When you're installing your Client Access and Mailbox servers and deploying Unified Messaging, you don't have to associate or add Client Access or Mailbox servers to UM dial plans. Client Access and Mailbox servers answer all incoming calls and then use the UM dial plans to locate users.

However, if you're integrating Unified Messaging with Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server, both the SIP and the RTP or SRTP media channels for incoming calls are handled by Lync servers and the Mailbox server. In a Lync integrated environment, you don't have VoIP gateways, IP PBXs, or SBCs. To Lync, the Mailbox server that's running the Microsoft Exchange Unified Messaging service looks just like an Exchange 2010 UM server. The Mailbox server and the Client Access server are considered trusted peers because both servers must be added to a SIP dial plan. Lync routes the incoming call using the Inbound Routing component, which uses SIP to communicate with the Client Access server and then route the call to a Mailbox server.

Return to top

Server configuration settings

In Exchange 2013, all the UM components and configuration settings that applied to a single computer running the Unified Messaging server role in Exchange 2010 are still available. However, some of those components and configuration settings are found on a Client Access server and others are available on a Mailbox server. In some cases, the same setting is available on both. The following list shows the parameters and settings that are available on both a Client Access server and a Mailbox server.

- [-DialPlans <MultiValuedProperty>]
- [-MaxCallsAllowed <Int32>]
- [-SipTcpListeningPort <Int32>]
- [-SipTlsListeningPort <Int32>]
- [-Status <Enabled | Disabled | NoNewCalls>]
- [-UMStartupMode <TCP | TLS | Dual>]

For the Mailbox server, you'll use the **Set-UMService**, **Get-UMService**, **Enable-UMService**, and

Disable-UMService cmdlets to view or configure UM properties for the Microsoft Exchange Unified Messaging service. A different set of cmdlets, **Set-UMCallRouterSettings** and **Get-UMCallRouterSettings**, are used to view or configure the Microsoft Exchange Unified Messaging Call Router service properties on a Client Access server. This ensures that the existing **Get-UMServer**, **Set-UMServer**, **Enable-UMServer**, and **Disable-UMServer** cmdlets from Exchange 2007 and Exchange 2010 will work in a coexistence deployment with Exchange 2013 Mailbox servers. This also ensures that the cmdlets will work when the Mailbox and Client Access servers are installed on the same or different computers.

Return to top

Server operation

When Client Access and Mailbox servers are installed, they're automatically enabled so they can answer incoming and outgoing voice calls and route voice mail messages to the intended recipients in your Exchange organization.

You can allow the Microsoft Exchange Unified Messaging service on a Mailbox server or the Microsoft Exchange Unified Messaging Call Router service on a Client Access server to answer new calls, or prevent it from doing so. By default, a Mailbox or Client Access server is in an enabled state after it's installed. When you're setting the Mailbox or Client Access server to accept incoming voice, fax, auto attendant, and Outlook Voice Access calls, you use the **Set-ServerComponentState** cmdlet.

Configuring Maintenance Mode for an Exchange 2013 Mailbox or Client Access server lets you take the server out of service. For a Mailbox server, out-of-service means that the server won't host any active databases, all transport queues are empty, and the server won't accept any incoming calls from Client Access servers, VoIP gateways, IP PBXs, SIP-enabled PBXs, or SBCs. For a Client Access server, out-of-service means that the server won't accept any incoming calls from VoIP gateways, IP PBXs, SIP-enabled PBXs or SBCs.

In Exchange 2007 and Exchange 2010, there was a status parameter that could be used to control the operational status of a Unified Messaging server. In Exchange 2013, no status parameter is available for that purpose on the **Set-UMService** cmdlet for a Mailbox server or the **Set-UMCallRouterSettings** cmdlet on a Client Access server.

Although the Client Access and Mailbox servers are set to enabled when they're installed, neither server can correctly process and route incoming calls to UM-enabled users until a UM dial plan is linked with at least one UM IP gateway.

