Retention tags are added to a retention policy, which is applied to a mailbox.

Important:
When you use the **Remove-RetentionPolicyTag** cmdlet to remove a retention tag, it removes the tag definition stored in Active Directory. The next time the Managed Folder Assistant runs, it processes all items that have the removed tag applied and restamps them. Depending on the number of mailboxes and messages, this process may result in significant resource consumption on all Mailbox servers that contain mailboxes with a retention policy that includes the removed tag.

For more information about retention tags, see Retention tags and retention policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RetentionPolicyTagIdParameter	The *Identity* parameter specifies the name of the retention policy tag.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RetentionPolicyTag

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-RetentionPolicyTag** cmdlet to modify the properties of a retention tag.

For more information about retention tags, see Retention tags and retention policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-RetentionPolicyTag -Identity <RetentionPolicyTagIdParameter> [-
AddressForJournaling <RecipientIdParameter>] [-AgeLimitForRetention
<EnhancedTimeSpan>] [-JournalingEnabled <$true | $false>] [-
LabelForJournaling <String>] [-MessageClass <String>] [-
MessageFormatForJournaling <UseMsg | UseTnef>] [-RetentionAction
<MoveToDeletedItems | MoveToFolder | DeleteAndAllowRecovery |
PermanentlyDelete | MarkAsPastRetentionLimit | MoveToArchive>] [-
RetentionEnabled <$true | $false>] <COMMON PARAMETERS>

Set-RetentionPolicyTag -Mailbox <MailboxIdParameter> [-OptionalInMailbox
<RetentionPolicyTagIdParameter[]>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Comment <String>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Force <SwitchParameter>] [-LegacyManagedFolder
<ELCFolderIdParameter>] [-LocalizedComment <MultiValuedProperty>] [-
LocalizedRetentionPolicyTagName <MultiValuedProperty>] [-
MustDisplayCommentEnabled <$true | $false>] [-Name <String>] [-RetentionId
<Guid>] [-SystemTag <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the comment for the AllUsers-DeletedItems retention policy tag.

```
Set-RetentionPolicyTag "AllUsers-DeletedItems" -Comment
"Items in the Deleted Items folder will be automatically
deleted in 120 days"
```

EXAMPLE 2

This example makes optional retention tags available to user Terry Adams using the *Mailbox* and *OptionalInMailbox* parameters.

```
Set-RetentionPolicyTag -Mailbox "Terry Adams" -
OptionalInMailbox "ProjectA","ProjectB"
```

Detailed Description

Retention tags are used to apply message retention settings to folders and items in a mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RetentionPolicyTagIdParameter	The *Identity* parameter specifies the name, distinguished name (DN), or GUID of the retention policy tag to be modified.
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies a mailbox for assigning opt-in tags. **Important:** You must use this parameter with the *OptionalInMailbox*

			parameter.
AddressForJournaling	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	This parameter isn't available in this release.
AgeLimitForRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AgeLimitForRetention* parameter specifies the age at which retention is enforced on an item. The age limit corresponds to the number of days from the date the item was delivered, or the date an item was created if it wasn't delivered. If this parameter isn't present and the *RetentionEnabled* parameter is set to `$true`, an error is returned.
Comment	Optional	System.String	The *Comment* parameter specifies a comment for the retention policy tag.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch overrides the confirmation prompt displayed by the cmdlet when you use the *RetentionId* parameter.
JournalingEnabled	Optional	System.Boolean	This parameter isn't available in this release.
LabelForJournaling	Optional	System.String	This parameter isn't available in this release.
LegacyManagedFolder	Optional	Microsoft.Exchange.Configuration.Tasks.ELCFolderIdParameter	The *LegacyManagedFolder* parameter specifies the name of a managed folder. The retention tag is created by using retention settings from the managed folder and its managed content settings. You can use this

			parameter to create retention tags based on existing managed folders to migrate users from managed folder mailbox policies to retention policies.
LocalizedComment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *LocalizedComment* parameter specifies the localized comment and language for the retention policy tag. This comment is displayed in Microsoft Outlook based on the user's locale.
LocalizedRetentionPolicyTagName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *LocalizedRetentionPolicyTagName* parameter specifies a localized name for the retention policy tag. This name is displayed in Outlook based on the user's locale.
MessageClass	Optional	System.String	The *MessageClass* parameter specifies the message type to which the tag applies. If not specified, the default value is set to *. With the exception of a default policy tag (DPT)

			for `voicemail`, Exchange doesn't support retention tags for different message types. Only tags with a *MessageClass* of `*` are supported, and they apply to all message types. To create a DPT for voice mail messages, set the *MessageClass* parameter to `voicemail` and the *Type* parameter to `All`. **Note:** A DPT for voice mail messages applies only to Microsoft Exchange Unified Messaging voice mail messages (identified by the `PR_MESSAGE_CLASS` MAPI property value `IPM.Note.Microsoft.Voicemail*`).
MessageFormatForJournaling	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.JournalingFormat	This parameter isn't available in this release.
MustDisplayCommentEnabled	Optional	System.Boolean	The *MustDisplayCommentEnabled* parameter specifies whether the comment can be hidden. The default value is `$true`.
Name	Optional	System.String	The *Name* parameter specifies the name of the

			retention policy tag.
OptionalInMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.RetentionPolicyTagIdParameter[]	The *OptionalInMailbox* parameter is used with the *Mailbox* parameter to specify opt-in retention tags available to the mailbox.
RetentionAction	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RetentionActionType	The *RetentionAction* parameter specifies one of the following actions: • `MarkAsPastRetentionLimit` This action isn't available for retention tags. If you specify this action for a retention tag, messages that have the tag applied aren't deleted or marked as past the retention limit. • `MoveToFolder` This action isn't available for retention tags. You can't specify this action for a retention tag. • `MoveToDeletedItems` This action isn't available for retention tags. If you specify this action for a retention tag, messages that have the tag applied aren't deleted or marked as past the retention limit. • `DeleteAndAllowRecovery` This action deletes a message and allows recovery from the Recoverable Items folder.

			• `PermanentlyDelete` This action permanently deletes a message. A message that has been permanently deleted can't be recovered by using the Recoverable Items folder. Permanently deleted messages aren't returned in a Discovery search, unless litigation hold is enabled for the mailbox. • `MoveToArchive` This action moves a message to the user's archive mailbox. If this parameter isn't present and the *RetentionEnabled* parameter is set to `$true`, an error is returned.
RetentionEnabled	Optional	System.Boolean	The *RetentionEnabled* parameter specifies whether the tag is enabled. When set to `$false`, the tag is disabled, and no retention action is taken on messages that have the tag applied. **Note:** Messages with a disabled tag are still considered tagged, so any default policy tags in the user's retention policy aren't applied to such messages.

			When you set the *RetentionEnabled* parameter to `$false`, the retention period for the tag is shown as **Never**. Users may apply this tag to items that they want to indicate should never be deleted or should never be moved to the archive. Enabling the tag later may result in unintentional deletion or archiving of items. To avoid this situation, if a retention policy is disabled temporarily, it may be advisable to change the name of that tag so that users are discouraged from using it, such as `DISABLED_<Original Name>`.
RetentionId	Optional	System.Guid	The *RetentionId* parameter specifies an alternate tag ID to ensure the retention tag found on mailbox items tagged in one Exchange organization matches the tag when the mailbox is moved to another Exchange organization

			(for example, in a cross-forest deployment or in a cross-premises deployment, when a mailbox is moved from an on-premises Exchange server to the cloud, or a cloud-based mailbox is moved to an on-premises Exchange server). **Important:** It's not ordinarily required to specify or modify the *RetentionId* parameter for a retention tag. The parameter is populated automatically by *<scriptname>* when importing retention tags in a cross-forest or cross-premises deployment.
SystemTag	Optional	System.Boolean	The *SystemTag* parameter specifies whether the retention policy tag is created for internal Exchange functionality.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RMSTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RMSTemplate** cmdlet to retrieve the current list of active rights policy templates from the Active Directory Rights Management Services (AD RMS) deployment for the organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RMSTemplate [-Organization <OrganizationIdParameter>] [-
DomainController <Fqdn>] [-Identity <RmsTemplateIdParameter>] [-ResultSize
<Unlimited>] [-TrustedPublishingDomain
<RmsTrustedPublishingDomainIdParameter>] [-Type <Archived | Distributed |
All>]
```

Examples

EXAMPLE 1

This example retrieves all RMS templates available from the RMS deployment.

```
Get-RMSTemplate -ResultSize unlimited
```

EXAMPLE 2

This example retrieves the Company Confidential RMS template.

```
Get-RMSTemplate -Identity "Company Confidential"
```

Detailed Description

Note:
The **Get-RMSTemplate** cmdlet doesn't return any active rights policy templates if internal licensing isn't enabled. Use the Get-IRMConfiguration cmdlet to check the *InternalLicensingEnabled* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RmsTemplateIdParameter	The *Identity* parameter specifies the name of the RMS template.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.Orga	The *Organization* parameter is reserved for

		nizationIdParameter	internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. The default value is `1000`. To return all results, use `unlimited`.
TrustedPublishingDomain	Optional	Microsoft.Exchange.Configuration.Tasks.RmsTrustedPublishingDomainIdParameter	This parameter is available only in the cloud-based service. The *TrustedPublishingDomain* parameter specifies the trusted publishing domain you want to search for RMS templates. You can use any value that uniquely identifies the trusted publishing domain, for example: • Name • Distinguished name (DN) • GUID
Type	Optional	Microsoft.Exchange.Security.RightsManagement.RmsTemplateType	This parameter is available only in the cloud-based service. The *Type* parameter specifies the type of RMS template. Use one of the following values: • `All`

			• Archived • Distributed

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-TransportRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-04-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-TransportRule** cmdlet to disable a specific transport rule for messages that pass through the Transport service on a Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-TransportRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the transport rule Sales-Disclaimer.

```
Disable-TransportRule "Sales-Disclaimer"
```

Detailed Description

You can enable or disable specific transport rules at any time using the **Disable-TransportRule** and Enable-TransportRule cmdlets. To learn more about transport rules, see Transport rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the rule you want to disable. Enter either the name or the GUID of the rule. You can omit the parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-TransportRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-04-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-TransportRule** cmdlet to enable a specific transport rule for messages that pass through the Transport service on a Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-TransportRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Mode <Audit |
AuditAndNotify | Enforce>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the transport rule `Disclaimer-Finance`.

```
Enable-TransportRule "Disclaimer-Finance"
```

EXAMPLE 2

This example enables the transport rule `Require approval of messages to contoso.com` in audit mode, so you can see how the rule would function by analyzing the related entries in message tracking logs.

```
Enable-TransportRule "Require approval of messages to
contoso.com" -Mode Audit
```

Detailed Description

You can turn specific transport rules on or off in your organization at any time using the **Enable-TransportRule** and Disable-TransportRule cmdlets. To learn more about transport rules, see Transport rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the rule you want to turn on. Enter either the name or the GUID of the rule. You can omit this parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Mode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleMode	The *Mode* parameter specifies in which mode this rule will operate after it's turned on. Valid values for this parameter include: • `Audit` The rule is turned on, and what would have happened if the rule was enforced is logged in message tracking logs. Exchange doesn't take any action that impacts the delivery of the message. • `AuditAndNotify` The rule is turned on, and it operates the same way it would in `Audit` mode, but notifications are also enabled. • `Enforce` The rule is turned on, and all actions specified in the

			rule are taken. The default value is `Enforce`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-TransportRule** cmdlet to view transport rules configured in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-TransportRule [-Identity <RuleIdParameter>] [-DlpPolicy <String>] [-
DomainController <Fqdn>] [-Filter <String>] [-Organization
<OrganizationIdParameter>] [-ResultSize <Unlimited>] [-State <Enabled |
Disabled>]
```

Examples

EXAMPLE 1

This example returns all transport rules configured in your organization.

```
Get-TransportRule
```

EXAMPLE 2

This example returns only the rule that matches the name "`Block email messages between Sales and Brokerage Groups`". The command is piped to the **Format-List** cmdlet to display the detailed configuration of the specified transport rule.

```
Get-TransportRule "Block email messages between Sales and
Brokerage Groups" | Format-List
```

For more information about pipelining, see Pipelining. For more information about how to work with the output of a command, see Working with command output.

EXAMPLE 3

This example returns the rules that are used to enforce the DLP policy PII (U.S.) in your organization.

```
Get-TransportRule -DlpPolicy "PII (U.S.)"
```

EXAMPLE 4

This example returns all rules in your organization that are used to enforce DLP policies in your organization. The command output is filtered to display only those rules that have a value for their **DlpPolicy** attribute.

```
Get-TransportRule | Where {$_.DlpPolicy -ne $null}
```

Detailed Description

The **Get-TransportRule** cmdlet lets you view the configuration of transport rules that are defined in your organization.

For information about how to configure transport rules in your organization, see Set-TransportRule. To learn more about transport rules, see Transport rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DlpPolicy	Optional	System.String	The *DlpPolicy* parameter specifies the data loss prevention (DLP) policy when you want to view the rules associated with a specific DLP policy. DLP policies in your organization allow you to prevent unintentional disclosure of sensitive information. Each DLP policy is enforced using a set of transport rules. If you want to view the rules that are used to support a specific DLP policy, use this parameter to specify the name of that policy.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Filter	Optional	System.String	The *Filter* parameter specifies an OPath filter that returns all transport rules that match the specified search criteria. This parameter searches the **Description** property, which includes the conditions, exceptions, actions and the associated values of a transport rule. This parameter uses the syntax `-Filter "Description -like '*<text>*'"`. For example, `-Filter "Description -like *192.168.1.1*'"`.

Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the transport rule you want to view. Enter either the name or GUID of the rule. You can omit this parameter label.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
State	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleState	The *State* parameter specifies whether to return only the rules that are enabled or the ones that are disabled. The following values are valid for this parameter: • `Enabled` The command returns only the rules that are currently enabled. • `Disabled` The command returns only the rules that are currently disabled.

			If you don't use this parameter, the command returns all rules, both enabled and disabled.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-TransportRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-TransportRule** cmdlet to create transport rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-TransportRule -Name <String> [-ActivationDate <DateTime>] [-
ADComparisonAttribute <DisplayName | FirstName | Initials | LastName |
Office | PhoneNumber | OtherPhoneNumber | Email | Street | POBox | City |

Examples

EXAMPLE 1

This example creates a transport rule with the following condition:

- **Between distribution list and distribution list** The first condition property value is the distribution group `Sales-Group`. The second condition property value is the distribution group `Brokerage-Group`.

The rule also has the following exceptions:

- **With text patterns in the subject** The value for this exception is `Press Release` or `Corporate Communication`.
- **From people** The values for this exception are the users Tony Smith and Pilar Ackerman.

The following action will be applied to any messages that match the "Between distribution list and distribution list" condition, but doesn't match the "with text patterns in the subject" or "from

people" exceptions:

- **Send reject message to sender** The value for this action is: `Email messages sent between the Sales department and the Brokerage department are prohibited.`

```
New-TransportRule "BlockMessagesBetweenSalesAndBrokerage" -
BetweenMemberOf1 "Sales-Group" -BetweenMemberOf2
"Brokerage-Group" -ExceptIfFrom "Tony Smith","Pilar
Ackerman" -ExceptIfSubjectContainsWords "Press
Release","Corporate Communication" -
RejectMessageEnhancedStatusCode "5.7.1" -
RejectMessageReasonText "Email messages sent between the
Sales department and the Brokerage department are
prohibited."
```

Detailed Description

Transport rule conditions and exceptions use one or more conditions along with the corresponding values to test for. For a list of supported transport rule conditions, see Transport rule conditions (predicates).

Transport rules apply actions to messages, most with corresponding action values. For a list of supported transport rule actions, see Transport rule actions.

For detailed information about how to create a transport rule, see Manage Transport Rules. For information about transport rules, see Transport rules.

In on-premises Exchange organizations, Transport rules created on Mailbox servers are stored in Active Directory. All Mailbox servers in the organization have access to the same set of transport rules. On Edge Transport servers, transport rules are saved in the local copy of Active Directory Lightweight Directory Services (AD LDS). Transport rules aren't shared or replicated between Edge Transport servers or between Mailbox servers and Edge Transport servers. Also, Mailbox servers and Edge Transport servers share a set of common conditions and actions, but some conditions and actions are exclusive to each server role.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter

			specifies the display name of the transport rule to be created. The length of the name can't exceed 64 characters.
ActivationDate	Optional	System.DateTime	The *ActivationDate* parameter specifies the date when this rule will become effective. The rule won't take any action on messages until the day you specify for this parameter.
ADComparisonAttribute	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ADAttribute	The *ADComparisonAttribute* parameter specifies an Active Directory attribute to compare between the sender and recipients. When you use this parameter, the specified Active Directory attribute of the sender is compared to the same Active Directory attribute of all the recipients of the message. You can use one of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials**

			• **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** When specifying the *ADComparisonAttribute* parameter, if you don't specify a value for the *ADComparisonOperator* parameter, the default comparison operator

			`Equal` is used. This parameter is used to define a rule condition.
ADComparisonOperator	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Evaluation	The *ADComparisonOperator* parameter specifies a comparison operator for the *ADComparisonAttribute* parameter. Valid values include: • `Equal` • `NotEqual` If you use the *ADComparisonOperator* parameter, you must also use the *ADComparisonAttribute* parameter. This parameter is used to define a rule condition.
AddManagerAsRecipientType	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.AddedRecipientType	The *AddManagerAsRecipientType* parameter specifies how the message is relayed to the manager of the sender or recipient. You can use any of the following values: • `To` The manager is added to the recipients in the To line of the message.

			• `Cc` The manager is added to the recipients in the carbon copy (Cc) line of the message. • `Bcc` The manager is added to the recipients in the blind carbon copy (Bcc) line of the message. • `Redirect` The message is redirected to the manager instead of being delivered to the original recipients. This parameter is used to define a rule action.
AddToRecipients	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AddToRecipients* parameter specifies one or more additional recipients for the message. Separate multiple recipients with commas. The specified recipients are added as To recipients. This parameter is used to define a rule action.
AnyOfCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfCcHeader* parameter specifies one or more recipients. The rule is applied if any of these recipients are present as a Cc recipient. This parameter is used to define a rule condition.

AnyOfCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfCcHeaderMemberOf* parameter specifies a distribution group. The rule is applied if a member of the specified distribution group is present as a Cc recipient. This parameter is used to define a rule condition.
AnyOfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *AnyOfRecipientAddressContainsWords* parameter specifies one or more words to check in a recipient address. The rule is applied if a recipient's address includes any of these words. This parameter is used to define a rule condition.
AnyOfRecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *AnyOfRecipientAddressMatchesPatterns* parameter specifies one or more regular expressions to match in a recipient address. The rule is applied if any of the recipients' addresses matches the pattern you specify.

			This parameter is used to define a rule condition.
AnyOfToCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToCcHeader* parameter specifies one or more recipients. The rule is applied if any of the recipients specified are present as a To or Cc recipient. This parameter is used to define a rule condition.
AnyOfToCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToCcHeaderMemberOf* parameter specifies a distribution group. The rule is applied if a member of the specified distribution group is present as a To or Cc recipient. This parameter is used to define a rule condition.
AnyOfToHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToHeader* parameter specifies one or more recipients. The rule is applied if any of the specified recipients are present as a To recipient. This parameter is used to define a rule condition.

AnyOfToHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToHeaderMemberOf* parameter specifies a distribution group. The rule is applied if a member of the specified distribution group is present as a To recipient. This parameter is used to define a rule condition.
ApplyClassification	Optional	System.String	The *ApplyClassification* parameter specifies a message classification to apply to the message. **Note:** The message classification referred to in this parameter is the custom message classification that you can create in your organization. It isn't related to the data loss prevention (DLP) classification. This parameter is used to define a rule action.
ApplyHtmlDisclaimerFallbackAction	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.DisclaimerFallbackAction	The *ApplyHtmlDisclaimerFallbackAction* parameter specifies an action to fall back to if the HTML disclaimer can't be applied to a message. Valid fallback actions include

			the following: • `Wrap` The original message is wrapped as an attachment in a new message and the disclaimer is used as the message body for the new message. • `Ignore` The rule is ignored and the message is delivered without the disclaimer. • `Reject` The message is rejected. **Note:** This parameter is used with the *ApplyHtmlDisclaimerText* parameter. If you use the *ApplyHtmlDisclaimerText* parameter without specifying a value for this parameter, the default fallback action, `Wrap`, is used. This parameter is used to define a rule action.
ApplyHtmlDisclaimerLocation	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.DisclaimerLocation	The *ApplyHtmlDisclaimerLocation* parameter specifies the location within the message where the HTML disclaimer text is inserted. You can use either of the following two values: • `Append` The disclaimer is added to the end of the message body. • `Prepend` The disclaimer is inserted to the beginning of the

			message body. **Note:** This parameter is used with the *ApplyHtmlDisclaimerText* parameter. If you use the *ApplyHtmlDisclaimerText* parameter without specifying a value for this parameter, the default value, Append, is used. This parameter is used to define a rule action.
ApplyHtmlDisclaimerText	Optional	Microsoft.Exchange.Data.DisclaimerText	The *ApplyHtmlDisclaimerText* parameter specifies disclaimer text to be inserted in the message. Disclaimer text can include HTML tags and inline cascading style sheet (CSS) tags. You can add images using the IMG tag. This parameter is used to define a rule action.
ApplyOME	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *ApplyOME* parameter specifies that a message and its attachments will be encrypted if the message matches the conditions of this rule.

			Valid input for this parameter is `$true` or `$false`. The default is `$false`. This parameter is used to define a rule action.
ApplyRightsProtectionTemplate	Optional	Microsoft.Exchange.Configuration.Tasks.RmsTemplateIdParameter	The *ApplyRightsProtectionTemplate* parameter specifies the name of a rights management service (RMS) template to apply to the message. This action adds rights protection to the messages that meet the conditions of this rule. To use this action, an Active Directory Rights Management Services (AD RMS) server should exist in the topology or the organization should be configured to use the ILS service. For more information, see Transport protection rules. This parameter is used to define a rule action.
AttachmentContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *AttachmentContainsWord*

			s parameter specifies one or more words to check in attachments. Only supported attachment types are checked. The rule is applied if any of the attachments contain any of the words you specify. This parameter is used to define a rule condition.
AttachmentExtensionMatchesWords	Optional	Microsoft.Exchange.Data.Word[]	The *AttachmentExtensionMatchesWords* parameter specifies one or more word patterns to check in attachment extensions. The rule is applied if the extensions of any of the attachments match the word patterns you specify. This parameter is used to define a rule condition.
AttachmentHasExecutableContent	Optional	System.Boolean	The *AttachmentHasExecutableContent* parameter specifies whether the rule is applied when any attachments in the message contain executable content. If you set this parameter to `$true`, the rule is applied if

			any of the attachments contains executable content. This parameter is used to define a rule condition.
AttachmentIsPasswordProtected	Optional	System.Boolean	The *AttachmentIsPasswordProtected* parameter specifies whether the attachment is a password protected file whose contents can't be inspected. For example, if a password protected ZIP file is in a message, this condition will be met. The rule is applied if any attachment is password protected. This parameter is used to define a rule condition.
AttachmentIsUnsupported	Optional	System.Boolean	The *AttachmentIsUnsupported* parameter specifies whether the rule is applied when any attachments in the message are of an unsupported type. Unsupported attachments are attachments for which an IFilter isn't installed on the servers. If you set this parameter to `$true`, the

			rule is applied if any of the attachments is an unsupported type. This parameter is used to define a rule condition.
AttachmentMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *AttachmentMatchesPatterns* parameter specifies one or more regular expressions to match in message attachment content. Only supported attachment types are checked for the specified pattern. **Note:** Only the first 150 kilobytes (KB) of the attachment is scanned when trying to match a pattern. This parameter is used to define a rule condition.
AttachmentNameMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *AttachmentNameMatchesPatterns* parameter specifies one or more word patterns to check in attachment names. The rule is applied if the name of any attachment matches the patterns you specify.

			This parameter is used to define a rule condition.
AttachmentProcessingLimitExceeded	Optional	System.Boolean	The *AttachmentProcessingLimitExceeded* parameter specifies whether the scanning of attachments in the message didn't complete because the processing exceeded built-in limits. This condition is used to create rules that work together with other attachment processing rules and gives you the ability to handle messages whose content couldn't be fully scanned. Valid values are `$true` and `$false`. This parameter is used to define a rule condition.
AttachmentPropertyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	This parameter is reserved for internal Microsoft use.
AttachmentSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *AttachmentSizeOver* parameter specifies an attachment size. The rule is applied if the size of any of the attachments exceeds the specified size. This parameter is used to

			define a rule condition.
BetweenMemberOf1	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *BetweenMemberOf1* parameter specifies a distribution group and must be used together with the *BetweenMemberOf2* parameter. The rule is applied if the message is sent between members of the distribution groups specified in these parameters. This parameter is used to define a rule condition.
BetweenMemberOf2	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *BetweenMemberOf2* parameter specifies a distribution group and must be used together with the *BetweenMemberOf1* parameter. The rule is applied if the message is sent between members of the distribution groups specified in these parameters. This parameter is used to define a rule condition.
BlindCopyTo	Optional	Microsoft.Exchange.Configuration.Tasks.Reci	The *BlindCopyTo* parameter specifies one or

		pientIdParameter[]	more recipients to add to the message as Bcc recipients. This parameter is used to define a rule action.
Comments	Optional	System.String	The *Comments* parameter specifies informative comments for the transport rule, such as what the rule is used for or how it has changed over time. The length of the comment can't exceed 1024 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContentCharacterSetContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ContentCharacterSetContainsWords* parameter specifies one or more character set names to check for in the message. The rule is applied if the message contains any of

			the character sets specified. This parameter is used to define a rule condition.
CopyTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *CopyTo* parameter specifies one or more recipients to add to the message as Cc recipients. This parameter is used to define a rule action.
DeleteMessage	Optional	System.Boolean	The *DeleteMessage* parameter specifies that the rule deletes any message that matches the conditions specified. This parameter is used to define a rule action.
Disconnect	Optional	System.Boolean	The *Disconnect* parameter specifies whether the rules agent disconnects the SMTP session. This parameter is used to define a rule action.
DlpPolicy	Optional	System.String	The *DlpPolicy* parameter specifies the data loss prevention (DLP) Policy associated with this rule. Each DLP policy is enforced using a set of Transport rules. To learn

			more about DLP, see Data loss prevention.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the transport rule should be enabled when it's created. The default value is `$true`.
ExceptIfADComparisonAttribute	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ADAttribute	The *ExceptIfADComparisonAttribute* parameter specifies an Active Directory attribute to compare

			between the sender and recipients. When you use this parameter, the specified Active Directory attribute of the sender is compared to the same Active Directory attribute of all the recipients of the message. You can use one of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber**

			• **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** When specifying the *ExceptIfADComparisonAttribute* parameter, if you don't specify a value for the *ExceptIfADComparisonOperator* parameter, the default comparison operator `Equal` is used.
ExceptIfADComparisonOperator	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Evaluation	The *ExceptIfADComparisonOperator* parameter specifies a comparison operator for the *ExceptIfADComparisonAttribute* parameter. Valid values are: • `Equal` • `NotEqual` If you use the *ExceptIfADComparisonOperator* parameter, you must also use the *ExceptIfADComparisonAttribute* parameter.

ExceptIfAnyOfCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfCcHeader* parameter specifies one or more recipients. The rule isn't applied if any of these recipients are present as a Cc recipient.
ExceptIfAnyOfCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfCcHeaderMemberOf* parameter specifies a distribution group. The rule isn't applied if a member of the specified distribution group is present as a Cc recipient.
ExceptIfAnyOfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfAnyOfRecipientAddressContainsWords* parameter specifies one or more words to check in a recipient address. The rule isn't applied if a recipient's address includes any of these words.
ExceptIfAnyOfRecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfAnyOfRecipientAddressMatchesPatterns* parameter specifies one or more regular expressions to match in a recipient

			address. The rule isn't applied if any of the recipient addresses matches the pattern you specify.
ExceptIfAnyOfToCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToCcHeader* parameter specifies one or more recipients. The rule isn't applied if any of the recipients specified are present as a To or Cc recipient.
ExceptIfAnyOfToCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToCcHeaderMemberOf* parameter specifies a distribution group. The rule isn't applied if a member of the specified distribution group is present as a To or Cc recipient.
ExceptIfAnyOfToHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToHeader* parameter specifies one or more recipients. The rule isn't applied if any of the specified recipients are present as a To recipient.
ExceptIfAnyOfToHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.Reci	The *ExceptIfAnyOfToHeaderM*

		pientIdParameter[]	*emberOf* parameter specifies a distribution group. The rule isn't applied if a member of the specified distribution group is present as a To recipient.
ExceptIfAttachmentContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfAttachmentContainsWords* parameter specifies one or more words to check in attachments. Only supported attachment types are checked. The rule isn't applied if any of the attachments contain any of the words you specify.
ExceptIfAttachmentExtensionMatchesWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfAttachmentExtensionMatchesWords* parameter specifies one or more word patterns to check in attachment extensions. The rule isn't applied if the extensions of any of the attachments match the word patterns you specify.
ExceptIfAttachmentHa	Optional	System.Boolean	The

sExecutableContent			*ExceptIfAttachmentHasExecutableContent* parameter specifies whether the rule is applied when any attachments in the message contain executable content. If you set this parameter to `$true`, the rule isn't applied if any of the attachments contains executable content.
ExceptIfAttachmentIsPasswordProtected	Optional	System.Boolean	The *ExceptIfAttachmentIsPasswordProtected* parameter specifies whether the attachment is a password protected file whose contents can't be inspected. For example, if a password protected ZIP file is in a message, this exception will be met. The rule isn't applied if any attachment is password protected.
ExceptIfAttachmentIsUnsupported	Optional	System.Boolean	The *ExceptIfAttachmentIsUnsupported* parameter specifies whether the rule is applied when any attachments in the

			message are of an unsupported type. Unsupported attachments are attachments for which an IFilter isn't installed on your servers. If you set this parameter to `$true` the rule isn't applied if any of the attachments is an unsupported type.
ExceptIfAttachmentMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfAttachmentMatchesPatterns* parameter specifies one or more regular expressions to match in message attachment content. Only supported attachment types are checked for the specified pattern. **Note:** Only the first 150 KB of the attachment is scanned when trying to match a pattern.
ExceptIfAttachmentNameMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfAttachmentNameMatchesPatterns* parameter specifies one or more word patterns to check in attachment names. The rule isn't applied if the name of any

			attachment matches the patterns you specify.
ExceptIfAttachmentProcessingLimitExceeded	Optional	System.Boolean	The *ExceptIfAttachmentProcessingLimitExceeded* parameter specifies whether the scanning of attachments in the message didn't complete because the processing exceeded built-in limits. This condition is used to create rules that work together with other attachment processing rules and gives you the ability to handle messages whose content couldn't be fully scanned. Valid values are `$true` and `$false`.
ExceptIfAttachmentPropertyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	This parameter is reserved for internal Microsoft use.
ExceptIfAttachmentSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfAttachmentSizeOver* parameter specifies an attachment size. The rule isn't applied if the size of any of the attachments exceeds the specified size.
ExceptIfBetweenMemb	Optional	Microsoft.Exchange.Co	The

erOf1		nfiguration.Tasks.RecipientIdParameter[]	*ExceptIfBetweenMemberOf1* parameter specifies a distribution group and must be used together with the *ExceptIfBetweenMemberOf2* parameter. The rule isn't applied if the message is sent between members of the distribution groups specified in these parameters.
ExceptIfBetweenMemberOf2	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfBetweenMemberOf2* parameter specifies a distribution group and must be used together with the *ExceptIfBetweenMemberOf1* parameter. The rule isn't applied if the message is sent between members of the distribution groups specified in these parameters.
ExceptIfContentCharacterSetContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfContentCharacterSetContainsWords* parameter specifies one or more character set names

			to check for in the message. The rule isn't applied if the message contains any of the character sets specified.
ExceptIfFrom	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfFrom* parameter specifies the sender. The rule isn't applied to messages received from this sender.
ExceptIfFromAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfFromAddressContainsWords* parameters specifies one or more words to check for in the From address. The rule isn't applied if the sender's address includes any of these words.
ExceptIfFromAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfFromAddressMatchesPatterns* parameter specifies one or more regular expressions to match in the sender's address. The rule isn't applied if the sender's address matches the pattern you specify.
ExceptIfFromMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.Reci	The *ExceptIfFromMemberOf*

		pientIdParameter[]	parameter specifies a distribution group. The rule isn't applied if the sender of the message is a member of this distribution group.
ExceptIfFromScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.FromUserScope	The *ExceptIfFromScope* parameter specifies whether the sender is inside or outside your organization. Valid values for this parameter are: • `InOrganization` • `NotInOrganization`
ExceptIfHasClassification	Optional	System.String	The *ExceptIfHasClassification* parameter specifies a message classification. The rule isn't applied to messages that have the specified classification. **Note:** The message classification referred to in this parameter is the custom message classification that you can create in your organization. It isn't related to the DLP classification.
ExceptIfHasNoClassification	Optional	System.Boolean	The *ExceptIfHasNoClassification* parameter specifies that the rule isn't applied to messages that don't have

			a message classification.
ExceptIfHasSenderOverride	Optional	System.Boolean	The *ExceptIfHasSenderOverride* parameter specifies the rule to check if the sender has chosen to override a DLP policy. Set this parameter to `$true` to prevent this rule from applying to messages where the sender took action to override a DLP policy restriction.
ExceptIfHeaderContainsMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *ExceptIfHeaderContainsMessageHeader* parameter specifies the SMTP message header to inspect for specific words or patterns. This parameter is used together with the *ExceptIfHeaderContainsWords* parameter.
ExceptIfHeaderContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfHeaderContainsWords* parameter specifies one or more words to look for in the message header specified in the *ExceptIfHeaderContainsMessageHeader* parameter.

			The rule isn't applied to messages where the header value of the specified header matches any of the words specified.
ExceptIfHeaderMatchesMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *ExceptIfHeaderMatchesMessageHeader* parameter specifies an SMTP message header to inspect. This parameter is used together with the *ExceptIfHeaderMatchesPatterns* parameter.
ExceptIfHeaderMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfHeaderMatchesPatterns* parameter specifies a pattern to match in the header specified in the *ExceptIfHeaderMatchesMessageHeader* parameter.
ExceptIfManagerAddresses	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfManagerAddresses* parameter specifies a recipient. The rule isn't applied to messages where the specified recipient is the manager of the sender or the recipient. Whether it's the manager for the sender or the

			recipient is defined in the *ExceptIfManagerForEvaluatedUser* parameter.
ExceptIfManagerForEvaluatedUser	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.EvaluatedUser	The *ExceptIfManagerForEvaluatedUser* parameter specifies whether the sender or the recipient's manager should be evaluated. The specified user's manager attribute is compared with users specified in the *ExceptIfManagerAddresses* parameter. Valid values include: • `Recipient` • `Sender` Use this parameter together with the *ExceptIfManagerAddresses* parameter.
ExceptIfMessageContainsDataClassifications	Optional	System.Collections.Hashtable[]	The *ExceptIfMessageContainsDataClassifications* parameter specifies the sensitive information types to look for in the message body and any of the attachments. For a list of sensitive information types available, see Sensitive information

			types inventory.
ExceptIfMessageSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfMessageSizeOver* parameter specifies a message size. The rule isn't applied to any messages that exceed the message size you specify for this parameter.
ExceptIfMessageTypeMatches	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.MessageType	The *ExceptIfMessageTypeMatches* parameter specifies a message type. The rule isn't applied to any messages that match the message type you specify. Valid values include: • `OOF` Auto-reply messages configured by the user • `AutoForward` Messages automatically forwarded to an alternative recipient • `Encrypted` Encrypted messages • `Calendaring` Meeting requests and responses • `PermissionControlled` Messages that have specific permissions configured • `Voicemail` Voice mail messages forwarded by Unified Messaging Service • `Signed` Digitally signed

			messages • `ApprovalRequest` Moderation request messages sent to moderators • `ReadReceipt` Read receipts
ExceptIfRecipientADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber**

			• **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule isn't applied if any of the specified attributes have the value specified.
ExceptIfRecipientADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfRecipientADAttributeMatchesPatterns* parameter specifies one or more patterns to check for

			in the specified Active Directory attribute of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager**

			• **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule isn't applied if the values of any of the specified attributes match the specified patterns for that attribute.
ExceptIfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientAddressContainsWords* parameter specifies words to check for in the recipient address.
ExceptIfRecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfRecipientAddressMatchesPatterns* parameter specifies one or more text patterns to match in the recipient address.
ExceptIfRecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientDomainIs* parameter specifies the

			recipient's domain. The rule isn't applied to messages sent to recipients whose email addresses are in the specified domain.
ExceptIfRecipientInSenderList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service. The *ExceptIfRecipientInSenderList* parameter specifies an exception when a recipient is defined in a supervision list entry on the sender's mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox.

ExceptIfSCLOver	Optional	Microsoft.Exchange.Data.SclValue	The *ExceptIfSCLOver* parameter specifies a spam confidence level (SCL) value. The rule isn't applied to messages with an SCL equal to or higher than the value specified. Valid SCL values are integers from 0 through 9, and -1. The value -1 specifies that the message is from a trusted source.
ExceptIfSenderADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSenderADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the sender. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City**

			• **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule isn't applied if any of the

			specified attributes have the value specified.
ExceptIfSenderADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfSenderADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the sender. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber**

			• **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule isn't applied if the values of any of the specified attributes match the specified patterns for that attribute.
ExceptIfSenderDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSenderDomainIs* parameter specifies the sender's domain. The rule isn't applied to messages received from senders whose email addresses are in the specified domain.

ExceptIfSenderInRecipientList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service. The *ExceptIfSenderInRecipientList* parameter specifies an exception when the sender is defined in a supervision list entry on a recipient's mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox.
ExceptIfSenderIpRanges	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfSenderIpRanges* parameter specifies the IP ranges to compare with the sender's IP address. The rule isn't applied if the

			IP address of the sender falls within one of the IP ranges specified in this parameter.
ExceptIfSenderManagementRelationship	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ManagementRelationship	The *ExceptIfSenderManagementRelationship* parameter specifies a relationship between the sender and the recipient. Valid values are: • `Manager` The rule isn't applied if the sender is the manager of the recipient. • `DirectReport` The rule isn't applied if the sender is a direct report of the recipient.
ExceptIfSentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentTo* parameter specifies a recipient. The rule isn't applied to messages sent to the specified recipient.
ExceptIfSentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentToMemberOf* parameter specifies a distribution group. The rule isn't applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is

			removed after creation of the rule, no exception is made.
ExceptIfSentToScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ToUserScope	The *ExceptIfSentToScope* parameter specifies whether the message is sent to internal, external, or partner recipients. Valid values are: • `InOrganization` The recipients are internal to your organization. • `NotInOrganization` The recipients are outside your organization. • `ExternalPartner` The recipients are in a partner organization. • `ExternalNonPartner` The recipients are external to your organization which isn't a partner organization.
ExceptIfSubjectContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSubjectContainsWords* parameter specifies words to look for in the message subject. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When specifying a phrase that

			contains one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`.
ExceptIfSubjectMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfSubjectMatchesPatterns* parameter specifies text patterns to check the message subject for.
ExceptIfSubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSubjectOrBodyContainsWords* parameter specifies words to look for in the message subject and body. The rule isn't applied if any of the words or phrases specified is found in the message subject or body. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When specifying a phrase with one or more spaces, you must enclose the phrase in quotation marks ("), for

			example: `Word1,"Phrase with spaces",word2.`
ExceptIfSubjectOrBodyMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfSubjectOrBodyMatchesPatterns* parameter specifies text patterns to look for in the message subject and body. The rule isn't applied if the word specified is found in the message subject or body.
ExceptIfWithImportance	Optional	Microsoft.Exchange.Management.Tasks.Importance	The *ExceptIfWithImportance* parameter specifies message importance. The rule isn't applied to messages matching the specified importance. Valid values are: • `High` • `Low` • `Normal`
ExpiryDate	Optional	System.DateTime	The *ExpiryDate* parameter specifies the date when this rule will stop processing. The rule won't take any action on messages past the date you specify for this parameter.
From	Optional	Microsoft.Exchange.Configuration.Tasks.Reci	The *From* parameter specifies the sender. The

		pientIdParameter[]	rule is applied to messages received from this sender. This parameter is used to define a rule condition.
FromAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *FromAddressContainsWords* parameter specifies one or more words to check for in the From address. The rule is applied if the sender's address includes any of these words. This parameter is used to define a rule condition.
FromAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *FromAddressMatchesPatterns* parameter specifies one or more regular expressions to match in the sender's address. The rule is applied if the sender's address matches the pattern you specify. This parameter is used to define a rule condition.
FromMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *FromMemberOf* parameter specifies a distribution group. The rule is applied if the sender of the message is a

			member of this distribution group. This parameter is used to define a rule condition.
FromScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.FromUserScope	The *FromScope* parameter specifies whether the sender is inside or outside your organization. Valid values for this parameter are: • `InOrganization` • `NotInOrganization` This parameter is used to define a rule condition.
GenerateIncidentReport	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *GenerateIncidentReport* parameter specifies the recipient to whom incident reports will be sent. An incident report is generated for messages that violate a DLP policy in your organization. This parameter is used to define a rule action.
GenerateNotification	Optional	Microsoft.Exchange.Data.DisclaimerText	This parameter is reserved for internal Microsoft use.
HasClassification	Optional	System.String	The *HasClassification* parameter specifies a message classification. The rule is applied to

			messages that have the specified classification. **Note:** The message classification referred to in this parameter is the custom message classification that you can create in your organization. It isn't related to the DLP classification. This parameter is used to define a rule condition.
HasNoClassification	Optional	System.Boolean	The *HasNoClassification* parameter specifies whether the rule is applied to messages that don't have a message classification. If you set this parameter to `$true`, the rule is applied to all messages that don't have a message classification. If you set this parameter to `$false`, the rule is applied to all messages that have one or more message classifications. This parameter is used to define a rule condition.
HasSenderOverride	Optional	System.Boolean	The *HasSenderOverride* parameter specifies the

			rule to check if the sender has chosen to override a DLP policy. Set this parameter to `$true` to apply this rule to messages where the sender took action to override a DLP policy restriction. This parameter is used to define a rule condition.
HeaderContainsMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *HeaderContainsMessageHeader* parameter specifies the SMTP message header to inspect for specific words or patterns. This parameter is used together with the *HeaderContainsWords* parameter. This parameter is used to define a rule condition.
HeaderContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *HeaderContainsWords* parameter specifies one or more words to look for in the message header specified in the *HeaderContainsMessageHeader* parameter. The rule is applied to messages

			where the header value of the specified header matches any of the words specified. This parameter is used to define a rule condition.
HeaderMatchesMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *HeaderMatchesMessageHeader* parameter specifies an SMTP message header to inspect. This parameter is used together with the *HeaderMatchesPatterns* parameter. This parameter is used to define a rule condition.
HeaderMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *HeaderMatchesPatterns* parameter specifies a pattern to match in the header specified in the *HeaderMatchesMessageHeader* parameter. This parameter is used to define a rule condition.
IncidentReportContent	Optional	Microsoft.Exchange.MessagingPolicies.Rules.IncidentReportContent[]	The *IncidentReportContent* parameter specifies the message properties that are included in the incident reports. This parameter is used

			together with the *GenerateIncidentReport* parameter. The valid values are: • `Sender` Includes the sender of the message. • `Recipients` Includes the recipients in the To: box of the message. Only the first 10 recipients are displayed in the incident report. If there are more than 10 recipients, the remaining number of recipients will be displayed. • `Subject` Includes the message subject. • `CC` Includes the recipients in the Cc: box of the message. Only the first 10 recipients are displayed in the incident report. If there are more than 10 recipients, the remaining number of recipients will be displayed. • `BCC` Includes the recipients in the Bcc: box of the message. Only the first 10 recipients are displayed in the incident report. If there are more than 10 recipients, the remaining number of recipients will be displayed. • `Severity` Includes the audit severity of the rule that was triggered. If the message was processed

			by more than one rule, the highest severity is displayed. • `Override` Includes the override if the sender has chosen to override a PolicyTip. If the sender has provided a justification, the first 100 characters of the justification is also included. • `RuleDetections` Includes the list of rules that the message triggered. • `FalsePositive` Includes the false positive if the sender marked the message as a false positive for a PolicyTip. • `DataClassifications` Includes the list of sensitive information types detected in the message. • `IdMatch` Includes the sensitive information type detected, the exact matched content from the message, and the 150 characters before and after the matched sensitive information. • `AttachOriginalMail` Includes the entire original message. **Note:** The message ID is always included in the incident report. This parameter is used to

			define a rule action.
IncidentReportOriginalMail	Optional	Microsoft.Exchange.MessagingPolicies.Rules.IncidentReportOriginalMail	The *IncidentReportOriginalMail* parameter specifies whether to include the original message with the incident report. This parameter is used together with the *GenerateIncidentReport* parameter. Valid values are: • `IncludeOriginalMail` • `DoNotIncludeOriginalMail` The default value is `DoNotIncludeOriginalMail`. This parameter is used to define a rule action. **Important:** The functionality of this parameter is now managed by the *IncidentReportContent* parameter, and this parameter will be deprecated in the future. Adding the value `AttachOriginalMail` to the *IncidentReportContent* parameter is equivalent to setting this parameter to `IncludeOriginalMail` value. Even though this parameter is still functional, we recommend you use the *IncidentReportContent* parameter instead.

LogEventText	Optional	Microsoft.Exchange.Data.EventLogText	The *LogEventText* parameter specifies a message string to add to the event log entry for this rule. This parameter is used to define a rule action.
ManagerAddresses	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ManagerAddresses* parameter specifies a recipient. The rule is applied to messages where the specified recipient is the manager of the sender or the recipient. Whether it's the manager for the sender or the recipient is defined in the *ManagerForEvaluatedUser* parameter. This parameter is used to define a rule condition.
ManagerForEvaluatedUser	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.EvaluatedUser	The *ManagerForEvaluatedUser* parameter specifies whether the sender or the recipient's manager should be evaluated. The specified user's manager attribute is compared with users specified in the *ManagerAddresses* parameter. Valid values

			include: • `Recipient` • `Sender` Use this parameter together with the *ManagerAddresses* parameter. This parameter is used to define a rule condition.
MessageContainsDataClassifications	Optional	System.Collections.Hashtable[]	The *MessageContainsDataClassifications* parameter specifies the sensitive information types to look for in the message body and any of the attachments. For a list of sensitive information types available, see Sensitive information types inventory. This parameter is used to define a rule condition.
MessageSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MessageSizeOver* parameter specifies a message size. The rule is applied to all messages that exceed the message size you specify for this parameter. This parameter is used to define a rule condition.

MessageTypeMatches	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.MessageType	The *MessageTypeMatches* parameter specifies a message type. The rule is applied to all messages that match the message type you specify. Valid values include: • `OOF` Auto-reply messages configured by the user • `AutoForward` Messages automatically forwarded to an alternative recipient • `Encrypted` Encrypted messages • `Calendaring` Meeting requests and responses • `PermissionControlled` Messages that have specific permissions configured • `Voicemail` Voice mail messages forwarded by Unified Messaging service • `Signed` Digitally signed messages • `ApprovalRequest` Moderations request messages sent to moderators • `ReadReceipt` Read receipts This parameter is used to define a rule condition.
Mode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleMode	The *Mode* parameter specifies in which mode this rule will operate. Valid

			values include: • `Audit` The rule is turned on, and what would have happened if the rule was enforced is logged in message tracking logs. Exchange doesn't take any action that impacts the delivery of the message. • `AuditAndNotify` The rule is turned on, and it operates the same way it would in `Audit` mode, but notifications are also enabled. • `Enforce` The rule is turned on, and all actions specified in the rule are taken. The default value `Enforce`.
ModerateMessageByManager	Optional	System.Boolean	The *ModerateMessageByManager* parameter specifies whether the message should be forwarded to the sender's manager for approval. To enable moderation by the sender's manager, set the value to `$true`. This parameter is used to define a rule action.
ModerateMessageByUser	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ModerateMessageByUser* parameter specifies a

			recipient to forward the message to for approval. This parameter is used to define a rule action.
NotifySender	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.NotifySenderType	The *NotifySender* parameter specifies how the sender of a message that goes against a DLP policy is notified. Valid values are: • `NotifyOnly` Sender is notified, but the message is delivered normally. • `RejectMessage` Message is rejected, and the sender is notified. • `RejectUnlessFalsePositiveOverride` Message is rejected unless it's marked as a false positive by the sender. • `RejectUnlessSilentOverride` Message is rejected unless the sender has chosen to override the policy restriction. • `RejectUnlessExplicitOverride` This is the same as `RejectUnlessSilentOverride`, but the sender can also provide a justification for overriding the policy restriction. If you specify any value

			other than `NotifyOnly`, you can provide a specific rejection status code and reason using the *RejectMessageEnhancedStatusCode* and *RejectMessageReasonText* parameters. This action is used together with the *MessageContainsDataClassifications* condition. If you use this parameter, you must also specify the sensitive information types you want to check against using the *MessageContainsDataClassifications* parameter. This parameter is used to define a rule action.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
PrependSubject	Optional	Microsoft.Exchange.Data.SubjectPrefix	The *PrependSubject* parameter specifies a word or phrase to add to the beginning of the message subject. **Note:** The rule will add the text as you specify in this

			parameter without adding spaces or other characters to separate it from the original subject. Consider ending the value you specify in this parameter with a colon (:) and a space, or at least a space, to separate it from the original subject. This parameter is used to define a rule action.
Priority	Optional	System.Int32	The *Priority* parameter specifies the priority for this transport rule. Rules with a lower priority value are processed first. If you modify the priority of the rule, the position of the rule in the rule list changes to match the priority that you specified, and the Transport Rules agent increments all rules with a higher priority value. The value of this parameter must be greater than or equal to 0, and must be one less than the total number of transport rules in your organization. For example, if you configured 8 transport rules, you can set this parameter to any

			value from 0 through 7.
Quarantine	Optional	System.Boolean	The *Quarantine* parameter specifies whether the rules agent delivers the message to the quarantine mailbox specified in the Content Filtering configuration. This parameter is used to define a rule action.
RecipientADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State**

			• **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule will be applied if any of the specified attributes have

			the value specified. This parameter is used to define a rule condition.
RecipientADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *RecipientADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber**

			• **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule will be applied if the values of any of the specified attributes match the specified patterns for that attribute. This parameter is used to define a rule condition.
RecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientAddressContainsWords* parameter specifies one or more words to check for in the recipient's email address.

			This parameter is used to define a rule condition.
RecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *RecipientAddressMatchesPatterns* parameter specifies a pattern to check the recipient address for. This parameter is used to define a rule condition.
RecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientDomainIs* parameter specifies the recipient's domain. The rule is applied to messages sent to recipients whose email addresses are in the specified domain. This parameter is used to define a rule condition.
RecipientInSenderList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service. The *RecipientInSenderList* parameter specifies the condition when a recipient is defined in a supervision list entry on the sender's mailbox. Supervision list entries perform the following functions:

			• They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox. This parameter is used to define a rule condition.
RedirectMessageTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *RedirectMessageTo* parameter specifies that the rule redirects the message to the specified recipient. This parameter is used to define a rule action.
RejectMessageEnhancedStatusCode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RejectEnhancedStatus	The *RejectMessageEnhancedStatusCode* parameter specifies an enhanced status code to provide when rejecting messages. Valid values are `5.7.1` or between `5.7.10` and `5.7.999`.

			Note: The transport rule can add a custom rejection message. To further customize the delivery status notification (DSN), you need to create a custom DSN message using the **New-SystemMessage** cmdlet. If an enhanced status code isn't specified, and only the *RejectMessageReasonText* parameter is used, the enhanced status code `5.7.1` is used. This parameter is used to define a rule action.
RejectMessageReasonText	Optional	Microsoft.Exchange.Data.DsnText	The *RejectMessageReasonText* parameter specifies a reason that explains why the message was rejected. **Note:** The transport rule can add a custom rejection message. To further customize the DSN, you need to create a custom DSN message using the **New-SystemMessage** cmdlet. If a *RejectMessageReasonText* parameter value isn't specified, and an

			enhanced status code is specified by using the *RejectMessageEnhancedStatusCode* parameter, the default reason text "`Delivery not authorized, message refused`" is used. This parameter is used to define a rule action.
RemoveHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *RemoveHeader* parameter specifies an SMTP header name to be removed from the message. This parameter is used to define a rule action.
RemoveOME	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *RemoveOME* parameter specifies that a message and its attachments will be decrypted if the message matches the conditions of this rule. Valid input for this parameter is `$true` or `$false`. The default is `$false`.

			This parameter is used to define a rule action.
RouteMessageOutboundConnector	Optional	Microsoft.Exchange.Configuration.Tasks.OutboundConnectorIdParameter	This parameter is available only in the cloud-based service. The *RouteMessageOutboundConnector* parameter specifies the connector to use for routing this message. This parameter is used to define a rule action.
RouteMessageOutboundRequireTls	Optional	System.Boolean	The *RouteMessageOutboundRequireTls* parameter specifies that Transport Layer Security (TLS) encryption is required when routing this message outside your organization. Set this parameter to `$true` to require TLS. This parameter is used to define a rule action.
RuleErrorAction	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleErrorAction	The *RuleErrorAction* parameter specifies how the message should be handled if the rule processing can't be

			completed. Valid values are: • `Ignore` The message is sent without completing the rule processing. • `Defer` The message is deferred so the rules engine can attempt to process the message again. The default value is `Ignore`.
RuleSubType	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleSubType	The *RuleSubType* parameter specifies the type of this transport rule. Valid values are: • `Dlp` Specifies that this rule is associated with a DLP policy. • `None` Specifies that this is a regular transport rule.
SCLOver	Optional	Microsoft.Exchange.Data.SclValue	The *SCLOver* parameter specifies an SCL value. The rule is applied to messages with an SCL equal to or higher than the value specified. Valid SCL values are integers from 0 through 9, and -1. The value -1 specifies that the message is from a trusted source. This parameter is used to define a rule condition.

SenderADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *SenderADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the sender. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes**

			• **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule will be applied if any of the specified attributes have the value specified. This parameter is used to define a rule condition.
SenderADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *SenderADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the sender.

			You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an

			Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule will be applied if the values of any of the specified attributes match the specified patterns for that attribute. This parameter is used to define a rule condition.
SenderAddressLocation	Optional	Microsoft.Exchange.MessagingPolicies.Rules.SenderAddressLocation	The *SenderAddressLocation* parameter specifies the fields to look in when evaluating sender addresses. Prior to Exchange Server 2013 Cumulative Update 1, Transport rules only processed message headers when evaluating senders. With the addition of the *SenderAddressLocation* parameter, you can configure the rules to also examine the message

			envelope (the sender information sent with the MAIL FROM command in the SMTP transmission) when evaluating senders. Valid values are: • `Header` Only message headers are examined when evaluating senders. • `Envelope` Only the message envelope is examined when evaluating senders. • `HeaderOrEnvelope` Both message headers and the message envelope are examined when evaluating senders. The default value is `Header`. **Note:** By configuring this parameter you can evaluate the message envelope for the following conditions and exceptions: • From • FromAddressContainsWords • FromAddressMatchesPatterns • FromMemberOf • SenderDomainIs
SenderDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *SenderDomainIs* parameter specifies the sender's domain. The rule is applied to messages

			received from senders whose email addresses are in the specified domain. This parameter is used to define a rule condition.
SenderInRecipientList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service. The *SenderInRecipientList* parameter specifies the condition when the sender is defined in a supervision list entry on a recipient's mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox.

			This parameter is used to define a rule condition.
SenderIpRanges	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SenderIpRanges* parameter specifies the IP ranges to compare with the sender's IP address. The rule is applied if the IP address of the sender falls within one of the IP ranges specified in this parameter. This parameter is used to define a rule condition.
SenderManagementRelationship	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ManagementRelationship	The *SenderManagementRelationship* parameter specifies a relationship between the sender and the recipient. Valid values are: • `Manager` The rule is applied if the sender is the manager of the recipient. • `DirectReport` The rule is applied if the sender is a direct report of the recipient. This parameter is used to define a rule condition.
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies a recipient. The rule is applied to messages sent to the

			specified recipient. This parameter is used to define a rule condition.
SentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentToMemberOf* parameter specifies a distribution group. The rule is applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is removed after creation of the rule, no action is taken. This parameter is used to define a rule condition.
SentToScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ToUserScope	The *SentToScope* parameter specifies whether the message is sent to internal, external, or partner recipients. Valid values are: • `InOrganization` The recipients are internal to your organization. • `NotInOrganization` The recipients are outside your organization. • `ExternalPartner` The recipients are in a partner organization. • `ExternalNonPartner` The recipients are external to your

			organization, which isn't a partner organization. This parameter is used to define a rule condition.
SetAuditSeverity	Optional	System.String	The *SetAuditSeverity* parameter specifies the severity level assigned to an incident report that's generated and the corresponding entry logged in the message tracking logs. You can specify one of the following values: • `DoNotAudit` No audit entry is logged. • `Low` The audit entry is assigned low severity. • `Medium` The audit entry is assigned medium severity. • `High` The audit entry is assigned high severity. This parameter is used to define a rule action.
SetHeaderName	Optional	Microsoft.Exchange.Data.HeaderName	The *SetHeaderName* parameter specifies the SMTP header name to add or modify when the rule is applied. When the *SetHeaderName* parameter is used, you must also use the *SetHeaderValue*

			parameter to specify a value for the header. This parameter is used to define a rule action.
SetHeaderValue	Optional	Microsoft.Exchange.Data.HeaderValue	The *SetHeaderValue* parameter specifies a value for the header specified in the *SetHeaderName* parameter. This parameter is used to define a rule action.
SetSCL	Optional	Microsoft.Exchange.Data.SclValue	The *SetSCL* parameter modifies the SCL value of the message to the value specified. The SCL value can be a number from 0 through 9, or -1. The value -1 specifies that the message is from a trusted source. This parameter is used to define a rule action.
SmtpRejectMessageRejectStatusCode	Optional	Microsoft.Exchange.Data.RejectStatusCode	The *SmtpRejectMessageRejectStatusCode* parameter specifies an enhanced status code to provide when rejecting a message. This parameter is used to

			define a rule action.
SmtpRejectMessageRejectText	Optional	Microsoft.Exchange.Data.RejectText	The *SmtpRejectMessageRejectText* parameter specifies a text string to add to the rejection message. You must use this parameter with the *SmtpRejectMessageRejectStatusCode* parameter. This parameter is used to define a rule action.
StopRuleProcessing	Optional	System.Boolean	The *StopRuleProcessing* parameter specifies whether the processing of subsequent rules should be stopped for this message. This parameter is used to define a rule action.
SubjectContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *SubjectContainsWords* parameter specifies words to look for in the message subject. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When

			specifying a phrase that contains one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`. This parameter is used to define a rule condition.
SubjectMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *SubjectMatchesPatterns* parameter specifies text patterns to check for in the message subject for. This parameter is used to define a rule condition.
SubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *SubjectOrBodyContainsWords* parameter specifies words to look for in the message subject or body. The rule is applied if any of the words or phrases specified is found in the message subject or body. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When

			specifying a phrase with one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`. This parameter is used to define a rule condition.
SubjectOrBodyMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *SubjectOrBodyMatchesPatterns* parameter specifies text patterns to look for in the message subject or body. The rule is applied if the word specified is found in the message subject or body. This parameter is used to define a rule condition.
UseLegacyRegex	Optional	System.Boolean	The *UseLegacyRegex* parameter specifies that the new rule uses the regular expressions compatible with Exchange Server 2010.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WithImportance	Optional	Microsoft.Exchange.Management.Tasks.Importance	The *WithImportance* parameter specifies message importance. The rule is applied to messages matching the specified importance. Valid values are: • `High` • `Low` • `Normal` This parameter is used to define a rule condition.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-TransportRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-04-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-TransportRule** cmdlet to remove a transport rule from your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-TransportRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a single transport rule.

```
Remove-TransportRule "Redirect messages from
kim@contoso.com to legal@contoso.com"
```

Detailed Description

On Mailbox servers, the cmdlet removes the rule from Active Directory. On an Edge Transport server, the cmdlet removes the rule from the local Active Directory Lightweight Directory Services (AD LDS) instance.

To temporarily disable a transport rule without removing it, use the **Disable-TransportRule** cmdlet instead.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the transport rule you want to remove. Enter either the name or the GUID of the rule.

			You can omit the parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance

			of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-TransportRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-TransportRule** cmdlet to modify existing transport rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
WithImportance <Low | Normal | High>]
```

Examples

EXAMPLE 1

This example modifies the `Sales Team Disclaimer` transport rule. Modifying the value of one condition doesn't affect other conditions, exceptions, or actions used in the rule.

This example sets the *FromMemberOf* parameter to a value of `Sales-Group`, which specifies that the rule is applied if the sender of the message is a member of the Sales-Group distribution group.

