests are occurring.	Not applicable.
MSExchange OWA\Current Unique Users	Shows the number of unique users currently logged on to Outlook Web App. This value monitors the number of unique active user sessions, so that users are only removed from this counter after they log off or their session times out. Determines current user load.	Not applicable.
MSExchange OWA\Requests/ sec	Shows the number of requests handled by Outlook Web App per second. Determines current user load.	Not applicable.
MSExchangeAutodiscover \Requests/sec	Shows the number of Autodiscover service requests processed each second. Determines current user load.	Not applicable.
MSExchangeWS\Requests/ sec	Shows the number of requests processed each second. Determines current user load.	Not applicable.
Web Service(_Total)\Current Connections	Shows the current number of connections established with the Web service. Determines	Not applicable.

	current user load.	
WebService(_Total) \Connection Attempts/sec	Shows the rate that connections to the Web service are being attempted. Determines current user load.	Not applicable.
Web Service(_Total)\ISAPI Extension Requests/sec	Shows the rate that Internet Server API (ISAPI) extension requests are received by the Web service. Determines current user load. Outlook Anywhere clients make use of this ISAPI extension for RPC over HTTP requests on servers running Windows Server 2003. For Windows Server 2008 counters, see "RPC/HTTP Proxy Counters (Windows Server 2008 Only)" earlier in this topic.	Not applicable.
Web Service(_Total)\Other Request Methods/sec	Shows the rate HTTP requests are made that don't use the OPTIONS, GET, HEAD, POST, PUT, DELETE, TRACE, MOVE, COPY, MKCOL, PROPFIND, PROPPATCH, SEARCH, LOCK, or UNLOCK methods. Determines current user load.	Not applicable.

Exchange Control Panel Load Counters

The following table shows Exchange 2010 Control Panel load counters.

Counter	Description	Threshold
MSExchange Control Panel \ASP.Net Request Failures/ sec	Shows the number of failures per second detected by ASP.NET in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Explicit Sign-On Inbound Proxy Requests/sec	Shows the number of explicit sign-on requests received from a primary Client Access server per second.	Not applicable.
MSExchange Control Panel \Explicit Sign-On Inbound Proxy Sessions/sec	Shows the number of explicit sign-on inbound proxy sessions loaded per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Explicit Sign-On Outbound Proxy Requests/sec	Shows the number of explicit sign-on requests sent to a secondary Client Access server per second.	Not applicable.

MSExchange Control Panel \Explicit Sign-On Outbound Session Requests/sec	Shows the number of explicit sign-on outbound proxy sessions loaded per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Explicit Sign-On Standard RBAC Requests/sec	Shows the number of requests received per second by an explicit sign-on standard RBAC session.	Not applicable.
MSExchange Control Panel \Explicit Sign-On Standard RBAC Sessions/sec	Shows the number of explicit sign-on standard RBAC sessions loaded per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Inbound Proxy Requests/sec	Shows the number of requests received from a primary Client Access server per second.	Not applicable.
MSExchange Control Panel \Inbound Proxy Sessions/sec	Shows the number of inbound proxy sessions loaded per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Outbound Proxy Requests - Average Response Time	Shows the average time (in ms) that requests sent to a secondary Client Access server took to complete during the sampling period.	Should be under 6,000 ms.
MSExchange Control Panel \Outbound Proxy Requests/ sec	Shows the number of requests sent to a secondary Client Access server per second.	Not applicable.
MSExchange Control Panel \Outbound Proxy Sessions/ sec	Shows the number of outbound proxy sessions loaded per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \PowerShell Runspaces - Activations/sec	Shows the number of Windows PowerShell runspaces activated per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \PowerShell Runspaces - Average Active Time	Shows the average time (in seconds) that a Windows PowerShell runspace stays active while executing cmdlets in the Exchange Control Panel during the sampling period.	Not applicable.
MSExchange Control Panel \PowerShell Runspaces/sec	Shows the number of Windows PowerShell runspaces created per second in the Exchange	

	Control Panel.	
MSExchange Control Panel \RBAC Sessions/sec	Shows the number of RBAC sessions loaded per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Requests - Activations/sec	Shows the number of requests activated per second in the Exchange Control Panel.	Not applicable.
MSExchange Control Panel \Requests - Average Response Time	Shows the average time (in ms) the Exchange Control Panel took to respond to a request during the sampling period.	Should be under 6,000 ms.

Availability Service Load Counter

The following table shows an availability service load counter.

Counter	Description	Threshold
MSExchange Availability Service\Availability Requests (sec)	Shows the number of requests serviced per second. The request can be only for free/busy information or include suggestions. One request may contain multiple mailboxes. Determines the rate at which Availability service requests are occurring.	Not applicable.

RPC Client Access Load Counters

The following table shows RPC Client Access load counters.

Counter	Description	Threshold
MSExchange RpcClientAccess \Active User Count	Shows the number of unique users that have shown some activity in the last 2 minutes.	Not applicable.
MSExchange RpcClientAccess \Connection Count	Shows the total number of client connections maintained.	Not applicable.
MSExchange RpcClientAccess \RPC Operations/sec	Shows the rate at which RPC operations occur, per second.	Not applicable.
MSExchange RpcClientAccess \User Count	Shows the number of users connected to the service.	Not applicable.

Exchange Address Book Load Counters

The following table shows Exchange Address Book load counters.

Counter	Description	Threshold
MSExchangeAB\NSPI Connections Current	Shows the number of NSPI clients currently connected to the server.	Not applicable.
MSExchangeAB\NSPI Connections/sec	Shows the number of NSPI client connections established to the server each second.	Not applicable.
MSExchangeAB\NSPI RPC Requests/sec	Shows the rate at which NSPI requests occur each second.	Not applicable.
MSExchangeAB\Referral RPC Requests/sec	Shows the rate at which referral requests occur each second.	Not applicable.

1.15.3.4 Mailbox Server Counters

Mailbox Server Counters

Exchange Server 2010 > Performance and Scalability > Performance and Scalability Counters and Thresholds >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

This topic describes performance and scalability counters relevant to the Mailbox server role in Microsoft Exchange Server 2010. You can use Performance Monitor (perfmon.exe) to monitor these counters. For more information, see Performance Monitor Getting Started Guide. For information about other counters relevant to Exchange 2010, see Performance and Scalability Counters and Thresholds.

Active Database Copy I/O Latency Requirements Counters

The following table shows active database copy input/output (I/O) latency requirements counters. When these values are exceeded, the client experience degrades. For example, users may experience slow system performance and message delivery delays.

Counter	Description	Threshold	Troubleshooting
MSExchange Database\I/O Database Reads (Attached) Average Latency	Indicates the average time, in milliseconds (ms), to read from the database file.	The average value should be below 20 ms. Spikes (maximum values) shouldn't be higher than 100 ms.	
MSExchange Database\I/O Database Writes (Attached) Average Latency	Indicates the average time, in ms, to write to the database file. This counter isn't a	In general, this latency should be less than the MSExchange Database\I/O Database Reads	

	good indicator for client latency because database writes are asynchronous.	(Attached) Average Latency when battery-backed write caching is utilized.	
Database\Database Page Fault Stalls/sec	Indicates the rate of page faults that can't be serviced because there are no pages available for allocation from the database cache.	This counter should be 0 on production servers.	If this counter is above 0, it's an indication that the MSExchange Database\I/O Database Writes (Attached) Average Latency is too high.

Active Log I/O Latency Requirements Counters

The following table shows active log I/O latency requirements counters. When these values are exceeded, the client experience degrades. For example, users may experience slow system performance and message delivery delays.

Counter	Description	Threshold	Troubleshooting
MSExchange Database\IO Log Writes Average Latency	Indicates the average time, in ms, to write a log buffer to the active log file.	This counter should be 10 on production servers.	If this counter is greater than 10, it's an indication that the MSExchange Database\I/O Database Writes (Attached) Average Latency is too high.
Database\Log Record Stalls/sec	Indicates the number of log records that can't be added to the log buffers per second because the log buffers are full.	The average value should be below 10 per second. Spikes (maximum values) shouldn't be higher than 100 per second.	
Database\Log Threads Waiting	Indicates the number of threads waiting to complete an update of the database by writing their data to the log.	The average value should be less than 10 threads waiting.	

Passive Database Copy I/O Latency Requirements Counters

The following table shows passive database copy I/O latency requirements counters. When these values are exceeded, the database copy may lag by not replaying logs to the passive database copy fast enough. Log replication performance may also be affected.

Counter	Description	Threshold	Troubleshooting
MSExchange Database\I/O Database Reads (Recovery) Average Latency	Indicates the average time, in ms, to read from the database file.	The average value should be below 200 ms. Spikes (maximum values) shouldn't be higher than 1,000 ms.	
MSExchange Database\I/O Database Writes (Recovery) Average Latency	Indicates the average time, in ms, to write to the database file.	In general, this latency should be less than the MSExchange Database\I/O Database Reads (Recovery) Average Latency when battery-backed write caching is utilized.	
Database\Database Page Fault Stalls/sec	Indicates the rate of page faults that can't be serviced because there are no pages available for allocation from the database cache.	This counter should be 0 on production servers.	If this counter is greater than 0, it's an indication that the MSExchange Database\I/O Database Writes (Attached) Average Latency is too high.

Replay Log I/O Latency Requirements Counter

The following table shows a replay log I/O latency requirements counter. When these values are exceeded, the database copy may lag by not replaying logs to the passive database copy fast enough. Log replication performance may also be affected.

Counter	Description	Threshold
MSExchange Database\IO Log Read Average Latency	Indicates the average time, in ms, to read data from a log file. Specific to log replay and database recovery operations.	The average value should be below 200 ms. Spikes (maximum values) shouldn't be higher than 1,000 ms.

Information Store RPC Processing Counters

The following table shows information store RPC processing counters.