After a dial plan is linked with a UM IP gateway, the Client Access and Mailbox servers locate all UM IP gateways that are associated with the UM dial plan and VoIP gateways, IP PBXs, and SBCs. To detect and identify any configuration changes on either UM dial plans or UM IP gateways, the Client Access or Mailbox servers check the configuration every 10 minutes.

If the UM IP gateway identifies any changes to the configuration, the Client Access or Mailbox

server reacts accordingly, and either starts using or stops using the appropriate VoIP gateway, IP PBX, or SBC. After the Client Access and Mailbox servers answer incoming calls for users linked with a UM dial plan and they're correctly communicating with VoIP gateways, IP PBXs, and SBCs, you can run a set of diagnostic operations to verify that they're operating correctly and that connectivity between the Exchange servers and VoIP gateways, IP PBXs, or SBCs is working correctly.

Return to top

UM protocols, ports, and services

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-04-25*

Microsoft Exchange 2013 Unified Messaging (UM) requires that several TCP and User Datagram Protocol (UDP) ports be used to establish communication between servers running Exchange 2013 and other devices. By allowing access through these IP ports, you enable Unified Messaging to function correctly. This topic discusses the TCP and UDP ports used in Exchange 2013 Unified Messaging.

Unified Messaging protocols and services

Exchange 2013 Unified Messaging features and services rely on static and dynamic TCP and UDP ports to ensure correct operation of Client Access servers running the Microsoft Exchange Unified Messaging Call Router service and Mailbox servers running the Microsoft Exchange Unified Messaging service.When Exchange 2013 is installed, static inbound Windows Firewall rules are added for Exchange. If you change the TCP ports that are used by Client Access and Mailbox servers, you may also need to reconfigure the Windows Firewall rules to allow Unified Messaging to work correctly.

Important:
On Exchange 2013 Client Access and Mailbox servers running UM components and services, Exchange setup creates inbound firewall rules that allow inbound communication without any TCP port restrictions. The following inbound rules for UM services are added:

1. **SESWorker (GFW) (TCP-In)**
2. **UMCallRouter (GFW) (TCP-In)**
3. **UMCallRouter (TCP-In)**
4. **UMService (GFW) (TCP-In)**
5. **UMService (TCP-In)**
6. **UMWorkerProcess – RPC (TCP-In)**

7. UMWorkerProcess (GFW) (TCP-In)
8. UMWorkerProcess (TCP-In)

Session Initiation Protocol

Session Initiation Protocol (SIP) is a protocol used for initiating, modifying, and ending an interactive user session that involves multimedia elements such as video, voice, instant messaging, online games, and virtual reality. It's one of the leading signaling protocols for Voice over IP (VoIP), together with H.323. Most VoIP standards-based solutions use either H.323 or SIP. However, several proprietary designs and protocols also exist. The VoIP protocols typically support features such as call waiting, conference calling, and call transfer.

SIP clients such as VoIP gateways and IP Private Branch eXchanges (PBXs) can use TCP and UDP port 5060 to connect to SIP servers, including Client Access servers running the Microsoft Exchange Unified Messaging Call Router service. SIP is used only for setting up and tearing down voice or video calls. All voice and video communications occur over Realtime Transport Protocol (RTP).

Real-Time Transport Protocol

RTP defines a standard packet format for delivering audio and video over a specific network, such as the Internet. RTP carries only voice/video data over the network. Call setup and teardown are generally performed by SIP.

RTP doesn't require a standard or static TCP or UDP port to communicate with. RTP communications occur on an even number UDP port, and the next higher odd number port is used for TCP communications. Although there are no standard port range assignments, RTP is generally configured to use ports between 1024 and 65535, and Mailbox servers running the Microsoft Exchange Unified Messaging service follow this convention. It's difficult for RTP to traverse firewalls because it uses a dynamic port range.

Unified Messaging Web services

The Unified Messaging Web services installed on Mailbox servers use IP for network communication between a client, the Mailbox server, and computers running other Exchange 2013 server roles. Several Exchange 2013 Outlook Web App and Outlook 2013 client features rely on Unified Messaging Web services to operate correctly.