```
Set-TransportRule "Sales Team Disclaimer" -FromMemberOf "Sales-Group"
```

Detailed Description

Transport rule conditions and exceptions include corresponding values to test for. For a list of supported transport rule conditions, see Transport rule conditions (predicates).

Transport rules apply actions to messages, some with corresponding action values. For a list of supported transport rule actions, see Transport rule actions.

For detailed information about how to create a transport rule, see Manage Transport Rules. To learn more about transport rules, see Transport rules.

In on-premises Exchange organizations, Transport rules created on Mailbox servers are stored in Active Directory. All Mailbox servers in the organization have access to the same set of transport rules. On Edge Transport servers, transport rules are saved in the local copy of Active Directory Lightweight Directory Services (AD LDS). Transport rules aren't shared or replicated between Edge Transport servers or between Mailbox servers and Edge Transport servers. Also, Mailbox servers and Edge Transport servers share a set of common conditions and actions, but some conditions and actions are exclusive to each server role.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules	The *Identity* parameter specifies the transport rule

		.Tasks.RuleIdParameter	you want to modify. Use the name or GUID of the transport rule.
ActivationDate	Optional	System.DateTime	The *ActivationDate* parameter specifies the date when this rule will become effective. The rule won't take any action on messages until the day you specify for this parameter.
ADComparisonAttribute	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ADAttribute	The *ADComparisonAttribute* parameter specifies an Active Directory attribute to compare between the sender and recipients. When you use this parameter, the specified Active Directory attribute of the sender is compared to the same Active Directory attribute of all the recipients of the message. You can use one of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office**

			• **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** When specifying the *ADComparisonAttribute* parameter, if you don't specify a value for the *ADComparisonOperator* parameter, the default comparison operator `Equal` is used. This parameter is used to

			define a rule condition.
ADComparisonOperator	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Evaluation	The *ADComparisonOperator* parameter specifies a comparison operator for the *ADComparisonAttribute* parameter. Valid values include: • `Equal` • `NotEqual` If you use the *ADComparisonOperator* parameter, you must also use the *ADComparisonAttribute* parameter. This parameter is used to define a rule condition.
AddManagerAsRecipientType	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.AddedRecipientType	The *AddManagerAsRecipientType* parameter specifies how the message is relayed to the manager of the sender or recipient. You can use any of the following values: • `To` The manager is added to the recipients in the To line of the message. • `Cc` The manager is added to the recipients in the carbon copy (Cc)

			line of the message. • `Bcc` The manager is added to the recipients in the blind carbon copy (Bcc) line of the message. • `Redirect` The message is redirected to the manager instead of being delivered to the original recipients. This parameter is used to define a rule action.
AddToRecipients	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AddToRecipients* parameter specifies one or more additional recipients for the message. Separate multiple recipients with commas. The specified recipients are added as To recipients. This parameter is used to define a rule action.
AnyOfCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfCcHeader* parameter specifies one or more recipients. The rule is applied if any of these recipients are present as a Cc recipient. This parameter is used to define a rule condition.
AnyOfCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.Reci	The *AnyOfCcHeaderMemberOf* parameter specifies a

		pientIdParameter[]	distribution group. The rule is applied if a member of the specified distribution group is present as a Cc recipient. This parameter is used to define a rule condition.
AnyOfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *AnyOfRecipientAddressContainsWords* parameter specifies one or more words to check in a recipient address. The rule is applied if a recipient's address includes any of these words. This parameter is used to define a rule condition.
AnyOfRecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *AnyOfRecipientAddressMatchesPatterns* parameter specifies one or more regular expressions to match in a recipient address. The rule is applied if any of the recipients' addresses matches the pattern you specify. This parameter is used to define a rule condition.

AnyOfToCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToCcHeader* parameter specifies one or more recipients. The rule is applied if any of the recipients specified are present as a To or Cc recipient. This parameter is used to define a rule condition.
AnyOfToCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToCcHeaderMemberOf* parameter specifies a distribution group. The rule is applied if a member of the specified distribution group is present as a To or Cc recipient. This parameter is used to define a rule condition.
AnyOfToHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToHeader* parameter specifies one or more recipients. The rule is applied if any of the specified recipients are present as a To recipient. This parameter is used to define a rule condition.
AnyOfToHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *AnyOfToHeaderMemberOf* parameter specifies a

			distribution group. The rule is applied if a member of the specified distribution group is present as a To recipient. This parameter is used to define a rule condition.
ApplyClassification	Optional	System.String	The *ApplyClassification* parameter specifies a message classification to apply to the message. **Note:** The message classification referred to in this parameter is the custom message classification that you can create in your organization. It isn't related to the data loss prevention (DLP) classification. This parameter is used to define a rule action.
ApplyHtmlDisclaimerFallbackAction	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.DisclaimerFallbackAction	The *ApplyHtmlDisclaimerFallbackAction* parameter specifies an action to fall back to if the HTML disclaimer can't be applied to a message. Valid fallback actions include the following: • `Wrap` The original message is wrapped as an attachment in a new

			message, and the disclaimer is used as the message body for the new message. • `Ignore` The rule is ignored, and the message is delivered without the disclaimer. • `Reject` The message is rejected. **Note:** This parameter is used with the *ApplyHtmlDisclaimerText* parameter. If you use the *ApplyHtmlDisclaimerText* parameter without specifying a value for this parameter, the default fallback action, `Wrap`, is used. This parameter is used to define a rule action.
ApplyHtmlDisclaimerLocation	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.DisclaimerLocation	The *ApplyHtmlDisclaimerLocation* parameter specifies the location within the message where the HTML disclaimer text is inserted. You can use either of the following two values: • `Append` The disclaimer is added to the end of the message body. • `Prepend` The disclaimer is inserted to the beginning of the message body. **Note:** This parameter is used with the

			ApplyHtmlDisclaimerText parameter. If you use the *ApplyHtmlDisclaimerText* parameter without specifying a value for this parameter, the default value, `Append`, is used. This parameter is used to define a rule action.
ApplyHtmlDisclaimerText	Optional	Microsoft.Exchange.Data.DisclaimerText	The *ApplyHtmlDisclaimerText* parameter specifies disclaimer text to be inserted in the message. Disclaimer text can include HTML tags and inline cascading style sheet (CSS) tags. You can add images using the IMG tag. This parameter is used to define a rule action.
ApplyOME	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *ApplyOME* parameter specifies that a message and its attachments will be encrypted if the message matches the conditions of this rule. Valid input for this parameter is `$true` or `$false`. The default is

			`$false`. This parameter is used to define a rule action.
ApplyRightsProtectionTemplate	Optional	Microsoft.Exchange.Configuration.Tasks.RmsTemplateIdParameter	The *ApplyRightsProtectionTemplate* parameter specifies the name of a rights management service (RMS) template to apply to the message. This action adds rights protection to the messages that meet the conditions of this rule. To use this action, an Active Directory Rights Management Services (AD RMS) server should exist in the topology or the organization should be configured to use the ILS service. For more information, see Transport protection rules. This parameter is used to define a rule action.
AttachmentContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *AttachmentContainsWords* parameter specifies one or more words to check in attachments. Only

			supported attachment types are checked. The rule is applied if any of the attachments contain any of the words you specify. This parameter is used to define a rule condition.
AttachmentExtensionMatchesWords	Optional	Microsoft.Exchange.Data.Word[]	The *AttachmentExtensionMatchesWords* parameter specifies one or more word patterns to check in attachment extensions. The rule is applied if the extensions of any of the attachments match the word patterns you specify. This parameter is used to define a rule condition.
AttachmentHasExecutableContent	Optional	System.Boolean	The *AttachmentHasExecutableContent* parameter specifies whether the rule is applied when any attachments in the message contain executable content. If you set this parameter to `$true`, the rule is applied if any of the attachments contains executable content.

			This parameter is used to define a rule condition.
AttachmentIsPasswordProtected	Optional	System.Boolean	The *AttachmentIsPasswordProtected* parameter specifies whether the attachment is a password protected file whose contents can't be inspected. For example, if a password protected ZIP file is in a message, this condition will be met. The rule is applied if any attachment is password protected. This parameter is used to define a rule condition.
AttachmentIsUnsupported	Optional	System.Boolean	The *AttachmentIsUnsupported* parameter specifies whether the rule is applied when any attachments in the message are of an unsupported type. Unsupported attachments are attachments for which an IFilter isn't installed on the servers. If you set this parameter to `$true`, the rule is applied if any of the attachments is an unsupported type.

			This parameter is used to define a rule condition.
AttachmentMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *AttachmentMatchesPatterns* parameter specifies one or more regular expressions to match in message attachment content. Only supported attachment types are checked for the specified pattern. **Note:** Only the first 150 kilobytes (KB) of the attachment is scanned when trying to match a pattern. This parameter is used to define a rule condition.
AttachmentNameMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *AttachmentNameMatchesPatterns* parameter specifies one or more word patterns to check in attachment names. The rule is applied if the name of any attachment matches the patterns you specify. This parameter is used to define a rule condition.

AttachmentProcessingLimitExceeded	Optional	System.Boolean	The *AttachmentProcessingLimitExceeded* parameter specifies whether the scanning of attachments in the message didn't complete because the processing exceeded built-in limits. This condition is used to create rules that work together with other attachment processing rules and gives you the ability to handle messages whose content couldn't be fully scanned. Valid values are `$true` and `$false`. This parameter is used to define a rule condition.
AttachmentPropertyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	This parameter is reserved for internal Microsoft use.
AttachmentSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *AttachmentSizeOver* parameter specifies an attachment size. The rule is applied if the size of any of the attachments exceeds the specified size. This parameter is used to define a rule condition.
BetweenMemberOf1	Optional	Microsoft.Exchange.Co	The *BetweenMemberOf1*

		nfiguration.Tasks.RecipientIdParameter[]	parameter specifies a distribution group and must be used together with the *BetweenMemberOf2* parameter. The rule is applied if the message is sent between members of the distribution groups specified in these parameters. This parameter is used to define a rule condition.
BetweenMemberOf2	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *BetweenMemberOf2* parameter specifies a distribution group and must be used together with the *BetweenMemberOf1* parameter. The rule is applied if the message is sent between members of the distribution groups specified in these parameters. This parameter is used to define a rule condition.
BlindCopyTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *BlindCopyTo* parameter specifies one or more recipients to add to the message as Bcc recipients.

			This parameter is used to define a rule action.
Comments	Optional	System.String	The *Comments* parameter specifies informative comments for the transport rule, such as what the rule is used for or how it has changed over time. The length of the comment can't exceed 1024 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContentCharacterSetContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ContentCharacterSetContainsWords* parameter specifies one or more character set names to check for in the message. The rule is applied if the message contains any of the character sets specified. This parameter is used to

			define a rule condition.
CopyTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *CopyTo* parameter specifies one or more recipients to add to the message as Cc recipients. This parameter is used to define a rule action.
DeleteMessage	Optional	System.Boolean	The *DeleteMessage* parameter specifies that the rule deletes any message that matches the conditions specified. This parameter is used to define a rule action.
Disconnect	Optional	System.Boolean	The *Disconnect* parameter specifies whether the rules agent disconnects the SMTP session. This parameter is used to define a rule action.
DlpPolicy	Optional	System.String	The *DlpPolicy* parameter specifies the data loss prevention (DLP) policy associated with this rule. Each DLP policy is enforced using a set of transport rules. To learn more about DLP, see Data loss prevention.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExceptIfADComparisonAttribute	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ADAttribute	The *ExceptIfADComparisonAttribute* parameter specifies an Active Directory attribute to compare between the sender and recipients. When you use this parameter, the specified Active Directory attribute of the sender is compared to the same Active Directory attribute of all the recipients of the

			message. You can use one of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** When specifying the

			ExceptIfADComparisonAttribute parameter, if you don't specify a value for the *ExceptIfADComparisonOperator* parameter, the default comparison operator `Equal` is used.
ExceptIfADComparisonOperator	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Evaluation	The *ExceptIfADComparisonOperator* parameter specifies a comparison operator for the *ExceptIfADComparisonAttribute* parameter. Valid values are: • `Equal` • `NotEqual` If you use the *ExceptIfADComparisonOperator* parameter, you must also use the *ExceptIfADComparisonAttribute* parameter.
ExceptIfAnyOfCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfCcHeader* parameter specifies one or more recipients. The rule isn't applied if any of these recipients are present as a Cc recipient.
ExceptIfAnyOfCcHead	Optional	Microsoft.Exchange.Co	The

erMemberOf		nfiguration.Tasks.RecipientIdParameter[]	*ExceptIfAnyOfCcHeaderMemberOf* parameter specifies a distribution group. The rule isn't applied if a member of the specified distribution group is present as a Cc recipient.
ExceptIfAnyOfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfAnyOfRecipientAddressContainsWords* parameter specifies one or more words to check in a recipient address. The rule isn't applied if a recipient's address includes any of these words.
ExceptIfAnyOfRecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfAnyOfRecipientAddressMatchesPatterns* parameter specifies one or more regular expressions to match in a recipient address. The rule isn't applied if any of the recipient addresses matches the pattern you specify.
ExceptIfAnyOfToCcHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToCcHeader* parameter specifies one or

			more recipients. The rule isn't applied if any of the recipients specified are present as a To or Cc recipient.
ExceptIfAnyOfToCcHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToCcHeaderMemberOf* parameter specifies a distribution group. The rule isn't applied if a member of the specified distribution group is present as a To or Cc recipient.
ExceptIfAnyOfToHeader	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToHeader* parameter specifies one or more recipients. The rule isn't applied if any of the specified recipients are present as a To recipient.
ExceptIfAnyOfToHeaderMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfAnyOfToHeaderMemberOf* parameter specifies a distribution group. The rule isn't applied if a member of the specified distribution group is present as a To recipient.
ExceptIfAttachmentCo	Optional	Microsoft.Exchange.Da	The

ntainsWords		ta.Word[]	*ExceptIfAttachmentContainsWords* parameter specifies one or more words to check in attachments. Only supported attachment types are checked. The rule isn't applied if any of the attachments contain any of the words you specify.
ExceptIfAttachmentExtensionMatchesWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfAttachmentExtensionMatchesWords* parameter specifies one or more word patterns to check in attachment extensions. The rule isn't applied if the extensions of any of the attachments match the word patterns you specify.
ExceptIfAttachmentHasExecutableContent	Optional	System.Boolean	The *ExceptIfAttachmentHasExecutableContent* parameter specifies whether the rule is applied when any attachments in the message contain executable content. If you set this parameter to `$true`, the rule isn't

			applied if any of the attachments contains executable content.
ExceptIfAttachmentIsPasswordProtected	Optional	System.Boolean	The *ExceptIfAttachmentIsPasswordProtected* parameter specifies whether the attachment is a password protected file whose contents can't be inspected. For example, if a password protected ZIP file is in a message, this exception will be met. The rule isn't applied if any attachment is password protected.
ExceptIfAttachmentIsUnsupported	Optional	System.Boolean	The *ExceptIfAttachmentIsUnsupported* parameter specifies whether the rule is applied when any attachments in the message are of an unsupported type. Unsupported attachments are attachments for which an IFilter isn't installed on your servers. If you set this parameter to `$true` the rule isn't applied if any of the attachments is an

			unsupported type.
ExceptIfAttachmentMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfAttachmentMatchesPatterns* parameter specifies one or more regular expressions to match in message attachment content. Only supported attachment types are checked for the specified pattern. **Note:** Only the first 150 KB of the attachment is scanned when trying to match a pattern.
ExceptIfAttachmentNameMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfAttachmentNameMatchesPatterns* parameter specifies one or more word patterns to check in attachment names. The rule isn't applied if the name of any attachment matches the patterns you specify.
ExceptIfAttachmentProcessingLimitExceeded	Optional	System.Boolean	The *ExceptIfAttachmentProcessingLimitExceeded* parameter specifies whether the scanning of attachments in the message didn't complete

			because the processing exceeded built-in limits. This condition is used to create rules that work together with other attachment processing rules and gives you the ability to handle messages whose content couldn't be fully scanned. Valid values are `$true` and `$false`.
ExceptIfAttachmentPropertyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	This parameter is reserved for internal Microsoft use.
ExceptIfAttachmentSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfAttachmentSizeOver* parameter specifies an attachment size. The rule isn't applied if the size of any of the attachments exceeds the specified size.
ExceptIfBetweenMemberOf1	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfBetweenMemberOf1* parameter specifies a distribution group and must be used together with the *ExceptIfBetweenMemberOf2* parameter. The rule isn't applied if the message is sent between

			members of the distribution groups specified in these parameters.
ExceptIfBetweenMemberOf2	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfBetweenMemberOf2* parameter specifies a distribution group and must be used together with the *ExceptIfBetweenMemberOf1* parameter. The rule isn't applied if the message is sent between members of the distribution groups specified in these parameters.
ExceptIfContentCharacterSetContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfContentCharacterSetContainsWords* parameter specifies one or more character set names to check for in the message. The rule isn't applied if the message contains any of the character sets specified.
ExceptIfFrom	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfFrom* parameter specifies the sender. The rule isn't

			applied to messages received from this sender.
ExceptIfFromAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfFromAddressContainsWords* parameters specifies one or more words to check for in the From address. The rule isn't applied if the sender's address includes any of these words.
ExceptIfFromAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfFromAddressMatchesPatterns* parameter specifies one or more regular expressions to match in the sender's address. The rule isn't applied if the sender's address matches the pattern you specify.
ExceptIfFromMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfFromMemberOf* parameter specifies a distribution group. The rule isn't applied if the sender of the message is a member of this distribution group.
ExceptIfFromScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules	The *ExceptIfFromScope* parameter specifies

		.Tasks.FromUserScope	whether the sender is inside or outside your organization. Valid values for this parameter are: • `InOrganization` • `NotInOrganization`
ExceptIfHasClassification	Optional	System.String	The *ExceptIfHasClassification* parameter specifies a message classification. The rule isn't applied to messages that have the specified classification. **Note:** The message classification referred to in this parameter is the custom message classification that you can create in your organization. It isn't related to the DLP classification.
ExceptIfHasNoClassification	Optional	System.Boolean	The *ExceptIfHasNoClassification* parameter specifies that the rule isn't applied to messages that don't have a message classification.
ExceptIfHasSenderOverride	Optional	System.Boolean	The *ExceptIfHasSenderOverride* parameter specifies the rule to check if the sender has chosen to override a DLP policy. Set this parameter to `$true` to

			prevent this rule from applying to messages where the sender took action to override a DLP policy restriction.
ExceptIfHeaderContainsMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *ExceptIfHeaderContainsMessageHeader* parameter specifies the SMTP message header to inspect for specific words or patterns. This parameter is used together with the *ExceptIfHeaderContainsWords* parameter.
ExceptIfHeaderContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfHeaderContainsWords* parameter specifies one or more words to look for in the message header specified in the *ExceptIfHeaderContainsMessageHeader* parameter. The rule isn't applied to messages where the header value of the specified header matches any of the words specified.
ExceptIfHeaderMatchesMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *ExceptIfHeaderMatchesMessageHeader* parameter

			specifies an SMTP message header to inspect. This parameter is used together with the *ExceptIfHeaderMatchesPatterns* parameter.
ExceptIfHeaderMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfHeaderMatchesPatterns* parameter specifies a pattern to match in the header specified in the *ExceptIfHeaderMatchesMessageHeader* parameter.
ExceptIfManagerAddresses	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfManagerAddresses* parameter specifies a recipient. The rule isn't applied to messages where the specified recipient is the manager of the sender or the recipient. Whether it's the manager for the sender or the recipient is defined in the *ExceptIfManagerForEvaluatedUser* parameter.
ExceptIfManagerForEvaluatedUser	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.EvaluatedUser	The *ExceptIfManagerForEvaluatedUser* parameter specifies whether the sender or the recipient's manager should be

			evaluated. The specified user's manager attribute is compared with users specified in the *ExceptIfManagerAddresses* parameter. Valid values include: • `Recipient` • `Sender` Use this parameter together with the *ExceptIfManagerAddresses* parameter.
ExceptIfMessageContainsDataClassifications	Optional	System.Collections.Hashtable[]	The *ExceptIfMessageContainsDataClassifications* parameter specifies the sensitive information types to look for in the message body and any of the attachments. For a list of sensitive information types available, see Sensitive information types inventory.
ExceptIfMessageSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfMessageSizeOver* parameter specifies a message size. The rule isn't applied to any messages that exceed the message size you specify for this parameter.

ExceptIfMessageTypeMatches	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.MessageType	The *ExceptIfMessageTypeMatches* parameter specifies a message type. The rule isn't applied to any messages that match the message type you specify. Valid values include: • `OOF` Auto-reply messages configured by the user • `AutoForward` Messages automatically forwarded to an alternative recipient • `Encrypted` Encrypted messages • `Calendaring` Meeting requests and responses • `PermissionControlled` Messages that have specific permissions configured • `Voicemail` Voice mail messages forwarded by Unified Messaging service • `Signed` Digitally signed messages • `ApprovalRequest` Moderation request messages sent to moderators • `ReadReceipt` Read receipts
ExceptIfRecipientADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientADAttributeContainsWords* parameter specifies one or

			more words to check for in specific Active Directory attributes of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager**

			• **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule isn't applied if any of the specified attributes have the value specified.
ExceptIfRecipientADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfRecipientADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials**

			• **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns

			for multiple attributes, separate them with commas. The rule isn't applied if the values of any of the specified attributes match the specified patterns for that attribute.
ExceptIfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientAddressContainsWords* parameter specifies words to check for in the recipient address.
ExceptIfRecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfRecipientAddressMatchesPatterns* parameter specifies one or more text patterns to match in the recipient address.
ExceptIfRecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientDomainIs* parameter specifies the recipient's domain. The rule isn't applied to messages sent to recipients whose email addresses are in the specified domain.
ExceptIfRecipientInSenderList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service.

			The *ExceptIfRecipientInSenderList* parameter specifies an exception when a recipient is defined in a supervision list entry on the sender's mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox.
ExceptIfSCLOver	Optional	Microsoft.Exchange.Data.SclValue	The *ExceptIfSCLOver* parameter specifies a spam confidence level (SCL) value. The rule isn't applied to messages with an SCL equal to or higher than the value specified. Valid SCL values are integers from 0 through 9,

			and -1. The value -1 specifies that the message is from a trusted source.
ExceptIfSenderADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSenderADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the sender. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber**

			• **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule isn't applied if any of the specified attributes have the value specified.
ExceptIfSenderADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfSenderADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the

			sender. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15**

			To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule isn't applied if the values of any of the specified attributes match the specified patterns for that attribute.
ExceptIfSenderDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSenderDomainIs* parameter specifies the sender's domain. The rule isn't applied to messages received from senders whose email addresses are in the specified domain.
ExceptIfSenderInRecipientList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service. The *ExceptIfSenderInRecipientList* parameter specifies an exception when the sender is defined in a supervision list entry on a recipient's

			mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox.
ExceptIfSenderIpRanges	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfSenderIpRanges* parameter specifies the IP ranges to compare with the sender's IP address. The rule isn't applied if the IP address of the sender falls within one of the IP ranges specified in this parameter.
ExceptIfSenderManagementRelationship	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ManagementRelationship	The *ExceptIfSenderManagementRelationship* parameter specifies a relationship between the sender and

			the recipient. Valid values are: • `Manager` The rule isn't applied if the sender is the manager of the recipient. • `DirectReport` The rule isn't applied if the sender is a direct report of the recipient.
ExceptIfSentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentTo* parameter specifies a recipient. The rule isn't applied to messages sent to the specified recipient.
ExceptIfSentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentToMemberOf* parameter specifies a distribution group. The rule isn't applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is removed after creation of the rule, no exception is made.
ExceptIfSentToScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ToUserScope	The *ExceptIfSentToScope* parameter specifies whether the message is sent to internal, external, or partner recipients. Valid values are: • `InOrganization` The

			recipients are internal to your organization. • `NotInOrganization` The recipients are outside your organization. • `ExternalPartner` The recipients are in a partner organization. • `ExternalNonPartner` The recipients are external to your organization which isn't a partner organization.
ExceptIfSubjectContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSubjectContainsWords* parameter specifies words to look for in the message subject. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When specifying a phrase that contains one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`.
ExceptIfSubjectMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfSubjectMatchesPatterns* parameter specifies

			text patterns to check the message subject for.
ExceptIfSubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfSubjectOrBodyContainsWords* parameter specifies words to look for in the message subject and body. The rule isn't applied if any of the words or phrases specified is found in the message subject or body. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When specifying a phrase with one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`.
ExceptIfSubjectOrBodyMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *ExceptIfSubjectOrBodyMatchesPatterns* parameter specifies text patterns to look for in the message subject and body. The rule

			isn't applied if the word specified is found in the message subject or body.
ExceptIfWithImportance	Optional	Microsoft.Exchange.Management.Tasks.Importance	The *ExceptIfWithImportance* parameter specifies message importance. The rule isn't applied to messages matching the specified importance. Valid values are: • `High` • `Low` • `Normal`
ExpiryDate	Optional	System.DateTime	The *ExpiryDate* parameter specifies the date when this rule will stop processing. The rule won't take any action on messages past the date you specify for this parameter.
From	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *From* parameter specifies the sender. The rule is applied to messages received from this sender. This parameter is used to define a rule condition.
FromAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *FromAddressContainsWords* parameter specifies one

			or more words to check for in the From address. The rule is applied if the sender's address includes any of these words. This parameter is used to define a rule condition.
FromAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *FromAddressMatchesPatterns* parameter specifies one or more regular expressions to match in the sender's address. The rule is applied if the sender's address matches the pattern you specify. This parameter is used to define a rule condition.
FromMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *FromMemberOf* parameter specifies a distribution group. The rule is applied if the sender of the message is a member of this distribution group. This parameter is used to define a rule condition.
FromScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.FromUserScope	The *FromScope* parameter specifies whether the sender is inside or outside your organization. Valid

			values for this parameter are: • `InOrganization` • `NotInOrganization` This parameter is used to define a rule condition.
GenerateIncidentReport	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *GenerateIncidentReport* parameter specifies the recipient to whom incident reports will be sent. An incident report is generated for messages that violate a DLP policy in your organization. This parameter is used to define a rule action.
GenerateNotification	Optional	Microsoft.Exchange.Data.DisclaimerText	This parameter is reserved for internal Microsoft use.
HasClassification	Optional	System.String	The *HasClassification* parameter specifies a message classification. The rule is applied to messages that have the specified classification. **Note:** The message classification referred to in this parameter is the custom message classification that you can create in your organization. It isn't related to the DLP classification.

			This parameter is used to define a rule condition.
HasNoClassification	Optional	System.Boolean	The *HasNoClassification* parameter specifies whether the rule is applied to messages that don't have a message classification. If you set this parameter to `$true`, the rule is applied to all messages that don't have a message classification. If you set this parameter to `$false`, the rule is applied to all messages that have one or more message classifications. This parameter is used to define a rule condition.
HasSenderOverride	Optional	System.Boolean	The *HasSenderOverride* parameter specifies the rule to check if the sender has chosen to override a DLP policy. Set this parameter to `$true` to apply this rule to messages where the sender took action to override a DLP policy restriction.

			This parameter is used to define a rule condition.
HeaderContainsMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *HeaderContainsMessageHeader* parameter specifies the SMTP message header to inspect for specific words or patterns. This parameter is used together with the *HeaderContainsWords* parameter. This parameter is used to define a rule condition.
HeaderContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *HeaderContainsWords* parameter specifies one or more words to look for in the message header specified in the *HeaderContainsMessageHeader* parameter. The rule is applied to messages where the header value of the specified header matches any of the words specified. This parameter is used to define a rule condition.
HeaderMatchesMessageHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *HeaderMatchesMessageH*

			eader parameter specifies an SMTP message header to inspect. This parameter is used together with the *HeaderMatchesPatterns* parameter. This parameter is used to define a rule condition.
HeaderMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *HeaderMatchesPatterns* parameter specifies a pattern to match in the header specified in the *HeaderMatchesMessageHeader* parameter. This parameter is used to define a rule condition.
IncidentReportContent	Optional	Microsoft.Exchange.MessagingPolicies.Rules.IncidentReportContent[]	The *IncidentReportContent* parameter specifies the message properties that are included in incident reports. This parameter is used together with the *GenerateIncidentReport* parameter. The valid values are: • `Sender` Includes the sender of the message. • `Recipients` Includes the recipients in the To: box of the message. Only the first 10 recipients are displayed

			in the incident report. If there are more than 10 recipients, the remaining number of recipients will be displayed. • `Subject` Includes the message subject. • `cc` Includes the recipients in the Cc: box of the message. Only the first 10 recipients are displayed in the incident report. If there are more than 10 recipients, the remaining number of recipients will be displayed. • `Bcc` Includes the recipients in the Bcc: box of the message. Only the first 10 recipients are displayed in the incident report. If there are more than 10 recipients, the remaining number of recipients will be displayed. • `Severity` Includes the audit severity of the rule that was triggered. If the message was processed by more than one rule, the highest severity is displayed. • `Override` Includes the override if the sender has chosen to override a PolicyTip. If the sender has provided a justification, the first 100 characters of the justification is also included. • `RuleDetections`

			Includes the list of rules that the message triggered. • `FalsePositive` Includes the false positive if the sender marked the message as a false positive for a PolicyTip. • `DataClassifications` Includes the list of sensitive information types detected in the message. • `IdMatch` Includes the sensitive information type that is detected, the exact matched content from the message, and the 150 characters before and after the matched sensitive information. • `AttachOriginalMail` Includes the entire original message. **Note:** The message ID is always included in the incident report. This parameter is used to define a rule action.
IncidentReportOriginalMail	Optional	Microsoft.Exchange.MessagingPolicies.Rules.IncidentReportOriginalMail	The *IncidentReportOriginalMail* parameter specifies whether to include the original message with the incident report. This parameter is used together with the

			GenerateIncidentReport parameter. Valid values are: • `IncludeOriginalMail` • `DoNotIncludeOriginalMail` The default value is `DoNotIncludeOriginalMail`. This parameter is used to define a rule action. **Important:** The functionality of this parameter is now managed by the *IncidentReportContent* parameter, and this parameter will be deprecated in the future. Adding the value `AttachOriginalMail` to the *IncidentReportContent* parameter is equivalent to setting this parameter to `IncludeOriginalMail` value. Even though this parameter is still functional, we recommend you use the *IncidentReportContent* parameter instead.
LogEventText	Optional	Microsoft.Exchange.Data.EventLogText	The *LogEventText* parameter specifies a message string to add to the event log entry for this rule. This parameter is used to define a rule action.
ManagerAddresses	Optional	Microsoft.Exchange.Co	The *ManagerAddresses*

		nfiguration.Tasks.RecipientIdParameter[]	parameter specifies a recipient. The rule is applied to messages where the specified recipient is the manager of the sender or the recipient. Whether it's the manager for the sender or the recipient is defined in the *ManagerForEvaluatedUser* parameter. This parameter is used to define a rule condition.
ManagerForEvaluatedUser	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.EvaluatedUser	The *ManagerForEvaluatedUser* parameter specifies whether the sender or the recipient's manager should be evaluated. The specified user's manager attribute is compared with users specified in the *ManagerAddresses* parameter. Valid values include: • `Recipient` • `Sender` Use this parameter together with the *ManagerAddresses* parameter. This parameter is used to define a rule condition.

MessageContainsDataClassifications	Optional	System.Collections.Hashtable[]	The *MessageContainsDataClassifications* parameter specifies the sensitive information types to look for in the message body and any of the attachments. For a list of sensitive information types available, see Sensitive information types inventory. This parameter is used to define a rule condition.
MessageSizeOver	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MessageSizeOver* parameter specifies a message size. The rule is applied to all messages that exceed the message size you specify for this parameter. This parameter is used to define a rule condition.
MessageTypeMatches	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.MessageType	The *MessageTypeMatches* parameter specifies a message type. The rule is applied to all messages that match the message type you specify. Valid values include: • OOF Auto-reply messages configured by

			the user • `AutoForward` Messages automatically forwarded to an alternative recipient • `Encrypted` Encrypted messages • `Calendaring` Meeting requests and responses • `PermissionControlled` Messages that have specific permissions configured • `Voicemail` Voice mail messages forwarded by Unified Messaging service • `Signed` Digitally signed messages • `ApprovalRequest` Moderation request messages sent to moderators • `ReadReceipt` Read receipts This parameter is used to define a rule condition.
Mode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleMode	The *Mode* parameter specifies in which mode this rule will operate. Valid values include: • `Audit` The rule is turned on, and what would have happened if the rule was enforced is logged in message tracking logs. Exchange doesn't take any action that impacts the delivery of the message. • `AuditAndNotify` The

			rule is turned on, and it operates the same way it would in `Audit` mode, but notifications are also enabled. • `Enforce` The rule is turned on, and all actions specified in the rule are taken. The default value is `Enforce`.
ModerateMessageByManager	Optional	System.Boolean	The *ModerateMessageByManager* parameter specifies whether the message should be forwarded to the sender's manager for approval. To enable moderation by the sender's manager, set the value to `$true`. This parameter is used to define a rule action.
ModerateMessageByUser	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ModerateMessageByUser* parameter specifies a recipient to forward the message to for approval. This parameter is used to define a rule action.
Name	Optional	System.String	The *Name* parameter specifies the display name of the transport rule to be

			created. The length of the name can't exceed 64 characters.
NotifySender	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.NotifySenderType	The *NotifySender* parameter specifies how the sender of a message that goes against a DLP policy is notified. Valid values are: • `NotifyOnly` Sender is notified, but the message is delivered normally. • `RejectMessage` Message is rejected, and the sender is notified. • `RejectUnlessFalsePositiveOverride` Message is rejected unless it's marked as a false positive by the sender. • `RejectUnlessSilentOverride` Message is rejected unless the sender has chosen to override the policy restriction. • `RejectUnlessExplicitOverride` This is the same as `RejectUnlessSilentOverride`, but the sender can also provide a justification for overriding the policy restriction. If you specify any value other than `NotifyOnly`, you can provide a specific

			rejection status code and reason using the *RejectMessageEnhancedStatusCode* and *RejectMessageReasonText* parameters. This action is used together with the *MessageContainsDataClassifications* condition. If you use this parameter, you must also specify the sensitive information types you want to check against using the *MessageContainsDataClassifications* parameter. This parameter is used to define a rule action.
PrependSubject	Optional	Microsoft.Exchange.Data.SubjectPrefix	The *PrependSubject* parameter specifies a word or phrase to add to the beginning of the message subject. **Note:** The rule will add the text as you specify in this parameter without adding spaces or other characters to separate it from the original subject. Consider ending the value you specify in this parameter with a colon (:) and a space, or at least a space,

			to separate it from the original subject. This parameter is used to define a rule action.
Priority	Optional	System.Int32	The *Priority* parameter specifies the priority for this transport rule. Rules with a lower priority value are processed first. If you modify the priority of the rule, the position of the rule in the rule list changes to match the priority that you specified, and the Transport Rules agent increments all rules with a higher priority value. The value of this parameter must be greater than or equal to 0, and must be one less than the total number of transport rules in your organization. For example, if you configured 8 transport rules, you can set this parameter to any value from 0 through 7.
Quarantine	Optional	System.Boolean	The *Quarantine* parameter specifies whether the rules agent delivers the message to the quarantine

			mailbox specified in the Content Filtering configuration. This parameter is used to define a rule action.
RecipientADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNu**

			mber • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule will be applied if any of the specified attributes have the value specified. This parameter is used to define a rule condition.
RecipientADAttribute	Optional	Microsoft.Exchange.M	The

MatchesPatterns		essagingPolicies.Rules.Tasks.Pattern[]	*RecipientADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the recipient. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title**

			• **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule will be applied if the values of any of the specified attributes match the specified patterns for that attribute. This parameter is used to define a rule condition.
RecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientAddressContainsWords* parameter specifies one or more words to check for in the recipient's email address. This parameter is used to define a rule condition.
RecipientAddressMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules	The *RecipientAddressMatchesPatterns* parameter

		.Tasks.Pattern[]	specifies a pattern to check the recipient address for. This parameter is used to define a rule condition.
RecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientDomainIs* parameter specifies the recipient's domain. The rule is applied to messages sent to recipients whose email addresses are in the specified domain. This parameter is used to define a rule condition.
RecipientInSenderList	Optional	Microsoft.Exchange.Data.Word[]	This parameter is available only in the cloud-based service. The *RecipientInSenderList* parameter specifies the condition when a recipient is defined in a supervision list entry on the sender's mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as

			a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox. This parameter is used to define a rule condition.
RedirectMessageTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *RedirectMessageTo* parameter specifies that the rule redirects the message to the specified recipient. This parameter is used to define a rule action.
RejectMessageEnhancedStatusCode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RejectEnhancedStatus	The *RejectMessageEnhancedStatusCode* parameter specifies an enhanced status code to provide when rejecting messages. Valid values are `5.7.1` or between `5.7.10` and `5.7.999`. **Note:** The transport rule can add a custom rejection message. To further customize the delivery status notification (DSN),

			you need to create a custom DSN message using the **New-SystemMessage** cmdlet. If an enhanced status code isn't specified, and only the *RejectMessageReasonText* parameter is used, the enhanced status code `5.7.1` is used. This parameter is used to define a rule action.
RejectMessageReasonText	Optional	Microsoft.Exchange.Data.DsnText	The *RejectMessageReasonText* parameter specifies a reason that explains why the message was rejected. **Note:** The transport rule can add a custom rejection message. To further customize the DSN, you need to create a custom DSN message using the **New-SystemMessage** cmdlet. If a *RejectMessageReasonText* parameter value isn't specified, and an enhanced status code is specified by using the *RejectMessageEnhancedStatusCode* parameter, the

			default reason text "`Delivery not authorized, message refused`" is used. This parameter is used to define a rule action.
RemoveHeader	Optional	Microsoft.Exchange.Data.HeaderName	The *RemoveHeader* parameter specifies an SMTP header name to be removed from the message. This parameter is used to define a rule action.
RemoveOME	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *RemoveOME* parameter specifies that a message and its attachments will be decrypted if they match the identified transport rule. The default is $false.
RouteMessageOutboundConnector	Optional	Microsoft.Exchange.Configuration.Tasks.OutboundConnectorIdParameter	This parameter is available only in the cloud-based service. The *RouteMessageOutboundConnector* parameter specifies the connector to

			use for routing this message. This parameter is used to define a rule action.
RouteMessageOutboundRequireTls	Optional	System.Boolean	The *RouteMessageOutboundRequireTls* parameter specifies that Transport Layer Security (TLS) encryption is required when routing this message outside your organization. Set this parameter to `$true` to require TLS. This parameter is used to define a rule action.
RuleErrorAction	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleErrorAction	The *RuleErrorAction* parameter specifies how the message should be handled if the rule processing can't be completed. Valid values are: • `Ignore` The message is sent without completing the rule processing. • `Defer` The message is deferred so the rules engine can attempt to process the message again. The default value is

			`Ignore`.
RuleSubType	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleSubType	The *RuleSubType* parameter specifies the type of this transport rule. Valid values are: • `Dlp` Specifies that this rule is associated with a DLP policy. • `None` Specifies that this is a regular transport rule.
SCLOver	Optional	Microsoft.Exchange.Data.SclValue	The *SCLOver* parameter specifies an SCL value. The rule is applied to messages with an SCL equal to or higher than the value specified. Valid SCL values are integers from 0 through 9, and -1. The value -1 specifies that the message is from a trusted source. This parameter is used to define a rule condition.
SenderADAttributeContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *SenderADAttributeContainsWords* parameter specifies one or more words to check for in specific Active Directory attributes of the sender. You can check against any of the following Active

			Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber** • **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active

			Directory attribute followed by a colon and the words. For example, to look for the word `Sales` in the `Department` attribute, set this parameter to `Department:Sales`. If you want to specify multiple values for multiple attributes, separate them with commas. The rule will be applied if any of the specified attributes have the value specified. This parameter is used to define a rule condition.
SenderADAttributeMatchesPatterns	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.Pattern[]	The *SenderADAttributeMatchesPatterns* parameter specifies one or more patterns to check for in the specified Active Directory attribute of the sender. You can check against any of the following Active Directory attributes: • **DisplayName** • **FirstName** • **Initials** • **LastName** • **Office** • **PhoneNumber**

			• **OtherPhoneNumber** • **Email** • **Street** • **POBox** • **City** • **State** • **ZipCode** • **Country** • **UserLogonName** • **HomePhoneNumber** • **OtherHomePhoneNumber** • **PagerNumber** • **MobileNumber** • **FaxNumber** • **OtherFaxNumber** • **Notes** • **Title** • **Department** • **Company** • **Manager** • **CustomAttribute1 - CustomAttribute15** To specify a value for an Active Directory attribute, use the name of the Active Directory attribute followed by a colon and the pattern. If you want to specify multiple patterns for multiple attributes, separate them with commas. The rule will be

			applied if the values of any of the specified attributes match the specified patterns for that attribute. This parameter is used to define a rule condition.
SenderAddressLocation	Optional	Microsoft.Exchange.MessagingPolicies.Rules.SenderAddressLocation	The *SenderAddressLocation* parameter specifies the fields to look in when evaluating sender addresses. Prior to Exchange Server 2013 Cumulative Update 1, transport rules only processed message headers when evaluating senders. With the addition of the *SenderAddressLocation* parameter, you can configure the rules to also examine the message envelope (the sender information sent with the MAIL FROM command in the SMTP transmission) when evaluating senders. Valid values are: • `Header` Only message headers are examined when evaluating senders.

			• `Envelope` Only the message envelope is examined when evaluating senders. • `HeaderOrEnvelope` Both message headers and the message envelope are examined when evaluating senders. The default value is `Header`. **Note:** By configuring this parameter, you can evaluate the message envelope for the following conditions and exceptions): • From • FromAddressContainsWords • FromAddressMatchesPatterns • FromMemberOf • SenderDomainIs
SenderDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *SenderDomainIs* parameter specifies the sender's domain. The rule is applied to messages received from senders whose email addresses are in the specified domain. This parameter is used to define a rule condition.
SenderInRecipientList	Optional	Microsoft.Exchange.Da	This parameter is available only in the cloud-based

		ta.Word[]	service. The *SenderInRecipientList* parameter specifies the condition when the sender is defined in a supervision list entry on a recipient's mailbox. Supervision list entries perform the following functions: • They specify individual exceptions for the user in the closed campus supervision policy. • They identify the user as a victim in the anti-bullying policy. To view the supervision list entries that are configured on a user's mailbox, run the **Get-SupervisionListEntry** command and specify the user's mailbox. This parameter is used to define a rule condition.
SenderIpRanges	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SenderIpRanges* parameter specifies the IP ranges to compare with the sender's IP address. The rule is applied if the IP address of the sender falls within one of the IP ranges

			specified in this parameter. This parameter is used to define a rule condition.
SenderManagementRelationship	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ManagementRelationship	The *SenderManagementRelationship* parameter specifies a relationship between the sender and the recipient. Valid values are: • `Manager` The rule is applied if the sender is the manager of the recipient. • `DirectReport` The rule is applied if the sender is a direct report of the recipient. This parameter is used to define a rule condition.
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies a recipient. The rule is applied to messages sent to the specified recipient. This parameter is used to define a rule condition.
SentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentToMemberOf* parameter specifies a distribution group. The rule is applied to messages where any recipient is a member of

			the specified group. **Note:** If the distribution group is removed after creation of the rule, no action is taken. This parameter is used to define a rule condition.
SentToScope	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.ToUserScope	The *SentToScope* parameter specifies whether the message is sent to internal, external, or partner recipients. Valid values are: • `InOrganization` The recipients are internal to your organization. • `NotInOrganization` The recipients are outside your organization. • `ExternalPartner` The recipients are in a partner organization. • `ExternalNonPartner` The recipients are external to your organization, which isn't a partner organization. This parameter is used to define a rule condition.
SetAuditSeverity	Optional	System.String	The *SetAuditSeverity* parameter specifies the severity level assigned to an incident report that's generated and the

			corresponding entry logged in the message tracking logs. You can specify one of the following values: • `DoNotAudit` No audit entry is logged. • `Low` The audit entry is assigned low severity. • `Medium` The audit entry is assigned medium severity. • `High` The audit entry is assigned high severity. This parameter is used to define a rule action.
SetHeaderName	Optional	Microsoft.Exchange.Data.HeaderName	The *SetHeaderName* parameter specifies the SMTP header name to add or modify when the rule is applied. When the *SetHeaderName* parameter is used, you must also use the *SetHeaderValue* parameter to specify a value for the header. This parameter is used to define a rule action.
SetHeaderValue	Optional	Microsoft.Exchange.Data.HeaderValue	The *SetHeaderValue* parameter specifies a value for the header specified in the *SetHeaderName*

			parameter. This parameter is used to define a rule action.
SetSCL	Optional	Microsoft.Exchange.Data.SclValue	The *SetSCL* parameter modifies the SCL value of the message to the value specified. The SCL value can be a number from 0 through 9, or -1. The value -1 specifies that the message is from a trusted source. This parameter is used to define a rule action.
SmtpRejectMessageRejectStatusCode	Optional	Microsoft.Exchange.Data.RejectStatusCode	The *SmtpRejectMessageRejectStatusCode* parameter specifies an enhanced status code to provide when rejecting a message. This parameter is used to define a rule action.
SmtpRejectMessageRejectText	Optional	Microsoft.Exchange.Data.RejectText	The *SmtpRejectMessageRejectText* parameter specifies a text string to add to the rejection message. You must use this parameter with the *SmtpRejectMessageRejectStatusCode* parameter.

			This parameter is used to define a rule action.
StopRuleProcessing	Optional	System.Boolean	The *StopRuleProcessing* parameter specifies whether the processing of subsequent rules should be stopped for this message. This parameter is used to define a rule action.
SubjectContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *SubjectContainsWords* parameter specifies words to look for in the message subject. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When specifying a phrase that contains one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`. This parameter is used to define a rule condition.
SubjectMatchesPatter	Optional	Microsoft.Exchange.M	The

ns		essagingPolicies.Rules.Tasks.Pattern[]	*SubjectMatchesPatterns* parameter specifies text patterns to check for in the message subject. This parameter is used to define a rule condition.
SubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.Word[]	The *SubjectOrBodyContainsWords* parameter specifies words to look for in the message subject or body. The rule is applied if any of the words or phrases specified is found in the message subject or body. You can specify one or more words or phrases. When specifying more than one word or phrase, each word or phrase should be separated by a comma (,). When specifying a phrase with one or more spaces, you must enclose the phrase in quotation marks ("), for example: `word1,"Phrase with spaces",word2`. This parameter is used to define a rule condition.
SubjectOrBodyMatche	Optional	Microsoft.Exchange.M	The

sPatterns		essagingPolicies.Rules.Tasks.Pattern[]	*SubjectOrBodyMatchesPatterns* parameter specifies text patterns to look for in the message subject or body. The rule is applied if the word specified is found in the message subject or body. This parameter is used to define a rule condition.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WithImportance	Optional	Microsoft.Exchange.Management.Tasks.Importance	The *WithImportance* parameter specifies message importance. The rule is applied to messages matching the specified importance. Valid values are: • `High` • `Low` • `Normal` This parameter is used to

			define a rule condition.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportRuleAction

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-07*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-TransportRuleAction** cmdlet to retrieve a list of all available transport rule actions that can be used when creating a transport rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-TransportRuleAction [-Name <String>]
```

Examples

EXAMPLE 1

This example returns all available transport rule actions.

```
Get-TransportRuleAction
```

EXAMPLE 2

This example retrieves detailed information about a single transport rule action. The command is piped to the **Format-List** command to display all properties of the transport rule action.

```
Get-TransportRuleAction -Name DeleteMessage | Format-List
```

For more information about pipelining, see Pipelining. For more information about how to work with the output of a command, see Working with command output.

Detailed Description

The **Get-TransportRuleAction** cmdlet displays a list of available actions you can use in transport.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Optional	System.String	The *Name* parameter specifies the rule action to display. For a list of values that can be used with this parameter on the server role that you're administering, see Transport rule actions.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-TransportRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Export-TransportRuleCollection** cmdlet to export the transport rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-TransportRuleCollection [-Identity <RuleIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports transport rules. Rule data is first exported to the variable `$file`, and then written to the XML file `Rules.xml` in the `C:\MyDocs` folder.

```
$file = Export-TransportRuleCollection
Set-Content -Path "C:\MyDocs\Rules.xml" -Value
$file.FileData -Encoding Byte
```

Detailed Description

The **Export-TransportRuleCollection** cmdlet can be used to export the transport rule collection in your organization. The format of the exported transport rule collection has changed in Exchange Server 2013. The new format can only be imported into Exchange Server 2013: it can't be imported into older versions of Exchange.

Exporting the rules collection is a two-step process. You first export the rules collection to a variable, and then use the **Set-Content** cmdlet to write the data to an XML file. For more information, see Set-Content.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory

			Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	This parameter has been deprecated and is no longer used.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-TransportRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Import-TransportRuleCollection** cmdlet to import a transport rule collection. You can import a rule collection you previously exported as a backup, or import rules that you've exported from an older version of Exchange.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-TransportRuleCollection -FileData <Byte[]> [-Identity
<RuleIdParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-MigrationSource <None | Fope | Ehe>]
[-Organization <OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example imports a transport rule collection from the XML file ExportedRules.xml.

```
[Byte[]]$Data = Get-Content -Path "C:\TransportRules
\ExportedRules.xml" -Encoding Byte -ReadCount 0
Import-TransportRuleCollection -FileData $Data
```

Detailed Description

Caution:

Importing a transport rule collection from an XML file removes or overwrites all pre-existing transport rules that were defined in your organization. Make sure that you have a backup of your current transport rule collection before you import and overwrite your current transport rules.

Importing file data is a two-step process. First you must load the data to a variable using the **Get-Content** cmdlet, and then use that variable to transmit the data to the cmdlet.

For information about how to export a transport rule collection to an XML file, see Export-TransportRuleCollection.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the variable name that contains the content of the XML file. The content is retrieved using the **Get-Content** cmdlet.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies that the command will override any errors or warnings encountered during the import operation.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter is no longer used and will be deprecated.
MigrationSource	Optional	Microsoft.Exchange.Data.Directory.Transport.MigrationSourceType	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportRulePredicate

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-07*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-TransportRulePredicate** cmdlet to retrieve a list of all available rule conditions (predicates) that can be used when creating a transport rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-TransportRulePredicate [-Name <String>]
```

Examples

EXAMPLE 1

This example returns all available conditions for transport rules.

```
Get-TransportRulePredicate
```

EXAMPLE 2

This example retrieves the single condition `SubjectMatches`. The command is piped to the **Format-List** command to display detailed transport rule condition information.

```
Get-TransportRulePredicate -Name SubjectMatches | Format-List
```

For more information about pipelining, see Pipelining. For more information about how to work with the output of a command, see Working with command output.

EXAMPLE 3

This example returns the list of all transport rule conditions related to message attachments by filtering the output..

```
Get-TransportRulePredicate | Where {$_.Name -like '*Attachment*'}
```

For more information about how to work with the output of a command, see Working with command output

Detailed Description

The **Get-TransportRulePredicate** cmdlet displays a list of available rule conditions that you can use in transport rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport rules" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description

Name	Optional	System.String	The *Name* parameter specifies the condition to display. For a list of values that can be used with this parameter on the server role that you're administering, see Transport rule conditions (predicates).

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AuthConfig

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AuthConfig** cmdlet to get the authorization configuration for partner applications.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AuthConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the authorization configuration for the Exchange organization and pipes the results to the **Format-List** command.

```
Get-AuthConfig | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AuthConfig

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AuthConfig** cmdlet to modify the authorization configuration for your Exchange

organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AuthConfig [-Realm <String>] [-ServiceName <String>] <COMMON
PARAMETERS>

Set-AuthConfig -CertificateThumbprint <String> [-Force <SwitchParameter>]
[-Server <ServerIdParameter>] [-SkipImmediateCertificateDeployment
<SwitchParameter>] <COMMON PARAMETERS>

Set-AuthConfig [-Force <SwitchParameter>] [-NewCertificateEffectiveDate
<DateTime>] [-NewCertificateThumbprint <String>] [-Server
<ServerIdParameter>] [-SkipImmediateCertificateDeployment
<SwitchParameter>] <COMMON PARAMETERS>

Set-AuthConfig [-ClearPreviousCertificate <SwitchParameter>] [-Force
<SwitchParameter>] [-PublishCertificate <SwitchParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example specifies a new certificate and a date when the certificate will become effective.

```
Set-AuthConfig -NewCertificateThumbprint
DB821B4FCA2A5DA9593B9DE00C86BC5EA35D0FC0 -
NewCertificateEffectiveDate 4/17/2013
```

EXAMPLE 2

This example immediately rolls over the certificate configured as the next certificate and makes it the current certificate. You must have installed a certificate marked as the next certificate.

```
Set-AuthConfig -PublishCertificate
```

Detailed Description

The **Set-AuthConfig** parameter defines Microsoft Exchange as a partner application for server-to-server authentication with other partner applications such as Microsoft SharePoint 2013 and Microsoft Lync 2013, including the certificate used for signing tokens. It's generally not required for this configuration to be modified except in some cases where you must use a different certificate instead of the self-signed certificate created by Exchange Setup or to use a new certificate after the old one has expired.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
CertificateThumbprint	Required	System.String	The *CertificateThumbprint* parameter specifies the thumbprint of the certificate to be used by Exchange for server-to-server authentication.
ClearPreviousCertificate	Optional	System.Management.Automation.SwitchParameter	The *ClearPreviousCertificate* switch clears the certificate saved as the previous certificate in the authorization configuration.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
NewCertificateEffectiveDate	Optional	System.DateTime	The *NewCertificateEffectiveDate* parameter specifies a date when the certificate configured as the next certificate should be used.
NewCertificateThumbprint	Optional	System.String	The *NewCertificateThumbprint* parameter specifies the thumbprint of the new

			certificate to be used as the next certificate in the authorization configuration.
PublishCertificate	Optional	System.Management.Automation.SwitchParameter	The *PublishCertificate* switch specifies that the specified certificate be immediately rolled over as the current certificate. The certificate is immediately deployed to all Client Access servers.
Realm	Optional	System.String	The *Realm* parameter specifies a security realm for partner applications. If a service or user presents a token from a domain that's not an accepted domain in the Exchange organization, the token must contain the specified realm to gain access to resources.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter isn't available in this release.
ServiceName	Optional	System.String	The *ServiceName* parameter identifies Microsoft Exchange to other partner applications such as SharePoint 2013.

			Caution: Exchange Setup configures the *ServiceName* parameter with a specific constant value. You shouldn't change this parameter. Changing the *ServiceName* parameter can result in server-to-server authentication with partner applications not functioning.
SkipImmediateCertificateDeployment	Optional	System.Management.Automation.SwitchParameter	The *SkipImmediateCertificateDeployment* switch specifies that the certificate shouldn't be used immediately. We recommend that you don't use this parameter in a production environment.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AuthServer

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AuthServer** cmdlet to retrieve settings of authorization servers configured in the Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AuthServer [-Identity <AuthServerIdParameter>] [-DomainController
<Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves all settings for all authorization servers in the Exchange organization.

```
Get-AuthServer | Format-List *
```

Detailed Description

An authorization server is a server or service that issues tokens trusted by Microsoft Exchange Server 2013 for access by partner applications.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner application - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AuthServerIdParameter	The *Identity* parameter specifies the identity of an authorization server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AuthServer

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-AuthServer** cmdlet to create an authorization server object in Microsoft Exchange Server 2013 and specify its *AuthMetadataUrl*. Exchange 2013 honors tokens issued by the authorization server for access by a partner application.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-AuthServer -AuthMetadataUrl <String> [-TrustAnySSLCertificate
<SwitchParameter>] <COMMON PARAMETERS>

New-AuthServer -IssuerIdentifier <String> -TokenIssuingEndpoint <String> -
Type <Unknown | MicrosoftACS | Facebook | LinkedIn | ADFS | AzureAD> [-
ApplicationIdentifier <String>] [-AppSecret <String>] [-
AuthorizationEndpoint <String>] <COMMON PARAMETERS>

New-AuthServer -AuthMetadataUrl <String> -Type <Unknown | MicrosoftACS |
Facebook | LinkedIn | ADFS | AzureAD> [-TrustAnySSLCertificate
<SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This command creates an authorization server.

```
New-AuthServer HRAppAuth -AuthMetadataUrl http://
hrappauth.contoso.com/metadata/json/1
```

Detailed Description

In Exchange 2013, partner applications authorized by Exchange can access their resources after they're authenticated using server-to-server authentication. A partner application can authenticate by using self-issued tokens trusted by Exchange or by using an authorization server trusted by Exchange.

The **New-AuthServer** cmdlet creates a trusted authorization server object in Exchange 2013, which allows it to trust tokens issued by the authorization server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner

applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
AuthMetadataUrl	Required	System.String	The *AuthMetadataUrl* parameter specifies the URL for the Microsoft Office 365 authorization server for your cloud-based organization. For details, see the Office 365 documentation.
IssuerIdentifier	Required	System.String	This parameter is reserved for internal Microsoft use.
Name	Required	System.String	The *Name* parameter specifies a name for the authorization server.
TokenIssuingEndpoint	Required	System.String	This parameter is reserved for internal Microsoft use.
Type	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthServerType	This parameter is reserved for internal Microsoft use.
ApplicationIdentifier	Optional	System.String	This parameter is reserved for internal Microsoft use.
AppSecret	Optional	System.String	This parameter is

			reserved for internal Microsoft use.
AuthorizationEndpoint	Optional	System.String	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the authorization server is enabled. Set the parameter to `$false` to prevent authorization tokens issued by this

			authorization server from being accepted.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AuthServer

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-AuthServer** cmdlet to remove an authorization server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-AuthServer -Identity <AuthServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the authorization server AMC.

```
Remove-AuthServer AMC
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AuthServerIdParameter	The *Identity* parameter specifies the identity of the authorization server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the

			confirmation prompt, use the syntax -`confirm:$false`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AuthServer

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AuthServer** cmdlet to configure an authorization server that partner applications can use to obtain tokens recognized by Microsoft Exchange.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AuthServer [-AuthMetadataUrl <String>] [-TrustAnySSLCertificate
<SwitchParameter>] <COMMON PARAMETERS>

Set-AuthServer [-AuthMetadataUrl <String>] [-
IsDefaultAuthorizationEndpoint <$true | $false>] [-TrustAnySSLCertificate
<SwitchParameter>] <COMMON PARAMETERS>

Set-AuthServer [-RefreshAuthMetadata <SwitchParameter>] <COMMON
PARAMETERS>

Set-AuthServer [-ApplicationIdentifier <String>] [-AppSecret <String>] [-
IssuerIdentifier <String>] [-TokenIssuingEndpoint <String>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <AuthServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This command disables the authorization server ACS.

```
Set-AuthServer ACS -Enabled $false
```

Detailed Description

In Exchange 2013, partner applications authorized by Exchange can access their resources after they're authenticated using server-to-server authentication. A partner application can authenticate

by using self-issued tokens trusted by Exchange or by using an authorization server trusted by Exchange. You can use the **New-AuthServer** cmdlet to create a trusted authorization server object in Exchange 2013, which allows it to trust tokens issued by the authorization server.

Use the **Set-AuthServer** cmdlet to enable or disable the authorization server, change the *AuthMetadataUrl* parameter, or refresh authorization metadata.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AuthServerIdParameter	The *Identity* parameter specifies the identity of authorization server.
ApplicationIdentifier	Optional	System.String	This parameter is reserved for internal Microsoft use.
AppSecret	Optional	System.String	This parameter is reserved for internal Microsoft use.
AuthMetadataUrl	Optional	System.String	The *AuthMetadataUrl* parameter specifies the URL of the authorization server. This can be the AuthMetadataUrl of your Microsoft Exchange Online organization.
Confirm	Optional	System.Management.Automation.SwitchPara	The *Confirm* switch causes the command to

		meter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the authorization server is enabled. Only enabled authorization servers can issue and accept tokens. Disabling the authorization server prevents any partner applications configured to use the authorization server from getting a token.
IsDefaultAuthorization	Optional	System.Boolean	The *IsDefaultAuthorizationE*

Endpoint			*ndpoint* parameter specifies whether this server is the default authorization endpoint. This server's authorization URL is advertised to calling partner applications, and applications need to get their OAuth access tokens from this authorization server. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
IssuerIdentifier	Optional	System.String	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	The *Name* parameter specifies a name for the authorization server.
RefreshAuthMetadata	Optional	System.Management.Automation.SwitchParameter	The *RefreshAuthMetadata* switch specifies whether Exchange should refresh the auth metadata from the specified URL.
TokenIssuingEndpoint	Optional	System.String	This parameter is reserved for internal

			Microsoft use.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* switch specifies whether Exchange should accept certificates from an untrusted certification authority. We don't recommend using this switch in a production environment.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-ExchangeCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-ExchangeCertificate** cmdlet to enable an existing certificate in the local certificate store for Exchange services such as Internet Information Services (IIS), SMTP, POP, IMAP, and Unified Messaging (UM).

Important:
There are many factors to consider when you configure certificates for Transport Layer Security (TLS) and Secure Sockets Layer (SSL) services. You must understand how these factors may affect your overall configuration. Don't use the **Enable-ExchangeCertificate** cmdlet to enable a wildcard certificate for POP and IMAP services. To enable a wildcard certificate, you must use the **Set-ImapSettings** or **Set-PopSettings** cmdlets with the fully qualified domain name (FQDN) of the service. Don't use the **Enable-ExchangeCertificate** cmdlet to enable a certificate for federation. Certificates used for federation trusts are managed by using the **New-FederationTrust** and **Set-FederationTrust** cmdlets.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-ExchangeCertificate -Thumbprint <String> [-Server
<ServerIdParameter>] <COMMON PARAMETERS>

Enable-ExchangeCertificate [-Identity <ExchangeCertificateIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: -Services <None | IMAP | POP | UM | IIS | SMTP |
Federation | UMCallRouter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-DoNotRequireSsl <SwitchParameter>] [-Force
<SwitchParameter>] [-NetworkServiceAllowed <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables a certificate for POP, IMAP, SMTP, and IIS services.

```
Enable-ExchangeCertificate -Thumbprint
5113ae0233a72fccb75b1d0198628675333d010e -Services
POP,IMAP,SMTP,IIS
```

Detailed Description

The **Enable-ExchangeCertificate** cmdlet enables certificates by updating the metadata stored with the certificate. To enable an existing certificate to work with additional Exchange services, use the **Enable-ExchangeCertificate** cmdlet and specify the additional services.

Important:
The **Enable-ExchangeCertificate** cmdlet is additive. When you specify a subset of services for which a certificate is enabled, the services that aren't specified aren't removed from the **Services** property. If you don't want to use an existing enabled certificate for Exchange services, you must enable another certificate, and then remove the certificate you don't want to use.

Different services have different certificate requirements. For example, some services may only require a server name in the **Subject Name** or **Subject Alternative Name** fields of a certificate, whereas other services may require an FQDN. Make sure that the certificate name can support the uses required by the services you enable it for.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Certificate management" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Services	Required	Microsoft.Exchange.Management.SystemConfigurationTasks.AllowedServices	The *Services* parameter specifies the services that use the certificate. Valid entries include one or more of the following: • `IIS` • `IMAP` • `POP` • `SMTP` • `UM` • `UMCallRouter` • `Federation` • `None` To enable a certificate for multiple services, separate each value with a comma, for example:

			`-Services IMAP,POP,IIS` You can't use the **Enable-ExchangeCertificate** cmdlet to enable a certificate for federation. Creating or modifying a federation trust enables or modifies how certificates are used for federation.
Thumbprint	Required	System.String	The *Thumbprint* parameter specifies the certificate that you're enabling. Each certificate contains a thumbprint, which is the digest of the certificate data. To view the thumbprint of a certificate, use the Get-ExchangeCertificate cmdlet.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DoNotRequireSsl	Optional	System.Management.Automation.SwitchPara	The *DoNotRequireSsl* switch specifies whether to leave IIS settings unchanged when IIS is one of the enabled services. If IIS is one of the

		meter	enabled services, the cmdlet changes the default website settings to require SSL. Set the *DoNotRequireSsl* switch to `$true` to override this behavior and leave IIS settings unchanged.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to override the confirmation prompt and set the new certificate as the default certificate for TLS for internal SMTP communication. By default, when you enable a certificate for SMTP, the command prompts for confirmation.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExchangeCertificateIdParameter	The *Identity* parameter specifies the certificate ID.
NetworkServiceAllowed	Optional	System.Management.Automation.SwitchParameter	The *NetworkServiceAllowed* switch specifies that the Network Service be allowed permissions to access the certificate specified, without enabling the certificate for SMTP.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server name on which you want to enable the certificate.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-ExchangeCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Export-ExchangeCertificate** cmdlet to export an existing certificate from the certificate store on the local computer. You can export a certificate with its private key or a certificate request file.

```
Export-ExchangeCertificate -Thumbprint <String> [-Server
<ServerIdParameter>] <COMMON PARAMETERS>

Export-ExchangeCertificate [-Identity <ExchangeCertificateIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-BinaryEncoded <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-FileName <String>] [-
Password <SecureString>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports a certificate specified by its thumbprint, along with the private key, to a file named htcert.pfx in the certificates directory on a Hub Transport server. The exported certificate is DER-encoded. A password is required when exporting a certificate with its private key.

The following command uses the **Export-ExchangeCertificate** cmdlet to export certificate data to the variable *$file*.

```
$file = Export-ExchangeCertificate -Thumbprint
5113ae0233a72fccb75b1d0198628675333d010e -
BinaryEncoded:$true -Password (Get-Credential).password
```

The following command uses the **Set-Content** cmdlet to write data stored in the variable *$file* to the file htcert.pfx.

```
Set-Content -Path "c:\certificates\htcert.pfx" -Value
$file.FileData -Encoding Byte
```

Detailed Description

The **Export-ExchangeCertificate** cmdlet creates either of the following files:

- **PKCS #10 file** If the thumbprint specified in the command points to a certificate request, the **Export-ExchangeCertificate** cmdlet creates a PKCS #10 file. A thumbprint is the digest of the certificate data. PKCS #10 is the Certification Request Syntax standard specified by RFC 2314. For more information, see PKCS #10: Certification Request Syntax.
- **PKCS #12 file** If the thumbprint specified in the command points to an actual certificate, the **Export-ExchangeCertificate** cmdlet creates a PKCS #12 file. PKCS #12 is the Personal Information Exchange Syntax standard specified by RSA Laboratories. For more information, see PKCS #12: Personal Information Exchange Syntax Standard.

Important:
When you use the **Export-ExchangeCertificate** cmdlet, you must export certificate data to a variable, as shown in "Examples" later in this topic, and then use the **Set-Content** cmdlet to write the data to a file. For more information about the Set-Content cmdlet, see Set-Content.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Certificate management" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Thumbprint	Required	System.String	The *Thumbprint* parameter specifies the thumbprint of the certificate that you're exporting. Each certificate contains a

			thumbprint, which is the digest of the certificate data. It can be retrieved by using the Get-ExchangeCertificate cmdlet.
BinaryEncoded	Optional	System.Management.Automation.SwitchParameter	The *BinaryEncoded* parameter specifies how the exported file is encoded. By default, this command creates a Base64-encoded file. To create a DER-encoded file, set this parameter to `$true`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
FileName	Optional	System.String	The *FileName* parameter specifies the name of the file that will contain the exported certificate.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExchangeCertificateIdParameter	The *Identity* parameter specifies the certificate ID.
Password	Optional	System.Security.SecureString	The *Password* parameter specifies the password for the private key that's exported with this command. Use the **Get-Credential** cmdlet to store the password variable.

			The **Get-Credential** cmdlet will prompt you for a user name and password, but only the password field is used to export or import the certificate. Therefore, you don't have to use a real domain name or user name in the **Name** field. For implementation details, see "Examples" later in this topic.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server name from which you want to export the certificate.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ExchangeCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ExchangeCertificate** cmdlet to view certificates in the local certificate store.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ExchangeCertificate [-Server <ServerIdParameter>] [-Thumbprint
<String>] <COMMON PARAMETERS>

Get-ExchangeCertificate [-Identity <ExchangeCertificateIdParameter>]
<COMMON PARAMETERS>

Get-ExchangeCertificate [-Instance <X509Certificate2>] [-Server
<ServerIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-DomainName
<MultiValuedProperty>]
```

Examples

EXAMPLE 1

This example returns all certificates stored on the Client Access server named ClientAccess01.

```
Get-ExchangeCertificate -Server ClientAccess01
```

EXAMPLE 2

This example returns the properties of a specified certificate in a formatted list.

Note:
The *Thumbprint* parameter is a positional parameter so you can provide only the thumbprint value without the *Thumbprint* parameter name.

```
Get-ExchangeCertificate
0271A7F1CA9AD8A27152CCAE044F968F068B14B8 | Format-List *
```

EXAMPLE 3

This example shows which certificate Exchange will select for the domain name mail.contoso.com. A Send or Receive connector selects the certificate to use based on the fully qualified domain name (FQDN) of the connector. If you have multiple certificates with the same FQDN, you can see which certificate Exchange will select by using the *DomainName* parameter to specify the FQDN. The first certificate returned is the certificate Exchange will select.

```
Get-ExchangeCertificate -DomainName mail.contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Certificate management" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge

			Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *DomainName* parameter specifies whether to return all certificates that contain the specified domain name in the **Subject Name** or the **Subject Alternative Name** fields.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExchangeCertificateIdParameter	The *Identity* parameter specifies the certificate ID.
Instance	Optional	System.Security.Cryptography.X509Certificates.X509Certificate2	The *Instance* parameter is no longer used and will be deprecated.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server from which you want to get the certificate. You can use any value that uniquely identifies the Exchange server.

			If you run **Get-ExchangeCertificate** on a Client Access server, and you don't use the *Server* parameter to specify the local server, the command returns the results from a Mailbox server.
Thumbprint	Optional	System.String	The *Thumbprint* parameter specifies a certificate thumbprint. Each certificate contains a thumbprint, which is the digest of the certificate data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-ExchangeCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Import-ExchangeCertificate** cmdlet to import a certificate or chain of certificates.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-ExchangeCertificate -Instance <String[]> <COMMON PARAMETERS>

Import-ExchangeCertificate -FileData <Byte[]> <COMMON PARAMETERS>

Import-ExchangeCertificate -FileName <String> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-FriendlyName <String>] [-Password <SecureString>] [-
PrivateKeyExportable <$true | $false>] [-Server <ServerIdParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example imports an existing certificate and private key from the PKCS #12 file ExportedCert.pfx.

```
Import-ExchangeCertificate -FileData ([Byte[]]$(Get-Content
-Path c:\certificates\ExportedCert.pfx -Encoding byte -
ReadCount 0)) -Password:(Get-Credential).password
```

EXAMPLE 2

This example imports a chain of certificates from the PKCS #7 file IssuedCert.p7b.

```
Import-ExchangeCertificate -FileData ([Byte[]]$(Get-Content
-Path c:\certificates\IssuedCert.p7b -Encoding byte -
ReadCount 0))
```

Detailed Description

You can use the **Import-ExchangeCertificate** cmdlet for the following purposes:

- To import a certificate or chain of certificates from a PKCS #7 file that has been issued by a certification authority (CA). PKCS #7 is the Cryptographic Message Syntax Standard, a syntax used for digitally signing or encrypting data using public key cryptography, including certificates.
- To import an existing certificate and private key from a PKCS #12 (.pfx or .p12) file to the certificate store on the local computer. PKCS #12 is the Personal Information Exchange Syntax Standard, a file format used to store certificates with corresponding private keys protected with a password. The standard is specified by RSA Laboratories. For more information, see the PKCS #12: Personal Information Exchange Syntax Standard website.

Important:

There are many factors to consider when you configure certificates for Transport Layer Security (TLS) and Secure Sockets Layer (SSL) services. You must understand how these factors may affect your overall configuration.

Note:

In Microsoft Exchange Server 2013, to import data from a file, you must use the **Get-Content** cmdlet to retrieve file data and use the *FileData* parameter to specify the retrieved data. This can be done in a two-step process, or in a single step. Examples shown in this cmdlet use the single-step approach.

The certificate may be published in Active Directory for the purposes of direct trust by using mutual TLS if the following conditions are true:

- The certificate is marked as an SMTP TLS certificate.
- The Subject Name on the certificate matches the fully qualified domain name (FQDN) of the local computer.

The certificate may be published in Active Directory by Edge Subscription if the following conditions are true:

- You import the certificate to an Edge Transport server.
- The certificate has an FQDN that matches the server FQDN.

The **Import-ExchangeCertificate** cmdlet imports either a certificate that's issued from an outstanding request or a PKCS #12 file.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Certificate management" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the content retrieved from the certificate file using the **Get-Content** cmdlet. For implementation details, see the Examples section.
FileName	Required	System.String	The *FileName*

			parameter specifies the name of the file that contains the certificate you want to import.
Instance	Required	System.String[]	The *Instance* parameter specifies whether to pass a whole object to the command to be processed. This parameter is mainly used in scripts where a whole object must be passed to the command.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change

			to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
FriendlyName	Optional	System.String	The *FriendlyName* parameter specifies a friendly name for the resulting certificate. The friendly name must be less than 64 characters. The default friendly name is Microsoft Exchange.
Password	Optional	System.Security.SecureString	The *Password* parameter specifies the password for the private key that's imported with this command. Use the **Get-Credential** cmdlet to store the password variable. The **Get-Credential** cmdlet prompts you for

			a user name and password, but only the password field is used to import the certificate. You don't have to use a real domain name or user name in the **Name** field. For implementation details, see the Examples section.
PrivateKeyExportable	Optional	System.Boolean	The *PrivateKeyExportable* parameter specifies whether the private key of the certificate can be exported.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server name to which you want to import the certificate.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ExchangeCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-ExchangeCertificate** cmdlet to create a self-signed certificate, renew an existing self-signed certificate, or generate a new certificate request for obtaining a certificate from a certification authority (CA).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ExchangeCertificate [-BinaryEncoded <SwitchParameter>] [-
GenerateRequest <SwitchParameter>] [-RequestFile <String>] <COMMON
PARAMETERS>

New-ExchangeCertificate [-Services <None | IMAP | POP | UM | IIS | SMTP |
Federation | UMCallRouter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-DomainName <MultiValuedProperty>] [-Force <SwitchParameter>] [-
FriendlyName <String>] [-IncludeAcceptedDomains <SwitchParameter>] [-
IncludeAutoDiscover <SwitchParameter>] [-IncludeServerFQDN
<SwitchParameter>] [-IncludeServerNetBIOSName <SwitchParameter>] [-
Instance <X509Certificate2>] [-KeySize <Int32>] [-PrivateKeyExportable
<$true | $false>] [-Server <ServerIdParameter>] [-SubjectKeyIdentifier
```

```
<String>] [-SubjectName <X500DistinguishedName>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example runs the **New-ExchangeCertificate** cmdlet without parameters and generates a self-signed certificate. The certificate has the fully qualified domain name (FQDN) of the local computer as the subject name. The Network Services local security group is also provided read access to the private key associated with the certificate. In addition, the certificate is published to Active Directory so that Exchange direct trust can validate the authenticity of the server for mutual TLS.

```
New-ExchangeCertificate
```

EXAMPLE 2

This example outputs the certificate request in Base64 format to the command-line console. You must send the certificate request to a CA within the organization, a trusted CA outside the organization, or a commercial CA. You can do this by pasting the certificate request output in an email message or in the appropriate field on the certificate request web page of the CA. You can also save the certificate request to a file using a text editor such as Notepad.

The certificate that results has the following attributes associated with it:

- Subject name: c=<ES>,o=<Woodgrove Bank>,cn=mail1.woodgrovebank.com
- Subject alternate names: woodgrovebank.com and example.com
- An exportable private key

```
New-ExchangeCertificate -GenerateRequest -SubjectName
"c=US, o=Woodgrove Bank, cn=mail1.woodgrovebank.com" -
DomainName woodgrovebank.com, example.com -
PrivateKeyExportable $true
```

EXAMPLE 3

This example is a variation of the certificate request generated in EXAMPLE 2. Instead of manually pasting the certificate request output produced by the cmdlet, the **Set-Content** cmdlet is used to write the request to a file.

The certificate that results has the following attributes associated with it:

- Subject name: c=<ES>,o=<Woodgrove Bank>,cn=mail1.woodgrovebank.com
- Subject alternate names: woodgrovebank.com and example.com
- An exportable private key

In the first step, the **New-ExchangeCertificate** cmdlet is used to generated the certificate request and save the output in a variable named *$Data*.

```
$Data = New-ExchangeCertificate -GenerateRequest -
SubjectName "c=US, o=Woodgrove Bank,
cn=mail1.woodgrovebank.com" -DomainName woodgrovebank.com,
example.com -PrivateKeyExportable $true
```

In the second step, the **Set-Content** cmdlet is used to write data from the variable to the certificate request file MyCertRequest.req in the Docs folder.

```
Set-Content -path "C:\Docs\MyCertRequest.req" -Value $Data
```

EXAMPLE 4

This example creates a DER-encoded certificate request file. The *BinaryEncoded* parameter is used to generate a DER-encoded certificate request. The **Set-Content** cmdlet is used with the *Encoding* parameter to write the request to a file.

The certificate that results will have the following attributes associated with it:

- Subject name: c=ES,o=Woodgrove Bank,cn=mail1.woodgrovebank.com
- Subject alternate names: woodgrovebank.com and example.com
- An exportable private key

In the first step, the **New-ExchangeCertificate** cmdlet is used to generate the certificate request in DER-encoded format and save the output in a variable named *$Data*.

```
$Data = New-ExchangeCertificate -GenerateRequest -
SubjectName "c=ES, o=Woodgrove Bank,
cn=mail1.woodgrovebank.com" -DomainName woodgrovebank.com,
example.com -BinaryEncoded -PrivateKeyExportable $true
```

In the second step, the **Set-Content** cmdlet is used to write data from the variable to the certificate request file MyCertRequest.req in the Docs folder.

```
Set-Content -path "C:\Docs\MyCertRequest.req" -Value
$Data.FileData -Encoding Byte
```

EXAMPLE 5

This example shows how to renew a self-signed certificate with a specific thumbprint value. You can obtain the thumbprint value in one of two ways.

- Select the certificate in the Exchange Administration Center, and then select **Edit** to view properties of the certificate. The thumbprint value is shown in the **Exchange Certificate** window.
- Run the **Get-ExchangeCertificate** cmdlet to return a list of all certificates installed on the server with their thumbprint values.

```
Get-ExchangeCertificate -Thumbprint
```

```
c4248cd7065c87cb942d60f7293feb7d533a4afc | New-
ExchangeCertificate
```

Detailed Description

Microsoft Exchange Server 2013 uses certificates for SSL and TLS encryption. The **New-ExchangeCertificate** cmdlet uses many parameters of type *SwitchParameter*. For more information about how to use this parameter type, see "Switch Parameters" in Parameters.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Certificate management" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
BinaryEncoded	Optional	System.Management.Automation.SwitchParameter	The *BinaryEncoded* switch specifies how the certificate request is encoded. By default, this cmdlet creates a Base64-encoded request. Use this switch to create a DER-encoded request. **Note:** The *BinaryEncoded* switch is available only if you use the *GenerateRequest* switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You

			don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *DomainName* parameter specifies one or more FQDNs or server names to be populated in the **Subject Alternative Name** field of the resulting certificate request or self-signed certificate. Domain names are restricted to the

			characters a through z, 0 through 9, and the hyphen (-). Each domain name can't be longer than 255 characters. To enter multiple domain or server names, you must enter the names separated by commas. **Note:** If this parameter isn't specified, and you don't use the *IncludeAcceptedDomains*, *IncludeAutoDiscover*, *IncludeServerFQDN*, and *IncludeServerNetBIOSName* switches, the server's **hostname** and **FQDN** are added by default.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to override the confirmation prompt and set the new self-signed certificate as the default certificate for TLS for internal SMTP communication. By default, this cmdlet requires a confirmation before setting the new certificate as the default certificate for TLS encryption of internal SMTP communication.

FriendlyName	Optional	System.String	The *FriendlyName* parameter specifies a friendly name for the certificate. The friendly name must be less than 64 characters. The default friendly name is `Microsoft Exchange`.
GenerateRequest	Optional	System.Management.Automation.SwitchParameter	The *GenerateRequest* switch specifies whether to generate a certificate request for a public key infrastructure (PKI) certificate (PKCS #10) in the local request store. By default, this cmdlet creates a self-signed certificate in the local computer certificate store. The *GenerateRequest* switch overrides this behavior.
IncludeAcceptedDomains	Optional	System.Management.Automation.SwitchParameter	The *IncludeAcceptedDomains* switch specifies whether all accepted domains in the organization are included in the **Subject Alternative Name** field of the certificate request or self-signed certificate.

			You can also specify one or more domain names using the *DomainName* parameter in addition to the accepted domains. The resulting certificate or request contains the specified domains and all accepted domains. **Note:** When you use the *IncludeAcceptedDomains* switch, any accepted domains you specify in the *DomainName* parameter aren't duplicated.
IncludeAutoDiscover	Optional	System.Management.Automation.SwitchParameter	The *IncludeAutoDiscover* switch specifies whether to add a **Subject Alternative Name** with the prefix `autodiscover` for each accepted domain in the Exchange organization. For example, if the organization has the accepted domains `woodgrovebank.com` and `woodgrovebank.co.uk`, using this switch results in the addition of the following **Subject Alternative Names**: • `autodiscover.woodgrovebank.com` • `autodiscover.woodgrovebank.co.uk`

			The switch can only be used on Client Access servers. The `autodiscover` prefix isn't added if the domain name already contains the prefix.
IncludeServerFQDN	Optional	System.Management.Automation.SwitchParameter	The *IncludeServerFQDN* switch specifies whether to include the FQDN of the server in the **Subject Alternative Name** field of the new certificate request or self-signed certificate. **Note:** When you use the *IncludeServerFQDN* switch, any FQDNs you specify in the *DomainName* parameter aren't duplicated.
IncludeServerNetBIOSName	Optional	System.Management.Automation.SwitchParameter	The *IncludeServerNetBIOSName* switch specifies whether to include the NetBIOS name of the server in the **Subject Alternative Name** field of the new certificate request or self-signed certificate. **Note:** When you use the

			IncludeServerNetBIOSName switch, any NetBIOS names you specify in the *DomainName* parameter aren't duplicated.
Instance	Optional	System.Security.Cryptography.X509Certificates.X509Certificate2	The *Instance* parameter is no longer used and will be deprecated.
KeySize	Optional	System.Int32	The *KeySize* parameter specifies the size (in bits) of the RSA public key associated with the certificate that you're creating. Acceptable values are 4096, 2048, and 1024. The default value is 2048.
PrivateKeyExportable	Optional	System.Boolean	The *PrivateKeyExportable* parameter specifies whether the new certificate has an exportable private key. By default, all certificate requests and certificates created by this cmdlet don't allow the private key to be exported. **Important:** If you can't export the private key, the certificate can't be exported or imported. To allow exporting the

			private key when exporting the certificate, set this parameter to `$true`.
RequestFile	Optional	System.String	The *RequestFile* parameter specifies the name of the file that contains the certificate request. This parameter is used with the *BinaryEncoded* and *GenerateRequest* parameters.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server name for which you want to create the new certificate. If not specified, the certificate or certificate request is generated for the Exchange server on which the command is executed.
Services	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.AllowedServices	The *Services* parameter specifies the services that will use the resulting certificate. **Important:** You can specify services using the **New-ExchangeCertificate** cmdlet only if you're generating a self-signed certificate. If you're

			creating a certificate request for a CA using the *GenerateRequest* switch, you must install the certificate after it's issued by the CA, and then specify services using the **Enable-ExchangeCertificate** cmdlet. Valid values include a combination of the following: • `Federation` • `IIS` • `IMAP` • `None` • `POP` • `SMTP` • `UM` • `UMCallRouter` The default values are `IMAP`,`POP`, and `SMTP`.
SubjectKeyIdentifier	Optional	System.String	The *SubjectKeyIdentifier* parameter specifies the subject key identifier extension for the certificate, which isn't required for normal operation.
SubjectName	Optional	System.Security.Cryptography.X509Certificates.X500DistinguishedName	The *SubjectName* parameter specifies the subject name of the resulting certificate. A subject name is an X.500 distinguished name that consists of one or more relative distinguished

			names (also known as RDNs). The subject name of a certificate is the field used by Domain Name System (DNS)-aware services. It binds a certificate to a particular server or domain name. If the *SubjectName* parameter isn't specified, the host name of the server where the cmdlet is run is used as the common name (CN) in the resulting certificate. For example, for the server EXMBX01, the *SubjectName* parameter value `CN=EXMBX01` is used.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ExchangeCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ExchangeCertificate** cmdlet to remove an existing certificate from the local certificate store.

Important:
There are many factors to consider when you configure certificates for Transport Layer Security (TLS) and Secure Sockets Layer (SSL) services. You must understand how these factors may affect your overall configuration.

```
Remove-ExchangeCertificate -Thumbprint <String> [-Server
<ServerIdParameter>] <COMMON PARAMETERS>

Remove-ExchangeCertificate [-Identity <ExchangeCertificateIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a certificate with the specified thumbprint.

```
Remove-ExchangeCertificate -Thumbprint
```

5113ae0233a72fccb75b1d0198628675333d010e

Detailed Description

You can't remove the certificate that's being used. If you want to replace the default certificate for the server with another certificate that has the same fully qualified domain name (FQDN), you must create the new certificate first, and then remove the old certificate.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Certificate management" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Thumbprint	Required	System.String	The *Thumbprint* parameter specifies the thumbprint of the certificate that you're removing. Each certificate contains a thumbprint, which is the digest of the certificate data.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExchangeCertificateIdParameter	The *Identity* parameter specifies the certificate ID.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server name from which you want to remove the certificate.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on

			the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-OAuthConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-07*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Test-OAuthConnectivity** cmdlet to test OAuth authentication to partner applications for a user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-OAuthConnectivity -Service <EWS | AutoD | Generic> -TargetUri <Uri>
[-AppOnly <SwitchParameter>] [-Confirm [<SwitchParameter>]] [-Mailbox
<MailboxIdParameter>] [-OrganizationDomain <String>] [-ReloadConfig
<SwitchParameter>] [-UseCachedToken <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests OAuth connectivity with Exchange for Gurinder Singh.

```
Test-OAuthConnectivity -Service EWS -TargetUri https://
cas.contoso.com/ews/ -Mailbox "Gurinder Singh"
```

Detailed Description

Important:
Exchange 2013 creates the SharePoint 2013 and Lync 2013 partner applications in on-premises Exchange 2013 deployments. For **Test-OAuthConnectivity** cmdlet to succeed for other partner applications, you must have created the partner application first using the `Configure-EnterpriseApplication.ps1` script.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Service	Required	Microsoft.Exchange.Monitoring.ModServiceType	The *Service* parameter specifies the partner application. Valid values for this parameter are: • `EWS` • `AutoD` • `Generic`
TargetUri	Required	System.Uri	The *TargetUri* parameter specifies the URL for the service you want to test OAuth connectivity with.
AppOnly	Optional	System.Management.Automation.SwitchParameter	The *AppOnly* switch specifies the cmdlet will authenticate to the

			specified service as Exchange without any user context. You don't need to specify a value with this switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the mailbox for which you want to test OAuth connectivity to the specified partner application.
OrganizationDomain	Optional	System.String	This parameter is available only in the cloud-based service. The *OrganizationDomain* parameter specifies the domain name of the Office 365 organization. For example, `contoso.com`.
ReloadConfig	Optional	System.Management.Automation.SwitchPar	The *ReloadConfig* switch reloads all the

		ameter	configuration settings from the Exchange configuration objects. You don't need to specify a value with this switch. If you don't use this switch, the cached configuration settings are used.
UseCachedToken	Optional	System.Management.Automation.SwitchParameter	The *UseCachedToken* switch specifies that OAuth will try to use an existing, cached authorization token. You don't need to specify a value with this switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PartnerApplication

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PartnerApplication** cmdlet to retrieve settings for a partner application.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PartnerApplication [-Identity <PartnerApplicationIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves settings for all partner applications configured in Exchange and pipes them to the **Format-List** cmdlet to display all properties in a list view.

```
Get-PartnerApplication | Format-List *
```

Detailed Description

In Microsoft Exchange Server 2013, you can configure partner applications such as Microsoft SharePoint to access Exchange resources. For details, see Integration with SharePoint and Lync.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.PartnerApplicationIdParameter	The *Identity* parameter specifies the identity of a partner application.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-PartnerApplication

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-PartnerApplication** cmdlet to create a partner application configuration.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-PartnerApplication -ApplicationIdentifier <String> [-Realm <String>]
<COMMON PARAMETERS>

New-PartnerApplication -AuthMetadataUrl <String> [-TrustAnySSLCertificate
<SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-AcceptSecurityIdentifierInformation
<$true | $false>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Enabled <$true | $false>] [-LinkedAccount <UserIdParameter>] [-
Organization <OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the HRApp partner application and configures it to use an authorization server.

```
New-PartnerApplication HRApp -ApplicationIdentifier
00000006-0000-0dd1-ac00-000000000000 -Realm contoso.com -
UseAuthServer $true
```

Detailed Description

In Microsoft Exchange Server 2013, you can configure partner applications such as Microsoft SharePoint to access Exchange resources. Use the **New-PartnerApplication** cmdlet to create a partner application configuration for an application that needs to access Exchange 2013 resources. For details, see Integration with SharePoint and Lync.

We recommend that you use the Configure-EnterprisePartnerApplication.ps1 script in the \Exchange Server\V15\Scripts folder to configure partner applications.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationIdentifier	Required	System.String	The *ApplicationIdentifier* parameter specifies a unique application identifier for the partner application that uses an authorization server. When specifying a value for the *ApplicationIdentifier* parameter, you must also use the *UseAuthServer* parameter.
AuthMetadataUrl	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *AuthMetadataUrl* parameter specifies the URL that Exchange can retrieve the AuthMetadata document from for a partner application that doesn't use an authorization server. When specifying the *AuthMetadataUrl* parameter for a partner application, you can't specify the *ApplicationIdentifier* and

			UseAuthServer parameters.
Name	Required	System.String	The *Name* parameter specifies a name for the partner application.
AcceptSecurityIdentifierInformation	Optional	System.Boolean	The *AcceptSecurityIdentifierInformation* parameter specifies whether Exchange should accept security identifiers (SIDs) from another trusted Active Directory forest for the partner application. By default, new partner applications are configured to not accept SIDs from another forest. If you're in deployment with a trusted forest, set the parameter to `$true`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the partner application is enabled. By default, new partner applications are enabled. Set the parameter to `$false` to create the application configuration in a disabled state.
LinkedAccount	Optional	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *LinkedAccount* parameter specifies a linked Active Directory user account for the application. Exchange evaluates Role Based Access Control (RBAC) permissions for the linked account when authorizing a token used to perform a task.

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Realm	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Realm* parameter specifies a security realm for the partner application. If the token is from a domain that's not an accepted domain, Exchange checks the realm specified in the token. In such a scenario, only tokens with the same realm specified in the partner application can access Exchange 2013 resources.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *TrustAnySSLCertificate* switch specifies whether Exchange should trust certificates issued by a certification authority (CA) not trusted by the server.

			Caution: We don't recommend using this switch in a production environment.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PartnerApplication

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-PartnerApplication** cmdlet to remove a partner application from Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PartnerApplication -Identity <PartnerApplicationIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This command removes the HRApp partner application.

```
Remove-PartnerApplication HRApp
```

Detailed Description

In Exchange 2013, you can configure partner applications such as Microsoft SharePoint to access Exchange Server resources. Use the **Remove-PartnerApplication** cmdlet to remove a partner application configuration if the application no longer needs to access Exchange 2013 resources. For details, see Integration with SharePoint and Lync.

We recommend that you use the Configure-EnterprisePartnerApplication.ps1 script in the \Exchange Server\V15\Scripts folder to configure partner applications.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PartnerApplicationIdParameter	The *Identity* parameter specifies the identity of the partner application.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt

			that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PartnerApplication

Exchange Management Shell > Exchange 2013 cmdlets > Security cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-21*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-PartnerApplication** cmdlet to configure a partner application.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PartnerApplication [-ApplicationIdentifier <String>] [-Realm <String>]
<COMMON PARAMETERS>

Set-PartnerApplication [-AuthMetadataUrl <String>] [-
TrustAnySSLCertificate <SwitchParameter>] <COMMON PARAMETERS>

Set-PartnerApplication [-RefreshAuthMetadata <SwitchParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <PartnerApplicationIdParameter> [-
AcceptSecurityIdentifierInformation <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-LinkedAccount <UserIdParameter>] [-Name <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example refreshes the auth metadata for the HRApp partner application.

```
Set-PartnerApplication HRApp -RefreshAuthMetadata
```

Detailed Description

In Microsoft Exchange Server 2013, you can configure partner applications such as Microsoft SharePoint to access Exchange resources. Use the **New-PartnerApplication** cmdlet to create a partner application configuration for an application that needs to access Exchange 2013 resources. For details, see Integration with SharePoint and Lync. We recommend that you use the Configure-EnterprisePartnerApplication.ps1 script in the \Exchange Server\V15\Scripts folder to configure partner applications.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Partner applications - configure" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PartnerApplicationIdParameter	The *Identity* parameter specifies the identity of the partner application you want to modify.
AcceptSecurityIdentifierInformation	Optional	System.Boolean	The *AcceptSecurityIdentifierInformation* parameter specifies whether Exchange should accept security identifiers (SIDs) from another trusted Active Directory forest for the partner application. By default, new partner applications are configured to not

			accept SIDs from another forest. If you're in deployment with a trusted forest, set the parameter to `$true`.
ApplicationIdentifier	Optional	System.String	The *ApplicationIdentifier* parameter specifies a unique application identifier for the partner application that uses an authorization server.
AuthMetadataUrl	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *AuthMetadataUrl* parameter specifies the URL that Exchange can retrieve the AuthMetadata document from for a partner application that doesn't use an authorization server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run.

			To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the partner application is enabled. By default, new partner applications are enabled. Set the parameter to `$false` to create the application configuration in a disabled state.
LinkedAccount	Optional	Microsoft.Exchange.Configuration.Tasks.UserI	The *LinkedAccount* parameter specifies a

		dParameter	linked Active Directory user account for the application. Exchange evaluates Role Based Access Control (RBAC) permissions for the linked account when authorizing a token used to perform a task.
Name	Optional	System.String	The *Name* parameter specifies a new name for the partner application.
Realm	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Realm* parameter specifies a security realm for the partner application. If the token is from a domain that's not an accepted domain, Exchange checks the realm specified in the token. In such a scenario, only tokens with the same realm specified in the partner application can access Exchange 2013 resources.

RefreshAuthMetadata	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RefreshAuthMetadata* switch specifies that the auth metadata should be refreshed from the authorization server.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *TrustAnySSLCertificate* switch specifies whether Exchange should trust certificates issued by a certification authority (CA) not trusted by the server. We don't recommend using this switch in a production environment.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-EventLogLevel

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-EventLogLevel** cmdlet to display a list of event categories and log levels for a

specified computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-Eventloglevel -Server <ServerIdParameter> <COMMON PARAMETERS>

Get-Eventloglevel [-Identity <ECIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays the event categories and log levels for the server Exchange01.

```
Get-EventLogLevel -Server "Exchange01"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange server configuration settings" entry in the Exchange and Shell infrastructure permissions topic.

Note:
You can specify either the *Server* or *Identity* parameter, but not both.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server for which you want to review event categories and log levels.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ECIdParameter	The *Identity* parameter specifies the name of the event category and log level to display.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-EventLogLevel

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-EventLogLevel** cmdlet to set the event log level registry value for the specified category.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-Eventloglevel -Identity <ECIdParameter> -Level <Lowest | Low | Medium
| High | Expert> [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the event log level to High for the MSExchangeTransport\SmtpReceive event logging category on the Exchange server Exchange01.

Note:
Run the **Get-EventLogLevel** cmdlet to retrieve a list of the event categories on your server. For more information, see Get-EventLogLevel.

```
Set-EventLogLevel -Identity "Exchange01\MSExchangeTransport
\SmtpReceive" -Level High
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ECIdParameter	The *Identity* parameter specifies the name of the event logging category for which you want to set the event logging level.
Level	Required	Microsoft.Exchange.Diagnostics.ExEventLog	The *Level* parameter specifies the log level for

		+EventLevel	the specific event logging category. The valid values are: • `Lowest` • `Low` • `Medium` • `High` • `Expert`
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-GlobalMonitoringOverride

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-21*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-GlobalMonitoringOverride** cmdlet to override the thresholds and parameters used by the probes, monitors, and responders on all Exchange 2013 servers in an Exchange Server 2013 environment. The cmdlet enables monitoring changes and threshold tuning to the environment.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-GlobalMonitoringOverride [-Duration <EnhancedTimeSpan>] <COMMON
PARAMETERS>

Add-GlobalMonitoringOverride -ApplyVersion <Version> <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <String> -ItemType <Probe | Monitor |
Responder | Maintenance> -PropertyName <String> -PropertyValue <String> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds a global monitoring override that disables the OnPremisesInboundProxy probe for 30 days for all servers running version 15.00.0847.32.

```
Add-GlobalMonitoringOverride -Identity "FrontendTransport
\OnPremisesInboundProxy" -PropertyName Enabled -
PropertyValue 0 -Duration 30.00:00:00 -ItemType Probe -
ApplyVersion "15.00.0847.32"
```

EXAMPLE 2

This example adds a global monitoring override that disables the StorageLogicalDriveSpaceEscalate responder for 21 days for all servers running version 15.00.0847.32.

```
Add-GlobalMonitoringOverride -Identity "MailboxSpace
\StorageLogicalDriveSpaceEscalate" -PropertyName Enabled -
PropertyValue 0 -Duration 21.00:00:00 -ItemType Responder -
ApplyVersion "15.00.0847.32"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ApplyVersion	Required	System.Version	The *ApplyVersion* parameter specifies the version of override. The valid input for this parameter is a number in the format 15.00.xxxx.xxx.
Identity	Required	System.String	The *Identity* parameter specifies the identity of the server to access.
ItemType	Required	Microsoft.Exchange.Data.MonitoringItemTypeEnum	The *ItemType* parameter specifies the item type that you want to designate the new property. It can be any of the following values: • `Probe` • `Monitor` • `Responder`

PropertyName	Required	System.String	The *PropertyName* parameter specifies the property you want to override.
PropertyValue	Required	System.String	The *PropertyValue* parameter specifies the new value of the property you are trying to override.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the

			local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Duration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *Duration* parameter specifies the length of time to keep the monitoring override. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, 30.10:00:00 specifies 30 days and 10 hours.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-GlobalMonitoringOverride

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-GlobalMonitoringOverride** cmdlet to retrieve the thresholds and parameters used by the probes, monitors, and responders in a Microsoft Exchange Server 2013 environment.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-GlobalMonitoringOverride [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the override settings and values for the Contoso domain.

```
Get-GlobalMonitoringOverride -DomainController Contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-GlobalMonitoringOverride

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-GlobalMonitoringOverride** cmdlet to remove a managed availability global override that has been configured for a probe, monitor, or responder.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-GlobalMonitoringOverride -Identity <String> -ItemType <Probe |
Monitor | Responder | Maintenance> -PropertyName <String> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a global monitoring override of the ActiveDirectoryConnectivityConfigDCServerReboot responder in the Exchange health set.

```
Remove-GlobalMonitoringOverride -Identity Exchange
\ActiveDirectoryConnectivityConfigDCServerReboot -ItemType
Responder -PropertyName Enabled
```

EXAMPLE 2

This example removes a global monitoring override of the ExtensionAttributes property of the OnPremisesInboundProxy probe in the FrontEndTransport health set.

```
Remove-GlobalMonitoringOverride -Identity FrontEndTransport
\OnPremisesInboundProxy -ItemType Probe -PropertyName
ExtensionAttributes
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell Infrastructure Permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	System.String	The *Identity* parameter

			specifies the monitoring item that was overridden. The value is in the form of HealthSet \MonitoringItem, or HealthSet\MonitoringItem \TargetResource.
ItemType	Required	Microsoft.Exchange.Data.MonitoringItemTypeEnum	The *ItemType* parameter specifies the item type that you want to remove. It can be any of the following values: • Probe • Monitor • Responder
PropertyName	Required	System.String	The *PropertyName* parameter specifies the property for the override you want to remove.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-HealthReport

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-HealthReport** cmdlet to return health information related to the server you specify. You can use the health values to determine the state of the server.The cmdlet also returns an alert value that provides the specific state of your server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-HealthReport -Identity <ServerIdParameter> [-GroupSize <Int32>] [-
HaImpactingOnly <SwitchParameter>] [-HealthSet <String>] [-
MinimumOnlinePercent <Int32>] [-RollupGroup <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves health information about a server running Microsoft Exchange Server 2013.

```
Get-HealthReport -RollupGroup
```

Detailed Description

The following list contains the health values that are returned:

- Online
- Partially Online
- Offline
- Sidelined
- Functional
- Unavailable

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test system health" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the identity of the server you want health information for.
GroupSize	Optional	System.Int32	The *GroupSize* parameter determines the size of the group to process against for a rollup. The default value is 12.
HaImpactingOnly	Optional	System.Management.Automation.SwitchParameter	The *HaImpactingOnly* switch specifies whether the cmdlet must roll up only the monitors that have **HaImpacting** set to `True`.
HealthSet	Optional	System.String	The *HealthSet* parameter returns the health state of a group of monitors. Monitors that are similar or are tied to a component's architecture are grouped to form a

			health set. You can determine the collection of monitors (and associated probes and responders) in a given health set by using the *Get-MonitoringItemIdentity* cmdlet.
MinimumOnlinePercent	Optional	System.Int32	The *MinimumOnlinePercent* parameter specifies the number of members in the group to be functioning with rollup information Degraded instead of Unhealthy. The default value is 70 percent.
RollupGroup	Optional	System.Management.Automation.SwitchParameter	The *RollupGroup* parameter specifies that the health data is rolled up across servers with redundancy limits.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MonitoringItemHelp

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MonitoringItemHelp** cmdlet to discover the monitoring items that you can use to return health information about your Exchange servers. Monitoring items are preconfigured to help you with your server health and monitoring.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MonitoringItemHelp -Identity <String> -Server <ServerIdParameter>
```

Examples

EXAMPLE 1

This example retrieves health set information on the server Exch01.

```
Get-MonitoringItemHelp -"HealthSet\MonitorName" -Server
Exch01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange server configuration settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	System.String	The *Identity* parameter specifies the identity of

			the monitoring item.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server running Microsoft Exchange Server 2013 to query for health set information. The default is the local Exchange 2013 server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MonitoringItemIdentity

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MonitoringItemIdentity** cmdlet to discover the monitoring items that you can use to return health information about your Exchange servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MonitoringItemIdentity -Identity <String> -Server <ServerIdParameter>
```

Examples

EXAMPLE 1

This example retrieves monitoring information about the HealthSet01 monitoring item on the ExchSrv01 server.

```
Get-MonitoringItemIdentity -Identity HealthSet01 -Server ExchSrv01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange server configuration settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	System.String	The *Identity* parameter specifies the identity of the monitoring item on a server running Microsoft Exchange Server 2013.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange 2013 server to query for health set information.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Invoke-MonitoringProbe

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-25*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Invoke-MonitoringProbe** cmdlet to run a Managed Availability probe on a selected server.

For information about the parameter sets in the Syntax section below, see Syntax.