Counter	Description	Threshold	Troubleshooting
MSExchangeIS\RPC Requests	Indicates the overall RPC requests currently executing within the information store process.	Should be below 70 at all times.	

MSExchangeIS\RPC Averaged Latency	Indicates the RPC latency, in ms, averaged for all operations in the last 1,024 packets. For information about how clients are affected when overall server RPC averaged latencies increase, see Understanding Client Throttling Policies.	Shouldn't be higher than 100 ms on average.	To determine if certain protocols are causing overall RPC latencies, monitor MSExchangeIS Client (*)\RPC Average Latency to separate latencies based on client protocol.
MSExchangeIS Mailbox\RPC Averaged Latency	Indicates the RPC latency, in ms, averaged for all operations in the last 1,024 packets.	Shouldn't be higher than 100 ms on average.	
MSExchangeIS Client (*)\RPC Average Latency	Shows a server RPC latency, in ms, averaged for the past 1,024 packets for a particular client protocol.	Should be less than 50 ms on average for each client.	Wide disparities between different client types, such as IMAP4, Microsoft Outlook Anywhere, or other clients (MAPI), can help direct troubleshooting to appropriate subcomponents.

RPC Client Throttling Counters

The following table shows RPC client throttling counters.

Counter	Description	Threshold	Troubleshooting
MSExchangeIS Client (*)\RPC Average Latency	RPC Average Latency is a server RPC latency, in ms, averaged for the past 1,024 packets.	Should be less than 50 ms on average for each client.	Wide disparities between different client types, such as IMAP4, Microsoft Outlook Anywhere, or other clients (MAPI), can help direct troubleshooting to appropriate subcomponents.
MSExchangeIS\Client: RPCs Failed:Server Too Busy/sec	Shows the client-reported rate of failed RPCs (since the store was started) due to the server too busy ROC error.	Should be 0 at all times.	Higher values may indicate RPC threads are exhausted or client throttling is occurring for clients running versions of Outlook earlier than Office Outlook 2007.
MSExchangeIS\Client:	The client-reported a	Should be 0 at all	

RPCs Failed:Server Too Busy	number of failed RPCs (since the store was started) due to the server too busy ROC error.	times.	

Message Queuing Counters

The following table shows message queuing counters.

Counter	Description	Threshold	Troubleshooting
MSExchangeIS Mailbox(_Total) \Messages Queued for Submission	Shows the current number of submitted messages not yet processed by the transport layer.	Should be below 50 at all times. Shouldn't be sustained for more than 15 minutes.	This may indicate connectivity issues to the transport server.
MSExchangeIS Public (_Total)\Messages Queued for Submission	Shows the current number of submitted messages not yet processed by the transport layer.	Should be less than 20 at all times.	

Database Counters

The following table shows database counters.

Counter	Description	Threshold	Troubleshooting
MSExchange Database ==> Instances(*)\Log Generation Checkpoint Depth	Represents the amount of work in the log file count that needs to be redone or undone to the database files if the process fails.	Should be below 500 at all times for the Mailbox server role. A healthy server should indicate between 20 and 30 for each database instance.	If checkpoint depth increases continually for a sustained period, this indicates either a long-running transaction, (which will impact the version store), or a bottleneck involving the database disks.
MSExchange Database(Information Store)\Database Page Fault Stalls/sec	Shows the rate that database file page requests require of the database cache manager to allocate a new page from the database cache.	If this value is nonzero, this indicates that the database isn't able to flush dirty pages to the database file fast enough to make pages free for new page allocations.	
MSExchange Database(Information Store)\Log Record Stalls/sec	Shows the number of log records that can't be added to the log buffers per second because the log buffers are full. If this counter is nonzero for a long period of time,	The average value should be below 10 per second. Spikes (maximum values) shouldn't be higher than 100 per second.	If I/O log write latencies are high, check for RAID5 or synchronize replication on log devices. You can also use the MSExchange Database Instances

	the log buffer size may be a bottleneck.		(Information store/ <Database Name>) \log record stalls/sec counter to determine which database(s) may be having issues. This will assist you in determining which drive(s) to focus on. This counter is an extended Exchange counter in Performance Monitor.
MSExchange Database(Information Store)\Log Threads Waiting	Shows the number of threads waiting for their data to be written to the log to complete an update of the database. If this number is too high, the log may be a bottleneck.	Should be less than 10 on average.	Regular spikes concurrent with log record stall spikes indicate that the transaction log disks are a bottleneck. If the value for log threads waiting is more than the spindles available for the logs, there is a bottleneck on the log disks.
MSExchange Database(Information Store)\Version buckets allocated	Shows the total number of version buckets allocated.	Should be less than 12,000 at all times.	The maximum default version is 16,384. If version buckets reach 70% of maximum, the server is at risk of running out of the version store.
MSExchange Database Instances (*)\I/O Database Reads Average Latency	Shows the average length of time, in ms, per database read operation.	Should be 20 ms on average. Should show 50 ms spikes.	
MSExchange Database Instances (*)\I/O Database Writes Average Latency	Shows the average length of time, in ms, per database write operation.	Should be 50 ms on average.	Spikes of up to 100 ms are acceptable if not accompanied by database page fault stalls.
MSExchange Database(Information Store)\Database Cache Size (MB)	Shows the amount of system memory, in megabytes (MB), used by the database cache manager to hold commonly used information from the database files to prevent file operations.	Maximum value is RAM-2GB (RAM-3GB for servers with sync replication enabled). This and Database Cache Hit % are useful counters for gauging whether a server's performance problems might be resolved by adding more physical	Use this counter along with store private bytes to determine if there are store memory leaks. If the database cache size seems too small for optimal performance and there is little available memory on the system (check the

		memory.	value of Memory/ Available Bytes), adding more memory to the system may increase performance. If there is ample memory on the system and the database cache size isn't growing beyond a certain point, the database cache size may be capped at an artificially low limit. Increasing this limit may increase performance.
MSExchange Database(Information Store)\Database Cache % Hit	Shows the percentage of database file page requests fulfilled by the database cache without causing a file operation. If this percentage is too low, the database cache size may be too small.	Should be over 90% for companies with majority online mode clients. Should be over 99% for companies with majority cached mode clients.	If the hit ratio is less than these numbers, the database cache may be insufficient.
MSExchange Database\Log Bytes Write/sec	Shows the rate of bytes written to the log.	Should be less than 10,000,000 at all times.	With each log file being 1,000,000 bytes in size, 10,000,000 bytes/sec would yield 10 logs per second. This may indicate a large message being sent or a looping message.

Client-Related Search Counters

The following table shows client-related search counters.

Counter	Description	Threshold	Troubleshooting
MSExchangeIS Mailbox(*)\Slow Findrow Rate	Shows the rate at which the slower FindRow needs to be used in the mailbox store.	Should be no more than 10 for any specific mailbox store.	Higher values indicate applications are crawling or searching mailboxes, which is affecting server performance. These include desktop search engines, customer relationship management (CRM), or other third-party applications.

MSExchangeIS Mailbox(*)\Search Task Rate	Shows the number of search tasks created per second.	Should be less than 10 at all times.	
MSExchangeIS\Slow QP Threads	Shows the number of query processor threads currently running queries that aren't optimized.	Should be less than 10 at all times.	
MSExchangeIS\Slow Search Threads	Shows the number of search threads currently running queries that aren't optimized.	Should be less than 10 at all times.	

Content Indexing Counters

The following table shows content indexing counters.

Counter	Description	Threshold	Troubleshooting
Process (Microsoft.Exchange.Search.ExSearch)\% Processor time	Shows the amount of processor time currently being consumed by the Exchange Search service.	Should be less than 1% of overall CPU typically and not sustained above 5%. Should be less than 10% of what the store process is during steady state.	
Process(msftefd*)\% Processor Time	Shows the amount of processor time being consumed to update content indexing within the store process.	Full crawls increase overall processing time, but should never exceed overall store CPU capacity.	Check throttling counters to determine if throttling is occurring due to server performance bottlenecks.
MSExchange Search Indices(*)\Recent Average Latency of RPCs Used to Obtain Content	Shows the average latency, in ms, of the most recent RPCs to the Information Store service. These RPCs are used to get content for the filter daemon for the specified database.	Should coincide with the latencies that Outlook clients are experiencing.	
MSExchange Search Indices(*)\ Average Document Indexing Time	Shows the average, in ms, of how long it takes to index documents.	Should be less than 30 seconds at all time.	
MSExchange Search Indices(*)\Full Crawl Mode Status	This counter is used to determine if a full crawl is occurring for any specified database.	Indicates whether this .mdb file is going through a full crawl (value=1) or not (value=0).	If CPU resources are high, it's possible content indexing is occurring for a database or set of databases.

Mailbox Assistant Counters

The following table shows mailbox assistant counters.

Counter	Description	Threshold
Process (MSExchangeMailboxAssistants)\%Processor Time	Shows the amount of processor time being consumed by mailbox assistants.	Should be less than 5% of overall CPU capacity.
MSExchange Assistants(*) \Events in queue	Shows the number of events in the in-memory queue waiting to be processed by the assistants.	Should be a low value at all times. High values may indicate a performance bottleneck.
MSExchange Assistants(*) \Average Event Processing Time in Seconds	Shows the average processing time of the events chosen.	Should be less than 2 at all times.

Resource Booking Counters

The following table shows resource booking counters.

Counter	Description	Threshold
MSExchange Resource Booking\Average ResourceBooking Processing Time	Shows the average time to process an event in the Resource Booking Attendant.	Should be a low value at all times. High values may indicate a performance bottleneck.
MSExchange Resource Booking\Requests Failed	Shows the total number of failures that occurred while the Resource Booking Attendant was processing events.	Should be 0 at all times.

Calendar Attendant Counters

The following table shows Calendar Attendant counters.