The following Unified Messaging client features rely on Unified Messaging Web services:

- Voice mail options available with Exchange 2013 Outlook Web App, including the Play on Phone feature and the ability to reset a PIN.
- The Play on Phone feature found in an Outlook client.

UM ports

The Microsoft Exchange Unified Messaging Call Router service found on a Client Access server uses SIP over either Transmission Control Protocol (TCP) or mutual Transport Layer Security (mutual TLS) to communicate with Mailbox servers that are running the Microsoft Exchange Unified Messaging service. To avoid TCP/User Datagram Protocol (UDP) port conflicts, the Microsoft Exchange Unified Messaging Call Router service and Microsoft Exchange Unified Messaging service default to and listen on different TCP ports. They can accept both unsecured and secured connections, depending on whether mutual TLS is used with SIP and RTP traffic. By default, a Client Access server listens for SIP requests on both TCP port 5060 in Unsecured mode and TCP port 5061 in SIP Secured mode when mutual TLS is used. These ports are configurable using the **Set-UMCallRouterSettings** cmdlet. The Microsoft Exchange Unified Messaging Call Router service on the Client Access server doesn't handle media (RTP or SRTP) traffic, so only TCP ports and no UDP ports are used. By default, a Mailbox server listens for SIP requests on both TCP port 5062 in Unsecured mode and TCP port 5063 in SIP Secured mode when mutual TLS is used. These ports aren't configurable using Exchange Management Shell cmdlets. The Microsoft Exchange Unified Messaging service on the Mailbox server will accept connections from a Client Access server on SIP ports 5062 and 5063. After the Client Access server redirects the SIP request to a Mailbox server, an RTP or SRTP media channel is created using a VoIP gateway, IP PBX, or SBC, and the Microsoft Exchange Unified Messaging worker process on the Mailbox server.

The following table summarizes the Exchange 2013 ports and protocols, and whether the ports can be changed.

UM listening ports

Protocol	TCP port	UDP port	Can the ports be changed?
SIP (Client Access server – Microsoft Unified Messaging Call Router service)	5060 (unsecured), 5061 (secured). The service listens on both ports.	Not applicable	Yes, using the **Set-UMCallRouterSettings** cmdlet.
SIP (Mailbox server – Microsoft Exchange Unified Messaging service)	5062 (unsecured), 5063 (secured). The service listens on both ports.	Not applicable	Ports can't be changed.
SIP (Mailbox server - UM worker process)	5065 and 5067 for TCP (unsecured). 5066 and 5068 for mutual TLS (secured).	Not applicable	Ports can't be changed.

RTP (Mailbox server - UM worker process)	Not applicable	Ports between 1024 and 65535.	The range of ports can be changed through the registry (however, this isn't a supported configuration): HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Microsoft Speech Server\2.0\AudioConnectionMinPort HKLM\SOFTWARE\Microsoft\Microsoft Speech Server\2.0\AudioConnectionMaxPort

Lync Server and UM ports

Exchange 2013 Unified Messaging supports Network Address Translation (NAT) traversal and allows for the RTP media to a Mailbox server to be tunneled through a NAT firewall. However, for this to work, you must also have Microsoft Office Communications Server 2007 R2 and Microsoft Lync Server 2010 or Microsoft Lync 2013 deployed in your environment. If you deploy both Exchange 2013 and Communications Server 2007 R2 or Microsoft Lync Server 2010 or Lync 2013 on your network, this deployment will enable Mailbox servers running the Microsoft Exchange Unified Messaging service to communicate with endpoints outside a NAT firewall. The Mailbox server is associated with a Communications Server 2007 R2, Microsoft Lync Server 2010, or a Lync 2013 pool and obtains the appropriate authentication tokens from the A/V Authentication service on a computer serving that particular Communications Server 2007 or Lync Server pool.

The A/V Authentication service is used to allow RTP voice media to traverse NAT devices and firewalls. This is necessary because media gateways handle signaling only and cannot transport voice securely across a NAT device or firewall. When you configure a Mediation Server in Communications Server 2007 R2, Lync Server 2010, or Lync 2013, you specify the A/V Edge server on which the A/V Authentication service is running so that the Mediation Server will know where to forward the incoming media packets.