Note:

This cmdlet cannot be used to run every Managed Availability probe. Only some probes (mainly the deep test probes) can be run manually using this cmdlet. Probes that cannot be run with this cmdlet will generate an error message when Invoke-MonitoringProbe is used to run them.

```
Invoke-MonitoringProbe -Identity <String> -Server <ServerIdParameter> [-
Account <String>] [-Endpoint <String>] [-ItemTargetExtension <String>] [-
Password <String>] [-PropertyOverride <String>] [-SecondaryAccount
<String>] [-SecondaryEndpoint <String>] [-SecondaryPassword <String>] [-
TimeOutSeconds <String>]
```

Examples

EXAMPLE 1

This example creates an Exchange ActiveSync monitoring probe on the EX1 server.

```
Invoke-MonitoringProbe -Identity ActiveSync.Protocol
\ActiveSyncSelfTestProbe -Server EX1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	System.String	The *Identity* parameter specifies the identity of the monitoring probe to run.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.
Account	Optional	System.String	The *Account* parameter specifies the identity of the mailbox or user account that will run the monitoring probe.

Endpoint	Optional	System.String	The *Endpoint* parameter specifies the name of the monitoring probe endpoint to connect to, for example, contoso.mail.com.
ItemTargetExtension	Optional	System.String	The *ItemTargetExtension* parameter specifies cmdlet extension data that you can pass to the monitoring probe. The probe that runs on the server may require specific data for its execution. This data is presented to the probe on execution in an XML format.
Password	Optional	System.String	The *Password* parameter specifies the password of the mailbox or user account that will run the monitoring probe.
PropertyOverride	Optional	System.String	The *PropertyOverride* parameter specifies a property that you want to override, for example, to set the time-out value to be extended beyond the default value.
SecondaryAccount	Optional	System.String	The *SecondaryAccount*

			parameter specifies the identity of the delegate mailbox or user account that will run the monitoring probe.
SecondaryEndpoint	Optional	System.String	The *SecondaryEndpoint* parameter specifies the name of the secondary monitoring probe endpoint to connect to, for example, contoso.mail.fabrikam.com.
SecondaryPassword	Optional	System.String	The *SecondaryPassword* parameter specifies the password of the delegate mailbox or user account that will run the monitoring probe.
TimeOutSeconds	Optional	System.String	The *TimeOutSeconds* parameter specifies the monitoring operation time-out period.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ServerComponentState

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ServerComponentState** cmdlet to retrieve configuration settings for Microsoft Exchange Server 2013 components and endpoints.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ServerComponentState -Identity <ServerIdParameter> [-Component
<String>] [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the component state for the Unified Messaging component.

```
Get-ServerComponentState -Component UnifiedMessaging
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test system health" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the requester.
Component	Optional	System.String	The *Component* parameter specifies the

			component or endpoint for which you want to retrieve the state.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ServerComponentState

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-15*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ServerComponentState** cmdlet to configure and update Microsoft Exchange Server 2013 components and endpoints on servers you specify.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ServerComponentState -Component <String> -Identity <ServerIdParameter>
-Requester <String> -State <Inactive | Active | Draining> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LocalOnly
<SwitchParameter>] [-RemoteOnly <SwitchParameter>] [-TimeoutInSeconds
<Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the Unified Messaging (UM) component state to Active, as requested by maintenance mode.

```
Set-ServerComponentState -Component UMCallRouter -Identity
MailboxServer01 -Requester Maintenance -State Active
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test system health" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Component	Required	System.String	The *Component* parameter specifies the component or endpoint for which you want to set the state.

Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the server you want to configure.
Requester	Required	System.String	The *Requester* parameter specifies the system requesting this state change. The string can be one of the following: • `HealthAPI` • `Maintenance` • `Sidelined` • `Functional` • `Deployment`
State	Required	Microsoft.Exchange.Data.ServiceState	The *State* parameter specifies the state that you want for the component. The state can be one of the following: • `Active` • `Inactive` • `Draining`
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
LocalOnly	Optional	System.Management.Automation.SwitchParameter	The *LocalOnly* parameter specifies that the cmdlet changes should be written to the Windows registry only.
RemoteOnly	Optional	System.Management.Automation.SwitchParameter	The *RemoteOnly* parameter specifies that the cmdlet changes should be written to Active Directory only.
TimeoutInSeconds	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ServerHealth

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ServerHealth** cmdlet to return health information related to the server you specify.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ServerHealth -Identity <ServerIdParameter> [-HaImpactingOnly
<SwitchParameter>] [-HealthSet <String>]
```

Examples

EXAMPLE 1

This example returns the server health for server Server01.

```
Get-ServerHealth -Identity Server01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test system health" entry in the Exchange and Shell infrastructure permissions topic.

The cmdlet returns health values that you can use to determine the state of the server. See Server health and performance for related information.

The cmdlet also returns an alert value that provides the specific state of your server. The following values may be returned:

- Degraded
- Unhealthy
- Repairing
- Disabled
- Unavailable
- UnInitialized

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the identity of the server you want health information for.
HaImpactingOnly	Optional	System.Management.Automation.SwitchParameter	The *HaImpactingOnly* switch specifies whether the cmdlet must roll up only the monitors that have **HaImpacting** set to `True`.
HealthSet	Optional	System.String	The *HealthSet* parameter returns the

			health state of a group of monitors. Monitors that are similar or are tied to a component's architecture are grouped to form a *health set*. You can determine the collection of monitors (and associated probes and responders) in a given health set by using the *Get-MonitoringItemIdentity* cmdlet.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ServerMonitor

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ServerMonitor** cmdlet to edit or set a parameter on a single monitor on an Exchange

server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ServerMonitor -Name <String> -Repairing <$true | $false> -Server
<ServerIdParameter> [-Confirm [<SwitchParameter>]] [-TargetResource
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the maintenance monitor on the Exch01 server.

```
Set-ServerMonitor -Name Maintenance -Repairing $true -
Server Exch01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the monitor identity.
Repairing	Required	System.Boolean	The *Repairing* parameter specifies whether to set or clear the repairing property on a monitor. The default value is `$true`.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You

			can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
TargetResource	Optional	System.String	The *TargetResource* parameter specifies the target resource that you want to set the monitor on.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-ServerMonitoringOverride

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-15*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-ServerMonitoringOverride** cmdlet to override the properties of managed availability probes, monitors, and responders on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-ServerMonitoringOverride [-Duration <EnhancedTimeSpan>] <COMMON
PARAMETERS>

Add-ServerMonitoringOverride -ApplyVersion <Version> <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <String> -ItemType <Probe | Monitor |
Responder | Maintenance> -PropertyName <String> -PropertyValue <String> -
Server <ServerIdParameter> [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds a maintenance server monitoring override for 20 days.

```
Add-ServerMonitoringOverride -Duration 20.00:00:00 -
Identity Server01 -ItemType Monitor -PropertyName Enabled -
PropertyValue 0
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ApplyVersion	Required	System.Version	The *ApplyVersion* parameter specifies the version of override. The valid input for this parameter is a number in the format 15.00.xxxx.xxx.
Identity	Required	System.String	The *Identity* parameter specifies HealthSet \MonitoringItemName \TargetResource. You can use *Get-ServerHealth* to find the correct object for the monitoring item you want to override.

ItemType	Required	Microsoft.Exchange.Data.MonitoringItemTypeEnum	The *ItemType* parameter specifies the server item type that you want to designate the new property. It can be any of the following values: • `Probe` • `Monitor` • `Responder`
PropertyName	Required	System.String	The *PropertyName* parameter specifies the server property you want to override.
PropertyValue	Required	System.String	The *PropertyValue* parameter specifies the new value for the server property.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.

			You can't use this parameter to configure other Edge Transport servers remotely.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Duration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *Duration* parameter specifies the length of time to keep the monitoring override. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, 30.10:00:00 specifies 30 days and 10 hours.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ServerMonitoringOverride

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ServerMonitoringOverride** cmdlet to return all overrides created on the specified server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ServerMonitoringOverride -Server <ServerIdParameter>
```

Examples

EXAMPLE 1

This example retrieves all monitoring overrides for the Exch01 server.

```
Get-ServerMonitoringOverride -Server Exch01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test system health" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ServerMonitoringOverride

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ServerMonitoringOverride** cmdlet to remove a managed availability local server override that has been configured for a probe, monitor, or responder.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ServerMonitoringOverride -Identity <String> -ItemType <Probe |
Monitor | Responder | Maintenance> -PropertyName <String> -Server
<ServerIdParameter> [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a server monitoring override of the ActiveDirectoryConnectivityConfigDCServerReboot responder in the Exchange health set from server EX1.

```
Remove-ServerMonitoringOverride -Server EX1 -Identity
Exchange\ActiveDirectoryConnectivityConfigDCServerReboot -
ItemType Responder -PropertyName Enabled
```

Example 2

This example removes a server monitoring override of the ExtensionAttributes property of the OnPremisesInboundProxy probe in the FrontEndTransport health set from server EX2.

```
Remove-ServerMonitoringOverride -Server EX2 -Identity
FrontEndTransport\OnPremisesInboundProxy -ItemType Probe -
PropertyName ExtensionAttributes
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell Infrastructure Permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	System.String	The *Identity* parameter specifies the monitoring item that was overridden. The value is in the form of HealthSet \MonitoringItem, or HealthSet\MonitoringItem \TargetResource.
ItemType	Required	Microsoft.Exchange.Data.MonitoringItemTypeEnum	The *ItemType* parameter specifies the item type of the override that you want to remove. It can be any of the following values: • Probe • Monitor • Responder
PropertyName	Required	System.String	The *PropertyName* parameter specifies the property for the override you want to remove.

Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter is used to specify the server from which the override is being removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ServiceHealth

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-ServiceHealth** cmdlet to test whether all the Microsoft Windows services that Exchange requires on a server have started. The **Test-ServiceHealth** cmdlet returns an error for any service required by a configured role when the service is set to start automatically and isn't currently running.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-ServiceHealth [-ActiveDirectoryTimeout <Int32>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-MonitoringContext <$true
| $false>] [-Server <ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example uses the **Test-ServiceHealth** command without parameters to test the services on the local server.

```
Test-ServiceHealth
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test system health" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description

ActiveDirectoryTimeout	Optional	System.Int32	The *ActiveDirectoryTimeout* parameter specifies the amount of time, in seconds, allowed for each Active Directory operation to complete before the operation times out. The default value is 15 seconds.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An

			Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.

Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server on which to check that the required services are running. If you don't specify this parameter, the command checks the services on the local server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ThrottlingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ThrottlingPolicy** cmdlet to view the user throttling settings for one or more throttling policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ThrottlingPolicy [-Identity <ThrottlingPolicyIdParameter>] [-
Diagnostics <SwitchParameter>] [-DomainController <Fqdn>] [-Explicit
<SwitchParameter>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
Organization <OrganizationIdParameter>] [-ThrottlingPolicyScope <Regular |
Organization | Global>]
```

Examples

EXAMPLE 1

This example returns the settings for all throttling policies.

```
Get-ThrottlingPolicy | Format-List
```

EXAMPLE 2

This example displays the parameters and values for throttling policy ThrottlingPolicy2.

```
Get-ThrottlingPolicy -Identity ThrottlingPolicy2 | Format-
List
```

Detailed Description

The **Get-ThrottlingPolicy** cmdlet returns the client throttling settings for one or more throttling policies. If you use the *Identity* parameter, the cmdlet returns the settings for the identified throttling policy. If you don't use the *Identity* parameter, the cmdlet returns the settings for all throttling policies.

For more information about how to control the resources consumed by individual users, see Exchange workload management.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.

Parameters

Parameter	Required	Type	Description
Diagnostics	Optional	System.Management.Automation.SwitchParameter	The *Diagnostics* switch specifies whether you want the output to include the diagnostics string. To return diagnostics information, use the syntax `Get-ThrottlingPolicy -Diagnostics`. You don't specify a value for this switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write

			data.
Explicit	Optional	System.Management.Automation.SwitchParameter	The *Explicit* switch specifies whether you only want to return the policy settings that have been directly assigned using this policy. By default, this parameter is set to `$false`.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	The *Identity* parameter identifies the name of the throttling policy that you want to return settings for.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
ThrottlingPolicyScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ThrottlingPolicyScopeType	The *ThrottlingPolicyScope* parameter specifies the scope of the throttling policy. You can use the following values: • `Global` • `Organization` • `Regular` For information about each of these policy scopes, see Exchange

			workload management.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ThrottlingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-15*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-ThrottlingPolicy** cmdlet to create a non-default user throttling policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ThrottlingPolicy -Name <String> [-AnonymousCutoffBalance <Unlimited>]
[-AnonymousMaxBurst <Unlimited>] [-AnonymousMaxConcurrency <Unlimited>] [-
AnonymousRechargeRate <Unlimited>] [-ComplianceMaxExpansionDGRecipients
<Unlimited>] [-ComplianceMaxExpansionNestedDGs <Unlimited>] [-Confirm
[<SwitchParameter>]] [-CpaCutoffBalance <Unlimited>] [-CpaMaxBurst
<Unlimited>] [-CpaMaxConcurrency <Unlimited>] [-CpaRechargeRate
<Unlimited>] [-DiscoveryMaxConcurrency <Unlimited>] [-DiscoveryMaxKeywords
<Unlimited>] [-DiscoveryMaxKeywordsPerPage <Unlimited>] [-
DiscoveryMaxMailboxes <Unlimited>] [-DiscoveryMaxPreviewSearchMailboxes
<Unlimited>] [-DiscoveryMaxRefinerResults <Unlimited>] [-
DiscoveryMaxSearchQueueDepth <Unlimited>] [-
DiscoveryMaxStatsSearchMailboxes <Unlimited>] [-
DiscoveryPreviewSearchResultsPageSize <Unlimited>] [-
DiscoverySearchTimeoutPeriod <Unlimited>] [-DomainController <Fqdn>] [-
EasCutoffBalance <Unlimited>] [-EasMaxBurst <Unlimited>] [-
EasMaxConcurrency <Unlimited>] [-EasMaxDeviceDeletesPerMonth <Unlimited>]
[-EasMaxDevices <Unlimited>] [-EasMaxInactivityForDeviceCleanup
<Unlimited>] [-EasRechargeRate <Unlimited>] [-

[-RcaRechargeRate <Unlimited>] [-RecipientRateLimit <Unlimited>] [-
ThrottlingPolicyScope <Regular | Organization | Global>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a non-default user throttling policy that can be associated with specific users. Any parameters that you omit inherit the values from the default throttling policy GlobalThrottlingPolicy_<GUID>. After you create this policy, you must associate it with specific users.

```
New-ThrottlingPolicy -Name ITUserPolicy -EwsMaxConcurrency
4 -ThrottlingPolicyScope Regular
```

EXAMPLE 2

This example creates a policy that applies to all users in your organization. Any parameters that you omit inherit the values from the default throttling policy GlobalThrottlingPolicy_<GUID>.

```
New-ThrottlingPolicy -Name AllUsersEWSPolicy -
EwsMaxConcurrency 4 -ThrottlingPolicyScope Organization
```

EXAMPLE 3

This example creates a throttling policy RemoteSiteUserPolicy that restricts the number of connections for a user to three. The users associated with this policy are only able to create three

remote Exchange Management Shell sessions. This policy also restricts to three the number of Exchange Administration Center operations or Exchange Web Services operations that can be executed at the same time.

```
New-ThrottlingPolicy -Name RemoteSiteUserPolicy -
PowerShellMaxConcurrency 3 -PowerShellMaxCmdletQueueDepth
12
```

EXAMPLE 4

This example creates a throttling policy that restricts a user to be able to only execute 10 cmdlets in a period of five seconds. If the users associated with this policy exceed this number, the cmdlet pipeline execution is stopped with a throttling error message. The user needs to wait for and then resubmit the execution of cmdlets on the open connection.

```
New-ThrottlingPolicy -Name ITStaffUserPolicyCmdletMax -
PowerShellMaxCmdlets 10 -PowerShellMaxCmdletsTimePeriod 5
```

EXAMPLE 5

This example creates a throttling policy that restricts a user to be able to only execute 10 destructive cmdlets in 60 seconds. If the users associated with this policy exceed this number, the cmdlet pipeline execution is stopped with a throttling error message. The user needs to wait for and then resubmit the execution of cmdlets on the open connection.

```
New-ThrottlingPolicy -Name
ITStaffUserPolicyDestructiveCmdlets -
PowerShellMaxDestructiveCmdlets 10 -
PowerShellMaxDestructiveCmdletsTimePeriod 60
```

Detailed Description

By default, there is one default throttling policy named GlobalThrottlingPolicy_<GUID> with a throttling scope of `Global`. Microsoft Exchange Server 2013 Setup creates a default client throttling policy when you install the Exchange 2013 Client Access server role. You should not replace, re-create, or remove the existing default throttling policy. However, you can create additional throttling policies with the scope of Organization or Regular to change your user throttling settings. You can also edit policies with the scope of Organization and Regular that you've created using the **Set-ThrottlingPolicy** cmdlet.

For more information about how to control how resources are consumed by individual users, see Exchange workload management.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the object in Active Directory. The default policy is named DefaultThrottlingPolicy<*GUID*>.
AnonymousCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousCutoffBalance* parameter specifies the resource consumption limits for an anonymous user before the user is completely blocked from performing operations on a specific component.
AnonymousMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousMaxBurst* parameter specifies the amount of time that an anonymous user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each

			component.
AnonymousMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousMaxConcurrency* parameter specifies how many anonymous connections can be made to a user's calendar data at the same time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If anonymous users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *AnonymousMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `1`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
AnonymousRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousRechargeRate*

			parameter specifies the rate at which an anonymous user's budget is charged (budget grows by) during the budget time.
ComplianceMaxExpansionDGRecipients	Optional	Microsoft.Exchange.Data.Unlimited	The *ComplianceMaxExpansionDGRecipients* parameter specifies the maximum number of recipients to expand in distribution groups when a discovery search is looking for a specified recipient.
ComplianceMaxExpansionNestedDGs	Optional	Microsoft.Exchange.Data.Unlimited	The *ComplianceMaxExpansionNestedDGs* parameter specifies the maximum number of nested distribution groups to expand when a discovery search is looking for a specified recipient.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You

			don't have to specify a value with the *Confirm* switch.
CpaCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaCutoffBalance* parameter specifies the resource consumption limits for a cross-premises user before that user is completely blocked from performing operations on a specific component.
CpaMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaMaxBurst* parameter specifies the amount of time that a cross-premises user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
CpaMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaMaxConcurrency* parameter specifies how many concurrent connections a cross-premises user can have against an Exchange server at one time. A connection is held from the moment a request is

			received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *CpaMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
CpaRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaRechargeRate* parameter specifies the rate at which a cross premises user budget is charged (budget grows by) during the budget time.
DiscoveryMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxConcurrency* parameter specifies the number of concurrent discovery search executions that a user can have at the same time.

DiscoveryMaxKeywords	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxKeywords* parameter specifies the maximum number of keywords that a user can include in a discovery search. For more information, see Search-Mailbox.
DiscoveryMaxKeywordsPerPage	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxKeywordsPerPage* parameter specifies the number of keywords for which to show statistics on a single page in the Exchange Administration Center (EAC).
DiscoveryMaxMailboxes	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxMailboxes* parameter specifies the maximum number of source mailboxes that a user can include in a discovery search.
DiscoveryMaxPreviewSearchMailboxes	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxPreviewSearchMailboxes* parameter specifies the maximum number of mailboxes that a user can include in

			eDiscovery Search Preview.
DiscoveryMaxRefinerResults	Optional	Microsoft.Exchange.Data.Unlimited	This parameter isn't used and will be removed.
DiscoveryMaxSearchQueueDepth	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxSearchQueueDepth* parameter specifies the maximum number of concurrent discovery search threads that can be active at the same time.
DiscoveryMaxStatsSearchMailboxes	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxStatsSearchMailboxes* parameter specifies the maximum number of mailboxes that a user can search in an In-Place eDiscovery search without being able to view the statistics. When the number of mailboxes configured with the *DiscoveryMaxStatsSearchMailboxes* parameter is exceeded, the user must copy the search results to a discovery mailbox to view the statistics for the discovery search. For more information, see In-

			Place eDiscovery.
DiscoveryPreviewSearchResultsPageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryPreviewSearchResultsPageSize* parameter specifies the number of messages displayed on a single page in eDiscovery Search Preview.
DiscoverySearchTimeoutPeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoverySearchTimeoutPeriod* parameter specifies the number of minutes that a discovery search will run before it times out.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD

			LDS) to read and write data.
EasCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *EasCutoffBalance* parameter specifies the resource consumption limits for a Microsoft Exchange ActiveSync user before that user is completely blocked from performing operations on a specific component.
EasMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxBurst* parameter specifies the amount of time that an Exchange ActiveSync user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
EasMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxConcurrency* parameter specifies how many concurrent connections an Exchange ActiveSync user can have against a server running Exchange 2013 at one time. A connection is held from the moment a

			request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *EasMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `10`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
EasMaxDeviceDeletesPerMonth	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxDeviceDeletesPerMonth* parameter specifies a limit to the number of Exchange ActiveSync partnerships that a user can delete per month. By default, each user can delete a maximum of 20 partnerships per calendar month. When the limit is

			reached, the partnership deletion attempt fails and an error message is displayed to the user.
EasMaxDevices	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxDevices* parameter specifies a limit to the number of Exchange ActiveSync partnerships that a user can have at one time. By default, each user can create 10 Exchange ActiveSync partnerships with their Exchange account. After users exceed the limit, they must delete one of their existing partnerships before they can create any more new partnerships. An email error message describing the limitation is sent to the user when the limit is exceeded. Additionally, an event is logged in the Application log when a user exceeds the limit.
EasMaxInactivityForDeviceCleanup	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxInactivityForDeviceCleanup* parameter specifies the length of

			time that a user's device partnerships will remain active. By default, there is no limit to the number of days that a user's device partnerships will remain active. Use this value if you want to minimize the amount of inactive device partnerships in your organization. To use this setting, specify a value in days since the user's last sync time to cause the device partnership to be removed.
EasRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *EasRechargeRate* parameter specifies the rate at which an Exchange ActiveSync user's budget is charged (budget grows by) during the budget time.
EncryptionRecipientCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionRecipientMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionRecipientMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionRecipientRe	Optional	Microsoft.Exchange.Da	This parameter is reserved

chargeRate		ta.Unlimited	for internal Microsoft use.
EncryptionSenderCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EwsCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsCutoffBalance* parameter specifies the resource consumption limits for an Exchange Web Services user before that user is completely blocked from performing operations on a specific component.
EwsMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsMaxBurst* parameter specifies the amount of time that an Exchange Web Services user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.

EwsMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsMaxConcurrency* parameter specifies how many concurrent connections an Exchange Web Services user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *EwsMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `10`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
EwsMaxSubscriptions	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsMaxSubscriptions* parameter specifies the maximum number of active push and pull

			subscriptions that an Exchange Web Services user can have on a specified Client Access server at the same time. If a user tries to create more subscriptions than the configured maximum, the subscription fails, and an event is logged in Event Viewer.
EwsRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsRechargeRate* parameter specifies the rate at which an Exchange Web Services user's budget is charged (budget grows by) during the budget time.
ExchangeMaxCmdlets	Optional	Microsoft.Exchange.Data.Unlimited	The *ExchangeMaxCmdlets* parameter specifies the number of cmdlets that can be executed within a specific time period before their execution is slowed down. The value specified by this parameter should be less than the value specified by the *PowerShellMaxCmdlets* parameter. The time period used for

			this limit is specified by the *PowerShellMaxCmdletsTimePeriod* parameter. We recommend that you set values for both parameters at the same time.
ForwardeeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *ForwardeeLimit* parameter specifies the limits for the number of recipients that can be configured in Inbox Rules when using the forward or redirect action. This parameter doesn't limit the number of messages that can be forwarded or redirected to the recipients that are configured.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ImapCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapCutoffBalance* parameter specifies the resource consumption limits for an IMAP user before that user is completely blocked from performing operations on

			a specific component.
ImapMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapMaxBurst* parameter specifies the amount of time that an IMAP user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
ImapMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapMaxConcurrency* parameter specifies how many concurrent connections an IMAP user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *ImapMaxConcurrency* parameter has a valid range from 0 through

			2147483647 inclusive. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
ImapRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapRechargeRate* parameter specifies the rate at which the IMAP user's budget is charged (budget grows by) during the budget time.
IsServiceAccount	Optional	System.Management.Automation.SwitchParameter	The *IsServiceAccount* switch specifies whether you want the user accounts associated with this policy to be moderated by the per-user thresholds specified by this policy, and also by additional throttling based on the health of system resources, such as overall CPU usage. This value is set to `$false` by default. You may want to set this value to `$true` if you intend to associate this policy with user accounts that require higher throttling limits. An

			account that might require higher throttling limits is a service account that performs a lot of non-interactive work (for example, service accounts that perform IMAP mailbox migrations or nightly Windows PowerShell tasks). By setting the *IsServiceAccount* switch to `$true`, work done by these accounts is moderated by the higher user throttling settings that you configure using the user throttling policy, but is slowed if resources start getting unhealthy.
MessageRateLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *MessageRateLimit* parameter specifies the number of messages per minute that can be submitted to transport. For messages submitted through the Mailbox server role (using Microsoft Outlook, Microsoft Office Outlook Web App, Exchange ActiveSync, or Exchange

			Web Services), this results in the deferral of messages until the quota for the user is available. Specifically, messages appear in the Outbox or Drafts folder for longer periods of time when users submit messages at a rate greater than the *MessageRateLimit* parameter. For POP or IMAP clients submitting messages directly to transport using SMTP, clients receive a transient error if they submit at a rate that exceeds the *MessageRateLimit* parameter. Exchange attempts to connect and send the messages at a later time.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OutlookServiceCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.

OutlookServiceMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxSocketConnectionsPerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxSocketConnectionsPerUser	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxSubscriptions	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OwaCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaCutoffBalance* parameter specifies the resource consumption limits for an Outlook Web App user before that user is completely blocked from performing operations on a specific component.
OwaMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaMaxBurst* parameter specifies the amount of time that an Outlook Web App user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is

			set separately for each component.
OwaMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaMaxConcurrency* parameter specifies how many concurrent connections an Outlook Web App user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *OwaMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `5`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
OwaRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaRechargeRate* parameter specifies the

			rate at which an Outlook Web App user's budget is charged (budget grows by) during the budget time.
OwaVoiceCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceCutoffBalance* parameter specifies the resource consumption limits for an Outlook Web App voice user before that user is completely blocked from performing operations on a specific component.
OwaVoiceMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceMaxBurst* parameter specifies the amount of time that an Outlook Web App voice user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
OwaVoiceMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceMaxConcurrency* parameter specifies how many concurrent connections an Outlook

			Web App voice user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *OwaVoiceMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `5`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
OwaVoiceRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceRechargeRate* parameter specifies the rate at which an Outlook Web App voice user's budget is charged (budget grows by) during the

			budget time.
PopCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *PopCutoffBalance* parameter specifies the resource consumption limits for a user before that user is completely blocked from performing operations on a specific component.
PopMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *PopMaxBurst* parameter specifies the amount of time that a user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
PopMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PopMaxConcurrency* parameter specifies how many concurrent connections a POP user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make

			more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *PopMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `20`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
PopRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *PopRechargeRate* parameter specifies the rate at which the user budget is charged (budget grows by) during the budget time.
PowerShellCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellCutoffBalance* parameter specifies the resource consumption limits for a user before that user is completely blocked from performing operations on a specific component.

PowerShellMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxBurst* parameter specifies the amount of time that a user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
PowerShellMaxCmdletQueueDepth	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxCmdletQueueDepth* parameter specifies the number of operations allowed to be executed by the user. This value directly affects the behavior of the *PowerShellMaxCmdlets* and *PowerShellMaxConcurrency* parameters. For example, the *PowerShellMaxConcurrency* parameter consumes at least two operations defined by the *PowerShellMaxCmdletQueueDepth* parameter but additional operations are also consumed per cmdlet execution. The number of

			operations depends on the cmdlets executed. We recommend that the value for the *PowerShellMaxCmdletQueueDepth* parameter be at least three times larger than the value of the *PowerShellMaxConcurrency* parameter. This parameter won't affect Exchange Administration Center operations or Exchange Web Services operations.
PowerShellMaxCmdlets	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxCmdlets* parameter specifies the number of cmdlets that can be executed within a specific time period before their execution is stopped. The value specified by this parameter should be more than the value specified by the *ExchangeMaxCmdlets* parameter. The time period used for this limit is specified by the *PowerShellMaxCmdletsTi*

			mePeriod parameter. Both values should be set at the same time.
PowerShellMaxCmdletsTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxCmdletsTimePeriod* parameter specifies the time period, in seconds, that the throttling policy uses to determine whether the number of cmdlets being executed exceeds the limits specified by the *PowerShellMaxCmdlets* and *ExchangeMaxCmdlets* parameters.
PowerShellMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxConcurrency* parameter specifies different information depending on context: • In the context of Remote PowerShell, the *PowerShellMaxConcurrency* parameter specifies the maximum number of Remote PowerShell sessions that a Remote PowerShell user can have open at the same time. • In the context of

			Exchange Web Services, the *PowerShellMaxConcurrency* parameter specifies the number of concurrent cmdlet executions that a user can have at the same time. This parameter value doesn't necessarily correlate to the number of browsers opened by the user.
PowerShellMaxDestructiveCmdlets	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxDestructiveCmdlets* parameter specifies the number of destructive cmdlets that can be executed within a specific time period before their execution is stopped. Destructive cmdlets are cmdlets that can make significant changes to user data and configuration settings in your Exchange organization. Throttling these cmdlets may help prevent accidental data loss. The following cmdlets are designated as

			destructive: • **Disable-Mailbox** • **Move-ActiveMailboxDatabase** • **Remove-AcceptedDomain** • **Remove-Mailbox** • **Remove-MailUser** • **Remove-Organization** • **Set-Mailbox** • **Set-MailUser** • **Update-MailboxDatabaseCopy** The time period used for this limit is specified by the *PowerShellMaxDestructiveCmdletsTimePeriod* parameter. Both values should be set at the same time. This feature isn't on by default. For more information, see the "Examples" section.
PowerShellMaxDestructiveCmdletsTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxDestructiveCmdletsTimePeriod* parameter specifies the time period, in seconds, that the throttling policy

			uses to determine how many destructive cmdlets can be run. You set a value for this parameter when you set the *PowerShellMaxDestructiveCmdlets* parameter. Both values should be set at the same time. For more information, see the description for the *PowerShellMaxDestructiveCmdlets* parameter.
PowerShellMaxOperations	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxOperations* parameter specifies the protocol-level operations that are used to send and receive data. If the execution of a cmdlet results in a significant number of operations (for example, if there is a lot of input/output occurring), throttling may occur. The default setting is `Unlimited`.
PowerShellMaxRunspaces	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxRunspaces* parameter specifies the number of concurrent Windows PowerShell

			sessions that a user is allowed to have. The default setting is `Unlimited`.
PowerShellMaxRunspacesTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxRunspacesTimePeriod* parameter specifies the time period, in seconds, that the throttling policy uses to determine how many Windows PowerShell sessions can be run. You set this value when you set the *PowerShellMaxRunspaces* parameter.
PowerShellMaxTenantConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxTenantConcurrency* parameter limits the number of concurrent Windows PowerShell connections per tenant organization. By default, the limit for concurrent Windows PowerShell connections per tenant organization is set to `9`. If users in a tenant organization try to make more concurrent requests than the limit set by the

			PowerShellMaxTenantConcurrency parameter, the new connection attempt fails. However, the existing connections remain valid. This limit is enforced even if a single user hasn't exceeded the per-user limit set by the *PowerShellMaxConcurrency* parameter. The *PowerShellMaxTenantConcurrency* parameter has a valid range from 0 through 100 inclusive. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`. **Note:** This property can only be set for the default throttling policy.
PowerShellMaxTenantRunspaces	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxTenantRunspaces* parameter specifies the number of concurrent Windows PowerShell sessions that a tenant is allowed to have.
PowerShellRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellRechargeRate*

			parameter specifies the rate at which the user budget is charged (budget grows by) during the budget time.
PswsMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PswsMaxConcurrency* parameter specifies how many concurrent connections a Windows PowerShell Web Services user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *PswsMaxConcurrency* parameter has a default value of `18`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.

PswsMaxRequest	Optional	Microsoft.Exchange.Data.Unlimited	The *PswsMaxRequest* parameter specifies how many requests a Windows PowerShell Web Services user can have against an Exchange server at one time. The default setting is `Unlimited`.
PswsMaxRequestTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PswsMaxRequestTimePeriod* parameter specifies the period of time, in seconds, that the throttling policy uses to determine how many requests can be run. The default setting is `Unlimited`.
PushNotificationCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationMaxBurstPerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationRechargeRatePerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.

PushNotificationSamplingPeriodPerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
RcaCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaCutoffBalance* parameter specifies the resource consumption limits for a user before that user is completely blocked from performing operations on a specific component.
RcaMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaMaxBurst* parameter specifies the amount of time that a user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
RcaMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaMaxConcurrency* parameter specifies how many concurrent connections an RPC Client Access user can have against a server running Exchange 2013 at one time. A connection is held from the moment a request is received until the connection is closed

			or the connection is otherwise disconnected (for example, if the user goes offline). If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *RcaMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is `20`. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
RcaRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaRechargeRate* parameter specifies the rate at which the user budget is charged (budget grows by) during the budget time.
RecipientRateLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *RecipientRateLimit* parameter specifies the limits on the number of recipients that a user can address in a 24-hour period.

ThrottlingPolicyScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ThrottlingPolicyScopeType	The *ThrottlingPolicyScope* parameter specifies the scope of the throttling policy. You can use the following values. • `Regular` Specifies a custom policy that applies to specific users. • `Organization` Specifies a custom policy that applies to all users in your organization. • `Global` Reserved for the default throttling policy. For more information about throttling policy scopes, see Exchange workload management.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ThrottlingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ThrottlingPolicy** cmdlet to remove a non-default Microsoft Exchange throttling policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ThrottlingPolicy -Identity <ThrottlingPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the user throttling policy ClientThrottlingPolicy2.

```
Remove-ThrottlingPolicy -Identity ClientThrottlingPolicy2
```

EXAMPLE 2

You can't remove a policy that's associated with any users. This example reassigns the users subject to ClientThrottlingPolicy2 to the default policy. Then, it removes ClientThrottlingPolicy2.

```
$policy = Get-ThrottlingPolicy ClientThrottlingPolicy2;
$mailboxes = Get-Mailbox | where-object
{$_.ThrottlingPolicy -eq $policy.Identity};
$defaultPolicy = Get-ThrottlingPolicy | where-object
{$_.IsDefault -eq $true};
```

```
foreach ($mailbox in $mailboxes)
{
  set-mailbox -Identity $mailbox.Identity -ThrottlingPolicy
$defaultPolicy;
}
Remove-ThrottlingPolicy ClientThrottlingPolicy2;
```

Detailed Description

You can't remove the default client throttling policy. Also, you can't remove a policy associated with any users. For more information, see EXAMPLE 2.

For more information about how to control the resources consumed by individual users, see Exchange workload management.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	The *Identity* parameter identifies the throttling policy you want to remove. Use the name that matches the name of the policy in Active Directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't

			provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ThrottlingPolicy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-01*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ThrottlingPolicy** cmdlet to modify the settings for a user throttling policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```

```

Examples

EXAMPLE 1

This example modifies a throttling policy so that users associated with this policy can have a maximum of four concurrent requests running in Exchange Web Services.

```
$a = Get-ThrottlingPolicy RemoteSiteUserPolicy
$a | Set-ThrottlingPolicy -EwsMaxConcurrency 4
```

EXAMPLE 2

This example modifies a throttling policy so that it restricts the number of connections for a user to three. The users associated with this policy are only able to create three Exchange Management Shell sessions. This policy also restricts to three the number of Exchange Administration Center operations or Exchange Web Services operations that can be executed at the same time. In addition, the *PowerShellMaxCmdletQueueDepth* parameter specifies that 12 operations maximum are allowed to be executed by the user.

```
Set-ThrottlingPolicy RemoteSiteUserPolicy -
PowerShellMaxConcurrency 3 -PowerShellMaxCmdletQueueDepth
12
```

EXAMPLE 3

This example modifies a throttling policy so that it restricts a user to be able to execute only 10 destructive cmdlets in 60 seconds. If the users associated with this policy exceed this number, the cmdlet pipeline execution is stopped with a throttling error message. The user needs to wait for, and then resubmit the execution of cmdlets on the open connection.

```
Set-ThrottlingPolicy <ThrottlingPolicyName> -
PowerShellMaxDestructiveCmdlets 10 -
PowerShellMaxDestructiveCmdletsTimePeriod 60
```

Detailed Description

Throttling policy settings are stored in Active Directory.

By default, there is one default user throttling policy named GlobalThrottlingPolicy with a throttling scope of Global. Microsoft Setup creates this policy when you install the Client Access server role. You shouldn't replace, re-create, or remove the existing default throttling policy. However, you can

edit any additional throttling policies with the scope of Organization or Regular if you want to change your user throttling settings. You can create polices with the scope of Organization or Regular using the **New-ThrottlingPolicy** cmdlet.

For more information about how to control the resources consumed by individual users, see Exchange workload management.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	The *Identity* parameter uniquely identifies the throttling policy that you want to modify values for. The name you use is the name of the throttling policy object in Active Directory.
AnonymousCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousCutoffBalance* parameter specifies the resource consumption limits for an anonymous user before the user is completely blocked from performing operations on a specific component.
AnonymousMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousMaxBurst* parameter specifies the amount of time that an anonymous user can

			consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
AnonymousMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousMaxConcurrency* parameter specifies how many anonymous connections can be made to a user's calendar data at the same time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If anonymous users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *AnonymousMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 1. To indicate that the number

			of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
AnonymousRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *AnonymousRechargeRate* parameter specifies the rate at which an anonymous user's budget is charged (budget grows by) during the budget time.
ComplianceMaxExpansionDGRecipients	Optional	Microsoft.Exchange.Data.Unlimited	The *ComplianceMaxExpansionDGRecipients* parameter specifies the maximum number of recipients to expand in distribution groups when a discovery search is looking for a specified recipient.
ComplianceMaxExpansionNestedDGs	Optional	Microsoft.Exchange.Data.Unlimited	The *ComplianceMaxExpansionNestedDGs* parameter specifies the maximum number of nested distribution groups to expand when a discovery search is looking for a specified recipient.
Confirm	Optional	System.Management.	The *Confirm* switch

		Automation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CpaCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaCutoffBalance* parameter specifies the resource consumption limits for a cross-premises user before that user is completely blocked from performing operations on a specific component.
CpaMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaMaxBurst* parameter specifies the amount of time that a cross-premises user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
CpaMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaMaxConcurrency* parameter specifies how many concurrent

			connections a cross-premises user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *CpaMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
CpaRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *CpaRechargeRate* parameter specifies the rate at which a cross-premises user budget is charged (budget grows by) during the budget time.
DiscoveryMaxConcurr	Optional	Microsoft.Exchange.Da	The

ency		ta.Unlimited	*DiscoveryMaxConcurrency* parameter specifies the number of concurrent discovery search cmdlet executions that a user can have at the same time.
DiscoveryMaxKeywords	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxKeywords* parameter specifies the maximum number of keywords that a user can include in a discovery search. For more information, see Search-Mailbox.
DiscoveryMaxKeywordsPerPage	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxKeywordsPerPage* parameter specifies the number of keywords for which to show statistics on a single page in the Exchange Administration Center (EAC).
DiscoveryMaxMailboxes	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxMailboxes* parameter specifies the maximum number of source mailboxes that a user can include in a discovery search.

DiscoveryMaxPreviewSearchMailboxes	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxPreviewSearchMailboxes* parameter specifies the maximum number of mailboxes that a user can include in eDiscovery Search Preview.
DiscoveryMaxRefinerResults	Optional	Microsoft.Exchange.Data.Unlimited	This parameter isn't used and will be removed.
DiscoveryMaxSearchQueueDepth	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxSearchQueueDepth* parameter specifies the maximum number of concurrent discovery search threads that can be active at the same time.
DiscoveryMaxStatsSearchMailboxes	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryMaxStatsSearchMailboxes* parameter specifies the maximum number of mailboxes that a user can search in an In-Place eDiscovery search and still be able to view the keyword statistics. When the number of mailboxes configured with the *DiscoveryMaxStatsSearch*

			Mailboxes parameter is exceeded, these keyword statistics won't be available. In this case, a user must copy the search results to a discovery mailbox to view the keyword statistics for the discovery search. For more information, see In-Place eDiscovery.
DiscoveryPreviewSearchResultsPageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoveryPreviewSearchResultsPageSize* parameter specifies the number of messages displayed on a single page in eDiscovery Search Preview.
DiscoverySearchTimeoutPeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *DiscoverySearchTimeoutPeriod* parameter specifies the number of minutes that a discovery search will run before it times out.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
EasCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *EasCutoffBalance* parameter specifies the resource consumption limits for a Microsoft Exchange ActiveSync user before that user is completely blocked from performing operations on a specific component.
EasMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxBurst* parameter specifies the amount of time that an Exchange ActiveSync user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.

EasMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxConcurrency* parameter indicates how many concurrent connections an Exchange ActiveSync user can have against a server running Microsoft Exchange Server 2013 at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *EasMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 10. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
EasMaxDeviceDeletesPerMonth	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxDeviceDeletesPerMonth* parameter

			specifies a limit to the number of Exchange ActiveSync partnerships that a user can delete per month. By default, each user can delete a maximum of 20 partnerships per calendar month. When the limit is reached, the partnership deletion attempt fails and an error message is displayed to the user.
EasMaxDevices	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxDevices* parameter specifies a limit to the number of Exchange ActiveSync partnerships that a user can have at one time. By default, each user can create 10 Exchange ActiveSync partnerships with their Exchange account. After users exceed the limit, they must delete one of their existing partnerships before they can create any more new partnerships. An email error message describing the limitation is sent to the user when the

			limit is exceeded. Additionally, an event is logged in the Application log when a user exceeds the limit.
EasMaxInactivityForDeviceCleanup	Optional	Microsoft.Exchange.Data.Unlimited	The *EasMaxInactivityForDeviceCleanup* parameter specifies the length of time that a user's device partnerships will remain active. By default, there is no limit to the number of days that a user's device partnerships will remain active. Use this value if you want to minimize the amount of inactive device partnerships in your organization. To use this setting, specify a value in days since the user's last sync time to cause the device partnership to be removed.
EasRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *EasRechargeRate* parameter specifies the rate at which an Exchange ActiveSync user's budget is charged (budget grows by) during the budget time.

EncryptionRecipientCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionRecipientMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionRecipientMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionRecipientRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EncryptionSenderRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
EwsCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsCutoffBalance* parameter specifies the resource consumption limits for an Exchange Web Services user before that user is completely blocked from performing operations on a specific component.
EwsMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsMaxBurst* parameter specifies the amount of time that an

			Exchange Web Services user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
EwsMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsMaxConcurrency* parameter specifies how many concurrent connections an Exchange Web Services user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *EwsMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 10. To indicate that the number

			of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
EwsMaxSubscriptions	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsMaxSubscriptions* parameter specifies the maximum number of active push and pull subscriptions that an Exchange Web Services user can have on a specific Client Access server at the same time. If a user tries to create more subscriptions than the configured maximum, the subscription fails, and an event is logged in Event Viewer.
EwsRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *EwsRechargeRate* parameter specifies the rate at which an Exchange Web Services user's budget is charged (budget grows by) during the budget time.
ExchangeMaxCmdlets	Optional	Microsoft.Exchange.Data.Unlimited	The *ExchangeMaxCmdlets* parameter specifies the number of cmdlets that can be executed within a specific time period before their execution is

			slowed down. The value specified by this parameter should be less than the value specified by the *PowerShellMaxCmdlets* parameter. The time period used for this limit is specified by the *PowerShellMaxCmdletsTimePeriod* parameter. We recommend that you set values for both parameters at the same time.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
ForceSettingGlobal	Optional	System.Management.	This parameter is reserved

		Automation.SwitchParameter	for internal Microsoft use.
ForwardeeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *ForwardeeLimit* parameter specifies the limits for the number of recipients that can be configured in Inbox Rules when using the forward or redirect action. This parameter doesn't limit the number of messages that can be forwarded or redirected to the recipients that are configured.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ImapCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapCutoffBalance* parameter specifies the resource consumption limits for an IMAP user before that user is completely blocked from performing operations on a specific component.
ImapMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapMaxBurst* parameter specifies the amount of time that an IMAP user can consume an elevated amount of

			resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
ImapMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapMaxConcurrency* parameter specifies how many concurrent connections an IMAP user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *ImapMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.

ImapRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *ImapRechargeRate* parameter specifies the rate at which the IMAP user's budget is charged (budget grows by) during the budget time.
IsServiceAccount	Optional	System.Management.Automation.SwitchParameter	The *IsServiceAccount* switch specifies whether you want the user accounts associated with this policy to be moderated by the per-user thresholds specified by this policy, and also by additional throttling based on the health of system resources, such as overall CPU usage. This value is set to `$false` by default. You may want to set this value to `$true` if you intend to associate this policy with user accounts that require higher throttling limits. An account that might require higher throttling limits is a service account that performs a lot of non-interactive work (for example, service accounts

			that perform IMAP mailbox migrations or nightly Windows PowerShell tasks) By setting the *IsServiceAccount* switch to `$true`, work done by these accounts is moderated by the higher user throttling settings that you configure using the user throttling policy, but is slowed if resources start getting unhealthy.
MessageRateLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *MessageRateLimit* parameter specifies the number of messages per minute that can be submitted to transport. For messages submitted through the Mailbox server role (using Microsoft Outlook, Microsoft Office Outlook Web App, Exchange ActiveSync, or Exchange Web Services), this results in the deferral of messages until the quota for the user is available. Specifically, messages appear in the Outbox or

			Drafts folder for longer periods of time when users submit messages at a rate greater than the *MessageRateLimit* parameter. For POP or IMAP clients submitting messages directly to transport using SMTP, clients receive a transient error if they submit at a rate that exceeds the *MessageRateLimit* parameter. Exchange attempts to connect and send the messages at a later time.
Name	Optional	System.String	The *Name* parameter specifies the name of the object in Active Directory. The default policy is named DefaultThrottlingPolicy<*GUID*>.
OutlookServiceCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.

OutlookServiceMaxSocketConnectionsPerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxSocketConnectionsPerUser	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceMaxSubscriptions	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OutlookServiceRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
OwaCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaCutoffBalance* parameter specifies the resource consumption limits for an Outlook Web App user before that user is completely blocked from performing operations on a specific component.
OwaMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaMaxBurst* parameter specifies the amount of time that an Outlook Web App user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.

OwaMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaMaxConcurrency* parameter specifies how many concurrent connections an Outlook Web App user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *OwaMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 5. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
OwaRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaRechargeRate* parameter specifies the rate at which an Outlook Web App user's budget is

			charged (budget grows by) during the budget time.
OwaVoiceCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceCutoffBalance* parameter specifies the resource consumption limits for an Outlook Web App voice user before that user is completely blocked from performing operations on a specific component.
OwaVoiceMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceMaxBurst* parameter specifies the amount of time that an Outlook Web App voice user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
OwaVoiceMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceMaxConcurrency* parameter specifies how many concurrent connections an Outlook Web App voice user can have against an Exchange

			server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *OwaVoiceMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 5. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
OwaVoiceRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *OwaVoiceRechargeRate* parameter specifies the rate at which an Outlook Web App voice user's budget is charged (budget grows by) during the budget time.
PopCutoffBalance	Optional	Microsoft.Exchange.Da	The *PopCutoffBalance*

		ta.Unlimited	parameter specifies the resource consumption limits for a user before that user is completely blocked from performing operations on a specific component.
PopMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *PopMaxBurst* parameter specifies the amount of time that a user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
PopMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PopMaxConcurrency* parameter specifies how many concurrent connections a POP user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection

			attempt fails. However, the existing connections remain valid. The *PopMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 20. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
PopRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *PopRechargeRate* parameter specifies the rate at which the user budget is charged (budget grows by) during the budget time.
PowerShellCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellCutoffBalance* parameter specifies the resource consumption limits for a user before that user is completely blocked from performing operations on a specific component.
PowerShellMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxBurst* parameter specifies the amount of time that a

			user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
PowerShellMaxCmdletQueueDepth	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxCmdletQueueDepth* parameter specifies the number of operations allowed to be executed by the user. This value directly affects the behavior of the *PowerShellMaxCmdlets* and *PowerShellMaxConcurrency* parameters. For example, the *PowerShellMaxConcurrency* parameter consumes at least two operations defined by the *PowerShellMaxCmdletQueueDepth* parameter but additional operations are also consumed by per cmdlet execution. The number of operations depends on the cmdlets that are executed. We

			recommend that the value for the *PowerShellMaxCmdletQueueDepth* parameter be at least three times larger than the value of the *PowerShellMaxConcurrency* parameter. This parameter won't affect Exchange Administration Center operations or Exchange Web Services operations.
PowerShellMaxCmdlets	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxCmdlets* parameter specifies the number of cmdlets that can be executed within a specific time period before their execution is stopped. The value specified by this parameter should be more than the value specified by the *ExchangeMaxCmdlets* parameter. The time period used for this limit is specified by the *PowerShellMaxCmdletsTimePeriod* parameter. Both values should be set at the

			same time.
PowerShellMaxCmdletsTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxCmdletsTimePeriod* parameter specifies the time period, in seconds, that the throttling policy uses to determine whether the number of cmdlets being executed exceeds the limits specified by the *PowerShellMaxCmdlets* and *ExchangeMaxCmdlets* parameters.
PowerShellMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxConcurrency* parameter specifies different information depending on context: • In the context of Remote PowerShell, the *PowerShellMaxConcurrency* parameter specifies the maximum number of Remote PowerShell sessions that a Remote PowerShell user can have open at the same time. • In the context of Exchange Web Services, the

			PowerShellMaxConcurrency parameter specifies the number of concurrent cmdlet executions that a user can have at the same time. This parameter value doesn't necessarily correlate to the number of browsers opened by the user.
PowerShellMaxDestructiveCmdlets	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxDestructiveCmdlets* parameter specifies the number of destructive cmdlets that can be executed within a specific time period before their execution is stopped. Destructive cmdlets are cmdlets that can make significant changes to user data and configuration settings in your Exchange organization. Throttling these cmdlets may help prevent accidental data loss. The following cmdlets are designated as destructive: • **Disable-Mailbox**

			• **Move-ActiveMailboxDatabase** • **Remove-AcceptedDomain** • **Remove-Mailbox** • **Remove-MailUser** • **Remove-Organization** • **Remove-SecondaryDomain** • **Remove-SyncMailbox** • **Remove-SyncMailUser** • **Set-Mailbox** • **Set-MailUser** • **Set-SyncMailbox** • **Set-SyncMailUser** • **Start-OrganizationUpgrade** • **Update-MailboxDatabaseCopy** The time period used for this limit is specified by the *PowerShellMaxDestructiveCmdletsTimePeriod* parameter. Both values should be set at the same time. This feature isn't enabled by default. For more information, see the example in this topic.

PowerShellMaxDestructiveCmdletsTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxDestructiveCmdletsTimePeriod* parameter specifies the time period, in seconds, that the throttling policy uses to determine how many destructive cmdlets can be run. You set a value for this parameter when set the *PowerShellMaxDestructiveCmdlets* parameter. Both values should be set at the same time. For more information, see the description for the *PowerShellMaxDestructiveCmdlets* parameter.
PowerShellMaxOperations	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxOperations* parameter specifies the protocol-level operations used to send and receive data. If the execution of a cmdlet results in a significant number of operations (for example, if there is a lot of input/output occurring), throttling may occur. The default setting is

			Unlimited.
PowerShellMaxRunspaces	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxRunspaces* parameter specifies the number of concurrent Windows PowerShell sessions that a user is allowed to have. The default setting is Unlimited.
PowerShellMaxRunspacesTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxRunspacesTimePeriod* parameter specifies the time period, in seconds, that the throttling policy uses to determine how many Windows PowerShell sessions can be run. You set this value when you set the *PowerShellMaxRunspaces* parameter.
PowerShellMaxTenantConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxTenantConcurrency* parameter limits the number of concurrent Windows PowerShell connections per tenant organization. By default, the limit for concurrent Windows PowerShell

			connections per tenant organization is set to 9. If users in a tenant organization try to make more concurrent requests than the limit set by the *PowerShellMaxTenantConcurrency* parameter, the new connection attempt fails. However, the existing connections remain valid. This limit is enforced even if a single user hasn't exceeded the per-user limit set by the *PowerShellMaxConcurrency* parameter. The *PowerShellMaxTenantConcurrency* parameter has a valid range from 0 through 100 inclusive. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`. **Note:** This property can only be set for the default throttling policy.
PowerShellMaxTenantRunspaces	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellMaxTenantRunspaces* parameter

			specifies the number of concurrent Windows PowerShell sessions that a tenant is allowed to have.
PowerShellRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *PowerShellRechargeRate* parameter specifies the rate at which the user budget is charged (budget grows by) during the budget time.
PswsMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *PswsMaxConcurrency* parameter specifies how many concurrent connections a Windows PowerShell Web Services user can have against an Exchange server at one time. A connection is held from the moment a request is received until a response is sent in its entirety to the requestor. If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. This parameter has a default value of 18. To

			indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
PswsMaxRequest	Optional	Microsoft.Exchange.Data.Unlimited	The *PswsMaxRequest* parameter specifies how many requests a Windows PowerShell Web Services user can have against an Exchange server at one time. The default setting is Unlimited.
PswsMaxRequestTimePeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *PswsMaxRequestTimePeriod* parameter specifies the period of time, in seconds, that the throttling policy uses to determine how many requests can be run. You set this value when you set the *PswsMaxRequest* parameter. The default setting is Unlimited.
PushNotificationCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationMaxB	Optional	Microsoft.Exchange.Da	This parameter is reserved

urstPerDevice		ta.Unlimited	for internal Microsoft use.
PushNotificationMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationRechargeRatePerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
PushNotificationSamplingPeriodPerDevice	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
RcaCutoffBalance	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaCutoffBalance* parameter specifies the resource consumption limits for a user before that user is completely blocked from performing operations on a specific component.
RcaMaxBurst	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaMaxBurst* parameter specifies the amount of time that a user can consume an elevated amount of resources before being throttled. This is measured in milliseconds. This value is set separately for each component.
RcaMaxConcurrency	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaMaxConcurrency* parameter specifies how

			many concurrent connections an RPC Client Access user can have against a server running Exchange 2013 at one time. A connection is held from the moment a request is received until the connection is closed or the connection is otherwise disconnected (for example, if the user goes offline). If users attempt to make more concurrent requests than their policy allows, the new connection attempt fails. However, the existing connections remain valid. The *RcaMaxConcurrency* parameter has a valid range from 0 through 2147483647 inclusive. The default value is 20. To indicate that the number of concurrent connections should be unthrottled (no limit), this value should be set to `$null`.
RcaRechargeRate	Optional	Microsoft.Exchange.Data.Unlimited	The *RcaRechargeRate* parameter specifies the rate at which the user

			budget is charged (budget grows by) during the budget time.
RecipientRateLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *RecipientRateLimit* parameter specifies the limits on the number of recipients that a user can address in a 24-hour period.
ThrottlingPolicyScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ThrottlingPolicyScopeType	The *ThrottlingPolicyScope* parameter specifies the scope of the throttling policy. You can use the following values: • `Regular` This scope specifies a custom policy that applies to specific users. • `Organization` This scope specifies a custom policy that applies to all users in your organization. • `Global` This scope is reserved for the default throttling policy. For more information about throttling policy scopes, see Exchange workload management.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ThrottlingPolicyAssociation

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ThrottlingPolicyAssociation** cmdlet to view the relationship between objects and their associated throttling policies. The object can be a user with a mailbox, a user without a mailbox, a contact, or a computer account.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ThrottlingPolicyAssociation [-Identity
<ThrottlingPolicyAssociationIdParameter>] <COMMON PARAMETERS>

Get-ThrottlingPolicyAssociation [-Anr <String>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Credential <PSCredential>] [-DomainController <Fqdn>]
```

```
[-Filter <String>] [-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-SortBy <String>] [-
ThrottlingPolicy <ThrottlingPolicyIdParameter>]
```

Examples

EXAMPLE 1

This example returns a list of all the mailboxes in your organization in the Users OU.

```
Get-ThrottlingPolicyAssociation -OrganizationalUnit Users
```

EXAMPLE 2

This example returns all the mailboxes that resolve from the ambiguous name resolution search on the string "Chr" that are in the domain DC01. This example returns mailboxes for users such as Chris Ashton, Christian Hess, and Christa Geller.

```
Get-ThrottlingPolicyAssociation -Anr Chr -DomainController
DC01
```

Detailed Description

For more information about how to control the resources consumed by individual users, see Exchange workload management.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.

Parameters

Parameter	Required	Type	Description
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an

			attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the

			local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyAssociationIdParameter	The *Identity* parameter specifies the object to query to see its throttling policy associations. The object can be a user with a mailbox, a user without a mailbox, a contact, or a computer account. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example:

			CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default

			scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the distinguished name (DN) for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter specifies the organization that the object specified by the *Identity* parameter is in.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParam	The *OrganizationalUnit* parameter specifies an organizational unit (OU)

		eter	and is used to limit the results. If you use this parameter, you only get mailboxes in the container that you specify. You can use either the OU or the domain name. If you use the OU, you must specify the canonical name of the OU.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest and don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.

ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all mailboxes that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. You can sort by the following attributes: • Alias • Display name • Name The results are sorted in ascending order.
ThrottlingPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	The *ThrottlingPolicy* parameter specifies the identity of the throttling policy for which you want to view throttling policy associations.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ThrottlingPolicyAssociation

Exchange Management Shell > Exchange 2013 cmdlets > Server health, monitoring, and performance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ThrottlingPolicyAssociation** cmdlet to associate a throttling policy with a specific object. The object can be a user with a mailbox, a user without a mailbox, a contact, or a computer account.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ThrottlingPolicyAssociation -Identity
<ThrottlingPolicyAssociationIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-IgnoreDefaultScope <SwitchParameter>] [-
ThrottlingPolicy <ThrottlingPolicyIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example associates a user with a user name of tonysmith to the throttling policy ITStaffPolicy that has higher limits.

```
Set-ThrottlingPolicyAssociation -Identity tonysmith -
ThrottlingPolicy ITStaffPolicy
```

You don't need to use the **Set-ThrottlingPolicyAssociation** cmdlet to associate a user with a policy. The following commands show another way to associate tonysmith to the throttling policy ITStaffPolicy.

```
$b = Get-ThrottlingPolicy ITStaffPolicy

Set-Mailbox -Identity tonysmith -ThrottlingPolicy $b
```

Detailed Description

The **Set-ThrottlingPolicyAssociation** cmdlet defines quota limits for specific objects. For example, if you notice that a user or other object is using excessive bandwidth, you can associate that object with a throttling policy that's more restrictive.

Note:
In data center deployments, the object referred to by the *Identity* and *ThrottlingPolicy* parameters must be in the same tenant.

For more information about how to control the resources consumed by individual users, see Exchange workload management.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyAssociationIdParameter	The *Identity* parameter specifies the object to which you want to associate a throttling policy. The object can be a user with a mailbox, a user without a mailbox, a contact, or a computer account.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You

			don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't

			currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • If you use the *Identity* parameter, you must use enter the value in the distinguished name (DN) format.
ThrottlingPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	The *ThrottlingPolicy* parameter specifies the throttling policy that you want to be associated with the object specified by the *Identity* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-AvailabilityAddressSpace

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Add-AvailabilityAddressSpace** cmdlet to define the access method and associated credentials used to exchange free/busy data across forests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-AvailabilityAddressSpace -AccessMethod <PerUserFB | OrgWideFB |
PublicFolder | InternalProxy | OrgWideFBBasic> -ForestName <String> [-
Confirm [<SwitchParameter>]] [-Credentials <PSCredential>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
ProxyUrl <Uri>] [-TargetAutodiscoverEpr <Uri>] [-UseServiceAccount <$true
| $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example is useful with an untrusted cross-forest Availability service, or if detailed cross-forest free/busy service isn't desired. When you're prompted by the command, type a user name and password. For an untrusted cross-forest configuration, make sure that the user doesn't have a mailbox.

```
Add-AvailabilityAddressSpace -ForestName
<example.contoso.com> -AccessMethod OrgWideFB -Credentials
<ExampleCredential>
```

EXAMPLE 2

This example is useful with a trusted cross-forest Availability service. The contoso.com forest trusts the current forest, and the specified account connects to the contoso.com forest. The specified account must be an existing account in the contoso.com forest.

```
Add-AvailabilityAddressSpace -ForestName
<example.contoso.com> -AccessMethod PerUserFB -Credentials
<ExampleCredential>
```

EXAMPLE 3

This example is useful with a trusted cross-forest Availability service. The contoso.com forest trusts the current forest and uses the service account (typically the local system account or the computer account) to connect to the contoso.com forest. Because the service is trusted, there is no issue with authorization when the current forest tries to retrieve free/busy information from contoso.com.

```
Add-AvailabilityAddressSpace -ForestName
<example.contoso.com> -AccessMethod PerUserFB -
UseServiceAccount $true
```

EXAMPLE 4

This example is useful for interoperability between Exchange 2013 and versions of Exchange earlier than Exchange 2007, for example Exchange 2003.

```
Add-AvailabilityAddressSpace -ForestName
<example.contoso.com> -AccessMethod PublicFolder
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Availability service address space settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AccessMethod	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.AvailabilityAccessMethod	The *AccessMethod* parameter specifies the availability access method and can have the following values: • `PerUserFB` This value causes the command to

			access the free/busy data in the defined per-user free/busy proxy account or group, or in the All Exchange Servers group. The `PerUserFB` value requires trust between the two forests. You must use either the *UseServiceAccount* parameter or *Credentials* parameter. • `OrgWideFB` This value causes the command to access the free/busy data in the per-user free/busy proxy account or group in the target forest. You must use either the *UseServiceAccount* parameter or *Credentials* parameter. • `OrgWideFBBasic` This value is reserved for internal Microsoft use. • `InternalProxy` This value is used to proxy a request to the Client Access server in the site with the latest version of Exchange. • `PublicFolder` This value causes the command to access free/busy data on servers running Microsoft Exchange Server 2003. The Exchange Inter-Organization Replication tool must be running between the two forests.

ForestName	Required	System.String	The *ForestName* parameter specifies the SMTP domain name of the target forest for users whose free/busy data must be retrieved. If your users are distributed among multiple SMTP domains in the target forest, run the **Add-AvailabilityAddressSpace** command once for each SMTP domain.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Credentials	Optional	System.Management.Automation.PSCredential	The *Credentials* parameter specifies the credentials for an account that has permission to access the Availability services in the target forest. This parameter requires the creation and passing of a credential object. This

			credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ProxyUrl	Optional	System.Uri	This parameter is available only in on-premises Exchange 2013. The *ProxyUrl* parameter specifies whether to direct a Microsoft Exchange Server 2007 Client Access server to proxy its free/busy requests through an Exchange Server 2013 Client Access server when requesting federated free/

			busy data for a user in another organization. Before you can configure this setting, you must create the proper trust relationships and sharing relationships. For more information, see New-FederationTrust.
TargetAutodiscoverEpr	Optional	System.Uri	The *TargetAutodiscoverEpr* parameter specifies the Autodiscover URL of Exchange Web Services for the external organization, for example, https://contoso.com/autodiscover/autodiscover.svc/wssecurity. Exchange uses Autodiscover to automatically detect the correct server endpoint for external requests.
UseServiceAccount	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *UseServiceAccount* parameter, when assigned a value of `$true`, uses the local Availability service

			account for authorization.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AvailabilityAddressSpace

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AvailabilityAddressSpace** cmdlet to return details about how your Exchange organization is configured in regard to the exchange of free/busy information.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AvailabilityAddressSpace [-Identity
<AvailabilityAddressSpaceIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns details about how your Exchange organization is configured in regard to the exchange of free/busy information across your organization.

```
Get-AvailabilityAddressSpace
```

EXAMPLE 2

This example returns details about how your Exchange organization is configured in regard to the exchange of free/busy information for the specific domain in the organization Contoso.com.

```
Get-AvailabilityAddressSpace -Identity Contoso.com
```

EXAMPLE 3

This example returns details about how your Exchange organization is configured in regard to the exchange of free/busy information for a specific domain in your organization. This example uses the FQDN of the domain controller.

```
Get-AvailabilityAddressSpace -DomainController <FQDN of the
domain controller>
```

Detailed Description

The **Get-AvailabilityAddressSpace** cmdlet returns details about the access method and associated credentials used to exchange free/busy information across forests. To effectively use the command, run it on a computer that has the Client Access server role installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Availability service address space settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AvailabilityAddressSpaceIdParameter	The *Identity* parameter specifies the availability address space entry to be retrieved.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AvailabilityAddressSpace

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-AvailabilityAddressSpace** cmdlet to remove a previously defined availability address space and the associated credentials used in cross-forest requests for free/busy information.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-AvailabilityAddressSpace -Identity
<AvailabilityAddressSpaceIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the availability address space entry Contoso.com.

```
Remove-AvailabilityAddressSpace -Identity Contoso.com
```

EXAMPLE 2

This example removes the availability address space entry Contoso.com and then requires confirmation before completing the removal.

```
Remove-AvailabilityAddressSpace -Identity Contoso.com -
Confirm
```

Detailed Description

To effectively use the **Remove-AvailabilityAddressSpace** cmdlet, run it on a computer that has the Client Access server role installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Availability service address space settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AvailabilityAddressSpaceIdParameter	The *Identity* parameter specifies the availability address space entry to be removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AvailabilityConfig

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AvailabilityConfig** cmdlet to retrieve the accounts that are trusted in the cross-forest exchange of free/busy information.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AvailabilityConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the accounts that are trusted in the cross-forest exchange of free/busy information.

```
Get-AvailabilityConfig
```

EXAMPLE 2

This example retrieves the accounts that are trusted in the cross-forest exchange of free/busy information. This example is scoped to return only the results of the specified *Identity* parameter.

```
Get-AvailabilityConfig -Identity <AvailabilityConfig Value>
```

Detailed Description

The **Get-AvailabilityConfig** cmdlet lists the accounts that have permissions to issue proxy availability service requests on an organizational or per-user basis.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Availability service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the availability configuration to be retrieved.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AvailabilityConfig

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-AvailabilityConfig** cmdlet to set the access level for free/busy information.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AvailabilityConfig [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-OrgWideAccount
<SecurityPrincipalIdParameter>] [-PerUserAccount
<SecurityPrincipalIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example is useful with a trusted cross-forest Availability service. If the remote forest is trusted, and a per-user free/busy proxy account or group in the remote forest is configured to use the service account, the configuration is added to the current forest to authorize the Microsoft ActiveSync request from the remote forest.

```
Set-AvailabilityConfig -PerUserAccount <domain name of servers group in remote forest>
```

EXAMPLE 2

This example is useful if the remote forest isn't trusted. Because this account is used for a cross-forest free/busy proxy account or group, minimize security vulnerabilities by using the credentials of a user who doesn't have an Exchange mailbox. When you're prompted, type the user name and password.

```
Set-AvailabilityConfig -OrgWideAccount <ExampleCredentials>
```

Detailed Description

The **Set-AvailabilityConfig** cmdlet defines two accounts or security groups: a per-user free/busy proxy account or group, and an organization-wide free/busy proxy account or group. These accounts and groups are trusted by all availability services in the current organization for availability proxy requests.

For cross-forest availability services to retrieve free/busy information in the current forest, they must be using one of the specified accounts, belong to one of the specified security groups, or have a user name and password for one of the specified accounts or security groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Availability service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the OrganizationID.
OrgWideAccount	Optional	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *OrgWideAccount* parameter specifies an account or security group that has permission to issue proxy Availability service requests on an organization-wide basis.
PerUserAccount	Optional	Microsoft.Exchange.Co	This parameter is

		nfiguration.Tasks.SecurityPrincipalIdParameter	available only in on-premises Exchange 2013. The *PerUserAccount* parameter specifies an account or security group that has permission to issue proxy Availability service requests on a per-user basis.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-MailPublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-MailPublicFolder** cmdlet to mail-disable a public folder.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-MailPublicFolder -Identity <MailPublicFolderIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mail-disables the public folder Help Desk.

```
Disable-MailPublicFolder -Identity "\Help Desk"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders, mail-enabled" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailPublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path

			using the format *TopLevelPublicFolder\PublicFolder*. You can omit the parameter label *Identity* so that only the public folder name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-MailPublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-MailPublicFolder** cmdlet to mail-enable public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-MailPublicFolder -Identity <PublicFolderIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-
HiddenFromAddressListsEnabled <$true | $false>] [-OverrideRecipientQuotas
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mail-enables the top-level public folder My Public Folder.

```
Enable-MailPublicFolder "\My Public Folder"
```

EXAMPLE 2

This example mail-enables the public folder Reports that's in the parent folder Marketing.

```
Enable-MailPublicFolder "\Marketing\Reports"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders, mail enabled" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *TopLevelPublicFolder\PublicFolder*. You can omit the parameter label so that only the public folder

			name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether the folder is hidden from address lists. Valid

			values are `$true` and `$false`. The default value is `$false`.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailPublicFolder

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailPublicFolder** cmdlet to retrieve mail-related information about mail-enabled public folders. If you want information about the basic (not mail-related) settings of mail-enabled public folders, use the **Get-PublicFolder** cmdlet instead.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailPublicFolder [-Anr <String>] <COMMON PARAMETERS>

Get-MailPublicFolder [-Identity <MailPublicFolderIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-ReadFromDomainController <SwitchParameter>]
[-ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example returns the information for up to 100 mail-enabled public folders. In this example, the output of the **Get-MailPublicFolder** command is piped to the **Format-List** command so that all the available information is displayed in the result.

```
Get-MailPublicFolder -ResultSize 100 | Format-List
```

EXAMPLE 2

This example returns information for the mail-enabled public folder Reports that resides in the Marketing top-level public folder.

```
Get-MailPublicFolder -Identity \Marketing\Reports
```

EXAMPLE 3

This example returns all mail-enabled public folders that begin with the word Marketing by using the *Anr* parameter.

```
Get-MailPublicFolder -Anr Marketing*
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders, mail-enabled" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory.

			This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailPublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also

			include the path using the format *TopLevelPublicFolder* *PublicFolder*. You can omit the parameter label so that only the public folder name or GUID is supplied.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can't use the *Anr*

			and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Microsoft Exchange.

ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. Sorting is done one attribute at a time. The results are sorted in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailPublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailPublicFolder** cmdlet to configure the mail-related settings of mail-enabled public folders. If you want to configure basic settings that aren't mail related, use the **Set-PublicFolder** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailPublicFolder -Identity <MailPublicFolderIdParameter> [-
AcceptMessagesOnlyFrom <MultiValuedProperty>] [-
AcceptMessagesOnlyFromDLMembers <MultiValuedProperty>] [-
AcceptMessagesOnlyFromSendersOrMembers <MultiValuedProperty>] [-Alias
<String>] [-ArbitrationMailbox <MailboxIdParameter>] [-
BypassModerationFromSendersOrMembers <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-Contacts <RecipientIdParameter[]>] [-CreateDTMFMap
<$true | $false>] [-CustomAttribute1 <String>] [-CustomAttribute10
<String>] [-CustomAttribute11 <String>] [-CustomAttribute12 <String>] [-
CustomAttribute13 <String>] [-CustomAttribute14 <String>] [-
CustomAttribute15 <String>] [-CustomAttribute2 <String>] [-
CustomAttribute3 <String>] [-CustomAttribute4 <String>] [-CustomAttribute5
<String>] [-CustomAttribute6 <String>] [-CustomAttribute7 <String>] [-
CustomAttribute8 <String>] [-CustomAttribute9 <String>] [-
DeliverToMailboxAndForward <$true | $false>] [-DisplayName <String>] [-
DomainController <Fqdn>] [-EmailAddresses <ProxyAddressCollection>] [-
EmailAddressPolicyEnabled <$true | $false>] [-ExtensionCustomAttribute1
<MultiValuedProperty>] [-ExtensionCustomAttribute2 <MultiValuedProperty>]
[-ExtensionCustomAttribute3 <MultiValuedProperty>] [-
ExtensionCustomAttribute4 <MultiValuedProperty>] [-
ExtensionCustomAttribute5 <MultiValuedProperty>] [-ExternalEmailAddress
<ProxyAddress>] [-ForwardingAddress <RecipientIdParameter>] [-
GrantSendOnBehalfTo <MultiValuedProperty>] [-HiddenFromAddressListsEnabled
<$true | $false>] [-IgnoreDefaultScope <SwitchParameter>] [-MailTip
<String>] [-MailTipTranslations <MultiValuedProperty>] [-MaxReceiveSize
<Unlimited>] [-MaxSendSize <Unlimited>] [-ModeratedBy
<MultiValuedProperty>] [-ModerationEnabled <$true | $false>] [-Name
<String>] [-PhoneticDisplayName <String>] [-PrimarySmtpAddress
<SmtpAddress>] [-RejectMessagesFrom <MultiValuedProperty>] [-
RejectMessagesFromDLMembers <MultiValuedProperty>] [-
RejectMessagesFromSendersOrMembers <MultiValuedProperty>] [-
RequireSenderAuthenticationEnabled <$true | $false>] [-
SendModerationNotifications <Never | Internal | Always>] [-
SimpleDisplayName <String>] [-UMDtmfMap <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]] [-WindowsEmailAddress <SmtpAddress>]
```

Examples

EXAMPLE 1

This example sets the primary SMTP address of the mail-enabled public folder MyPublicFolder@contoso.com to MyPublicFolder@fabrikam.com.

```
Set-MailPublicFolder -Identity MyPublicFolder@contoso.com -
PrimarySmtpAddress MyPublicFolder@fabrikam.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders, mail-enabled" section in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailPublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *TopLevelPublicFolder**PublicFolder*. You can omit the parameter label so that only the public folder name or GUID is supplied.
AcceptMessagesOnlyFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFrom* parameter specifies the mailbox users, mail users, and mail contacts that can send email messages to this mail-enabled public folder. You can also specify Microsoft Exchange as a valid recipient for this parameter. If you configure a mail-enabled public folder to accept messages only from the Microsoft Exchange recipient, it only receives system-generated messages.

			The *AcceptMessagesOnlyFrom* parameter can take any of the following values for valid senders: • Distinguished name (DN) • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled public folder to accept messages from all senders.
AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this mail-enabled public folder. You can use any of the following values for the allowed distribution

			groups: • DN • Canonical name • GUID • Name • Display name • Legacy Exchange DN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled public folder to accept messages from all senders.
AcceptMessagesOnlyFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromSendersOrMembers* parameter specifies the mailbox users, mail users, mail contacts, and distribution groups who are allowed to send email messages to this mail-enabled public folder. You can use any of the following values for the allowed distribution groups: • DN • Canonical name • GUID

			• Name • Display name • Legacy Exchange DN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled public folder to accept messages from all senders.
Alias	Optional	System.String	The *Alias* parameter specifies the alias (mail nickname) of the public folder. If not specified, the *Alias* parameter value is stamped with the name of the public folder. The string must comply with RFC 2821 requirements for valid "local part" SMTP addresses.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process.
BypassModerationFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassModerationFromSendersOrMembers* parameter specifies the

			recipients whose messages bypass moderation when sending to this mail-enabled public folder. You can use any of the following values: • DN • Canonical name • GUID • Name • Display name • Legacy Exchange DN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled public folder to accept messages from all senders. Senders designated as moderators for this mail-enabled public folder are allowed to send messages to this mail-enabled public folder.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Contacts	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *Contacts* parameter specifies the contacts for the public folder. *Contacts* are persons about whom you can save several types of information, such as addresses, telephone numbers, and web page URLs.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual tone multi-frequency (DTMF) map be created for the user.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to

			store additional information.
CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.

CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify

			custom attributes. You can use these attributes to store additional information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional

			information.
DeliverToMailboxAndForward	Optional	System.Boolean	The *DeliverToMailboxAndForward* parameter specifies whether email messages are sent to a forwarding address.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name of the **Public Folder Proxy** object.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	The *EmailAddresses* parameter specifies proxy addresses (for example, user@contoso.com).
EmailAddressPolicyEnabled	Optional	System.Boolean	The *EmailAddressPolicyEnabled* parameter specifies

			whether to enable an email address policy that's applied to the folder.
ExtensionCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list.

			Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.

ExtensionCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to

			1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExternalEmailAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies an email address outside the organization.
ForwardingAddress	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *ForwardingAddress* parameter specifies the forwarding address of the folder.
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies the DN of other mailboxes that can send on behalf of this folder.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether the mailbox is viewable from address lists.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchPar	The *IgnoreDefaultScope* parameter instructs the

		ameter	command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message that's displayed to senders when they start drafting an email message to this recipient. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Da	The *MailTipTranslations*

		ta.MultiValuedProperty	parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each language, you must provide the locale, followed by a colon and the specific *MailTip* parameter value in that language. Each *MailTip* parameter value must be less than or equal to 250 characters. Multiple languages can be separated by commas.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxReceiveSize* parameter specifies the maximum size of email messages that can be received by the folder. Valid values are from 1 kilobyte (KB) to 2,097,151 KB. If a value isn't specified for this parameter, no size limit is imposed.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxSendSize* parameter specifies the maximum size of email

			messages that can be sent. Valid values are from 1 KB to 2,097,151 KB. If a value isn't specified for this parameter, no size limit is imposed.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to the mail-enabled public folder. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there is a user who is already specified as the manager of this distribution group, the *ModeratedBy* parameter is automatically set by the *ManagedBy* parameter of the mail-enabled public folder. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies

			whether to enable moderation for the mail-enabled public folder. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Name	Optional	System.String	The *Name* parameter specifies the name of the public folder. Use this parameter if you want to change the name of the public folder.
PhoneticDisplayName	Optional	System.String	The *PhoneticDisplayName* parameter specifies a phonetic pronunciation of the *DisplayName* parameter. The maximum length of this parameter value is 255 characters.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary SMTP address for the folder.
RejectMessagesFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFrom* parameter specifies the recipients from which to reject messages. You can

			use any of the following values to specify the recipients: • DN • Canonical name • GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled public folder to accept messages from all senders.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies the distribution list members from which to reject messages. You can use any of the following values to specify the recipients: • DN • Canonical name • GUID • Name • Display name • LegacyExchangeDN

			• Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled public folder to accept messages from all senders.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromSendersOrMembers* parameter specifies the mailbox users, mail users, mail contacts, and distribution groups whose members aren't allowed to send email messages to this mail-enabled public folder. You can use any of the following values to specify the recipients: • DN • Canonical name • GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail-enabled

			public folder to accept messages from all senders.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether senders must be authenticated.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never` Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent only to the senders who are internal to your organization. Set this parameter to

			Never to disable all status notifications. **Note:** The sender is always notified if the message is rejected by the moderators, regardless of the value of this parameter. The default value is Never.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies if you want to create a user-defined DTMF map for the UM-enabled user.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies an email address in the format *EmailAddress*@contoso.com.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OrganizationRelationship

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-OrganizationRelationship** cmdlet to retrieve settings for an organization relationship that has been created for federated sharing with other federated Exchange organizations or for hybrid deployments with Exchange Online.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OrganizationRelationship [-Identity
<OrganizationRelationshipIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the organization relationship settings for Contoso using the *Identity* parameter.

```
Get-OrganizationRelationship -Identity Contoso
```

EXAMPLE 2

This example retrieves the organization relationship settings by using the FQDN of the domain controller.

```
Get-OrganizationRelationship -DomainController
'mail.contoso.com'
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Organization relationships" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active

			Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationRelationshipIdParameter	The *Identity* parameter specifies the identity of the organizational relationship. You can use the following values: • Canonical name • GUID • Name
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OrganizationRelationship

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-OrganizationRelationship** cmdlet to create a relationship with an external Microsoft Exchange Server 2010 and Exchange Server 2013 organization for the purpose of accessing calendar free/busy information or moving mailboxes between on-premises Exchange servers and

the Exchange Online service as part of a hybrid deployment.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OrganizationRelationship -DomainNames <MultiValuedProperty> -Name
<String> [-ArchiveAccessEnabled <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DeliveryReportEnabled <$true | $false>] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-
FreeBusyAccessEnabled <$true | $false>] [-FreeBusyAccessLevel <None |
AvailabilityOnly | LimitedDetails>] [-FreeBusyAccessScope
<GroupIdParameter>] [-MailboxMoveEnabled <$true | $false>] [-
MailTipsAccessEnabled <$true | $false>] [-MailTipsAccessLevel <None |
Limited | All>] [-MailTipsAccessScope <GroupIdParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationContact <SmtpAddress>] [-
PhotosEnabled <$true | $false>] [-TargetApplicationUri <Uri>] [-
TargetAutodiscoverEpr <Uri>] [-TargetOwaURL <Uri>] [-TargetSharingEpr
<Uri>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an organization relationship with Contoso. The domain name to connect to is contoso.com. The following settings are used:

- Free/busy access is enabled.
- The requesting organization receives time, subject, and location information from the target organization.

This example attempts to automatically discover configuration information from the external organization by using the domain names provided in the **Get-FederationInformation** command. If you use this method to create your organization relationship, you must first ensure that you've created an organization identifier by using the **Set-FederationOrganizationIdentifier** cmdlet.

```
Get-FederationInformation -DomainName Contoso.com | New-
OrganizationRelationship -Name "Contoso" -
FreeBusyAccessEnabled $true -FreeBusyAccessLevel -
LimitedDetails
```

EXAMPLE 2

This example creates the organization relationship with Fourth Coffee using the following settings. In this example, the connection settings with the external organization are provided.

- The domain to connect to is mail.fourthcoffee.com.
- The Exchange Web Services application URL is mail.fourthcoffee.com.
- The Autodiscover URL is https://mail.fourthcoffee.com/autodiscover/autodiscover.svc/wssecurity.
- Free/busy access is enabled.
- The requesting organization only receives free/busy information with the time.