Counter	Description	Threshold
MSExchange Calendar Attendant\Average Calendar Attendant Processing time	Shows the average time to process an event in the Calendar Attendant.	Should be a low value at all times. High values may indicate a performance bottleneck.
MSExchange Calendar Attendant\Requests Failed	Shows the total number of failures that occurred while the Calendar Attendant was processing events.	Should be 0 at all times.

Store Client Request Counters

The following table shows store client request counters.

Counter	Description	Threshold

MSExchange Store Interface (_Total)\RPC Latency average (msec)	Shows the average latency, in ms, of RPC requests. The average is calculated over all RPCs since exrpc32 was loaded.	Should be less than 100 ms at all times.
MSExchange Store Interface (*)\ROP Requests outstanding	Shows the total number of outstanding remote operations requests. Used for determining current load.	
MSExchange Store Interface (_Total)\RPC Requests outstanding	Shows the current number of outstanding RPC requests.	Should be 0 at all times.
MSExchange Store Interface (*)\RPC Requests Outstanding	Shows the total number of outstanding RPC requests. Used for determining current load.	
MSExchange Store Interface (*)\RPC Requests Sent/sec	Shows the current rate of initiated RPC requests per second. Used for determining current load.	Not applicable.
MSExchange Store Interface (*)\RPC Slow Requests latency average (msec)	Shows the average latency, in ms, of slow requests. Used for determining the average latencies of RPC slow requests.	
MSExchange Store Interface (*)\RPC Requests failed (%)	Shows the percentage of failed requests in the total number of RPC requests. Failed means the sum of failed with error code plus failed with exception.	Should be less than 1 at all times.
MSExchange Store Interface (*)\RPC Slow Requests (%)	Shows the percentage of slow RPC requests among all RPC requests. A slow RPC request is one that has taken more than 500 ms.	Should be less than 1 at all times.
MSExchangeMailSubmission (*)\Successful Submissions Per Second	Determines current mail submission rate.	Not applicable.
MSExchangeMailSubmission (*)\Hub Servers In Retry	Shows the number of Hub Transport servers in retry mode.	Should be 0 at all times.
MSExchangeMailSubmission (*)\Failed Submissions Per Second	Shows the number of failed submissions per second.	Should be 0 at all times.
MSExchangeMailSubmission (*)\Temporary Submission Failures/sec	Shows the number of temporary submission failures per second.	Should be 0 at all times.
MSExchange Replication(*)	Shows the number of	Should be less than 1 at all

\CopyQueueLength	transaction log files waiting to be copied to the passive copy log file folder. A copy isn't considered complete until it has been checked for corruption.	times for continuous replication.
MSExchange Replication(*) \ReplayQueueLength	Shows the number of transaction log files waiting to be replayed into the passive copy.	Indicates the current replay queue length. Higher values cause longer store mount times when a handoff, failover, or activation is performed.
MSExchange Replica Seeder (*)\Seeding Finished %	Shows the finished percentage of seeding. Its value is from 0 through 100% . Used to determine if seeding is occurring for a particular database, which is possibly affecting overall server performance or current network bandwidth.	Not applicable.
MSExchangeIS\RPC Operations/sec	Indicates the current number of RPC operations occurring per second.	Should closely correspond to historical baselines. Values much higher than expected indicate that the workload has changed, while values much lower than expected indicate a bottleneck preventing client requests from reaching the server.

Client Activity Counters

The following table shows client activity counters.

Counter	Description	Threshold
MSExchangeIS\RPC Client Backoff/sec	Indicates the rate at which client backoffs are occurring. Higher values may indicate that the server may be incurring a higher load resulting in an increase in overall averaged RPC latencies, causing client throttling to occur. This can also occur when certain client user actions are being performed. Depending on what the client is doing and the rate at which RPC operations are occurring, it may be normal to see backoffs occurring.	Not applicable.
MSExchangeIS\Client: RPCs	Shows the client-reported	Should be 0 at all times.

Failed:Server Too Busy/sec	rate of failed RPCs (since the store was started) due to the server too busy ROC error.	Higher values may indicate RPC threads are exhausted or client throttling is occurring for clients running versions of Outlook earlier than Outlook 2007.
MSExchangeIS\Client: RPCs Failed:Server Too Busy	The client-reported number of failed RPCs (since the store was started) due to the server too busy ROC error.	Should be 0 at all times.

Information Store Counters

The following table shows information store counters for determining user load.

Counter	Description	Threshold
MSExchangeIS Client(*)\RPC Operations/sec	Shows what client protocol is performing an excessive amount of RPC Operations/sec. High IMAP4, POP3, or Outlook Anywhere latency can indicate problems with Client Access servers rather than Mailbox servers. This is especially true when other clients (which includes MAPI) latency is lower in comparison. In some instances, high IMAP latencies could indicate a bottleneck on the Mailbox server in addition to the latencies that the Client Access server is experiencing.	Not applicable.
MSExchangeIS Client (*)\RPC Average Latency	RPC Average Latency is a server RPC latency, in ms, averaged for the past 1,024 packets.	Should be less than 50 ms on average.
MSExchangeIS Client(*)\JET Log Records/sec	Shows the rate that database log records are generated while processing requests for the client. Used to determine current load.	Not applicable.
MSExchangeIS Client(*)\JET Pages Read/sec	Shows the rate that database pages are read from disk while processing requests for the client. Used to determine current load.	Not applicable.
MSExchangeIS Client(*) \Directory Access: LDAP Reads/sec	Shows the current rate that LDAP reads occur while processing requests for the client. Used to determine the	Not applicable.

	current LDAP read rate per protocol.	
MSExchangeIS Client(*) \Directory Access: LDAP Searches/sec	Shows the current rate that LDAP searches occur while processing requests for the client. Used to determine the current LDAP search rate per protocol.	Not applicable.
MSExchangeIS Mailbox (_Total)\Messages Delivered/sec	Shows the rate that messages are delivered to all recipients. Indicates current message delivery rate to the store.	Not applicable.
MSExchangeIS Mailbox (_Total)\Messages Sent/sec	Shows the rate that messages are sent to transport. Used to determine current messages sent to transport.	Not applicable.
MSExchangeIS Mailbox (_Total)\Messages Submitted/sec	Shows the rate that messages are submitted by clients. Used to determine current rate that messages are being submitted by clients.	Not applicable.
MSExchangeIS\User Count	Shows the number of users connected to the information store. Used to determine current user load.	Not applicable.
MSExchangeIS Public(_Total) \Replication Receive Queue Size	Shows the number of replication messages waiting to be processed.	Should be less than 100 at all times. This value should return to a minimum value between replication intervals.

Mailbox Assistant Counters

The following table shows mailbox assistant counters.

Counter	Description	Threshold
MSExchange Assistants(*) \Mailboxes Processed/sec	Shows the rate of mailboxes processed by time-based assistants per second. Determines current load statistics for this counter.	Not applicable.
MSExchange Assistants(*) \Events Polled/sec	Shows the number of events polled per second. Determines current load statistics for this counter.	Not applicable.

1.15.3.5 Transport Server Counters

Transport Server Counters

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2012-07-23*

This topic provides information about counters relevant to the Hub Transport and Edge Transport server roles in Microsoft Exchange Server 2010. You can use Performance Monitor (perfmon.exe) to monitor these counters. For more information, see Performance Monitor Getting Started Guide. For information about other counters relevant to Exchange 2010, see Performance and Scalability Counters and Thresholds.

Transport Disk Counters

The following table shows transport disk counters.

Counter	Description	Threshold
Logical/Physical Disk(*)\Avg. Disk sec/Read	Shows the average time, in seconds, of a read of data from the disk.	Should be less than 20 milliseconds (ms) on average. Spikes (maximum values) shouldn't be higher than 50 ms.
Logical/Physical Disk(*)\Avg. Disk sec/Write	Shows the average time, in seconds, of a write of data to the disk.	Should be less than 20 ms on average. Spikes (maximum values) shouldn't be higher than 50 ms.

Transport Queue Length Counters

The following table shows transport queue length counters.

Counter	Description	Threshold
\MSExchangeTransport Queues(_total)\Aggregate Delivery Queue Length (All Queues)	Shows the number of messages queued for delivery in all queues.	Should be less than 3,000 and not more than 5,000.
\MSExchangeTransport Queues(_total)\Active Remote Delivery Queue Length	Shows the number of messages in the active remote delivery queues.	Should be less than 250 at all times.
\MSExchangeTransport Queues(_total)\Active Mailbox Delivery Queue Length	Shows the number of messages in the active mailbox queues.	Should be less than 250 at all times.
\MSExchangeTransport Queues(_total)\Submission Queue Length	Shows the number of messages in the submission queue.	Shouldn't exceed 100. If sustained high values are occurring, investigate Active Directory and Mailbox servers for bottlenecks or performance-related issues.

\MSExchangeTransport Queues(_total)\Active Non-Smtp Delivery Queue Length	Shows the number of messages in the drop directory used by a Foreign connector.	Should be less than 250 at all times.
\MSExchangeTransport Queues(_total)\Retry Mailbox Delivery Queue Length	Shows the number of messages in a retry state attempting to deliver a message to a remote mailbox.	Should be less than 100 at all times.
\MSExchangeTransport Queues(_total)\Retry Non-Smtp Delivery Queue Length	Shows the number of messages in a retry state in the non-SMTP gateway delivery queues.	Shouldn't exceed 100.
\MSExchangeTransport Queues(_total)\Retry Remote Delivery Queue Length	Shows the number of messages in a retry state in the remote delivery queues.	Shouldn't exceed 100. We recommend that you check the next hop to determine the causes for queuing.
\MSExchangeTransport Queues(_total)\Unreachable Queue Length	Shows the number of messages in the Unreachable queue.	Shouldn't exceed 100.
\MSExchangeTransport Queues(_total)\Largest Delivery Queue Length	Shows the number of messages in the largest delivery queues.	Should be less than 200 for the Edge Transport and Hub Transport server roles.
\MSExchangeTransport Queues(_total)\Poison Queue Length	Shows the number of messages in the poison message queue.	Should be 0 at all times.