For more information about how to deploy Communications Server 2007 R2 or Lync Server 2010 or

2013 and Exchange 2013 Unified Messaging, see the following:

- Deploying Exchange 2013 UM and Lync Server overview
- Checklist: Integrate Exchange 2013 UM with Lync Server

After you install a Mailbox server that is running the Microsoft Exchange Unified Messaging service,

you can configure several options, including the number of concurrent calls, the TCP and Transport Layer Security (TLS) listening ports, the status, and the UM startup mode.

Important:
It's not required that Mailbox servers be added to a UM dial plan before it can process calls for Unified Messaging (UM), except when you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server. By default, all Mailbox servers in an organization are available to answer incoming calls.

For additional management tasks related to Unified Messaging and Mailbox servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox server (UM service)" entry in the Unified Messaging permissions topic.
- Verify that the Mailbox server is installed, either on the same computer as the Client Access server or on a separate computer.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the Shell to configure Unified Messaging properties on a Mailbox server

This example removes a Mailbox server named `MyMailboxServer` from all Session Initiation Protocol (SIP) dial plans.

```
Set-UMService -Identity MyMailboxServer -DialPlans $null
```

This example adds the Mailbox server named `MyMailboxServer` to a UM SIP dial plan named `MySIPDialPlanName` and also sets the maximum number of incoming voice calls.

```
Set-UMService -Identity MyMailboxServer -DialPlans
MySIPDialPlanName -MaxCalls 150
```

This example sets the startup mode to Dual mode on a Mailbox server named `MyUMServer`.

```
Set-UMService -Identity MyMailboxServer -DialPlans
MySIPDialPlanName -UMStartUpMode -Dual
```

Use the Shell to view Mailbox server properties

This example displays a list of all the Mailbox servers.

```
Get-UMService
```

This example displays a formatted list of properties for the Mailbox server named `MyMailboxServer`.

```
Get-UMService -Identity MyMailboxServer | Format-List
```

Manage UM settings on a Client Access server

Connect your voice mail system to your telephone network > UM services > UM services procedures >

What do you want to do?

Use the Shell to configure Unified Messaging properties on a Client Access server

This example removes a Client Access server named `MyClientAccessServer` from all Session Initiation Protocol (SIP) dial plans.

```
Set-UMCallRouterSettings -DialPlans $null - Server
MyClientAccessServer
```

This example adds a Client Access server named `MyClientAccessServer` to a SIP dial plan named `MySIPDialPlan` and also sets the maximum number of incoming voice calls.

```
Set-UMCallRouterSettings -DialPlans MySIPDialPlan -MaxCalls
150 -Server MyClientAccessServer
```

This example sets the SIP TCP listening port to 5077 and the startup mode to Dual mode on a Client Access server named `MyClientAccessServer`.

```
Set-UMCallRouterSettings  -Server MyClientAccessServer-
SipTCPListeningPort 5077 -UMStartUpMode -Dual
```

Use the Shell to view Client Access server properties

This example displays a list of all the Client Access servers.

```
Get-UMCallRouterSettings
```

This example displays a formatted list of properties for the Client Access server.

```
Get-UMCallRouterSettings | Format-List
```

Allow or prevent call answering on a Mailbox server

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-18*

You can allow the Microsoft Exchange Unified Messaging service on a Mailbox server to answer new calls or prevent it from doing so. By default, a Mailbox server is in an enabled state after it's installed. When you're setting the Mailbox server to accept incoming voice, fax, auto attendant and Outlook Voice Access calls, you use the **Set-ServerComponentState** cmdlet.

Configuring Maintenance Mode for a Mailbox server lets you take the server out of service. For a Mailbox server, out-of-service means that the server won't host any active databases, all transport queues are empty, and the server won't accept any incoming calls from Client Access servers, VoIP gateways, IP PBXs, SIP-enabled PBXs, or session border controllers (SBCs).