```
New-OrganizationRelationship -Name "Fourth Coffee" -
DomainNames "mail.fourthcoffee.com" -FreeBusyAccessEnabled
```

```
$true -FreeBusyAccessLevel -AvailabilityOnly -
TargetAutodiscoverEpr "https://mail.fourthcoffee.com/
autodiscover/autodiscover.svc/wssecurity" -
TargetApplicationUri "mail.fourthcoffee.com"
```

Detailed Description

Before you can create an organization relationship, you must first create a federation trust. For more information, see Federation.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Organization relationships" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainNames	Required	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *DomainNames* parameter specifies the SMTP domains of the external organization. If adding multiple domain names, separate each entry with a comma.
Name	Required	System.String	The *Name* parameter specifies the meaningful name of the organization relationship.
ArchiveAccessEnabled	Optional	System.Boolean	The *ArchiveAccessEnabled* parameter specifies whether the organization

			relationship has been configured to provide remote archive access. Valid input for the *ArchiveAccessEnabled* parameter is `$true` or `$false`. The default value is `$false`. When the *ArchiveAccessEnabled* parameter is set to `$true`, the external organization specified in the organization relationship provides remote access to mailbox archives.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeliveryReportEnabled	Optional	System.Boolean	The *DeliveryReportEnabled* parameter specifies whether Delivery Report data should be shared over this organization relationship.

			The accepted values are `$true` or `$false`. The default value is `$false`. If set to `$true`, this means the following two things: • The organization has agreed to share all Delivery Report data with the organization specified in the organization relationship. • This organization relationship should be used to retrieve Delivery Report information from the organization referenced in the organization relationship. For message tracking to work in a cross-premise, Exchange scenario, the *DeliveryReportEnabled* parameter must be set to `$true` on both sides of the organization relationship. If one, or both, of the members of the organization relationship specifies the *DeliveryReportEnabled*

			parameter as `$false`, tracking between the organizations won't work in either direction.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the sharing relationship. This parameter can be used to completely stop sharing for a particular relationship. The valid values for this parameter are `$true` or `$false`. The default value is `$true`.
FreeBusyAccessEnabled	Optional	System.Boolean	The *FreeBusyAccessEnabled* parameter specifies whether this organization relationship should be

			used for retrieving free/busy information from the external organization. The valid values for this parameter are `$true` or `$false`. The default value is `$false`.
FreeBusyAccessLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.FreeBusyAccessLevel	The *FreeBusyAccessLevel* parameter specifies the maximum amount of detail returned to the requesting organization. You can use the following values: • `None` No free/busy access • `AvailabilityOnly` Free/busy access with time only • `LimitedDetails` Free/busy access with time, subject, and location
FreeBusyAccessScope	Optional	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *FreeBusyAccessScope* parameter specifies a security distribution group in the internal organization that contains users that can have their free/busy information accessed by an external organization. You can use the following values: • Distinguished name (DN)

			• Canonical name • GUID • Name • Display name
MailboxMoveEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MailboxMoveEnabled* parameter specifies whether the organization relationship is used for moving mailboxes to the external organization. If this parameter isn't set, the move requests require an administrator to provide a remote credential for the remote organization. The valid values for this parameter are `$true` or `$false`. The default value is `$false`.
MailTipsAccessEnabled	Optional	System.Boolean	The *MailTipsAccessEnabled* parameter specifies whether MailTips data for users in this organization are returned over this organization relationship. The accepted values are `$true` or `$false`. The default value is `$false`.

MailTipsAccessLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailTipsAccessLevel	The *MailTipsAccessLevel* parameter specifies the level of MailTips data that's externally shared over this organization relationship. This parameter can have the following values: • `All` All MailTips are returned, but the recipients in the remote organization are considered external. For the Auto Reply MailTip, the external Auto Reply message is returned. • `Limited` Only those MailTips that could prevent a non-delivery report (NDR) or an Auto Reply are returned. Custom MailTips, the Large Audience MailTip, and Moderated Recipient MailTips won't be returned. • `None` No MailTips are returned to the remote organization. The default value is `None`.
MailTipsAccessScope	Optional	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *MailTipsAccessScope* parameter specifies a Security Distribution group in the organization that contains users for whom recipient-specific MailTips are returned over

			this organization relationship. The recipient-specific MailTips are: • Auto Reply • Mailbox Full • Custom If a group is specified, these MailTips are returned only for those recipients that are members of the specified group. If a group isn't specified, recipient-specific MailTips are returned for all recipients in the organization. By default, no group is specified. This restriction only applies to mailboxes, mail users, and mail contacts. It doesn't apply to distribution groups.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationContact	Optional	Microsoft.Exchange.Data.SmtpAddress	The *OrganizationContact* parameter specifies the email address that can be used to contact the

			external organization, for example, administrator@fourthcoffee.com.
PhotosEnabled	Optional	System.Boolean	The *PhotosEnabled* parameter specifies whether photo data for users in this organization are returned over this organization relationship. The accepted values are `$true` or `$false`. The default value is `$false`.
TargetApplicationUri	Optional	System.Uri	The *TargetApplicationUri* parameter specifies the target Uniform Resource Identifier (URI) of the external organization. The *TargetApplicationUri* parameter is specified by Exchange when requesting a delegated token for the external organization to fetch free and busy information, for example, mail.contoso.com.
TargetAutodiscoverEpr	Optional	System.Uri	The *TargetAutodiscoverEpr* parameter specifies the Autodiscover URL of Exchange Web Services

			for the external organization, for example, https://contoso.com/autodiscover/autodiscover.svc/wssecurity. Exchange uses the Autodiscover service to automatically detect the correct Client Access server endpoint for external requests.
TargetOwaURL	Optional	System.Uri	The *TargetOwaURL* parameter specifies the Microsoft Office Outlook Web App URL of the external organization defined in the organization relationship. It is used for Outlook Web App redirection in a cross-premise Exchange scenario. Configuring this attribute enables users in the organization to use their current Outlook Web App URL to access Outlook Web App in the external organization.
TargetSharingEpr	Optional	System.Uri	The *TargetSharingEpr* parameter specifies the URL of the target Exchange Web Services

			for the external organization. If the *TargetSharingEpr* parameter is used, Exchange always uses this URL to reach the external Client Access server and doesn't use the *TargetAutodiscoverEpr* parameter information to locate the Client Access server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OrganizationRelationship

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-OrganizationRelationship** cmdlet to remove the organization relationship with an external Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OrganizationRelationship -Identity
<OrganizationRelationshipIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the organization relationship Contoso using the *Identity* parameter.

```
Remove-OrganizationRelationship -Identity Contoso
```

Detailed Description

The **Remove-OrganizationRelationship** cmdlet removes the organization relationship objects. To stop sharing information without removing the organization relationship objects, disable the organization relationship by using the **Set-OrganizationRelationship** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Organization relationships" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.Orga	The *Identity* parameter specifies the identity of

		nizationRelationshipId Parameter	the organization relationship that you want to remove. You can use one of the following values: • Canonical name • GUID • Name
Confirm	Optional	System.Management. Automation.SwitchPar ameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da ta.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management. Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OrganizationRelationship

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-OrganizationRelationship** cmdlet to modify a relationship with an external Exchange organization for the purposes of accessing calendar free/busy information or moving mailboxes between on-premises Exchange servers and the Exchange Online service as part of a hybrid deployment.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OrganizationRelationship -Identity
```

```
<OrganizationRelationshipIdParameter> [-ArchiveAccessEnabled <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DeliveryReportEnabled <$true |
$false>] [-DomainController <Fqdn>] [-DomainNames <MultiValuedProperty>]
[-Enabled <$true | $false>] [-Force <SwitchParameter>] [-
FreeBusyAccessEnabled <$true | $false>] [-FreeBusyAccessLevel <None |
AvailabilityOnly | LimitedDetails>] [-FreeBusyAccessScope
<GroupIdParameter>] [-MailboxMoveEnabled <$true | $false>] [-
MailTipsAccessEnabled <$true | $false>] [-MailTipsAccessLevel <None |
Limited | All>] [-MailTipsAccessScope <GroupIdParameter>] [-Name <String>]
[-OrganizationContact <SmtpAddress>] [-PhotosEnabled <$true | $false>] [-
TargetApplicationUri <Uri>] [-TargetAutodiscoverEpr <Uri>] [-TargetOwaURL
<Uri>] [-TargetSharingEpr <Uri>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the free/busy access level to `LimitedDetails`, which includes time, subject, and location.

```
Set-OrganizationRelationship -Identity "Fourth Coffee" -
FreeBusyAccessLevel LimitedDetails
```

EXAMPLE 2

This example disables the organization relationship with Contoso

```
Set-OrganizationRelationship -Identity "Contoso" -Enabled
$false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Organization relationships" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OrganizationRelationshipIdParameter	The *Identity* parameter specifies the organization relationship to be modified. You can use the following values: • Canonical name

			• GUID • Name
ArchiveAccessEnabled	Optional	System.Boolean	The *ArchiveAccessEnabled* parameter specifies whether the organization relationship has been configured to provide remote archive access. Valid input for the *ArchiveAccessEnabled* parameter is `$true` or `$false`. The default value is `$false`. When the *ArchiveAccessEnabled* parameter is set to `$true`, the external organization specified in the organization relationship provides remote access to mailbox archives.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeliveryReportEnabled	Optional	System.Boolean	The *DeliveryReportEnabled*

			parameter specifies whether Delivery Report data should be shared over this organization relationship. The accepted values are `$true` or `$false`. The default value is `$false`. If set to `$true`, this means the following two things: • The organization has agreed to share all Delivery Report data with the organization specified in the organization relationship. • This organization relationship should be used to retrieve Delivery Report information from the organization referenced in the organization relationship. For message tracking to work in a cross-premises, Exchange scenario, the *DeliveryReportEnabled* parameter must be set to `$true` on both sides of the organization relationship.

			If one, or both, of the members of the organization relationship specifies the *DeliveryReportEnabled* parameter as `$false`, tracking between the organizations won't work in either direction.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DomainNames	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *DomainNames* parameter specifies the SMTP domains of the external organization. If adding multiple domain names, separate each entry with a comma, for example, "contoso.com","northamerica.contoso.com".
Enabled	Optional	System.Boolean	The *Enabled* parameter

			specifies whether to enable the organization relationship. This parameter can be used to completely stop the sharing for a particular relationship. The valid input values are `$true` or `$false`. The default value is `$true`.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the warning or confirmation messages that appear during specific configuration changes.
FreeBusyAccessEnabled	Optional	System.Boolean	The *FreeBusyAccessEnabled* parameter specifies whether this organization relationship should be used for retrieving free/busy information from the external organization. The accepted values are `$true` or `$false`. The default value is `$false`.
FreeBusyAccessLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.FreeBusyA	The *FreeBusyAccessLevel* parameter specifies the maximum amount of

		ccessLevel	detail returned to the requesting organization. You can use the following values: • `None` No free/busy access • `AvailabilityOnly` Free/busy access with time only • `LimitedDetails` Free/busy access with time, subject, and location
FreeBusyAccessScope	Optional	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *FreeBusyAccessScope* parameter specifies a security distribution group in the internal organization that contains users that can have their free/busy information accessed by an external organization. You can use the following values: • Canonical name • Display name • Distinguished name (DN) • GUID • Name
MailboxMoveEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MailboxMoveEnabled* parameter specifies that the organization

			relationship is used to provide the credential information for moving mailboxes to the external organization. If this parameter isn't set, the move requests require an administrator to provide a remote credential for the remote organization. The accepted values are `$true` or `$false`. The default value is `$false`.
MailTipsAccessEnabled	Optional	System.Boolean	The *MailTipsAccessEnabled* parameter specifies whether MailTips data for users in this organization are returned over this organization relationship. The accepted values are `$true` or `$false`. The default value is `$false`.
MailTipsAccessLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailTipsAccessLevel	The *MailTipsAccessLevel* parameter specifies the level of MailTips data externally shared over this organization relationship. This parameter can have the following values: • `All` All MailTips are returned, but the recipients in the remote

			organization are considered external. For the Auto Reply MailTip, the external Auto Reply message is returned. • `Limited` Only those MailTips that could prevent a non-delivery report (NDR) or an Auto Reply are returned. Custom MailTips, the Large Audience MailTip, and Moderated Recipient MailTips won't be returned. • `None` No MailTips are returned to the remote organization. The default value is `None`.
MailTipsAccessScope	Optional	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *MailTipsAccessScope* parameter specifies a Security Distribution group in the organization that contains users for whom recipient-specific MailTips are returned over this organization relationship. The recipient-specific MailTips are: • Auto Reply • Mailbox Full • Custom If a group is specified, these MailTips are returned only for those recipients that are

			members of the specified group. If a group isn't specified, recipient-specific MailTips are returned for all recipients in the organization. By default, no group is specified. This restriction only applies to mailboxes, mail users, and mail contacts. It doesn't apply to distribution groups.
Name	Optional	System.String	The *Name* parameter specifies the meaningful name of the organization relationship. Use this parameter to change the name of the organization relationship.
OrganizationContact	Optional	Microsoft.Exchange.Data.SmtpAddress	The *OrganizationContact* parameter specifies the email address that can be used to contact the external organization, for example, administrator@fourthcoffee.com.
PhotosEnabled	Optional	System.Boolean	The *PhotosEnabled* parameter specifies whether photo data for

			users in this organization are returned over this organization relationship. The accepted values are `$true` or `$false`. The default value is `$false`.
TargetApplicationUri	Optional	System.Uri	The *TargetApplicationUri* parameter specifies the target Uniform Resource Identifier (URI) of the external organization. The *TargetApplicationUri* parameter is specified by Exchange when requesting a delegated token to retrieve free and busy information, for example, mail.contoso.com.
TargetAutodiscoverEpr	Optional	System.Uri	The *TargetAutodiscoverEpr* parameter specifies the Autodiscover URL of Exchange Web Services for the external organization, for example, https://contoso.com/autodiscover/autodiscover.svc/wssecurity. Exchange uses Autodiscover to automatically detect the

			correct Client Access server endpoint for external requests.
TargetOwaURL	Optional	System.Uri	The *TargetOwaURL* parameter specifies the Microsoft Office Outlook Web App URL of the external organization defined in the organization relationship. It is used for Outlook Web App redirection in a cross-premise Exchange scenario. Configuring this attribute enables users in the organization to use their current Outlook Web App URL to access Outlook Web App in the external organization.
TargetSharingEpr	Optional	System.Uri	The *TargetSharingEpr* parameter specifies the URL of the target Exchange Web Services for the external organization. If the *TargetSharingEpr* parameter is used, Exchange always uses this URL to reach the external Client Access server and doesn't use the

			TargetAutoDiscoverEpr parameter information to locate the Client Access server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-OrganizationRelationship

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Test-OrganizationRelationship** cmdlet to verify that the organization relationship is properly configured and functioning as expected.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-OrganizationRelationship -UserIdentity <RecipientIdParameter> [-
Identity <OrganizationRelationshipIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example validates the organization relationship deployed in the Exchange organization and checks whether a delegation token can be retrieved for a mailbox for the external organization domain contoso.com.

```
Test-OrganizationRelationship -UserIdentity
katherine@contoso.com -Identity contoso.com -Confirm
```

Detailed Description

The **Test-OrganizationRelationship** cmdlet doesn't include any functional tests of federated sharing features, such as accessing user free/busy information or moving mailboxes between organizations. It only verifies that the configuration will allow these features to work correctly.

Before you can test an organization relationship, you must first create an organization relationship. For more information, see Create an organization relationship.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Organization relationships" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
UserIdentity	Required	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *UserIdentity* parameter specifies the mailbox for which a delegation token is requested to access the

			external organization's configuration information. You can use any of the following values: • Distinguished name (DN) • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationRelationshipIdParameter	The *Identity* parameter specifies the organization relationship to be tested. You can use the following values: • Canonical name • GUID • Name
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolder** cmdlet to retrieve the attributes of a public folder or a set of public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolder [-Identity <PublicFolderIdParameter>] <COMMON PARAMETERS>

Get-PublicFolder -Recurse <SwitchParameter> [-Identity
<PublicFolderIdParameter>] [-ResultSize <Unlimited>] <COMMON PARAMETERS>

Get-PublicFolder -GetChildren <SwitchParameter> [-Identity
<PublicFolderIdParameter>] [-ResultSize <Unlimited>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Mailbox
<MailboxIdParameter>] [-Organization <OrganizationIdParameter>] [-
ResidentFolders <SwitchParameter>]
```

Examples

EXAMPLE 1

This example uses the **Get-PublicFolder** command without parameters to return the root public folder object (IPM_SUBTREE).

```
Get-PublicFolder
```

EXAMPLE 2

This example returns the names of all the system folders (which aren't shown by default), starting at the system folder root (\NON_IPM_SUBTREE).

```
Get-PublicFolder -Identity \NON_IPM_SUBTREE -Recurse |
Format-List Name
```

EXAMPLE 3

This example returns the Pending Litigation public folder from \Legal\Documents\.

```
Get-PublicFolder -Identity "\Legal\Documents\Pending
Litigation"
```

EXAMPLE 4

This example returns the Pending Litigation public folder from \Legal\Documents\ and all the public folders under the Pending Litigation public folder. Because the result size isn't specified, the command returns up to the maximum number of public folders, which is 10,000.

```
Get-PublicFolder -Identity "\Legal\Documents\Pending
Litigation" -Recurse
```

EXAMPLE 5

This example returns the Pending Litigation public folder from \Legal\Documents\ and all the public folders under the Pending Litigation public folder, without a limit on the number returned.

```
Get-PublicFolder -Identity "\Legal\Documents\Pending
Litigation" -Recurse -ResultSize Unlimited
```

EXAMPLE 6

This example returns the public folders that reside in the public folder content mailbox Legal Department.

```
Get-PublicFolder -Mailbox "Legal Department" -
ResidentFolders
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
GetChildren	Required	System.Management.	The *GetChildren*

		Automation.SwitchParameter	parameter specifies whether to retrieve only the children of the folder specified by the *Identity* parameter. You can't use the *GetChildren* parameter with the *Recurse* parameter.
Recurse	Required	System.Management.Automation.SwitchParameter	The *Recurse* parameter specifies that the command must return the specified public folder and all its children. You don't need to specify a value with this parameter. You can't use the *GetChildren* parameter with the *Recurse* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.Publi	The *Identity* parameter specifies the GUID or

		cFolderIdParameter	public folder name that represents a specific public folder. You can also include the path using the format *TopLevelPublicFolder* *PublicFolder*. You can omit the parameter label *Identity* so that only the public folder name or GUID is supplied.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the hierarchy public folder mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-

			4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ResidentFolders	Optional	System.Management.Automation.SwitchParameter	The *ResidentFolders* specifies whether to return public folders that reside in a specific content public folder mailbox. If this parameter isn't specified, the command will only return public folders whose contents reside in the primary hierarchy public folder mailbox.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum

			number of results to return. The default maximum is 10,000. For no limit on the returned results, set this parameter to `Unlimited`. This parameter can only be passed in combination with the *Recurse* or *GetChildren* parameters.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-PublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-PublicFolder** cmdlet to create a public folder with the specified name.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-PublicFolder -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-EformsLocaleId <CultureInfo>] [-Mailbox
<MailboxIdParameter>] [-Organization <OrganizationIdParameter>] [-Path
<PublicFolderIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the public folder Marketing in the root of the public folder.

```
New-PublicFolder -Name Marketing
```

EXAMPLE 2

This example creates the public folder FY2013 under the existing folders \Legal\Cases. The path to the new folder is \Legal\Cases\FY2013.

```
New-PublicFolder -Name FY2013 -Path \Legal\Cases
```

EXAMPLE 3

This example creates the public folder Support in the North_America hierarchy public folder mailbox.

```
New-PublicFolder -Name Support -Mailbox North_America
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name for the public folder.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EformsLocaleId	Optional	System.Globalization.CultureInfo	The *EformsLocaleId* parameter specifies the locale-specific version of the e-forms library. The valid input for the *EformsLocaleId* parameter is the string names listed in the **Culture Name** column in the Microsoft .NET Class Library class reference available at CultureInfo Class.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the hierarchy public folder

			mailbox in which you want this public folder created. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Path	Optional	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Path* parameter specifies the location of the folder in the folder hierarchy, for example, \Legal\Cases.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-PublicFolder** cmdlet to remove an existing public folder.

Caution:

The **Remove-PublicFolder** cmdlet removes the public folder data from all servers in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PublicFolder -Identity <PublicFolderIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Recurse
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the public folder My Public Folder from the \Test\Directory tree.

```
Remove-PublicFolder -Identity "\Test\Directory\My Public
Folder"
```

EXAMPLE 2

This example deletes the public folder Directory Folder and all its child public folders by using the *Recurse* switch.

```
Remove-PublicFolder -Identity "\Test\Directory Folder" -
Recurse
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *\TopLevelPublicFolder\PublicFolder*. You can omit the parameter label so that only the public folder name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default

			when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Recurse	Optional	System.Management.Automation.SwitchParameter	The *Recurse* switch specifies whether all subfolders of the specified folder should be removed. If the *Recurse* switch isn't specified and the public folder has subfolders, the command doesn't run and an error message is returned.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PublicFolder

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-PublicFolder** cmdlet to set the attributes of public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PublicFolder -Identity <PublicFolderIdParameter> [-AgeLimit
<EnhancedTimeSpan>] [-Confirm [<SwitchParameter>]] [-DomainController
```

```
<Fqdn>] [-EformsLocaleId <CultureInfo>] [-Force <SwitchParameter>] [-
IssueWarningQuota <Unlimited>] [-LastMovedTime <ExDateTime>] [-MaxItemSize
<Unlimited>] [-Name <String>] [-OverrideContentMailbox
<MailboxIdParameter>] [-Path <PublicFolderIdParameter>] [-
PerUserReadStateEnabled <$true | $false>] [-ProhibitPostQuota <Unlimited>]
[-RetainDeletedItemsFor <EnhancedTimeSpan>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the content location of the public folder hierarchy mailbox to North_America.

```
Set-PublicFolder "\Customer Service Requests" -
OverrideContentMailbox North_America
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *TopLevelPublicFolder**PublicFolder*.
AgeLimit	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AgeLimit* parameter specifies the overall age limit on the folder. Replicas of this public

			folder are automatically deleted when the age limit is exceeded.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EformsLocaleId	Optional	System.Globalization.CultureInfo	The *EformsLocaleId* parameter specifies the locale-specific version of the e-forms library. The valid input for the *EformsLocaleId* parameter is the string names listed

			in the **Culture Name** column in the Microsoft .NET Class Library class reference available at CultureInfo Class.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
IssueWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *IssueWarningQuota* parameter specifies the public folder size that triggers a warning to public folder owners stating that the folder is almost full. The default value is `unlimited`, which is 2 terabytes. When you enter a value, qualify the value with one of the following

			units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as kilobytes. The valid input range for this parameter is from 1 through 2TB.
LastMovedTime	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *LastMovedTime* parameter specifies the date and time that the public folder was last moved. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for

			example, **"10/05/2010 5:00 PM"**.
MaxItemSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxItemSize* parameter specifies the maximum size for posted items. Items larger than the value of the *MaxItemSize* parameter are rejected. The default value is `unlimited`, which is 2 gigabytes. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as kilobytes. The valid input range for this parameter is from 1 through 2GB.
Name	Optional	System.String	The *Name* parameter specifies the name for the public folder.
OverrideContentMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *OverrideContentMailbox*

			parameter specifies the identity of the public folder mailbox that you want to move this public folder's content to.
Path	Optional	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Path* parameter specifies the path of the public folder, for example, *\TopLevelPublicFolder\PublicFolder*.
PerUserReadStateEnabled	Optional	System.Boolean	The *PerUserReadStateEnabled* parameter specifies whether to maintain read and unread data on a per-user basis.
ProhibitPostQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ProhibitPostQuota* parameter specifies the size of a public folder at which users are notified that the public folder is full. Users can't post to a folder whose size is larger than the *ProhibitPostQuota* parameter value. The default value is `unlimited`, which is 2 terabytes. When you enter a value, qualify the value with one of the following units: • `B` (bytes)

			• KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as kilobytes. The valid input range for this parameter is from 1 through 2TB.
RetainDeletedItemsFor	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RetainDeletedItemsFor* parameter specifies the retention time for deleted items.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-PublicFolderClientPermission

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Add-PublicFolderClientPermission** cmdlet to add permissions to public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-PublicFolderClientPermission -Identity <PublicFolderIdParameter> -
AccessRights <MailboxFolderAccessRight[]> -User
<MailboxFolderUserIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds permission for the user Chris to create items in the public folder My Public Folder.

```
Add-PublicFolderClientPermission -Identity "\My Public
Folder" -User Chris -AccessRights CreateItems
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
AccessRights	Required	Microsoft.Exchange.M	The *AccessRights*

		anagement.StoreTasks.MailboxFolderAccessRight[]	parameter specifies the rights being added. This parameter accepts the following values: • `ReadItems` The user has the right to read items within the specified public folder. • `CreateItems` The user has the right to create items within the specified public folder. • `EditOwnedItems` The user has the right to edit the items that the user owns in the specified public folder. • `DeleteOwnedItems` The user has the right to delete items that the user owns in the specified public folder. • `EditAllItems` The user has the right to edit all items in the specified public folder. • `DeleteAllItems` The user has the right to delete all items in the specified public folder. • `CreateSubfolders` The user has the right to create subfolders in the specified public folder. • `FolderOwner` The user is the owner of the specified public folder. The user has the right to view and move the public folder and create subfolders. The user can't read items, edit

			items, delete items, or create items. • `FolderContact` The user is the contact for the specified public folder. • `FolderVisible` The user can view the specified public folder, but can't read or edit items within the specified public folder. In addition to access rights, you can create rights based upon roles, which includes multiple access rights. This parameter accepts the following values for roles: • `None` FolderVisible • `Owner` CreateItems, ReadItems, CreateSubfolders, FolderOwner, FolderContact, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • `PublishingEditor` CreateItems, ReadItems, CreateSubfolders, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • `Editor` CreateItems, ReadItems,

			FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • `PublishingAuthor` CreateItems, ReadItems, CreateSubfolders, FolderVisible, EditOwnedItems, DeleteOwnedItems • `Author` CreateItems, ReadItems, FolderVisible, EditOwnedItems, DeleteOwnedItems • `NonEditingAuthor` CreateItems, ReadItems, FolderVisible • `Reviewer` ReadItems, FolderVisible • `Contributor` CreateItems, FolderVisible
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *TopLevelPublicFolder**PublicFolder*. You can omit the parameter label so that only the public folder name or GUID is supplied.

User	Required	Microsoft.Exchange.Management.StoreTasks.MailboxFolderUserIdParameter	The *User* parameter specifies the user principal name (UPN), *domain**user*, or alias of the user for whom rights are being added.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderClientPermission

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolderClientPermission** cmdlet to retrieve the user permissions for a public folder.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderClientPermission -Identity <PublicFolderIdParameter> [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>] [-User
<MailboxFolderUserIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the permissions for all users of \My Public Folder.

```
Get-PublicFolderClientPermission "\My Public Folder"
```

EXAMPLE 2

This example retrieves the permissions for the public folder My Public Folder, for the user Chris. In this example, the output of the **Get-PublicFolderClientPermission** command is piped to the **Format-List** command so that all available information is displayed in the result.

```
Get-PublicFolderClientPermission -Identity "\My Public
Folder" -User Chris | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *\TopLevelPublicFolder\PublicFolder*. You can omit the parameter label so that only the public folder name or GUID is

			supplied.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the public folder mailbox for which you want to view the permissions. By default, the permissions are returned for the primary public folder mailbox. Using the *Mailbox* parameter allows you to specify a different public folder mailbox.
User	Optional	Microsoft.Exchange.Management.StoreTasks.MailboxFolderUserIdParameter	The *User* parameter specifies the user principal name (UPN), *domain**user*, or alias of a specific user for

			whom you want to view the permissions on the public folder.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PublicFolderClientPermission

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-PublicFolderClientPermission** cmdlet to remove permissions from public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PublicFolderClientPermission -Identity <PublicFolderIdParameter> -
User <MailboxFolderUserIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes permission for the user Chris to the public folder My Public Folder.

```
Remove-PublicFolderClientPermission -Identity "\My Public
Folder" -User Contoso\Chris
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path by using the format *\TopLevelPublicFolder\PublicFolder*. You can omit the parameter label so that only the public folder name or GUID is supplied.
User	Required	Microsoft.Exchange.Management.StoreTasks.MailboxFolderUserIdParameter	The *User* parameter specifies the user principal name (UPN), *domain\user*, or alias of the user whose permissions are being removed.
Confirm	Optional	System.Management.Automation.SwitchPara	The *Confirm* switch can be used to suppress the

		meter	confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$false`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderDatabase

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-PublicFolderDatabase** cmdlet to view public folder database settings for Microsoft Exchange Server 2010 or earlier public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderDatabase [-Identity <DatabaseIdParameter>] <COMMON
PARAMETERS>

Get-PublicFolderDatabase -Server <ServerIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-Status <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns all the attributes of all the public folder databases in the organization by piping the results of the **Get-PublicFolderDatabase** command to the **Format-List** command.

```
Get-PublicFolderDatabase | Format-List
```

EXAMPLE 2

This example returns information about the public folder database PFDatabase that resides on Server01.

```
Get-PublicFolderDatabase -Identity "Server01\PFDatabase"
```

EXAMPLE 3

This example returns information about all public folders on Server01.

```
Get-PublicFolderDatabase -Server Server01
```

Detailed Description

You can specify either the *Server* or *Identity* parameter, but not both. Only the *Server* and *Identity* parameters can be piped.

Note:
When you run the **Get-PublicFolderDatabase** cmdlet with no parameters, it returns attributes of all of the public folder databases in the Exchange organization. To return specific database properties (including backup and mount status information) where the **Get-PublicFolderDatabase** cmdlet has to contact servers directly or perform a complex or slow calculation, make sure you use the *Status* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name of a server that contains a public folder database. If specified, only the public folder database on the specified server is returned. This parameter can't be used with the

			Identity parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies a public folder database. You can use the following values: • GUID • Distinguished name (DN) • Database name If you don't specify the server name, the cmdlet searches for databases on the local server. If you have multiple databases with the same name, the cmdlet retrieves all databases with the same name in the specified scope. This parameter can't be used with the *Server* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Status	Optional	System.Management.Automation.SwitchParameter	The *Status* parameter specifies whether additional backup and mount status information is included for servers running Exchange 2010. If the *Status* parameter is included, additional backup and mount status information is included for Exchange 2010 servers.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderItemStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolderItemStatistics** cmdlet to view information about items within a specified public folder. Information returned includes subject, last modification time, last access time, creation time, attachments, message size, and the type of item. You can use this raw information to better understand the distribution of items and item characteristics across public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderItemStatistics -Identity <PublicFolderIdParameter> [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example returns default statistics for all items in the Pamphlets public folder under the \Marketing\2013 path. Default information includes item identity, creation time, and subject.

```
Get-PublicFolderItemStatistics -Identity "\Marketing\2013
\Pamphlets"
```

EXAMPLE 2

This example returns additional information about the items within the public folder, such as subject, last modification time, creation time, attachments, message size, and the type of item by piping the results of the **Get-PublicFolderItemStatistics** command to the **Format-List** command.

```
Get-PublicFolderItemStatistics -Identity "\Marketing\2013
\Pamphlets" | Format-List
```

EXAMPLE 3

This example exports the output of the **Get-PublicFolderItemStatistics** command to the PFItemStats.csv file that includes the following information for all items within the public folder \Marketing\Reports:

- Subject of the message (*Subject*)
- Date and time when the item was last modified (*LastModificationTime*)
- If the item has attachments (*HasAttachments*)
- Type of item (*ItemType*)
- Size of the item (*MessageSize*)

```
Get-PublicFolderItemStatistics -Identity "\Marketing
\Reports" | Select
Subject,LastModificationTime,HasAttachments,ItemType,Messag
eSize | Export-CSV C:\PFItemStats.csv
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the following format: *TopLevelPublicFolder**PublicFolder*
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the hierarchy public folder mailbox.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-PublicFolderMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Update-PublicFolderMailbox** cmdlet to update the hierarchy for public folders.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-PublicFolderMailbox -Identity <MailboxIdParameter> <COMMON
PARAMETERS>

Update-PublicFolderMailbox -Identity <MailboxIdParameter> [-FullSync
<SwitchParameter>] [-InvokeSynchronizer <SwitchParameter>] [-
SuppressStatus <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the public folder hierarchy on the public folder mailbox PF_marketing and suppresses the command's output.

```
Update-PublicFolderMailbox -Identity PF_marketing -
SuppressStatus
```

EXAMPLE 2

This example updates all public folder mailboxes and suppresses the command's output.

```
Get-Mailbox -PublicFolder | Update-PublicFolderMailbox -
SuppressStatus
```

Detailed Description

This cmdlet only needs to be used if you want to manually invoke the hierarchy synchronizer and the mailbox assistant. Both these are invoked at least once every 24 hours for each public folder mailbox in the organization. The hierarchy synchronizer is invoked every 15 minutes if any users are logged on to a secondary mailbox through Microsoft Outlook or a Microsoft Exchange Web Services client.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the public folder mailbox. This parameter accepts the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias
Confirm	Optional	System.Management.	The *Confirm* switch can be

		Automation.SwitchParameter	used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$false`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FullSync	Optional	System.Management.Automation.SwitchParameter	The *FullSync* parameter specifies that you want to perform a full synchronization of the public folder mailbox.
InvokeSynchronizer	Optional	System.Management.Automation.SwitchParameter	The *InvokeSynchronizer* parameter can only be used on secondary hierarchy public folder mailboxes and triggers hierarchy synchronization

			from the primary public folder mailbox to the specified secondary public folder mailbox. This parameter should only be used for troubleshooting purposes.
SuppressStatus	Optional	System.Management.Automation.SwitchParameter	The *SuppressStatus* parameter specifies that the output of this cmdlet is suppressed and that the command will run asynchronously in the background from the Exchange Management Shell. If you don't use this parameter in the command, the output will display status messages every 3 seconds for up to one minute. Until the minute passes, you can't use that instance of the Shell.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderMailboxDiagnostics

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-17*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolderMailboxDiagnostics** cmdlet to view event-level information about a public folder mailbox. This information can be used to troubleshoot public folder issues.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderMailboxDiagnostics -Identity <MailboxIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
IncludeDumpsterInfo <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example returns the diagnostic information for the public folder mailbox Customer Escalations.

```
Get-PublicFolderMailboxDiagnostics -Identity "Customer
```

```
Escalations"
```

EXAMPLE 2

This example returns the diagnostic information for the public folder mailbox Sales Forecasts and exports the report to a CSV file.

```
Get-PublicFolderMailboxDiagnostics -Identity "Sales
Forecasts" | Export-CSV C:\Diagnostics\SalesForecasts.csv
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the public folder mailbox. The public folder mailbox is where the content of the public folder resides.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeDumpsterInfo	Optional	System.Management.Automation.SwitchParameter	The *IncludeDumpsterInfo* parameter specifies that diagnostic information for the \NON_IPM_TREE \DUMPSTER_ROOT folder, which serves as the dumpster for public folder mailboxes, is included in the returned information.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolderStatistics** cmdlet to retrieve statistical information about public folders, such as folder size and last logon time.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderStatistics [-Identity <PublicFolderIdParameter>] [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>] [-Organization
<OrganizationIdParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example retrieves statistics about the public folder Marketing\2013\Pamphlets. The output of

the **Get-PublicFolderStatistics** command is piped to the **Format-List** command so that all the available information is displayed in the result.

```
Get-PublicFolderStatistics -Identity "\Marketing\2013
\Pamphlets" | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter	The *Identity* parameter specifies the GUID or public folder name that represents a specific public folder. You can also include the path using the format *\TopLevelPublicFolder*

			\PublicFolder. You can omit the parameter label so that only the public folder name or GUID is supplied.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the hierarchy public folder mailbox.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return statistics for all public folders that match the query, use `unlimited` for the value of this parameter. The default value is `100`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SharingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SharingPolicy** cmdlet to view the settings of sharing policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SharingPolicy [-Identity <SharingPolicyIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the default information for the sharing policy FourthCoffee.

```
Get-SharingPolicy -Identity FourthCoffee
```

EXAMPLE 2

This example retrieves the full information for the sharing policy Fabrikam.

```
Get-SharingPolicy Fabrikam | Format List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Sharing policies" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.SharingPolicyIdParameter	The *Identity* parameter specifies the identity of the sharing policy for which you want to view the settings. You can use one of the following values: • ADObjectID • Distinguished name (DN) • Legacy DN • GUID The *Identity* parameter can't be used with the *Organization* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-SharingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-SharingPolicy** cmdlet to create a sharing policy to regulate how users inside your organization can share calendar and contact information with users outside the organization. Users can only share this information after federation has been configured in Exchange. After federation is configured, users can send sharing invitations that comply with a sharing policy to external recipients in other Microsoft Exchange Server 2013 and Exchange Server 2010 organizations that have federation enabled. A sharing policy needs to get assigned to a mailbox to be effective. If a mailbox doesn't have a specific sharing policy assigned, a default policy enforces the level of sharing permitted for this mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-SharingPolicy -Domains <MultiValuedProperty> -Name <String> [-Confirm
[<SwitchParameter>]] [-Default <SwitchParameter>] [-DomainController
<Fqdn>] [-Enabled <$true | $false>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the sharing policy Contoso for the contoso.com domain, which is a domain outside the organization. This policy allows users in the contoso.com domain to see detailed free/busy information and contacts. By default, this policy is enabled.

```
New-SharingPolicy -Name "Contoso" -Domains
```

```
'mail.contoso.com: CalendarSharingFreeBusyDetail,
ContactsSharing'
```

EXAMPLE 2

This example creates a default sharing policy, which is applied to all mailboxes that don't implicitly have a sharing policy assigned to them. This sharing policy SharingPolicy01 applies to two different domains, and the sharing policy is disabled.

```
New-SharingPolicy -Name "SharingPolicy01" -Domains
'mail.contoso.com: CalendarSharingFreeBusySimple',
'mail.fabrikam.com: CalendarSharingFreeBusySimple' -Enabled
$false -Default $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Sharing policies" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Domains	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Domains* parameter specifies the domains to which this sharing policy applies and the sharing policy actions. Values for this parameter take the format: '*Domain:SharingPolicyAction*'. The following sharing policy action values can be used: • **CalendarSharingFreeBusySimple** Share free/busy hours only

			• **CalendarSharingFreeBusyDetail** Share free/busy hours, subject, and location • **CalendarSharingFreeBusyReviewer** Share free/busy hours, subject, location, and the body of the message or calendar item • **ContactsSharing** Share contacts only Separate multiple domains with a comma, for example, 'mail.contoso.com: CalendarSharingFreeBusySimple', 'mail.fabrikam.com: CalendarSharingFreeBusyDetail, ContactsSharing'. **Note:** A domain doesn't include subdomains. You must configure each subdomain separately.
Name	Required	System.String	The *Name* parameter specifies the name of the new sharing policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Default	Optional	System.Management.Automation.SwitchParameter	The *Default* switch specifies that this sharing policy is the default sharing policy for all mailboxes. If no sharing policy has been applied to a mailbox, the default policy is automatically applied. If you want to disable sharing across your organization, you can set the default policy as disabled. You don't have to specify a value with this switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the new sharing policy. Valid input for this parameter is `$true` or `$false`. The default is `$true`. When the sharing policy is disabled, users who are provisioned to use this policy continue to share information until the sharing policy assistant runs and removes the permissions on the shared folder. The frequency with which the sharing policy assistant runs is assigned in the **Set-MailboxServer** cmdlet using the *SharingPolicySchedule* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-SharingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-SharingPolicy** cmdlet to remove a sharing policy. Before you can remove a sharing policy, you must ensure that no mailbox users are provisioned to use that policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-SharingPolicy -Identity <SharingPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the sharing policy Fabrikam.

```
Remove-SharingPolicy Fabrikam
```

EXAMPLE 2

This example removes the sharing policy Contoso and suppresses the confirmation that you want to remove the policy.

```
Remove-SharingPolicy -Identity Contoso -Confirm:$false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Sharing policies" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.SharingPolicyIdParameter	The *Identity* parameter specifies the identity of the sharing policy that you want to remove. You can use one of the following values: • ADObjectID • Distinguished name (DN) • Legacy DN • GUID
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when

			this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SharingPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-SharingPolicy** cmdlet to modify an existing sharing policy to regulate how users inside your organization can share free/busy and contact information with users outside the organization. Users can only share this information after federation has been configured in Exchange. After federation is configured, users can send sharing invitations that comply with a sharing policy to external recipients in other Microsoft Exchange Server 2010 and Exchange Server 2013 organizations that have federation enabled. A sharing policy needs to be assigned to a mailbox to be effective. If a mailbox doesn't have a specific sharing policy assigned, a default policy enforces the level of sharing permitted for this mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-SharingPolicy -Identity <SharingPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-Default <SwitchParameter>] [-DomainController
<Fqdn>] [-Domains <MultiValuedProperty>] [-Enabled <$true | $false>] [-
Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the sharing policy Contoso for contoso.com, which is a domain outside your organization. This policy allows users in the Contoso domain to see simple free/busy information.

```
Set-SharingPolicy -Identity Contoso -Domains
'mail.contoso.com: CalendarSharingFreeBusySimple'
```

EXAMPLE 2

This example adds a second domain to the sharing policy SharingPolicy01. When you're adding a domain to an existing policy, you must include any previously included domains.

```
Set-SharingPolicy -Identity SharingPolicy01 -Domains
'contoso.com: CalendarSharingFreeBusySimple',
'atlanta.contoso.com: CalendarSharingFreeBusyReviewer',
'beijing.contoso.com: CalendarSharingFreeBusyReviewer'
```

EXAMPLE 3

This example disables the sharing policy SharingPolicy01.

```
Set-SharingPolicy -Identity "SharingPolicy01" -Enabled
$false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Sharing policies" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.SharingPolicyIdParameter	The *Identity* parameter specifies the identity of the sharing policy that you want to modify. You can use one of the following values: • ADObjectID • Distinguished name (DN) • Legacy DN • GUID

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Default	Optional	System.Management.Automation.SwitchParameter	The *Default* switch specifies that this sharing policy is the default sharing policy for all mailboxes. If no sharing policy has been applied to a mailbox, the default policy is automatically applied. If you want to disable sharing across your organization, you can set the default policy to be disabled. You don't have to specify a value with this parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Domains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Domains* parameter specifies domains to which this policy applies and the sharing policy action. Values for this parameter use the format *Domain*: *SharingPolicyAction*. The following sharing policy action values can be used: • `CalendarSharingFreeBusySimple` Share free/busy hours only • `CalendarSharingFreeBusyDetail` Share free/busy hours, subject, and location • `CalendarSharingFreeBusyReviewer` Share free/busy hours, subject, location, and the body of the message or calendar item • `ContactsSharing` Share contacts only

			The following is an example: `'Contoso.com: Ca` **Note:** Adding a domain doesn't include subdomains. You must configure each subdomain separately.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the sharing policy. Valid values for this parameter are `$true` or `$false`. The default is `$true`. When the sharing policy is disabled, users who are provisioned to use this policy continue to share information until the sharing policy assistant runs.
Name	Optional	System.String	The *Name* parameter specifies the name of the sharing policy.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can

			view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SiteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SiteMailbox** cmdlet to view information about site mailboxes. This cmdlet is primarily used by Microsoft SharePoint and Exchange to display information to users in the user interface. However, you may find it helpful for discovering information such as the site mailbox's owners, members, and lifecycle status.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SiteMailbox <COMMON PARAMETERS>

Get-SiteMailbox [-BypassOwnerCheck <SwitchParameter>] [-DeletedSiteMailbox
<SwitchParameter>] [-Organization <OrganizationIdParameter>] <COMMON
PARAMETERS>
```

```
COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-Anr
<String>] [-DomainController <Fqdn>] [-Identity <RecipientIdParameter>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the default information about the site mailbox ContentSite, which includes the site name, when the site mailbox was closed, and the SharePoint URL.

```
Get-SiteMailbox -BypassOwnerCheck -Identity ContentSite
```

EXAMPLE 2

This example returns the full information about the site mailbox ContentSite.

```
Get-SiteMailbox -BypassOwnerCheck -Identity ContentSite |
Format-List
```

EXAMPLE 3

This example queries for site mailboxes that are marked for deletion and removes them from the mailbox database by pipelining the **Remove-Mailbox** cmdlet.

```
Get-SiteMailbox -BypassOwnerCheck -DeletedSiteMailbox |
Remove-Mailbox -Confirm:$false
```

Detailed Description

If you aren't a member or owner of the site mailbox that you want to view the diagnostics information for, you must use the *BypassOwnerCheck* parameter when running this cmdlet. If you aren't a member or owner of the site mailbox and you run this cmdlet without using the *BypassOwnerCheck* parameter, the command fails with an "object not found" error.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailboxes" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Co	This parameter is reserved

		nfiguration.Tasks.AccountPartitionIdParameter	for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches the string. The default attributes searched are: • CommonName (CN) • DisplayName • Name • Alias
BypassOwnerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassOwnerCheck* parameter is used by administrators who aren't members or owners of the site mailbox. If you aren't a member or owner of the site mailbox and you run this cmdlet without using the *BypassOwnerCheck* parameter, the command fails with an "object not found" error.
DeletedSiteMailbox	Optional	System.Management.Automation.SwitchPar	This parameter is available only in on-

		ameter	premises Exchange 2013. The *DeletedSiteMailbox* parameter returns site mailboxes that have been marked for pending deletion. When the lifecycle application in SharePoint closes a site mailbox, the site mailbox is retained for the period specified in the lifecycle policy in the closed state. The mailbox can then be reactivated by an end user or by a SharePoint administrator. After the retention period, the Exchange site mailbox that's housed in the mailbox database will have its name prepended with **MDEL:** to indicate that it has been marked for deletion. To free storage space and the alias, use the Remove-Mailbox cmdlet to manually remove these site mailboxes from the mailbox database.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-

			premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the identity of the site mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • Display name • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* switch specifies that information should be read from a domain controller in the user's

			domain. If you run the command `Set-AdServerSettings -ViewEntireForest $true` to include all objects in the forest and you don't use the *ReadFromDomainController* switch, it's possible that information will be read from a global catalog that has outdated information. When you use the *ReadFromDomainController* switch, multiple reads might be necessary to get the information. You don't have to specify a value with this switch. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all site mailboxes that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SiteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-SiteMailbox** cmdlet to change a site mailbox's settings, such as the Microsoft SharePoint URL. This cmdlet is primarily used by the SharePoint and Microsoft Exchange user interfaces, such as the SharePoint URL. This cmdlet should only be used for diagnostic and troubleshooting purposes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-SiteMailbox <COMMON PARAMETERS>

Set-SiteMailbox [-ShowInMyClient <$true | $false>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <RecipientIdParameter> [-Active <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DisplayName <String>] [-
DomainController <Fqdn>] [-Force <SwitchParameter>] [-Members
<RecipientIdParameter[]>] [-Owners <RecipientIdParameter[]>] [-
RemoveDuplicateMessages <$true | $false>] [-SharePointUrl <Uri>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the SharePoint URL for the MarketingEvents 2013 site mailbox.

```
Set-SiteMailbox -Identity "MarketingEvents 2013" -
SharePointUrl "https://myserver/teams/marketing"
```

EXAMPLE 2

This example disables the duplication of email messages in the site mailbox SMO_ContosoSales.

```
Set-SiteMailbox -Identity SMO_ContosoSales -
RemoveDuplicateMessages $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailboxes" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the identity of the site mailbox. You can use any of the following values: • Distinguished name (DN) • GUID • Name • Display name • Alias • Primary SMTP address
Active	Optional	System.Boolean	The *Active* parameter specifies whether to change the site mailbox's lifecycle status. This parameter accepts `$true`

			or `$false`. This parameter is intended for use only by the user interface. We recommend that you don't use this parameter in the Exchange Management Shell.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name of the site mailbox.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies that the command should run immediately and bypass confirmation prompts.
Members	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *Members* parameter specifies the members of the site mailbox. You can add or remove members using this parameter. This is a multivalued parameter and multiple recipients should be separated by a comma. This parameter is intended for use only by the user interface. We recommend that you don't use this parameter in the Shell.
Owners	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *Owners* parameter specifies the site mailbox's owners. This is a multivalued field and multiple recipients should be separated by commas. This parameter is intended for use only by the user interface. We recommend that you

			don't use this parameter in the Shell.
RemoveDuplicateMessages	Optional	System.Boolean	The *RemoveDuplicateMessages* parameter specifies that when users post messages to a site mailbox, duplicate messages will be deleted. This parameter accepts the values of `$true` or `$false`. The default value is `$false`.
SharePointUrl	Optional	System.Uri	The *SharePointUrl* parameter specifies the URL of the SharePoint site, for example, `"https://myserver/teams/edu"`.
ShowInMyClient	Optional	System.Boolean	The *ShowInMyClient* parameter specifies that the site mailbox folder will show in your email client. This parameter is intended for use only by the user interface. We recommend that you don't use this parameter in the Shell.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-SiteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Test-SiteMailbox** cmdlet to test the site mailbox to Microsoft SharePoint connectivity and to test whether users have the correct permissions to use a site mailbox. This cmdlet should be used for troubleshooting and diagnostic purposes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-SiteMailbox [-BypassOwnerCheck <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-SharePointUrl <Uri>] [-Confirm
[<SwitchParameter>]] [-Identity <RecipientIdParameter>] [-
```

```
RequestorIdentity <RecipientIdParameter>] [-UseAppTokenOnly
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

The example tests a SharePoint site's connectivity only. You can use this command before creating a site mailbox or if you're having a problem creating a site mailbox.

```
Test-SiteMailbox -BypassOwnerCheck -SharePointUrl "https://
myserver/teams/edu"
```

EXAMPLE 2

This example tests the Exchange server connectivity with an existing site mailbox using the *Identity* and *UseAppTokenOnly* parameters. The *Identity* parameter specifies the site mailbox, and the *UseAppTokenOnly* parameter specifies that you want to test under the identity of the Exchange server. Run this command for troubleshooting documentation synchronization issues.

```
Test-SiteMailbox -BypassOwnerCheck -Identity
mysitemailbox@contoso.com -UseAppTokenOnly
```

EXAMPLE 3

This example tests a specific user's ability to access a SharePoint site by using the *RequestorIdentity* parameter.

```
Test-SiteMailbox -BypassOwnerCheck -RequestorIdentity
"kweku@contoso.com" -SharePointUrl "https://myserver/teams/
edu"
```

Detailed Description

If you don't specify the *RequestorIdentity* parameter, the command uses the identification of the user running this command.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the"Site mailboxes" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description

BypassOwnerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassOwnerCheck* parameter specifies that the user running this command isn't the owner of the site mailbox being tested. If you're running this command and you aren't the owner of the site mailbox, you must use this parameter for the command to complete successfully. You don't have to supply a value with this parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the identity of the site mailbox. You can use any of the following values: • Distinguished name (DN)

			• GUID • Name • Display name • Alias • Primary SMTP address You can't use this parameter in conjunction with the *SharePointUrl* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RequestorIdentity	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *RequestorIdentity* parameter specifies the identity of a user for whom you want to test to make sure that they have the correct permissions to connect to the SharePoint site mailbox. If you don't specify this parameter, the command uses the identification of the user running this command. You can use any of the following values: • DN • GUID • Name • Display name • Alias • Primary SMTP address

			You can't use this parameter in conjunction with the *UseAppTokenOnly* parameter.
SharePointUrl	Optional	System.Uri	This parameter is available only in on-premises Exchange 2013. The *SharePointUrl* parameter specifies the SharePoint URL where the site mailbox is hosted, for example, `"https://myserver/teams/edu"`. You can't use this parameter in conjunction with the *Identity* parameter.
UseAppTokenOnly	Optional	System.Management.Automation.SwitchParameter	The *UseAppTokenOnly* parameter specifies that you want to test under the identity of the Exchange server. You can't use this cmdlet in conjunction with the *RequestorIdentity* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-SiteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Update-SiteMailbox** cmdlet to trigger a Microsoft SharePoint synchronization. This command synchronizes document content membership and permissions into Microsoft Exchange. You may need to perform this action when troubleshooting document or membership synchronization issues.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-SiteMailbox -Identity <RecipientIdParameter> [-BypassOwnerCheck
<SwitchParameter>] [-FullSync <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-Server <String>] [-Confirm
[<SwitchParameter>]] [-Target <All | Document | Membership | Maintenance>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the site mailbox MarketingEvents 2013. If you don't specify the target, this triggers both document and membership synchronization. Because the *BypassOwnerCheck* parameter is used, it isn't necessary to be an owner or member of the site mailbox to run this cmdlet.

```
Update-SiteMailbox -BypassOwnerCheck -Identity
"MarketingEvents 2013"
```

EXAMPLE 2

This example updates the site mailbox WinterHoliday@tailspintoys.com and performs a full synchronization. By default, the update only occurs for synchronization from the last synchronization. This is only applicable to document synchronization

```
Update-SiteMailbox -BypassOwnerCheck -Identity
WinterHoliday@tailspintoys.com -FullSync
```

Detailed Description

If you are running this command against a site mailbox in which you aren't the owner, you need to use the *BypassOwnerCheck* parameter to run this cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailboxes" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the identity of the site mailbox. This parameter accepts the following values: • DisplayName • SMTP address

			• Name • GUID
BypassOwnerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassOwnerCheck* parameter specifies that the user running the command in the Exchange Management Shell isn't a site mailbox owner or member. If you run the command without this parameter and you aren't the site mailbox owner or member, the command doesn't run or return any information.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
FullSync	Optional	System.Management.Automation.SwitchParameter	The *FullSync* parameter specifies full sync is expensive and will have a performance impact on the Exchange system.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.
Server	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Server* parameter specifies the fully qualified domain name (FQDN) or the Microsoft SharePoint server on which the site mailbox is located.
Target	Optional	Microsoft.Exchange.Management.RecipientTasks.TeamMailboxDiagnosticsBase+TargetType	The *Target* parameter specifies whether to update the SharePoint documents, the site mailbox's membership list or both. This parameter accepts the following values: • `All` • `Document` • `Membership` If you don't specify this parameter when you run the cmdlet, this parameter value defaults to `ALL`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SiteMailboxDiagnostics

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-07*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SiteMailboxDiagnostics** cmdlet to view important event-related data for each site mailbox. This information can be used to troubleshoot site mailbox issues.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SiteMailboxDiagnostics -Identity <RecipientIdParameter> [-
BypassOwnerCheck <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-Confirm [<SwitchParameter>]] [-SendMeEmail
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example returns the event information for the site mailbox by using its display name Marketing Events 2013.

```
Get-SiteMailboxDiagnostics -BypassOwnerCheck -Identity
"Marketing Events 2013"
```

EXAMPLE 2

This example returns the event information for the Marketing Events 2013 site mailbox and sends an email to the primary SMTP address of the user running this command.

```
Get-SiteMailboxDiagnostics -BypassOwnerCheck -Identity
events2013@contoso.com -SendMeEmail
```

Detailed Description

If you aren't a member or owner of the site mailbox that you want to view the diagnostics information for, you must use the *BypassOwnerCheck* parameter when running this cmdlet. If you aren't a member or owner of the site mailbox and you run this cmdlet without using the *BypassOwnerCheck* parameter, the command fails with an "object not found" error.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailboxes" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the site mailbox. You can use the following values: • Alias • Display name • *Domain\Account* • SMTP address • Distinguished name (DN) • Object GUID

			• User principal name (UPN) • LegacyExchangeDN
BypassOwnerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassOwnerCheck* switch is used by administrators who aren't members or owners of the site mailbox. If you aren't a member or owner of the site mailbox and you run this cmdlet without using the *BypassOwnerCheck* parameter, the command fails with an "object not found" error.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
SendMeEmail	Optional	System.Management.Automation.SwitchPar	The *SendMeEmail* parameter specifies that

		ameter	the diagnostic information is sent to the primary SMTP email address for whichever user is logged into Remote PowerShell.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SiteMailboxProvisioningPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SiteMailboxProvisioningPolicy** cmdlet to view information about site mailbox provisioning policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SiteMailboxProvisioningPolicy [-Identity <MailboxPolicyIdParameter>]
[-DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns the default information about all site mailbox provisioning policies in your organization.

```
Get-SiteMailboxProvisioningPolicy
```

EXAMPLE 2

This example returns detailed information about the provisioning policy with the identity SM_NewPolicy

```
Get-SiteMailboxProvisioningPolicy -Identity SM_NewPolicy |
Format-List
```

EXAMPLE 3

This example returns all policies in your organization, but only displays the IsDefault information to identify which policy is the default policy.

```
Get-SiteMailboxProvisioningPolicy | Format-List IsDefault
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailbox provisioning policy" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identity of the site mailbox provisioning policy.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-SiteMailboxProvisioningPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-SiteMailboxProvisioningPolicy** cmdlet to create a provisioning policy for site mailboxes that configures the send and receive quotas and allows you to set the default provisioning policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-SiteMailboxProvisioningPolicy -Name <String> [-AliasPrefix <String>]
[-Confirm [<SwitchParameter>]] [-DefaultAliasPrefixEnabled <$true |
$false>] [-DomainController <Fqdn>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-IsDefault <SwitchParameter>] [-IssueWarningQuota
<ByteQuantifiedSize>] [-MaxReceiveSize <ByteQuantifiedSize>] [-
Organization <OrganizationIdParameter>] [-ProhibitSendReceiveQuota
<ByteQuantifiedSize>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the default provisioning policy SM_ProvisioningPolicy that has the following settings:

- The warning quota for the site mailboxes is 9 GB.
- The site mailboxes are prohibited from receiving messages when the mailbox size reaches 10 GB.
- The maximum size of email messages that can be sent to site mailboxes is 50 MB.

```
New-SiteMailboxProvisioningPolicy -Name
SM_ProvisioningPolicy -IsDefault -IssueWarningQuota 9GB -
ProhibitSendReceiveQuota 10GB -MaxReceiveSize 50MB
```

EXAMPLE 2

This example creates the default provisioning policy SM_DefaultPolicy that uses the defaults for send and receive quotas. If you don't explicitly specify the *IssueWarningQuota* and *ProhibitSendReceiveQuota* parameters, the command uses the default values.

```
New-SiteMailboxProvisioningPolicy -Name SM_DefaultPolicy -
IsDefault
```

EXAMPLE 3

This example creates the default provisioning policy SM_DefaultPolicy and sets the *AliasPrefix* to **Project**. When site mailboxes are created, they are prepended with the prefix **Project-**.

Note:

By default, the *DefaultAliasPrefixEnabled* parameter is set to `$true`, all on-premises site mailboxes are created with the prefix **SM-**, and all cloud-based site mailboxes are created with the prefix **SMO-**. The *AliasPrefix* parameter takes precedence over the *DefaultAliasPrefixEnabled* parameter.

```
New-SiteMailboxProvisioningPolicy -Name SM_DefaultPolicy -
IsDefault -AliasPrefix Project
```

Detailed Description

You can create multiple site mailbox provisioning policies, but only the default policy is followed when users create site mailboxes. When Exchange is installed, a site mailbox provisioning policy is created named Default. When creating a site mailbox provisioning policy, you can set the send and receive quotas. If you don't explicitly state the quotas, the cmdlet uses the default values. The following are the default values.

- *IssueWarningQuota* 4.5 gigabytes (GB)
- *ProhibitSendReceiveQuota* 5 GB
- *MaxReceiveSize* 36 megabytes (MB)

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailboxes" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *Name* parameter specifies the name of the provisioning policy that you are creating.

AliasPrefix	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *AliasPrefix* parameter allows you to configure a custom prefix that you want added to site mailbox aliases. If the *AliasPrefix* parameter is set to a valid, non-null string, each new site mailbox will have that string prepended to the alias. If the *AliasPrefix* parameter is set to `$null` and the *DefaultAliasPrefixEnabled* parameter is set to `$true`, the default prefix is used. If the *AliasPrefix* parameter is set to `$null` and the *DefaultAliasPrefixEnabled* parameter is set to `$false`, no prefix is used.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -

			`Confirm:$False`. You must include a colon (`:`) in the syntax.
DefaultAliasPrefixEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *DefaultAliasPrefixEnabled* parameter specifies whether all new site mailboxes will have **SM-** prepended to the alias if the site mailbox is in an on-premises organization or will have **SMO-** prepended to the alias if the site mailbox is in an Exchange Online or Office365 organization. However, if a value has been specified for the *AliasPrefix* parameter, that value will be used even if this parameter is set to `$true`. For example, if the *DefaultAliasPrefixEnabled* parameter is set to `$true`, the *AliasPrefix* parameter is set to `$null`, and an on-premises site mailbox is created named

			BugBash_2013, the alias for that site mailbox will be SM-BugBash_2013. If the *AliasPrefix* parameter is `$null` and the *DefaultAliasPrefixEnabled* parameter is `$false`, no prefix will be added for new site mailboxes. This parameter accepts `$true` or `$false`. The default value is `$true`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefault	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IsDefault* parameter specifies that the site

			mailbox provisioning policy is the default policy. You can have multiple policies, but only the default policy is followed when users create site mailboxes.
IssueWarningQuota	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *IssueWarningQuota* parameter specifies the site mailbox size that triggers a warning message to the site mailbox. The default value is 4.5 GB. When you enter the value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `1B` through `unlimited`. If you enter a value of `unlimited`, no size limit is

			imposed on the site mailbox.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum size of email messages that can be received by the site mailbox. The default value is 36 MB. When you enter the value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `1B` through `unlimited`. If you enter a value of `unlimited`, no size limit is imposed on the site mailbox.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.Orga	The *Organization* parameter is reserved for

		nizationIdParameter	internal Microsoft use.
ProhibitSendReceiveQuota	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *ProhibitSendReceiveQuota* parameter specifies the size at which the site mailbox can no longer send or receive messages. The default value is 5 GB. When you enter the value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `1B` through `unlimited`. If you enter a value of `unlimited`, no size limit is imposed on the site mailbox.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it

			would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-SiteMailboxProvisioningPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-SiteMailboxProvisioningPolicy** cmdlet to delete a site mailbox provisioning policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-SiteMailboxProvisioningPolicy -Identity <MailboxPolicyIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the site mailbox policy that was created when you installed Microsoft Exchange.

⚠**Warning:**
You must first create and designate a default policy before you can remove the policy named Default.

```
Remove-SiteMailboxProvisioningPolicy -Identity Default
```

Detailed Description

You can't delete the default site mailbox provisioning policy. You need to create a default policy by using the New-SiteMailboxProvisioningPolicy cmdlet or assign another provisioning policy as the default by using the Set-SiteMailboxProvisioningPolicy cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailbox provisioning policy" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identity of the site mailbox provisioning policy that you want to delete.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SiteMailboxProvisioningPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Sharing and collaboration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-SiteMailboxProvisioningPolicy** cmdlet to modify an existing site mailbox provisioning policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-SiteMailboxProvisioningPolicy -Identity <MailboxPolicyIdParameter> [-
AliasPrefix <String>] [-Confirm [<SwitchParameter>]] [-
DefaultAliasPrefixEnabled <$true | $false>] [-DomainController <Fqdn>] [-
IgnoreDehydratedFlag <SwitchParameter>] [-IsDefault <SwitchParameter>] [-
IssueWarningQuota <ByteQuantifiedSize>] [-MaxReceiveSize
<ByteQuantifiedSize>] [-Name <String>] [-ProhibitSendReceiveQuota
<ByteQuantifiedSize>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the site mailbox provisioning policy named Default to allow the maximum size of email messages that can be received by the site mailbox to 25 MB. When you install Exchange, a provisioning policy is created with the name Default.

```
Set-SiteMailboxProvisioningPolicy -Identity Default -
MaxReceiveSize 25MB
```

EXAMPLE 2

This example changes the warning quota to 9.5 GB and the prohibit send and receive quota to 10 GB.

```
Set-SiteMailboxProvisioningPolicy -Identity Default -
IssueWarningQuota 9GB -ProhibitSendReceiveQuota 10GB
```

EXAMPLE 3

This example changes the default provisioning policy SM_DefaultPolicy and sets the *AliasPrefix*

parameter to `Project`. When site mailboxes are created, they are prepended with the prefix **Project-**.

Note:
By default, the *DefaultAliasPrefixEnabled* parameter is set to `$true` and all on-premises site mailboxes are created with the prefix **SM-** and all cloud-based site mailboxes are created with the prefix **SMO-**. The *AliasPrefix* parameter takes precedence over the *DefaultAliasPrefixEnabled* parameter.

```
Set-SiteMailboxProvisioningPolicy -Identity
SM_DefaultPolicy -AliasPrefix Project
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Site mailbox provisioning policy" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identity of the site mailbox provisioning policy that you want to edit.
AliasPrefix	Optional	System.String	The *AliasPrefix* parameter allows you to configure a custom prefix that you want added to site mailbox aliases. If the *AliasPrefix* parameter is set to a valid, non-null string, each new site mailbox will have that string prepended to the

			alias. If the *AliasPrefix* parameter is set to `$null` and the *DefaultAliasPrefixEnabled* parameter is set to `$true`, the default prefix will be used. If *AliasPrefix* parameter is set to `$null` and the *DefaultAliasPrefixEnabled* parameter is set to `$false`, no prefix will be used.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DefaultAliasPrefixEnabled	Optional	System.Boolean	The *DefaultAliasPrefixEnabled* parameter specifies whether all new site mailboxes will have **SM-** prepended to the alias if the site mailbox is in an on-premises organization or will have **SMO-**

			prepended to the alias if the site mailbox is in an Exchange Online or Office365 organization. However, if a value has been specified for the *AliasPrefix* parameter, that value will be used even if this parameter is set to `$true`. For example, if the *DefaultAliasPrefixEnabled* parameter is set to `$true`, the *AliasPrefix* parameter is set to `$null`, and an on-premises site mailbox is created named BugBash_2013, the alias for that site mailbox will be SM-BugBash_2013. If the *AliasPrefix* parameter is `$null` and the *DefaultAliasPrefixEnabled* parameter is `$false`, no prefix will be added for new site mailboxes. This parameter accepts `$true` or `$false`. The default value is `$true`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefault	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IsDefault* switch specifies that the site mailbox provisioning policy is the default policy. You can have multiple policies, but only the default policy is followed when users create site mailboxes.
IssueWarningQuota	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *IssueWarningQuota* parameter specifies the site mailbox size that triggers a warning message to the site

			mailbox. The default value is 4.5 gigabytes (GB). When you enter the value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `1 B` to `unlimited`. If you enter a value of `unlimited`, no size limit is imposed on the site mailbox.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum size of email messages that can be received by the site mailbox. The default value is 36 MB. When you enter the value, qualify the value with one of the following units: • B (bytes)

			• KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `1 B` to `unlimited`. If you enter a value of `unlimited`, no size limit is imposed on the site mailbox.
Name	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Name* parameter allows you to change the name of the site mailbox provisioning policy.
ProhibitSendReceiveQuota	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *ProhibitSendReceiveQuota* parameter specifies the size at which the site mailbox can no longer send or receive messages. The default value is 5 GB. When you enter the value, qualify the value with one

			of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `1 B` to `unlimited`. If you enter a value of `unlimited`, no size limit is imposed on the site mailbox.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMActiveCalls

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-UMActiveCalls** cmdlet to return information about the calls that are active and being processed by the Mailbox server running the Microsoft Exchange Unified Messaging service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMActiveCalls [-Server <ServerIdParameter>] <COMMON PARAMETERS>

Get-UMActiveCalls -InstanceServer <UMServer> <COMMON PARAMETERS>

Get-UMActiveCalls -DialPlan <UMDialPlanIdParameter> <COMMON PARAMETERS>

Get-UMActiveCalls -IPGateway <UMIPGatewayIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays the details of all active calls on the local Mailbox server.

```
Get-UMActiveCalls
```

EXAMPLE 2

This example displays the details of all active calls on the Mailbox server MyUMServer.

```
Get-UMActiveCalls -Server MyUMServer
```

EXAMPLE 3

This example displays the details of all active calls being processed by the UM IP gateway MyUMIPGateway.

```
Get-UMActiveCalls -IPGateway MyUMIPGateway
```

EXAMPLE 4

This example displays a list of active calls associated with the UM dial plan MyUMDialPlan.

```
Get-UMActiveCalls -DialPlan MyUMDialPlan
```

Detailed Description

The **Get-UMActiveCalls** cmdlet returns information about the active calls being processed. If the **Get-UMActiveCalls** cmdlet specifies either the UM dial plan or UM IP gateway, it looks in Active Directory to determine which Mailbox server running the Microsoft Exchange Unified Messaging service must be contacted. If the Mailbox server is specified at a command prompt, the **Get-UMActiveCalls** cmdlet returns the active calls being processed by the server specified.

Note:
When a Mailbox server is process cycling, the **Get-UMActiveCalls** cmdlet doesn't return a list of all calls for both the discontinued process and the active process. It returns the active calls only for the new process.

After this task is completed, you can see the list of active calls being processed by a Mailbox server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Server (UM service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *DialPlan* parameter specifies the UM dial plan for which you want to retrieve active calls.
InstanceServer	Required	Microsoft.Exchange.Data.Directory.Management.UMServer	The *InstanceServer* parameter specifies the Mailbox server running the Microsoft Exchange Unified Messaging service for which you want to retrieve active

			calls.
IPGateway	Required	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *IPGateway* parameter specifies the UM IP gateway for which you want to retrieve active calls.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Mailbox server running the Microsoft Exchange Unified Messaging service for which you want to retrieve active calls.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-UMAutoAttendant

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-UMAutoAttendant** cmdlet to disable an existing Unified Messaging (UM) auto attendant that's enabled.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-UMAutoAttendant -Identity <UMAutoAttendantIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the UM auto attendant MyUMAutoAttendant.

```
Disable-UMAutoAttendant -Identity MyUMAutoAttendant
```

Detailed Description

The **Disable-UMAutoAttendant** cmdlet disables an existing UM auto attendant that's currently enabled. The **Disable-UMAutoAttendant** cmdlet disables the UM auto attendant by modifying its status variable. The **Disable-UMAutoAttendant** cmdlet can't disable the UM auto attendant if it's linked or associated to the UM hunt group associated with the default UM dial plan.

After this task is completed, the UM auto attendant is disabled and won't accept incoming calls.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *Identity* parameter specifies the identifier for the UM auto attendant that's being disabled.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-UMAutoAttendant

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-UMAutoAttendant** cmdlet to enable an existing Unified Messaging (UM) auto attendant that's disabled.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-UMAutoAttendant -Identity <UMAutoAttendantIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the UM auto attendant MyUMAutoAttendant.

```
Enable-UMAutoAttendant -Identity MyUMAutoAttendant
```

Detailed Description

The **Enable-UMAutoAttendant** cmdlet enables the UM auto attendant by modifying its status variable. When you create a UM auto attendant, it isn't enabled by default. For the auto attendant to answer incoming calls, you must first enable it. After this task is completed, the UM auto attendant answers incoming calls.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *Identity* parameter specifies the identifier for the UM auto attendant being enabled.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMAutoAttendant

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMAutoAttendant** cmdlet to retrieve the properties and the values for a Unified Messaging (UM) auto attendant.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMAutoAttendant [-Identity <UMAutoAttendantIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
UMDialPlan <UMDialPlanIdParameter>]
```

Examples

EXAMPLE 1

This example returns a formatted list of all UM auto attendants in the Active Directory forest.

```
Get-UMAutoAttendant | Format-List
```

EXAMPLE 2

This example displays the properties of the UM auto attendant MyUMAutoAttendant.

```
Get-UMAutoAttendant -Identity MyUMAutoAttendant
```

EXAMPLE 3

This examples displays all the UM auto attendants associated with the UM dial plan MyUMDialPlan.

```
Get-UMAutoAttendant -UMDialPlan MyUMDialPlan
```

Detailed Description

The **Get-UMAutoAttendant** cmdlet retrieves the properties for a single UM auto attendant or for a list of UM auto attendants.

After this task is completed, if no parameter is supplied with the cmdlet, the cmdlet returns all UM auto attendants in the Active Directory forest. Or, if the UM dial plan ID is supplied but no name is supplied, the cmdlet returns all UM auto attendants linked to the UM dial plan.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *Identity* parameter specifies the identifier for the UM auto attendant that's being viewed. This is the directory object ID for the UM auto attendant.

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies whether to display all the UM auto attendants that are associated with the UM dial plan that's specified.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-UMAutoAttendant

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-UMAutoAttendant** cmdlet to create a Unified Messaging (UM) auto attendant.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-UMAutoAttendant -Name <String> -UMDialPlan <UMDialPlanIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
DTMFFallbackAutoAttendant <UMAutoAttendantIdParameter>] [-Organization
```

```
<OrganizationIdParameter>] [-PilotIdentifierList <MultiValuedProperty>] [-
SharedUMDialPlan <SwitchParameter>] [-SpeechEnabled <$true | $false>] [-
Status <Enabled | Disabled>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the UM auto attendant MyUMAutoAttendant that can accept incoming calls using the extension number 55000 but isn't speech-enabled.

```
New-UMAutoAttendant -Name MyUMAutoAttendant -UMDialPlan
MyUMDialPlan -PilotIdentifierList 55000 -Status Enabled
```

EXAMPLE 2

This example creates the speech-enabled UM auto attendant MyUMAutoAttendant using the extension numbers 56000 and 56100 that can accept incoming calls.

```
New-UMAutoAttendant -Name MyUMAutoAttendant -UMDialPlan
MyUMDialPlan -PilotIdentifierList 56000,56100 -
SpeechEnabled $true -Status Enabled
```

Detailed Description

The **New-UMAutoAttendant** cmdlet creates one or more UM auto attendants. UM auto attendants have a forest-wide scope in the configuration container in Active Directory. When you create a UM auto attendant, the auto attendant isn’t speech-enabled or able to answer incoming calls by default. The auto attendant is linked to a single UM dial plan that contains a list of extension numbers. Linking the UM auto attendant to the UM dial plan enables the associated Mailbox servers to answer incoming calls using the UM auto attendant.

After this task is completed, a UM auto attendant is created.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the display

			name for the UM auto attendant. The display name for the UM auto attendant can contain as many as 64 characters.
UMDialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan identifier for the UM dial plan to be associated with this UM auto attendant.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
DTMFFallbackAutoAttendant	Optional	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *DTMFFallbackAutoAttendant* parameter specifies a secondary UM auto attendant. A secondary UM auto attendant can be used only if the *SpeechEnabled* parameter is set to `$true`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
PilotIdentifierList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *PilotIdentifierList* parameter specifies a list of one or more pilot numbers. Pilot numbers route incoming calls to Mailbox servers. The calls are then answered by the UM auto attendant.
SharedUMDialPlan	Optional	System.Management.Automation.SwitchPara	The *SharedUMDialPlan* parameter specifies

		meter	whether the auto attendant being created is linked or associated with a dial plan outside the scope of the organization. If you specify this parameter, the auto attendant can be linked with another tenant's dial plan. This parameter is used during tenant provisioning and is only used in a data center.
SpeechEnabled	Optional	System.Boolean	The *SpeechEnabled* parameter specifies whether the UM auto attendant is speech-enabled. The default value is `$true`. If this parameter is omitted, or if the value is `$false`, the UM auto attendant isn't speech-enabled.
Status	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.StatusEnum	The *Status* parameter specifies whether the UM auto attendant being created will be enabled. If this parameter isn't

			supplied, the UM auto attendant is created but left in a disabled state.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UMAutoAttendant

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UMAutoAttendant** cmdlet to delete a Unified Messaging (UM) auto attendant.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UMAutoAttendant -Identity <UMAutoAttendantIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the UM auto attendant MyUMAutoAttendant.

```
Remove-UMAutoAttendant -Identity MyUMAutoAttendant
```

Detailed Description

The **Remove-UMAutoAttendant** cmdlet deletes an existing UM auto attendant from Active Directory. The **Remove-UMAutoAttendant** cmdlet deletes the UM auto attendant and also deletes instances of the UM auto attendant from any associated UM dial plans. When the UM auto attendant is deleted, incoming telephone calls to the configured extensions are no longer answered by the UM auto attendant.

After this task is completed, the UM auto attendant is removed from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *Identity* parameter specifies the identifier for the UM auto attendant being deleted. This is the directory object ID for the UM auto attendant.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMAutoAttendant

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMAutoAttendant** cmdlet to modify an existing Unified Messaging (UM) auto attendant.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMAutoAttendant -Identity <UMAutoAttendantIdParameter> [-
AfterHoursKeyMapping <MultiValuedProperty>] [-AfterHoursKeyMappingEnabled
<$true | $false>] [-AfterHoursMainMenuCustomPromptEnabled <$true |
$false>] [-AfterHoursMainMenuCustomPromptFilename <String>] [-
AfterHoursTransferToOperatorEnabled <$true | $false>] [-
AfterHoursWelcomeGreetingEnabled <$true | $false>] [-
AfterHoursWelcomeGreetingFilename <String>] [-AllowDialPlanSubscribers
<$true | $false>] [-AllowedInCountryOrRegionGroups <MultiValuedProperty>]
[-AllowedInternationalGroups <MultiValuedProperty>] [-AllowExtensions
<$true | $false>] [-BusinessHoursKeyMapping <MultiValuedProperty>] [-
BusinessHoursKeyMappingEnabled <$true | $false>] [-
BusinessHoursMainMenuCustomPromptEnabled <$true | $false>] [-
BusinessHoursMainMenuCustomPromptFilename <String>] [-
BusinessHoursSchedule <ScheduleInterval[]>] [-
BusinessHoursTransferToOperatorEnabled <$true | $false>] [-
BusinessHoursWelcomeGreetingEnabled <$true | $false>] [-
BusinessHoursWelcomeGreetingFilename <String>] [-BusinessLocation
<String>] [-BusinessName <String>] [-CallSomeoneEnabled <$true | $false>]
[-Confirm [<SwitchParameter>]] [-ContactAddressList
```

```
<AddressListIdParameter>] [-ContactRecipientContainer
<OrganizationalUnitIdParameter>] [-ContactScope <DialPlan |
GlobalAddressList | AddressList>] [-DefaultMailbox <MailboxIdParameter>]
[-DomainController <Fqdn>] [-DTMFFallbackAutoAttendant
<UMAutoAttendantIdParameter>] [-ForceUpgrade <SwitchParameter>] [-
ForwardCallsToDefaultMailbox <$true | $false>] [-HolidaySchedule
<MultiValuedProperty>] [-InfoAnnouncementEnabled <True | False |
Uninterruptible>] [-InfoAnnouncementFilename <String>] [-Language
<UMLanguage>] [-MatchedNameSelectionMethod <Title | Department | Location
| None | PromptForAlias | InheritFromDialPlan>] [-Name <String>] [-
NameLookupEnabled <$true | $false>] [-OperatorExtension <String>] [-
PilotIdentifierList <MultiValuedProperty>] [-SendVoiceMsgEnabled <$true |
$false>] [-SpeechEnabled <$true | $false>] [-StarOutToDialPlanEnabled
<$true | $false>] [-TimeZone <String>] [-TimeZoneName <UMTimeZone>] [-
WeekStartDay <Sunday | Monday | Tuesday | Wednesday | Thursday | Friday |
Saturday>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the UM auto attendant MySpeechEnabledAA to fall back to the MyDTMFAA, sets the operator's extension to 50100, enables transfers to this extension number after business hours and enables a caller to press the * button on a telephone keypad to get to the Outlook Voice Access welcome greeting when a UM auto attendant menu is being played.