Transport Dumpster Counters

The following table shows transport dumpster counters.

Counter	Description	Threshold
\MSExchangeTransport Dumpster\Dumpster Size	Shows the total size (in bytes) of mail items currently in the transport dumpster on this server.	Not applicable.
\MSExchangeTransport Dumpster\Dumpster Inserts/sec	Shows the rate at which items are inserted into the transport dumpster on this server. Determines the current rate of transport dumpster inserts.	Not applicable.
\MSExchangeTransport Dumpster\Dumpster Item Count	Shows the total number of mail items currently in the transport dumpster on this server. Shows the current number of items being held in the transport dumpster.	Not applicable.
\MSExchangeTransport Dumpster\Dumpster Deletes/sec	Shows the rate at which items are deleted from the transport dumpster on this	Not applicable.

	server. Determines the current rate of transport dumpster deletions.	

Transport Database Counters

The following table shows transport database counters.

Counter	Description	Threshold
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\I/O Log Writes/sec	Shows the rate of log file write operations completed. Determines the current load. Compare values to historical baselines.	Not applicable.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\I/O Log Reads/sec	Shows the rate of log file read operations completed. Determines the current load. Compare values to historical baselines.	Not applicable.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\Log Generation Checkpoint Depth	Represents the amount of work (in count of log files) that needs to be redone or undone to the database files if the process fails.	Not applicable.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database) \Version buckets allocated	Total number of version buckets allocated. Shows the default backpressure values as listed in the edgetransport.exe.config file.	Should be less than 200 at all times.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\I/O Database Reads/sec	Shows the rate of database read operations completed. Determines the current load. Compare values to historical baselines.	Not applicable.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\I/O Database Writes/sec	Shows the rate of database write operations completed. Determines the current load. Compare values to historical baselines.	Not applicable.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\Log Record Stalls/sec	Shows the number of log records that can't be added to the log buffers per second because they are full. If this counter is nonzero most of the time, the log buffer size may be a bottleneck.	Should be less than 10 per second on average. Spikes (maximum values) shouldn't be greater than 100 per second.
MSExchange Database ==> Instances(edgetransport/ Transport Mail Database)\Log Threads Waiting	Shows the number of threads waiting for their data to be written to the log to complete an update of the database. If this number is too high, the log may be a	Should be less than 10 threads waiting on average.

	bottleneck.	

Extensibility Agent Counters

The following table shows extensibility agent counters.

Counter	Description	Threshold
MSExchange Extensibility Agents(*)\Average Agent Processing Time (sec)	Shows the average agent processing time in seconds per event.	Should be less than 20 at all times. Sustained higher latencies may indicate a hung agent.
MSExchange Extensibility Agents(*)\Total Agent Invocations	Shows the total number of invocations since the last restart. Shows the current invocation rate.	Not applicable.

Transport Load Assessment Counters

The following table shows transport load assessment counters.

Counter	Description	Threshold
\MSExchangeTransport Queues(_total)\Messages Submitted Per Second	Shows the number of messages queued in the Submission queue per second. Determines current load. Compare values to historical baselines.	Not applicable.
\MSExchangeTransport Queues(_total)\Messages Completed Delivery Per Second	Shows the number of messages delivered per second. Determines current load. Compare values to historical baselines.	Not applicable.
\MSExchange Store Driver (_total)\Inbound: LocalDeliveryCallsPerSecond	Shows the number of local delivery attempts per second. Determines current load. Compare values to historical baselines.	Not applicable.
\MSExchange Store Driver (_total)\Outbound: Submitted Mail Items Per Second	Shows the number of mail items per second being submitted. Determines current load. Compare values to historical baselines.	Not applicable.
\MSExchangeTransport SmtpReceive(_total)\Average bytes/message	Shows the average number of message bytes per inbound message received. Determines sizes of messages being received for an SMTP receive connector.	Not applicable.
\MSExchangeTransport SmtpReceive(_total) \Messages Received/sec	Shows the number of messages received by the SMTP server each second. Determines current load.	Not applicable.

	Compare values to historical baselines.	
\MSExchangeTransport SmtpSend(_total)\Messages Sent/sec	Shows the number of messages sent by the SMTP send connector each second. Determines current load. Compare values to historical baselines.	Not applicable.
\MSExchange Store Driver (_total)\ Inbound: MessageDeliveryAttemptsPer Second	Shows the number of attempts for delivering transport mail items per second. Determines current load. Compare values to historical baselines.	Not applicable.
MSExchange Store Driver (_total)\Inbound: Recipients Delivered Per Second	Shows the number of inbound recipients delivered per second. Determines current load. Compare values to historical baselines.	Not applicable.
MSExchangeTransport Queues(_total)\Messages Queued for Delivery Per Second	Shows the number of messages queued for delivery per second. Determines current load. Compare values to historical baselines.	Not applicable.
MSExchangeTransport Queues(_total)\Messages Completed Delivery Per Second	Shows the number of messages delivered per second. Determines current load. Compare values to historical baselines.	Not applicable.

1.15.3.6.1 Performance and Scalability Counters for Unified Messaging

Performance and Scalability Counters for Unified Messaging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-11-16*

The following table provides information about performance counters that are used by the Unified Messaging (UM) server role in Microsoft Exchange Server 2010. You can use Performance Monitor (perfmon.exe) to monitor these counters.

For more information, see Performance Monitor Getting Started Guide. For information about other counters relevant to Exchange 2010, see Performance and Scalability Counters and Thresholds.

Object	Counter	Description	Threshold	Troubleshooting
MSExchangeUMA vailability	% of Failed Mailbox Connection Attempts Over the Last Hour	Shows the percentage of mailbox connection attempts that failed in the last hour.	Should be less than 5%.	
MSExchangeUMA vailability	% of Inbound Calls Rejected by the UM Service Over the Last Hour	Shows the percentage of inbound calls that were rejected by the Microsoft Exchange Unified Messaging service over the last hour.	Should be less than 5%.	
MSExchangeUMA vailability	% of Inbound Calls Rejected by the UM Worker Process Over the Last Hour	Shows the percentage of inbound calls that were rejected by the UM worker process over the last hour.	Should be less than 5%.	
MSExchangeUMA vailability	% of Messages Successfully Processed Over the Last Hour	Shows the percentage of messages that were successfully	Should be greater or equal to 95%	

		processed by the Microsoft Exchange Unified Messaging service over the last hour.		
MSExchangeUMAvailability	% of Partner Voice Message Transcription Failures Over the Last Hour	Shows the percentage of voice messages for which transcription failed in the last hour.	Should be less than 5%.	
MSExchangeUMAvailability	Directory Access Failures	Shows the number of times that attempts to access Active Directory failed.	Should be 0 at all times.	
MSExchangeUMAvailability	Calls Disconnected on Irrecoverable Internal Error	Shows the number of calls disconnected after an internal system error occurred.	Should be 0 at all times.	
MSExchangeUMPerformance	Operations over Six Seconds	Shows the number of all UM operations that took more than six seconds to complete. This is the time during which a caller was waiting for UM to respond.	Should be 0 at all times.	
MSExchangeUMCallAnswer	Calls Disconnected by Callers During UM Audio Hourglass	Shows the number of calls during which the caller disconnected while Unified Messaging was playing the audio hourglass tones.	Should be 0 at all times.	A nonzero value suggests excessive latency between a Unified Messaging server and targeted domain controller.
MSExchangeUMAvailability	Total Inbound Calls Rejected by the UM Service	Shows the total number of inbound calls that were rejected by the Microsoft Exchange Unified Messaging Service since the service was started.	Should be 0 at all times.	

MSExchangeUMAvailability	Total Inbound Calls Rejected by the UM Worker Process	Shows the total number of inbound calls that were rejected by the UM Worker process since the service was started.	Should be 0 at all times.	

1.15.3.6.2 General Performance Counters for Unified Messaging

General Performance Counters for Unified Messaging

Performance and Scalability > Performance and Scalability Counters and Thresholds > Unified Messaging Counters >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-08*

There are many performance counters that can be used to maintain and troubleshoot a Microsoft Exchange Server 2010 Unified Messaging (UM) server. Unified Messaging performance counters measure quantities of information or data for Unified Messaging based on the number, size, duration, and rate of data that's being requested or received.

General Performance Counters

The following table provides a list of the general performance counters that can be used to monitor Exchange 2010 Unified Messaging.