In Exchange 2007 and Exchange 2010, there was a status parameter that could be used to control the operational status of a Unified Messaging server. In Exchange 2013, no status parameter is available for that purpose on the **Set-UMService** cmdlet for a Mailbox server.

Important:
It's not required that Client Access and Mailbox servers be added to a UM dial plan before they can process calls for Unified Messaging, except when you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server. By default, all Client Access and Mailbox servers in an organization are available to answer incoming calls.

For additional management tasks related to Mailbox servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Server Configuration Settings" entry in the Unified Messaging permissions topic.
- Verify that the Mailbox server is installed, either on the same computer as the Client Access server or on a separate computer.
- If you're putting a Mailbox server into Maintenance Mode, verify that there's enough redundancy of all database copies to allow the server to go out of service.
- Before taking a server out of Maintenance Mode, verify the health of the server and make sure it's ready to go into service.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to allow or prevent call answering on a Mailbox server

This example enables a Mailbox server `UMMBXr-05x.contoso.com` to answer incoming voice, fax, auto attendant, and Outlook Voice Access calls from VoIP gateways, IP PBXs, SIP-enabled PBXs, and SBCs, and writes the change to the registry on the UMMBX-05x server.

```
Set-ServerComponentState -Component UnifiedMessaging -
Identity UMMBX-05x.contoso.com -Requester Maintenance -
State Active -LocalOnly
```

This example prevents a Mailbox server `UMMBX-05x.contoso.com` from answering incoming voice, fax, auto attendant, and Outlook Voice Access calls from VoIP gateways, IP PBXs, SIP-enabled PBXs, and SBCs, and writes the change only to Active Directory.

```
Set-ServerComponentState -Component UnifiedMessaging -
Identity UMMBX-05x.contoso.com -Requester Maintenance -
State Inactive -RemoteOnly
```

Allow or prevent call answering on a Client Access server

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-18*

You can allow the Microsoft Exchange Unified Messaging Call Router service on a Client Access server to answer new calls or prevent it from doing so. By default, a Client Access server is in an enabled state after it's installed. When you're setting the Client Access server to accept incoming voice, fax, auto attendant and Outlook Voice Access calls, you use the **Set-ServerComponentState** cmdlet.

Configuring Maintenance Mode for a Client Access server lets you take the server out of service. For a Client Access server, out-of-service means that the server won't accept any incoming calls from VoIP gateways, IP PBXs, SIP-enabled PBXs, or session border controllers (SBCs).

In Exchange 2007 and Exchange 2010, there was a status parameter that could be used to control the operational status of a Unified Messaging server. In Exchange 2013, no status parameter is available for that purpose on the **Set-UMCallRouterSettings** cmdlet on a Client Access server.

Important:

It's not required that Client Access and Mailbox servers be added to a UM dial plan before they can process calls for Unified Messaging, except when you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server. By default, all Client Access and Mailbox servers in an organization are available to answer incoming calls.

For additional management tasks related to Client Access servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Server Configuration Settings" entry in the Unified Messaging permissions topic.
- Verify that the Client Access server is installed, either on the same computer as the Mailbox server or on a separate computer.
- If you're putting a Client Access server into Maintenance Mode, verify that there's enough healthy capacity in the Client Access array to allow the server to go out of service.
- Before taking a server out of Maintenance Mode, verify the health of the server and make sure it's ready to go into service.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to allow or prevent call answering on a Client Access server

This example enables a Client Access server `UMCallRouter-05x.contoso.com` to answering incoming voice, fax, auto attendant, and Outlook Voice Access calls from VoIP gateways, IP PBXs, SIP-enabled PBXs, and SBCs, and writes the change to the registry on the UMCallRouter-05x server.

```
Set-ServerComponentState -Component UnifiedMessaging -
Identity UMCallRouter-05x.contoso.com -Requester
```

```
Maintenance -State Active -LocalOnly
```

This example prevents a Client Access server `UMCallRouter-05x.contoso.com` from answering incoming voice, fax, auto attendant, and Outlook Voice Access calls from VoIP gateways, IP PBXs, SIP-enabled PBXs, and SBCs, and writes the change only to Active Directory.

```
Set-ServerComponentState -Component UnifiedMessaging -
Identity UMCallRouter-05x.contoso.com -Requester
Maintenance -State Inactive -RemoteOnly
```