```
Set-UMAutoAttendant -Identity MySpeechEnabledAA -
DTMFFallbackAutoAttendant MyDTMFAA -OperatorExtension 50100
-AfterHoursTransferToOperatorEnabled $true -
StaroutToDialPlanEnabled $true
```

EXAMPLE 2

This example configures the UM auto attendant MyUMAutoAttendant that has business hours configured to be 10:45 to 13:15 (Sunday), 09:00 to 17:00 (Monday), and 09:00 to 16:30 (Saturday) and holiday times and their associated greetings configured to be "`New Year`" on January 2, 2013, and "`Building Closed for Construction`" from April 24, 2013 through April 28, 2013.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30 -HolidaySchedule "New
Year,newyrgrt.wav,1/2/2013","Building Closed for
Construction,construction.wav,4/24/2013,4/28/2013"
```

EXAMPLE 3

This example configures the UM auto attendant MyAutoAttendant and enables business hours key mappings so that when callers press 1, they're forwarded to another UM auto attendant named SalesAutoAttendant. When they press 2, they're forwarded to extension number 12345 for Support, and when they press 3, they're sent to another auto attendant that plays an audio file.

```
Set-UMAutoAttendant -Identity MyAutoAttendant -
BusinessHoursKeyMappingEnabled $true -
BusinessHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

Detailed Description

The **Set-UMAutoAttendant** cmdlet changes or modifies the settings of an existing UM auto attendant. By default, some UM auto attendant parameters are required and are created. However, after a UM auto attendant is created, not all properties for the UM auto attendant are writable. Therefore, some values for the UM auto attendant can't be changed or modified unless the UM auto attendant is deleted and a new UM auto attendant is created.

After this task is completed, the parameters and values specified are configured on the UM auto attendant.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *Identity* parameter specifies the identifier for the UM auto attendant being viewed. This parameter is the directory object ID for the UM auto attendant.
AfterHoursKeyMapping	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AfterHoursKeyMapping* parameter specifies the key mappings to be used for after business hours for the UM auto attendant.

			A key mapping is defined as an entry in a table that has as many as 9 entries. The 0 key is reserved for a transfer to the operator. The following is an example for a custom table that has two entries: "Sales, 77899","Service, 78990". The default value is `disabled`.
AfterHoursKeyMappingEnabled	Optional	System.Boolean	The *AfterHoursKeyMappingEnabled* parameter specifies whether to enable or disable key mappings for after business hours for the UM auto attendant. A key mapping is defined as an entry in a table that has as many as 9 entries. The 0 key is reserved for a transfer to the operator. The following is an example for a custom table that has two entries: "Sales, 77899","Service, 78990".
AfterHoursMainMenuCustomPromptEnable	Optional	System.Boolean	The *AfterHoursMainMenuCust*

d			*omPromptEnabled* parameter specifies whether the after business hours custom main menu is enabled. The default value is `disabled`.
AfterHoursMainMenuCustomPromptFilename	Optional	System.String	The *AfterHoursMainMenuCustomPromptFilename* parameter specifies the .wav file to be used for the after business hours custom main menu prompt.
AfterHoursTransferToOperatorEnabled	Optional	System.Boolean	The *AfterHoursTransferToOperatorEnabled* parameter specifies whether to allow calls to be transferred to the operator's extension number after business hours.
AfterHoursWelcomeGreetingEnabled	Optional	System.Boolean	The *AfterHoursWelcomeGreetingEnabled* parameter specifies whether the after hours greeting is enabled. The system default audio is used if this parameter is set to `disabled`. The default value is `disabled`.

AfterHoursWelcomeGreetingFilename	Optional	System.String	The *AfterHoursWelcomeGreetingFilename* parameter specifies the .wav file to be used for the after hours greeting message.
AllowDialPlanSubscribers	Optional	System.Boolean	The *AllowDialPlanSubscribers* parameter specifies whether to allow the dial plan subscribers to dial numbers that are resolved to a subscriber in the same dial plan. The default value is `$true`.
AllowedInCountryOrRegionGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedInCountryOrRegionGroups* parameter specifies the list of in-country/region dial group names allowed. The names must match group names defined in the dial plan. The string must have fewer than 128 characters.
AllowedInternationalGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedInternationalGroups* parameter specifies the list of international dial group names allowed. The names must match group

			names defined in the dial plan. The string must have fewer than 128 characters.
AllowExtensions	Optional	System.Boolean	The *AllowExtensions* parameter specifies whether callers can make calls to extensions that have the same number of digits as the number specified on the dial plan object. The default value is `$false`.
BusinessHoursKeyMapping	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BusinessHoursKeyMapping* parameter specifies the key mappings for business hours for the UM auto attendant. A key mapping is defined as an entry in a table that has as many as 9 entries. The 0 key is reserved for a transfer to the operator. The following is an example for a custom table that has two entries: "Sales, 77899","Service, 78990". The default is `disabled`.
BusinessHoursKeyMappingEnabled	Optional	System.Boolean	The *BusinessHoursKeyMappin*

			gEnabled parameter specifies whether the custom menus for business hours are enabled or disabled. The default value is `disabled`.
BusinessHoursMainMenuCustomPromptEnabled	Optional	System.Boolean	The *BusinessHoursMainMenuCustomPromptEnabled* parameter specifies whether the business hours custom main menu prompt is enabled. The default value is `disabled`.
BusinessHoursMainMenuCustomPromptFilename	Optional	System.String	The *BusinessHoursMainMenuCustomPromptFilename* parameter specifies the .wav file to be used for the business hours custom main menu prompt.
BusinessHoursSchedule	Optional	Microsoft.Exchange.Common.ScheduleInterval[]	The *BusinessHoursSchedule* parameter specifies the hours the business is open.
BusinessHoursTransferToOperatorEnabled	Optional	System.Boolean	The *BusinessHoursTransferToOperatorEnabled* parameter specifies whether to allow call

			transfers to the operator's extension number during business hours.
BusinessHoursWelcomeGreetingEnabled	Optional	System.Boolean	The *BusinessHoursWelcomeGreetingEnabled* parameter specifies whether the custom business hours greeting is enabled. The system default audio is used if this parameter is set to `disabled`. The default value is `disabled`.
BusinessHoursWelcomeGreetingFilename	Optional	System.String	The *BusinessHoursWelcomeGreetingFilename* parameter specifies the .wav file to be used for the welcome message.
BusinessLocation	Optional	System.String	The *BusinessLocation* parameter specifies what the Mailbox server should read to the caller who selected the business location option on a UM auto attendant menu.
BusinessName	Optional	System.String	The *BusinessName* parameter specifies the name of the company or organization being used to generate the UM auto

			attendant welcome greeting for callers.
CallSomeoneEnabled	Optional	System.Boolean	The *CallSomeoneEnabled* parameter specifies whether the Call Someone feature is enabled. The default value is `$true`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContactAddressList	Optional	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *ContactAddressList* parameter specifies the identity of the address list. If the *ContactScope* parameter is set to `AddressList`, this parameter defines the scope for directory searches.
ContactRecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *ContactRecipientContainer* parameter specifies the name or identity of the container used for

			directory searches.
ContactScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DialScopeEnum	The *ContactScope* parameter specifies the scope of the directory search given to callers when they access the UM auto attendant and specify a user's name.
DefaultMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *DefaultMailbox* parameter specifies the mailbox to be used with the *ForwardCallsToDefaultMailbox* parameter. The mailbox specified must be UM-enabled and associated with the same UM dial plan as the UM auto attendant.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DTMFFallbackAutoAtt	Optional	Microsoft.Exchange.Co	The

endant		nfiguration.Tasks.UMAutoAttendantIdParameter	*DTMFFallbackAutoAttendant* parameter specifies the dual tone multi-frequency (DTMF) auto attendant used if the speech-enabled auto attendant is unavailable. If the *SpeechEnabled* parameter is set to `$true`, this auto attendant must have an associated DTMF auto attendant to use as the fallback auto attendant.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* switch specifies whether you're prompted for confirmation before a UM auto attendant object is upgraded.
ForwardCallsToDefaultMailbox	Optional	System.Boolean	The *ForwardCallsToDefaultMailbox* parameter specifies whether incoming calls received by the UM auto attendant are forwarded. The default is `$false`. When this is set to `$true`, all incoming calls to the UM auto attendant are transferred to the UM-enabled mailbox set by

			the *DefaultMailbox* parameter.
HolidaySchedule	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *HolidaySchedule* parameter specifies the holiday schedule for the organization. The schedule is formatted as an array of strings. Each string contains three parts: • Name, which is limited to 64 characters • File name for the audio prompt, which is in the .wav format • Day (date) of the holiday The following is an example: "Christmas, Christmas.wav, 12/25/2013".
InfoAnnouncementEnabled	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.InfoAnnouncementEnabledEnum	The *InfoAnnouncementEnabled* parameter specifies whether to enable the informational greeting. The default setting is `$true`.
InfoAnnouncementFilename	Optional	System.String	The *InfoAnnouncementFilename* parameter specifies

			the .wav file to be used for the informational announcement.
Language	Optional	Microsoft.Exchange.Data.UMLanguage	The *Language* parameter specifies the language used by the UM auto attendant. This language is selected from the list of available dial plan languages.
MatchedNameSelectionMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AutoAttendantDisambiguationFieldEnum	The *MatchedNameSelectionMethod* parameter specifies the selection to use to differentiate between users who have names that match the touchtone or speech input. This setting can be set to the following: • Department • Title • Location • None • Prompt for alias • Inherited from UM dial plan
Name	Optional	System.String	The *Name* parameter specifies the display name to be used for the UM auto attendant. This name is limited to 64 characters.

NameLookupEnabled	Optional	System.Boolean	The *NameLookupEnabled* parameter specifies whether to allow callers to perform directory lookups by dialing the name or by speaking the name. This parameter can prevent callers from connecting to unknown extensions.
OperatorExtension	Optional	System.String	The *OperatorExtension* parameter specifies the extension number of the operator. If this parameter isn't specified, the dial plan operator is used. If the dial plan operator isn't specified, the feature isn't enabled.
PilotIdentifierList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *PilotIdentifierList* parameter specifies a list of one or more pilot numbers. Pilot numbers are used to route incoming calls to Mailbox servers. The calls are then answered by the UM auto attendant.
SendVoiceMsgEnabled	Optional	System.Boolean	The *SendVoiceMsgEnabled* parameter specifies whether to allow the Send

			Message feature.
SpeechEnabled	Optional	System.Boolean	The *SpeechEnabled* parameter specifies whether the auto attendant is speech-enabled. The default setting on the UM auto attendant is `$false`.
StarOutToDialPlanEnabled	Optional	System.Boolean	The *StarOutToDialPlanEnabled* parameter specifies whether a caller can press the * button on a telephone keypad to get to the Outlook Voice Access welcome greeting when a UM auto attendant menu is played. The default setting is `$false`.
TimeZone	Optional	System.String	The *Timezone* parameter specifies the time zone used with the auto attendant. The default time zone is the time zone setting on the server.
TimeZoneName	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMTimeZone	The *TimeZoneName* parameter specifies all or part of a Microsoft Windows time zone display name. The string is

			compared to the display names in the local system registry to determine a simple *contains* match. An error is returned if the time zone name isn't correct.
WeekStartDay	Optional	System.DayOfWeek	The *WeekStartDay* parameter specifies the starting day of the week. The valid values for this parameter are `Sunday`, `Monday`, `Tuesday`, `Wednesday`, `Thursday`, `Friday`, and `Saturday`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-UMCallAnsweringRule

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-UMCallAnsweringRule** cmdlet to disable a call answering rule that has been created within a UM-enabled mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-UMCallAnsweringRule -Identity <UMCallAnsweringRuleIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Mailbox
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the call answering rule MyUMCallAnsweringRule in the mailbox for Tony Smith.

```
Disable -UMCallAnsweringRule -Identity
MyUMCallAnsweringRule -Mailbox tonysmith
```

EXAMPLE 2

This example uses the *WhatIf* switch to test whether the call answering rule MyUMCallAnsweringRule in the mailbox for Tony Smith is ready to be disabled and if there are any errors within the command.

```
Disable -UMCallAnsweringRule -Identity
MyUMCallAnsweringRule -Mailbox tonysmith -WhatIf
```

EXAMPLE 3

This example disables the call answering rule MyUMCallAnsweringRule in the mailbox for Tony Smith and prompts the user logged on to confirm that they're disabling the call answering rule.

```
Disable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith -Confirm
```

Detailed Description

The **Disable-UMCallAnsweringRule** cmdlet disables the call answering rule by modifying its status variable. Disabling a call answering rule prevents it from being retrieved and processed when an incoming call is received. With this cmdlet, you can disable an existing call answering rule that's enabled.

When the call answering rule is created, you should disable the call answering rule when you're setting up conditions and actions. This prevents the call answering rule from being processed when an incoming call is received until you've correctly configured the call answering rule. After this task is completed, the cmdlet sets the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call answering rules entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMCallAnsweringRuleIdParameter	The *Identity* parameter specifies the UM call answering rule in a UM-enabled mailbox that's to be disabled.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing

			continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox that contains the UM call answering rule. The default is the user's mailbox running the cmdlet.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-UMCallAnsweringRule

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-UMCallAnsweringRule** cmdlet to enable a call answering rule that has been created within a UM-enabled mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-UMCallAnsweringRule -Identity <UMCallAnsweringRuleIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Mailbox
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the call answering rule MyUMCallAnsweringRule in the mailbox for Tony

Smith.

```
Enable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith
```

EXAMPLE 2

The example uses the *WhatIf* switch to test whether the call answering rule MyUMCallAnsweringRule in the mailbox for Tony Smith is ready to be enabled and if there are any errors within the command.

```
Enable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith -WhatIf
```

EXAMPLE 3

This example enables the call answering rule MyUMCallAnsweringRule in the mailbox for Tony Smith and prompts the logged-on user to confirm that the call answering rule is to be enabled.

```
Enable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith -Confirm
```

Detailed Description

The **Enable-UMCallAnsweringRule** cmdlet enables the call answering rule by modifying its status variable. When the call answering rule is created, it's enabled. This cmdlet allows you to enable a previously disabled call answering rule. Enabling a call answering rule enables the cmdlet to retrieve the call answering rule including the conditions and actions for a specified call answering rule.

After this task is completed, the cmdlet sets the parameters and values specified. When you enable a call answering rule, the call answering rule is processed when an incoming call is received.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMC	The *Identity* parameter specifies the UM call

		allAnsweringRuleIdParameter	answering rule in a UM-enabled mailbox that's to be enabled.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox that contains the UM call answering rule. The

			default is the user's mailbox running the cmdlet.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMCallAnsweringRule

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMCallAnsweringRule** cmdlet to view the properties of a Unified Messaging (UM) call answering rule that has been created within a UM-enabled mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMCallAnsweringRule [-Identity <UMCallAnsweringRuleIdParameter>] [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example returns a formatted list of call answering rules in a user's UM-enabled mailbox.

```
Get-UMCallAnsweringRule -Identity MyUMCallAnsweringRule -
Mailbox tonysmith | Format-List
```

EXAMPLE 2

This example displays the properties of the call answering rule MyUMCallAnsweringRule.

```
Get-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
```

Detailed Description

The **Get-UMCallAnsweringRule** cmdlet enables you to view the properties of a call answering rule that has been created in a UM-enabled user's mailbox. It allows you to retrieve the properties for a single call answering rule or a list of call answering rules in a UM-enabled user's mailbox.

After this task is completed, the cmdlet returns the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UMCallAnsweringRuleIdParameter	The *Identity* parameter specifies the identifier for a call answering rule being viewed.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox that contains the UM call answering rule. The default is the user's mailbox running the cmdlet.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-UMCallAnsweringRule

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-UMCallAnsweringRule** cmdlet to create a call answering rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-UMCallAnsweringRule -Name <String> [-CallerIds <MultiValuedProperty>]
[-CallersCanInterruptGreeting <$true | $false>] [-CheckAutomaticReplies
<$true | $false>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-ExtensionsDialed <MultiValuedProperty>] [-KeyMappings
<MultiValuedProperty>] [-Mailbox <MailboxIdParameter>] [-Organization
<OrganizationIdParameter>] [-Priority <Int32>] [-ScheduleStatus <Int32>]
[-TimeOfDay <TimeOfDay>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the call answering rule MyCallAnsweringRule in the mailbox for tonysmith with the priority of 2.

```
New-UMCallAnsweringRule -Mailbox tonysmith -Name
MyCallAnsweringRule -Priority 2
```

EXAMPLE 2

This example creates the following actions on the call answering rule MyCallAnsweringRule in the mailbox for tonysmith:

- Sets the call answering rule to two caller IDs.
- Sets the priority of the call answering rule to 2.
- Sets the call answering rule to allow callers to interrupt the greeting.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -
CallerIds "1,4255550100,,","1,4255550123,," -Priority 2 -
CallersCanInterruptGreeting $true -Mailbox tonysmith
```

EXAMPLE 3

This example creates the call answering rule MyCallAnsweringRule in the mailbox for tonysmith that sets the free/busy status to Out of Office and sets the priority to 2.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith@contoso.com -ScheduleStatus 0x8
```

EXAMPLE 4

This example creates the call answering rule MyCallAnsweringRule in the mailbox tonysmith and performs the following actions:

Sets the priority of the call answering rule to 2.

Creates key mappings for the call answering rule.

If the caller reaches the voice mail for the user and the status of the user is set to Busy, the caller can:

- Press the 1 key and be transferred to a receptionist at extension 45678.
- Press the 2 key and the Find Me feature will be used for urgent issues and ring extension 23456 first, and then 45671.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -ScheduleStatus 0x4 - -KeyMappings
"1,1,Receptionist,,,,,45678,","5,2,Urgent
Issues,23456,23,45671,50,,"
```

EXAMPLE 5

This example creates the call answering rule MyCallAnsweringRule in the mailbox for tonysmith and performs the following actions:

- Sets the priority of the call answering rule to 2.
- If the caller reaches voice mail during working hours, the caller is asked to call back later.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -TimeOfDay "1,0,,"
```

EXAMPLE 6

This example creates the call answering rule MyCallAnsweringRule in the mailbox for tonysmith with a custom period for the time of day and performs the following actions:

- Sets the priority of the call answering rule to 2.
- If the caller reaches voice mail and the time is between 8:00 A.M. and 12:00 P.M. on Tuesday, ask the caller to call back later.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -TimeOfDay "3,4,8:00,12:00"
```

Detailed Description

The **New-UMCallAnsweringRule** cmdlet creates a Unified Messaging (UM) call answering rule stored in a UM-enabled user's mailbox. You can run the cmdlet and create a call answering rule of the user that's logged on or use the *Mailbox* parameter to specify the mailbox where you want the call answering rule to be created. You can use the **New-UMCallAnsweringRule** cmdlet to specify the following conditions:

- Who the incoming call is from
- Time of day
- Calendar free/busy status
- Whether automatic replies are turned on for email

You can also specify the following actions:

- Find me
- Transfer the caller to someone else
- Leave a voice message

After this task is completed, the cmdlet sets the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the Unified Messaging (UM) call answering rule or Call Answering Rule ID being modified. The call answering ID or name must be unique per the user's UM-enabled mailbox. The name or ID for the call answering rule can contain up to 255 characters.
CallerIds	Optional	Microsoft.Exchange.Da	The *CallerIds* parameter

		ta.MultiValuedProperty	specifies an entry for the "If the Caller is" condition. Each entry for this parameter can contain a phone number, an Active Directory contact, a personal contact, or the personal Contacts folder. The parameter can contain 50 phone numbers or contact entries and no more than one entry for specifying the default Contacts folder. If the *CallerIds* parameter doesn't contain a condition, the condition isn't set and is ignored. The default value is `$null`.
CallersCanInterruptGreeting	Optional	System.Boolean	The *CallersCanInterruptGreeting* parameter specifies whether a caller can interrupt the voice mail greeting while it's being played. The default is `$null`.
CheckAutomaticReplies	Optional	System.Boolean	The *CheckAutomaticReplies* parameter specifies an entry for the "If My Automatic Replies are

			Enabled" condition. The default is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtensionsDialed	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionsDialed* parameter specifies an entry for the "If the Caller Dials" condition. Each entry must be unique per call answering rule. Each extension must correspond to existing

			extension numbers assigned to UM-enabled users. The default is `$null`.
KeyMappings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *KeyMappings* parameter specifies a key mapping entry for a call answering rule. The key mappings are those menu options offered to callers if the call answering rule is set to `$true`. You can configure a maximum of 10 entries. None of the defined key mappings can overlap. The default is `$null`.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox where the call answering rule is created. The default is the user's mailbox that's running the cmdlet.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Priority	Optional	System.Int32	The *Priority* parameter specifies the order that the call answering rule will be evaluated against other existing call

			answering rules. Call answering rules are processed in order of increasing priority values. The priority must be unique between all call answering rules in the UM-enabled mailbox. The priority on the call answering rule must be between 1 (highest) and 9 (lowest). The default is 9.
ScheduleStatus	Optional	System.Int32	The *ScheduleStatus* parameter specifies an entry for the "If my Schedule show that I am" condition. Users can specify their free/busy status to be checked. This parameter can be set from 0 through 15 and is interpreted as a 4-bit mask that represents the calendar status including Free, Tentative, Busy, and Out of Office. The following settings can be used to set the schedule status: • None = 0x0 • Free = 0x1 • Tentative = 0x2 • Busy = 0x4

			• OutOfOffice = 0x8 The default setting is `$null`.
TimeOfDay	Optional	Microsoft.Exchange.Data.TimeOfDay	The *TimeOfDay* parameter specifies an entry for the "If the Call Arrives During" condition for the call answering rule. You can specify working hours, non-working hours, or custom hours. The default is `$null`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UMCallAnsweringRule

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UMCallAnsweringRule** cmdlet to remove an existing Unified Messaging (UM) call answering rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UMCallAnsweringRule -Identity <UMCallAnsweringRuleIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Mailbox
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the call answering rule MyUMCallAnsweringRule from a user's mailbox. The user's mailbox is the mailbox of the user running the cmdlet.

```
Remove-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
```

EXAMPLE 2

This example removes the call answering rule MyUMCallAnsweringRule from the mailbox of tonysmith.

```
Remove-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith
```

Detailed Description

The **Remove-UMCallAnsweringRule** cmdlet removes an existing UM call answering rule that has been created and stored in a UM-enabled user's mailbox. When you remove an existing call answering rule, all of the remaining call answering rules are still processed in order of their priority.

After this task is completed, the cmdlet sets the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMCallAnsweringRuleIdParameter	The *Identity* parameter specifies the identifier for a call answering rule being removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox where the call answering rule is changed. The default is the user's mailbox running the cmdlet.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMCallAnsweringRule

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-05*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMCallAnsweringRule** cmdlet to change properties of an existing UM call answering rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMCallAnsweringRule -Identity <UMCallAnsweringRuleIdParameter> [-
CallerIds <MultiValuedProperty>] [-CallersCanInterruptGreeting <$true |
$false>] [-CheckAutomaticReplies <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExtensionsDialed
<MultiValuedProperty>] [-KeyMappings <MultiValuedProperty>] [-Mailbox
<MailboxIdParameter>] [-Name <String>] [-Priority <Int32>] [-
ScheduleStatus <Int32>] [-TimeOfDay <TimeOfDay>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the priority to 2 on the existing call answering rule MyCallAnsweringRule that exists in the mailbox for tonysmith.

```
Set-UMCallAnsweringRule -Mailbox tonysmith -Name
MyCallAnsweringRule -Priority 2
```

EXAMPLE 2

This example performs the following actions on the call answering rule MyCallAnsweringRule in the mailbox for tonysmith:

- Sets the call answering rule to two caller IDs.
- Sets the priority of the call answering rule to 2.
- Sets the call answering rule to allow callers to interrupt the greeting.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -
CallerIds "1,4255550100,,","1,4255550123,," -Priority 2 -
CallersCanInterruptGreeting $true -Mailbox tonysmith
```

EXAMPLE 3

This example changes the free/busy status to Out of Office on the call answering rule MyCallAnsweringRule in the mailbox for tonysmith and sets the priority to 2.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith@contoso.com -ScheduleStatus 0x8
```

EXAMPLE 4

This example performs the following actions on the call answering rule MyCallAnsweringRule in the mailbox tonysmith:

- Sets the priority of the call answering rule to 2.
- Creates key mappings for the call answering rule.
- If the caller reaches the voice mail for the user and the status of the user is set to Busy, the caller can:
- Press the 1 key and be transferred to a receptionist at extension 45678.
- Press the 2 key and the Find Me feature will be used for urgent issues and ring extension 23456 first, and then 45671.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -ScheduleStatus 0x4 -KeyMappings
"1,1,Receptionist,,,,,45678,","5,2,Urgent
Issues,23456,23,45671,50,,"
```

EXAMPLE 5

This example performs the following actions on the call answering rule MyCallAnsweringRule in the mailbox for tonysmith:

- Sets the priority of the call answering rule to 2.
- If the caller reaches voice mail during working hours, the caller is asked to call back later.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -TimeOfDay "1,0,,"
```

EXAMPLE 6

This example sets a custom period for the time of day on the call answering rule MyCallAnsweringRule in the mailbox for tonysmith and performs the following actions:

- Sets the priority of the call answering rule to 2.
- If the caller reaches voice mail and the time is between 8:00 A.M. and 12:00 P.M. on Tuesday, ask the caller to call back later.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -TimeOfDay "3,4,8:00,12:00"
```

Detailed Description

The *Set-UMCallAnsweringRule* cmdlet changes the properties of an existing UM call answering rule stored in a UM enabled user's mailbox. You can use the **Set-UMCallAnsweringRule** cmdlet to specify the following conditions:

- Who the incoming call is from
- Time of day
- Calendar free/busy status
- Whether automatic replies are turned on for email

You can also specify the following actions:

- Find me
- Transfer the caller to someone else
- Leave a voice message

After this task is completed, the cmdlet sets the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMCallAnsweringRuleIdParameter	The *Identity* parameter specifies the identifier for a call answering rule being changed.
CallerIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *CallerIds* parameter specifies an entry for the "If the Caller is" condition. Each entry for this parameter can contain a phone number, an Active Directory contact, a personal contact, or the personal Contacts folder.

			The parameter can contain 50 phone numbers or contact entries and no more than one entry for specifying the default Contacts folder. If the *CallerIds* parameter doesn't contain a condition, the condition isn't set and is ignored. The default value is `$null`.
CallersCanInterruptGreeting	Optional	System.Boolean	The *CallersCanInterruptGreeting* parameter specifies whether a caller can interrupt the voice mail greeting while it's being played. The default is `$null`.
CheckAutomaticReplies	Optional	System.Boolean	The *CheckAutomaticReplies* parameter specifies an entry for the "If My Automatic Replies are Enabled" condition. The default is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtensionsDialed	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionsDialed* parameter specifies an entry for the "If the Caller Dials" condition. Each entry must be unique per call answering rule. Each extension must correspond to existing extension numbers assigned to UM-enabled users. The default is `$null`.
KeyMappings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *KeyMappings* parameter specifies a key mapping entry for a call answering rule. The key

			mappings are those menu options offered to callers if the call answering rule is set to `$true`. You can configure a maximum of 10 entries. None of the defined key mappings can overlap. The default is `$null`.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox where the call answering rule will be changed. The default is the user's mailbox that's running the cmdlet.
Name	Optional	System.String	The *Name* parameter specifies the name of the UM call answering rule or Call Answering Rule ID being modified. The call answering ID or name must be unique per the user's UM-enabled mailbox. The name or ID for the call answering rule can contain up to 255 characters.
Priority	Optional	System.Int32	The *Priority* parameter specified the order that the call answering rule

			will be evaluated against other existing call answering rules. Call answering rules are processed in order of increasing priority values. The priority must be unique between all call answering rules in the UM-enabled mailbox. The priority on the call answering rule must be between 1 (highest) and 9 (lowest). The default is 9.
ScheduleStatus	Optional	System.Int32	The *ScheduleStatus* parameter specifies an entry for the "If my Schedule show that I am" condition. Users can specify their free/busy status to be checked. This parameter can be set from 0 through 15 and is interpreted as a 4-bit mask that represents the calendar status including Free, Tentative, Busy, and Out of Office. The following settings can be used to set the schedule status: • None = 0x0 • Free = 0x1

			• Tentative = 0x2 • Busy = 0x4 • OutOfOffice = 0x8 The default setting is `$null`.
TimeOfDay	Optional	Microsoft.Exchange.Data.TimeOfDay	The *TimeOfDay* parameter specifies an entry for the "If the Call Arrives During" condition for the call answering rule. You can specify working hours, non-working hours, or custom hours. The default is `$null`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-UMCallDataRecord

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Export-UMCallDataRecord** cmdlet to export Unified Messaging (UM) call data records for UM dial plans and UM IP gateways for a date that you've specified.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-UMCallDataRecord -ClientStream <Stream> -Date <ExDateTime> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-UMDialPlan <UMDialPlanIdParameter>] [-
UMIPGateway <UMIPGatewayIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example returns all Unified Messaging call data records on February 1, 2012, and exports them to a CSV file.

```
Export-UMCallDataRecord -Date 02/01/12
```

EXAMPLE 2

This example exports all Unified Messaging call data records for February 1, 2012, for the UM dial plan MyUMDialPlan.

```
Export-UMCallDataRecord -Date 02/01/12 -UMDialPlan
MyUMDialPlan
```

Detailed Description

The **Export-UMCallDataRecord** cmdlet exports Unified Messaging call data records for a specified date to a comma-separated value (CSV) file. You can filter call data records for specific UM dial

plans or UM IP gateways. However, if you don't specify a UM IP gateway, all call data records are returned.

Note:
The **Export-UMCallDataRecord** cmdlet is available when you're using the Exchange Administration Center. You can't use the cmdlet from the Exchange Management Shell.

After this task is completed, a report is generated that contains Unified Messaging call data records.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call data and summary reports" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
ClientStream	Required	System.IO.Stream	The *ClientStream* parameter specifies the .NET stream to use to output for the Unified Messaging call data records.
Date	Required	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *Date* parameter specifies the date of Unified Messaging call data records to retrieve. If there are no call records for the date specified, the report will be empty.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan to export statistics for. If you don't specify a UM dial plan, statistics include all UM dial plans in the organization.
UMIPGateway	Optional	Microsoft.Exchange.Co	The *UMIPGateway*

		nfiguration.Tasks.UMIPGatewayIdParameter	parameter specifies the UM IP gateway to export statistics for. If you don't specify a gateway, statistics include all UM IP gateways in the selected UM dial plan, or if a UM dial plan isn't selected, statistics include all UM IP gateways in the organization.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMCallDataRecord

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMCallDataRecord** cmdlet to display Unified Messaging (UM) call data records for a specific UM-enabled user's mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMCallDataRecord -Mailbox <MailboxIdParameter> [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example displays the UM call data records for the UM-enabled user Tony.

```
Get-UMCallDataRecord -Mailbox tony@contoso.com
```

Detailed Description

The **Get-UMCallDataRecord** cmdlet displays UM call data records for the last 90 days for a UM-enabled mailbox that you specify. Each UM call data record provides detailed information about all calls either placed to or received by the specified user. The following table details each of the properties returned:

Property Name	Description
Date	Date and time of the Mailbox server running the Microsoft Exchange Unified Messaging service that took the call in the Coordinated Universal Time (UTC) format.

Duration	Total duration of this call. For Find Me calls, this will always be zero because the call is being transferred and won't be handled by Unified Messaging any longer.
AudioCodec	Audio codec used for the call including G.711 or Group System Mobile (GSM).
DialPlan	Name of the UM dial plan handling the call.
CallType	Type of the call (localized in the user's language): • Call Answering Voice Message • Call Answering Missed Call • Auto Attendant • Subscriber Access • Fax • PlayOnPhone • Find Me • None • UnauthenticatedPilotNumber • PromptProvisioning
CallingNumber	Phone number or address of the caller.
CalledNumber	Phone number or address of the intended recipient of the call.
Gateway	Fully qualified domain name (FQDN) of the UM IP gateway handling the call.
Network MOS (NMOS)	Mean opinion score for the network performance.
NMOSDegradation	Total NMOS degradation, which is how far the NMOS reported value was from its top value for the corresponding audio codec.

PercentagePacketLoss	Percentage that reflects the average network packet loss during the call.
Jitter	Average jitter of the network.
RoundTripMilliseconds	Round trip time for Real Time Control Protocol (RTCP) statistics in milliseconds.
BurstLossDurationMilliseconds	Average duration of packet loss during bursts during the call.

After this task is completed, a report is generated that contains UM call data records for a specific UM-enabled mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call data and summary reports" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the UM-enabled mailbox that UM call data records are displayed.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMCallRouterSettings

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-UMCallRouterSettings** cmdlet to retrieve the properties for a Client Access server that runs the Microsoft Exchange Unified Messaging Call Router service and returns a list of available Client Access servers from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMCallRouterSettings [-DomainController <Fqdn>] [-Server
<ServerIdParameter>]
```

Examples

EXAMPLE 1

This example displays a list of all the Client Access servers running the Microsoft Exchange Unified

Messaging Call Router service in the Active Directory forest.

```
Get-UMCallRouterSettings
```

EXAMPLE 2

This example displays a formatted list of properties for the Client Access server MyUMCallRouter running the Microsoft Exchange Unified Messaging Call Router service.

```
Get-UMCallRouterSettings -Server MyUMCallRouter | Format-
List
```

Detailed Description

The **Get-UMCallRouterSettings** cmdlet retrieves the properties for a Client Access server that runs the Microsoft Exchange Unified Messaging Call Router service and returns a list of available Client Access servers from Active Directory. When the cmdlet is used for a single Client Access server, it returns the UM call router properties including `MaxCalls`, `MaxFaxCalls`, and `UMDialPlans`. The properties and their values for the Client Access server are stored in the Unified Messaging section of the Exchange Server configuration object in Active Directory.

After this task is completed, the cmdlet returns the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access Server (UM call router service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.Serve	The *Server* parameter specifies the name of

		rIdParameter	the Client Access server that runs the Microsoft Exchange Unified Messaging Call Router service that's viewed. This parameter specifies the directory object ID for the UM call router.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMCallRouterSettings

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-UMCallRouterSettings** cmdlet to set specific properties on a Client Access server running the Microsoft Exchange Unified Messaging Call Router service. This cmdlet can be used to set individual parameters for a specified Client Access server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMCallRouterSettings [-Confirm [<SwitchParameter>]] [-DialPlans
<MultiValuedProperty>] [-DomainController <Fqdn>] [-ExternalHostFqdn
<UMSmartHost>] [-ExternalServiceFqdn <UMSmartHost>] [-IPAddressFamily
<IPv4Only | IPv6Only | Any>] [-IPAddressFamilyConfigurable <$true |
$false>] [-MaxCallsAllowed <Int32>] [-Server <ServerIdParameter>] [-
SipTcpListeningPort <Int32>] [-SipTlsListeningPort <Int32>] [-
UMForwardingAddressTemplate <String>] [-UMPodRedirectTemplate <String>] [-
```

```
UMStartupMode <TCP | TLS | Dual>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the following configuration on the Client Access server MyUMCallRouter:

- Adds the Client Access server to the UM SIP dial plan MySIPDialPlan.
- Enables the Microsoft Exchange Unified Messaging Call Router service on the Client Access server to accept both IPv4 and IPv6 data packets.
- Sets the maximum number of incoming voice, fax, auto attendant, and Outlook Voice Access calls to 150.
- Enables the Microsoft Exchange Unified Messaging Call Router service to start up using TLS mode.

```
Set-UMCallRouterSettings -DialPlans MySIPDialPlan -
IPAddressFamily Any -Server
MyUMCallRouter.northwindtraders.com -UMStartupMode TLS
```

EXAMPLE 2

This example removes the Client Access server UMCallRouter001 from all UM SIP dial plans.

```
Set-UMCallRouterSettings -DialPlans $null -Server
UMCallRouter001.contoso.com
```

Detailed Description

The **Set-UMCallRouterSettings** cmdlet sets specific properties on a Client Access server running the Microsoft Exchange Unified Messaging Call Router service. This cmdlet can be used to set individual Unified Messaging parameters for a specified Client Access server.

After this task is completed, the cmdlet sets the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access Server (UM call router service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.A	The *Confirm* switch

		utomation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DialPlans	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *DialPlans* parameter specifies the dial plan used by the Microsoft Exchange Unified Messaging Call Router service on a Client Access server. The Client Access server only needs to be associated with a UM dial plan if Microsoft Office Communications Server 2007 R2, Lync Server 2010, or Lync Server 15 is used in your organization. To remove a Client Access server from a dial plan, use `$null`. The default is no dial plans assigned. To enter multiple

			values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalHostFqdn	Optional	Microsoft.Exchange.Data.UMSmartHost	This parameter is reserved for internal Microsoft use.
ExternalServiceFqdn	Optional	Microsoft.Exchange.Data.UMSmartHost	This parameter is reserved for internal

			Microsoft use.
IPAddressFamily	Optional	Microsoft.Exchange.Data.Directory.IPAddressFamily	The *IPAddressFamily* parameter specifies whether the UM IP gateway will use Internet Protocol version 4 (IPv4), IPv6, or both to communicate. If set to `IPv4Only`, the UM IP gateway only uses IPv4 to communicate. If set to `IPv6Only`, the UM IP gateway only uses IPv6. If set to `Any`, IPv6 is used first, and then if necessary, it falls back to IPv4. The default is `IPv4Only`.
IPAddressFamilyConfigurable	Optional	System.Boolean	The *IPAddressFamilyConfigurable* parameter specifies whether you're able to set the *IPAddressFamily* parameter to `IPv6Only` or `Any`. The default is `$true`.
MaxCallsAllowed	Optional	System.Int32	The *MaxCallsAllowed* parameter will be removed in future

			versions of the product.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name of the Client Access server that runs the Microsoft Exchange Unified Messaging Call Router service that will be changed. This parameter specifies the directory object ID for the Client Access server.
SipTcpListeningPort	Optional	System.Int32	The *SipTcpListeningPort* parameter specifies the TCP port used by the Client Access server running the Microsoft Exchange Unified Messaging Call Router service to receive incoming calls. This TCP port is used by a Client Access server when a UM dial plan isn't configured to use SIP Secured or Secured mode. The default is port 5060.
SipTlsListeningPort	Optional	System.Int32	The *SipTlsListeningPort* parameter specifies the

			Transport Layer Security (TLS) port used by a Client Access server running the Microsoft Exchange Unified Messaging Call Router service to receive incoming calls. This TLS port is used by a Client Access server when a UM dial plan is configured to use SIP Secured or Secured mode. The default is port 5061.
UMForwardingAddressTemplate	Optional	System.String	This parameter is reserved for internal Microsoft use.
UMPodRedirectTemplate	Optional	System.String	This parameter is reserved for internal Microsoft use.
UMStartupMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMStartupMode	The *UMStartupMode* parameter specifies whether the Client Access server running the Microsoft Exchange Unified Messaging Call Router service starts up in TCP, TLS, or Dual mode. If the Client Access server isn't

			associated with any UM dial plans or is being added to UM dial plans that have different security settings, you should choose `Dual` mode. In `Dual` mode, the Client Access server can listen on ports 5060 and 5061 at the same time. If the startup mode is changed, the Microsoft Exchange Unified Messaging Call Router service must be restarted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMCallSummaryReport

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMCallSummaryReport** cmdlet to return statistics about all calls received or placed by Mailbox server running the Microsoft Exchange Unified Messaging service in an organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMCallSummaryReport -GroupBy <Day | Month | Total> [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-UMDialPlan
<UMDialPlanIdParameter>] [-UMIPGateway <UMIPGatewayIdParameter>]
```

Examples

EXAMPLE 1

This example displays the statistics for all calls received or placed by Mailbox servers in the organization.

```
Get-UMCallSummaryReport -GroupBy Total
```

EXAMPLE 2

This example displays the statistics for all calls received or placed by Mailbox servers in the organization over the last 12 months.

```
Get-UMCallSummaryReport -GroupBy Month
```

EXAMPLE 3

This example displays the statistics for all calls received or placed by Mailbox servers in the organization over the last 90 days.

```
Get-UMCallSummaryReport -GroupBy Day
```

EXAMPLE 4

This example displays the statistics for calls received or placed by Mailbox servers for the UM dial plan MyUMDialPlan.

```
Get-UMCallSummaryReport -GroupBy Month -UMDialplan
MyUMDialPlan
```

Detailed Description

The **Get-UMCallSummaryReport** cmdlet displays the aggregated statistics about all calls received or placed by Mailbox servers running the Microsoft Exchange Unified Messaging service in an organization including voice messages, missed calls, subscriber access, auto attendant, or fax calls. The data returned by running this cmdlet includes audio quality metrics for the sample calls such as the following:

Metrics	Description
Date	Date in which all calls associated with the selected UM IP gateway and UM dial plan have been grouped, as per the following: • If the *GroupBy* parameter is set to `All`, this column has the value `---`. • If the *GroupBy* parameter is set to `Month`, the date is in the format *MMM/YY* (for example, Jan/12), where *MMM* is the first three letters of the month and *YY* is the last two digits of the corresponding year. • If the *GroupBy* parameter is set to `Date`, the date is in the format *MM/DD/YY* (for example, 01/23/12), where *MM* is the corresponding two digits of the month, *DD* is the corresponding two digits of the day, and *YY* is the last two digits of the corresponding year.

Voice Message	Percentage of incoming calls answered by Unified Messaging on behalf of users in which callers left a voice message.
Missed Calls	Percentage of incoming calls answered by Unified Messaging on behalf of users in which the callers didn't leave a voice message resulting in a missed call notification.
Outlook Voice Access	Percentage of incoming calls in which users authenticate to Unified Messaging to access their email, calendars, and voice messages.
Outbound	Percentage of calls placed or transferred by Unified Messaging on behalf of authenticated or unauthenticated users, which can be one of the following: • Find Me • Play On Phone • Play On Phone Greetings
Automated Attendant	Percentage of incoming calls that were answered by auto attendants.
Fax	Percentage of incoming calls that were redirected to a fax partner.
Other	Percentage of any other incoming or placed calls that don't fall in any of the previous categories. This is provided to allow different types of calls that might be provided in the future to be accounted for as well. This category includes unauthenticated calls made to pilot numbers.
Failed Or Rejected	Percentage of calls that either failed or were rejected by the Mailbox server for that organization.

Audio Quality	Overall audio quality for the selected period of time for the organization/user using the following scale: • Greater than 4.50 = Excellent • From 3.5 through 4.49 = Good • From 2.5 through 3.49 = Average • From 1.50 through 2.49 =Poor • Up to 1.49 = Bad
Total Calls	If the UM IP gateway is selected, this is the total number of calls grouped for the selected UM IP gateway for the corresponding date. If the UM dial plan control is selected, this is the total number of calls grouped for the selected UM dial plan for the corresponding date. If the user is selected, this column has the total number of calls for the user.
Network MOS (NMOS)	Average NMOS for the specific UM dial plan or UM IP gateway.
NMOS Degradation	NMOS degradation for the specific UM dial plan or UM IP gateway.
Jitter	Average jitter for the specific UM dial plan or UM IP gateway.
Packet loss	Average packet loss for the specific UM dial plan or UM IP gateway.
Round Trip	Round trip time (in milliseconds) for the selected UM dial plan or UM IP gateway.
Burst loss Duration	Average duration of packet loss during bursts of losses for the selected UM dial plan or UM IP gateway.

Number of samples	Number of calls sampled, when calculating the averages. A sample refers to any call data record that contains at least one of the audio quality metrics.

After this task is completed, a summary report will be displayed for all calls that are processed by Mailbox servers running the Microsoft Exchange Unified Messaging service in your organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM call data and summary reports" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
GroupBy	Required	Microsoft.Exchange.Data.GroupBy	The *GroupBy* parameter displays the daily statistics for the last 90 days, monthly statistics for the last 12 months, or a summary of all call statistics for your Mailbox servers running the Microsoft Exchange Unified Messaging service in your organization.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that retrieves data from Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the Unified Messaging (UM) dial plan to show statistics for. If you don't specify a dial plan, statistics are included for all dial plans in the organization.
UMIPGateway	Optional	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *UMIPGateway* parameter specifies the UM IP gateway to show statistics for. If you don't specify a UM IP gateway, statistics are included for all UM IP gateways for a selected dial plan, or, if no dial plan is selected, results will be returned for all UM IP gateways in the organization.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-UMConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-UMConnectivity** cmdlet to test the operation of a Mailbox server computer running the Microsoft Exchange Unified Messaging service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-UMConnectivity -Phone <String> -PIN <String> -TUILogon <$true |
$false> -UMDialPlan <UMDialPlanIdParameter> [-CertificateThumbprint
<String>] [-ListenPort <Int32>] [-MediaSecured <$true | $false>] [-
MonitoringContext <$true | $false>] [-RemotePort <Int32>] [-Secured <$true
| $false>] [-Timeout <Int32>] <COMMON PARAMETERS>

Test-UMConnectivity [-CallRouter <SwitchParameter>] [-
CertificateThumbprint <String>] [-ListenPort <Int32>] [-MediaSecured
<$true | $false>] [-MonitoringContext <$true | $false>] [-RemotePort
<Int32>] [-Secured <$true | $false>] [-Timeout <Int32>] <COMMON
PARAMETERS>

Test-UMConnectivity -Phone <String> -UMIPGateway <UMIPGatewayIdParameter>
[-CertificateThumbprint <String>] [-DiagDtmfDurationInMilisecs <Int32>] [-
DiagDtmfSequence <String>] [-DiagInitialSilenceInMilisecs <Int32>] [-
DiagInterDtmfDiffGapInMilisecs <String>] [-DiagInterDtmfGapInMilisecs
<Int32>] [-From <String>] [-ListenPort <Int32>] [-MediaSecured <$true |
$false>] [-MonitoringContext <$true | $false>] [-Secured <$true | $false>]
[-Timeout <Int32>] <COMMON PARAMETERS>

Test-UMConnectivity -TUILogonAll <$true | $false> [-CertificateThumbprint
<String>] [-ListenPort <Int32>] [-MediaSecured <$true | $false>] [-
MonitoringContext <$true | $false>] [-RemotePort <Int32>] [-Secured <$true
| $false>] [-Timeout <Int32>] <COMMON PARAMETERS>

Test-UMConnectivity -ResetPIN <$true | $false> [-MonitoringContext <$true
| $false>] <COMMON PARAMETERS>
```

```
COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example performs connectivity and operational tests on the local Mailbox server, and then displays the Voice over IP (VoIP) connectivity information.

```
Test-UMConnectivity
```

EXAMPLE 2

This example tests the ability of the local Mailbox server to use an unsecured TCP connection instead of a secured mutual TLS connection to place a call through the UM IP gateway MyUMIPGateway by using the telephone number 56780.

```
Test-UMConnectivity -UMIPGateway MyUMIPGateway -Phone 56780
-Secured $false
```

EXAMPLE 3

This example tests a SIP dial plan by using a SIP URI. This example can be used in an environment that includes Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server.

```
Test-UMConnectivity -Phone
sip:sipdp.contoso.com@contoso.com -UMIPGateway
MyUMIPGateway -Secured $true -From sip:user1@contoso.com -
MediaSecured $true
```

Detailed Description

Two diagnostic tests are designed to test the operation of the Microsoft Exchange Server 2013 Mailbox server software (mode 1) and the operation of the whole system that includes the connected telephony components (mode 2).

The **Test-UMConnectivity** cmdlet can be used to test the operation of a Mailbox server and related connected telephony equipment. When you run this cmdlet and include the *UMIPGateway* parameter, the Mailbox server tests the full end-to-end operation of the Unified Messaging system. This test includes the telephony components connected to the Mailbox server, such as IP gateways, Private Branch eXchanges (PBXs), and cabling. If the *UMIPGateway* parameter isn't specified, the Mailbox server tests only the operation of the Unified Messaging components that are installed and configured on the server.

When you run this cmdlet in an on-premises Unified Messaging deployment, you need to create a UM IP gateway object for the computer or server that the cmdlet is testing. When you create the UM IP gateway object, you must configure it with a fully qualified domain name (FQDN) and that FQDN must match the name of the computer running this cmdlet.

After this task is complete, the cmdlet will have tested the operation of the Mailbox server and related telephony components.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM server" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Phone	Required	System.String	The *Phone* parameter specifies the telephone number or Session Initiation Protocol (SIP) Uniform Resource Identifier (URI) used when the test call is redirected. The extension number should be configured in the PBX to forward calls to the UM hunt group.
PIN	Required	System.String	The *PIN* parameter specifies the PIN associated with the UM-enabled mailbox.
ResetPIN	Required	System.Boolean	The *ResetPIN* parameter specifies whether to generate or regenerate a new PIN

			for all the test mailboxes in the current site.
TUILogon	Required	System.Boolean	The *TUILogon* parameter specifies whether the cmdlet tries to log on to one or more UM-enabled mailboxes. The mailboxes must be UM-enabled and associated with the UM dial plan to which the Mailbox server running the Microsoft Exchange Unified Messaging service belongs. The default setting is `$false`.
TUILogonAll	Required	System.Boolean	The *TUILogonAll* parameter specifies whether to try to connect to all test mailboxes in the current Active Directory site. The default setting is `$false`. The accounts that are tested must be generated by calling the New-TestCasConnectivityUser.ps1 script, and the

			corresponding mailboxes must be UM-enabled. Otherwise, no action is taken.
UMDialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan to be tested. This parameter must be used with the *TUILogon* parameter.
UMIPGateway	Required	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *UMIPGateway* parameter specifies the name of the UM IP gateway or IP PBX to use for the outgoing test call.
CallRouter	Optional	System.Management.Automation.SwitchParameter	The *CallRouter* parameter specifies the Client Access server that runs the Microsoft Exchange Unified Messaging Call Router service used for testing the functionality of Unified Messaging.
CertificateThumbprint	Optional	System.String	The *CertificateThumbprint* parameter specifies the certificate thumbprint used for SIP Secured

			and Secured mode.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DiagDtmfDurationInMilisecs	Optional	System.Int32	The *DiagDtmfDurationInMilisecs* parameter specifies the duration of each digit sent.
DiagDtmfSequence	Optional	System.String	The *DiagDtmfSequence* parameter specifies the sequence of digits sent.
DiagInitialSilenceInMilisecs	Optional	System.Int32	The *DiagInitialSilenceInMilisecs* parameter specifies the time period in milliseconds that the cmdlet pauses before the digit sequence is sent.
DiagInterDtmfDiffGapInMilisecs	Optional	System.String	The *DiagInterDtmfDiffGapI*

			nMilisecs parameter specifies whether to customize the time between the digits in the diagnostic sequence. This is a comma-delimited list that can accept null entries. This should include multiple values.
DiagInterDtmfGapInMilisecs	Optional	System.Int32	The *DiagInterDtmfGapInMilisecs* parameter specifies the time in milliseconds between each digit sent in the digit sequence. This is a single value.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
From	Optional	System.String	The *From* parameter specifies the SIP URI or SIP address that the call originated from. It's used only when you use the *Phone*

			parameter. The default setting is the SIP URI specified when you use the *Phone* parameter.
ListenPort	Optional	System.Int32	The *ListenPort* parameter specifies the IP port number on which to listen. If not specified, IP port 9000 is used.
MediaSecured	Optional	System.Boolean	The *MediaSecured* parameter specifies whether to use Secure RTP or RTP (unsecured) mode.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you

			include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
RemotePort	Optional	System.Int32	The *RemotePort* parameter specifies the port used for the call. If not specified, the default is port 5060 for Transmission Control Protocol (TCP) and 5061 for mutual Transport Layer Security (TLS).
Secured	Optional	System.Boolean	The *Secured* parameter specifies whether the test is run in SIP Secured mode.
Timeout	Optional	System.Int32	The *Timeout* parameter specifies the length of time in seconds to wait for the test operation to finish. The default is 600 seconds. You can't set this parameter with

			a value of less than 60 seconds. However, we recommend that you always configure this parameter with a value of 60 seconds or more. The maximum value for this parameter is 1800 seconds.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMDialplan

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMDialplan** cmdlet to display the properties of a single Unified Messaging (UM) dial plan or to return a list of all UM dial plans associated with Mailbox servers running the Microsoft Exchange Unified Messaging service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMDialPlan [-Identity <UMDialPlanIdParameter>] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example displays a list of all the UM dial plans in the Active Directory forest.

```
Get-UMDialplan
```

EXAMPLE 2

This example displays a formatted list of properties for the UM dial plan MyUMDialPlan.

```
Get-UMDialplan -Identity MyUMDialPlan | Format-List
```

Detailed Description

The **Get-UMDialplan** cmdlet displays all properties for a UM dial plan.

After this task is completed, when you specify the *Identity* parameter, you can view the values set. When the **Get-UMDialplan** cmdlet is run, if no parameter is supplied, the cmdlet returns all UM dial plans in the Active Directory forest.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *Identity* parameter specifies the UM dial plan ID.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-UMDialplan

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-UMDialplan** cmdlet to create a Unified Messaging (UM) dial plan to establish a link between UM IP gateways, UM hunt groups, and Mailbox servers to enable communication between Unified Messaging components.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-UMDialPlan -CountryOrRegionCode <String> -Name <String> -
NumberOfDigitsInExtension <Int32> [-AccessTelephoneNumbers
<MultiValuedProperty>] [-Confirm [<SwitchParameter>]] [-DefaultLanguage
<UMLanguage>] [-DefaultOutboundCallingLineId <String>] [-DomainController
<Fqdn>] [-FaxEnabled <$true | $false>] [-GenerateUMMailboxPolicy <$true |
$false>] [-GlobalCallRoutingScheme <None | E164 | GatewayGuid | Reserved1
| Reserved2 | Reserved3>] [-Organization <OrganizationIdParameter>] [-
SipResourceIdentifierRequired <$true | $false>] [-SubscriberType
<Enterprise | Consumer>] [-URIType <TelExtn | E164 | SipName>] [-
VoIPSecurity <SIPSecured | Unsecured | Secured>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the UM dial plan MyUMDialPlan that uses four-digit extension numbers.

```
New-UMDialplan -Name MyUMDialPlan -
NumberOfDigitsInExtension 4
```

EXAMPLE 2

This example creates the UM dial plan MyUMDialPlan that uses five-digit extension numbers that support SIP URIs.

```
New-UMDialplan -Name MyUMDialPlan -URIType SipName -
NumberOfDigitsInExtension 5
```

EXAMPLE 3

This example creates the unsecured UM dial plan MyUMDialPlan that supports E.164 numbers and that uses five-digit extension numbers.

```
New-UMDialplan -Name MyUMDialPlan -URIType E164 -
NumberOfDigitsInExtension 5 -VoIPSecurity Unsecured
```

Detailed Description

The **New-UMDialplan** cmdlet creates a UM dial plan in Active Directory. A UM dial plan object has an organization-wide scope and contains all configuration information related to a telephony dial plan. A UM dial plan is a required component for establishing Unified Messaging communications with Microsoft Exchange Server 2013. When you create a UM dial plan, an understanding of telephony configurations and the implications of adding to or modifying a UM configuration is required.

Note:
After the new UM dial plan is created, a UM IP gateway and a Mailbox server must be associated with the UM dial plan to enable Unified Messaging operations.

After this task is completed, a new UM dial plan is created.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
CountryOrRegionCode	Required	System.String	The *CountryOrRegionCode* parameter specifies the country or region code that precedes a telephone number used to place calls from other countries or regions to the country or region in which the UM dial plan is located. For example, 1 is the code used for North

			America, and 44 is the code used for the United Kingdom.
Name	Required	System.String	The *Name* parameter specifies the display name of the UM dial plan. This description is presented to the administrator when a user is enabled for Unified Messaging. The UM dial plan name field can contain as many as 64 characters.
NumberOfDigitsInExtension	Required	System.Int32	The *NumberOfDigitsInExtension* parameter specifies the fixed number of digits in an extension number. The range for this parameter is from 1 through 20 digits.
AccessTelephoneNumbers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AccessTelephoneNumbers* parameter specifies the telephone number or numbers used for subscriber access. These numbers are sometimes referred to

			as pilot or pilot ID numbers. The telephone number is limited to 32 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DefaultLanguage	Optional	Microsoft.Exchange.Data.UMLanguage	The *DefaultLanguage* parameter specifies the default language of the system. This default language is selected from the list of available languages. If there are no other UM language packs installed, the default value is en-US.
DefaultOutboundCallingLineId	Optional	System.String	The *DefaultOutboundCallingLineId* parameter specifies the phone

			number that a Mailbox server would use as the calling line ID when placing an outbound call. By default, this is set to `$null` and only the extension number of the UM-enabled user that places the outbound call is used. This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FaxEnabled	Optional	System.Boolean	The *FaxEnabled* parameter specifies whether the Mailbox servers associated with the dial plan answer and process incoming fax calls. The default is

			`$true`.
GenerateUMMailboxPolicy	Optional	System.Boolean	The *GenerateUMMailboxPolicy* parameter specifies whether a default UM mailbox policy is created when the UM dial plan is created. The default setting is to create a UM mailbox when the UM dial plan is created.
GlobalCallRoutingScheme	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMGlobalCallRoutingScheme	The *GlobalCallRoutingScheme* parameter specifies whether UM-enabled users and auto attendant numbers should be included in the global routing database. If the setting is `E164`, the numbers are provisioned in the global routing database.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
SipResourceIdentifierRequired	Optional	System.Boolean	The *SipResourceIdentifierRe*

			quired parameter specifies whether the Session Initiation Protocol (SIP) resource identifier is required to be specified when mailboxes are UM-enabled and associated with the dial plan. The default is `$false` but it can only be set to `$true` if the Uniform Resource Identifier (URI) type of the dial plan is E.164.
SubscriberType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMSubscriberType	The *SubscriberType* parameter specifies either `Consumer` or `Enterprise` as the type of dial plan. Enterprise dial plans are most likely to be used in a single organization. Consumer dial plans are used in hosted environments and can represent dial plans that may belong to different tenants.
URIType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMUriType	The *URIType* parameter specifies the URI type to be sent and received

			with SIP messages from the Private Branch eXchange (PBX).
VoIPSecurity	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMVoIPSecurityType	This parameter is available only in on-premises Exchange 2013. The *VoIPSecurity* parameter specifies whether the signaling channel is encrypted using mutual Transport Layer Security (TLS). The default setting is `Unsecured`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UMDialplan

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UMDialplan** cmdlet to delete an existing Unified Messaging (UM) dial plan.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UMDialPlan -Identity <UMDialPlanIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the existing UM dial plan MyUMDialPlan.

```
Remove-UMDialplan -Identity MyUMDialPlan
```

Detailed Description

The **Remove-UMDialplan** cmdlet deletes an existing UM dial plan from Active Directory. Make sure the UM dial plan isn't being used by other UM objects such as UM mailbox policies or UM IP gateways. When you delete an existing UM dial plan, the cmdlet verifies that the specified UM dial plan isn't referenced by a Mailbox server, UM IP gateway, or UM mailbox policies. The only benefit gained from deleting an obsolete UM dial plan is to reuse the name or perform general Active Directory housekeeping.

After this task is completed, the UM dial plan is removed from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *Identity* parameter specifies the identifier for the UM dial plan being deleted. This is the directory object ID for the UM dial plan.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMDialplan

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMDialplan** cmdlet to set various properties on a Unified Messaging (UM) dial plan.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMDialPlan -Identity <UMDialPlanIdParameter> [-AccessTelephoneNumbers
<MultiValuedProperty>] [-AllowDialPlanSubscribers <$true | $false>] [-
AllowedInCountryOrRegionGroups <MultiValuedProperty>] [-
AllowedInternationalGroups <MultiValuedProperty>] [-AllowExtensions <$true
| $false>] [-AllowHeuristicADCallingLineIdResolution <$true | $false>] [-
AudioCodec <G711 | Wma | Gsm | Mp3>] [-AutomaticSpeechRecognitionEnabled
<$true | $false>] [-CallAnsweringRulesEnabled <$true | $false>] [-
CallSomeoneEnabled <$true | $false>] [-ConfiguredInCountryOrRegionGroups
<MultiValuedProperty>] [-ConfiguredInternationalGroups
<MultiValuedProperty>] [-Confirm [<SwitchParameter>]] [-ContactAddressList
<AddressListIdParameter>] [-ContactRecipientContainer
<OrganizationalUnitIdParameter>] [-ContactScope <DialPlan |
GlobalAddressList | Extension | AutoAttendantLink | AddressList>] [-
CountryOrRegionCode <String>] [-DefaultLanguage <UMLanguage>] [-
DefaultOutboundCallingLineId <String>] [-DialByNamePrimary <LastFirst |
FirstLast | SMTPAddress>] [-DialByNameSecondary <LastFirst | FirstLast |
SMTPAddress | None>] [-DomainController <Fqdn>] [-
EquivalentDialPlanPhoneContexts <MultiValuedProperty>] [-Extension
<String>] [-FaxEnabled <$true | $false>] [-ForceUpgrade <SwitchParameter>]
[-InCountryOrRegionNumberFormat <NumberFormat>] [-InfoAnnouncementEnabled
<True | False | Uninterruptible>] [-InfoAnnouncementFilename <String>] [-
InputFailuresBeforeDisconnect <Int32>] [-InternationalAccessCode <String>]
[-InternationalNumberFormat <NumberFormat>] [-LegacyPromptPublishingPoint
<String>] [-LogonFailuresBeforeDisconnect <Int32>] [-
MatchedNameSelectionMethod <Title | Department | Location | None |
PromptForAlias>] [-MaxCallDuration <Int32>] [-MaxRecordingDuration
<Int32>] [-Name <String>] [-NationalNumberPrefix <String>] [-
NumberingPlanFormats <MultiValuedProperty>] [-OperatorExtension <String>]
[-OutsideLineAccessCode <String>] [-PilotIdentifierList
<MultiValuedProperty>] [-RecordingIdleTimeout <Int32>] [-
SendVoiceMsgEnabled <$true | $false>] [-TUIPromptEditingEnabled <$true |
$false>] [-UMAutoAttendant <UMAutoAttendantIdParameter>] [-VoIPSecurity
<SIPSecured | Unsecured | Secured>] [-WelcomeGreetingEnabled <$true |
$false>] [-WelcomeGreetingFilename <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the UM dial plan MyDialPlan to use 9 for the outside line access code.

```
Set-UMDialplan -Identity MyDialPlan -OutsideLineAccessCode
9
```

EXAMPLE 2

This example configures the UM dial plan MyDialPlan to use a welcome greeting.

```
Set-UMDialplan -Identity MyDialPlan -WelcomeGreetingEnabled
$true -WelcomeGreetingFilename welcome.wav
```

EXAMPLE 3

This example configures the UM dial plan MyDialPlan with dialing rules.

```
$csv=import-csv "C:\MyInCountryGroups.csv"
Set-UMDialPlan -Identity MyDialPlan -
ConfiguredInCountryOrRegionGroups $csv
Set-UMDialPlan -Identity MyDialPlan -
AllowedInCountryOrRegionGroups "local, long distance"
```

Detailed Description

The **Set-UMDialplan** cmdlet changes or modifies the properties of an existing UM dial plan. Some UM dial plan properties are required and are created by default. However, in some cases, after the UM dial plan is created, not all properties for the UM dial plan are writable. Therefore, some of the properties can't be changed unless the existing UM dial plan is deleted and a new one is created.

Important:
UM dial plans are important to the operation of Unified Messaging. Modifications to an existing UM dial plan should be performed by an administrator who understands the implications of changes to UM dial plans.

After this task is completed, the parameters and values specified are configured on the UM dial plan.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *Identity* parameter specifies the UM dial plan ID. This parameter is the directory object identifier for the UM dial plan. This parameter is used to link mailboxes and Mailbox and Client Access servers to dial plans.
AccessTelephoneNum	Optional	Microsoft.Exchange.Da	The

bers		ta.MultiValuedProperty	*AccessTelephoneNumbers* parameter specifies a single valid voice mail pilot number or a list of valid voice mail pilot numbers. This list is presented to you when a user is being enabled for Unified Messaging.
AllowDialPlanSubscribers	Optional	System.Boolean	The *AllowDialPlanSubscribers* parameter specifies whether to allow subscribers dial numbers that resolve to a subscriber within the same dial plan. The default value is `$true`.
AllowedInCountryOrRegionGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedInCountryOrRegionGroups* parameter specifies the list of in-country/region names from the same dial group that can be dialed. The name of the allowed in-country/region group must match the group name specified in the UM dial plan.
AllowedInternational	Optional	Microsoft.Exchange.Da	The

Groups		ta.MultiValuedProperty	*AllowedInternationalGroups* parameter specifies the list of international dial group names allowed. The international dial group name must match the group name specified in the dial plan.
AllowExtensions	Optional	System.Boolean	The *AllowExtensions* parameter specifies whether to allow calls to dial plan extensions. The default value is `$false`.
AllowHeuristicADCallingLineIdResolution	Optional	System.Boolean	The *AllowHeuristicADCallingLineIdResolution* parameter specifies whether to allow calling line ID resolution using telephone number fields that may be configured in Active Directory. When this parameter is set to `$true`, the telephone numbers such as those defined in the **Mobile** or **Home** telephone number fields in Active Directory are used. Setting this parameter to `$true` allows for resolution of calling IDs for both UM-enabled

			and non-UM-enabled users. The default is `$true`. You may want to set this parameter to `$false` if the telephone numbers for users aren't in a standard format. If the telephone numbers aren't in a standard format, the Mailbox server may not be able to correctly resolve the caller ID to a name of a user in a consistent manner.
AudioCodec	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AudioCodecEnum	The *AudioCodec* parameter specifies the audio codec used for recording. `Mp3` is the default setting.
AutomaticSpeechRecognitionEnabled	Optional	System.Boolean	The *AutomaticSpeechRecognitionEnabled* parameter specifies whether Automatic Speech Recognition (ASR) is enabled for users who are members of the dial plan.
CallAnsweringRulesEnabled	Optional	System.Boolean	The *CallAnsweringRulesEnabled* parameter specifies whether Call Answering

			Rules are enabled for UM-enabled users associated with the UM dial plan.
CallSomeoneEnabled	Optional	System.Boolean	The *CallSomeoneEnabled* parameter specifies whether the Call Someone feature is enabled.
ConfiguredInCountryOrRegionGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConfiguredInCountryOrRegionGroups* parameter specifies the in-country groups that can be used. Each string consists of four parts: • Group name (up to 32 characters) • AllowedNumberString • DialNumberString • TextComment
ConfiguredInternationalGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConfiguredInternationalGroups* parameter specifies the international groups that can be used. Each string consists of four parts: • Group name (up to 32 characters) • AllowedNumberString • DialNumberString • TextComment

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContactAddressList	Optional	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *ContactAddressList* parameter specifies the identity of the address list. If the *ContactScope* parameter is set to `AddressList`, this parameter defines the scope for directory searches.
ContactRecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *ContactRecipientContainer* parameter specifies the name or identity of the container used for directory searches.
ContactScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CallSomeoneScopeEnum	The *ContactScope* parameter specifies the scope of the directory search provided to callers when they access the UM dial plan and specify a

			user's name.
CountryOrRegionCode	Optional	System.String	The *CountryOrRegionCode* parameter specifies the country or region code that precedes a telephone number used to place calls from other countries or regions to the country or region in which the UM dial plan is located. For example, 1 is the code used for North America, and 44 is the code used for the United Kingdom.
DefaultLanguage	Optional	Microsoft.Exchange.Data.UMLanguage	The *DefaultLanguage* parameter specifies the default language of the system. This default language is selected from the list of available languages. The default value is `U.S. English`.
DefaultOutboundCallingLineId	Optional	System.String	The *DefaultOutboundCallingLineId* parameter specifies the phone number that a Mailbox server would use as the calling line ID when placing an outbound call. By default, this is set to

			`$null` and only the extension number of the UM-enabled user that places the outbound call is used. This parameter is reserved for internal Microsoft use.
DialByNamePrimary	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DialByNamePrimaryEnum	The *DialByNamePrimary* parameter specifies that the Dial by Name lookup key is to be created from the specified source. The default value is `LastFirst`.
DialByNameSecondary	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DialByNameSecondaryEnum	The *DialByNameSecondary* parameter specifies that the secondary Dial by Name lookup key is to be created from the specified source. The default value is `SMTPAddress`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
EquivalentDialPlanPhoneContexts	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *EquivalentDialPlanPhoneContexts* parameter specifies the name of an equivalency dial plan. This parameter can be used when two UM dial plans exist but are in different forests or when a Private Branch eXchange (PBX) numbering plan spans two UM dial plans. Adding the name of the equivalency dial plan allows name lookups using a caller ID to search in the user's dial plan but then also search for a name for the calling line ID in any equivalent dial plans that are configured.
Extension	Optional	System.String	The *Extension* parameter specifies the extension number used by the Call Someone feature when a call is transferred.
FaxEnabled	Optional	System.Boolean	The *FaxEnabled* parameter specifies whether the Mailbox servers associated with

			the UM dial plan answers and processes incoming fax calls. The default value is `$true`.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* switch specifies whether you're prompted for confirmation before a UM dial plan object is upgraded.
InCountryOrRegionNumberFormat	Optional	Microsoft.Exchange.Data.NumberFormat	The *InCountryOrRegionNumberFormat* parameter specifies the prefix string to use and the number of digits to take from the directory. This number is used when dialing into this dial plan from inside the same country or region code.
InfoAnnouncementEnabled	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.InfoAnnouncementEnabledEnum	The *InfoAnnouncementEnabled* parameter specifies whether an informational announcement is enabled. This parameter can be set to `True`, `False`, or `Uninterruptible`. The default value is `False`.
InfoAnnouncementFil	Optional	System.String	The

ename			*InfoAnnouncementFilename* parameter specifies the audio file name for an informational announcement.
InputFailuresBeforeDisconnect	Optional	System.Int32	The *InputFailuresBeforeDisconnect* parameter specifies the number of sequential user input errors allowed before the call is disconnected. The default value is 3.
InternationalAccessCode	Optional	System.String	The *InternationalAccessCode* parameter specifies the code that precedes a telephone number to dial international calls. For example, 011 is the code used to call the United States.
InternationalNumberFormat	Optional	Microsoft.Exchange.Data.NumberFormat	The *InternationalNumberFormat* parameter specifies the prefix string to use and the number of digits to take from the directory, when dialing into this dial plan from a different country code.

LegacyPromptPublishingPoint	Optional	System.String	The *LegacyPromptPublishingPoint* parameter specifies the location of the prompt publishing point for Microsoft Exchange Server 2007 Unified Messaging servers. In coexistence scenarios, this parameter is used when Exchange 2007 and Exchange Server 2010 Unified Messaging servers are added to the same Exchange 2010 UM dial plan.
LogonFailuresBeforeDisconnect	Optional	System.Int32	The *LogonFailuresBeforeDisconnect* parameter specifies the number of sequential unsuccessful logon attempts that can be made before the call is disconnected. The default value is 3.
MatchedNameSelectionMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DisambiguationFieldEnum	The *MatchedNameSelectionMethod* parameter specifies the selection to use to differentiate between users who have names that match the touchtone

			or speech input. This setting can be set to the following: • `Title` • `Department` • `Location` • `None` • `PromptForAlias`
MaxCallDuration	Optional	System.Int32	The *MaxCallDuration* parameter specifies the maximum length of time that a call can last before it's interrupted and the call is dropped. The default value is `30` minutes.
MaxRecordingDuration	Optional	System.Int32	The *MaxRecordingDuration* parameter specifies the maximum length of time that messages can be recorded. This includes all kinds of calls. The default is `20` minutes. The value of this setting can be from 1 through 100. Setting this value too low can cause long voice messages to be disconnected before they are completed. Setting this value too high lets users save lengthy voice messages in their Inboxes.
Name	Optional	System.String	The *Name* parameter

			specifies the display name to use for the UM dial plan. This name is limited to 64 characters.
NationalNumberPrefix	Optional	System.String	The *NationalNumberPrefix* parameter specifies the dialing code that precedes a telephone number when placing calls from one local area to another within a specific country or region. For example, 1 is the code used within North America, and 0 is the code used within the United Kingdom.
NumberingPlanFormats	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NumberingPlanFormats* parameter specifies one or more phone number masks that can be used for resolving caller ID to names of users in Active Directory.
OperatorExtension	Optional	System.String	The *OperatorExtension* parameter specifies the extension number of the operator. If this parameter isn't specified, the Do Not Allow Transfer to the

			Operator feature is unavailable.
OutsideLineAccessCode	Optional	System.String	The *OutsideLineAccessCode* parameter specifies the code that precedes a telephone number to dial an external in-country telephone number. This code is also referred to as a trunk access code. The default value is 9.
PilotIdentifierList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *PilotIdentifierList* parameter specifies the pilot numbers configured on the dial plan. A single dial plan can have multiple pilot numbers. The pilot numbers must be in the E.164 format.
RecordingIdleTimeout	Optional	System.Int32	The *RecordingIdleTimeout* parameter specifies the length of time that a caller can be silent when recording a voice message before the recording is ended. The default value is 5 seconds.
SendVoiceMsgEnabled	Optional	System.Boolean	The *SendVoiceMsgEnabled* parameter specifies

			whether the Send Message feature is enabled.
TUIPromptEditingEnabled	Optional	System.Boolean	The *TUIPromptEditingEnabled* parameter specifies whether authorized users are permitted to record UM dial plan or automated attendant prompts by using the Telephone User Interface (TUI). The default setting is `$false`.
UMAutoAttendant	Optional	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *UMAutoAttendant* parameter specifies the auto attendant run when the caller presses the star (*) key. If this parameter is specified, it overrides the Call Someone feature.
VoIPSecurity	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMVoIPSecurityType	This parameter is available only in on-premises Exchange 2013. The *VoIPSecurity* parameter specifies whether the Voice over IP (VoIP) traffic is encrypted or that the signaling channel or the signaling and the media channels

			are encrypted by using mutual Transport Layer Security (TLS). The default setting is `Unsecured`.
WelcomeGreetingEnabled	Optional	System.Boolean	The *WelcomeGreetingEnabled* parameter specifies whether a custom welcome greeting is enabled. The default value is `$false`.
WelcomeGreetingFilename	Optional	System.String	The *WelcomeGreetingFilename* parameter specifies the audio file name for the welcome greeting.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMHuntGroup** cmdlet to display the properties and values for an existing Unified Messaging (UM) hunt group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMHuntGroup [-Identity <UMHuntGroupIdParameter>] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-UMDialPlan
<UMDialPlanIdParameter>]
```

Examples

EXAMPLE 1

This example displays all the UM hunt groups in the Active Directory forest.

```
Get-UMHuntGroup
```

EXAMPLE 2

This example displays the details of the UM hunt group MyUMHuntGroup in a formatted list.

```
Get-UMHuntGroup -Identity MyUMIPGateway\MyUMHuntGroup |
Format-List
```

EXAMPLE 3

This example displays all of the UM hunt groups associated with the UM dial plan MyUMDialPlan.

```
Get-UMHuntGroup -UMDialPlan MyUMDialPlan
```

Detailed Description

The **Get-UMHuntGroup** cmdlet retrieves the properties for a single UM hunt group or a list of UM hunt groups. When you're using the **Get-UMHuntGroup** cmdlet, you can't only enter the name of the UM hunt group. You must also include the name of the UM IP gateway associated with the UM hunt group, for example, `Get-UMHuntGroup -Identity MyUMIPGateway\MyUMHuntGroup1`.

After this task is completed, if the *Identity* parameter is specified, the properties for the UM hunt group are returned. If neither the *Identity* nor the *UMDialPlan* parameter is specified, all UM hunt groups in the Active Directory forest are returned.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM hunt groups" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UMHuntGroupIdParameter	The *Identity* parameter specifies the identifier for the UM hunt group being viewed. This is the directory object ID

			for the UM hunt group.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan associated with a UM hunt group.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-UMHuntGroup

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-UMHuntGroup** cmdlet to create a Unified Messaging (UM) hunt group used to link incoming calls to a specific UM dial plan.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-UMHuntGroup -Name <String> -UMDialPlan <UMDialPlanIdParameter> -
UMIPGateway <UMIPGatewayIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
PilotIdentifier <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the UM hunt group MyUMHuntGroup that has a pilot identifier of 12345.

```
New-UMHuntGroup -Name MyUMHuntGroup -PilotIdentifier 12345
-UMDialPlan MyUMDialPlan -UMIPGateway MyUMIPGateway
```

EXAMPLE 2

This example creates the UM hunt group MyUMHuntGroup that has multiple pilot identifiers.

```
New-UMHuntGroup -Name MyUMHuntGroup -PilotIdentifier
5551234,55555 -UMDialPlan MyUMDialPlan -UMIPGateway
MyUMIPGateway
```

Detailed Description

The **New-UMHuntGroup** cmdlet creates a UM hunt group in Active Directory. Running this cmdlet enables all Mailbox servers associated with UM dial plans to communicate with an IP gateway. A UM hunt group must be created to allow communication between a UM IP gateway and a UM dial plan.

After this task is completed, a new UM hunt group is created.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM hunt groups" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the UM hunt group name used for display purposes. This string can contain as many as 64 characters, and it must be unique.

UMDialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan used with the UM hunt group.
UMIPGateway	Required	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *UMIPGateway* parameter specifies the UM IP gateway to be associated with the UM hunt group.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change

			to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
PilotIdentifier	Optional	System.String	The *PilotIdentifier* parameter specifies the number string used to uniquely identify the pilot access number for the specified IP gateway. This number must match the subscriber access number configured in the UM dial plan.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UMHuntGroup

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UMHuntGroup** cmdlet to remove and delete an existing Unified Messaging (UM) hunt group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UMHuntGroup -Identity <UMHuntGroupIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the UM hunt group MyUMHuntGroup.

```
Remove-UMHuntGroup -Identity MyUMHuntGroup
```

Detailed Description

The **Remove-UMHuntGroup** cmdlet deletes an existing UM hunt group from Active Directory. When the **Remove-UMHuntGroup** cmdlet is used, the UM hunt group is removed from the UM IP gateway, and then deleted from Active Directory. If the operation leaves the UM IP gateway without any remaining configured UM hunt groups, the IP gateway can't handle or process Unified Messaging calls.

After this task is completed, the UM hunt group is removed from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM hunt groups" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMHuntGroupIdParameter	The *Identity* parameter specifies the identifier for the UM hunt group being deleted. This is the directory object ID for the UM hunt group object.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-UMIPGateway

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-UMIPGateway** cmdlet to disable a Unified Messaging (UM) IP gateway.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-UMIPGateway -Identity <UMIPGatewayIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Immediate <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the UM IP gateway MyUMIPGateway and stops it from accepting incoming calls from the IP gateway.

```
Disable-UMIPGateway -Identity MyUMIPGateway
```

EXAMPLE 2

This example disables the UM IP gateway MyUMIPGateway and disconnects all current calls immediately.

```
Disable-UMIPGateway -Identity MyUMIPGateway -Immediate
$true
```

Detailed Description

The status variable for a UM IP gateway can be used to enable or disable call answering destined for the IP gateway. The **Disable-UMIPGateway** cmdlet disables a UM IP gateway in Active Directory by modifying its status variable. After this task is completed, the UM IP gateway no longer answers incoming calls or makes outgoing calls.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.UMIPGatewayIdParameter	specifies the identifier for the UM IP gateway being disabled. This is the directory object ID for the UM IP gateway.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Immediate	Optional	System.Boolean	The *Immediate* parameter specifies whether the Mailbox

			server running the Microsoft Exchange Unified Messaging service drops incoming calls associated with this UM IP gateway immediately or waits for the current calls to finish processing.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-UMIPGateway

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-UMIPGateway** cmdlet to enable a Unified Messaging (UM) IP gateway.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-UMIPGateway -Identity <UMIPGatewayIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the UM IP gateway MyUMIPGateway.

```
Enable-UMIPGateway -Identity MyUMIPGateway
```

Detailed Description

The status variable for a UM IP gateway can be used to enable or disable call answering destined for the IP gateway. The **Enable-UMIPGateway** cmdlet enables a UM IP gateway in Active Directory by modifying its status variable.

After this task is completed, the UM IP gateway answers incoming calls and makes outgoing calls through the IP gateway or IP Private Branch eXchange (PBX).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.UMIPGatewayIdParameter	specifies the identifier for the UM IP gateway being enabled. This parameter is the directory object ID for the UM IP gateway.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMIPGateway

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMIPGateway** cmdlet to return a list of properties and values for a specified Unified Messaging (UM) IP gateway or a list of UM IP gateways.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMIPGateway [-Identity <UMIPGatewayIdParameter>] [-DomainController
<Fqdn>] [-IncludeSimulator <SwitchParameter>] [-Organization
```

```
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example displays a formatted list of all the UM IP gateways in the Active Directory forest.

```
Get-UMIPGateway | Format-List
```

EXAMPLE 2

This example displays the properties for the UM IP gateway MyUMIPGateway.

```
Get-UMIPGateway -Identity MyUMIPGateway
```

EXAMPLE 3

This example displays all the UM IP gateways including IP gateway simulators in the Active Directory forest.

```
Get-UMIPGateway -IncludeSimulator $true
```

Detailed Description

The **Get-UMIPGateway** cmdlet displays the properties and values for a specified UM IP gateway, such as the display name, IP address, status, and outgoing calls settings. If no parameter is specified, all UM IP gateways in the Active Directory forest are returned.

When you're using the **Get-UMIPGateway** cmdlet, you can't enter the IP address configured on the UM IP gateway. You must use the name of the UM IP gateway. The name specified with the *Identity* parameter of the **Get-UMIPGateway** cmdlet can be the same as or different from the host name of the UM IP gateway, for example, **Get-UMIPGateway** *MyUMIPGateway*.

After this task is completed, you can view the list of properties and values for a specific UM IP gateway. Or, if the *Identity* parameter isn't used, the cmdlet returns a list of all UM IP gateways in the forest.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *Identity* parameter specifies the identifier for the UM IP gateway being viewed. This parameter is the directory object ID for the UM IP gateway.
IncludeSimulator	Optional	System.Management.Automation.SwitchParameter	The *IncludeSimulator* switch retrieves the simulator of the UM IP gateway being viewed. A simulator allows a client to connect to the Mailbox server.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-UMIPGateway

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-UMIPGateway** cmdlet to create a Unified Messaging (UM) IP gateway. A UM IP gateway is used to connect Unified Messaging servers to an IP gateway or a Session Initiation Protocol (SIP)–enabled IP Private Branch eXchange (PBX).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-UMIPGateway -Address <UMSmartHost> -Name <String> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-GlobalCallRoutingScheme
<None | E164 | GatewayGuid | Reserved1 | Reserved2 | Reserved3>] [-
IPAddressFamily <IPv4Only | IPv6Only | Any>] [-Organization
<OrganizationIdParameter>] [-UMDialPlan <UMDialPlanIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the UM IP gateway MyUMIPGateway that enables a Mailbox server to start accepting calls from an IP gateway with an IP address of 10.10.10.1.

```
New-UMIPGateway -Identity MyUMIPGateway -Address 10.10.10.1
```

EXAMPLE 2

This example creates the UM IP gateway MyUMIPGateway and prevents it from accepting incoming calls and outgoing calls, sets an IPv6 address, and allows the UM IP gateway to use IPv4 and IPV6 addresses.

```
New-UMIPGateway -Identity MyUMIPGateway -Address
fe80::39bd:88f7:6969:d223%11 -IPAddressFamily Any -Status
Disabled -OutcallsAllowed $false
```

EXAMPLE 3

This example creates the UM IP gateway MyUMIPGateway that enables a Mailbox server to start accepting calls from an IP gateway with an FQDN of MyUMIPGateway.contoso.com.

```
New-UMIPGateway -Identity MyUMIPGateway -Address
"MyUMIPGateway.contoso.com"
```

Detailed Description

The **New-UMIPGateway** cmdlet creates a UM IP gateway. A UM IP gateway has organization-wide scope and references a single physical IP gateway. The UM IP gateway that's created is used to establish a connection to an IP gateway or a SIP-enabled IP PBX. After this task is completed, a new UM IP gateway is created.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Address	Required	Microsoft.Exchange.Data.UMSmartHost	The *Address* parameter specifies the IP address configured on the IP gateway or SIP-enabled IP PBX.
Name	Required	System.String	The *Name* parameter specifies the display name for the UM IP gateway. The name for the new UM IP gateway can contain up to 64

			characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
GlobalCallRoutingScheme	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMGlobalCallRoutingScheme	The *GlobalCallRoutingScheme* parameter specifies whether the IP gateway can accept calls for UM-enabled users and auto attendant

			numbers included in the global routing database. If the value is set to `E164`, the IP gateway accepts the call.
IPAddressFamily	Optional	Microsoft.Exchange.Data.Directory.IPAddressFamily	The *IPAddressFamily* parameter specifies whether the UM IP gateway uses Internet Protocol version 4 (IPv4), IPv6, or both to communicate. If set to `IPv4Only`, the UM IP gateway only uses IPv4 to communicate. If set to `IPv6Only`, the UM IP gateway only uses IPv6. If set to `Any`, IPv6 will be used first, and then, if necessary, it will fallback to IPv4. The default is `IPv4Only`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan to be associated with the UM

			IP gateway.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UMIPGateway

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UMIPGateway** cmdlet to delete a Unified Messaging (UM) IP gateway.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UMIPGateway -Identity <UMIPGatewayIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the UM IP gateway MyUMIPGateway.

```
Remove-UMIPGateway -Identity MyUMIPGateway
```

Detailed Description

The **Remove-UMIPGateway** cmdlet deletes a specified UM IP gateway. After the UM IP gateway is deleted, Mailbox servers no longer accept new call requests from the IP gateway.

Important:
The **Remove-UMIPGateway** cmdlet should be run only by an administrator who fully understands the implications of disabling communication with a Session Initiation Protocol (SIP)–enabled IP Private Branch eXchange (PBX) or IP gateway.

After this task is completed, the UM IP gateway is removed from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *Identity* parameter specifies the identifier for the UM IP gateway being deleted.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMIPGateway

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMIPGateway** cmdlet to modify the configuration settings for a single Unified Messaging (UM) IP gateway or to return a list of configuration settings that can be modified on a specified UM IP gateway.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMIPGateway -Identity <UMIPGatewayIdParameter> [-Address
<UMSmartHost>] [-Confirm [<SwitchParameter>]] [-
DelayedSourcePartyInfoEnabled <$true | $false>] [-DomainController <Fqdn>]
[-ForceUpgrade <SwitchParameter>] [-IPAddressFamily <IPv4Only | IPv6Only |
Any>] [-MessageWaitingIndicatorAllowed <$true | $false>] [-Name <String>]
[-OutcallsAllowed <$true | $false>] [-Port <Int32>] [-Simulator <$true |
$false>] [-Status <Enabled | Disabled | NoNewCalls>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the IP address of the UM IP gateway MyUMIPGateway.

```
Set-UMIPGateway -Identity MyUMIPGateway -Address 10.10.10.1
```

EXAMPLE 2

This example prevents the UM IP gateway from accepting incoming calls and prevents outgoing

calls.

```
Set-UMIPGateway -Identity MyUMIPGateway -Address 10.10.10.1
-Status Disabled -OutcallsAllowed $false
```

EXAMPLE 3

This example prevents the UM IP gateway MyUMIPGateway from accepting incoming calls and outgoing calls, sets an IPv6 address, and allows the UM IP gateway to use IPv4 and IPv6 addresses.

```
Set-UMIPGateway -Identity MyUMIPGateway -Address
fe80::39bd:88f7:6969:d223%11 -IPAddressFamily Any -Status
Disabled -OutcallsAllowed $false
```

EXAMPLE 4

This example enables the UM IP gateway to function as an IP gateway simulator and can be used with the **Test-UMConnectivity** cmdlet.

```
Set-UMIPGateway -Identity MyUMIPGateway -Simulator $true
```

Detailed Description

The **Set-UMIPGateway** cmdlet modifies configuration settings for a specific UM IP gateway, for example, the IP address to the IP gateway. These modifications include allowing outgoing calls and controlling communications with a Session Initiation Protocol (SIP)–enabled IP Private Branch eXchange (PBX) or IP gateway.

Important:
It's possible that modifications to the UM IP gateway settings may disrupt communication between Mailbox servers and the SIP-enabled IP PBX or IP gateway. Modifications to a UM IP gateway should be performed only by an administrator who fully understands the implications of making configuration changes to the UM IP gateway.