General performance counters for Unified Messaging

Performance counter	Performance object	Description
% Successful Caller ID Resolutions	MSExchangeUMGeneral	% Successful Caller ID Resolutions is the percentage of caller IDs that were resolved successfully.
% Successful Extension Caller ID Resolutions	MSExchangeUMGeneral	% Successful Extension Caller ID Resolutions is the percentage of successful attempts to resolve caller IDs that contained no "@" or "+" signs and were of the same length as the dial plan's extension. This counter is used only for TelExtn dial plans.
Average Call Duration	MSExchangeUMGeneral	Average Call Duration is the average duration, in seconds, of calls since the service was started.
Average MWI Latency	MSExchangeUMGeneral	Average MWI Latency is the average time, in milliseconds,

		from the moment a voice mail event occurs and Unified Messaging receives confirmation from the IP gateway that the message was delivered. This average is calculated over the last 50 messages.
Average Recent Call Duration	MSExchangeUMGeneral	Average Recent Call Duration is the average duration, in seconds, of the last 50 calls.
Call Duration Exceeded	MSExchangeUMGeneral	Call Duration Exceeded is the number of calls that were disconnected because they exceeded the UM maximum call length. This number includes all types of calls, including fax calls.
Caller ID Resolutions Attempted	MSExchangeUMGeneral	Caller ID Resolutions Attempted is the number of caller ID resolutions that were attempted.
Caller ID Resolutions Succeeded	MSExchangeUMGeneral	Caller ID Resolutions Succeeded is the number of caller IDs that were resolved successfully.
Calls Disconnected by User Failure	MSExchangeUMGeneral	Calls Disconnected by User Failure is the total number of calls disconnected after too many user entry failures.
Current Auto Attendant Calls	MSExchangeUMGeneral	Current Auto Attendant Calls is the number of auto attendant calls that are currently connected to the UM server.
Current Calls	MSExchangeUMGeneral	Current Calls is the number of calls that are currently connected to the UM server.
Current Fax Calls	MSExchangeUMGeneral	Current Fax Calls is the number of fax calls that are currently connected to the UM server. Voice calls become fax calls after a fax tone is detected.
Current Play on Phone Calls	MSExchangeUMGeneral	Current Play on Phone Calls is the number of outbound calls initiated to play back messages.
Current Prompt Editing Calls	MSExchangeUMGeneral	Current Prompt Editing Calls is the number of logged on users who are editing custom

		prompts.
Current Subscriber Access Calls	MSExchangeUMGeneral	Current Subscriber Access Calls is the number of logged on subscribers who are currently connected to the UM server.
Current Unauthenticated Pilot Number Calls	MSExchangeUMGeneral	Current Unauthenticated Pilot Number Calls is the number of voice calls to the pilot number that have not yet been authenticated.
Current Voice Mail Calls	MSExchangeUMGeneral	Current Voice Mail Calls is the number of voice mail calls that are currently connected to the Unified Messaging server.
Delayed Calls	MSExchangeUMGeneral	Delayed Calls is the number of calls that experienced one or more delays longer than 2 seconds.
Extension Caller ID Resolutions Attempted	MSExchangeUMGeneral	Extension Caller ID Resolutions Attempted is the number of attempts to resolve caller IDs that contained no "@" or "+" signs and were of the same length as the dial plan's extension. This counter is used only for TelExtn dial plans.
Extension Caller ID Resolutions Succeeded	MSExchangeUMGeneral	Extension Caller ID Resolutions Succeeded is the number of successful attempts to resolve caller IDs that contained no "@" or "+" signs and were of the same length as the dial plan's extension. This counter is used only for TelExtn dial plans.
OCS User Event Notifications	MSExchangeUMGeneral	OCS User Event Notifications is the total number of OCS user event notifications that occurred since the service was started.
Total Calls	MSExchangeUMGeneral	Total Calls is the number of calls answered or placed since the service was started. Transfers are not included.
Total Calls per Second	MSExchangeUMGeneral	Total Calls per Second is the number of new calls that

		have arrived in the last second.
Total Play on Phone Calls	MSExchangeUMGeneral	Total Play on Phone Calls is the total number of Play on Phone calls that have been initiated since the service was started.
User Response Latency	MSExchangeUMGeneral	User Response Latency is the average response time, in milliseconds, for the system to respond to a user request. This average is calculated over the last 25 calls. This counter is limited to calls that require significant processing.

1.15.3.6.3 Call Answering Performance Counters for Unified Messaging

Call Answering Performance Counters for Unified Messaging

Performance and Scalability > Performance and Scalability Counters and Thresholds > Unified Messaging Counters >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-08*

There are many performance counters that can be used to maintain and troubleshoot a Microsoft Exchange Server 2010 Unified Messaging (UM) server. Unified Messaging performance counters are used to measure quantities of information or data for Unified Messaging and are based on the number, size, duration, and rate of data that's being requested or received.

Call Answering Performance Counters

The following table provides a list of the call answering performance counters that can be used to monitor Unified Messaging.

Unified Messaging call answering performance counters

Performance counter	Performance object	Description
Average Greeting Size	MSExchangeUMCallAnswering	Average Greeting Size is the average size, in seconds, of recorded greetings that have been retrieved by the Unified Messaging server.
Average Recent Voice Message Size	MSExchangeUMCallAnswering	Average Recent Voice Message Size is the average size, in seconds, of the last 50 voice messages that have been left for subscribers.

Average Time Taken for Call Answering Rule Evaluations	MSExchangeUMCallAnswering	Average Time Taken for Call Answering Rule Evaluations is the average time it takes to determine if one or more call answering rules apply to a call answering call.
Average Voice Message Size	MSExchangeUMCallAnswering	Average Voice Message Size is the average size, in seconds, of voice messages left for subscribers.
Call Answering Calls	MSExchangeUMCallAnswering	Call Answering Calls is the number of diverted calls that were answered on behalf of subscribers.
Call Answering Escapes	MSExchangeUMCallAnswering	Call Answering Escapes is the number of times a caller pressed the * key to connect to another user instead of leaving a message.
Call Answering Missed Calls	MSExchangeUMCallAnswering	Call Answering Missed Calls is the number of times a diverted call was dropped without a message being left.
Call Answering Protected Voice Messages	MSExchangeUMCallAnswering	Call Answering Protected Voice Messages is the total number of protected voice messages that were submitted because calls were answered on behalf of subscribers.
Call Answering Voice Message Protection Failures	MSExchangeUMCallAnswering	Call Answering Voice Message Protection Failures is the total number of voice messages, submitted because calls were answered on behalf of the subscribers, for which the attempt to apply protection failed.
Call Answering Voice Messages	MSExchangeUMCallAnswering	Call Answering Voice Messages is the total number of voice messages that were submitted for delivery because the calls were answered on behalf of subscribers.
Calls Disconnected by Callers During UM Audio Hourglass	MSExchangeUMCallAnswering	Calls Disconnected by Callers During UM Audio Hourglass is the number of calls during which the caller disconnected while Unified Messaging was playing the audio hourglass tones.

Calls Disconnected by UM on Irrecoverable External Error	MSExchangeUMCallAnswering	Calls Disconnected by UM on Irrecoverable External Error is the number of calls that have been disconnected after an irrecoverable external error occurred.
Calls Without Personal Greetings	MSExchangeUMCallAnswering	Calls Without Personal Greetings is the number of diverted calls received for subscribers that did not have recorded greeting messages.
Diverted Extension Not Provisioned	MSExchangeUMCallAnswering	Diverted Extension Not Provisioned is the number of calls received for which the diverted extension supplied with the call is not a UM subscriber extension.
Fetch Greeting Timed Out	MSExchangeUMCallAnswering	Fetch Greeting Timed Out is the number of diverted calls for which the subscriber's personal greeting could not be retrieved within the time allowed.
Total Calls to Subscribers with One or More Call Answering Rules Configured	MSExchangeUMCallAnswering	Total Calls to Subscribers with One or More Call Answering Rules Configured evaluates calls to determine whether any call answering rules should be applied.
Total Number of Call Answering Rules Calls	MSExchangeUMCallAnswering	Total Number of Call Answering Rules Calls is the total number of calls that fulfill the conditions of at least one call answering rule. The rule is subsequently invoked to handle the call.
Total Number of Timed-out Call Answering Rule Evaluations	MSExchangeUMCallAnswering	Total Number of Timed-out Call Answering Rule Evaluations is the total number of calls for which call answering rules weren't applied because the system timed out. As a result, the calls were answered using the Exchange 2007 UM voice mail behavior.

Subscriber Access Performance Counters for Unified Messaging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-08*

There are many performance counters that can be used to maintain and troubleshoot a Microsoft Exchange Server 2010 Unified Messaging (UM) server. Unified Messaging performance counters are used to measure quantities of information or data for Unified Messaging based on the number, size, duration, and rate of data that's being requested or received.

Subscriber Access Performance Counters

The following table provides a list of the subscriber access performance counters that can be used to monitor Unified Messaging.

Unified Messaging subscriber access performance counters

Performance counter	Performance object	Description
Average Recent Sent Voice Message Size	MSExchangeUMSubscriberAccess	Average Recent Sent Voice Message Size is the average size, in seconds, of the last 50 voice messages that were sent.
Average Recent Subscriber Call Duration	MSExchangeUMSubscriberAccess	Average Recent Subscriber Call Duration is the average length of time, in seconds, that subscribers spent logged on to the system for the last 50 subscriber calls.
Average Sent Voice Message Size	MSExchangeUMSubscriberAccess	Average Sent Voice Message Size is the average size, in seconds, of voice messages that are sent. This size doesn't include any attachment data.
Average Subscriber Call Duration	MSExchangeUMSubscriberAccess	Average Subscriber Call Duration is the average duration, in seconds, that subscribers spent logged on to the system. This timer starts when logon completes.
Calendar Accessed	MSExchangeUMSubscriberAccess	Calendar Accessed is the number of times subscribers accessed their calendars using the telephone user interface.
Calendar Items Details Requested	MSExchangeUMSubscriberAccess	Calendar Items Details Requested is the number of times a subscriber requested

		additional details for a calendar item.
Calendar Items Heard	MSExchangeUMSubscriberAccess	Calendar Items Heard is the number of Calendar items that have been heard by authenticated subscribers.
Calendar Late Attendance	MSExchangeUMSubscriberAccess	Calendar Late Attendance is the number of messages that have been sent to inform the organizer of a meeting that the subscriber will be late.
Called Meeting Organizer	MSExchangeUMSubscriberAccess	Called Meeting Organizer is the number of times subscribers called the meeting organizer.
Calls Disconnected by Callers During UM Audio Hourglass	MSExchangeUMSubscriberAccess	Calls Disconnected by Callers During UM Audio Hourglass is the number of calls in which the caller disconnected while UM was playing the audio hourglass tones.
Calls Disconnected by UM on Irrecoverable External Error	MSExchangeUMSubscriberAccess	Calls Disconnected by UM on Irrecoverable External Error is the total number of calls that have been disconnected after an irrecoverable external error occurred.
Contact Items Heard	MSExchangeUMSubscriberAccess	Contact Items Heard is the number of times authenticated subscribers listened to directory details.
Contacts Accessed	MSExchangeUMSubscriberAccess	Contacts Accessed is the number of times subscribers accessed the Main Menu Contacts option by using the telephone user interface.
Directory Accessed	MSExchangeUMSubscriberAccess	Directory Accessed is the number of times subscribers accessed the Main Menu Directory option by using the telephone user interface.
Directory Accessed by Dial by Name	MSExchangeUMSubscriberAccess	Directory Accessed by Dial by Name is the number of directory access operations where the subscriber used the Dial by Name feature.
Directory Accessed by Extension	MSExchangeUMSubscriberAccess	Directory Accessed by Extension is the number of directory access operations in which the user supplied the extension number.