Configure the startup mode on a Mailbox server

Connect your voice mail system to your telephone network > UM services > UM services procedures >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-15*

You can specify the startup mode for the Microsoft Exchange Unified Messaging service on a Mailbox server. By default, the Mailbox server will start up in TCP mode, but if you're using Transport Layer Security (TLS) to encrypt Voice over IP (VoIP) traffic, you must configure the Mailbox server to use TLS or Dual mode. We recommend that Mailbox servers be configured to use Dual as the startup mode. This is because all Client Access servers and Mailbox servers can answer incoming calls for all UM dial plans, and those dial plans can have different security settings (Unsecured, SIP secured, or Secured). If you change the startup mode, you must restart the Microsoft Exchange Unified Messaging service for the change to take effect.

Important:
By default, Mailbox servers are available to answer incoming calls. You don't have to add a Mailbox server to a UM dial plan to process UM calls unless you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server.

For additional management tasks related to Unified Messaging and Mailbox servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox server (UM service)" entry in the Unified Messaging permissions topic.

- Verify that the Mailbox server is installed, either on the same computer as the Client Access server or on a separate computer.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the startup mode on a Mailbox server

1. In the EAC, navigate to **Servers** > **Servers**.
2. In the list view, select the Exchange server you want to modify, and then click **Edit** .
3. On the **Exchange Server** page, click **Unified Messaging**.
4. Under **UM Service settings** > **UM startup mode**, select one of the following from the drop-down list:
   - **TCP** Use this option if you aren't using mTLS and are using only Unsecured dial plans.
   - **TLS** Use this option if you are using mTLS and using only SIP Secured or Secured dial plans.
   - **DUAL** Use this option if you are using mTLS and using Unsecured, SIP Secured, and Secured dial plans.
5. After you select the UM startup mode, click **Save**.

Use the Shell to configure the startup mode on a Mailbox server

This example sets the startup mode for a Mailbox server named `MyUMServer1` to Dual mode.

```
Set-UMService -Identity MyUMServer1 -UMStartUpMode Dual
```

This example sets the startup mode for a Mailbox server named `MyUMServer1` to TLS mode.

```
Set-UMService -Identity MyUMServer1 -UMStartUpMode TLS
```

Configure the startup mode on a Client Access server

Topic Last Modified: *2013-02-15*

You can specify the startup mode for the Microsoft Exchange Unified Messaging Call Router service on a Client Access server. By default, the Client Access server will start up in TCP mode, but if you're using Transport Layer Security (TLS) to encrypt Voice over IP (VoIP) traffic, you must configure the Client Access server to use TLS or Dual mode. We recommend that Client Access servers be configured to use Dual as the startup mode. This is because all Client Access and Mailbox servers can answer incoming calls for all UM dial plans, and those dial plans can have different security settings. If you change the startup mode, you must restart the Microsoft Exchange Unified Messaging Call Router service for the change to take effect.

Important:

By default, Client Access servers are available to answer incoming calls. You don't have to add a Client Access server to a UM dial plan to process UM calls unless you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server.

For additional management tasks related to Unified Messaging and Client Access servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access server (UM call router service)" entry in the Unified Messaging permissions topic.
- Verify that the Client Access server is installed, either on the same computer as the Mailbox server or on a separate computer.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the startup mode on a Client Access server

1. In the EAC, navigate to **Servers** > **Servers**.
2. In the list view, select the Exchange server you want to modify, and then click **Edit** ✎.

3. On the **Exchange Server** page, click **Unified Messaging**.
4. Under **UM Call Router settings** > **UM startup mode**, select one of the following from the drop-down list:
   - **TCP** Use this option if you aren't using mTLS and are using only Unsecured dial plans.
   - **TLS** Use this option if you are using mTLS and using only SIP Secured or Secured dial plans.
   - **DUAL** Use this option if you are using mTLS and using Unsecured, SIP Secured, and Secured dial plans.
5. After you select the UM startup mode, click **Save**.