After this task is completed, the parameters and values specified are configured on the UM IP gateway.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMIPGatewayIdParameter	The *Identity* parameter specifies the identifier for the UM IP gateway being modified. This parameter is the directory object ID for the UM IP gateway.
Address	Optional	Microsoft.Exchange.Data.UMSmartHost	The *Address* parameter specifies the IP address or the fully qualified domain name (FQDN) configured on the UM IP gateway or SIP-enabled IP PBX. An FQDN is required if the UM dial plan associated with the UM IP gateway is operating in SIP Secured or Secured mode. If an FQDN is used, verify that the Domain Name System (DNS) has been configured correctly.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DelayedSourcePartyInfoEnabled	Optional	System.Boolean	The *DelayedSourcePartyInfoEnabled* parameter specifies whether Unified Messaging should delay the process of accepting an inbound call from the Voice over IP (VoIP) gateway if the corresponding SIP INVITE of the call contains no calling party and diversion information.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ForceUpgrade	Optional	System.Management.A	This parameter is

		utomation.SwitchParameter	available only in on-premises Exchange 2013. The *ForceUpgrade* switch specifies whether you're prompted for confirmation before a UM IP gateway object is upgraded.
IPAddressFamily	Optional	Microsoft.Exchange.Data.Directory.IPAddressFamily	The *IPAddressFamily* parameter specifies whether the UM IP gateway will use Internet Protocol version 4 (IPv4), IPv6, or both to communicate. If set to `IPv4Only`, the UM IP gateway will only use IPv4 to communicate. If set to `IPv6Only`, the UM IP gateway will only use IPv6. If set to `Any`, IPv6 will be used first, and then if necessary, it will fall back to IPv4. The default is `IPv4Only`.
MessageWaitingIndicatorAllowed	Optional	System.Boolean	The *MessageWaitingIndicatorAllowed* parameter specifies whether to

			enable the UM IP gateway to allow SIP NOTIFY messages to be sent to users associated with a UM dial plan and the UM IP gateway. The default value is `$true`.
Name	Optional	System.String	The *Name* parameter specifies the display name for the UM IP gateway. This display name is limited to 64 characters.
OutcallsAllowed	Optional	System.Boolean	The *OutcallsAllowed* parameter specifies whether to allow this UM IP gateway to be used for outgoing calls. This doesn't govern call transfers.
Port	Optional	System.Int32	The *Port* parameter specifies the IP port on which the IP gateway or IP PBX is listening. By default, it's port 5060. The range for this parameter is from 0 through 65535.
Simulator	Optional	System.Boolean	The *Simulator* parameter specifies the simulator used for the

			UM IP gateway being viewed. A simulator allows a client to connect to the Mailbox server.
Status	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.GatewayStatus	The *Status* parameter specifies whether to enable or disable the UM IP gateway.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-UMMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-UMMailbox** cmdlet to disable Unified Messaging (UM) for a UM-enabled recipient.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-UMMailbox -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-KeepProperties <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables Unified Messaging on the mailbox for tonysmith@contoso.com.

```
Disable-UMMailbox -Identity tonysmith@contoso.com
```

Detailed Description

The **Disable-UMMailbox** cmdlet disables Unified Messaging for a Microsoft Exchange Server 2013 recipient who's currently UM-enabled. When the task is complete, Mailbox servers running the Microsoft Exchange Unified Messaging service no longer handle calls for the extension number associated with the mailbox. You can continue to use the Exchange mailbox for all other operations unrelated to Unified Messaging.

After this task is completed, the user is disabled for Unified Messaging and can't use the voice mail features found in Unified Messaging any longer.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the user to disable for Unified Messaging. The variables for this parameter include the following: • ADObjectID • GUID • Distinguished Name (DN) • Domain\Account • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically.

			• You can only use the distinguished name for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
KeepProperties	Optional	System.Boolean	The *KeepProperties* parameter specifies whether the mailbox and directory resident properties should be retained. If this parameter isn't included, the user's UM properties are retained.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-UMMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-UMMailbox** cmdlet to enable Unified Messaging (UM) for an existing mail-enabled user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-UMMailbox -Identity <MailboxIdParameter> -UMMailboxPolicy
<MailboxPolicyIdParameter> [-AutomaticSpeechRecognitionEnabled <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
Extensions <MultiValuedProperty>] [-IgnoreDefaultScope <SwitchParameter>]
[-NotifyEmail <String>] [-PilotNumber <String>] [-Pin <String>] [-
PinExpired <$true | $false>] [-SIPResourceIdentifier <String>] [-
ValidateOnly <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables Unified Messaging on the mailbox for tonysmith@contoso.com, sets the extension and PIN for the user that must be changed when the user logs on to Outlook Voice Access, assigns the UM mailbox policy MyUMMailboxPolicy to the user's mailbox, and then sends an email message that contains the Unified Messaging welcome information to administrator@contoso.com.

```
Enable-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy -Extensions 51234 -PIN
5643892 -NotifyEmail administrator@contoso.com -PINExpired
$true
```

EXAMPLE 2

This example enables Unified Messaging on a SIP-enabled mailbox for tonysmith@contoso.com, associates the UM mailbox policy MyUMMailboxPolicy, and sets the extension number, SIP resource identifier, and PIN for the user that must be changed when the user logs on to Outlook Voice Access, and then sends an email message that contains the Unified Messaging welcome information to tonysmith@contoso.com.

```
Enable-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy -Extensions 51234 -PIN
5643892 -SIPResourceIdentifier "tonysmith@contoso.com" -
PINExpired $true
```

Detailed Description

The **Enable-UMMailbox** cmdlet enables Unified Messaging for an existing mail-enabled Microsoft Exchange Server 2013 user. When the mail-enabled user is enabled for Unified Messaging, the settings from a UM mailbox policy are applied to the user. After the user is enabled for Unified Messaging, the user can use the UM features included with Exchange 2013.

After this task is completed, the user is enabled for Unified Messaging and can use the voice mail features included with Exchange 2013.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the user to enable for Unified Messaging. The values for this parameter include the following: • ADObjectID • GUID • Distinguished name (DN) • *Domain\Account*

			• user principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
UMMailboxPolicy	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *UMMailboxPolicy* parameter specifies the name of the UM mailbox policy to be associated with the user.
AutomaticSpeechRecognitionEnabled	Optional	System.Boolean	The *AutomaticSpeechRecognitionEnabled* parameter enables Automatic Speech Recognition (ASR) to be used with the UM mailbox. ASR is only available if the user's specified language preference is installed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	This parameter is available only in on-

		ta.Fqdn	premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Extensions	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Extensions* parameter specifies the extension number for the user. Either a single extension number or an array of telephone number extensions can be specified. The user's extension must be unique to the UM dial plan. If this parameter isn't included, a default telephone number value from Active Directory is used. If you're enabling a user for Unified Messaging using a Session Initiation Protocol (SIP) Uniform Resource Identifier (URI) or E.164 dial plan, you must also specify the *SIPResourceIdentifier* parameter.

IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the distinguished name for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.

NotifyEmail	Optional	System.String	The *NotifyEmail* parameter specifies the email address to which the server sends the email message that contains the Unified Messaging welcome information. By default, the message is sent to the SMTP address of the enabled user.
PilotNumber	Optional	System.String	The *PilotNumber* parameter specifies the subscriber access number users can dial to gain access to their mailboxes. The default value is the subscriber access number specified on a dial plan object in Active Directory.
Pin	Optional	System.String	The *PIN* parameter specifies the value for the initial PIN to be used with the UM mailbox. The PIN is checked against the UM mailbox policy rules. The PIN value must be from 4 through 24 numeric characters. If no PIN is specified, a PIN generated by the system is sent to the user. The PIN generated by the system

			contains six numeric characters, which is the default.
PinExpired	Optional	System.Boolean	The *PINExpired* parameter specifies whether the PIN is treated as expired. If this parameter is supplied and is set to `$false`, users aren't required to reset their PIN the next time they log on. If the PIN isn't supplied, the PIN is treated as expired and users are prompted to reset their PIN the next time they log on.
SIPResourceIdentifier	Optional	System.String	The *SIPResourceIdentifier* parameter specifies the SIP address or E.164 address for the user. This property is compared to the URI type defined on the UM dial plan.
ValidateOnly	Optional	System.Management.Automation.SwitchParameter	The *ValidateOnly* switch tells the cmdlet to evaluate the conditions and requirements necessary to perform the operation and then reports whether the operation will succeed or

			fail. No changes are made when the *ValidateOnly* switch is used.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMMailbox** cmdlet to display the Unified Messaging (UM) properties for a UM-enabled recipient.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMMailbox [-Anr <String>] <COMMON PARAMETERS>

Get-UMMailbox [-Identity <MailboxIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example displays a list of all the UM-enabled mailboxes in the Active Directory forest in a formatted list.

```
Get-UMMailbox | Format-List
```

EXAMPLE 2

This example displays the UM mailbox properties for tonysmith@contoso.com.

```
Get-UMMailbox -Identity tonysmith@contoso.com
```

Detailed Description

The **Get-UMMailbox** cmdlet retrieves the Unified Messaging properties for a single UM mailbox. It can also return a list of UM-enabled mailboxes.

After this task is completed, you can see the properties and values configured on a single UM mailbox. Or, if the *Identity* parameter isn't used, the cmdlet returns a list of all the UM-enabled mailboxes in a forest.

Note:
When running in an environment with Exchange Server 2007 and Exchange Server 2013 where the user's mailbox is located on an Exchange 2007 Mailbox server, running the **Get-UMMailbox** cmdlet on an Exchange 2013 server won't work correctly. To resolve the issue, run the **Get-UMMailbox** cmdlet from an Exchange 2007 server or a computer running the Exchange 2007 administrative tools.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	The *AccountPartition*parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects that have an attribute that matches that string. The following default attributes are searched: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to use to access Active Directory.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter filters the results returned by the cmdlet.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the user to enable for Unified Messaging. The values for this parameter include the following: • ADObjectID • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchPar	This parameter is available only in on-premises Exchange 2013.

		ameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the distinguished name for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters

			together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	This parameter is available only in on-premises Exchange 2013. The *OrganizationalUnit* parameter specifies an organizational unit (OU) and is used to limit the results. If you use this parameter, you retrieve only mailboxes in the container you specify. You can use the OU or the domain name. If you use the OU, you must specify the canonical name of the OU.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's

			domain. If you've set the recipient scope to include all recipients in the forest and if you don't use this parameter, the user information may be read from a global catalog whose information is outdated. If you do use this parameter, multiple reads may be necessary to get the information. By default, the recipient scope is set to the domain that hosts your Exchange servers.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies a maximum number of results to be returned. Otherwise, a maximum number isn't specified, and the command returns all results.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. You can sort by the following attributes: • **Alias**

			• **DisplayName** • **Name** The results are sorted in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMMailbox** cmdlet to set the Unified Messaging (UM) properties for a user who is currently UM-enabled.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMMailbox -Identity <MailboxIdParameter> [-AirSyncNumbers
<MultiValuedProperty>] [-AllowUMCallsFromNonUsers <None | SearchEnabled>]
[-AnonymousCallersCanLeaveMessages <$true | $false>] [-
AutomaticSpeechRecognitionEnabled <$true | $false>] [-
CallAnsweringAudioCodec <G711 | Wma | Gsm | Mp3>] [-
CallAnsweringRulesEnabled <$true | $false>] [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-FaxEnabled <$true | $false>] [-
IgnoreDefaultScope <SwitchParameter>] [-ImListMigrationCompleted <$true |
$false>] [-MissedCallNotificationEnabled <$true | $false>] [-Name
<String>] [-OperatorNumber <String>] [-PhoneNumber <String>] [-
PhoneProviderId <String>] [-PinlessAccessToVoiceMailEnabled <$true |
$false>] [-PlayOnPhoneEnabled <$true | $false>] [-SubscriberAccessEnabled
<$true | $false>] [-TUIAccessToCalendarEnabled <$true | $false>] [-
TUIAccessToEmailEnabled <$true | $false>] [-UMMailboxPolicy
<MailboxPolicyIdParameter>] [-UMSMSNotificationOption <None | VoiceMail |
VoiceMailAndMissedCalls>] [-VerifyGlobalRoutingEntry <SwitchParameter>] [-
VoiceMailAnalysisEnabled <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures a UM-enabled user, tony@contoso.com with the following settings:

- Changes the call answering audio codec to Wma
- Disables call answering rules
- Prevents him from receiving incoming faxes
- Enables voice mail notifications but not missed call notifications using text messaging

```
Set-UMMailbox -Identity tony@contoso.com -
CallAnsweringAudioCodec Wma -CallAnsweringRulesEnabled
$false -FaxEnabled $false -UMSMSNotificationOption
VoiceMail
```

EXAMPLE 2

This example prevents the user tony@contoso.com from accessing his calendar and email when he's using Outlook Voice Access.

```
Set-UMMailbox -Identity tony@contoso.com -
TUIAccessToCalendarEnabled $false -TUIAccessToEmailEnabled
$false
```

Detailed Description

The **Set-UMMailbox** cmdlet sets UM properties associated with a user who has been UM-enabled. Many of the UM properties for the user are stored on the user's mailbox, and other UM properties for the user are stored in Active Directory.

After this task is completed, the parameters and values specified are configured on the UM mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.MailboxIdParameter	specifies the user to enable for Unified Messaging. The values for this parameter include the following: • ADObjectID • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
AirSyncNumbers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AirSyncNumbers* parameter specifies whether to register a mobile phone number with a hosted voice mail service. Each UM mailbox can have up to three numbers defined, and numbers must be in E.164 format.
AllowUMCallsFromNonUsers	Optional	Microsoft.Exchange.Data.Directory.Recipient.AllowUMCallsFromNonUsersFlags	The *AllowUMCallsFromNonUsers* parameter specifies whether to exclude the mailbox from directory searches.
AnonymousCallersCa	Optional	System.Boolean	The

nLeaveMessages			*AnonymousCallersCanLeaveMessages* parameter specifies whether diverted calls without a caller ID are allowed to leave a message.
AutomaticSpeechRecognitionEnabled	Optional	System.Boolean	The *AutomaticSpeechRecognitionEnabled* parameter specifies whether users can use Automatic Speech Recognition (ASR) when they log on to their mailbox. This parameter can only be set to `$true` if there is ASR support for the language selected by the user in Microsoft Office Outlook Web App **Options**.
CallAnsweringAudioCodec	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AudioCodecEnum	The *CallAnsweringAudioCodec* parameter specifies the audio codec used to encode voice mail messages left for the user. The audio codec used is the audio codec set on the UM dial plan. The default value is Mp3.
CallAnsweringRulesEn	Optional	System.Boolean	The

abled			*CallAnsweringRulesEnabled* parameter specifies whether users can configure or set up Call Answering Rules for their accounts. The default value is `$true`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FaxEnabled	Optional	System.Boolean	The *FaxEnabled* parameter specifies whether a user is allowed

			to receive incoming faxes.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the distinguished name for the *Identity* parameter. Other forms of identification, such as

			alias or GUID, aren't accepted.
ImListMigrationCompleted	Optional	System.Boolean	The *ImListMigrationCompleted* parameter specifies whether a UM-enabled user's Microsoft Lync 2013 contact list has been successfully migrated from a user's Exchange mailbox to Lync 2013 servers and that the user's Microsoft Exchange Server 2013 mailbox can be migrated back to Exchange Server 2010. For Lync 2013, the contact list for a Lync user can be stored in an Exchange 2013 user's mailbox called a Unified Contact Store (UCS). By storing the contact list in a user's mailbox, it allows applications to show a consistent, up-to-date list of the user's contact list. If a user's mailbox is being migrated from Exchange 2013 to Exchange 2010, and the user is in UCS mode, the user's contact list must first be moved

			from their Exchange 2013 mailbox to Lync 2013 to preserve the user's contact list. This is the case because Exchange 2010 doesn't support the Exchange Web Services (EWS) methods used to support the UCS feature in Lync 2013. A setting of `$false` indicates that a Lync user's contacts haven't been migrated. The default is `$false`.
MissedCallNotificationEnabled	Optional	System.Boolean	The *MissedCallNotificationEnabled* parameter specifies whether to send missed call notifications. **⚠Warning:** When you're integrating Unified Messaging and Lync Server, missed call notifications aren't available to users who have a mailbox located on an Exchange 2007 or Exchange 2010 Mailbox server. A missed call notification is generated when a user disconnects before the call is sent to a Mailbox server.
Name	Optional	System.String	The *Name* parameter

			specifies the display name for the user. The display name is limited to 64 characters.
OperatorNumber	Optional	System.String	The *OperatorNumber* parameter specifies the string of digits for the personal operator.
PhoneNumber	Optional	System.String	This parameter is available only in the cloud-based service. The *PhoneNumber* parameter specifies whether to assign a phone number to a UM-enabled user. This is only used for E.164 consumer dial plans.
PhoneProviderId	Optional	System.String	This parameter is available only in the cloud-based service. The *PhoneProviderId* parameter specifies the user's phone number and mobile service provider. This information is used to provide custom call forwarding and cancelling voice mail setup instructions based on the mobile phone provider.

PinlessAccessToVoiceMailEnabled	Optional	System.Boolean	The *PinlessAccessToVoiceMailEnabled* parameter specifies whether UM-enabled users are required to use a PIN to access their voice mail. A PIN is still required to access email and the calendar. The default value is `$false`.
PlayOnPhoneEnabled	Optional	System.Boolean	The *PlayOnPhoneEnabled* parameter specifies whether a user can use the Play on Phone feature to listen to voice messages. The default value is `$true`.
SubscriberAccessEnabled	Optional	System.Boolean	The *SubscriberAccessEnabled* parameter specifies whether the users are allowed subscriber access to their individual mailboxes. If it's set to `$true`, after users are authenticated, they're able to retrieve voice mail over the telephone. The default value is `$true`.
TUIAccessToCalendarE	Optional	System.Boolean	The

nabled			*TUIAccessToCalendarEnabled* parameter specifies whether UM-enabled users can access and manage their individual calendar using the Microsoft Outlook Voice Access telephone user interface (TUI) or touchtone interface. The default value is `$true`.
TUIAccessToEmailEnabled	Optional	System.Boolean	The *TUIAccessToEmailEnabled* parameter specifies whether users can access their individual email messages over the telephone. The default value is `$true`.
UMMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *UMMailboxPolicy* parameter specifies the UM mailbox policy associated with the UM-enabled user's mailbox.
UMSMSNotificationOption	Optional	Microsoft.Exchange.Data.Directory.Recipient.UMSMSNotificationOptions	The *UMSMSNotificationOption* parameter specifies whether a UM-enabled user gets SMS or text messaging notifications for voice mail only, voice

			mail and missed calls, or no notifications. The values for this parameter are: `VoiceMail`, `VoiceMailAndMissedCalls`, and `None`. The default value is `None`.
VerifyGlobalRoutingEntry	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *VerifyGlobalRoutingEntry* parameter specifies the phone number has been successfully registered in the global routing database.
VoiceMailAnalysisEnabled	Optional	System.Boolean	The *VoiceMailAnalysisEnabled* parameter specifies whether a copy of each voice mail left for a UM-enabled user will be forwarded to Microsoft for analysis and improvement of speech recognition features.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMMailboxPIN

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMMailboxPIN** cmdlet to return information from a Unified Messaging (UM)-enabled user's mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMMailboxPin [-Identity <MailboxIdParameter>] [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-IgnoreErrors <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-ReadFromDomainController <SwitchParameter>]
[-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example displays the UM mailbox PIN-related properties for all UM-enabled users.

```
Get-UMMailboxPIN
```

EXAMPLE 2

This example displays the UM mailbox PIN-related properties for tonysmith@contoso.com.

```
Get-UMMailboxPIN -Identity tonysmith@contoso.com
```

Detailed Description

The **Get-UMMailboxPIN** cmdlet returns information calculated from the PIN data stored in encrypted form in the user's mailbox. This cmdlet also shows whether the mailbox or user access has been locked out.

After this task is completed, you can view information on a user's mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identifier that can be used to retrieve information about the mailbox. The values for this parameter include the following: • ADObjectID • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the

			command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *Organization* and *Identity* parameters together. • You can't use the *Credential* parameter.

IgnoreErrors	Optional	System.Management.Automation.SwitchParameter	The *IgnoreErrors* switch specifies whether errors that may occur when running this cmdlet are written as warnings.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you've set the recipient scope to include all recipients in the forest and if you don't use this parameter, the user information may be read from a global catalog whose information is outdated. If you use this parameter, multiple reads may be necessary to get the information. By default, the recipient scope is set to the domain that hosts your Exchange

			servers.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies a maximum number of results to be returned. If a maximum number isn't specified, the cmdlet returns all results.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMMailboxPIN

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMMailboxPIN** cmdlet to reset the PIN for a Unified Messaging (UM)–enabled mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMMailboxPIN -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-LockedOut <$true | $false>] [-NotifyEmail <String>]
[-Pin <String>] [-PinExpired <$true | $false>] [-SendEmail <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resets the PIN on the UM-enabled mailbox for tonysmith@contoso.com.

```
Set-UMMailboxPIN -Identity tonysmith@contoso.com
```

EXAMPLE 2

This example resets the initial PIN to 1985848 on the UM-enabled mailbox for tonysmith@contoso.com, and then sets the PIN as expired so that the user will be asked to change the PIN the next time the user logs on.

```
Set-UMMailboxPIN -Identity tonysmith@contoso.com -PIN
1985848 -PinExpired $true
```

EXAMPLE 3

This example locks the UM-enabled mailbox for tonysmith@contoso.com to prevent the user from accessing the mailbox.

```
Set-UMMailboxPIN -Identity tonysmith@contoso.com -LockedOut
$true
```

EXAMPLE 4

This example unlocks the UM-enabled mailbox for tonysmith@contoso.com and allows the user access to the mailbox.

```
Set-UMMailboxPIN -Identity tonysmith@contoso.com -LockedOut
$false
```

Detailed Description

The **Set-UMMailboxPIN** cmdlet is used when a UM-enabled user has been locked out of a mailbox because either the user tried to log on by using an incorrect PIN multiple times or because the user has forgotten the PIN. You can use this cmdlet to set the user's PIN. The new PIN must comply with the PIN policy rules specified in the user's mailbox policy. The new PIN is sent to the user in an email message, or sent to an alternative email address. You can control whether the user must reset the PIN at logon and if the mailbox will continue to be locked.

After this task is completed, the PIN on a UM-enabled mailbox is set.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM

mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the UM-enabled user PIN being set. The values for this parameter include the following: • ADObjectID • GUID • Distinguished name (DN) • Domain\Account • user principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global

			catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
LockedOut	Optional	System.Boolean	The *LockedOut* parameter specifies whether the mailbox will continue to be locked. If set to `$true`, the mailbox is marked as locked out. By default, if this parameter is omitted or set to `$false`, the command clears the locked-out status on the mailbox.
NotifyEmail	Optional	System.String	The *NotifyEmail* parameter specifies the email address to which the server sends the email message that contains the PIN reset information. By default, the message is sent to the SMTP address of the enabled user.
Pin	Optional	System.String	The *Pin* parameter specifies a new PIN for use with the mailbox. The PIN is checked against the

			PIN rules defined in the Unified Messaging mailbox policy. If the PIN isn't supplied, the command generates a new PIN for the mailbox and includes it in an email message sent to the user.
PinExpired	Optional	System.Boolean	The *PINExpired* parameter specifies whether the PIN is treated as expired. If this parameter is supplied and is set to `$false`, the user isn't required to reset the PIN the next time that the user logs on. If the PIN isn't supplied, the PIN is treated as expired and the user is prompted to reset the PIN the next time that the user logs on.
SendEmail	Optional	System.Boolean	The *SendEmail* parameter specifies whether to send a PIN to the user in an email message. The default is `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UMMailboxPolicy** cmdlet to display the properties and values of a Unified Messaging (UM) mailbox policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMMailboxPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
UMDialPlan <UMDialPlanIdParameter>]
```

Examples

EXAMPLE 1

This example returns a formatted list of all UM mailbox policies in the Active Directory forest.

```
Get-UMMailboxPolicy | Format-List
```

EXAMPLE 2

This example returns the properties and values for the UM mailbox policy MyUMMailboxPolicy.

```
Get-UMMailboxPolicy -Identity MyUMMailboxPolicy
```

EXAMPLE 3

This examples displays all the UM mailbox policies associated with the UM dial plan MyUMDialPlan.

```
Get-UMMailboxPolicy -UMDialPlan MyUMDialPlan
```

Detailed Description

The **Get-UMMailboxPolicy** cmdlet retrieves the configuration properties and values for a UM mailbox policy or returns a list of UM mailbox policies.

After this task is completed, if the *Identity* parameter is supplied, the properties and values for the specified UM mailbox policy object are returned. If no parameter is specified at the command prompt, all UM mailbox policies in the Active Directory forest are returned.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identifier for the UM mailbox policy being viewed. This is the directory object ID for the UM mailbox policy.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies that all UM mailbox policies associated with the UM dial plan are displayed.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-UMMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-UMMailboxPolicy** cmdlet to create a Unified Messaging (UM) mailbox policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-UMMailboxPolicy -Name <String> -UMDialPlan <UMDialPlanIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-SharedUMDialPlan <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the UM mailbox policy MyUMMailboxPolicy associated with the UM dial plan MyUMDialPlan.

```
New-UMMailboxPolicy -Name MyUMMailboxPolicy -UMDialPlan
MyUMDialPlan
```

Detailed Description

The **New-UMMailboxPolicy** cmdlet creates a UM mailbox policy that has organization-wide scope. UM mailbox policies provide a set of policy values to be applied to UM-enabled users associated with a particular UM dial plan. UM mailbox policies are directly associated with UM dial plans. Therefore, the settings contained within a UM mailbox policy apply only to UM-enabled users of the UM dial plan that the UM mailbox policy is associated with. You can also use the **New-UMMailboxPolicy** cmdlet to create a UM mailbox policy template that can be used to create additional UM mailbox policies.

After this task is completed, a new UM mailbox policy is created.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the display name for the UM mailbox policy. The name for the UM mailbox policy can contain as many as 64 characters.
UMDialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the identifier for the UM dial plan to be associated with the UM mailbox policy. This parameter is the directory object ID for the UM dial plan.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Dat	This parameter is

		a.Fqdn	available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
SharedUMDialPlan	Optional	System.Management.Automation.SwitchParameter	The *SharedUMDialPlan* switch specifies whether the new UM mailbox policy being created is linked or associated with a dial plan outside the scope of the organization. If you specify this parameter, the UM mailbox policy can be linked with another tenant's dial plan. This parameter is used during tenant provisioning and is only used in a data

			center.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UMMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UMMailboxPolicy** cmdlet to delete a Unified Messaging (UM) mailbox policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UMMailboxPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the UM mailbox policy MyUMMailboxPolicy.

```
Remove-UMMailboxPolicy -Identity MyUMMailboxPolicy
```

Detailed Description

The **Remove-UMMailboxPolicy** cmdlet deletes or removes a UM mailbox policy. If the UM mailbox policy is deleted from Active Directory, the UM mailbox policy can't be used when configuring UM-enabled users. The UM mailbox policy can't be deleted if the UM mailbox policy is referenced by any UM-enabled mailboxes.

After this task is completed, the UM mailbox policy is removed from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identifier for the UM mailbox policy being deleted. This parameter is the directory object ID for the UM mailbox policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UMMailboxPolicy** cmdlet to modify a Unified Messaging (UM) mailbox policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMMailboxPolicy -Identity <MailboxPolicyIdParameter> [-
AllowAutomaticSpeechRecognition <$true | $false>] [-
AllowCallAnsweringRules <$true | $false>] [-AllowCommonPatterns <$true |
$false>] [-AllowDialPlanSubscribers <$true | $false>] [-
AllowedInCountryOrRegionGroups <MultiValuedProperty>] [-
AllowedInternationalGroups <MultiValuedProperty>] [-AllowExtensions <$true
| $false>] [-AllowFax <$true | $false>] [-AllowMessageWaitingIndicator
<$true | $false>] [-AllowMissedCallNotifications <$true | $false>] [-
AllowPinlessVoiceMailAccess <$true | $false>] [-AllowPlayOnPhone <$true |
$false>] [-AllowSMSNotification <$true | $false>] [-AllowSubscriberAccess
<$true | $false>] [-AllowTUIAccessToCalendar <$true | $false>] [-
AllowTUIAccessToDirectory <$true | $false>] [-AllowTUIAccessToEmail <$true
| $false>] [-AllowTUIAccessToPersonalContacts <$true | $false>] [-
AllowVoiceMailAnalysis <$true | $false>] [-AllowVoiceMailPreview <$true |
$false>] [-AllowVoiceNotification <$true | $false>] [-
AllowVoiceResponseToOtherMessageTypes <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-FaxMessageText <String>]
[-FaxServerURI <String>] [-ForceUpgrade <SwitchParameter>] [-
InformCallerOfVoiceMailAnalysis <$true | $false>] [-
LogonFailuresBeforePINReset <Unlimited>] [-MaxGreetingDuration <Int32>] [-
MaxLogonAttempts <Unlimited>] [-MinPINLength <Int32>] [-Name <String>] [-
PINHistoryCount <Int32>] [-PINLifetime <Unlimited>] [-
ProtectAuthenticatedVoiceMail <None | Private | All>] [-
ProtectedVoiceMailText <String>] [-ProtectUnauthenticatedVoiceMail <None |
Private | All>] [-RequireProtectedPlayOnPhone <$true | $false>] [-
ResetPINText <String>] [-SourceForestPolicyNames <MultiValuedProperty>] [-
UMDialPlan <UMDialPlanIdParameter>] [-UMEnabledText <String>] [-
```

```
VoiceMailPreviewPartnerAddress <SmtpAddress>] [-
VoiceMailPreviewPartnerAssignedID <String>] [-
VoiceMailPreviewPartnerMaxDeliveryDelay <Int32>] [-
VoiceMailPreviewPartnerMaxMessageDuration <Int32>] [-VoiceMailText
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the PIN settings for users associated with the UM mailbox policy MyUMMailboxPolicy.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 8 -MaxLogonAttempts 12 -
MinPINLength 8 -PINHistoryCount 10 -PINLifetime 60 -
ResetPINText "The PIN used to allow you access to your
mailbox using Outlook Voice Access has been reset."
```

EXAMPLE 2

This example selects the in-country or region groups and international groups from those configured on the UM dial plan associated with the UM mailbox policy. UM-enabled users associated with this UM mailbox policy can place outbound calls according to the rules defined on these groups.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
AllowDialPlanSubscribers $true -
AllowedInCountryOrRegionGroups InCountry/
RegionGroup1,InCountry/RegionGroup2 -
AllowedInternationalGroups
InternationalGroup1,InternationalGroup2 -AllowExtensions
$true
```

EXAMPLE 3

This example configures the text of voice mail messages sent to UM-enabled users and the text included in an email message sent to a user who is UM-enabled.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
UMEnabledText "You have been enabled for Unified
Messaging." -VoiceMailText "You have received a voice mail
message from Microsoft Exchange 2013 Unified Messaging."
```

Detailed Description

When the **Set-UMMailboxPolicy** cmdlet is used to modify UM mailbox policy objects, you can change settings such as PIN policies, message text settings, and dialing restrictions for a single UM-enabled recipient or multiple UM-enabled recipients. UM mailbox policies are associated with UM-enabled mailboxes and can be configured to increase the level of security for UM-enabled users.

After this task is completed, the parameters and values specified are configured on the UM mailbox policy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identifier for the UM mailbox policy being modified. This is the directory object ID for the UM mailbox policy.
AllowAutomaticSpeechRecognition	Optional	System.Boolean	The *AllowAutomaticSpeechRecognition* parameter specifies whether users associated with the UM mailbox policy can use Automatic Speech Recognition (ASR). The default value is `$true`.
AllowCallAnsweringRules	Optional	System.Boolean	The *AllowCallAnsweringRule*

			s parameter specifies whether users associated with the UM mailbox policy are allowed to configure or set up Call Answering Rules for their accounts. The default value is `$true`.
AllowCommonPatterns	Optional	System.Boolean	The *AllowCommonPatterns* parameter specifies whether to allow obvious PINs. Examples of obvious PINs include subsets of the telephone number, sequential numbers, or repeated numbers. If set to `$false`, sequential and repeated numbers and the suffix of the mailbox extension are rejected. If set to `$true`, only the suffix of the mailbox extension is rejected.
AllowDialPlanSubscribers	Optional	System.Boolean	The *AllowDialPlanSubscribers* parameter specifies whether to let subscribers in a dial plan dial a number that

			resolves to another subscriber within the same dial plan. The default value is `$true`.
AllowedInCountryOrRegionGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedInCountryOrRegionGroups* parameter specifies whether to let subscribers dial the list of in-country/region dial group names. The names that subscribers are allowed to dial must match the group names defined in the UM dial plan. The string is limited to 128 characters.
AllowedInternationalGroups	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedInternationalGroups* parameter specifies whether to let subscribers dial the list of international dial group names. The names that subscribers dial must match the group names defined in the dial plan.
AllowExtensions	Optional	System.Boolean	The *AllowExtensions* parameter specifies whether to let

			subscribers dial calls to the number of digits specified on the UM dial plan. The default value is `$true`.
AllowFax	Optional	System.Boolean	The *AllowFax* parameter specifies whether users associated with the UM mailbox policy are allowed to receive incoming faxes. The default value is `$true`.
AllowMessageWaitingIndicator	Optional	System.Boolean	The *AllowMessageWaitingIndicator* parameter specifies whether users associated with the UM mailbox policy can receive notifications that they've received a new voice mail message. The default value is `$true`.
AllowMissedCallNotifications	Optional	System.Boolean	The *AllowMissedCallNotifications* parameter specifies whether missed call notifications are enabled for users associated with the UM mailbox policy. The default value is `$true`.

			⚠Warning: When you're integrating Unified Messaging and Lync Server, missed call notifications aren't available to users who have a mailbox located on an Exchange 2007 or Exchange 2010 Mailbox server. A missed call notification is generated when a user disconnects before the call is sent to a Mailbox server.
AllowPinlessVoiceMailAccess	Optional	System.Boolean	The *AllowPinlessVoiceMailAccess* parameter specifies whether users associated with the UM mailbox policy are required to use a PIN to access their voice mail. A PIN is still required to access their email and calendar. The default value is `$false`.
AllowPlayOnPhone	Optional	System.Boolean	The *AllowPlayOnPhone* parameter specifies whether users associated with the UM mailbox policy can use the Play on Phone feature to listen to voice mail messages. The default value is `$true`.
AllowSMSNotification	Optional	System.Boolean	The

			AllowSMSNotification parameter specifies whether UM-enabled users associated with the UM mailbox policy are allowed to get SMS or text messages sent to their mobile phones. If this parameter is set to `$true`, you also want to set the **Set-UMMailbox** cmdlet *UMSMSNotificationOption* parameter for the UM-enabled user to either `voiceMail` or `VoiceMailAndMissedCalls`. The default value is `$true`.
AllowSubscriberAccess	Optional	System.Boolean	The *AllowSubscriberAccess* parameter specifies whether users associated with the UM mailbox policy are allowed subscriber access to their individual mailboxes. If this parameter is set to `$true`, after users are authenticated, they're able to retrieve voice mail over the telephone.

			The default value is `$true`.
AllowTUIAccessToCalendar	Optional	System.Boolean	The *AllowTUIAccessToCalendar* parameter specifies whether users associated with the UM mailbox policy can access their individual calendars over the telephone. The default value is `$true`.
AllowTUIAccessToDirectory	Optional	System.Boolean	The *AllowTUIAccessToDirectory* parameter specifies whether users associated with the UM mailbox policy can access the directory over the telephone. The default value is `$true`.
AllowTUIAccessToEmail	Optional	System.Boolean	The *AllowTUIAccessToEmail* parameter specifies whether users associated with the UM mailbox policy can access their individual email messages over the telephone. The default value is `$true`.

AllowTUIAccessToPersonalContacts	Optional	System.Boolean	The *AllowTUIAccessToPersonalContacts* parameter specifies whether users associated with the UM mailbox policy can access their personal contacts over the telephone. The default value is `$true`.
AllowVoiceMailAnalysis	Optional	System.Boolean	The *AllowVoiceMailAnalysis* parameter specifies whether a copy of each voice mail left for the users associated with the UM mailbox policy will be forwarded to Microsoft for analysis and improvement of our speech recognition features.
AllowVoiceMailPreview	Optional	System.Boolean	The *AllowVoiceMailPreview* parameter specifies whether users associated with the UM mailbox policy are able to receive Voice Mail Previews for call-answered messages, or have Voice Mail

			Previews provided for voice mail messages that they send to other users in their mailbox. The default value is `$true`.
AllowVoiceNotification	Optional	System.Boolean	The *AllowVoiceNotification* parameter will be removed in future versions of the product.
AllowVoiceResponseToOtherMessageTypes	Optional	System.Boolean	The *AllowVoiceResponseToOtherMessageTypes* parameter specifies whether UM-enabled users associated with the UM mailbox policy can record and attach a voice mail message when replying to email messages and calendar items.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the

			Confirm switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FaxMessageText	Optional	System.String	The *FaxMessageText* parameter specifies the text included in the body part of fax messages. This text is limited to 512 characters.
FaxServerURI	Optional	System.String	The *FaxServerURI* parameter specifies the Session Initiation Protocol (SIP) Uniform Resource Identifier (URI) for the fax solution that serves the UM-enabled users associated with the UM mailbox policy. This fax product or fax service accepts incoming fax calls that were redirected

			from Microsoft Exchange Server 2013 Client Access and Mailbox servers and creates inbound fax messages for the UM-enabled users associated with the UM mailbox policy. Although you can enter more than one fax server URI, only one URI will be used by Client Access and Mailbox servers running UM services.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* switch specifies whether you're prompted for confirmation before a UM mailbox policy is upgraded.
InformCallerOfVoiceMailAnalysis	Optional	System.Boolean	The *InformCallerOfVoiceMailAnalysis* parameter specifies whether the callers leaving the voice mails will be informed about the possibility of their voice mails being forwarded to Microsoft for analysis.
LogonFailuresBeforePI	Optional	Microsoft.Exchange.Da	The

NReset		ta.Unlimited	*LogonFailuresBeforePINReset* parameter specifies the number of sequential unsuccessful logon attempts before the mailbox PIN is automatically reset. To disable this feature, set this parameter to `Unlimited`. If this parameter isn't set to `Unlimited`, it must be set to less than the value of the *MaxLogonAttempts* parameter. The range is from 0 through 999. The default setting is 5.
MaxGreetingDuration	Optional	System.Int32	The *MaxGreetingDuration* parameter specifies the maximum greeting length. The range is from 1 through 10 minutes. The default value is 5 minutes.
MaxLogonAttempts	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxLogonAttempts* parameter specifies the number of times users can try unsuccessfully to log on, in sequence, before the UM mailboxes are locked.

			The range is from 1 through 999. The default value is 15.
MinPINLength	Optional	System.Int32	The *MinPINLength* parameter specifies the minimum number of digits required in a PIN for UM-enabled users. The range is from 4 through 24. The default value is 6.
Name	Optional	System.String	The *Name* parameter specifies the display name for the UM mailbox policy. This setting is limited to 64 characters.
PINHistoryCount	Optional	System.Int32	The *PINHistoryCount* parameter specifies the number of previous PINs that are remembered and aren't allowed during a PIN reset. This number includes the first time that the PIN was set. The range is from 1 through 20. The default value is 5.
PINLifetime	Optional	Microsoft.Exchange.Data.Unlimited	The *PINLifetime* parameter specifies the number of days until a

			new password is required. The range is from 1 through 999. The default value is 60. If you specify `Unlimited`, the users' PINs won't expire.
ProtectAuthenticatedVoiceMail	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DRMProtectionOptions	The *ProtectAuthenticatedVoiceMail* parameter specifies whether Mailbox servers that answer Outlook Voice Access calls for UM-enabled users associated with the UM mailbox policy create protected voice mail messages. The default setting is `None`. This means that no protection is applied to voice mail messages. If the value is set to `Private`, only messages marked as private are protected. If the value is set to `All`, every voice mail message is protected.
ProtectedVoiceMailText	Optional	System.String	The *ProtectedVoiceMailText* parameter specifies the text included in the body

			part of the protected voice mail messages for UM-enabled users associated with the UM mailbox policy. This text can contain up to 512 characters.
ProtectUnauthenticatedVoiceMail	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DRMProtectionOptions	The *ProtectUnauthenticatedVoiceMail* parameter specifies whether the Mailbox servers that answer calls for UM-enabled users associated with the UM mailbox policy create protected voice mail messages. This also applies when a message is sent from a UM auto attendant to a UM-enabled user associated with the UM mailbox policy. The default setting is `None`. This means that no protection is applied to voice mail messages. If the value is set to `Private`, only messages marked as private are protected. If the value is set to `All`, every voice

			mail message is protected.
RequireProtectedPlayOnPhone	Optional	System.Boolean	The *RequireProtectedPlayOnPhone* parameter specifies whether users associated with the UM mailbox policy can only use Play on Phone for protected voice mail messages or whether users can use multimedia software to play the protected message. The default value is `$false`. When set to `$false`, users are able to use both methods to listen to protected voice mail messages.
ResetPINText	Optional	System.String	The *ResetPINText* parameter specifies the text to be included in the PIN reset email message. This text is limited to 512 characters.
SourceForestPolicyNames	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SourceForestPolicyNames* parameter specifies the name or names of the

			corresponding UM mailbox policy objects located in the source forest during a cross-forest migration.
UMDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan associated with the UM mailbox policy.
UMEnabledText	Optional	System.String	The *UMEnabledText* parameter specifies the text to be included when a user is enabled for Unified Messaging. This text is limited to 512 characters.
VoiceMailPreviewPartnerAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *VoiceMailPreviewPartnerAddress* parameter specifies the SMTP address of a Voice Mail Preview partner that's contracted to provide transcription services for UM-enabled users in this UM mailbox policy. The default value is `$null`.
VoiceMailPreviewPartnerAssignedID	Optional	System.String	The *VoiceMailPreviewPartnerAssignedID* parameter

			specifies the identification string, if any, provided to the organization by the Voice Mail Preview partner that's contracted to provide transcription services for UM-enabled users in this UM mailbox policy. The default value is `$null`.
VoiceMailPreviewPartnerMaxDeliveryDelay	Optional	System.Int32	The *VoiceMailPreviewPartnerMaxDeliveryDelay* parameter specifies the number of seconds that a Mailbox server waits for a Voice Mail Preview partner system to return a message with a Voice Mail Preview. If this time is exceeded, the Mailbox server delivers the voice mail message without a preview. The default value is 1200. The minimum value for this parameter is 300.
VoiceMailPreviewPartnerMaxMessageDuration	Optional	System.Int32	The *VoiceMailPreviewPartnerMaxMessageDuration* parameter specifies the

			maximum duration, in seconds, of voice mail messages sent to the Voice Mail Preview partner that's contracted to provide transcription services for UM-enabled users in this UM mailbox policy. The default value is 180. The minimum number for this parameter is 60. This setting should be set equal to the maximum value allowed by the Voice Mail Preview partner.
VoiceMailText	Optional	System.String	The *VoiceMailText* parameter specifies the text to be included in the body part of voice mail messages. The parameter applies to call answering messages in addition to messages originated by an authenticated subscriber. This text is limited to 512 characters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-UMPrompt

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Export-UMPrompt** cmdlet to export an audio file being used as a greeting prompt for Unified Messaging (UM) dial plans and auto attendants.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-UMPrompt -BusinessHoursWelcomeGreetingAndMenu <SwitchParameter> -
UMAutoAttendant <UMAutoAttendantIdParameter> [-TestMenuKeyMapping
<CustomMenuKeyMapping[]>] <COMMON PARAMETERS>

Export-UMPrompt -BusinessHoursWelcomeGreeting <SwitchParameter> -
UMAutoAttendant <UMAutoAttendantIdParameter> [-TestBusinessName <String>]
<COMMON PARAMETERS>
```

```
Export-UMPrompt -AfterHoursWelcomeGreetingAndMenu <SwitchParameter> -
UMAutoAttendant <UMAutoAttendantIdParameter> [-TestMenuKeyMapping
<CustomMenuKeyMapping[]>] <COMMON PARAMETERS>

Export-UMPrompt -PromptFileName <String> -UMAutoAttendant
<UMAutoAttendantIdParameter> <COMMON PARAMETERS>

Export-UMPrompt -AfterHoursWelcomeGreeting <SwitchParameter> -
UMAutoAttendant <UMAutoAttendantIdParameter> [-TestBusinessName <String>]
<COMMON PARAMETERS>

Export-UMPrompt -BusinessHours <SwitchParameter> -UMAutoAttendant
<UMAutoAttendantIdParameter> <COMMON PARAMETERS>

Export-UMPrompt -BusinessLocation <SwitchParameter> -UMAutoAttendant
<UMAutoAttendantIdParameter> <COMMON PARAMETERS>

Export-UMPrompt -PromptFileName <String> -UMDialPlan
<UMDialPlanIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports the welcome greeting for the UM dial plan MyUMDialPlan and saves it as the file welcomegreeting.mp3.

```
$prompt = Export-UMPrompt -PromptFileName
"customgreeting.mp3" -UMDialPlan MyUMDialPlan
set-content -Path "d:\DialPlanPrompts\welcomegreeting.mp3"
-Value $prompt.AudioData -Encoding Byte
```

EXAMPLE 2

This example exports the business hours welcome greeting used for the UM auto attendant MyUMAutoAttendant and saves it as the file BusinessHoursWelcomeGreeting.mp3.

```
$prompt = Export-UMPrompt -BusinessHoursWelcomeGreeting -
UMAutoAttendant MyUMAutoAttendant
set-content -Path "d:\UMPrompts
\BusinessHoursWelcomeGreeting.mp3" -Value $prompt.AudioData
-Encoding Byte
```

EXAMPLE 3

This example exports a custom greeting for the UM auto attendant MyUMAutoAttendant and saves

it to the file welcomegreetingbackup.mp3.

```
Export-UMPrompt -PromptFileName "welcomegreeting.mp3" -
UMAutoAttendant MyUMAutoAttendant
set-content -Path "e:\UMPromptsBackup
\welcomegreetingbackup.mp3" -Value $prompt.AudioData -
Encoding Byte
```

EXAMPLE 4

This example exports the after hours welcome greeting for the UM auto attendant MyUMAutoAttendant, saves it as the file AfterHoursWelcomeGreeting.mp3, and uses Northwind Traders as the test business name.

```
Export-UMPrompt -AfterHoursWelcomeGreeting -UMAutoAttendant
MyUMAutoAttendant -TestBusinessName "Northwind Traders"
set-content -Path "d:\AfterHoursWelcomeGreeting.mp3" -Value
$prompt.AudioData -Encoding Byte
```

Detailed Description

The **Export-UMPrompt** cmdlet exports prompts that belong to existing UM dial plan and UM auto attendant objects. After the **Export-UMPrompt** cmdlet exports a prompt, you can save a copy of the prompt to a local drive as an audio file. You can then play the audio file using a media player.

After this task is completed, the UM prompts are displayed or saved.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
AfterHoursWelcomeGreeting	Required	System.Management.Automation.SwitchParameter	The *AfterHoursWelcomeGreeting* parameter specifies the system-generated after hours welcome greeting for

			the UM auto attendant specified.
AfterHoursWelcomeGreetingAndMenu	Required	System.Management.Automation.SwitchParameter	The *AfterHoursWelcomeGreetingAndMenu* parameter specifies the system-generated after hours welcome greeting and menu prompts for the UM auto attendant specified.
BusinessHours	Required	System.Management.Automation.SwitchParameter	The *BusinessHours* parameter specifies that the prompt to be returned is the business hours prompt of the auto attendant.
BusinessHoursWelcomeGreeting	Required	System.Management.Automation.SwitchParameter	The *BusinessHoursWelcomeGreeting* parameter specifies the system-generated business hours welcome greeting for the UM auto attendant specified.
BusinessHoursWelcomeGreetingAndMenu	Required	System.Management.Automation.SwitchParameter	The *BusinessHoursWelcomeGreetingAndMenu* parameter specifies the

			system-generated business hours welcome greeting and menu prompts for the UM auto attendant specified.
BusinessLocation	Required	System.Management.Automation.SwitchParameter	The *BusinessLocation* parameter specifies the business location greeting played for callers when the caller calls into a UM auto attendant and specifies the business location.
PromptFileName	Required	System.String	The *PromptFileName* parameter specifies the name of the custom prompt to export.
UMAutoAttendant	Required	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *UMAutoAttendant* parameter specifies the UM auto attendant ID. This parameter specifies the directory object identifier for the UM auto attendant.
UMDialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan ID. This parameter specifies the directory object identifier for the UM

			dial plan.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
TestBusinessName	Optional	System.String	The *TestBusinessName* parameter specifies whether the business name configured on a UM auto attendant or the business name specified by this

			parameter is used to generate the welcome greeting prompt.
TestMenuKeyMapping	Optional	Microsoft.Exchange.Data.CustomMenuKeyMapping[]	The *TestMenuKeyMapping* parameter specifies whether the existing key mappings configured on a UM auto attendant or the key mapping menu specified by this parameter is used to generate the welcome greeting and menu.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-UMPrompt

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Import-UMPrompt** cmdlet to copy or upload a custom audio file to be used by Unified Messaging (UM) dial plans and auto attendants.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-UMPrompt -PromptFileName <String> -PromptFileStream <Stream> -
UMAutoAttendant <UMAutoAttendantIdParameter> <COMMON PARAMETERS>

Import-UMPrompt -PromptFileData <Byte[]> -PromptFileName <String> -
UMAutoAttendant <UMAutoAttendantIdParameter> <COMMON PARAMETERS>

Import-UMPrompt -PromptFileData <Byte[]> -PromptFileName <String> -
UMDialPlan <UMDialPlanIdParameter> <COMMON PARAMETERS>

Import-UMPrompt -PromptFileName <String> -PromptFileStream <Stream> -
UMDialPlan <UMDialPlanIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example imports the welcome greeting file welcomegreeting.wav from d:\UMPrompts into the UM dial plan MyUMDialPlan.

```
[byte[]]$c = Get-content -Path "d:\UMPrompts
\welcomegreeting.wav" -Encoding Byte -ReadCount 0
Import-UMPrompt -UMDialPlan MyUMDialPlan -PromptFileName
```

```
"welcomegreeting.wav" -PromptFileData $c
```

EXAMPLE 2

This example imports the welcome greeting file welcomegreeting.wav from d:\UMPrompts into the UM auto attendant MyUMAutoAttendant.

```
[byte[]]$c = Get-content -Path "d:\UMPrompts
\welcomegreeting.wav" -Encoding Byte -ReadCount 0
Import-UMPrompt -UMAutoAttendant MyUMAutoAttendant -
PromptFileName "welcomegreeting.wav" -PromptFileData $c
```

EXAMPLE 3

This example imports the welcome greeting file AfterHoursWelcomeGreeting.wav from d:\UMPrompts into the UM auto attendant MyUMAutoAttendant.

```
[byte[]]$c = Get-content -Path "d:\UMPrompts
\AfterHoursWelcomeGreeting.wav" -Encoding Byte -ReadCount 0
Import-UMPrompt -UMAutoAttendant MyUMAutoAttendant -
PromptFileName "AfterHoursWelcomeGreeting.wav" -
PromptFileData $c
```

Detailed Description

The **Import-UMPrompt** cmdlet imports custom greeting audio files into UM dial plans and auto attendants. There are many custom greetings used by UM dial plans and auto attendants including welcome greetings for dial plans and after hours welcome greetings and menus, business hours and non-business hours welcome greetings and menus, and key mappings for UM auto attendants.

After this task is completed, the custom audio file can be used by a UM dial plan or auto attendant.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
PromptFileData	Required	System.Byte[]	The *PromptFileData* parameter specifies the byte array of the

			custom prompt.
PromptFileName	Required	System.String	The *PromptFileName* parameter specifies the name of the custom prompt.
PromptFileStream	Required	System.IO.Stream	The *PromptFileStream* parameter specifies whether the audio file will be uploaded or imported as an audio stream and not a byte array. The default setting is for the audio file to imported as a byte array.
UMAutoAttendant	Required	Microsoft.Exchange.Configuration.Tasks.UMAutoAttendantIdParameter	The *UMAutoAttendant* parameter specifies the UM auto attendant ID. This parameter specifies the directory object identifier for the UM auto attendant.
UMDialPlan	Required	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *UMDialPlan* parameter specifies the UM dial plan ID. This parameter specifies the directory object identifier for the UM dial plan.
Confirm	Optional	System.Management.A	The *Confirm* switch can

		utomation.SwitchParameter	be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-UMService

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-UMService** cmdlet to set the status of an Exchange 2007 or Exchange 2010 Unified Messaging server to disabled. This prevents the UM server from processing UM incoming calls.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-UMService -Identity <UMServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Immediate <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables Unified Messaging on the UM server MyUMServer but doesn't disconnect calls that are being processed.

```
Disable-UMService -Identity MyUMServer
```

EXAMPLE 2

This example disables Unified Messaging on the UM server MyUMServer and disconnects all calls being processed.

```
Disable-UMService -Identity MyUMServer -Immediate $true
```

Detailed Description

The **Disable-UMService** cmdlet sets the status of a UM server. A UM server has a logical status variable controlled using the enable and disable cmdlets. A UM server won't process any new calls unless it's in the enabled state. With this status variable, you can start or stop call processing on a UM server so the UM server can be brought online or taken offline in a controlled way.

Warning:
This cmdlet only is available for Exchange 2007 and Exchange 2010 servers running the Unified Messaging server role and is not available for Exchange 2013 Client Access and Mailbox servers.

After this task is completed, the UM server can no longer:

- Answer any incoming calls.
- Respond to Play on Phone requests from a UM server.
- Be used to manage UM-enabled mailboxes.
- Be queried when a diagnostic task is used.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Server (UM service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMServerIdParameter	The *Identity* parameter specifies the identifier for the UM server being disabled. This is the directory object ID for the UM server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Immediate	Optional	System.Boolean	The *Immediate* parameter specifies whether the UM server drops all current calls or enables current calls to finish. If this parameter is set to `$true`, all calls that are currently connected are disconnected.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-UMService

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-UMService** cmdlet to set the status of a Microsoft Exchange Server 2007 or Exchange Server 2010 Unified Messaging server to enabled. This setting enables the Unified Messaging server to process UM calls.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-UMService -Identity <UMServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables Unified Messaging on the UM server MyUMServer.

```
Enable-UMService -Identity MyUMServer
```

Detailed Description

The **Enable-UMService** cmdlet sets the status of an Exchange server running the Unified Messaging server role. A UM server has a logical status variable controlled using the enable and disable cmdlets. A UM server won't process any new calls unless it's in the enabled state. With the status variable, you can start or stop call processing on a UM server so the UM server can be brought online or taken offline in a controlled way.

After this task is completed, the UM server is available to answer incoming calls.

Warning:
This cmdlet only is available for Exchange 2007 and Exchange 2010 servers running the Unified Messaging server role, and it's not available on Exchange 2013 Client Access and Mailbox servers.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Server (UM service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMServerIdParameter	The *Identity* parameter specifies the identifier for the UM server being enabled. This is the directory object ID for the Mailbox server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UMService

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-UMService** cmdlet to display the properties for a single Mailbox server that's running the Microsoft Exchange Unified Messaging service or to display a list of Mailbox servers that are running the Microsoft Exchange Unified Messaging service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UMService [-Identity <UMServerIdParameter>] [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays a list of all the Mailbox servers in the Active Directory forest.

```
Get-UMService
```

EXAMPLE 2

This example displays a formatted list of properties for the Mailbox server MyUMServer.

```
Get-UMService -Identity MyUMServer | Format-List
```

Detailed Description

The **Get-UMService** cmdlet retrieves the properties for a Mailbox server that's running the Microsoft Exchange Unified Messaging service or returns a list of available Mailbox servers from Active Directory. When the cmdlet is used for a single Mailbox server, it returns the Mailbox server properties including **MaxCalls**, **MaxFaxCalls**, and **UMDialPlans**. The properties and their values for

the Mailbox server are stored in the Unified Messaging section of the Exchange Server configuration object in Active Directory.

The **ExchangeVersion** attribute that's returned is the minimum version of Microsoft Exchange you can use to manage the returned object. This attribute isn't the same as the version of Microsoft Exchange that's displayed in the Exchange Administration Center when you select **Server Configuration**.

After this task is completed, you can view the parameters and values for a single Mailbox server or a list of all of the Mailbox servers in Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Server (UM service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UMServerIdParameter	The *Identity* parameter specifies the name of the Mailbox server that's running the Microsoft Exchange Unified Messaging service. If this parameter isn't supplied, a list of all Mailbox servers is returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UMService

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-UMService** cmdlet to set the properties on a Microsoft Exchange Server 2013 Mailbox server or Exchange Server 2007 or Exchange Server 2010 Unified Messaging server that's running the Microsoft Exchange Unified Messaging (UM) service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UMService -Identity <UMServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DialPlans <MultiValuedProperty>] [-DomainController
<Fqdn>] [-ExternalHostFqdn <UMSmartHost>] [-ExternalServiceFqdn
<UMSmartHost>] [-GrammarGenerationSchedule <ScheduleInterval[]>] [-
IPAddressFamily <IPv4Only | IPv6Only | Any>] [-IPAddressFamilyConfigurable
<$true | $false>] [-IrmLogEnabled <$true | $false>] [-IrmLogMaxAge
<EnhancedTimeSpan>] [-IrmLogMaxDirectorySize <Unlimited>] [-
IrmLogMaxFileSize <ByteQuantifiedSize>] [-IrmLogPath <LocalLongFullPath>]
[-MaxCallsAllowed <Int32>] [-SIPAccessService
<ProtocolConnectionSettings>] [-SipTcpListeningPort <Int32>] [-
SipTlsListeningPort <Int32>] [-Status <Enabled | Disabled | NoNewCalls>]
[-UMForwardingAddressTemplate <String>] [-UMPodRedirectTemplate <String>]
[-UMStartupMode <TCP | TLS | Dual>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example performs the following actions:

- Enables the Microsoft Exchange Unified Messaging service on the Mailbox server MyUMServer to accept both IPv4 and IPv6 data packets.
- Enables the Microsoft Exchange Unified Messaging service on the Mailbox server MyUMServer to

start up using both TCP and TLS mode.

```
Set-UMService -Identity MyUMServer -IPAddressFamily Any -
UMStartupMode Dual
```

EXAMPLE 2

This example removes the Mailbox server MyUMServer from all UM dial plans.

```
Set-UMService -Identity MyUMServer -DialPlans $null
```

EXAMPLE 3

This example performs the following actions:

- Adds the Mailbox server MyUMServer to the UM dial plan MySIPDialPlan.
- Sets the maximum number of incoming calls to 50.
- Sets northamerica.lyncpoolna.contoso.com as the FQDN for the SIP access service that is used by Microsoft Lync Server for inbound and outbound calling from remote Lync clients.
- Enables the Microsoft Exchange Unified Messaging service on the Mailbox server MyUMServer to start up in TLS mode.

```
Set-UMService -Identity MyUMServer -DialPlans MySIPDialPlan
-MaxCallsAllowed 50 -SipAccessService
northamerica.lyncpoolna.contoso.com -UMStartupMode TLS
```

Detailed Description

The **Set-UMService** cmdlet sets specific properties on an Exchange 2013 Mailbox server or Exchange 2007 or Exchange 2010 Unified Messaging server that's running the Microsoft Exchange Unified Messaging service. This cmdlet can be used to set individual Unified Messaging parameters for a specified Mailbox or Unified Messaging server. After this task is completed, the cmdlet sets the parameters and the values specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox server (UM service)" entry in the Unified Messaging permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UMS	The *Identity* parameter specifies the ID for the

		erverIdParameter	Exchange 2013 Mailbox or Exchange 2007 or Exchange 2010 Unified Messaging server object to be configured that's running the Microsoft Exchange Unified Messaging service. This parameter specifies the directory object ID for the Mailbox server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DialPlans	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *DialPlans* parameter specifies all dial plans for which an Exchange 2013 Client Access or Mailbox server or Exchange 2007 or Exchange 2010 Unified Messaging server handles incoming calls. Exchange 2013 Client Access and Mailbox servers can't be associated with a TelExt or

			E.164 UM dial plan but can be associated or added to SIP dial plans. If you're integrating Unified Messaging with Microsoft Office Communications Server 2007 R2, Lync Server 2010, or Lync Server 2013, you must associate or add all Client Access and Mailbox servers to SIP dial plans. This parameter can also be used to associate Exchange 2007 or Exchange 2010 Unified Messaging servers to a UM dial plan. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing

			entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalHostFqdn	Optional	Microsoft.Exchange.Data.UMSmartHost	This parameter is reserved for internal Microsoft use.
ExternalServiceFqdn	Optional	Microsoft.Exchange.Data.UMSmartHost	This parameter is reserved for internal Microsoft use.
GrammarGenerationSchedule	Optional	Microsoft.Exchange.Common.ScheduleInterval[]	The *GrammarGenerationSchedule* parameter specifies the scheduled times to start speech grammar generation. This parameter allows only one start time per day. The default scheduled time for grammar generation is 02:00–02:30 local time each day.
IPAddressFamily	Optional	Microsoft.Exchange.Data.Directory.IPAddress	The *IPAddressFamily* parameter specifies

		Family	whether the UM IP gateway will use Internet Protocol version 4 (IPv4), IPv6, or both to communicate. If set to `IPv4Only`, the UM IP gateway only uses IPv4 to communicate. If set to `IPv6Only`, the UM IP gateway only uses IPv6. If set to `Any`, IPv6 is used first, and then if necessary, it falls back to IPv4. The default is `IPv4Only`.
IPAddressFamilyConfigurable	Optional	System.Boolean	The *IPAddressFamilyConfigurable* parameter specifies whether you're able to set the *IPAddressFamily* parameter to `IPv6Only` or `Any`. The default is `$true`.
IrmLogEnabled	Optional	System.Boolean	The *IrmLogEnabled* parameter specifies whether to enable logging of Information Rights Management (IRM) transactions. IRM logging is enabled by default. Values include: • `$true` Enable IRM logging • `$false` Disable IRM logging

IrmLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *IrmLogMaxAge* parameter specifies the maximum age for the IRM log file. Log files that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *IrmLogMaxAge* parameter to 00:00:00 prevents the automatic removal of IRM log files because of their age.
IrmLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *IrmLogMaxDirectorySize* parameter specifies the maximum size of all IRM logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default

			value is 250 megabytes (MB). When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *IrmLogMaxFileSize* parameter must be less than or equal to the value of the *IrmLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log directory.
IrmLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *IrmLogMaxFileSize* parameter specifies the maximum size of each IRM log file. When a log file reaches its maximum file size, a new log file is

			created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *IrmLogMaxFileSize* parameter must be less than or equal to the value of the *IrmLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the IRM log files.
IrmLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *IrmLogPath* parameter specifies the default IRM log directory location. The default value is `C:\Program Files\Microsoft\Exchange`

			`Server\V15`. If you set the value of the *IrmLogPath* parameter to `$null`, you effectively disable IRM logging. However, if you set the value of the *IrmLogPath* parameter to `$null` when the value of the *IrmLogEnabled* attribute is `$true`, Exchange will log errors in the Application event log. The preferred way for disabling IRM logging is to set the *IrmLogEnabled* parameter to `$false`.
MaxCallsAllowed	Optional	System.Int32	The *MaxCallsAllowed* parameter specifies the maximum number of concurrent voice calls that an Exchange 2013 Mailbox server or Exchange 2013 Mailbox or Exchange 2007 or Exchange 2010 Unified Messaging server that's running the Microsoft Exchange Unified Messaging service allows.
SIPAccessService	Optional	Microsoft.Exchange.Data.ProtocolConnectionSettings	The *SIPAccessService* parameter specifies the FQDN and Transmission

			Control Protocol (TCP) port of the nearest Lync Server pool location for inbound and outbound calls from remote Lync users located outside of the network. When this parameter isn't set, the Mailbox server running the Microsoft Exchange Unified Messaging service may select a Lync pool for Real-Time Transport Protocol (RTP) media traffic that isn't the closest geographically to the remote user. This parameter is optional when you're configuring Unified Messaging with single Lync Server pool deployments. However, for Lync Server deployments that span multiple geographic regions, it's recommended that you specify this parameter. This parameter is set on a per-Mailbox server running the Microsoft Exchange Unified Messaging service basis

			and must point to the Lync Server pool that is located the closest geographically to the Mailbox server.
SipTcpListeningPort	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
SipTlsListeningPort	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
Status	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ServerStatus	The *Status* parameter will be removed in future versions of the product.
UMForwardingAddressTemplate	Optional	System.String	This parameter is reserved for internal Microsoft use.
UMPodRedirectTemplate	Optional	System.String	This parameter is reserved for internal Microsoft use.
UMStartupMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMStartupMode	The *UMStartupMode* parameter specifies whether the Microsoft Exchange Unified Messaging service on an Exchange 2013 Mailbox server or Exchange 2007 or Exchange 2010 Unified Messaging server will start up in TCP, TLS, or Dual mode. If the Mailbox or Unified Messaging server is being added to

			UM dial plans that have different security settings, you should choose Dual mode. In Dual mode, the Mailbox or Unified Messaging server can listen on ports 5060 and 5061 at the same time. If the startup mode is changed, the Microsoft Exchange Unified Messaging service must be restarted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ExchangeUMCallFlow

Exchange Management Shell > Exchange 2013 cmdlets > Unified Messaging cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-04*

Note:

The **Test-ExchangeUMCallFlow** cmdlet (the UM Troubleshooting Tool) isn't included in Microsoft Exchange Server 2013 or Microsoft Exchange Server 2010. You need to download the UM Troubleshooting Tool from the Microsoft Download Center. For more information, see Unified Messaging Troubleshooting Tool.

Use the **Test-ExchangeUMCallFlow** cmdlet (the UM Troubleshooting Tool) to test call flow between Client Access servers running the Microsoft Exchange Unified Messaging Call Router service, Mailbox servers running the Microsoft Exchange Unified Messaging service, VoIP gateways, IP PBXs, Session Initiation Protocol (SIP) servers and Microsoft Lync Server. The **Test-ExchangeUMCallFlow** cmdlet can be used to diagnose configuration errors found in telephony components, Exchange 2010 SP1 or later or Exchange 2013 Unified Messaging settings, and connectivity issues between on-premises and hybrid Unified Messaging deployments.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-ExchangeUMCallFlow [-Mode <Gateway | SIPClient>] [-VoIPSecurity
<Unsecured | SIPSecured | Secured>] [-CertificateThumbprint <string>] [-
NextHop <string>] [-Diversion <string>] [-HuntGroup <string>]

Test-ExchangeUMCallFlow [-Mode <Gateway | SIPClient>] [-NextHop <string>]
[-CalledParty <string>] [-CallingParty <string>] [-Credential
<PSCredential>]
```

Examples

EXAMPLE 1

This example uses the `Gateway` mode and tests the call flow in a non-Lync Server environment. This example sets the VoIP security mode to `Unsecured`, uses the IP address 10.1.1.1 as the next hop, and includes an extension number in the diversion information.

```
Test-ExchangeUMCallFlow -Mode Gateway -VoIPSecurity
Unsecured -NextHop 10.1.1.1 -Diversion 12345
```

EXAMPLE 2

This example uses the `SIPClient` mode and tests the call flow with a Secured UM dial plan in an environment that contains servers running Lync Server. By default, when you run the cmdlet, the cmdlet uses the credentials of the user currently logged onto the computer.

```
Test-ExchangeUMCallFlow -Mode SIPClient -CallingParty
tony@contoso.com -CalledParty david@contoso.com -Credential
$get
```

EXAMPLE 3

This example uses the `Gateway` mode and tests the call flow in a non-Lync Server environment. This example sets the VoIP security mode to `Secured`, uses the IP address 10.176.10.194 as the next hop, and includes diversion information.

```
Test-ExchangeUMCallFlow -Mode Gateway -VoIPSecurity Secured
-CertificateThumbprint
a909502dd82ae41433e6f83886b00d4277a32a7b -NextHop
gateway.contoso.com -HuntGroup 10000 -Diversion "History-
Info: <sip:10001@10.176.10.194;user=phone?Reason=SIP%
3Bcause%3D487%3Btext%
3DTimeout>;index=1,<sip:10000@10.176.10.194;user=phone?
Reason=SIP>;index=1.1"
```

Detailed Description

The UM Troubleshooting Tool is an Exchange Management Shell cmdlet named **Test-ExchangeUMCallFlow**. You can use this cmdlet to diagnose configuration errors specific to call answering scenarios to test whether voice mail is functioning correctly in both on-premises and hybrid UM deployments. The **Test-ExchangeUMCallFlow** cmdlet only supports testing of call answering scenarios; however, it can't currently be used to test the following incoming call scenarios:

- Incoming calls to a UM auto attendant.
- Incoming calls to an Outlook Voice Access number as an unauthenticated user.
- Incoming calls to an Outlook Voice Access number as an authenticated Outlook Voice Access user.

You can use this cmdlet in deployments with Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server or in UM deployments with VoIP gateways or IP PBXs.

This cmdlet emulates calls and runs a series of diagnostic tests that help on-premises administrators to identify configuration errors in telephony equipment, Exchange 2010 SP1 and Exchange 2013 Unified Messaging settings, and connectivity issues between on-premises and hybrid deployments of Exchange 2010 SP1 and Exchange 2013 Unified Messaging.

When you run the cmdlet, it states the reason and possible solutions for issues that have been detected. It also outputs general audio quality metrics for diagnosing audio quality issues related to network connectivity such as jitter and average packet loss. The **Test-ExchangeUMCallFlow** cmdlet supports testing UM components and services in `Secured`, `SIP Secured`, and `Unsecured` calls, and it can be run either in `Gateway` or `SIPClient` modes.

Important:
The **Test-ExchangeUMCallFlow** cmdlet must be used to test only the voice mail functionality of a server running the Exchange 2010 SP1 UM server role and a Mailbox server running the Microsoft Exchange Unified Messaging service with Exchange 2013 installed.

The **Test-ExchangeUMCallFlow** cmdlet can be installed on a computer running the Exchange 2010 SP1 or later UM server role or a Mailbox server running Exchange 2013 or on another 64-bit computer running:

- Either the Windows 7 or Windows Vista operating systems.
- Either the Windows Server 2008 or Windows Server 2008 R2 operating systems.

Prior to installing the UM Troubleshooting Tool, the following components must be installed on a 64-bit version of Windows 7, Windows Vista, or the 64-bit edition of Windows Server 2008:

- Microsoft .NET Framework 3.5 SP1. For information, see Microsoft .NET Framework 3.5 Service Pack 1.
- Microsoft .NET Framework 3.5 Family Update for Windows Vista x64 and Windows Server 2008 x64 updates if the tool will be run on a computer running Windows Vista or Windows Server 2008. For more information, see Microsoft .NET Framework 3.5 Family Update for Windows Vista x64, and Windows Server 2008 x64.
- Windows Remote Management (WinRM) 2.0 and Windows PowerShell V2 (Windows6.0-KB968930.msu). For details, see Microsoft Knowledge Base article 968930, Windows Management Framework Core package (Windows PowerShell 2.0 and WinRM 2.0).
- Unified Communications Managed API 2.0, Core Runtime (64-bit) (UcmaRuntimeWebDownloadX64.msi). For information, see Unified Communications Managed API 2.0, Core Runtime (64-bit).

Parameters

Parameter	Required	Type	Description
CalledParty	Required	System.String	The *CalledParty* parameter specifies the SIP URI of the Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server user that has been

			enabled for the Enterprise Voice user that the **Test-ExchangeUMCallFlow** cmdlet will make the voice call to, for example: `-CalledParty tonysmith@contoso.com`. Use this parameter if you're running the tool in `SIPClient` mode.
CallingParty	Required	System.String	The *CallingParty* parameter specifies the SIP URI of the Office Communications Server 2007 R2 or Lync Server user that has been enabled for the Enterprise Voice user who's making the incoming call, for example: `-CallingParty tonysmith@contoso.com`. Use this parameter if you're running the tool in `SIPClient` mode.
Diversion	Required	System.String	The *Diversion* parameter specifies the string that should be sent as diversion information for the incoming call. This can be in the form of a Diversion or History-Info header. The diversion information can be either

			an extension number or also include additional diversion information. When you provide diversion information as a History-Info header, verify the following: • There are at least two different entries with different user parts. • The last entry should contain the user's associated UM dial plan pilot number. • The second to last entry should include the UM-enabled user's extension number. This entry must also include the appropriate Reason text. This text must be properly escaped in accordance with standard URL parameter escaping rules.
Mode	Required	Microsoft.Exchange.UM.TroubleshootingTool.TestMode	The *Mode* parameter specifies whether the deployment being tested includes VoIP gateways, IP PBX, or Office Communications Server R2 or Lync servers. You

			can specify either `Gateway` mode when your UM deployment includes VoIP gateways or IP PBXs or `SIPClient` mode if your UM deployment includes Office Communications Server 2007 R2 or Lync Server.
NextHop	Required	System.String	The *NextHop* parameter specifies the IP address or fully qualified domain name (FQDN) and can also include the TCP port of the next hop that the **Test-ExchangeUMCallFlow** cmdlet must connect to while emulating the VoIP gateway or IP PBX. When you include the TCP port, you must include either port 5060 for `Unsecured` mode or port 5061 for `Secured` or `SIPSecured` mode, for example: `gateway.contoso.com:5061` If you're using the cmdlet in a hybrid environment, you must enter the FQDN of the Session Border Controller (SBC). If you're using the

			cmdlet in an on-premises environment, you must use the FQDN of an Exchange 2013 Mailbox server or Exchange 2010 SP1 UM server running the Microsoft Exchange Unified Messaging service.
CertificateThumbprint	Optional	System.String	The *CertificateThumbprint* parameter specifies the thumbprint of the certificate used for Transport Layer Security (TLS). This is required if either the `SIPSecured` or `Secured` mode is configured on the UM dial plan. This certificate thumbprint is the certificate that was exported from the VoIP gateway, IP Private Branch eXchange (PBX), or Session Border Controller (SBC). Also, the computer that has the UM Troubleshooting Tool installed and is being used to test for call flow must trust the next hop's certificate of authority.

Credential	Optional	System.String	The *Credential* parameter specifies the credentials that will be used to run the cmdlet.
HuntGroup	Optional	System.String	The *HuntGroup* parameter specifies the UM hunt group associated with the VoIP gateway being emulated. This is typically an extension number. Use this parameter if you're running the tool in `Gateway` mode.
VoIPSecurity	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UMVoIPSecurityType	The *VoIPSecurity* parameter specifies the security mode when using the cmdlet in `Gateway` mode. You can use one of the following Voice over IP (VoIP) security modes: • `Secured` (TLS/SRTP) • `Unsecured` (TCP/RTP) (default) • `SIPSecured` (TLS/RTP)

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-Contact** cmdlet to retrieve information on a specified contact or contacts.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-Contact [-Anr <String>] <COMMON PARAMETERS>

Get-Contact [-Identity <ContactIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
```

```
<SwitchParameter>] [-RecipientTypeDetails <RecipientTypeDetails[]>] [-
ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example retrieves the contact Markus Breyer using the *Identity* parameter and pipelines the object to the **Format-List** command to display the information about the contact.

```
Get-Contact -Identity MarkusBreyer | Format-List
```

EXAMPLE 2

This example uses the *Anr* parameter to retrieve all mail-enabled contacts whose names start with Markus.

```
Get-Contact -Anr Markus* -RecipientTypeDetails MailContact
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an

			attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ContactIdParameter	The *Identity* parameter specifies the contact. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-

			4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController*

			parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter returns objects only from the specified organizational unit (OU).
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain

			controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.
RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientTypeDetails[]	The *RecipientTypeDetails* parameter specifies the type of recipients returned. Recipient types are divided into recipient types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type UserMailbox represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each mailbox type is identified

			by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to ConferenceRoomMailbox, whereas a user mailbox has *RecipientTypeDetails* set to UserMailbox. You can select from the following values: • `ArbitrationMailbox` • `ConferenceRoomMailbox` • `Contact` • `DiscoveryMailbox` • `DynamicDistributionGroup` • `EquipmentMailbox` • `ExternalManagedContact` • `ExternalManagedDistributionGroup` • `LegacyMailbox` • `LinkedMailbox` • `MailboxPlan` • `MailContact` • `MailForestContact` • `MailNonUniversalGroup` • `MailUniversalDistributionGroup` • `MailUniversalSecurityGroup` • `MailUser` • `PublicFolder` • `RoleGroup` • `RoomList` • `RoomMailbox` • `SharedMailbox` • `SystemAttendantMailbox` • `SystemMailbox` • `User` • `UserMailbox`
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to

			return.
SortBy	Optional	System.String	The *SortBy* parameter specifies to sort by a single attribute in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-Contact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-Contact** cmdlet to modify the settings of an existing contact.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-Contact -Identity <ContactIdParameter> [-AllowUMCallsFromNonUsers
<None | SearchEnabled>] [-AssistantName <String>] [-City <String>] [-
Company <String>] [-Confirm [<SwitchParameter>]] [-CountryOrRegion
<CountryInfo>] [-CreateDTMFMap <$true | $false>] [-Department <String>] [-
DisplayName <String>] [-DomainController <Fqdn>] [-Fax <String>] [-
FirstName <String>] [-GeoCoordinates <GeoCoordinates>] [-HomePhone
<String>] [-IgnoreDefaultScope <SwitchParameter>] [-Initials <String>] [-
LastName <String>] [-Manager <UserContactIdParameter>] [-MobilePhone
<String>] [-Name <String>] [-Notes <String>] [-Office <String>] [-OtherFax
<MultiValuedProperty>] [-OtherHomePhone <MultiValuedProperty>] [-
OtherTelephone <MultiValuedProperty>] [-Pager <String>] [-Phone <String>]
[-PhoneticDisplayName <String>] [-PostalCode <String>] [-PostOfficeBox
<MultiValuedProperty>] [-SeniorityIndex <Int32>] [-SimpleDisplayName
<String>] [-StateOrProvince <String>] [-StreetAddress <String>] [-
TelephoneAssistant <String>] [-Title <String>] [-UMCallingLineIds
<MultiValuedProperty>] [-UMDtmfMap <MultiValuedProperty>] [-WebPage
<String>] [-WhatIf [<SwitchParameter>]] [-WindowsEmailAddress
```

<SmtpAddress>]

Examples

EXAMPLE 1

This example makes the following changes to the existing contact Arlene Huff in the Users container in the Active Directory domain contoso.com:

- Change the *City* parameter value to Seattle.
- Change the *Company* parameter value to Contoso.

```
Set-Contact -Identity "contoso.com/Users/Arlene Huff" -City "Seattle" -Company "Contoso"
```

Detailed Description

You can use the **Set-Contact** cmdlet to modify the settings of contact objects that are visible in Active Directory Users and Computers. If the contact is mail-enabled, use the **Set-MailContact** cmdlet to modify the contact's email settings that aren't available by using the **Set-Contact** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ContactIdParameter	The *Identity* parameter specifies the object that you want to modify. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips

			• Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • Domain\Account Example: Atlanta\JPhillips • GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com
AllowUMCallsFromNonUsers	Optional	Microsoft.Exchange.Data.Directory.Recipient.AllowUMCallsFromNonUsersFlags	The *AllowUMCallsFromNonUsers* parameter specifies whether to exclude the contact from directory searches.
AssistantName	Optional	System.String	The *AssistantName* parameter specifies the name of the contact's assistant.

City	Optional	System.String	The *City* parameter specifies the contact's city.
Company	Optional	System.String	The *Company* parameter specifies the contact's company.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
CountryOrRegion	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	The *CountryOrRegion* parameter specifies the contact's country or region.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual-tone multiple-frequency (DTMF) map be created for the contact.
Department	Optional	System.String	The *Department* parameter specifies the contact's department.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the contact's name in the

			Exchange Administration Center and in the Exchange global address list (GAL). The *DisplayName* parameter has meaning only for mail-enabled objects.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Fax	Optional	System.String	The *Fax* parameter specifies the contact's fax number.
FirstName	Optional	System.String	The *FirstName* parameter specifies the contact's first name.
GeoCoordinates	Optional	Microsoft.Exchange.Data.GeoCoordinates	The *GeoCoordinates* parameter specifies the contact's physical location in latitude, longitude, and altitude coordinates. Use this parameter to specify the global position of the

			contact's location. You have to specify one of the following sets of coordinates; use semicolons to separate the values: • Latitude and longitude; for example, `"47.644125;-122.122411"` • Latitude, longitude, and altitude; for example, `"47.644125;-122.122411;161.432"`
HomePhone	Optional	System.String	The *HomePhone* parameter specifies the contact's home telephone number.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the

			IgnoreDefaultScope parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as GUID, aren't accepted.
Initials	Optional	System.String	The *Initials* parameter specifies the initials for the contact's name.
LastName	Optional	System.String	The *LastName* parameter specifies the contact's surname.
Manager	Optional	Microsoft.Exchange.Configuration.Tasks.UserContactIdParameter	The *Manager* parameter specifies the contact's manager.
MobilePhone	Optional	System.String	The *MobilePhone* parameter specifies the contact's primary mobile phone number.
Name	Optional	System.String	The *Name* parameter specifies the contact's name in Active Directory

			Users and Computers, and also in the **Group Name** field in the Exchange Administration Center if the group is mail-enabled. The *Name* value can't exceed 64 characters.
Notes	Optional	System.String	The *Notes* parameter specifies additional information about the contact.
Office	Optional	System.String	The *Office* parameter specifies the contact's physical office name or number.
OtherFax	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *OtherFax* parameter specifies the contact's alternative fax number.
OtherHomePhone	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *OtherHomePhone* parameter specifies the contact's alternative home telephone number.
OtherTelephone	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *OtherTelephone* parameter specifies the contact's alternative office telephone number.
Pager	Optional	System.String	The *Pager* parameter specifies the contact's pager number.

Phone	Optional	System.String	The *Phone* parameter specifies the contact's office telephone number.
PhoneticDisplayName	Optional	System.String	The *PhoneticDisplayName* parameter specifies a phonetic pronunciation of the *DisplayName* parameter. The maximum length of this parameter value is 255 characters.
PostalCode	Optional	System.String	The *PostalCode* parameter specifies the contact's postal code.
PostOfficeBox	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *PostOfficeBox* parameter specifies the contact's post office box number.
SeniorityIndex	Optional	System.Int32	The *SeniorityIndex* parameter specifies the order in which this contact will display in a hierarchical address book. A contact with a value of 2 will display higher in an address book than a contact with a value of 1.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative

			description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively. The *SimpleDisplayName* parameter has meaning only for mail-enabled objects.
StateOrProvince	Optional	System.String	The *StateOrProvince* parameter specifies the contact's state or province.
StreetAddress	Optional	System.String	The *StreetAddress* parameter specifies the contact's physical address.
TelephoneAssistant	Optional	System.String	The *TelephoneAssistant* parameter specifies the telephone number of the contact's assistant.
Title	Optional	System.String	The *Title* parameter specifies the contact's title.
UMCallingLineIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMCallingLineIds* parameter specifies telephone numbers or extensions that can be mapped to a Unified Messaging (UM)-enabled

			user. You can specify more than one telephone number for each user, separated by a comma. Values for this parameter must be less than 128 characters in length and may include an optional plus sign (+) that precedes the numbers. Each UM-enabled user must have a unique *UMCallingLineIds* parameter value.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the UM-enabled contact.
WebPage	Optional	System.String	The *WebPage* parameter specifies the contact's web page.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the contact's email address stored in Active Directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-DistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-DistributionGroup** cmdlet to remove mail capabilities from a mail-enabled distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-DistributionGroup -Identity <DistributionGroupIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
IgnoreDefaultScope <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables Distribution Group1.