Directory Accessed by Spoken Name	MSExchangeUMSubscriberAccess	Directory Accessed by Spoken Name is the number of directory access operations in which the subscriber spoke a recipient name.
Directory Accessed Successfully by Dial by Name	MSExchangeUMSubscriberAccess	Directory Accessed Successfully by Dial by Name is the number of Dial by Name directory access operations that completed successfully on behalf of users.
Directory Accessed Successfully by Spoken Name	MSExchangeUMSubscriberAccess	Directory Accessed Successfully by Spoken Name is the number of speech recognition directory access operations that completed successfully on behalf of subscribers.
Email Message Queue Accessed	MSExchangeUMSubscriberAccess	Email Message Queue Accessed is the number of times subscribers accessed their e-mail message queue by using the telephone user interface.
Email Messages Deleted	MSExchangeUMSubscriberAccess	Email Messages Deleted is the number of e-mail messages that were deleted by authenticated subscribers.
Email Messages Heard	MSExchangeUMSubscriberAccess	Email Messages Heard is the number of e-mail messages that were heard by authenticated subscribers.
Forward Messages Sent	MSExchangeUMSubscriberAccess	Forward Messages Sent is the number of messages that have been forwarded by authenticated subscribers.
Launched Calls	MSExchangeUMSubscriberAccess	Launched Calls is the number of subscriber calls that resulted in an outbound call being placed.
Meetings Accepted	MSExchangeUMSubscriberAccess	Meetings Accepted is the number of Meeting Accepted messages sent by subscribers.
Meetings Declined	MSExchangeUMSubscriberAccess	Meetings Declined is the number of Meeting Declined messages sent by subscribers.
Protected Voice Messages	MSExchangeUMSubscriberAcc	Protected Voice Messages

Heard	ess	Heard is the number of protected voice messages played (all, or in part) to subscribers.
Protected Voice Messages Sent	MSExchangeUMSubscriberAccess	Protected Voice Messages Sent is the number of protected voice messages sent by authenticated UM subscribers.
Replied to Organizer	MSExchangeUMSubscriberAccess	Replied to Organizer is the number of times subscribers sent reply messages to meeting organizers.
Reply Messages Sent	MSExchangeUMSubscriberAccess	Reply Messages Sent is the number of replies sent by authenticated subscribers.
Subscriber Authentication Failures	MSExchangeUMSubscriberAccess	Subscriber Authentication Failures is the number of authentication failures that have occurred since the service was started. This number is incremented once for every failed authentication. It is possible that a single phone call could generate several authentication failures.
Subscriber Logon Failures	MSExchangeUMSubscriberAccess	Subscriber Logon Failures is the number of logon failures since the service was started. This number is incremented at most once per phone call.
Subscriber Logons	MSExchangeUMSubscriberAccess	Subscriber Logons is the number of successful authentications by UM subscribers since the service was started.
Voice Message Decryption Failures	MSExchangeUMSubscriberAccess	Voice Message Decryption Failures is the total number of times that an attempt to decrypt a protected voice message failed.
Voice Message Protection Failures	MSExchangeUMSubscriberAccess	Voice Message Protection Failures is the total number of interpersonal voice messages for which an attempt to apply protection failed.
Voice Message Queue Accessed	MSExchangeUMSubscriberAccess	Voice Message Queue Accessed is the number of times subscribers accessed

		their voice message queues by using the telephone user interface.
Voice Messages Deleted	MSExchangeUMSubscriberAccess	Voice Messages Deleted is the number of voice messages that were deleted by authenticated subscribers.
Voice Messages Heard	MSExchangeUMSubscriberAccess	Voice Messages Heard is the number of voice messages played to subscribers. This count is incremented as soon as playback starts. The subscriber does not need to listen to the entire message.
Voice Messages Sent	MSExchangeUMSubscriberAccess	Voice Messages Sent is the number of voice messages that have been sent by authenticated UM subscribers.

1.15.3.6.5 Auto Attendant Performance Counters for Unified Messaging

Auto Attendant Performance Counters for Unified Messaging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-08*

There are many performance counters that can be used to maintain and troubleshoot a Microsoft Exchange Server 2010 Unified Messaging (UM) server.

Unified Messaging performance counters are used to measure quantities of information or data for Unified Messaging based on the number, size, duration, and rate of data that's being requested or received. The **MSExchangeUMAutoAttendant** performance object can contain multiple instances. The number of instances for the performance object depends on the number of UM auto attendants that are created in the Exchange organization.

UM Auto Attendant Performance Counters

The following table provides a list of the auto attendant performance counters that can be used to monitor Exchange 2010 Unified Messaging.

Auto attendant performance counters for Unified Messaging

Performance counter	Performance object	Description
% Successful Calls	MSExchangeUMAutoAttendant	% Successful Calls calculates the success rate of the auto attendant.
Ambiguous Name Transfers	MSExchangeUMAutoAttenda	Ambiguous Name Transfers is

	nt	the number of times that callers were transferred to the operator because the name that they spelled or spoke was too common in the search results.
Average Call Time	MSExchangeUMAutoAttendant	Average Call Time is the average length of time that callers interacted with the auto attendant.
Average Recent Call Time	MSExchangeUMAutoAttendant	Average Recent Call Time is the average length of time, in seconds, of the last 50 auto attendant calls.
Business Hours Calls	MSExchangeUMAutoAttendant	Business Hours Calls is the number of calls processed by this auto attendant during business hours.
Calls Disconnected by UM on Irrecoverable External Error	MSExchangeUMAutoAttendant	Calls Disconnected by UM on Irrecoverable External Error is the total number of calls that were disconnected after an irrecoverable external error occurred.
Calls with DTMF fallback	MSExchangeUMAutoAttendant	Calls with DTMF fallback is the number of calls to this auto attendant during which a caller has been passed to the DTMF fallback auto attendant. This only happens for speech-enabled auto attendants.
Calls with Sent Message	MSExchangeUMAutoAttendant	Calls with Sent Message is the number of calls to this auto attendant in which a caller has sent a voice message.
Calls with Speech Input	MSExchangeUMAutoAttendant	Calls with Speech Input is the total number of calls during which the caller is determined to have spoken at least once.
Calls with Spoken Name	MSExchangeUMAutoAttendant	Calls with Spoken Name is the number of calls to this auto attendant during which a caller has spoken a name at least once.
Custom Menu Options	MSExchangeUMAutoAttendant	Custom Menu Options is the number of times that callers have selected custom menu options.
Directory Accessed	MSExchangeUMAutoAttendant	Directory Accessed is the number of directory access operations performed by this

		auto attendant.
Directory Accessed by Dial by Name	MSExchangeUMAutoAttendant	Directory Accessed by Dial by Name is the number of directory access operations in which the subscriber used the Dial by Name feature.
Directory Accessed by Extension	MSExchangeUMAutoAttendant	Directory Accessed by Extension is the number of directory access operations in which the user supplied the extension number.
Directory Accessed by Spoken Name	MSExchangeUMAutoAttendant	Directory Accessed by Spoken Name is the number of directory access operations in which the subscriber spoke a recipient name.
Directory Accessed Successfully by Dial by Name	MSExchangeUMAutoAttendant	Directory Accessed Successfully by Dial by Name is the number of successful directory access operations in which the caller used the Dial by Name feature.
Directory Accessed Successfully by Spoken Name	MSExchangeUMAutoAttendant	Directory Accessed Successfully by Spoken Name is the number of successful directory access operations in which the caller spoke a recipient name.
Disallowed Transfers	MSExchangeUMAutoAttendant	Disallowed Transfers is the number of times a caller was transferred to the operator because the user they identified was configured to accept calls only from users who are logged on.
Disconnected Without Input	MSExchangeUMAutoAttendant	Disconnected Without Input is the number of calls that were dropped without input being offered in response to the auto attendant prompts.
Menu Option 1 Used	MSExchangeUMAutoAttendant	Menu Option 1 Used is the number of times that a caller has chosen option 1 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 2 Used	MSExchangeUMAutoAttendant	Menu Option 2 Used is the number of times that a caller has chosen option 2 from the custom menu. **Note:**

		This value is always zero if no menu or option is defined.
Menu Option 3 Used	MSExchangeUMAutoAttendant	Menu Option 3 Used is the number of times that a caller has chosen option 3 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 4 Used	MSExchangeUMAutoAttendant	Menu Option 4 Used is the number of times that a caller has chosen option 4 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 5 Used	MSExchangeUMAutoAttendant	Menu Option 5 Used is the number of times that a caller has chosen option 5 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 6 Used	MSExchangeUMAutoAttendant	Menu Option 6 Used is the number of times that a caller has chosen option 6 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 7 Used	MSExchangeUMAutoAttendant	Menu Option 7 Used is the number of times that a caller has chosen option 7 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 8 Used	MSExchangeUMAutoAttendant	Menu Option 8 Used is the number of times that a caller has chosen option 8 from the custom menu. **Note:** This value is always zero if no menu or option is defined.
Menu Option 9 Used	MSExchangeUMAutoAttendant	Menu Option 9 Used is the number of times that a caller has chosen option 9 from the custom menu. **Note:** This value is always zero if no menu or option is defined.