```
Disable-DistributionGroup -Identity "Distribution Group1"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the identity of the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-

			5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-DistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-DistributionGroup** cmdlet to mail-enable an existing universal group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-DistributionGroup -Identity <GroupIdParameter> [-Alias <String>] [-
Confirm [<SwitchParameter>]] [-DisplayName <String>] [-DomainController
<Fqdn>] [-OverrideRecipientQuotas <SwitchParameter>] [-PrimarySmtpAddress
<SmtpAddress>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the distribution group Distribution Group1.

```
Enable-DistributionGroup -Identity "Distribution Group1"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *Identity* parameter specifies the identity of the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID`

			Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Alias	Optional	System.String	The *Alias* parameter specifies the email alias of the group.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name of the distribution group. A display name is typically the same as the *Domain*

			\Account Name.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary SMTP address for the distribution group. By default, the primary SMTP address is generated based on the default email address policy. If you specify a primary SMTP address by using this parameter, the cmdlet sets the *EmailAddressPolicyEnabled* attribute of the distribution group to `$false`, and the email addresses of this distribution group won't be automatically updated

			based on email address policies.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-DistributionGroup** cmdlet to query for existing distribution groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DistributionGroup [-ManagedBy <GeneralRecipientIdParameter>] <COMMON
PARAMETERS>

Get-DistributionGroup [-Anr <String>] <COMMON PARAMETERS>

Get-DistributionGroup [-Identity <DistributionGroupIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-RecipientTypeDetails <RecipientTypeDetails[]>] [-
ResultSize <Unlimited>] [-SortBy <String>] [-UsnForReconciliationSearch
<Int64>]
```

Examples

EXAMPLE 1

This example retrieves the group Marketing Reports and pipelines the object to the **Format-List** command to display the information about the distribution group.

```
Get-DistributionGroup -Identity "Marketing Reports" |
Format-List
```

EXAMPLE 2

This example retrieves all distribution groups whose names contain the string "marketing" and pipelines the object to the **Format-Table** command to display the distribution group names and who they're managed by.

```
Get-DistributionGroup -Anr marketing | Format-Table Name,
ManagedBy
```

Detailed Description

You can use distribution groups to create email distribution lists and security groups to assign permissions to shared resources. Distribution groups can be used only with email applications to send email messages to collections of users. You can use the **Get-DistributionGroup** cmdlet to query for existing distribution groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password for accessing Active Directory. The default is the current user's credentials. This parameter requires the creation and passing of a credential object. This credential object is

			created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the identity of the distribution group object. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example:

			Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope

			setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
ManagedBy	Optional	Microsoft.Exchange.Configuration.Tasks.Gene	The *ManagedBy* parameter indicates the

		ralRecipientIdParameter	DN of the user or contact that manages the group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter limits results to a specific organizational unit (OU) container.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.

RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientTypeDetails[]	The *RecipientTypeDetails* parameter specifies the type of recipients returned. Recipient types are divided into recipient types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type UserMailbox represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each mailbox type is identified by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to ConferenceRoomMailbox, whereas a user mailbox has *RecipientTypeDetails* set to UserMailbox. You can select from the following values: • `ArbitrationMailbox` • `ConferenceRoomMailbox` • `Contact` • `DiscoveryMailbox` • `DynamicDistributionGroup` • `EquipmentMailbox` • `ExternalManagedContact` • `ExternalManagedDistri`

			butionGroup • LegacyMailbox • LinkedMailbox • MailboxPlan • MailContact • MailForestContact • MailNonUniversalGroup • MailUniversalDistribution Group • MailUniversalSecurity Group • MailUser • PublicFolder • RoleGroup • RoomList • RoomMailbox • SharedMailbox • SystemAttendantMailbox • SystemMailbox • User • UserMailbox
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter indicates the maximum number of recipient objects returned.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute used to sort the results.
UsnForReconciliationSearch	Optional	System.Int64	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-DistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-DistributionGroup** cmdlet to create a distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-DistributionGroup -Name <String> [-Alias <String>] [-
ArbitrationMailbox <MailboxIdParameter>] [-BypassNestedModerationEnabled
<$true | $false>] [-Confirm [<SwitchParameter>]] [-CopyOwnerToMember
<SwitchParameter>] [-DisplayName <String>] [-DomainController <Fqdn>] [-
ExternalDirectoryObjectId <String>] [-IgnoreNamingPolicy
<SwitchParameter>] [-ManagedBy <MultiValuedProperty>] [-
MemberDepartRestriction <Closed | Open | ApprovalRequired>] [-
MemberJoinRestriction <Closed | Open | ApprovalRequired>] [-Members
<MultiValuedProperty>] [-ModeratedBy <MultiValuedProperty>] [-
ModerationEnabled <$true | $false>] [-Notes <String>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-OverrideRecipientQuotas
<SwitchParameter>] [-PrimarySmtpAddress <SmtpAddress>] [-RoomList
<SwitchParameter>] [-SamAccountName <String>] [-
SendModerationNotifications <Never | Internal | Always>] [-Type
<Distribution | Security>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a mail-enabled universal security group that has the following parameters:

- The group name is Managers.
- The group is created in the Users container in the domain contoso.com.
- The group *SamAccountName* parameter value is Managers.
- The group type is Security.

```
New-DistributionGroup -Name "Managers" -OrganizationalUnit
"contoso.com/Users" -SamAccountName "Managers" -Type
"Security"
```

EXAMPLE 2

This example creates the distribution group ITDepartment and ignores the naming policy.

```
New-DistributionGroup -Name "ITDepartment" -
```

`IgnoreNamingPolicy`

Detailed Description

You can use the **New-DistributionGroup** cmdlet to create Active Directory group objects of the following types:

- Mail-enabled universal security group (USG)
- Universal distribution group

Distribution groups are used to consolidate groups of recipients into a single point of contact for email messages. Distribution groups can't be used to assign permissions to network resources in Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name for the new distribution group. The value specified in the *Name* parameter is also used for the *DisplayName* parameter if the *DisplayName* parameter isn't specified. The *Name* parameter value can't exceed 64 characters. **Note:** If a group naming policy is enforced, you need to follow the naming constraints specified in the

			DistributionGroupNameBlockedWordList and the *DistributionGroupNamingPolicy* parameters of the **Set-OrganizationConfig** cmdlet. If the values of the *Name* and *DisplayName* parameters are different: • The *Name* parameter specifies the distribution group name in Active Directory Users and Computers. • The *DisplayName* parameter specifies the distribution group name in the Exchange Administration Center (EAC) and in the Exchange global address list (GAL).
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the distribution group. The *Alias* parameter is then used to generate the primary SMTP email address of the object. The value of the *Alias* parameter can't contain spaces. If the *Alias* parameter isn't specified, the value of the

			SamAccountName parameter is used to generate the primary SMTP email address, with any spaces converted to underscores.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-

			4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassNestedModerationEnabled	Optional	System.Boolean	The *BypassNestedModerationEnabled* parameter specifies whether to allow the parent group moderators to provide approval for any nested groups that are also moderated. If you set this parameter to `$true`, after a moderator approves a message sent to this distribution group, the message is automatically approved for any other moderated recipients that are members of this distribution group. The default value is `$false`. **Note:** This parameter can be set only by top-level

			organization and tenant administrators.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
CopyOwnerToMember	Optional	System.Management.Automation.SwitchParameter	The *CopyOwnerToMember* parameter specifies that a recipient specified in the *ManagedBy* parameter is also a member of the distribution group.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name of the distribution group in the EAC and in the Exchange GAL. If the *DisplayName* parameter isn't specified, the value of the *Name* parameter is used for the *DisplayName* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalDirectoryObjectId	Optional	System.String	This parameter is reserved for internal Microsoft use.
IgnoreNamingPolicy	Optional	System.Management.Automation.SwitchParameter	The *IgnoreNamingPolicy* parameter specifies that the naming policy defined in the *DistributionGroupNamingPolicy* parameter of the **Set-OrganizationConfig** cmdlet can be ignored. You don't need to specify a value with this parameter.
ManagedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ManagedBy* parameter specifies the name of the mailbox recipient or Active Directory user that appears in the **Managed by** tab of the Active Directory object. If this parameter isn't specified, the creator of the group is the owner.

			This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com To specify an Active Directory user, use one of

			the following values: • GUID • DN • UPN • *Domain\Account Name* The recipients specified with the *ManagedBy* parameter aren't members of the distribution group. If you want recipients specified in this parameter to be added as members of the distribution group, use the *CopyOwnerToMember* parameter.
MemberDepartRestriction	Optional	Microsoft.Exchange.Data.Directory.Recipient.MemberUpdateType	The *MemberDepartRestriction* parameter specifies the restrictions that you can put on recipients who want to depart the group membership. This parameter can take one of the following values: • `Open` • `Closed` • `ApprovalRequired` **Note:** Universal security groups can't use the `Open` value. By default, they're set to `Closed`.

MemberJoinRestriction	Optional	Microsoft.Exchange.Data.Directory.Recipient.MemberUpdateType	The *MemberJoinRestriction* parameter specifies the restrictions that you can put on recipients who want to join the group membership. This parameter can take one of the following values: • `Open` • `Closed` • `ApprovalRequired` **Note:** Universal security groups can't use the `Open` value. By default, they're set to `Closed`.
Members	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Members* parameter specifies the initial list of recipients or Active Directory users who are a part of this distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=c

			ontoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com To specify an Active Directory user, use one of the following values: • GUID • DN • UPN • *Domain\Account Name*
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to this distribution group. To designate more than one

			user, separate the users by commas. The *ModeratedBy* parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there is a user already specified as the manager of this distribution group, the *ModeratedBy* field is automatically set to the *ManagedBy* parameter of the distribution group. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the distribution group. To ensure moderation, set this parameters to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Notes	Optional	System.String	The *Notes* parameter specifies additional information about the

			distribution group.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the container where the distribution group is created.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary return SMTP email address for the distribution group. This parameter has meaning only if the distribution group has multiple SMTP email addresses.
RoomList	Optional	System.Management.Automation.SwitchParameter	The *RoomList* parameter specifies that all members of the distribution group are room resource mailboxes. You can create a distribution list for an office building in your organization and add all the rooms in that building to the distribution group.

			Room list distribution groups are then used to generate a list of building locations in Microsoft Outlook 2010 so the user can select a building and get information about when rooms are available in that building, without having to add the rooms in that building individually.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies the name for clients of the object running older operating systems. The *SamAccountName* parameter is displayed in Active Directory. If the *Alias* parameter isn't specified, the following conditions are true: • The value of the *SamAccountName* parameter is used for the value of the *Alias* parameter, with any spaces converted to underscores.

			• The *SamAccountName* parameter, with any spaces converted to underscores, is used to generate the primary SMTP email address of the object.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never` Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent only to the senders who are internal to your organization. Set this parameter to `Never` to disable all status notifications.

			Note: The senders are always notified if their message is rejected by the moderators, regardless of the value of the parameter. The default value is `Never`.
Type	Optional	Microsoft.Exchange.Management.RecipientTasks.GroupType	The *Type* parameter specifies the group type created in Active Directory. The group's scope is always Universal. Valid values are `Distribution` or `Security`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-DistributionGroup** cmdlet to delete an existing distribution group from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DistributionGroup -Identity <DistributionGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ForReconciliation
<SwitchParameter>] [-IgnoreDefaultScope <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes an existing distribution group Temporary Staff.

```
Remove-DistributionGroup -Identity "Temporary Staff"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the distribution group that you want to remove. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com

			• User Principal Name Example: JPhillips@contoso.com
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* parameter specifies whether to bypass security checks and moderation for the member being added, if the specified distribution group is a moderated distribution group.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
ForReconciliation	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN

			for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-DistributionGroup** cmdlet to modify the settings of an existing distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DistributionGroup -Identity <DistributionGroupIdParameter> [-
AcceptMessagesOnlyFrom <MultiValuedProperty>] [-
AcceptMessagesOnlyFromDLMembers <MultiValuedProperty>] [-
AcceptMessagesOnlyFromSendersOrMembers <MultiValuedProperty>] [-Alias
<String>] [-ArbitrationMailbox <MailboxIdParameter>] [-
BypassModerationFromSendersOrMembers <MultiValuedProperty>] [-
BypassNestedModerationEnabled <$true | $false>] [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-CreateDTMFMap <$true | $false>] [-CustomAttribute1
<String>] [-CustomAttribute10 <String>] [-CustomAttribute11 <String>] [-
CustomAttribute12 <String>] [-CustomAttribute13 <String>] [-

RequireSenderAuthenticationEnabled <$true | $false>] [-RoomList
<SwitchParameter>] [-SamAccountName <String>] [-
SendModerationNotifications <Never | Internal | Always>] [-
SendOofMessageToOriginatorEnabled <$true | $false>] [-SimpleDisplayName
<String>] [-UMDtmfMap <MultiValuedProperty>] [-WhatIf [<SwitchParameter>]]
[-WindowsEmailAddress <SmtpAddress>]
```

Examples

EXAMPLE 1

This example changes the display name of an existing distribution group from Accounting to Accounting Group.

```
Set-DistributionGroup -Identity "Accounting" -DisplayName
"Accounting Group"
```

EXAMPLE 2

This example converts the Bldg34 Conf Rooms distribution group to a room list.

```
Set-DistributionGroup -Identity "Bldg34 Conf Rooms" -
RoomList
```

EXAMPLE 3

This example changes the name of an existing distribution group from Ed_DirectReports to Ayla_DirectReports and ignores the group naming policy.

```
Set-DistributionGroup -Identity Ed_DirectReports -Name
Ayla_DirectReports -IgnoreNamingPolicy
```

Detailed Description

Distribution groups are used to consolidate groups of recipients into a single point of contact for email messages. Distribution groups can't be used to assign permissions to network resources in Active Directory. You can use the **Set-DistributionGroup** cmdlet to overwrite existing settings or to add new settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the object that you want to modify. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)`

			Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AcceptMessagesOnlyFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFrom* parameter specifies the mailbox users, mail users, and mail contacts who can send email messages to this distribution group. You can also specify Microsoft Exchange as a valid recipient for this parameter. If you configure a distribution

			group to accept messages only from the Microsoft Exchange recipient, the distribution group only receives system-generated messages. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address`

			Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to accept messages from all senders.
AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips

			• `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to accept messages from all senders.
AcceptMessagesOnlyFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromSendersOrMembers* parameter specifies the recipients who can send email messages to this distribution group. You can specify users, contacts, or distribution groups. If you specify a

			distribution group, messages are accepted from all recipients that are members of that distribution group. You can also specify Exchange as a valid recipient for this parameter. If you configure a distribution group to accept messages only from the Exchange recipient, the distribution group only receives system-generated messages. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2

			• `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to accept messages from all senders.
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the distribution group. The *Alias* parameter is used to generate the primary SMTP email address of the object. The value of the *Alias* parameter can't contain spaces. If the *Alias* parameter isn't specified, the value of the *SamAccountName* parameter is used to

			generate the primary SMTP email address, with any spaces converted to underscores.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox that's used to manage the moderation process. This parameter is automatically set when moderation is enabled.
BypassModerationFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassModerationFromSendersOrMembers* parameter specifies senders for whom moderation is to be bypassed. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example:

			CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassNestedModerationEnabled	Optional	System.Boolean	The *ByPassNestedModerationEnabled* parameter specifies whether to allow the parent group moderators to provide approval for any nested groups that are also moderated. If you set this parameter to `$true`, all moderation in any nested distribution groups is

			bypassed on approved email messages. The default value is `$false`.
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* parameter specifies whether to bypass security checks and moderation for the member that's being added. Use this parameter when the specified distribution group is a moderated distribution group, and you want to bypass security checks and moderation for the member that's being added.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap*

			parameter specifies that a dual-tone multiple-frequency (DTMF) map be created for the distribution group.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to

			store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.

CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify

			custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the distribution group's name in the Exchange Administration Center and in the Exchange global address list (GAL).
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	The *EmailAddresses* parameter specifies the email alias of the distribution group. All valid Microsoft Exchange Server 2013 email address types can be used. You can specify multiple values for the *EmailAddresses* parameter as a comma-delimited list. **Important:** Exchange 2013 doesn't validate custom addresses for correct formatting. You must ensure that the custom address you specify complies with the format requirements for that address type. Because X.400 addresses are considered custom addresses in Exchange 2013, they also aren't validated, and you must provide the correct syntax when specifying an X.400 address.
EmailAddressPolicyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013.

			The *EmailAddressPolicyEnabled* parameter specifies the application of email address policies to this distribution group. Valid values are `$true` or `$false`. The default value is `$true`. By default, all applicable email address policies are applied to this distribution group.
ExpansionServer	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *ExpansionServer* parameter specifies the Exchange server used to expand the distribution group. Enter the expansion server as a legacy Exchange DN value. The default behavior is to use the closest Exchange Server 2003 computer, or the closest Exchange Server 2007 or Exchange server that has the Hub Transport server role installed.
ExtensionCustomAttri	Optional	Microsoft.Exchange.Da	The

bute1		ta.MultiValuedProperty	*ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values.

			For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that

			store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes.

			For more information about using multivalued properties, see Modifying multivalued properties.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* parameter suppresses the following confirmation: "To save changes on object <*object name*>, the object must be upgraded to the current Exchange version. After the upgrade, this object can't be managed by an earlier version of the Exchange Management Tools. Do you want to continue to upgrade and save the object?" This confirmation occurs when you upgrade a distribution group that was created in Microsoft Exchange Server 2003. You can't manage an Exchange 2003 distribution group by using the Exchange Administration Center until you update the object's version.
GenerateExternalDirectoryObjectId	Optional	System.Management.Automation.SwitchPar	This parameter is reserved for internal Microsoft use.

		ameter	
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies a mailbox user who can send on behalf of this distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/

			cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, the value of the *GrantSendOnBehalfTo* parameter is blank, which means that no other mailbox user has permission to send on behalf of this distribution group.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether to hide the distribution group from any Exchange address list. Values are `$true` or `$false`. The default value is `$false`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell

			session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IgnoreNamingPolicy	Optional	System.Management.Automation.SwitchParameter	The *IgnoreNamingPolicy* parameter specifies that the naming policy defined in the *DistributionGroupNamingPolicy* parameter of the **Set-OrganizationConfig** cmdlet can be ignored. You don't need to specify a value with this

			parameter.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message that's displayed to senders when they start drafting an email message to this recipient. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *MailTipTranslations* parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each language, you must provide the locale, followed by a colon and the specific *MailTip* parameter message in that language. Each *MailTip* parameter message must be less than or equal to 250 characters. Multiple languages can be separated by commas.

ManagedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ManagedBy* parameter specifies the name of the mailbox recipient that appears on the **Managed by** tab of the Active Directory object. If this parameter isn't specified, the creator of the group is the owner. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/

			ou=AdministrativeGroup/ cn=Recipients/ cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com The recipients specified with the *ManagedBy* parameter aren't automatically members of the distribution group. If you want recipients specified in this parameter to be added as members of the distribution group, you need to add them as members.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum allowed email message size that can be sent to this distribution group. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes)

			• MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. Valid values are from 0 through 2147482624 bytes. By default, the *MaxReceiveSize* parameter is set to unlimited.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxSendSize* parameter specifies the maximum allowed email message size that can be sent from this distribution group. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. Valid values are from 0 through 2147482624 bytes.

			By default, the *MaxSendSize* parameter is set to unlimited.
MemberDepartRestriction	Optional	Microsoft.Exchange.Data.Directory.Recipient.MemberUpdateType	The *MemberDepartRestriction* parameter specifies the restrictions that you can put on recipients who want to depart the group membership. This parameter takes the following values: • `Open` • `Closed` • `ApprovalRequired` **Note:** Universal security groups can't use the `Open` value. By default, they're set to `Closed`.
MemberJoinRestriction	Optional	Microsoft.Exchange.Data.Directory.Recipient.MemberUpdateType	The *MemberJoinRestriction* parameter specifies the restrictions that you can put on recipients who want to join the group membership. You can use the following values: • `Open` • `Closed` • `ApprovalRequired` **Note:** Universal security groups can't use the `Open` value. By default, they're set to `Closed`.

ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the list of users who are responsible for moderating the messages sent to this distribution group. To designate more than one user, separate the users by commas. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/

			ou=AdministrativeGroup/ cn=Recipients/ cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com This parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there's a user already specified as the manager of this distribution group, the *ModeratedBy* field is automatically set to the *ManagedBy* parameter of the distribution group. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation of email sent to this distribution group. To ensure moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.

Name	Optional	System.String	The *Name* parameter specifies the name of the distribution group. The *Name* parameter specifies the distribution group name in Active Directory Users and Computers. **Note:** If group naming policy is enforced, you need to follow the naming constraints specified in the Set-OrganizationConfig cmdlet.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary return SMTP email address for the distribution group. This parameter only has meaning if the distribution group has multiple SMTP email addresses.
RejectMessagesFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFrom* parameter specifies mailbox users and mail-enabled contacts who aren't allowed to send email messages to this distribution group. This parameter accepts the following values:

			• Alias Example: JPhillips • Canonical DN Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • Display Name Example: Jeff Phillips • Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • Domain\Account Example: Atlanta\JPhillips • GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to

			accept messages from all mailbox users and all mail-enabled contacts.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies the distribution groups who aren't allowed to send email messages to the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN`

			Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to accept messages from all distribution groups.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromSendersOrMembers* parameter specifies the identity of recipients from whom messages are rejected. This parameter accepts the following values: • Alias Example: JPhillips • Canonical DN Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • Display Name Example: Jeff Phillips • Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=c

			ontoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
ReportToManagerEnabled	Optional	System.Boolean	The *ReportToManagerEnabled* parameter specifies whether to allow delivery reports to be sent to the distribution group manager. Valid values are `$true` or `$false`. The default value is `$false`.
ReportToOriginatorEnabled	Optional	System.Boolean	The *ReportToOriginatorEnabled* parameter specifies whether to allow delivery

			reports to be sent to the senders of email messages that are sent to this distribution group. Valid values are `$true` or `$false`. The default value is `$true`.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether to require email message delivery from authenticated senders. If the value is `$true`, messages are accepted only from authenticated senders. Valid values are `$true` or `$false`. The default value is `$true`.
RoomList	Optional	System.Management.Automation.SwitchParameter	The *RoomList* parameter specifies that all members of the distribution group are room resource mailboxes. You can create a distribution list for an office building in your organization and add all the rooms in that building to the distribution group. Room list distribution groups are used to

			generate a list of building locations in Microsoft Outlook so the user can select a building and get suggestions about when rooms are available in that building, without having to add the rooms in that building individually. You can't use the *RoomList* parameter with the *ExternalManaged* parameter.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies the name for clients of the object running older operating systems. The *SamAccountName* parameter is displayed in Active Directory.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the

			moderated distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never` If you want notifications to be sent to all external and internal senders, set this parameter to `Always`. If you want notifications to be sent only to the senders who are internal to your organization, set this parameter to `Internal`. To disable all status notifications, set this parameter to `Never`. **Note:** Senders are always notified if their message is rejected by the moderators, regardless of the value of the parameter. The default value is `Never`.
SendOofMessageToOriginatorEnabled	Optional	System.Boolean	The *SendOofMessageToOriginatorEnabled* parameter specifies whether to allow out-of-office messages to be delivered to the senders of email

			messages sent to this distribution group. Valid values are `$true` or `$false`. The default value is `$false`.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the UM-enabled distribution group.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the value of the **E-mail** field of the Active Directory object.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-DistributionGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Add-DistributionGroupMember** cmdlet to add a recipient to a distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-DistributionGroupMember -Identity <DistributionGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Member
<RecipientWithAdUserGroupIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds John Evans to the distribution group Staff.

```
Add-DistributionGroupMember -Identity "Staff" -Member
"JohnEvans@contoso.com"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the identity of the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips

			• GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* parameter specifies whether to bypass security checks and moderation for the member being added, if the specified distribution group is a moderated distribution group.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Member	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientWithAdUserGroupIdParameter	The *Member* parameter specifies the recipient or Active Directory user to add to the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,D

			C=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com To specify an Active Directory user, use one of the following values: • GUID • DN • UPN • *Domain\Account Name*
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DistributionGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-DistributionGroupMember** cmdlet to find existing distribution group members.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DistributionGroupMember -Identity <DistributionGroupMemberIdParameter>
[-Credential <PSCredential>] [-DomainController <Fqdn>] [-
IgnoreDefaultScope <SwitchParameter>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the existing distribution group members for the distribution group Marketing

USA.

```
Get-DistributionGroupMember -Identity "Marketing USA"
```

EXAMPLE 2

This example sets the scope of the search to the entire forest by running the **Set-ADServerSettings** cmdlet, and then the **Get-DistributionGroupMember** cmdlet searches the entire forest for the distribution group members in the Marketing Worldwide distribution group.

```
Set-ADServerSettings -ViewEntireForest $true
Get-DistributionGroupMember -Identity "Marketing Worldwide"
```

Detailed Description

If your organization has multiple Active Directory domains, you may need to run the **Set-ADServerSettings** cmdlet with the *ViewEntireForest* parameter set to `$true` before running the **Get-DistributionGroupMember** cmdlet to view the entire forest. For more information, see EXAMPLE 2.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupMemberIdParameter	The *Identity* parameter specifies the identity of the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)`

			Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see

			Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController*

			parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *Credential* parameter.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary

			to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of members returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DistributionGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-DistributionGroupMember** cmdlet to remove an existing recipient from a distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DistributionGroupMember -Identity <DistributionGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Member
<GeneralRecipientIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes Jan Dryml from the distribution group Technical Support.

```
Remove-DistributionGroupMember -Identity "Technical
Support" -Member "Jan Dryml"
```

Detailed Description

The **Remove-DistributionGroupMember** cmdlet removes an existing recipient from a distribution group or a mail-enabled security group. You can't use the **Remove-DistributionGroupMember** cmdlet to remove a recipient from a dynamic distribution group. A dynamic distribution group queries Active Directory mail-enabled objects and builds the group's membership based on the results. The group's membership is recalculated whenever an email message is sent to the group.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the distribution group that you want to modify. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name`

			(DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* parameter specifies whether to bypass security checks and moderation for the member being added, if the specified distribution group is a moderated distribution group.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Member	Optional	Microsoft.Exchange.Configuration.Tasks.GeneralRecipientIdParameter	The *Member* parameter specifies the recipient that you want to remove from the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips

			• `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-DistributionGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Update-DistributionGroupMember** cmdlet to update a member of a specified distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-DistributionGroupMember -Identity <DistributionGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Members
<MultiValuedProperty>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates John's membership in the distribution group Research Reports.

```
Update-DistributionGroupMember -Identity "Research Reports"
-Members john@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DistributionGroupIdParameter	The *Identity* parameter specifies the identity of the distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.c

			om • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* parameter specifies whether to bypass security checks and moderation for the member being added, if the specified distribution group is a moderated distribution group.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-

			premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Members	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Members* parameter specifies the recipient or Active Directory user to update as a member of the distribution group. To specify a recipient, you can use any of the following values: This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID`

			Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com To specify an Active Directory user, you can choose from this subset of the values: • `Distinquished Name (DN)` • `Domain\Account` • `GUID` • `User Principal Name (UPN)` Separate multiple users with a comma, for example, `"contoso\ayla","contoso\tony"`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DynamicDistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-DynamicDistributionGroup** cmdlet to retrieve the settings on an existing dynamic distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DynamicDistributionGroup [-ManagedBy <GeneralRecipientIdParameter>]
<COMMON PARAMETERS>

Get-DynamicDistributionGroup [-Anr <String>] <COMMON PARAMETERS>

Get-DynamicDistributionGroup [-Identity <DynamicGroupIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
```

```
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example retrieves the dynamic distribution group Marketing and pipes the object to the **Format-List** command to display the information about the dynamic distribution group.

```
Get-DynamicDistributionGroup -Identity "Marketing" |
Format-List
```

EXAMPLE 2

This example retrieves all dynamic distribution groups that contain the string "research" and pipes the object to the **Format-Table** command to display the dynamic distribution group names and who they're managed by.

```
Get-DynamicDistributionGroup -Anr *research* | Format-Table
Name, ManagedBy
```

Detailed Description

You can use distribution groups to create email distribution lists and security groups to assign permissions to shared resources. Distribution groups can be used only with email applications (such as Microsoft Exchange) to send email messages to collections of users. You can use the **Get-DynamicDistributionGroup** cmdlet to retrieve the settings on an existing dynamic distribution group in Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Dynamic distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParamet	This parameter is reserved for internal Microsoft use.

		er	
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DynamicGroupIdParameter	The *Identity* parameter specifies the dynamic distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account`

			Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default

			scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
ManagedBy	Optional	Microsoft.Exchange.Configuration.Tasks.GeneralRecipientIdParameter	The *ManagedBy* parameter specifies the name of the mailbox user, mail-enabled group, or mail-enabled contact that appears in the **Managed by** tab of the Active Directory object. This parameter accepts the following values:

			• Alias Example: JPhillips • Canonical DN Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • Display Name Example: Jeff Phillips • Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • Domain\Account Example: Atlanta\JPhillips • GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter limits results to a specific organizational unit (OU) container.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest and don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of recipient

			objects returned.
SortBy	Optional	System.String	The *SortBy* parameter is used to sort the results.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-DynamicDistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-DynamicDistributionGroup** cmdlet to create a dynamic distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-DynamicDistributionGroup -RecipientFilter <String> <COMMON PARAMETERS>

New-DynamicDistributionGroup -IncludedRecipients <None | MailboxUsers |
Resources | MailContacts | MailGroups | MailUsers | AllRecipients> [-

[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the dynamic distribution group Marketing Group in the Users container in the contoso.com domain. The Marketing Group dynamic distribution group contains all mailbox users or mail-enabled contacts found anywhere in the contoso.com domain who have a **Department** field that equals the strings "Marketing" or "Sales".

```
New-DynamicDistributionGroup -Name "Marketing Group" -Alias
"Marketing_Group" -IncludedRecipients
"MailboxUsers,MailContacts" -OrganizationalUnit
"contoso.com/Users" -ConditionalDepartment
"Marketing","Sales" -RecipientContainer "contoso.com"
```

EXAMPLE 2

This example uses the *RecipientFilter* parameter to create the dynamic distribution group Pacific Northwest in the Users container in the contoso.com domain. The Pacific Northwest dynamic distribution group contains all mailbox users found anywhere in the contoso.com domain who have a **State/Province** field that equals "Washington" or "Oregon".

```
New-DynamicDistributionGroup -Name "Pacific Northwest" -
Alias "Pacific_Northwest" -OrganizationalUnit "contoso.com/
Users" -RecipientFilter {((RecipientType -eq 'UserMailbox')
-and ((StateOrProvince -eq 'Washington' -or StateOrProvince
-eq 'Oregon')))} -RecipientContainer "contoso.com"
```

Detailed Description

A dynamic distribution group queries Active Directory mail-enabled objects and builds the group membership based on the results. The group membership is recalculated whenever an email message is sent to the group. The query filters provided with Microsoft Exchange are limited to any combination of the following parameters:

- *ConditionalCompany*

- *ConditionalCustomAttribute N* (where *N* is a value from 1 through 15)
- *ConditionalDepartment*
- *ConditionalStateOrProvince*
- *IncludedRecipients*

You can also create any custom query using the *RecipientFilter* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Dynamic distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
IncludedRecipients	Required	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter filters the recipient types used to build the dynamic distribution group. The *IncludedRecipients* parameter can't be used if the *RecipientFilter* parameter is specified. You can use the following values: • `AllRecipients` • `MailboxUsers` • `Resources` • `MailContacts` • `MailGroups` • `MailUsers` • `None` `AllRecipients` can be used only by itself. When multiple values in the *IncludedRecipients* parameter are separated by commas, the **OR** Boolean operator is applied.

Name	Required	System.String	The *Name* parameter specifies the name of the dynamic distribution group. If the *DisplayName* parameter isn't specified, the value of the *Name* parameter is also used for the *DisplayName* parameter. The *Name* parameter value can't exceed 64 characters. If the values of the *Name* and *DisplayName* parameters are different: • The *Name* parameter specifies the dynamic distribution group name in Active Directory Users and Computers. • The *DisplayName* parameter specifies the dynamic distribution group name in the Exchange Administration Center and in the Exchange global address list (GAL).
RecipientFilter	Required	System.String	The *RecipientFilter* parameter filters the mail-enabled recipients used to

			build the dynamic distribution group. The *RecipientFilter* parameter can't be used if any of the following parameters are specified: • *IncludedRecipients* • *ConditionalCompany* • *ConditionalCustomAttribute N* (where *N* is a value from 1 through 15) • *ConditionalDepartment* • *ConditionalStateOrProvince* The *RecipientFilter* parameter uses `OPath` syntax to query Active Directory and filter recipients.
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the dynamic distribution group. The value of the *Alias* parameter is used to generate the primary SMTP email address for the dynamic distribution group. The value of the *Alias* parameter can't contain spaces. If the *Alias* parameter isn't specified,

			the value of the *Name* parameter is used for the value of the *Alias* parameter, with any spaces in the *Name* parameter converted to underscore characters (_).
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process.
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter filters the mailbox users or mail-enabled contacts used to build the dynamic distribution group. When multiple values of the *ConditionalCompany* parameter are separated by commas, the **OR** Boolean operator is applied.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify

			filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter.

			You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribu*

			te1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAtt	Optional	Microsoft.Exchange.Da	The

ribute14		ta.MultiValuedProperty	*ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in

			this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify

			filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter.

			You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribu*

			te1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAtt	Optional	Microsoft.Exchange.Da	The

ribute8		ta.MultiValuedProperty	*ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in

			this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter filters the mailbox users or mail-enabled contacts used to build the dynamic distribution group. The *ConditionalDepartment* parameter can't be used if the *RecipientFilter* parameter is specified. When multiple values of the *ConditionalDepartment* parameter are separated by commas, the **OR** Boolean operator is applied.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter filters mailbox users or mail-enabled contacts used to build the dynamic distribution group. The

			ConditionalStateOrProvince parameter can't be used if the *RecipientFilter* parameter is specified. When multiple values of the *ConditionalStateOrProvince* parameter are separated by commas, the **OR** Boolean operator is applied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name of the dynamic distribution group in the Exchange Administration Center and in the Exchange GAL. If the *DisplayName* parameter isn't specified, the value of the *Name* parameter is used for the *DisplayName*

			parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalDirectoryObjectId	Optional	System.String	This parameter is reserved for internal Microsoft use.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to this dynamic distribution group. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the

			dynamic distribution group. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies where to create the dynamic distribution group in Active Directory by using canonical name syntax.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary return SMTP email address for the dynamic distribution group. This parameter has meaning only if the dynamic distribution group has multiple SMTP email addresses.

RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the dynamic distribution group based on their location in Active Directory. The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If you don't specify a value for the *RecipientContainer* parameter, the cmdlet will default to use the local container. This location is specified by using the *OrganizationalUnit* parameter.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated dynamic distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never`

			If you want notifications to be sent to all senders, set this parameter to `Always`. If you want notifications to be sent only to the senders internal to your organization, set this parameter to `Internal`. To disable all status notifications, set this parameter to `Never`. **Note:** Senders are always notified if their message is rejected by the moderators, regardless of the value of this parameter. The default value is `Never`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DynamicDistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-DynamicDistributionGroup** cmdlet to delete an existing dynamic distribution group. This cmdlet removes the dynamic distribution group from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DynamicDistributionGroup -Identity <DynamicGroupIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
IgnoreDefaultScope <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the dynamic distribution group Test Users.

```
Remove-DynamicDistributionGroup -Identity "Test Users"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Dynamic distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DynamicGroupIdParameter	The *Identity* parameter specifies the dynamic distribution group that you want to remove. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips

			• `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the

			default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DynamicDistributionGroup

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-DynamicDistributionGroup** cmdlet to modify the settings of an existing dynamic distribution group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DynamicDistributionGroup -Identity <DynamicGroupIdParameter> [-
AcceptMessagesOnlyFrom <MultiValuedProperty>] [-
AcceptMessagesOnlyFromDLMembers <MultiValuedProperty>] [-
AcceptMessagesOnlyFromSendersOrMembers <MultiValuedProperty>] [-Alias

[-WindowsEmailAddress <SmtpAddress>]
```

Examples

EXAMPLE 1

This example applies the following changes to the existing dynamic distribution group Developers:

- Change the `ConditionalCompany` query filter to `Contoso`.
- Change the `IncludedRecipients` query filter to `MailboxUsers`.
- Add the value `Internal` to the `ConditionalCustomAttribute1` attribute.

```
Set-DynamicDistributionGroup -Identity "Developers" -
ConditionalCompany "Contoso" -IncludedRecipients
MailboxUsers -ConditionalCustomAttribute1 "Internal"
```

Detailed Description

A dynamic distribution group queries Active Directory mail-enabled objects and builds the group membership based on the results. The group membership is recalculated whenever an email message is sent to a group. You can use the **Set-DynamicDistributionGroup** cmdlet to overwrite existing settings or to add new settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Dynamic distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DynamicGroupIdParameter	The *Identity* parameter specifies the object that you want to modify. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/

			ou=AdministrativeGroup/ cn=Recipients/ cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AcceptMessagesOnlyFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFrom* parameter specifies the mailbox users, mail users, and mail contacts that can send email messages to this dynamic distribution group. You can also specify Microsoft Exchange as a valid recipient for this parameter. If you configure a dynamic distribution group to accept messages only from the Microsoft Exchange recipient, the dynamic distribution group only receives system-generated messages. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN`

			Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, this parameter is blank, which enables the dynamic distribution group to accept messages from all senders.

AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this dynamic distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/

			cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, this parameter is blank, which enables the dynamic distribution group to accept messages from all senders.
AcceptMessagesOnlyFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromSendersOrMembers* parameter specifies the recipients who can send email messages to this dynamic distribution group. You can specify users, contacts, or distribution groups. If you specify a distribution group, messages are accepted from all recipients that are members of that distribution group. You can also specify Microsoft Exchange as a valid recipient for this parameter. If you configure a distribution group to accept messages

			only from the Microsoft Exchange recipient, the dynamic distribution group only receives system-generated messages. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address`

			Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to accept messages from all senders. This parameter can't be used in conjunction with the *AcceptMessagesOnlyFrom* or *AcceptMessagesOnlyFromDLMembers* parameters.
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the object. The value of the *Alias* parameter can't contain spaces.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process. This parameter accepts the following values: • `Alias`

			Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassModerationFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassModerationFromSendersOrMembers* parameter specifies the list of senders for whom

			moderation is bypassed. You can specify users or distribution groups. If you specify a distribution group, the moderation is bypassed for all recipients that are members of that distribution group. Separate multiple values with a comma. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN`

			Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter filters the mailbox users or mail-enabled contacts used to build the dynamic distribution group. When multiple values of the *ConditionalCompany* parameter are separated by commas, the **OR** Boolean operator is applied. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients'

			custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this

			parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all

			included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ConditionalCustomAttribu*

		y	*te1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use

			the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients'

			custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this

			parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all

			included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ConditionalCustomAttribu*

		y	*te1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use

			the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter filters the mailbox users or mail-enabled contacts used to build the dynamic distribution group. When multiple values of the *ConditionalDepartment* parameter are separated by commas, the **OR** Boolean operator is applied. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter filters the mailbox users or mail-enabled contacts used to build the dynamic

			distribution group. When multiple values of the *ConditionalStateOrProvince* parameter are separated by commas, the **OR** Boolean operator is applied. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual-tone multiple-frequency (DTMF) map be created for the dynamic distribution group.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to

			CustomAttribute15 parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can

			use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.

CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify

			custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name of the distribution group in the Exchange Administration Center and in the Exchange global address list (GAL).
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollec	The *EmailAddresses* parameter specifies the

		tion	email addresses of the distribution group. All Microsoft Exchange email address types are valid. You can specify multiple values for the *EmailAddresses* parameter. Separate multiple values by using commas. **Important:** Exchange doesn't validate custom addresses for proper formatting. You must ensure that the custom address you specify complies with the format requirements for that address type. Because X.400 addresses are considered custom addresses in Exchange, they also aren't validated and you must provide the correct syntax when specifying an X.400 address.
EmailAddressPolicyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *EmailAddressPolicyEnabled* parameter specifies the application of email address policies to this dynamic distribution group. Valid values are

			`$true` or `$false`. The default value is `$true`. By default, all applicable email address policies are applied to this distribution group.
ExpansionServer	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *ExpansionServer* parameter specifies the Exchange server used to expand the distribution group. Enter the expansion server as a `Legacy Exchange DN` value. The default behavior is to use the closest Exchange server that has the Mailbox server role installed.
ExtensionCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute*

			parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ExtensionCustomAttribute*

		y	*1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information

			about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* parameter specifies whether to suppress the following confirmation: "To save changes on

			object, the object must be upgraded to the current Exchange version. After upgrade, this object cannot be managed by a previous version of Exchange System Manager. Do you want to continue to upgrade and save the object?" This confirmation occurs when you upgrade a dynamic distribution group that was created in Microsoft Exchange Server 2003. You can't manage an Exchange 2003 dynamic distribution group by using the Exchange Administration Center until you update the object's version and change the recipient filter by using either the *RecipientFilter* or *IncludedRecipients* parameters.
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies a mailbox user who can send on behalf of this dynamic distribution

			group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com

			By default, the *GrantSendOnBehalfTo* parameter is blank, which means that no other mailbox user has permission to send on behalf of this distribution group.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether to hide the distribution group from any Exchange address lists. Valid values are `$true` or `$false`. The default value is `$false`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default

			scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IncludedRecipients	Optional	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter filters the recipient types used to build the dynamic distribution group. The available values for the *IncludedRecipients* parameter are: • `None` • `AllRecipients` • `MailboxUsers` • `Resources` • `MailContacts` • `MailUsers` • `MailGroups` The `AllRecipients` value can be used only by itself. When multiple values of

			the *IncludedRecipients* parameter are separated by commas, the **OR** Boolean operator is applied.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message displayed to senders when they start drafting an email message to this dynamic distribution group. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *MailTipTranslations* parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each language, you must provide the locale, followed by a colon and the specific *MailTip* parameter message in that language. Each *MailTip* parameter message must be less than or equal to 250

			characters. Multiple languages can be separated by commas.
ManagedBy	Optional	Microsoft.Exchange.Configuration.Tasks.GeneralRecipientIdParameter	The *ManagedBy* parameter specifies the name of the mailbox user, mail-enabled group, or mail-enabled contact that appears on the **Managed by** tab of the Active Directory object. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.c

			om • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com **Note:** Don't set this parameter to be managed by a recipient that's not mail-enabled because, if you try to edit this dynamic distribution group at a later time, you'll receive an error message stating that the object couldn't be found.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum allowed email message size that can be sent to this distribution group. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes)

			• `TB` (terabytes) Unqualified values are treated as bytes. Valid values are from 0 through 2147482624 bytes. By default, the *MaxReceiveSize* parameter is set to `unlimited`.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxSendSize* parameter specifies the maximum allowed email message size that can be sent from this distribution group. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. Valid values are from 0 through 2147482624 bytes. By default, the *MaxSendSize* parameter is set to `unlimited`.

ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to this dynamic distribution group. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there's a user who's already specified as the manager of this mailbox, the *ModeratedBy* parameter is automatically set by the *ManagedBy* parameter of the mailbox. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the dynamic distribution group. To enable moderation, set this parameter to `$true`. To disable moderation, set

			this parameter to `$false`. The default value is `$false`.
Name	Optional	System.String	The *Name* parameter specifies the name of the dynamic distribution group. The *Name* parameter specifies the distribution group name in Active Directory Users and Computers.
Notes	Optional	System.String	The *Notes* parameter specifies comments about the distribution group.
PhoneticDisplayName	Optional	System.String	The *PhoneticDisplayName* parameter specifies a phonetic pronunciation of the *DisplayName* parameter. The maximum length of this parameter value is 255 characters.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary return SMTP email address for the distribution group. This parameter has meaning only if the distribution group has multiple SMTP

			email addresses.
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the dynamic distribution group based on their location in Active Directory. The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If a value for the *RecipientContainer* parameter isn't specified, the cmdlet will default to use the local container.
RecipientFilter	Optional	System.String	The *RecipientFilter* parameter filters the mail-enabled recipients used to build the dynamic distribution group. The *RecipientFilter* parameter can't be used if any of the following parameters are specified: • *IncludedRecipients* • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* The *RecipientFilter*

			parameter uses `OPath` syntax to query Active Directory and filter recipients. The *RecipientFilter* parameter can use any combination of the following object types as filters: • `RecipientType` • `ConditionalCompany` • `ConditionalDepartment` • `ConditionalStateOrProvince`
RejectMessagesFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFrom* parameter specifies mailbox users and mail-enabled contacts that aren't allowed to send email messages to this distribution group. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account`

			Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, this parameter is blank, which enables the distribution group to accept messages from all mailbox users and all mail-enabled contacts.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies the distribution groups who aren't allowed to send email messages to the distribution group. This parameter accepts the following values:

			• Alias Example: JPhillips • Canonical DN Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • Display Name Example: Jeff Phillips • Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • Domain\Account Example: Atlanta\JPhillips • GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com By default, this parameter is blank, which enables the distribution group to accept messages from all

			distribution groups.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromSendersOrMembers* parameter specifies the recipients who aren't allowed to send email messages to this distribution group. You can specify users, contacts, or distribution groups. If you specify a distribution group, messages from any recipient that's a member of that distribution group is rejected. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-

			4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com By default, the value of this parameter is blank, which enables the distribution group to accept messages from all senders.
ReportToManagerEnabled	Optional	System.Boolean	The *ReportToManagerEnabled* parameter specifies whether to enable delivery reports to be sent to the distribution group manager. Valid values are `$true` or `$false`. The default value is `$false`.
ReportToOriginatorEnabled	Optional	System.Boolean	The *ReportToOriginatorEnable*

			d parameter specifies whether to enable delivery reports to be sent to the sender of email messages that are sent to this distribution group. Valid values are `$true` or `$false`. The default value is `$true`.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether to require email message delivery from authenticated senders. Valid values are `$true` or `$false`. The default value is `$true`. If the value is `$true`, messages are accepted only from authenticated senders.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when a message they sent to the moderated distribution group is rejected by one of the moderators. You

			can specify one of the following values: • `Always` • `Internal` • `Never` If you want notifications to be sent to all senders, set this parameter to `Always`. If you want notifications to be sent to only the senders that are internal to your organization, set this parameter to `Internal`. To disable all status notifications, set this parameter to `Never`. The default value is `Never`.
SendOofMessageToOriginatorEnabled	Optional	System.Boolean	The *SendOofMessageToOriginatorEnabled* parameter specifies whether to enable out-of-office messages to be delivered to the sender of email messages that are sent to this distribution group. Valid values are `$true` or `$false`. The default value is `$false`.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName*

			parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the Unified Messaging (UM)-enabled dynamic distribution group.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress*

			parameter specifies the value of the **E-mail** field of the Active Directory object.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-Group

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-Group** cmdlet to query for existing groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-Group [-Anr <String>] <COMMON PARAMETERS>

Get-Group [-Identity <GroupIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-RecipientTypeDetails <RecipientTypeDetails[]>] [-
ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example uses the **Get-Group** cmdlet without parameters to return all of the groups in Active Directory.

```
Get-Group
```

EXAMPLE 2

This example uses the *Identity* parameter to return the group Marketing Reports.

```
Get-Group -Identity "Marketing Reports"
```

EXAMPLE 3

This example uses the *Anr* parameter to return all groups that begin with "Mar".

```
Get-Group -Anr Mar*
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an

			attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the account used to read Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

			The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *Identity* parameter specifies the identity of the distribution group object. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)`

			Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This

			allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.Orga	The *OrganizationalUnit* parameter specifies an

		nizationalUnitIdParameter	organizational unit (OU) and is used to limit the results.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Microsoft Exchange.
RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientTypeDetails[]	The *RecipientTypeDetails* parameter specifies the type of recipients

			returned. Recipient types are divided into recipient types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type UserMailbox represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each mailbox type is identified by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to ConferenceRoomMailbox, whereas a user mailbox has *RecipientTypeDetails* set to UserMailbox. You can select from the following values: • `ArbitrationMailbox` • `ConferenceRoomMailbox` • `Contact` • `DiscoveryMailbox` • `DynamicDistributionGroup` • `EquipmentMailbox` • `ExternalManagedContact` • `ExternalManagedDistributionGroup` • `LegacyMailbox` • `LinkedMailbox` • `MailboxPlan` • `MailContact`

			• MailForestContact • MailNonUniversalGroup • MailUniversalDistributionGroup • MailUniversalSecurityGroup • MailUser • PublicFolder • RoleGroup • RoomList • RoomMailbox • SharedMailbox • SystemAttendantMailbox • SystemMailbox • User • UserMailbox
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of members returned.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute to sort by.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-Group

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-Group** cmdlet to modify group object settings visible in Active Directory Users and Computers. If the group is a mail-enabled security group or a distribution group, you can use the **Set-DistributionGroup** cmdlet to modify other Microsoft Exchange settings that aren't available by using the **Set-Group** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-Group -Identity <GroupIdParameter> <COMMON PARAMETERS>

Set-Group -Identity <GroupIdParameter> [-Universal <SwitchParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-BypassSecurityGroupManagerCheck <SwitchParameter>] [-
Confirm [<SwitchParameter>]] [-DisplayName <String>] [-DomainController
<Fqdn>] [-IgnoreDefaultScope <SwitchParameter>] [-IsHierarchicalGroup
<$true | $false>] [-ManagedBy <GeneralRecipientIdParameter[]>] [-Name
<String>] [-Notes <String>] [-PhoneticDisplayName <String>] [-
SeniorityIndex <Int32>] [-SimpleDisplayName <String>] [-WhatIf
[<SwitchParameter>]] [-WindowsEmailAddress <SmtpAddress>]
```

Examples

EXAMPLE 1

This example applies the following changes to the existing global security group Legal Department:

- Change the group's scope to universal.
- Add a *Notes* parameter value of verified.

```
Set-Group -Identity "Legal Department" -Universal -Notes
"verified"
```

EXAMPLE 2

This example specifies that the group Human Resources is a hierarchical group and will display last within its hierarchy because its index number is 1.

```
Set-Group -Identity "Human Resources" -IsHierarchicalGroup
$true -SeniorityIndex 1
```

Detailed Description

You can't use the **Set-Group** cmdlet to modify dynamic distribution groups. To modify dynamic distribution groups, use the **Set-DynamicDistributionGroup** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Distribution groups" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GroupIdParameter	The *Identity* parameter specifies the object that you want to modify. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/

			cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* parameter specifies whether to bypass security checks and moderation if the specified group is a moderated distribution group.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name of the group in the Exchange Administration Center and in the Exchange global address

			list (GAL). This parameter has significance only if the group is mail-enabled.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope

			setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as GUID, aren't accepted.
IsHierarchicalGroup	Optional	System.Boolean	The *IsHierarchicalGroup* parameter specifies whether the group is part of a hierarchical address book. This parameter accepts `$true` or `$false`. The default value is `$false`.

ManagedBy	Optional	Microsoft.Exchange.Configuration.Tasks.GeneralRecipientIdParameter[]	The *ManagedBy* parameter specifies the name of the user, group, or contact that appears in the **Managed by** tab of the Active Directory object. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips

			• `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Name	Optional	System.String	The *Name* parameter specifies the name of the group. The *Name* parameter specifies the group name in Active Directory Users and Computers.
Notes	Optional	System.String	The *Notes* parameter specifies the notes that describe the purpose of the group.
PhoneticDisplayName	Optional	System.String	The *PhoneticDisplayName* parameter specifies a phonetic pronunciation of the *DisplayName* parameter. The maximum length of this parameter value is 255 characters.
SeniorityIndex	Optional	System.Int32	The *SeniorityIndex* parameter specifies the order in which this group will display in a hierarchical address book. A group with a value of 2 will display higher in an

			address book than a group with a value of 1.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively. The *SimpleDisplayName* parameter has meaning only for mail-enabled objects.
Universal	Optional	System.Management.Automation.SwitchParameter	The *Universal* parameter changes the scope of the group from `global` or `domain local` to `universal`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the value of the **E-mail** field of the Active Directory object.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-MailContact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-MailContact** cmdlet to remove the Exchange attributes of an existing mail-enabled contact in Active Directory. The contact object remains in Active Directory but is no longer mail-enabled.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-MailContact -Identity <MailContactIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mail-disables a contact.

```
Disable-MailContact -Identity EdMeadows
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailContactIdParameter	The *Identity* parameter specifies the mail contact. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID`

			Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.	The *IgnoreDefaultScope* parameter instructs the

		Automation.SwitchParameter	command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-MailContact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-MailContact** cmdlet to mail-enable an existing contact in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-MailContact -Identity <ContactIdParameter> -ExternalEmailAddress
<ProxyAddress> [-Alias <String>] [-Confirm [<SwitchParameter>]] [-
DisplayName <String>] [-DomainController <Fqdn>] [-MacAttachmentFormat
<BinHex | UuEncode | AppleSingle | AppleDouble>] [-MessageBodyFormat <Text
| Html | TextAndHtml>] [-MessageFormat <Text | Mime>] [-
OverridePrimarySmtpAddress <SmtpAddress>] [-UsePreferMessageFormat <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mail-enables an existing contact in Active Directory and provides the contact with the external email address roland@tailspintoys.com.

```
Enable-MailContact -Identity Roland -ExternalEmailAddress
"roland@tailspintoys.com"
```

Detailed Description

The **Enable-MailContact** cmdlet mail-enables an existing contact in Active Directory by adding the attributes required by Microsoft Exchange. The contact's identity, associated alias, and target email address are required to mail-enable a contact.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
ExternalEmailAddress	Required	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies the target email address.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ContactIdParameter	The *Identity* parameter specifies the identity of the contact. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example:

			CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the mail-enabled contact.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the contact's display name.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
MacAttachmentFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MacAttachmentFormat	The *MacAttachmentFormat* parameter specifies the Apple Macintosh operating system attachment format for messages sent to the mail contact. The valid values for this parameter are: • `BinHex` • `UuEncode` • `AppleSingle` • `AppleDouble` By default, this parameter is set to `BinHex`. The acceptable values for the *MacAttachmentFormat* parameter are dependent on the *MessageFormat* parameter. If the

			MessageFormat parameter is set to `Text`, you can only use `BinHex` or `UuEncode` values for this parameter. If the *MessageFormat* parameter is set to `Mime`, you can only use `BinHex`, `AppleSingle`, or `AppleDouble` values for this parameter.
MessageBodyFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageBodyFormat	The *MessageBodyFormat* parameter specifies the message body format for messages sent to the mail contact. The valid values for this parameter are: • `Text` • `Html` • `TextAndHtml` By default, this parameter is set to `TextAndHtml`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`,

			the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to set this parameter to `Html` or `TextAndHtml`, you must also set the *MessageFormat* parameter to `Mime`.
MessageFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageFormat	The *MessageFormat* parameter specifies the message format for messages sent to the mail contact. The valid values for this parameter are: • `Text` • `Mime` By default, this parameter is set to `Mime`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you

			want to change the *MessageFormat* parameter from `Mime` to `Text`, you must also change the *MessageBodyFormat* parameter to `Text`.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the *Reply to* address for the mail user. By default, the primary SMTP address is the same as the *ExternalEmailAddress* parameter value. We recommend that you don't set this parameter unless you're in a cross-forest scenario. If you want to set the primary SMTP address to be a different address from the external email address, you need to set the *EmailAddressPolicyEnabled* parameter to `$false` by using the **Set-MailContact** cmdlet, otherwise the mail user's

			primary SMTP address will use the *ExternalEmailAddress* parameter value, regardless of the value in the *PrimarySMTPAddress* parameter.
UsePreferMessageFormat	Optional	System.Boolean	The *UsePreferMessageFormat* parameter specifies whether the recipient-preferred message format settings override the global settings for mail sent to this user. When set to `$true`, this parameter specifies that the recipient-preferred message format settings override the global settings for mail sent to this user.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailContact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailContact** cmdlet to retrieve all of the specified contact attributes from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailContact [-Anr <String>] <COMMON PARAMETERS>

Get-MailContact [-Identity <MailContactIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-RecipientTypeDetails <RecipientTypeDetails[]>] [-
ResultSize <Unlimited>] [-SortBy <String>] [-UsnForReconciliationSearch
<Int64>]
```

Examples

EXAMPLE 1

This example retrieves the mail-enabled contact Arlene.

```
Get-MailContact -Identity Arlene | Format-List
```

Detailed Description

The **Get-MailContact** cmdlet retrieves all attributes of the specified contact. No parameters are required. If the cmdlet is run without a parameter, a complete list of contacts for the Exchange organization is returned.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**

Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the account to use to gain access to Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable

			properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailContactIdParameter	The *Identity* parameter identifies the contact. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com

			• `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't

			accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies a container in which to limit the results. Either an organizational unit (OU) or a domain can be specified. Also, the canonical name should be specified, for example: • OU: westcoast.contoso.com/users • Domain: westcoast.contoso.com
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain

			controller in the user's domain. If you set the recipient scope to include all recipients in the forest and you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers running Microsoft Exchange.
RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientTypeDetails[]	The *RecipientTypeDetails* parameter specifies the type of recipients returned. Recipient types are divided into recipient types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type UserMailbox represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each

			mailbox type is identified by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to ConferenceRoomMailbox, whereas a user mailbox has *RecipientTypeDetails* set to UserMailbox. You can select from the following values: • `ArbitrationMailbox` • `ConferenceRoomMailbox` • `Contact` • `DiscoveryMailbox` • `DynamicDistributionGroup` • `EquipmentMailbox` • `ExternalManagedContact` • `ExternalManagedDistributionGroup` • `LegacyMailbox` • `LinkedMailbox` • `MailboxPlan` • `MailContact` • `MailForestContact` • `MailNonUniversalGroup` • `MailUniversalDistributionGroup` • `MailUniversalSecurityGroup` • `MailUser` • `PublicFolder` • `RoleGroup` • `RoomList` • `RoomMailbox` • `SharedMailbox` • `SystemAttendantMailbox` • `SystemMailbox` • `User` • `UserMailbox`
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the total number

			of recipient objects to return. If not specified, the parameter returns all results that match the filter.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. Sorting is performed one attribute at a time and is always performed in ascending order.
UsnForReconciliationSearch	Optional	System.Int64	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailContact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MailContact** cmdlet to create a mail-enabled contact.

```
New-MailContact -ExternalEmailAddress <ProxyAddress> -Name <String> [-
Alias <String>] [-ArbitrationMailbox <MailboxIdParameter>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
ExternalDirectoryObjectId <String>] [-FirstName <String>] [-Initials
<String>] [-LastName <String>] [-MacAttachmentFormat <BinHex | UuEncode |
AppleSingle | AppleDouble>] [-MessageBodyFormat <Text | Html |
TextAndHtml>] [-MessageFormat <Text | Mime>] [-ModeratedBy
<MultiValuedProperty>] [-ModerationEnabled <$true | $false>] [-
Organization <OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-OverrideRecipientQuotas
<SwitchParameter>] [-PrimarySmtpAddress <SmtpAddress>] [-
SendModerationNotifications <Never | Internal | Always>] [-
UsePreferMessageFormat <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a mail-enabled contact using the required parameters and the *OrganizationalUnit* parameter.

```
New-MailContact -Name "Chris Ashton" -ExternalEmailAddress
"Chris@tailspintoys.com" -OrganizationalUnit "Marketing"
```

Detailed Description

The **New-MailContact** cmdlet creates a new mail contact object in Active Directory, and then mail-enables the mail contact.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
ExternalEmailAddress	Required	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies the target email address.
Name	Required	System.String	The *Name* parameter specifies the common name of the mail contact.

Alias	Optional	System.String	The *Alias* parameter specifies the alias of the mail contact.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name displayed in Microsoft Outlook for the mail contact.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalDirectoryObjectId	Optional	System.String	This parameter is reserved for internal Microsoft use.
FirstName	Optional	System.String	The *FirstName* parameter specifies the first name of the mail contact.
Initials	Optional	System.String	The *Initials* parameter specifies the initials of the mail contact.
LastName	Optional	System.String	The *LastName* parameter specifies the last name of the mail contact.
MacAttachmentFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MacAttachmentFormat	The *MacAttachmentFormat* parameter specifies the Apple Macintosh operating system attachment format for messages sent to the mail contact. The valid values for this parameter are: • `BinHex` • `UuEncode` • `AppleSingle` • `AppleDouble` By default, this parameter is set to `BinHex`.

			The acceptable values for the *MacAttachmentFormat* parameter are dependent on the *MessageFormat* parameter. If the *MessageFormat* parameter is set to `Text`, you can only use `BinHex` or `UuEncode` values for this parameter. If the *MessageFormat* parameter is set to `Mime`, you can only use `BinHex`, `AppleSingle`, or `AppleDouble` values for this parameter.
MessageBodyFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageBodyFormat	The *MessageBodyFormat* parameter specifies the message body format for messages sent to the mail contact. The valid values for this parameter are: • `Text` • `Html` • `TextAndHtml` By default, this parameter is set to `TextAndHtml`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat*

			parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to set this parameter to `Html` or `TextAndHtml`, you must also set the *MessageFormat* parameter to `Mime`.
MessageFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageFormat	The *MessageFormat* parameter specifies the message format for messages sent to the mail contact. The valid values for this parameter are: • `Text` • `Mime` By default, this parameter is set to `Mime`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to

			any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to change the *MessageFormat* parameter from `Mime` to `Text`, you must also change the *MessageBodyFormat* parameter to `Text`.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to this mailbox. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there's a user already specified as the manager of this mailbox, the *ModeratedBy* parameter is automatically set by the

			ManagedBy parameter of the mailbox. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter enables or disables moderation for the mailbox. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the organizational unit (OU) to which the new contact is added, for example, redmond.contoso.com/contacts.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress*

			parameter specifies the primary SMTP address for the mail contact. By default, the primary SMTP address is generated based on the default email address policy. If you specify a primary SMTP address by using this parameter, the command sets the **EmailAddressPolicyEnabled** attribute of the mail contact to `$false`, and the email addresses of this mail contact aren't automatically updated based on email address policies.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when a message they sent to the moderated distribution group is rejected by one of the moderators. You can specify one of the following values: • `Always` • `Internal` • `Never`

			Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent only to the senders internal to your organization. Set this parameter to `Never` to disable all status notifications. The default value is `Never`.
UsePreferMessageFormat	Optional	System.Boolean	The *UsePreferMessageFormat* parameter specifies whether recipient preferred message format settings are used. When set to `$true`, this parameter specifies that the recipient preferred message format settings override the global settings for mail sent to this user.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailContact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MailContact** cmdlet to delete an existing mail-enabled contact from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailContact -Identity <MailContactIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ForReconciliation
<SwitchParameter>] [-IgnoreDefaultScope <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mail-enabled contact John from Active Directory.

```
Remove-MailContact -Identity contoso.com/john
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailContactIdParameter	The *Identity* parameter specifies the identity of the mail contact. You can use the following values: • ADObjectID • Distinguished name (DN) • GUID • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ForReconciliation	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the

			following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailContact

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailContact** cmdlet to modify an existing mail-enabled contact in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailContact -Identity <MailContactIdParameter> [-
AcceptMessagesOnlyFrom <MultiValuedProperty>] [-
AcceptMessagesOnlyFromDLMembers <MultiValuedProperty>] [-
AcceptMessagesOnlyFromSendersOrMembers <MultiValuedProperty>] [-Alias
<String>] [-ArbitrationMailbox <MailboxIdParameter>] [-

```

Examples

EXAMPLE 1

This example sets John Rodman's external email address to john@contoso.com.

```
Set-MailContact -Identity "John Rodman" -
ExternalEmailAddress "john@contoso.com"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailContactIdParameter	The *Identity* parameter specifies the mail contact. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-

			5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AcceptMessagesOnlyFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFrom* parameter specifies the mailbox users, mail users, and mail contacts that can send email messages to this mail contact. You can also specify Microsoft Exchange as a valid recipient for this parameter. If you configure a mail contact to accept messages only from the Microsoft Exchange recipient, it only receives system-generated messages. You can use any of the following values for the

			valid senders: • DN • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail contact to accept messages from all senders.
AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this mail contact. You can use any of the following values for the allowed distribution groups: • DN • Canonical name • GUID • Name • Display name • Legacy Exchange DN

			• Primary SMTP email address By default, this parameter is blank. This default value enables the mail contact to accept messages from all senders.
AcceptMessagesOnlyFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromSendersOrMembers* parameter specifies the recipients who are allowed to send email messages to this mail contact. You can use any of the following values for the allowed distribution groups: • DN • Canonical name • GUID • Name • Display name • Legacy Exchange DN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail contact to accept messages from all senders.
Alias	Optional	System.String	The *Alias* parameter

			specifies the alias of the mail-enabled contact. An alias can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $ • % • ^ • & • * • + • - • . • / • = • ? • _ • { • } • | • ~
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process.
BypassModerationFro	Optional	Microsoft.Exchange.Da	The

mSendersOrMembers		ta.MultiValuedProperty	*BypassModerationFromSendersOrMembers* parameter specifies the recipients whose messages bypass moderation when sending to this mail contact. You can use any of the following values: • DN • Canonical name • GUID • Name • Display name • Legacy Exchange DN • Primary SMTP email address By default, this value is blank. This default value ensures that all messages are moderated when this mail contact is configured for moderation. Senders that are designated as moderators for this mail contact are allowed to send messages to this mail contact.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual tone multi-frequency (DTMF) map be created for the contact.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional

			information.
CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to

			CustomAttribute15 parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can

			use these attributes to store additional information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name of the user.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	The *EmailAddresses* parameter specifies the email address of the mail contact. All valid Microsoft Exchange email address types may be used. You can specify multiple values for the *EmailAddresses* parameter as a comma-delimited list. If you include multiple values, the first email address becomes the mail contact's primary SMTP email address. **Important:** Exchange doesn't validate custom addresses for proper formatting. You must ensure that the custom address you specify complies with the format requirements for that address type. Because X.400 addresses are considered custom addresses in Exchange, they aren't validated, and

			you must provide the correct syntax when specifying an X.400 address.
EmailAddressPolicyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *EmailAddressPolicyEnabled* parameter specifies whether the email addresses for the mailbox are automatically updated based on the email address policies defined.
ExtensionCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information

			about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list.

			Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.

ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExternalEmailAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies the external email address of the recipient.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* parameter suppresses the following confirmation: "To save changes on object <*object name*>, the object must be upgraded to the current Exchange

			version. After the upgrade, this object can't be managed by an earlier version of the Exchange management tools. Do you want to continue to upgrade and save the object?" This confirmation appears when you upgrade a mail contact that was created in Exchange Server 2003. You can't manage an Exchange 2003 mail contact by using the Exchange Administration Center until you update the object's version.
GenerateExternalDirectoryObjectId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies the DNs of recipients that can send messages on behalf of this contact.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether the contact appears in

			address lists. The possible values for this parameter are `$true` or `$false`. If the value is `$true`, the contact doesn't appear in the address list. The default value is `$false`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* switch tells the command to ignore the default recipient scope setting for the Exchange Management Shell session, and to use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently available in the default scope. Using the *IgnoreDefaultScope* switch introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an

			appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
MacAttachmentFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MacAttachmentFormat	The *MacAttachmentFormat* parameter specifies the Apple Macintosh operating system attachment format for messages sent to the mail contact. The valid values for this parameter are: • `BinHex` • `UuEncode` • `AppleSingle` • `AppleDouble` By default, this parameter is set to `BinHex`. The acceptable values for the *MacAttachmentFormat* parameter are dependent on the *MessageFormat* parameter. If the *MessageFormat* parameter is set to `Text`, you can only use `BinHex` or `UuEncode` values for

			this parameter. If the *MessageFormat* parameter is set to `Mime`, you can only use `BinHex`, `AppleSingle`, or `AppleDouble` values for this parameter.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message displayed to senders when they start drafting an email message to this recipient. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *MailTipTranslations* parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each language, you must provide the locale, followed by a colon and the specific *MailTip* parameter value in that language. Each *MailTip* parameter value must be less than or equal to 250

			characters. Multiple languages can be separated by commas.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum size of email messages that can be received, from 1 kilobyte (KB) to 2,097,151 KB. If a value isn't specified, the limit is set to the maximum value.
MaxRecipientPerMessage	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxRecipientPerMessage* parameter specifies the maximum number of recipients for messages from this mail contact.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxSendSize* parameter specifies the maximum size of email messages that can be

			sent, from 1 KB to 2,097,151 KB. If a value isn't specified, the limit is set to the maximum value.
MessageBodyFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageBodyFormat	The *MessageBodyFormat* parameter specifies the message body format for messages sent to the mail contact. The valid values for this parameter are: • `Text` • `Html` • `TextAndHtml` By default, this parameter is set to `TextAndHtml`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to set this parameter to `Html` or `TextAndHtml`, you must also set the

			MessageFormat parameter to `Mime`.
MessageFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageFormat	The *MessageFormat* parameter specifies the message format for messages sent to the mail contact. The valid values for this parameter are: • `Text` • `Mime` By default, this parameter is set to `Mime`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to change the *MessageFormat* parameter from `Mime` to `Text`, you must also change the *MessageBodyFormat*

			parameter to `Text`.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to the mail-enabled contact. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there is a user who is already specified as the manager of this distribution group, the *ModeratedBy* parameter is automatically set by the *ManagedBy* parameter of the mail-enabled contact. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the mail-enabled contact. The possible values for this parameter are `$true` or

			`$false`. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Name	Optional	System.String	The *Name* parameter specifies the name of the mail-enabled contact.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress* parameter specifies the primary SMTP email address.
RejectMessagesFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFrom* parameter specifies the recipients from which to reject messages. You can use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN

			• Primary SMTP email address By default, this parameter is blank. This default value enables the mail contact to accept messages from all senders.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies the distribution list members from which to reject messages. You can use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail contact to accept messages from all senders.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *RejectMessagesFromSend*

		y	*ersOrMembers* parameter specifies the recipients who aren't allowed to send email messages to this mail contact. You can use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank. This default value enables the mail contact to accept messages from all senders.
RemovePicture	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemovePicture* parameter specifies whether to remove the picture that a user has added to a mail contact. A picture file can be added to the mail contact by

			using the **Import-RecipientDataProperty** cmdlet.
RemoveSpokenName	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoveSpokenName* parameter specifies whether to remove the spoken name that a user has added to a mail contact. A sound file can be added to the mail contact by using the **Import-RecipientDataProperty** cmdlet.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether to accept messages only from authenticated recipients. The default value is `$false`.
SecondaryAddress	Optional	System.String	The *SecondaryAddress* parameter specifies the secondary address that's used by the Unified Messaging (UM)-enabled contact.

SecondaryDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *SecondaryDialPlan* parameter specifies a secondary UM dial plan to use. This parameter is provided to create a secondary proxy address.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never` Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent only to the senders internal to your organization. Set this parameter to `Never` to disable all status notifications.

			Note: The sender is always notified if the message is rejected by the moderators, regardless of the value of this parameter. The default value is `Never`.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the UM-enabled contact.
UseMapiRichTextFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.UseMapiRichTextFormat	The *UseMapiRichTextFormat* parameter specifies how messages in MAPI rich text format (RTF) are handled for this mail contact. Set this parameter to `Never` to convert all messages sent

			to this contact to plain text. Set this parameter to `Always` to always send messages to this contact in MAPI RTF. Set this parameter to `UseDefaultSettings` to have the format decided based on the setting configured in the MAPI client that sent the message.
UsePreferMessageFormat	Optional	System.Boolean	The *UsePreferMessageFormat* parameter specifies whether the message format settings configured for the mail contact override the global settings configured for the remote domain. The possible values for this parameter are `$true` or `$false`. Set this parameter to `$true` to have the message format settings configured for the mail contact to override any global settings. The default value is `$false`.
UserCertificate	Optional	Microsoft.Exchange.Data.MultiValuedPropert	This parameter is reserved for internal Microsoft use.

		y	
UserSMimeCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the Windows email address for this mailbox. This address isn't used by Exchange.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-MailUser

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-MailUser** cmdlet to mail-disable an existing user in Active Directory by removing the attributes used by Exchange.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-MailUser <COMMON PARAMETERS>

Disable-MailUser [-Archive <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <MailUserIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-IgnoreLegalHold <SwitchParameter>] [-
IncludeSoftDeletedObjects <SwitchParameter>] [-
PreventRecordingPreviousDatabase <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mail-disables an existing user.

```
Disable-MailUser markus@contoso.com
```

Detailed Description

The **Disable-MailUser** cmdlet mail-disables an existing user by removing the Active Directory Exchange Server attributes of the user. The user isn't deleted from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailUserIdParameter	The *Identity* parameter specifies the identity of the mail user object. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example:

			JPhillips@contoso.com
Archive	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory

			objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IgnoreLegalHold	Optional	System.Management.Automation.SwitchParameter	The *IgnoreLegalHold* switch ignores the legal hold status of the mail user and allows you to disable the cloud-based mailbox on legal hold. **⚠Warning:** When you disable a mailbox, the mailbox is disconnected from the user account. After you disable a mailbox, you can't include it in a discovery search. Disconnected mailboxes are permanently deleted from the mailbox

			database after the deleted mailbox retention period expires. Check with your organization's legal or Human Resources department before disabling a mailbox on legal hold.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PreventRecordingPreviousDatabase	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-MailUser

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-MailUser** cmdlet to mail-enable an existing user in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-MailUser -ExternalEmailAddress <ProxyAddress> [-MacAttachmentFormat
<BinHex | UuEncode | AppleSingle | AppleDouble>] [-MessageBodyFormat <Text
| Html | TextAndHtml>] [-MessageFormat <Text | Mime>] [-UsageLocation
<CountryInfo>] [-UsePreferMessageFormat <$true | $false>] <COMMON
PARAMETERS>

Enable-MailUser -ArchiveGuid <Guid> [-Archive <SwitchParameter>] [-
ArchiveName <MultiValuedProperty>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <UserIdParameter> [-AddOnSKUCapability
<MultiValuedProperty>] [-Alias <String>] [-BypassModerationCheck
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DisplayName <String>]
[-DomainController <Fqdn>] [-IncludeSoftDeletedObjects <SwitchParameter>]
[-JournalArchiveAddress <SmtpAddress>] [-OverrideRecipientQuotas
<SwitchParameter>] [-PreserveEmailAddresses <SwitchParameter>] [-
PrimarySmtpAddress <SmtpAddress>] [-SKUAssigned <$true | $false>] [-

```

Examples

EXAMPLE 1

This example mail-enables user John with the external email address john@contoso.com.

```
Enable-MailUser -Identity John -ExternalEmailAddress
```

```
john@contoso.com
```

Detailed Description

The **Enable-MailUser** cmdlet mail-enables an existing user in Active Directory by adding the attributes required by Microsoft Exchange. The user's identity and an external email address are required. Mail-enabled users have an email address at the Exchange organization (for example, john@contoso.com), but they don't have an Exchange mailbox. Email messages addressed to the mail-enabled user are sent instead to the specified external email address.

Note:
To create a user who is mail-enabled at the time of creation, use the **New-MailUser** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
ArchiveGuid	Required	System.Guid	This parameter is reserved for internal Microsoft use.
ExternalEmailAddress	Required	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies an email address outside the organization. Email messages sent to the mail-enabled user are sent to this external address.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *Identity* parameter specifies the identity of the mail user object. This parameter accepts the following values: • `Alias`

			Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AddOnSKUCapability	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
Alias	Optional	System.String	The *Alias* parameter

			specifies the alias of the user. An alias can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $ • % • ^ • & • * • + • - • . • / • = • ? • _ • { • } • | • ~
Archive	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ArchiveName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
BypassModerationCheck	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name for the mail user. The *DisplayName* parameter is the name that appears in the Exchange Administration Center.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
JournalArchiveAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is reserved for internal Microsoft use.

MacAttachmentFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MacAttachmentFormat	The *MacAttachmentFormat* parameter specifies the Apple Macintosh operating system attachment format for messages sent to the mail user. The valid values for this parameter are: • `BinHex` • `UuEncode` • `AppleSingle` • `AppleDouble` By default, this parameter is set to `BinHex`. The acceptable values for the *MacAttachmentFormat* parameter are dependent on the *MessageFormat* parameter. If the *MessageFormat* parameter is set to `Text`, you can only use `BinHex` or `UuEncode` values for this parameter. If the *MessageFormat* parameter is set to `Mime`, you can only use `BinHex`, `AppleSingle`, or `AppleDouble` values for this parameter.
MessageBodyFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.	The *MessageBodyFormat* parameter specifies the

		MessageBodyFormat	message body format for messages sent to the mail user. The valid values for this parameter are: • `Text` • `Html` • `TextAndHtml` By default, this parameter is set to `TextAndHtml`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to set this parameter to `Html` or `TextAndHtml`, you must also set the *MessageFormat* parameter to `Mime`.
MessageFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageFormat	The *MessageFormat* parameter specifies the message format for messages sent to the mail user.

			The valid values for this parameter are: • `Text` • `Mime` By default, this parameter is set to `Mime`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to change the *MessageFormat* parameter from `Mime` to `Text`, you must also change the *MessageBodyFormat* parameter to `Text`.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PreserveEmailAddresses	Optional	System.Management.Automation.SwitchPar	This parameter is reserved for internal Microsoft use.

		ameter	
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the *Reply to* address for the mail user. By default, the primary SMTP address is the same as the *ExternalEmailAddress* parameter value. We recommend that you don't set this parameter unless you're in a cross-forest scenario. If you want to set the primary SMTP address to be a different address from the external email address, you need to set the *EmailAddressPolicyEnabled* parameter to `$false` by using the **Set-MailUser** cmdlet, otherwise the mail user's primary SMTP address will use the *ExternalEmailAddress* parameter value regardless of the value in the *PrimarySmtpAddress* parameter.
SKUAssigned	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

SKUCapability	Optional	Microsoft.Exchange.Data.Directory.Capability	This parameter is reserved for internal Microsoft use.
UsageLocation	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	This parameter is reserved for internal Microsoft use.
UsePreferMessageFormat	Optional	System.Boolean	The *UsePreferMessageFormat* parameter specifies whether the message format settings configured for the mailbox override the global settings configured for the domain. Set this parameter to `$true` to have the message format settings configured for the mailbox to override any global settings.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailUser

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailUser** cmdlet to retrieve the specified user's mail-related attributes from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailUser [-ArchiveDatabase <DatabaseIdParameter>] <COMMON PARAMETERS>

Get-MailUser [-Anr <String>] <COMMON PARAMETERS>

Get-MailUser [-Identity <MailUserIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-SoftDeletedMailUser
<SwitchParameter>] [-SortBy <String>] [-UsnForReconciliationSearch
<Int64>]
```

Examples

EXAMPLE 1

This example retrieves a complete list of mail-enabled users for the entire Exchange organization.

```
Get-MailUser
```

EXAMPLE 2

This example retrieves the settings for the mail user named Ed, and then the command is piped to the **Format-List** cmdlet for display.

```
Get-MailUser -Identity Ed | Format-List
```

Detailed Description

The **Get-MailUser** cmdlet retrieves all mail-related attributes of the specified user.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName**

			• **LastName** • **Alias**
ArchiveDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is reserved for internal Microsoft use.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the account to use to gain access to Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter

			indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailUserIdParameter	The *Identity* parameter identifies the user. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/

			ou=AdministrativeGroup/ cn=Recipients/ cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management. Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server

			automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies a container in which to limit the results. You can specify either an organizational unit (OU) or a domain. The canonical name should be specified, for example: • OU: westcoast.contoso.com/users • Domain: westcoast.contoso.com
ReadFromDomainController	Optional	System.Management.Automation.SwitchPar	This parameter is available only in on-

		ameter	premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest and don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of recipient objects to return. If not specified, the parameter returns all results that match the filter.
SoftDeletedMailUser	Optional	System.Management.Automation.SwitchPar	This parameter is reserved for internal Microsoft use.

		ameter	
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. Sorting is performed one attribute at a time and is always performed in ascending order.
UsnForReconciliationSearch	Optional	System.Int64	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailUser

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MailUser** cmdlet to create a mail-enabled user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailUser -ExternalEmailAddress <ProxyAddress> [-MacAttachmentFormat

```

Examples

EXAMPLE 1

This example consists of two commands.

In the first command, the password *$password* of the type System.Security.SecureString is created. When the command is executed, the prompt "Enter password" is displayed. The string entered by the user becomes the new password string, *$password*.

The second command creates the mail-enabled user object Ed Meadows and assigns the newly created password to the object by means of the *Password* parameter. Ed is an employee at Tailspin Toys, but because he works closely with employees at Contoso, Ltd, he's being given an email address at contoso.com. Ed doesn't have a mailbox on the server running Exchange at Contoso. Email messages sent to Ed's contoso.com email address are sent to his external email address, Ed@tailspintoys.com.

```
$password = Read-Host "Enter password" -AsSecureString
New-MailUser -Name "Ed Meadows" -Password $password -
ExternalEmailAddress ed@tailspintoys.com -UserPrincipalName
ed@contoso.com -OrganizationalUnit contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
ExternalEmailAddress	Required	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies an email address outside of the organization. Email messages sent to the mail-enabled user are sent to this external address.

FederatedIdentity	Required	System.String	This parameter is available only in the cloud-based service. The *FederatedIdentity* parameter associates an on-premises Active Directory user with a user in the cloud.
ImportLiveId	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *ImportLiveID* parameter imports an unmanaged Microsoft account (formerly known as a Windows Live ID) into the cloud-based domain. An unmanaged Microsoft account was created in the domain before the domain was enrolled in the cloud-based service. Importing a Microsoft account into the domain lets you save any settings associated with the Microsoft account, like instant messaging contacts. However, the Microsoft account is now subject to the security and privacy policies of the

			organization.
MicrosoftOnlineServicesID	Required	Microsoft.Exchange.Data.WindowsLiveId	The *MicrosoftOnlineServicesID* parameter specifies the user ID for the object. This parameter only applies to objects in the cloud-based service. It isn't available for on-premises deployments.
Name	Required	System.String	The *Name* parameter specifies the common name (CN) of the mail-enabled user.
Password	Required	System.Security.SecureString	The *Password* parameter specifies the password used by the mail user to secure his or her account.
UseExistingLiveId	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *UseExistingLiveId* parameter uses the specified Microsoft account (formerly known as a Windows Live ID) that already exists in the cloud-based domain. The specified Microsoft account can't have a mail user associated with it.

UserPrincipalName	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *UserPrincipalName* parameter specifies the name of a system user in an email address format (for example, ed@contoso.com).
WindowsLiveID	Required	Microsoft.Exchange.Data.WindowsLiveId	This parameter is available only in the cloud-based service. The *WindowsLiveID* parameter creates a Microsoft account (formerly known as a Windows Live ID) associated with the mail user.
AddOnSKUCapability	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the user. An alias can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $

			• % • ^ • & • * • + • - • . • / • = • ? • _ • { • } • | • ~
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example:

			CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
BypassLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name displayed in Microsoft Outlook for the mail user.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EvictLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *EvictLiveId* parameter removes an unmanaged Microsoft account (formerly known as a Windows Live ID) from the cloud-based domain. An unmanaged Microsoft account was created in the domain before the domain was enrolled in the cloud-based service.

			Evicting a Microsoft account from the domain lets you save any settings associated with the Microsoft account, like instant messaging contacts.
ExternalDirectoryObjectId	Optional	System.String	This parameter is reserved for internal Microsoft use.
FirstName	Optional	System.String	The *FirstName* parameter specifies the first name of the mail user.
ImmutableId	Optional	System.String	The *ImmutableId* parameter is used by GAL synchronization (GALSync) and specifies a unique and immutable identifier in the form of an SMTP address for an Exchange mailbox used for federated delegation when requesting Security Assertion Markup Language (SAML) tokens. If federation is configured for this mailbox and you don't set this parameter when you create the mailbox, Exchange creates the value for the immutable ID based upon

			the mailbox's **ExchangeGUID** and the federated account namespace, for example, 7a78e7c8-620e-4d85-99d3-c90d90f29699@mail.contoso.com. You must set the *ImmutableId* parameter if Active Directory Federation Services (AD FS) is deployed to allow single sign-on into an off-premises mailbox and AD FS is configured to use a different attribute than **ExchangeGUID** for sign-on token requests. Both, Exchange and AD FS must request the same token for the same user to ensure proper functionality for a cross-premises Exchange deployment scenario.
Initials	Optional	System.String	The *Initials* parameter specifies the initials of the mail user.
Languages	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.

LastName	Optional	System.String	The *LastName* parameter specifies the last name of the mail user.
MacAttachmentFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MacAttachmentFormat	The *MacAttachmentFormat* parameter specifies the Apple Macintosh operating system attachment format for messages sent to the mail user. The valid values for this parameter are: • `BinHex` • `UuEncode` • `AppleSingle` • `AppleDouble` By default, this parameter is set to `BinHex`. The acceptable values for the *MacAttachmentFormat* parameter are dependent on the *MessageFormat* parameter. If the *MessageFormat* parameter is set to `Text`, you can only use `BinHex` or `UuEncode` values for this parameter. If the *MessageFormat* parameter is set to `Mime`, you can only use `BinHex`, `AppleSingle`, or `AppleDouble` values for this parameter.

MailboxProvisioningConstraint	Optional	Microsoft.Exchange.Data.Directory.MailboxProvisioningConstraint	This parameter is reserved for internal Microsoft use.
MailboxProvisioningPreferences	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
MessageBodyFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageBodyFormat	The *MessageBodyFormat* parameter specifies the message body format for messages sent to the mail user. The valid values for this parameter are: • `Text` • `Html` • `TextAndHtml` By default, this parameter is set to `TextAndHtml`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to set this parameter to `Html` or `TextAndHtml`,

			you must also set the *MessageFormat* parameter to `Mime`.
MessageFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageFormat	The *MessageFormat* parameter specifies the message format for messages sent to the mail user. The valid values for this parameter are: • `Text` • `Mime` By default, this parameter is set to `Mime`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to change the *MessageFormat* parameter from `Mime` to `Text`, you must also change the

			MessageBodyFormat parameter to `Text`.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users responsible for moderating the messages sent to this mail user. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable or disable moderation for the mail user. The two possible values for this parameter are `$true` or `$false`. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
NetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the organizational unit (OU) in which the new user is added (for example, redmond.contoso.com/contacts).
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress* parameter specifies the primary SMTP address for the mail user. By default, the primary SMTP address is generated based on the default email address policy. If you specify a primary SMTP address by using this parameter, the command sets the **EmailAddressPolicyEnabled** attribute of the mail user to `$false`, and the email addresses of this

			mail user aren't automatically updated based on email address policies.
RemotePowerShellEnabled	Optional	System.Boolean	The *RemotePowerShellEnabled* parameter specifies whether the user can use remote Windows PowerShell. Remote Windows PowerShell is required to open the Exchange Management Shell on Mailbox and Client Access servers. Access to remote Windows PowerShell is required even if you're trying to open the Shell on the local server. The valid values are `$True` and `$False`. The default value is `$True`.
ResetPasswordOnNextLogon	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *ResetPasswordOnNextLogon* parameter specifies whether the user must change the password at

			the next logon. If this parameter is set to `$true`, the user must change the password at the next logon.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter defines the logon name used to support clients and servers running older versions of the operating system. This attribute must contain fewer than 20 characters. An account name can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $ • % • ^ • & • - • . • _ • { • }

			• | • ~
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never` Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent only to the senders who are internal to your organization. Set this parameter to `Never` to disable all status notifications. The default value is `Never`. **Note:** The sender is always notified if the message is rejected by the

			moderators, regardless of the value of this parameter.
SKUAssigned	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
SKUCapability	Optional	Microsoft.Exchange.Data.Directory.Capability	This parameter is reserved for internal Microsoft use.
UsageLocation	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	This parameter is reserved for internal Microsoft use.
UsePreferMessageFormat	Optional	System.Boolean	The *UsePreferMessageFormat* parameter specifies whether the message format settings configured for the mailbox override the global settings configured for the domain. Set this parameter to `$true` to have the message format settings configured for the mailbox to override any global settings.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailUser

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MailUser** cmdlet to remove an existing mail-enabled user from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailUser -Identity <MailUserIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ForReconciliation
<SwitchParameter>] [-IgnoreDefaultScope <SwitchParameter>] [-
IgnoreLegalHold <SwitchParameter>] [-KeepWindowsLiveID <SwitchParameter>]
[-Permanent <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mail-enabled user Ed Meadows from Active Directory.

```
Remove-MailUser -Identity "Ed Meadows"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailUserIdParameter	The *Identity* parameter specifies the identity of the mail user. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-

			5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

ForReconciliation	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the distinguished name (DN) for the *Identity*

			parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IgnoreLegalHold	Optional	System.Management.Automation.SwitchParameter	The *IgnoreLegalHold* switch ignores the legal hold status of the mail user and allows you to remove the user account that's on legal hold and the associated cloud mailbox. **⚠Warning:** After you remove a mailbox, you can't include it in a discovery search. Depending on the command parameters you use, removed mailboxes are either purged immediately or when the deleted mailbox retention period expires. Check with your organization's legal or Human Resources department before disabling a mailbox that's on legal hold.
KeepWindowsLiveID	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *KeepWindowsLiveID* parameter preserves the Microsoft account (formerly known as a Windows Live ID)

			associated with the deleted mail user.
Permanent	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailUser

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailUser** cmdlet to modify the mail-related attributes of an existing user in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailUser -Identity <MailUserIdParameter> [-AcceptMessagesOnlyFrom
<MultiValuedProperty>] [-AcceptMessagesOnlyFromDLMembers
<MultiValuedProperty>] [-AcceptMessagesOnlyFromSendersOrMembers

Examples

EXAMPLE 1

This example sets the email address outside the organization to which mail-enabled user John Woods' (john) email is sent.

```
Set-MailUser john -ExternalEmailAddress
john@tailspintoys.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailUserIdParameter	The *Identity* parameter specifies the mail user. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example:

			CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AcceptMessagesOnlyFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFrom* parameter specifies the mailbox users and mail users that can send email messages to this mail user. You can also specify Exchange as a valid recipient for this parameter. If you configure a mail user to accept messages only

			from the Exchange recipient, the mail user only receives system-generated messages. You can use one of the following values for the valid senders: • DN • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address By default, this parameter is blank, which enables the mail user to accept messages from all senders.
AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this mail user. You can use any of the following values for the allowed distribution groups:

			• DN • Canonical name • GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail user to accept messages from all senders.
AcceptMessagesOnlyFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromSendersOrMembers* parameter specifies the recipients who are allowed to send email messages to this mail user. You can use any of the following values for the allowed distribution groups: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address

			By default, this parameter is blank, which enables the mail user to accept messages from all senders.
AddOnSKUCapability	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
AggregatedMailboxGuids	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the user. An alias can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $ • % • ^ • & • * • + • - • . • / • = • ? • _ • {

			• } • | • ~
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox user who is used to manage the moderation process.
ArchiveGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
ArchiveName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ArchiveQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ArchiveQuota* parameter specifies the archive mailbox size at which it no longer accepts messages. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.

			The value must be greater than the value of the *ArchiveWarningQuota* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes.
ArchiveWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ArchiveWarningQuota* parameter specifies the archive mailbox size at which a warning message is sent to the user. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value must be less than the value of the *ArchiveQuota* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes.

BypassLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
BypassModerationFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassModerationFromSendersOrMembers* parameter specifies the recipients whose messages bypass moderation when sending to this mail user. You can use any of the following values: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address This value makes sure that all messages are moderated when this mail user is configured for moderation. **Note:** Senders designated as moderators for this mail user are never moderated.
CalendarVersionStore	Optional	System.Boolean	This parameter is reserved

Disabled			for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual tone multi-frequency (DTMF) map be created for the user.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.

CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify

			custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional

			information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
DisplayName	Optional	System.String	The *DisplayName*

			parameter specifies the display name of the user.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	The *EmailAddresses* parameter specifies the email alias of the mail user. All valid Exchange email address types may be used. You can specify multiple values for the *EmailAddresses* parameter as a comma-delimited list. **Important:** Exchange doesn't validate custom addresses for proper formatting. You must ensure that the custom address you specify complies with the format requirements for that address type. Because X.400 addresses are considered custom addresses in Exchange, they're also not validated, and you must provide the

			correct syntax when specifying an X.400 address.
EmailAddressPolicyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *EmailAddressPolicyEnabled* parameter specifies whether the email addresses for the mailbox are automatically updated based on the email address policies defined. The two possible values for this parameter are `$true` or `$false`. When this parameter is set to `$true`, you can't change the *PrimarySmtpAddress* or *WindowsEmailAddress* parameters.
EndDateForRetentionHold	Optional	System.DateTime	The *EndDateForRetentionHold* parameter specifies the end date for retention hold for messaging records management (MRM). To use this parameter, the *RetentionHoldEnabled* parameter must be set to `$true`.

ExchangeGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
ExtensionCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each

			ExtensionCustomAttribute parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttri	Optional	Microsoft.Exchange.Da	The

bute4		ta.MultiValuedProperty	*ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values.

			For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExternalEmailAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *ExternalEmailAddress* parameter specifies an email address outside the organization. Email messages sent to the user are sent to this external address.
FederatedIdentity	Optional	System.String	This parameter is available only in the cloud-based service. The *FederatedIdentity* parameter associates an on-premises Active Directory user with a Microsoft Office user.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* parameter suppresses the following confirmation: "To save changes on object <*object name*>, the object must be upgraded to the current Exchange version. After the upgrade, this object cannot be

			managed by an earlier version of the Exchange Management Tools. Do you want to continue to upgrade and save the object?" This confirmation occurs when you upgrade a mail user that was created in Microsoft Exchange Server 2003. You can't manage an Exchange 2003 mail user by using the Exchange Administration Center until you update the object's version.
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies the DN of recipients that can send messages on behalf of this user.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether the user appears in the address list. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.

IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.

ImmutableId	Optional	System.String	The *ImmutableId* parameter is used by Outlook Live Directory Sync (OLSync) and specifies a unique and immutable identifier in the form of an SMTP address for an Exchange mailbox that's used for federated delegation when requesting Security Assertion Markup Language (SAML) tokens. If federation is configured for this mailbox and you don't set this parameter when you create the mailbox, Exchange will create the value for the immutable ID based upon the mailbox's **ExchangeGUID** and the federated account namespace, for example, 7a78e7c8-620e-4d85-99d3-c90d90f29699@mail.contoso.com. You must set the *ImmutableId* parameter if Active Directory Federation Services (AD FS) is deployed to allow single

			sign-on into off-premises mailboxes and AD FS is configured to use a different attribute than **ExchangeGUID** for sign-on token requests. Both, Exchange and AD FS must request the same token for the same user to ensure proper functionality for cross-premise Exchange organizations.
JournalArchiveAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is reserved for internal Microsoft use.
LitigationHoldDate	Optional	System.DateTime	The *LitigationHoldDate* parameter specifies the date when the mailbox is placed on litigation hold. The parameter is populated automatically when placing a mailbox on litigation hold. This can be used for informational or reporting purposes. **Note:** When using the Exchange Management Shell to place the mailbox on litigation hold, you can optionally specify any date as the *LitigationHoldDate*, but the mailbox is placed on litigation hold when the

			cmdlet is run.
LitigationHoldEnabled	Optional	System.Boolean	The *LitigationHoldEnabled* parameter specifies that the mailbox is under litigation hold and that messages can't be deleted from the user's account. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`. After a mailbox is placed on litigation hold, deleted items and all versions of changed items are retained in the Recoverable Items folder. Items that are purged from the dumpster are also retained and the items are held indefinitely. If you enable litigation hold, single-item recovery quotas aren't applied.
LitigationHoldOwner	Optional	System.String	The *LitigationHoldOwner* parameter specifies the user who placed the mailbox on litigation hold. The parameter is populated automatically when placing a mailbox on litigation hold. This can

			be used for informational and reporting purposes. **Note:** When using the Shell to place a mailbox on litigation hold, you can optionally specify a string value for this parameter.
MacAttachmentFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MacAttachmentFormat	The *MacAttachmentFormat* parameter specifies the Apple Macintosh operating system attachment format for messages sent to the mail user. The valid values for this parameter are: • `BinHex` • `UuEncode` • `AppleSingle` • `AppleDouble` By default, this parameter is set to `BinHex`. The acceptable values for the *MacAttachmentFormat* parameter are dependent on the *MessageFormat* parameter. If the *MessageFormat* parameter is set to `Text`, you can only use `BinHex` or `UuEncode` values for this parameter. If the *MessageFormat*

			parameter is set to `Mime`, you can only use `BinHex`, `AppleSingle`, or `AppleDouble` values for this parameter.
MailboxContainerGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
MailboxProvisioningConstraint	Optional	Microsoft.Exchange.Data.Directory.MailboxProvisioningConstraint	This parameter is reserved for internal Microsoft use.
MailboxProvisioningPreferences	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message displayed to senders when they start drafting an email message to this recipient. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *MailTipTranslations* parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each

			language, you must provide the locale, followed by a colon and the specific *MailTip* parameter message in that language. Each *MailTipTranslations* parameter message must be less than or equal to 250 characters. Multiple languages can be separated by commas.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum size of email messages that can be received by the mail user, from 1 kilobyte (KB) through 2,097,151 KB. If not specified, there are no size restrictions.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxSendSize* parameter specifies the maximum size of email messages that can be sent

			by the mail user, from 1 KB through 2,097,151 KB. If not specified, there are no size restrictions.
MessageBodyFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageBodyFormat	The *MessageBodyFormat* parameter specifies the message body format for messages sent to the mail user. The valid values for this parameter are: • `Text` • `Html` • `TextAndHtml` By default, this parameter is set to `TextAndHtml`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to set this parameter to `Html` or `TextAndHtml`, you must also set the *MessageFormat*

			parameter to `Mime`.
MessageFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.MessageFormat	The *MessageFormat* parameter specifies the message format for messages sent to the mail user. The valid values for this parameter are: • `Text` • `Mime` By default, this parameter is set to `Mime`. The *MessageFormat* and *MessageBodyFormat* parameters are interdependent. If the *MessageFormat* parameter is set to `Mime`, the *MessageBodyFormat* parameter can be set to any valid value. However, if the *MessageFormat* parameter is set to `Text`, the *MessageBodyFormat* parameter can only be set to `Text`. Therefore, if you want to change the *MessageFormat* parameter from `Mime` to `Text`, you must also change the *MessageBodyFormat* parameter to `Text`.

MicrosoftOnlineServicesID	Optional	Microsoft.Exchange.Data.SmtpAddress	The *MicrosoftOnlineServicesID* parameter specifies the user ID for the object. This parameter only applies to objects in the cloud-based service. It isn't available for on-premises deployments.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users responsible for moderating the messages sent to the distribution group. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`. If you leave this parameter blank and there is a user already specified as the manager of this distribution group, the *ModeratedBy* parameter is automatically set with the value in the *ManagedBy* parameter of the **Set-DistributionGroup** cmdlet. Otherwise, an

			error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the distribution group. The two possible values for this parameter are `$true` or `$false`. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Name	Optional	System.String	The *Name* parameter specifies the name of the user.
NetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
Password	Optional	System.Security.SecureString	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress* parameter specifies the primary SMTP address.
RecipientLimits	Optional	Microsoft.Exchange.Da	This parameter is available only in on-

		ta.Unlimited	premises Exchange 2013. The *RecipientLimits* parameter specifies the maximum number of recipients for messages from this user.
RecoverableItemsQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *RecoverableItemsQuota* parameter specifies the size limit for the Recoverable Items folder for a mail-enabled user that has a corresponding remote mailbox or remote archive mailbox in the cloud-based service.
RecoverableItemsWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *RecoverableItemsWarningQuota* parameter specifies the size of the Recoverable Items folder before Exchange logs an event to the application event log.
RejectMessagesFrom	Optional	Microsoft.Exchange.Da	The *RejectMessagesFrom*

		ta.MultiValuedProperty	parameter specifies the recipients from which to reject messages. You can use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail user to accept messages from all senders.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies the distribution list members from which to reject messages. You can use any of the following values to specify the recipients: • DN • Alias • Canonical name

			• Display name • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail user to accept messages from all senders.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromSendersOrMembers* parameter specifies the recipients who aren't allowed to send email messages to this mail user. You can use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables

			the mail user to accept messages from all senders.
RemovePicture	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemovePicture* parameter specifies whether to remove the picture that a user has added to a mailbox.
RemoveSpokenName	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoveSpokenName* parameter specifies whether to remove the spoken name that a user has added to a mailbox.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether to accept messages only from authenticated recipients. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.

ResetPasswordOnNextLogon	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *ResetPasswordOnNextLogon* parameter specifies whether to require mail users to change their Microsoft account (formerly known as Windows Live ID) password the next time they sign in to the cloud-based service. If the *ResetPasswordOnNextLogon* parameter is set to `$true`, it requires mail users to change their Microsoft account password the next time they sign in to the cloud-based service. The two possible values for this parameter are `$true` or `$false`.
RetainDeletedItemsFor	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RetainDeletedItemsFor* parameter specifies the length of time to keep deleted items. To specify a value, enter it as a time span:

			dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a 15-hour interval, enter 15:00:00.
RetentionComment	Optional	System.String	The *RetentionComment* parameter specifies a comment displayed in Outlook regarding the user's retention hold status. This comment can be set only if the *RetentionHoldEnabled* parameter is set to `$true`. This comment should be localized to the user's preferred language.
RetentionHoldEnabled	Optional	System.Boolean	The *RetentionHoldEnabled* parameter specifies whether retention hold is enabled for messaging retention policies. The two possible values for this parameter are `$true` or `$false`. To set the start date for retention hold, use the *StartDateForRetentionHol*

			d parameter.
RetentionUrl	Optional	System.String	The *RetentionUrl* parameter specifies the URL or an external web page with additional details about the organization's messaging retention policies. This URL can be used to expose details regarding retention policies in general, which is usually a customized legal or IT website for the company.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies the logon name used to support clients and servers running older versions of the operating system, such as Microsoft Windows NT 4.0, Windows 98, Windows 95, and LAN Manager. This attribute must contain fewer than 20 characters. An account name can contain letters, numbers, and the

			following punctuation marks and symbols: • ! • # • $ • % • ^ • & • - • . • _ • { • } • | • ~
SecondaryAddress	Optional	System.String	The *SecondaryAddress* parameter specifies the secondary address used by the Unified Messaging (UM)-enabled user.
SecondaryDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *SecondaryDialPlan* parameter specifies a secondary UM dial plan to use. This parameter is provided to create a secondary proxy address.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a

			message to the moderated distribution group. You can use one of the following values: • `Always` • `Internal` • `Never` If you want notifications to be sent to all senders, set this parameter to `Always`. If you want notifications to be sent only to the senders who are internal to your organization, set this parameter to `Internal`. To disable all status notifications, set this parameter to `Never`. **Note:** The sender is always notified if the message is rejected by the moderators, regardless of the value of this parameter. The default value is `Never`.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted.

			This limited set of characters consists of ASCII characters 26 through 126, inclusively.
SingleItemRecoveryEnabled	Optional	System.Boolean	The *SingleItemRecoveryEnabled* parameter specifies whether to prevent the Recovery Items folder from being purged. When this parameter is set to `$true`, it prevents the Recovery Items folder from being purged. It also prevents any items from being removed that have been deleted or edited. The possible values for this parameter are `$true` or `$false`. The default value is `$false`.
SKUAssigned	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
SKUCapability	Optional	Microsoft.Exchange.Data.Directory.Capability	This parameter is reserved for internal Microsoft use.
StartDateForRetentionHold	Optional	System.DateTime	The *StartDateForRetentionHold* parameter specifies the start date for retention hold for MRM. To use this parameter, the

			RetentionHoldEnabled parameter must be set to `$true`.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the UM-enabled user.
UsageLocation	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	This parameter is reserved for internal Microsoft use.
UseMapiRichTextFormat	Optional	Microsoft.Exchange.Data.Directory.Recipient.UseMapiRichTextFormat	The *UseMapiRichTextFormat* parameter specifies how messages in MAPI rich text format (RTF) are handled for this mail user. You can use one of the following values: • `Never` • `Always` • `UseDefaultSettings` To convert all messages sent to this user to plain text, set this parameter to `Never`. To always send messages to this user in MAPI RTF, set this parameter to `Always`. To have the format determined based on the

			setting configured in the MAPI client that sent the message, set this parameter to `UseDefaultSettings`.
UsePreferMessageFormat	Optional	System.Boolean	The *UsePreferMessageFormat* parameter specifies whether the message format settings configured for the mail user override the global settings configured for the remote domain. The two possible values for this parameter are `$true` or `$false`. To have the message format settings configured for the mail user to override any global settings, set this parameter to `$true`.
UserCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
UserPrincipalName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *UserPrincipalName* parameter specifies a UPN for the useront.

UserSMimeCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the Windows email address for this mailbox. This address isn't used by Exchange.
WindowsLiveID	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in the cloud-based service. The *WindowsLiveID* parameter renames the Microsoft account associated with the mail user.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-Recipient

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-Recipient** cmdlet to return a list of recipient objects from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-Recipient [-RecipientPreviewFilter <String>] <COMMON PARAMETERS>

Get-Recipient [-BookmarkDisplayName <String>] [-Identity
<RecipientIdParameter>] [-IncludeBookmarkObject <$true | $false>] <COMMON
PARAMETERS>

Get-Recipient [-Database <DatabaseIdParameter>] <COMMON PARAMETERS>

Get-Recipient [-Anr <String>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
AuthenticationType <Managed | Federated>] [-Capabilities
<MultiValuedProperty>] [-Credential <PSCredential>] [-DomainController
<Fqdn>] [-Filter <String>] [-IgnoreDefaultScope <SwitchParameter>] [-
Organization <OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-Properties <String[]>] [-PropertySet
<All | ControlPanel | ConsoleSmallSet | ConsoleLargeSet | Minimum>] [-
ReadFromDomainController <SwitchParameter>] [-RecipientType
<RecipientType[]>] [-RecipientTypeDetails <RecipientTypeDetails[]>] [-
ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example retrieves information about all the recipients in your organization.

```
Get-Recipient -ResultSize unlimited
```

EXAMPLE 2

This example retrieves information about all the mail contacts in your organization and sorts them by name.

```
Get-Recipient -RecipientType MailContact -SortBy Name
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient provisioning permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)**

			• **DisplayName** • **FirstName** • **LastName** • **Alias**
AuthenticationType	Optional	Microsoft.Exchange.Data.Directory.AuthenticationType	This parameter is available only in the cloud-based service. The *AuthenticationType* parameter specifies the recipient by authentication type. Use one of the following values: • `Federated` • `Managed`
BookmarkDisplayName	Optional	System.String	This parameter is reserved for internal Microsoft use.
Capabilities	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-**

			Credential cmdlet. For more information, see Get-Credential.
Database	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies a mailbox database. Use this parameter to return all recipients stored on a specific mailbox database. Use the mailbox database *Name* property as the value for this parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable

			properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the recipient. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com

			• `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't

			accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
IncludeBookmarkObject	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies an organizational unit (OU) or domain canonical name, and is used to limit the results. If you use this parameter, you only get recipients in the container that you specify, for example: • OU: westcoast.contoso.com/users • Domain: westcoast.contoso.com
Properties	Optional	System.String[]	This parameter is reserved for internal Microsoft use.
PropertySet	Optional	Microsoft.Exchange.Data.Directory.Managem	This parameter is reserved for internal Microsoft use.

		ent.PropertySet	
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Microsoft Exchange.
RecipientPreviewFilter	Optional	System.String	The *RecipientPreviewFilter* parameter specifies a recipient filter that would define the recipients returned by this

			command. You can create a custom recipient filter for a dynamic distribution group, an address list, or an email address policy. To verify that the recipient filter you specified will return the recipients you want, you can pass the OPATH filter specified in the **RecipientFilter** property for that dynamic distribution group, address list, or email address policy to the *RecipientPreviewFilter* parameter and preview the list of recipients.
RecipientType	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientType[]	The *RecipientType* parameter specifies the type of recipients to return. You can use one or more of the following values: • `DynamicDistributionGroup` • `UserMailbox` • `MailUser` • `MailContact` • `MailUniversalDistributionGroup` • `MailUniversalSecurityGroup` • `MailNonUniversalGroup` • `PublicFolder`
RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.	The *RecipientTypeDetails* parameter specifies the type of recipients

		RecipientTypeDetails[]	returned. Recipient types are divided into recipient types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type UserMailbox represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each mailbox type is identified by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to ConferenceRoomMailbox, whereas a user mailbox has *RecipientTypeDetails* set to UserMailbox. You can select from the following values: • `ConferenceRoomMailbox` • `Contact` • `DiscoveryMailbox` • `DynamicDistributionGroup` • `EquipmentMailbox` • `ExternalManagedContact` • `ExternalManagedDistributionGroup` • `LegacyMailbox` • `LinkedMailbox` • `MailboxPlan` • `MailContact` • `MailForestContact`

			• `MailNonUniversalGroup` • `MailUniversalDistributionGroup` • `MailUniversalSecurityGroup` • `MailUser` • `PublicFolder` • `RoleGroup` • `RoomList` • `RoomMailbox` • `SharedMailbox` • `SystemAttendantMailbox` • `SystemMailbox` • `User` • `UserMailbox`
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all recipients that match the filter, use `unlimited` for the value of this parameter. The default value is 1000.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. You can sort by the following attributes: • **Alias** • **DisplayName** • **Name** The results are sorted in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SecurityPrincipal

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SecurityPrincipal** cmdlet to return a list of security principals.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SecurityPrincipal [-Identity <ExtendedSecurityPrincipalIdParameter>]
[-DomainController <Fqdn>] [-Filter <String>] [-IncludeDomainLocalFrom
<SmtpDomain>] [-Organization <OrganizationIdParameter>] [-
OrganizationalUnit <ExtendedOrganizationalUnitIdParameter>] [-ResultSize
<Unlimited>] [-RoleGroupAssignable <SwitchParameter>] [-Types
<MultiValuedProperty>]
```

Examples

EXAMPLE 1

This example retrieves security principals in the OU People, well-known security principals, and domain local groups from the domain Contoso.com.

```
Get-SecurityPrincipal -OrganizationalUnit
OU=People,DC=Contoso,DC=com -IncludeDomainLocalFrom
Contoso.com
```

EXAMPLE 2

This example retrieves security principals from the Legal department by using the *Filter* parameter. Only security principals matching the filter condition are retrieved.

```
Get-SecurityPrincipal -Filter {Department -eq "Legal"} -
IncludeDomainLocalFrom Contoso.com
```

EXAMPLE 3

This example retrieves a single security principal explicitly specified by using the *Identity* parameter.

```
Get-SecurityPrincipal -Identity Administrator -
IncludeDomainLocalFrom Contoso.com
```

EXAMPLE 4

This example retrieves well-known security principals by pipelining the results from the **Get-SecurityPrincipal** cmdlet to the **Where-Object** command. The results are pipelined to the **Format-Table** command. Only the *Name* and *SID* parameters are selected to be included in the final output.

```
Get-SecurityPrincipal -IncludeDomainLocalFrom Contoso.com |
? {$_.Type -eq "WellKnownSecurityPrincipal"} | ft Name,SID
-AutoSize
```

Note:

The question mark character (?) is an alias for the **Where-Object** command. `Ft` is an alias for the **Format-Table** command. Both aliases are included by default in the Windows PowerShell command-line interface.

Detailed Description

Security principals are entities, such as users or security groups, which can be assigned permissions and user rights.

Note:

If the *IncludeDomainLocalFrom* parameter is specified along with the *Filter* or *Identity* parameters, the cmdlet doesn't return domain local security groups. This cmdlet is required for internal Exchange Administration Center functionality.

The **Get-SecurityPrincipal** cmdlet is used by the Exchange Administration Center in Microsoft Exchange Server 2013 to populate fields that display recipient information.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Active Directory Domain Services server settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter specifies one or more attributes and their corresponding values to restrict the security principals returned by the command. When the *Filter* parameter is used, only those security principals matching the filter conditions are returned.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExtendedSecurityPrincipalIdParameter	The *Identity* parameter specifies the identity of the security principal. When the security principal is explicitly specified by using this parameter, no

			additional security principals are returned.
IncludeDomainLocalFrom	Optional	Microsoft.Exchange.Data.SmtpDomain	This parameter is available only in on-premises Exchange 2013. The *IncludeDomainLocalFrom* parameter specifies the FQDN of an Active Directory domain. The command returns domain local groups from the specified domain.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.ExtendedOrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies an organizational unit (OU), container, or domain name. It's used to limit the results. If you use this parameter, you only get mailboxes in the OU, container, or domain that you specify, in addition to well-known security

			principals and domain local groups from the domain you specify in the *IncludeDomainLocalFrom* parameter.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of objects to return. The default value is 1000. To return all objects that match the query, use the value `unlimited`.
RoleGroupAssignable	Optional	System.Management.Automation.SwitchParameter	The *RoleGroupAssignable* switch filters security principals and returns only those entities that can be assigned to an RBAC role group.
Types	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Types* parameter isn't available at this time.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-User

Exchange Management Shell > Exchange 2013 cmdlets > Users and Groups Cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-User** cmdlet to retrieve all users in the forest that match the specified conditions.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-User [-Anr <String>] <COMMON PARAMETERS>

Get-User [-Identity <UserIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Arbitration <SwitchParameter>] [-ConsumerNetID <NetID>] [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-Filter <String>] [-
IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-PublicFolder <SwitchParameter>] [-
ReadFromDomainController <SwitchParameter>] [-RecipientTypeDetails
<RecipientTypeDetails[]>] [-ResultSize <Unlimited>] [-SoftDeletedUser
<SwitchParameter>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example retrieves information about users in the Marketing OU.

```
Get-User -OrganizationalUnit "Marketing"
```

EXAMPLE 2

This example uses the *Filter* parameter to retrieve information about all users that have the word Manager at the end of their title.

```
Get-User -Filter "Title -like '*Manager'"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Arbitration	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are

			executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
ConsumerNetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the account used to read Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *Identity* parameter specifies the identity of the user object. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips

			• GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the

			IgnoreDefaultScope parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter returns objects only from the specified organizational unit (OU).
PublicFolder	Optional	System.Management.Automation.SwitchParameter	The *PublicFolder* parameter specifies that the user object for which

			you're executing the command is a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. This parameter is required to retrieve information for a public folder mailbox.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information.

			Note: By default, the recipient scope is set to the domain that hosts your servers running Exchange.
RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientTypeDetails[]	The *RecipientTypeDetails* parameter specifies the type of recipients returned. Recipient types are divided into types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type `UserMailbox` represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each mailbox type is identified by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to `RoomMailbox`, whereas a user mailbox has *RecipientTypeDetails* set to `UserMailbox`. You can use the following values: • `DisabledUser` • `DiscoveryMailbox` • `EquipmentMailbox` • `LegacyMailbox`

			• LinkedMailbox • LinkedUser • MailUser • RemoteEquipmentMailbox • RemoteRoomMailbox • RemoteSharedMailbox • RemoteTeamMailbox • RemoteUserMailbox • RoomMailbox • SharedMailbox • TeamMailbox • User • UserMailbox
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return.
SoftDeletedUser	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute to sort by. This parameter sorts by a single attribute in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-User

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-User** cmdlet to modify user attributes in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-User -Identity <UserIdParameter> [-AllowUMCallsFromNonUsers <None |
SearchEnabled>] [-Arbitration <SwitchParameter>] [-ArchiveRelease <None |
E14 | E15>] [-AssistantName <String>] [-BusinessNetID <NetID>] [-
CertificateSubject <MultiValuedProperty>] [-City <String>] [-Company
<String>] [-Confirm [<SwitchParameter>]] [-CopyShadowAttributes
<SwitchParameter>] [-CountryOrRegion <CountryInfo>] [-CreateDTMFMap <$true
| $false>] [-Department <String>] [-DisplayName <String>] [-
DomainController <Fqdn>] [-EnableAccount <SwitchParameter>] [-Fax
<String>] [-FirstName <String>] [-GenerateExternalDirectoryObjectId
<SwitchParameter>] [-GeoCoordinates <GeoCoordinates>] [-HomePhone
<String>] [-IgnoreDefaultScope <SwitchParameter>] [-Initials <String>] [-
InPlaceHoldsRaw <MultiValuedProperty>] [-LastName <String>] [-LEOEnabled
<$true | $false>] [-LinkedCredential <PSCredential>] [-
LinkedDomainController <String>] [-LinkedMasterAccount <UserIdParameter>]
[-MailboxRelease <None | E14 | E15>] [-Manager <UserContactIdParameter>]
[-MicrosoftOnlineServicesID <SmtpAddress>] [-MobilePhone <String>] [-Name
<String>] [-NetID <NetID>] [-Notes <String>] [-Office <String>] [-OtherFax
<MultiValuedProperty>] [-OtherHomePhone <MultiValuedProperty>] [-
OtherTelephone <MultiValuedProperty>] [-Pager <String>] [-Phone <String>]
[-PhoneticDisplayName <String>] [-PostalCode <String>] [-PostOfficeBox
<MultiValuedProperty>] [-PublicFolder <SwitchParameter>] [-
RemotePowerShellEnabled <$true | $false>] [-ResetPasswordOnNextLogon
<$true | $false>] [-SamAccountName <String>] [-SeniorityIndex <Int32>] [-
SimpleDisplayName <String>] [-SKUAssigned <$true | $false>] [-
StateOrProvince <String>] [-StreetAddress <String>] [-TelephoneAssistant

<None | NotStarted | InProgress | Warning | Error | Cancelled | Complete |
ForceComplete>] [-UserPrincipalName <String>] [-WebPage <String>] [-WhatIf
[<SwitchParameter>]] [-WindowsEmailAddress <SmtpAddress>] [-WindowsLiveID
<SmtpAddress>]
```

Examples

EXAMPLE 1

This example sets the display name for user Jill Frank.

```
Set-User -Identity Contoso\Jill -DisplayName "Jill Frank"
```

EXAMPLE 2

This example unlinks the linked mailbox Kweku@fabrikam.com and converts it to a user mailbox by setting the *LinkedMasterAccount* parameter to `$null`.

Important:
Performing this procedure on a linked mailbox removes all permissions on the mailbox such as Send As, Full Access, folder, and calendar delegation.

```
Set-User -Identity Kweku@fabrikam.com -LinkedMasterAccount
$null
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *Identity* parameter specifies the identity of the user. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-

			4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AllowUMCallsFromNonUsers	Optional	Microsoft.Exchange.Data.Directory.Recipient.AllowUMCallsFromNonUsersFlags	The *AllowUMCallsFromNonUsers* parameter specifies whether to exclude the user from directory searches.
Arbitration	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing approval workflow. For

			example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
ArchiveRelease	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailboxRelease	This parameter is reserved for internal Microsoft use.
AssistantName	Optional	System.String	The *AssistantName* parameter specifies the name of the user's assistant.
BusinessNetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
CertificateSubject	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *CertificateSubject* parameter specifies the value of the subject field of the user's digital certificate.
City	Optional	System.String	The *City* parameter specifies the user's city.
Company	Optional	System.String	The *Company* parameter specifies the user's company.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CopyShadowAttributes	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
CountryOrRegion	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	The *CountryOrRegion* parameter specifies the user's country or region.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual-tone multiple-frequency (DTMF) map be created for the user.
Department	Optional	System.String	The *Department* parameter specifies the user's department.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the user's display name.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnableAccount	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Fax	Optional	System.String	The *Fax* parameter specifies the user's fax number.
FirstName	Optional	System.String	The *FirstName* parameter specifies the user's given name.
GenerateExternalDirectoryObjectId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
GeoCoordinates	Optional	Microsoft.Exchange.Data.GeoCoordinates	The *GeoCoordinates* parameter specifies the user's physical location in latitude, longitude, and altitude coordinates. Use this parameter to specify the global position of physical resources, such as conference rooms. You have to specify one of the following sets of

			coordinates; use semicolons to separate the values. • Latitude and longitude; for example, `"47.644125;-122.122411"` • Latitude, longitude, and altitude; for example, `"47.644125;-122.122411;161.432"`
HomePhone	Optional	System.String	The *HomePhone* parameter specifies the user's home telephone number.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions:

			• You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
Initials	Optional	System.String	The *Initials* parameter specifies the user's initials.
InPlaceHoldsRaw	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
LastName	Optional	System.String	The *LastName* parameter specifies the user's surname.
LEOEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LinkedCredential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *LinkedCredential* parameter specifies credentials to use to access the domain controller specified by the

			LinkedDomainController parameter. You can only use the *LinkedCredential* parameter with a linked user. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
LinkedDomainController	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *LinkedDomainController* parameter specifies the domain controller in the forest where the user account resides, if this user is a linked user. The domain controller in the forest where the user account resides is used to get security information for the account specified by the *LinkedMasterAccount* parameter.

			This parameter is required only if you're connecting a linked user.
LinkedMasterAccount	Optional	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	This parameter is available only in on-premises Exchange 2013. The *LinkedMasterAccount* parameter specifies the master account in the forest where the user account resides, if this user is a linked user. The master account is the account to which the user links. The master account grants access to the user. You can use one of the following values: • GUID • DN • *Domain\Account* • UPN • LegacyExchangeDN • SmtpAddress • Alias • `$null` If you set this parameter's value to `$null`, you will unlink the account and convert the linked mailbox into a non-linked user mailbox. The mailbox

			won't retain the permissions previously set on it such as Send As, full access, folder, and calendar delegation. This parameter is required only if you're connecting a linked user.
MailboxRelease	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailboxRelease	This parameter is reserved for internal Microsoft use.
Manager	Optional	Microsoft.Exchange.Configuration.Tasks.UserContactIdParameter	The *Manager* parameter specifies the user's manager.
MicrosoftOnlineServicesID	Optional	Microsoft.Exchange.Data.SmtpAddress	The *MicrosoftOnlineServicesID* parameter specifies the user ID for the object. This parameter only applies to objects in the cloud-based service. It isn't available for on-premises deployments.
MobilePhone	Optional	System.String	The *MobilePhone* parameter specifies the user's primary mobile phone number.
Name	Optional	System.String	The *Name* parameter specifies the user's

			common name.
NetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
Notes	Optional	System.String	The *Notes* parameter specifies additional information about the user.
Office	Optional	System.String	The *Office* parameter specifies the user's physical office name or number.
OtherFax	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *OtherFax* parameter specifies the user's alternative fax number.
OtherHomePhone	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *OtherHomePhone* parameter specifies the user's alternative home telephone number.
OtherTelephone	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *OtherTelephone* parameter specifies the user's alternative telephone number.
Pager	Optional	System.String	The *Pager* parameter specifies the user's pager number.
Phone	Optional	System.String	The *Phone* parameter specifies the user's office telephone number.

PhoneticDisplayName	Optional	System.String	The *PhoneticDisplayName* parameter specifies a phonetic pronunciation of the *DisplayName* parameter. The maximum length of this parameter value is 255 characters.
PostalCode	Optional	System.String	The *PostalCode* parameter specifies the user's zip code or postal code.
PostOfficeBox	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *PostOfficeBox* parameter specifies the user's post office box number.
PublicFolder	Optional	System.Management.Automation.SwitchParameter	The *PublicFolder* parameter specifies that the user for which you're executing the command is a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. This parameter is required to change the settings for a public folder mailbox.
RemotePowerShellEnabled	Optional	System.Boolean	The *RemotePowerShellEnabled* parameter specifies

			whether the user can use remote PowerShell. remote PowerShell is required to open the Exchange Management Shell or the Exchange Administration Center. Access to remote PowerShell is required even if you're trying to open the Shell or the Exchange Administration Center on the local server. The valid values are `$true` and `$false`. The default value depends on the management roles assigned to the user.
ResetPasswordOnNextLogon	Optional	System.Boolean	The *ResetPasswordOnNextLogon* parameter specifies whether the user's password must be reset the next time the user logs on. The two possible values for this parameter are `$true` or `$false`. The default value is `$true`.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013.

			The *SamAccountName* parameter specifies the logon name used to support clients and servers running older versions of the operating system, such as Microsoft Windows NT 4.0, Windows 98, Windows 95, and LAN Manager. This attribute must contain fewer than 20 characters.
SeniorityIndex	Optional	System.Int32	The *SeniorityIndex* parameter specifies the order in which this user will display in a hierarchical address book. A user with a value of 2 will display higher in an address book than a user with a value of 1.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.

SKUAssigned	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
StateOrProvince	Optional	System.String	The *StateOrProvince* parameter specifies the user's state or province.
StreetAddress	Optional	System.String	The *StreetAddress* parameter specifies the user's physical address.
TelephoneAssistant	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *TelephoneAssistant* parameter specifies the telephone number of the user's assistant.
Title	Optional	System.String	The *Title* parameter specifies the user's title.
UMCallingLineIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *UMCallingLineIds* parameter specifies telephone numbers or extensions that can be mapped to a Unified Messaging (UM)-enabled user. You can specify more than one telephone number for each user, separated by a comma.

			This parameter accepts digits less than 128 characters in length and may include an optional plus sign (+) preceding the numbers. Each UM-enabled user must have a unique *UMCallingLineIds* parameter value.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the UM-enabled user.
UpgradeDetails	Optional	System.String	This parameter is reserved for internal Microsoft use.
UpgradeMessage	Optional	System.String	This parameter is reserved for internal Microsoft use.
UpgradeRequest	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UpgradeRequestTypes	This parameter is reserved for internal Microsoft use.
UpgradeStage	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UpgradeStage	This parameter is reserved for internal Microsoft use.
UpgradeStageTimeStamp	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.

UpgradeStatus	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.UpgradeStatusTypes	This parameter is reserved for internal Microsoft use.
UserPrincipalName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *UserPrincipalName* parameter specifies the UPN of the user.
WebPage	Optional	System.String	The *WebPage* parameter specifies the user's Web page.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the email address of the recipient.

WindowsLiveID	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is reserved for internal Microsoft use.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Exchange admin center in Exchange 2013

Exchange Server 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-05*

The Exchange Admin Center (EAC) is the web-based management console in Microsoft Exchange Server 2013 that's optimized for on-premises, online, and hybrid Exchange deployments. The EAC replaces the Exchange Management Console (EMC) and the Exchange Control Panel (ECP), which were the two interfaces used to manage Exchange Server 2010.

One advantage a web-based EAC provides is that you can partition Internet and intranet access from within the ECP IIS virtual directory. With this functionality, you can control whether users are allowed to have Internet access to the EAC from outside of your organization, while still allowing an end user to access Outlook Web App Options. For more information, see Turn off access to the Exchange admin center.

Contents

Accessing the EAC

Because the EAC is now a web-based management console, you'll need to use the ECP virtual directory URL to access the console from your web browser. In most cases the EAC's URL will look similar to the following:

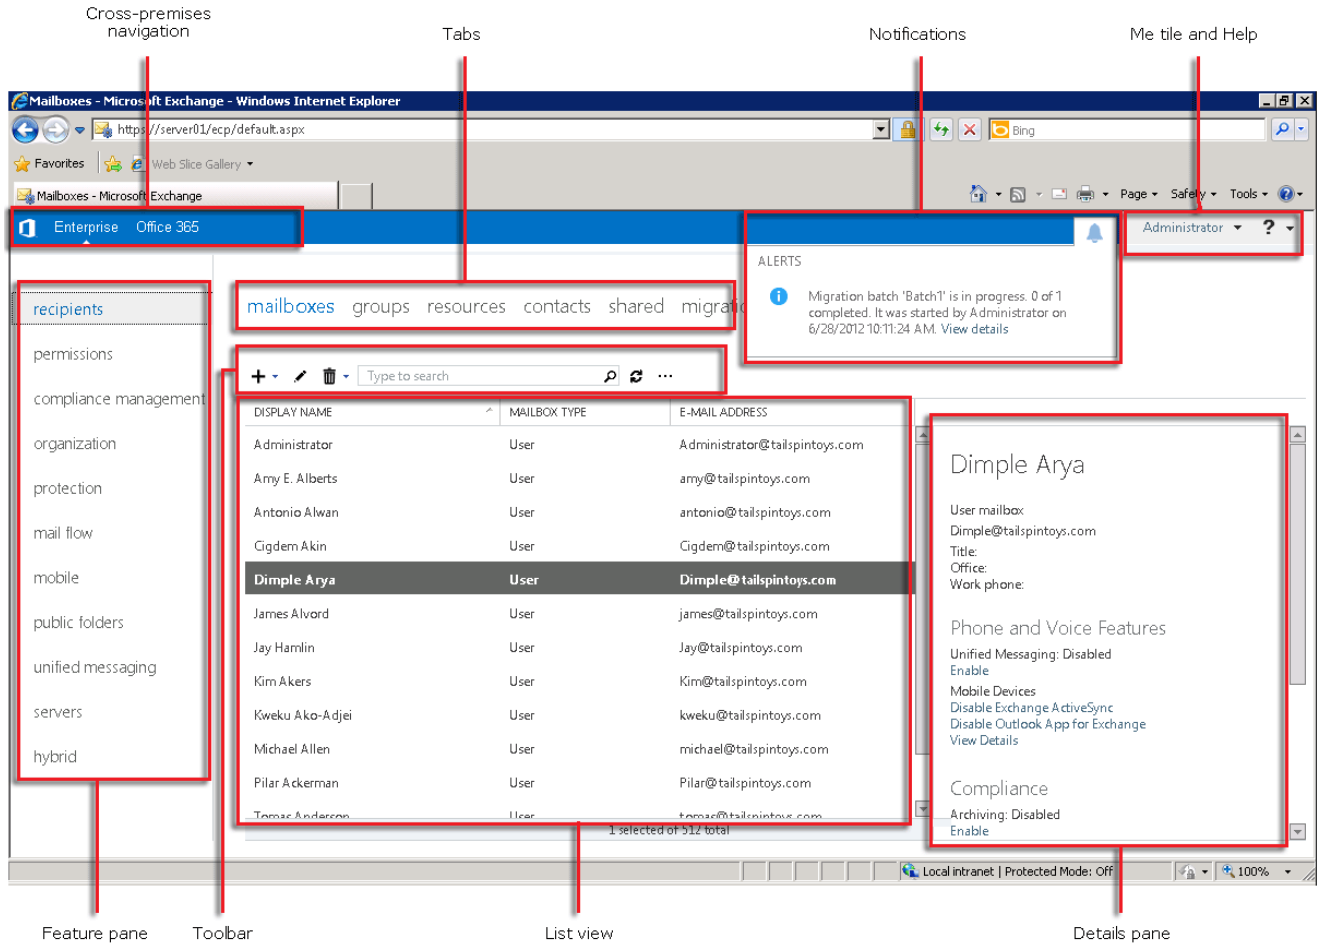
- **Internal URL:** `https://<CASServerName>/ecp` The internal URL is used to access the EAC from within your organization's firewall.
- **External URL:** `https://mail.contoso.com/ecp` The external URL is used to access the EAC from outside of your organization's firewall. Some organizations may want to turn off external access to the EAC. For details, see Turn off access to the Exchange admin center.

To locate the internal or external URL for the EAC, you can use the Get-EcpVirtualDirectory cmdlet. For details, see Find the internal and external URLs for the Exchange admin center.

If you're in a coexistence scenario, where you're running Exchange 2010 and Exchange 2013 in the same organization, and your mailbox is still housed on the Exchange 2010 Mailbox server, the browser will default to the Exchange 2010 ECP. You can access the EAC by adding the Exchange version to the URL. For example, to access the EAC whose virtual directory is hosted on the Client Access server CAS15-NA, use the following URL: `https://CAS15-NA/ecp?ExchClientVer=15`. Conversely, if you want to access the Exchange 2010 ECP and your mailbox resides on an Exchange 2013 Mailbox server, use the following URL: `https://CAS14-NA/ecp?ExchClientVer=14`.

Common user interface elements in the EAC

The section describes the user interface elements that are common across the EAC.



Cross-premises navigation

The cross-premises navigation allows you to easily switch between your Exchange Online and on-premises Exchange deployments. If you don't have an Exchange Online organization, the link will direct you to the Office 365 sign-up page. To learn more, see **Exchange Server 2013 Hybrid Deployments**.

Feature pane

This is the first level of navigation for most of the tasks that you'll perform in the EAC. The feature pane is similar to the console tree from the EMC in Exchange 2010. However, in Exchange 2013 the feature pane is organized by feature areas as opposed to server roles, and there are fewer clicks to find what you need.

- **Recipients** This is where you'll manage mailboxes, groups, resource mailboxes, contacts, shared mailboxes, and mailbox migrations and moves.
- **Permissions** This is where you'll manage administrator roles, user roles, and Outlook Web App policies.
- **Compliance management** This is where you'll manage In-Place eDiscovery, In-Place Hold, auditing, data loss prevention (DLP), retention policies, retention tags, and journal rules.
- **Organization** This is where you'll manage the tasks that pertain to your Exchange Organization, including federated sharing, Outlook Apps, and address lists.

- **Protection** This is where you'll manage anti-malware protection for your organization.
- **Mail flow** This is where you'll manage rules, delivery reports, accepted domains, email address policies, and send and receive connectors.
- **Mobile** This is where you'll manage the mobile devices that you allow to connect to your organization. You can manage mobile device access and mobile device mailbox policies.
- **Public folders** In Exchange 2010, you had to manage public folders by using the Public Folder Management Console, which was located outside of the EMC in the Toolbox. In Exchange 2013, public folders can be managed from within the **public folders** feature area.
- **Unified Messaging** This is where you'll manage UM dial plans and UM IP gateways.
- **Servers** This is where you'll manage your Mailbox and Client Access servers, databases, database availability groups (DAGs), virtual directories, and certificates.
- **Hybrid** This is where you'll set up and configure a Hybrid organization.

Tabs

The tabs are your second level of navigation. Each of the feature areas contains various tabs, each representing a complete feature. The only exception to this rule is the Hybrid feature area. You must first enable your organization for a hybrid deployment by using the Hybrid Configuration wizard.

Toolbar

When you click most tabs, you'll see a toolbar. The toolbar has icons that perform a specific action. The following table describes the most common icons and their actions. To display the action associated with an icon, simply hover over the icon.

Icon	Name	Action
+	Add, New	Use this icon to create a new object. Some of these icons have an associated down arrow you can click to show additional objects you can create. For example, in **Recipients** > **Mailboxes**, clicking the down arrow displays **User mailbox** and **Linked mailbox** as additional options.
	Edit	Use this icon to edit an object.

	Delete	Use this icon to delete an object. Some delete icons have a down arrow you can click to show additional options.
	Search	Use this icon to open a search box in which you can type the search phrase for an object you want to find.
	Refresh	Use this icon to refresh the list view.
	More options	Use this icon to view more actions you can perform for that tab's objects. For example, in **Recipients** > **Mailboxes** clicking this icon shows the following options: **Disable**, **Add/Remove columns**, **Export data to a CSV file**, **Connect a mailbox**, and **Advanced search**.
	Up arrow and down arrow	Use these icons to move an object's priority up or down. For example, in **Mail flow** > **Email address policies** click the up arrow to raise the priority of an email address policy. You can also use these arrows to navigate the public folder hierarchy and to move rules up or down in the list view.

	Copy	Use this icon to copy an object so you can make changes to it without changing the original object. For example, in **Permissions** > **Admin roles**, select a role from the list view, and then click this icon to create a new role group based on an existing one.
–	Remove	Use this icon to remove an item from a list. For example, in the **Public Folder Permissions** dialog box, you can remove users from the list of users allowed to access the public folder by selecting the user and clicking this icon.

List view

When you select a tab, in most cases you'll see a list view. The list view in EAC is designed to remove limitations that existed in ECP. ECP can only display up to 500 objects, and if you want to view objects that aren't listed in the details pane, you need to use search and filter options to find those specific objects. In Exchange 2013, the viewable limit from within the EAC list view is approximately 20,000 objects for on-premises deployments and 10,000 objects in Exchange Online. In addition, paging is included so you can page to the results. In the **Recipients** list view, you can also configure page size and export the data to a CSV file.

Details pane

When you select an object from the list view, information about that object is displayed in the details pane. In some cases (for example, with recipient objects) the details pane includes quick management tasks. For example, if you navigate to **Recipients** > **Mailboxes** and select a mailbox from the list view, the details pane displays an option to enable or disable the archive for that mailbox. The details pane can also be used to bulk edit several objects. Simply press the CTRL key, select the objects you want to bulk edit, and use the options in the details pane. For example,

selecting multiple mailboxes allows you to bulk update users' contact and organization information, custom attributes, mailbox quota, Outlook Web App settings, and more.

Notifications

The EAC includes a notification viewer that displays the status of long-running processes and provides notifications when the process completes. In addition, for particularly long-running processes (such as a move requests), you can opt-in to receive email notifications.

Me tile and Help

The *Me tile* allows you to sign out of the EAC and sign in as a different user. From the Help ? drop-down menu, you can perform the following actions:

- **Help** Click ? to view the online help content.
- **Disable Help bubble** The Help bubble displays contextual help for fields when you create or edit and object. You can turn off the Help bubble help or turn it on if it has been disabled.
- **Copyright and Privacy** Click the privacy or copyright link to read the copyright and privacy information for Exchange 2013.

Supported browsers

For the best experience with the EAC, use one of the operating system and browser combinations labeled "Premium".

Note:
Other operating system and browser combinations not listed in the table are unsupported, including touch.

- **Premium:** All functional features are supported and fully tested.
- **Supported:** Has same functional feature support as premium. However, supported browsers will be missing features that the browser and operating system combination doesn't support.
- **Unsupported:** The browser and operating system isn't supported or tested.

Web Browser	Windows XP and Windows Server 2003	Windows Vista	Windows 7 and Windows Server 2008	Windows 8 and Windows Server 2012	Mac OSX	Linux
Internet Explorer 8	Supported	Supported	Premium	Unsupported	Unsupported	Unsupported
Internet	Unsupported	Supported	Premium	Unsupported	Unsupported	Unsupported

FAQ: Exchange admin center

Exchange Server 2013 > Exchange admin center in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-13*

This topic provides you with a list of frequently asked questions for the new Exchange admin center (EAC) in Microsoft Exchange Server 2013. Have other questions about EAC not answered here? Send us an email at Ex2013HelpFeedback@microsoft.com.

Was the EAC developed solely for Exchange Online?

The EAC serves all deployment options for Exchange 2013, including customers who want to deploy on-premises, in the cloud with Exchange Online, or a hybrid deployment.

Did you remove the Exchange Management Console (EMC) because you're building the interface primarily for small and mid-sized customers?

The EAC was developed to provide a single, intuitive management experience for all our customers

and was designed to help make the execution of the most common administration tasks simpler.

We created a single interface that provides a superset of scenario coverage over the Exchange Management Console (EMC) and the Exchange Control Panel (ECP) and one that addressed key challenges and scenarios for customers.

Additionally, we listened to customers of all sizes and their primary concerns were the following:

- Maintaining and downloading patches in order to operate an administrative tool is an operational overhead for customers which, in turn, increases operational costs.
- As the IT workforce becomes increasingly mobile, customers wanted to be able to manage their environments from anywhere, not only from the desktops and servers where their administrative tools are installed.
- Using multiple tools for different deployment options becomes confusing and increases training and operational costs

Is PowerShell logging and cmdlet exposure coming back to EAC?

We have taken early customer feedback on this and are evaluating the possibility of addressing this in a future update.

Will the EMC be reintroduced an upcoming service pack?

No. We fully support the EAC experience.

Can you use the Exchange 2010 EMC to manage Exchange 2013 objects?

No. You can't use the Exchange 2010 EMC to manage Exchange 2013 objects and servers. While customers upgrade to Exchange 2013, we encourage them to use the EAC to:

1. Manage Exchange 2013 mailboxes, servers, and corresponding services.
2. View and update Exchange 2010 mailboxes and properties.
3. View and update Exchange 2007 mailboxes and properties.

We encourage customers to use Exchange 2010 EMC to create Exchange 2010 mailboxes.

We encourage customers to use Exchange 2007 EMC to create Exchange 2007 mailboxes.

Customers can continue to perform management tasks using the Exchange Management Shell and script tasks.

Why isn't the search box always visible?

As part of our design principles for Exchange 2013, we wanted to help make sure that nothing is in your way until you need it. This simplicity is represented in all our end user experiences (including the EAC). The search box slides out after you click the icon. This provides more room for the user to type their query in the text box, and also provides type-downs that display once real-time query matching occurs. This improvement allows us to hide unnecessary complexity without diminishing the management experience. We will continue to enhance all of our experiences based on feedback.

Will EAC work on tablets?

Administration through tablets and mobile devices isn't supported at this time.

Why does Exchange 2010 ECP open when I try to access the Exchange 2013 EAC?

If your mailbox exists on an Exchange 2010 Mailbox server, the Exchange 2010 ECP will automatically load in your browser. This is by design. You can access the EAC by adding the Exchange version to the URL. For example, to access the EAC whose virtual directory is hosted on the Client Access server CAS01-NA, use the following URL: `https://CAS01-NA/ecp?ExchClientVer=15`.

How do you limit where EAC can be used?

To limit Internet versus intranet access, Exchange provides partitioning at the level of the virtual directory in IIS. Administrators can explicitly allow or deny IT management scenarios from being performed by external internet clients (for example, from clients not joined to a domain within the corporate firewall). For more information, see Turn off access to the Exchange admin center.

What's changed for the Exchange 2013 Toolbox?

In Exchange 2007 and Exchange 2010, the EMC contained the Toolbox, which provided access to various tools for managing your Exchange organization. The Exchange 2013 Toolbox is considerably pared down from the previous versions. The Details Templates Editor, Remote Connectivity Analyzer, and the Queue Viewer are still available in the Exchange 2013 Toolbox. The remaining tools were either repurposed or moved into the EAC.

The following table lists the changes to the Exchange 2013 Toolbox:

Tool	Where is it now?

Exchange Best Practices Analyzer (ExBPA)	The ExBPA has been retired. Readiness checks have replaced the ExBPA to make sure that your Active Directory forest and Exchange servers are ready for Exchange 2013. Each readiness check topic describes the actions that you can take to resolve issues that are found when the readiness checks are run. You should only perform the steps outlined in a readiness check topic if that readiness check was displayed during setup.
Mail Flow Troubleshooter	The Mail Flow Troubleshooter has been retired. You can now use the messaging tracking feature in the EAC. Go to **Mail flow** > **Delivery reports**.
Performance Monitor	The Performance Monitor has been retired from the Toolbox. You can still find the Performance Monitor under **Administrative Tools** in Windows Server 2008 and Windows Server 2012.
Performance Troubleshooter	The Performance Troubleshooter has been retired from the Toolbox.
Routing Log Viewer	The Routing Log Viewer has been retired.
Public Folder Management Console	Public folders are now managed from within the EAC. In the EAC, go to **Public Folders**.
Role Based Access Control (RBAC) User Editor	RBAC is now managed from within the EAC. In the EAC, go to **Permissions**.

Turn off access to the Exchange admin

center

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-05-20*

For security purposes, some organizations may want to restrict access to the Exchange admin center (EAC) for users coming from the Internet. This procedure shows you how to turn off access to the EAC. This procedure doesn't prevent users from accessing the Options in Outlook Web App.

Note:

This procedure disables EAC administrator access entirely on the CAS server where the steps are applied. If you to enable EAC administrator for internal users, you should install a separate CAS server and configure it to only handle internal requests using the following command:
`Set-ECPVirtualDirectory -Identity "InternalCAS\ecp (default web site)" -AdminEnabled $True`

Caution:

The procedure applies only to on-premises deployments of Exchange Server 2013.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange admin center connectivity" entry in the Exchange and Shell infrastructure permissions topic.
- You can't use the EAC to perform this procedure. You must use the Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Shell to turn off Internet access to the EAC

This example turns off the access to the EAC on server CAS01.

```
Set-ECPVirtualDirectory -Identity "CAS01\ecp (default web site)" -AdminEnabled $false
```

For detailed syntax and parameter information, see Set-EcpVirtualDirectory.

How do you know this worked?

To verify that you have successfully turned off access to the EAC, do the following:

1. Using your Internet browser, type your organization's internal or external URL for accessing Outlook Web App but replace the **/owa** identifier with **/ecp**. For example, if your external URL for accessing Outlook Web App is https://primary.tailspintoys.com/owa, use https://primary.tailspintoys.com/ecp.
2. If access is turned off, you'll receive a **404 – website not found** error.

Find the internal and external URLs for the Exchange admin center

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-04*

Because the Exchange admin center (EAC) is a web-based management console in Exchange Server 2013, you access it by using the ECP virtual directory URL in a web browser. This topic shows you how to find the ECP virtual directory URL.

Note:

The ECP is the web-based user interface developed for Exchange Server 2010. The EAC cmdlets for virtual directories still use "ECP" in the name, and these cmdlets can be used to manage Exchange 2010 and Exchange 2013 ECP virtual directories.

To learn more about the EAC, see Exchange admin center in Exchange 2013.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You can't use the EAC to perform this procedure. You must use the Shell.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Administration Center connectivity" entry in the Exchange and Shell infrastructure permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Shell to find the internal and external URLs for the ECP virtual directory

This example returns the ECP virtual directory name, internal URL, and external URL in a formatted list.

```
Get-ECPVirtualDirectory | Format-List
Name,InternalURL,ExternalURL
```

When the command is completed, use the *InternalURL* or *ExternalURL* values in your web browser to launch the EAC.

For detailed syntax and parameter information, see Get-EcpVirtualDirectory.

Keyboard shortcuts in the Exchange admin center

Exchange Server 2013 > Exchange admin center in Exchange 2013 >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2013-02-10*

Microsoft is committed to making its products and services easier for everyone to use. The following sections provide information about the keyboard shortcuts that make Microsoft Exchange and other Microsoft products and services more accessible for people with disabilities.

Keyboard shortcuts in Exchange

By using keyboard shortcuts in the Exchange admin center (EAC), you can quickly accomplish the common tasks described in the following table. To learn more about the Exchange admin center, see Exchange admin center in Exchange 2013 and **Exchange admin center in Exchange Online**.

Keyboard shortcuts in the Exchange admin center

To do this	Use this keyboard shortcut
Move between areas or between controls in the EAC	Tab and Shift-Tab

Move between items in drop-down menus in the EAC	Up and Down arrow keys. **Note:** Tab and SHIFT-Tab aren't supported to be used to move between menu items in this case.
Move within lists from one item to another	Up, Down, Home, End, Page Up, Page Down arrow keys. **Note:** You can also use Up, Down, Left, and Right arrow keys to move between option buttons or within a group of associated check boxes.
Move within primary property pages from one item to another	Up, Down, Home, End, Page Up, Page Down, Tab, Shift-Tab arrow keys. You can use Enter or the Spacebar to activate your selection.
Move within secondary property pages from one item to another	Up, Down, Home, End, Page Up, Page Down, Tab, Shift-Tab arrow keys. You can use Enter or the Spacebar to activate your selection.

Keyboard shortcuts in other Microsoft products and services

To learn about keyboard shortcuts for other Microsoft products, visit the Keyboard Shortcuts page on the Microsoft Accessibility Web site. There, you can search for the keyboard shortcuts for a specific product, such as Windows Server 2008.

In addition, for information about accessibility features in Microsoft Office 365, including keyboard shortcuts, see Accessibility in Office 365.

Server health and performance

Exchange Server 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-08*

Understanding server health and performance is critical to designing and maintaining a high-

performance messaging infrastructure. Microsoft Exchange Server 2013 introduces improvements in server health and performance.

Looking for a list of all server health and performance topics? See Server health and performance documentation.

Managed availability

Exchange 2013 introduces the concept of *managed availability*. Managed availability runs on every Exchange 2013 server. It's made up of two processes, the Exchange Health Manager Service (MSExchangeHMHost.exe) and the Exchange Health Manager Worker process (MSExchangeHMWorker.exe), and the following asynchronous components:

- **Probe engine** The *probe engine* takes measurements on the server.
- **Monitoring probe engine** The *monitoring probe engine* stores the business logic about what constitutes a healthy state. It functions like a pattern recognition engine, looking for patterns and measurements that differ from a healthy state, and then evaluating whether a component or feature is unhealthy.
- **Responder engine** When the *responder engine* is alerted about an unhealthy component, its first action is to try to recover that component. Managed availability enables multi-stage recovery actions. The first attempt may be to restart the application pool, the second attempt may be to restart the corresponding service, and the third attempt may be to restart the server. And, the final attempt may be to put the server offline, so that it no longer accepts traffic. If all of these actions fail, an alert is sent to the help desk.

For more information about managed availability, see Managed Availability.

Workload management

Exchange 2013 workload management includes the following components:

- *User workload management* is the new name for the user throttling features of Exchange Server 2010. You can customize these setting based on the needs of your environment.
- *System workload management* is new for Exchange 2013 and is used to automatically throttle specific Exchange workloads by monitoring the health of key server resources. These settings should be customized only under the direction of Microsoft Customer Service and Support.

For more information, see Exchange workload management.

Server health and performance documentation

The following table contains links to topics that will help you learn about and manage server health and performance in Exchange 2013.

Topic	Description

Exchange workload management	Learn about managing Exchange workloads by controlling how resources are consumed by individual users.
Managed Availability	Learn about the built-in resource monitoring and recovery actions that are available in Exchange 2013.

Exchange workload management

Exchange Server 2013 > Server health and performance >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-08-08*

An Exchange workload is an Exchange Server feature, protocol, or service that's been explicitly defined for the purposes of Exchange system resource management. Each Exchange workload consumes system resources such as CPU, mailbox database operations, or Active Directory requests to run user requests or background work. Examples of Exchange workloads include Outlook Web App, Exchange ActiveSync, mailbox migration, and mailbox assistants.

You manage Exchange workloads by controlling how resources are consumed by individual users (sometimes called user throttling in Exchange 2010). Controlling how Exchange system resources are consumed by individual users was possible in Exchange Server 2010, and this capability has been expanded for Exchange Server 2013.

Note:

Managing workloads by monitoring the health of system resources on the Exchange servers in your organization should only be done under the direction of Microsoft Customer Service and Support.

Managing workloads by controlling how resources are consumed by individual users

Throttling functionality is enhanced in Exchange 2013. The enhanced functionality helps make sure that excessive resource consumption by individual users doesn't adversely affect server performance or the user experience.

By default, user throttling in Exchange 2013 allows users to increase resource consumption for short periods without experiencing any reduction in bandwidth. Also, the complete lockout of users who

use a very large amount of resources will be infrequent, or never occur. Rather than completely blocking a user from performing operations, throttling occurs and processes are delayed for short periods of time (think of them as "microdelays"), occurring before they cause a significant impact on a server.

Feature Highlights

Here are some highlights of the way Exchange controls how resources are consumed by individual users in Exchange 2013:

- **Burst allowances** Burst allowances let your users perform short periods of increased resource consumption without experiencing any throttling.
- **Recharge rate** Recharge rate manages your users' resource consumption by using a resource budget system. You can set the rate at which your users' resource budgets are recharged. For example, a value of 600,000 (in milliseconds) implies that users' budgets get recharged at a rate of ten minutes of usage per hour.
- **Traffic shaping** When a user's resource usage reaches the configured limit over a period of time, that user is delayed for very short periods of time well in advance of causing a significant impact on a server. Users generally don't notice these "microdelays." This process enables Exchange 2013 to efficiently shape traffic without blocking users from being productive. Traffic shaping has less impact on your users than early lockout, and it significantly reduces the chance that a lockout will occur.
- **Maximum usage** In rare circumstances, a user may consume a very high amount of resources over a short period of time. As a precaution, a user who reaches a maximum usage threshold may be temporarily blocked from using resources. Users who are temporarily blocked from resource usage are unblocked as soon as their usage budgets are recharged.

For a list of cmdlets you can use to control how resources are consumed by individual users, see "Cmdlets to control how resources are used by individual users" later in this topic.

Exchange 2013 throttling functionality and deployment considerations

Whether you perform a clean installation of Exchange 2013 or install Exchange 2013 into a coexistence environment that includes Exchange 2010 computers, all users with mailboxes on computers running Exchange 2013 are throttled using the new Exchange 2013 throttling functionality. However, Exchange 2010 mailboxes will remain throttled by Exchange 2010 throttling functionality when they access their mailboxes through Exchange 2010 Client Access servers.

When Exchange 2013 is installed into a coexistence environment, the Exchange 2013 installation process may try to carry forward some of the throttling settings that you had set in your Exchange 2010 configuration. However, the Exchange 2013 throttling functionality is so different that the impact of any legacy throttling settings will generally not impact how throttling works in Exchange 2013.

Managing throttling policies by using scopes

Similar to Exchange 2010, there's a single default throttling policy in Exchange 2013. In Exchange 2013, the default throttling policy is named **GlobalThrottlingPolicy**. This policy has the **Global**

scope. The other available user throttling scopes are **Organization** and **Regular**. Due to the introduction of scope assignment for Exchange 2013 user throttling policies, you manage throttling policies differently than in Exchange 2010. The **GlobalThrottlingPolicy** defines the baseline default throttling settings for every new and existing user in your organization unless you have customized throttling policies for your organization. In many typical Exchange deployment scenarios, the **GlobalThrottlingPolicy** will be adequate to manage your users.

We strongly recommend that you don't customize throttling settings by modifying the **GlobalThrottlingPolicy**. Instead, you should create additional throttling policies. Creating additional throttling policies will help you better manage your workloads. It will also prevent any modifications to throttling policy settings from being overwritten by future Exchange 2013 updates.

To customize throttling settings that apply to all users in your organization, create a new throttling policy with the scope assignment **Organization**. In new Organization-scope policies, you should only set the throttling settings that are different from those in the **GlobalThrottlingPolicy**. To customize throttling settings that apply only to specific users in your organization, create a new throttling policy with the scope assignment **Regular**. In new Regular-scope policies, you should only set the throttling settings that are different from those in the **GlobalThrottlingPolicy** and any other organization policies. This will help you to inherit the rest of the policy settings from the **GlobalThrottlingPolicy** and let you benefit from any updates to throttling policies that are added in future Exchange updates.

Managing workload throttling settings

You manage Exchange workload throttling settings by using the Exchange Management Shell.

Cmdlets to control how resources are used by individual users

You manage throttling settings with the following cmdlets, which were introduced in Exchange 2010:

Manage throttling policies

- Get-ThrottlingPolicy
- New-ThrottlingPolicy
- Remove-ThrottlingPolicy
- Set-ThrottlingPolicy

Assign throttling policies

- Get-ThrottlingPolicyAssociation
- Set-ThrottlingPolicyAssociation

Note:

The ***-ResourcePolicy**, ***-WorkloadManagementPolicy** and ***-WorkloadPolicy** system workload management cmdlets have been deprecated. System workload management settings should be customized only under the direction of Microsoft Customer Service and Support.

Change user throttling settings for specific users

Topic Last Modified: *2014-08-05*

You can control how resources are consumed by individual users in your Exchange organization by changing the default throttling settings.

Controlling how resources are consumed by individual users was possible in Exchange Server 2010, and this capability has been expanded for Exchange Server 2013. The policy named GlobalThrottlingPolicy defines the default throttling settings for every new and existing user in your organization unless you've customized the throttling policies. In many typical Exchange deployment scenarios, the policy named GlobalThrottlingPolicy is adequate to manage users.

To customize throttling settings to apply only to specific users in your organization, create a new throttling policy with the scope assignment Regular. You can only change the default throttling settings by using the Shell.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.
- In new Regular-scope policies, you should set only the throttling settings that are different from those in the policy named GlobalThrottlingPolicy and any other organization policies. This way, the rest of the policy settings from the policy named GlobalThrottlingPolicy will be inherited, as will any updates to throttling policies that are added in future Exchange updates. We recommend that you review the section "Manage throttling policies using scopes" in the topic Exchange workload management before following this procedure.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to change the way resources can be used by specific users in your entire organization

This example creates a non-default user throttling policy named ITStaffPolicy that can be associated with specific users. Any parameters that you omit inherit the values from the default throttling policy GlobalThrottlingPolicy. After you create this policy, you must associate it with specific users.

```
New-ThrottlingPolicy -Name ITStaffPolicy -EwsMaxConcurrency
4 -ThrottlingPolicyScope Regular
```

This example associates a user with the user name tonysmith with the throttling policy ITStaffPolicy (which has higher limits).

```
Set-ThrottlingPolicyAssociation -Identity tonysmith -
ThrottlingPolicy ITStaffPolicy
```

You don't need to use the **Set-ThrottlingPolicyAssociation** cmdlet to associate a user with a policy. The following commands show another way to associate tonysmith with the throttling policy ITStaffPolicy.

```
$b = Get-ThrottlingPolicy ITStaffPolicy

Set-Mailbox -Identity tonysmith -ThrottlingPolicy $b
```

For more information about syntax and parameters, see New-ThrottlingPolicy and Set-ThrottlingPolicyAssociation.

How do you know this worked?

To verify that you've successfully created the Regular throttling policy, do the following:

1. Run the following command.

```
Get-ThrottlingPolicy | Format-List
```

2. Verify that the Regular throttling policy you just created is listed in the column that shows the GlobalThrottlingPolicy object.
3. Run the following command.

```
Get-ThrottlingPolicy | Format-List
```

4. Verify that the properties for the new Regular policy match the value or values you configured.
5. Run the following command.

```
Get-ThrottlingPolicyAssociation
```

6. Verify that the new Regular policy is associated with the user or users you associated it with.

Change user throttling settings for all users in your organization

Topic Last Modified: *2014-08-05*

You can control how resources are consumed by individual users in your Exchange organization by changing the default throttling settings.

Controlling how resources are consumed by individual users was possible in Exchange Server 2010, and this capability has been expanded for Exchange Server 2013. The policy named GlobalThrottlingPolicy defines the default throttling settings for every new and existing user in your organization unless you've customized the throttling policies. In many typical Exchange deployment scenarios, the policy named GlobalThrottlingPolicy is adequate to manage users.

To customize throttling settings that apply to all users in your organization, create a new throttling policy with the scope assignment Organization. You can only change the default throttling settings by using the Shell.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "User throttling" entry in the Server health and performance permissions topic.
- In new Organization-scope policies, you should set only the throttling settings that are different from those in the policy named GlobalThrottlingPolicy and any other organization policies. This way, the rest of the policy settings from the policy named GlobalThrottlingPolicy will be inherited, as will any updates to throttling policies that are added in future Exchange updates. We recommend that you review the section "Manage throttling policies using scopes" in the topic Exchange workload management before following this procedure.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to change the way resources can be used by all users in your entire organization

This example creates a throttling policy that applies to all users in your organization. Any parameters that you omit inherit the values from the default throttling policy GlobalThrottlingPolicy.

```
New-ThrottlingPolicy -Name AllUsersEWSPolicy
EwsMaxConcurrency 4 -ThrottlingPolicyScope Organization
```

For more information about syntax and parameters, see New-ThrottlingPolicy.

How do you know this worked?

To verify that you've successfully created the Organization throttling policy, do the following:

1. Run the following command.

```
Get-ThrottlingPolicy | Format-List
```

2. Verify that the Organization throttling policy you just created is listed in the column that shows the GlobalThrottlingPolicy object.
3. Run the following command.

```
Get-ThrottlingPolicy | Format-List
```

4. Verify that the properties for the new Organization policy match the value or values you configured.

About Exchange documentation

Exchange Server 2013 >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-19*

You're reading a collection of conceptual and procedural topics organized by subject or by technologies used by Microsoft Exchange. You can access each topic directly from the table of contents in the left pane, from a link in another Help topic, from the results of a search, or from your own custom list of favorite topics.

Other information related to Exchange documentation is in Third-party copyright notices.

Where to find Exchange documentation

The Exchange Server for IT pros TechCenter is your primary gateway to in-depth technical information about Microsoft Exchange. Through the TechCenter, which is located on the Microsoft

TechNet site, you can access the Exchange Library and the Exchange Team Blog.

If you're an admin for an Exchange hybrid or Exchange Online deployment, you may also be interested in the Office 365 for IT pros TechCenter.

The Exchange Library contains the most up-to-date Help documentation. This documentation is reviewed and approved by the Exchange product team and evolves as new information, issues, and troubleshooting tips becomes available.

The Exchange Team Blog contains technical articles written by the Exchange Team, as well as product announcements and updates. The blog is an excellent way to interact with the Exchange Team. We read and respond to your feedback and comments.

Tip:

Looking for an offline version of Exchange Help content? Download the Help files from the Microsoft Download Center as follows:
Exchange Server 2013, including hybrid deployments
Exchange Online

Additional resources

Looking for more than just documentation? Check out these other Exchange resources:

- Exchange Server Downloads Use this page to download service packs, add-ins, tools, and trial software to help you optimize your Exchange organization.
- Exchange Server Forums The forum provides a place to discuss Exchange with users and Exchange Team members.
- Exchange Server for Developers You'll find Exchange developer documentation here.
- Support for Microsoft Exchange Server Check out this page for support resources for multiple versions of Exchange.
- Accessibility for people with disabilities This topic provides important information about features, products, and services that help make Microsoft Exchange more accessible for people with disabilities.

Accessibility for people with disabilities

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-24*

Microsoft is committed to making its products and services easier for everyone to use. The following sections provide information about the features, products, and services that make Microsoft Exchange more accessible for people with disabilities:

- Accessibility features of Exchange
- Accessibility features of Exchange Help
- Accessibility products and services from Microsoft

Accessibility features of Exchange

The following features help make Microsoft Exchange more accessible for people with disabilities:

- Keyboard shortcuts in the Exchange admin center
- Keyboard Shortcuts in Outlook Web App

In addition, some accessibility features and utilities of Windows may benefit Exchange users with disabilities. Also, Windows PowerShell size and color changes provide accessibility options when using the Exchange Management Shell. For more information about Windows PowerShell accessibility options, see Accessibility in Windows PowerShell 2.0 ISE.

Accessibility features of Exchange Help

Every figure in Help for Microsoft Exchange, including screenshots, diagrams, flow charts, and other figures, has associated alternate text. Users who have difficulty viewing figures can pause the cursor on the figure to read the alternate text. The alternate text describes what is illustrated in the figure.

Accessibility products and services from Microsoft

The following sections provide information about the features, products, and services that make Microsoft Windows more accessible for people with disabilities.

Note:

The information in this section applies only to users who license Microsoft products in the United States. If you obtained this product outside of the United States, visit the Microsoft Accessibility website for a list of telephone numbers and addresses for Microsoft support services. You can contact your subsidiary to find out whether the type of products and services described in this section are available in your area. You can learn more about the accessibility features included in Microsoft products on the Accessibility in Microsoft Products web site.

Accessibility features of Windows

The Windows operating system has many built-in accessibility features that are useful for individuals who have difficulty typing or using a mouse, are blind or have low vision, or who are deaf or hard-of-hearing. The features are installed during Setup. For more information about these features, see Help in Windows and Microsoft Accessibility.

- **Free step-by-step tutorials** Microsoft offers a series of step-by-step tutorials that provide detailed procedures for adjusting the accessibility options and settings on your computer. This information is presented in a side-by-side format so that you can learn how to use the mouse, the keyboard, or a combination of both.

To find step-by-step tutorials for Microsoft products, see Microsoft Accessibility.

- **Assistive technology products for Windows** A wide variety of assistive technology products are available to make computers easier to use for people with disabilities. You can search a catalog of assistive technology products that run on Windows at Microsoft Accessibility.

If you use assistive technology, be sure to contact your assistive technology vendor before you upgrade your software or hardware to check for possible compatibility issues.

Documentation in alternative formats

If you have difficulty reading or handling printed materials, you can obtain the documentation for many Microsoft products in more accessible formats. You can obtain an index of accessible product documentation at Microsoft Accessibility.

In addition, you can obtain additional Microsoft publications from Learning Ally. Learning Ally distributes these documents to registered, eligible members of their distribution service. For information about the availability of Microsoft product documentation and books from Microsoft Press, contact Learning Ally.

Learning Ally 20 Roszel Road Princeton, NJ 08540 Telephone number from within the United States: (800) 221-4792 Web site: Learning Ally

Customer service for people with hearing impairments

If you're deaf or hard-of-hearing, complete access to Microsoft product and customer services is available through a text telephone (TTY/TDD) service:

- For customer service, contact Microsoft Sales Information Center at (800) 892-5234 between 6:30 A.M. and 5:30 P.M. Pacific Time, Monday through Friday, excluding holidays.
- For technical assistance in the United States, contact Microsoft Product Support Services at (800) 892-5234 between 6:00 A.M. and 6:00 P.M. Pacific Time, Monday through Friday, excluding holidays. In Canada, dial (905) 568-9641 between 8:00 A.M. and 8:00 P.M. Eastern Time, Monday through Friday, excluding holidays.

Microsoft Support Services are subject to the prices, terms, and conditions in place at the time the service is used. For more information, see Microsoft Support.

For more information

For more information about how accessible technology for computers helps to improve the lives of people with disabilities, see Microsoft Accessibility.