Menu Option Timed Out	MSExchangeUMAutoAttendant	Menu Option Timed Out is the number of times that the system has timed out while waiting for a caller to select an option from the custom menu. **Note:** This value is always zero if no menu is defined.
Operator Transfers	MSExchangeUMAutoAttendant	Operator Transfers is the number of calls that have been transferred to the operator.
Operator Transfers Requested by User	MSExchangeUMAutoAttendant	Operator Transfers Requested by User is the number of times that a caller to this auto attendant has asked to be transferred to an operator.
Operator Transfers Requested by User from Opening Menu	MSExchangeUMAutoAttendant	Operator Transfers Requested by User from Opening Menu is the number of times that a caller to this auto attendant has asked to be transferred to an operator while at the opening menu.
Out of Hours Calls	MSExchangeUMAutoAttendant	Out of Hours Calls is the number of calls processed by this auto attendant outside of business hours.
Sent to Auto Attendant	MSExchangeUMAutoAttendant	Sent to Auto Attendant is the number of times that a caller to this auto attendant has used the custom menu to go to an auto attendant.
Total Calls	MSExchangeUMAutoAttendant	Total Calls is the number of calls that have been processed by this auto attendant.
Transferred Count	MSExchangeUMAutoAttendant	Transferred Count is the number of calls that were transferred by this auto attendant. This number does not include calls that were transferred by the operator.

Return to top

System Availability Counters for Unified Messaging

Performance and Scalability > Performance and Scalability Counters and Thresholds > Unified Messaging Counters >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-04-28*

There are many performance counters that can be used to maintain and troubleshoot a computer that's running Microsoft Exchange Server 2010.

Unified Messaging performance counters are used to measure quantities of information or data for Unified Messaging based on the number, size, duration, and rate of data that's being requested or received.

UM System Availability Performance Counters

The following table provides a list of the system availability performance counters that can be used to monitor Unified Messaging.

System availability performance counters for Unified Messaging

Performance counter	Performance object	Description
% of Failed Mailbox Connection Attempts Over the Last One Hour	MSExchangeAvailability	% of Failed Mailbox Connection Attempts Over the Last One Hour is the percentage of mailbox connection attempts that failed in the last hour.
% of Inbound Calls Rejected by the UM Service over the Last Hour	MSExchangeAvailability	% of Inbound Calls Rejected by the UM Service Over the Last Hour is the percentage of incoming calls that were rejected by the Microsoft Exchange Unified Messaging service in the last hour.
% of Inbound Calls Rejected by the UM Worker Process Over the Last Hour	MSExchangeAvailability	% of Inbound Calls Rejected by the UM Worker Process Over the Last Hour is the percentage of incoming calls that were rejected by the UM Worker process in the last hour.
% of Messages Successfully Processed Over the Last Hour	MSExchangeAvailability	% of Messages Successfully Processed Over the Last Hour is the percentage of messages that were successfully processed by the Microsoft Exchange Unified Messaging service in the last hour.

% of Partner Voice Message Transcription Failures Over the Last Hour	MSExchange Availability	% of Partner Voice Message Transcription Failures Over the Last Hour is the percentage of partner voice message transcription failures in the last hour.
Call Answer Queued Messages	MSExchangeAvailability	Call Answer Queued Messages is the number of messages created and not yet submitted for delivery.
Calls Disconnected by UM on Irrecoverable External Error	MSExchangeAvailability	Calls Disconnected by UM on Irrecoverable External Error is the number of calls disconnected after an irrecoverable external error occurred.
Calls Disconnected by UM on Irrecoverable External Error/ sec	MSExchangeAvailability	Calls Disconnected by UM on Irrecoverable External Error/ sec is the number of calls disconnected after an irrecoverable external error occurred in the last second.
Calls Disconnected on Irrecoverable Internal Error	MSExchangeAvailability	Calls Disconnected on Irrecoverable Internal Error is the number of calls that were disconnected after an internal system error occurred.
Directory Access Failures	MSExchangeAvailability	Directory Access Failures is the number of times that attempts to access Active Directory failed.
Failed Mailbox Connection Attempts %	MSExchangeAvailability	Failed Mailbox Connection Attempts % is the percentage of failed attempts to connect to the Mailbox server.
Incomplete Signaling Information	MSExchangeAvailability	Incomplete Signaling Information is the number of calls for which the signaling information was missing or incomplete.
Maximum Calls Allowed	MSExchangeAvailability	Maximum Calls Allowed is the length of time, in seconds, that the server concurrently processed the maximum number of calls allowed.
Name TTSed	MSExchangeAvailability	Name TTSed is the number of times the system used Text-to-Speech (TTS) to create an audio version of the display name of a subscriber.

Queued OCS User Event Notifications	MSExchangeAvailability	Queued OCS User Event Notifications is the number of notifications that have been created and not yet submitted for delivery.
Spoken Name Accessed	MSExchangeAvailability	Spoken Name Accessed is the number of times the system retrieved the recorded name of a user.
Total Worker Process Call Count	MSExchangeAvailability	Total Worker Process Call Count is the number of calls handled by this UM worker process.
Worker Process Recycled	MSExchangeAvailability	Worker Process Recycled is the number of times a new UM worker process has been started.

1.15.3.6.7 Performance Monitoring Counters for Unified Messaging

Performance Monitoring Counters for Unified Messaging

Performance and Scalability > Performance and Scalability Counters and Thresholds > Unified Messaging Counters >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-11-24*

There are many performance counters that can be used to maintain and troubleshoot a Microsoft Exchange Server 2010 Unified Messaging (UM) server. Unified Messaging performance counters are used to measure quantities of information or data for Unified Messaging based on the number, size, duration, and rate of data that's being requested or received.

UM Performance Monitoring Counters

The following table provides a list of the Unified Messaging performance monitoring counters that can be used to monitor Unified Messaging.

Unified Messaging performance monitoring counters

Performance counter	Performance object	Description
Operations Between Five and Six Seconds	MSExchangeUMPerformance	Operations Between Five and Six Seconds is the number of all UM operations that took between 5 and 6 seconds to complete. This is the time during which a caller was waiting for UM to respond.
Operations Between Four and Five Seconds	MSExchangeUMPerformance	Operations Between Four and Five Seconds is the number of all UM operations

		that took between 4 and 5 seconds to complete. This is the time during which a caller was waiting for UM to respond.
Operations Between Three and Four Seconds	MSExchangeUMPerformance	Operations Between Three and Four Seconds is the number of all UM operations that took between 3 and 4 seconds to complete. This is the time during which a caller was waiting for UM to respond.
Operations Between Two and Three Seconds	MSExchangeUMPerformance	Operations Between Two and Three Seconds is the number of all UM operations that took between 2 and 3 seconds to complete. This is the time during which a caller was waiting for UM to respond.
Operations over Six Seconds	MSExchangeUMPerformance	Operations over Six Seconds is the number of all UM operations that took more than 6 seconds to complete. This is the time during which a caller was waiting for Unified Messaging to respond.
Operations under Two Seconds	MSExchangeUMPerformance	Operations under Two Seconds is the number of all UM operations that took less than 2 seconds to complete. This is the time during which a caller was waiting for Unified Messaging to respond.

1.15.3.6.8 Fax Answering Performance Counters for Unified Messaging

Fax Answering Performance Counters for Unified Messaging

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2009-12-07*

There are many performance counters that can be used to maintain and troubleshoot a Microsoft Exchange Server 2010 Unified Messaging server. Unified Messaging performance counters are used to measure quantities of information or data for Unified Messaging based on the number, size, duration, and rate of data that is being requested or received.

Fax Answering Performance Counters

The following table provides a list of the fax answering performance counters that can be used to monitor Unified Messaging.

Unified Messaging fax answering performance counters

Performance counter	Performance object	Description
Percentage of Successful Valid Fax Calls	MSExchangeUMFax	Percentage of Successful Valid Fax Calls is the percentage of successful valid fax call requests.
Total Invalid Fax Calls	MSExchangeUMFax	Total Invalid Fax Calls is the total number of fax call requests to extensions that resolved to mailboxes that are not enabled for fax.
Total Successful Valid Fax Calls	MSExchangeUMFax	Total Successful Valid Fax Calls is the total number of valid fax call requests to extensions that resolved to mailboxes that are enabled for fax and were successfully transferred to a fax partner.
Total Valid Fax Calls	MSExchangeUMFax	Total Valid Fax Calls is the total number of valid fax call requests to extensions that resolved to mailboxes that are enabled for fax and were successfully transferred to the fax partner.

1.16 About Exchange Documentation

About Exchange Documentation

Exchange Server 2010 >

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2011-11-28*

This is a collection of conceptual and procedural topics organized by subject or by technologies used by Microsoft Exchange Server 2010 Service Pack 2 (SP2). You can access each topic directly from the table of contents in the left pane, from a link in another Help topic, from the results of a search, or from your own custom list of favorite topics.

For more detail about Exchange 2010 SP2 documentation, see the following topics:

- Accessibility for People with Disabilities
- Third-Party Copyright Notices

Where to Find Exchange 2010

Documentation

The Exchange Server 2010 TechCenter is your primary gateway to in-depth technical information about Exchange 2010. Through the TechCenter, which is located on the Microsoft TechNet site, you can access the Exchange 2010 Library and the Exchange Team Blog.

Exchange 2010 Library

The Exchange 2010 Library contains the most up-to-date Help documentation. This documentation is reviewed and approved by the Exchange product team and will evolve over time as Exchange 2010 gains exposure and new information, issues, and troubleshooting information becomes available.

The topics in the library also act as the in-product Help, which is accessible via the Exchange Management Console.

When you install Microsoft Exchange Server 2010 for the first time, the advanced security settings in Internet Explorer may block you from the TechNet site, which is where Exchange Server Help documentation is located. If that happens, use the following procedure to add Microsoft TechNet to your list of trusted Web sites.

1. Open Internet Explorer. Copy the following URL into the Internet Explorer address field: http://technet.microsoft.com/en-us/library/bb124558(EXCHG.141).aspx
   A pop-up box appears saying that the content is being blocked.
2. Click **Add**. The **Trusted sites** dialog box appears.
3. In **Add this website to the zone** box, make sure that the URL in step 1 is displayed.
4. Click **Add**, and then click **Close**.

Note:
Another dialog box may appear asking you to add another Microsoft site. In this case, repeat the process.

Offline Copy of the Help File

Looking for an offline version of this Exchange 2010 SP2 Help content? Download the Help file from the Microsoft Download Center.

Note:
Haven't upgraded to Exchange 2010 SP2? You can also download the Help file for previous versions of Exchange.

- Exchange 2010 SP1 Help
- Exchange 2010 RTM Help

Exchange Team Blog

The Exchange Team Blog contains technical articles written by the Exchange Team, as well as product announcements and updates. Through the use of feedback and comments, the blog is an excellent way to interact with the Exchange Team.

Additional Resources

Looking for more than just documentation? Check out these other Exchange 2010 resources:

- Exchange 2010 Learning Resources Use this page to take self-paced training for Exchange 2010, review learning plans and course descriptions for certifications, and order administrative guides.

- Exchange Server Downloads Use this page to download service packs, add-ins, tools, and trial software to help you optimize your Exchange 2010 organization.
- Exchange 2010 Forum The forum provides a place to discuss Exchange 2010 with customers and Exchange Team members.
- Exchange Support Use this page to locate support resources for Exchange 2010. You can search the Microsoft Knowledge Base, TechNet forums, or you can contact Microsoft Support for additional help.

Note:
Looking for Exchange 2010 developer documentation? Check out the Exchange Server Developer Center.

1.16.1 Accessibility for People with Disabilities

Accessibility for People with Disabilities

Applies to: *Exchange Server 2010 SP3, Exchange Server 2010 SP2*

Topic Last Modified: *2010-07-28*

Microsoft is committed to making its products and services easier for everyone to use. The following sections provide information about the features, products, and services that help make Microsoft Exchange 2010 more accessible for people with disabilities.

Accessibility Features of Exchange 2010

The following features in Exchange 2010 help make it more accessible for people with disabilities:

- Keyboard shortcuts
- Outlook Voice Access
- The light version of Outlook Web App

In addition, some accessibility features and utilities of Windows may benefit Exchange users with disabilities. Microsoft Management Console (MMC) keyboard shortcuts provide accessibility options when using the Exchange Management Console. Windows PowerShell size and color changes provide accessibility options when using the Exchange Management Shell. For more information about using keyboard shortcuts in MMC, see Accessibility for MMC. For more information about Windows PowerShell accessibility options, see Customizing the Windows PowerShell Console.

Note:
The information in this section applies only to users who license Microsoft products in the United States. If you obtained this product outside of the United States, you can use the subsidiary information card that came with your software package or visit Microsoft Accessibility for a list of telephone numbers and addresses for Microsoft support services. You can contact your subsidiary to find out whether the type of products and services described in this section are available in your area. Information about accessibility is available in other languages, including Japanese and French.

Keyboard Shortcuts

By using keyboard shortcuts in the Exchange Management Console, you can quickly accomplish the following common tasks.

To do this	Use this keyboard shortcut
Switch cursor between the console tree,	TAB

elements in the result pane, the divider between the result pane and the work pane, elements in the work pane, and the action pane	
Switch between **File**, **Action**, **View**, and **Help** menus	ALT + underlined letter of the menu
Select actions in the action pane and on the **Action** menu	ALT + A
Switch between elements on each page of a wizard	TAB

Outlook Voice Access

Outlook Voice Access provides blind and low-vision users another way to access their e-mail and calendar. Outlook Voice Access allows Unified Messaging-enabled users to retrieve e-mail messages from their Exchange 2010 mailbox by using an analog, digital, or mobile telephone. They can then interact with their mailbox by using touchtone or voice commands. They can read e-mail, listen to voice messages, interact with their Microsoft Office Outlook calendar, access their personal contacts, and manage personal options, for example, configuring their Outlook Voice Access PIN or recording their voice mail recordings. For more information about using Outlook Voice Access, see Outlook Voice Access Quick Start Guide.

Light Version of Outlook Web App

The light version of Outlook Web App is optimized for accessibility, such as for users who are blind or have low vision. The light version provides fewer features and is faster for some operations. Users may prefer the light version if they're on a slow connection or using a computer with unusually strict browser security settings. The light version can be used with almost any browser and has the same features across all browsers.

Accessibility Features of Exchange 2010 Help

Exchange 2010 Help includes features that make it accessible to a wider range of users, including those who have limited dexterity, low vision, or other disabilities. In addition, Exchange 2010 Help is available on the Web at the Exchange Server 2010 Library.

Keyboard Shortcuts for Using the Help Window

By using the following keyboard shortcuts in Help, you can quickly accomplish many common tasks.

To do this	Use this keyboard shortcut or function key
Display the Help window.	F1
Switch the cursor between the Help topic pane and the navigation pane (tabs such as **Contents**, **Search**, and **Index**).	F6
Change between tabs (for example, **Contents**, **Search**, and **Index**) while in the navigation pane.	ALT + underlined letter of the tab
Select the next hidden text or hyperlink.	TAB
Select the previous hidden text or hyperlink.	SHIFT+TAB

Perform the action for the selected Show All, Hide All, hidden text, or hyperlink.	ENTER
Display the **Options** menu to access any Help toolbar command.	ALT+O
Hide or show the pane containing the **Contents**, **Search**, and **Index** tabs.	ALT+O, and then press T
Display the previously viewed topic.	ALT+O, and then press B
Display the next topic in a previously displayed sequence of topics.	ALT+O, and then press F
Return to the specified home page.	ALT+O, and then press H
Stop the Help window from opening a Help topic (useful if you want to stop a Web page from downloading).	ALT+O, and then press S
Open the **Internet Options** dialog box for Microsoft Internet Explorer, where you can change accessibility settings.	ALT+O, and then press O
Refresh the topic (useful if you have linked to a Web page).	ALT+O, and then press R
Print all topics in a book or a selected topic only.	ALT+O, and then press P
Close the Help window.	ALT+F4

Alternate Text for Figures

Every figure in Exchange 2010 Help, including screenshots, diagrams, flow charts, and other figures, has associated alternate text. Users who have difficulty viewing figures can pause the cursor on the figure to read the alternate text. The alternate text describes what is illustrated in the figure.

Accessibility Products and Services from Microsoft

The following sections provide information about the features, products, and services that make Microsoft Windows more accessible for people with disabilities.

Note:

The information in this section may apply only to users who license Microsoft products in the United States. If you obtained this product outside of the United States, you can use the subsidiary information card that came with your software package or visit Microsoft Accessibility for a list of Microsoft support service telephone numbers and addresses. You can contact your subsidiary to find out whether the type of products and services described in this section are available in your area. Information about accessibility is available in other languages, including Japanese and French.

Accessibility Features of Windows

The Windows operating system has many built-in accessibility features that are useful for individuals who have difficulty typing or using a mouse, are blind or have low vision, or who are deaf or hard-of-hearing. The features are installed during Setup. For more information about these features, see Help in Windows and Microsoft Accessibility.

- **Free Step-by-Step Tutorials** Microsoft offers a series of step-by-step tutorials that provide detailed procedures for adjusting the accessibility

options and settings on your computer. This information is presented in a side-by-side format so that you can learn how to use the mouse, the keyboard, or a combination of both.
To find step-by-step tutorials for Microsoft products, see Microsoft Accessibility.

- **Assistive Technology Products for Windows** A wide variety of assistive technology products are available to make computers easier to use for people with disabilities. You can search a catalog of assistive technology products that run on Windows at Microsoft Accessibility.
  If you use assistive technology, be sure to contact your assistive technology vendor before you upgrade your software or hardware to check for possible compatibility issues.

Documentation in Alternative Formats

If you have difficulty reading or handling printed materials, you can obtain the documentation for many Microsoft products in more accessible formats. You can obtain an index of accessible product documentation at Microsoft Accessibility.

In addition, you can obtain additional Microsoft publications from Recording for the Blind & Dyslexic, Inc (RFB&D). RFB&D distributes these documents to registered, eligible members of their distribution service. For information about the availability of Microsoft product documentation and books from Microsoft Press, contact RFB&D.

Recording for the Blind & Dyslexic, Inc.

20 Roszel Road

Princeton, NJ 08540

Telephone number from within the United States: (800) 221-4792

Web site: Recording for the Blind & Dyslexic

Customer Service for People with Hearing Impairments

If you're deaf or hard-of-hearing, complete access to Microsoft product and customer services is available through a text telephone (TTY/TDD) service:

- For customer service, contact Microsoft Sales Information Center at (800) 892-5234 between 6:30 A.M. and 5:30 P.M. Pacific Time, Monday through Friday, excluding holidays.
- For technical assistance in the United States, contact Microsoft Product Support Services at (800) 892-5234 between 6:00 A.M. and 6:00 P.M. Pacific Time, Monday through Friday, excluding holidays. In Canada, dial (905) 568-9641 between 8:00 A.M. and 8:00 P.M. Eastern Time, Monday through Friday, excluding holidays.

Microsoft Support Services are subject to the prices, terms, and conditions in place at the time the service is used. For more information, see Microsoft Support.

For More Information

For more information about how accessible technology for computers helps to improve the lives of people with disabilities, see Microsoft Accessibility.