Use the Shell to configure the startup mode on a Client Access server

This example sets the startup mode for a Client Access server named `UMCallRouter1` to Dual mode.

```
Set-UMCallRouterSettings -Server UMCallRouter1 -
UMStartUpMode Dual
```

This example sets the startup mode for a Client Access server named `UMCallRouter1` to TLS mode.

```
Set-UMCallRouterSettings -Server UMCallRouter1 -
UMStartUpMode TLS
```

Configure the number of incoming calls on a Mailbox server

Connect your voice mail system to your telephone network > UM services > UM services procedures >

Applies to: *Exchange Server 2013, Exchange Server*

Topic Last Modified: *2013-02-23*

You can configure the number of incoming concurrent connections that a Mailbox server that's running the Microsoft Exchange Unified Messaging service will accept. This includes all incoming calls including Outlook Voice Access, call answering, auto attendants, and fax calls. When you increase the number of concurrent connections on a Mailbox server, more system resources are required than if you decrease the number of concurrent calls. Decreasing the number of concurrent calls is especially important on slower computers on which Unified Messaging services are installed. The range for the number of concurrent voice calls is 0 to 200. The default setting is 100.

For additional tasks related to Unified Messaging and Mailbox servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox server (UM service)" entry in the Unified Messaging permissions topic.
- Verify that you've correctly installed the Client Access and Mailbox servers.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the number of incoming calls on a Mailbox server

1. In the EAC, navigate to **Servers** > **Servers**.
2. In the list view, select the Exchange server you want to modify, and then click **Edit** .
3. On the **Exchange Server** page, click **Unified Messaging**.
4. Under **UM Service settings**, under **Maximum number of calls allowed**, enter a number from 0 to 200, and click **Save**.

Use the Shell to configure the number of incoming calls on a Mailbox server

This example sets the number of incoming voice, Outlook Voice Access, and fax calls that can be accepted by a Mailbox server named `MyMailboxServer1` to 50.

```
Set-UMService -Identity MyMailboxServer1 -MaxCallsAllowed
50
```

Start the Microsoft Exchange Unified Messaging service

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-16*

You can use the Services snap-in in Microsoft Management Console (MMC) or cmd.exe at a command prompt to start the Microsoft Exchange Unified Messaging service on a Mailbox server. By default, the Microsoft Exchange Unified Messaging service is started after a Mailbox server is installed. However, there may be times when you have to restart the Microsoft Exchange Unified Messaging service manually, for example, when you've taken the Mailbox server offline and have to bring it back online.

When the Microsoft Exchange Unified Messaging service is started on a Mailbox server, the Mailbox server is available to answer and process incoming UM calls.

For additional management tasks related to Mailbox servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- To perform the following procedures, you must log on to the Mailbox server by using an account that's a member of the local Administrators group.
- Verify that the Mailbox server is installed, either on the same computer as the Client Access server or on a separate computer.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the MMC Services snap-in to start the Microsoft Exchange Unified Messaging service

1. Click **Start**, and then click **Control Panel**.
2. In Control Panel, double-click **Administrative Tools**.
3. In **Administrative Tools**, double-click **Services**.
4. In the **Services** details pane, right-click **Microsoft Exchange Unified Messaging**, and then click **Start**.

Use a command prompt to start the Microsoft Exchange Unified Messaging service

1. Click **Start**, and then click **Run**.
2. In the **Open** box, type the following command, and then press Enter.

```
net start MSExchangeUM
```

Stop the Microsoft Exchange Unified Messaging service

Connect your voice mail system to your telephone network > UM services > UM services procedures >

Applies to: *Exchange Server 2013*

Set the TCP listening port on a Client Access server

Connect your voice mail system to your telephone network > UM services > UM services procedures >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-04-09*

You can configure the TCP port that's used to listen for SIP requests on a Client Access server running the Microsoft Exchange Unified Messaging Call Router service. By default, when you install a Client Access server, the SIP TCP listening port number is set to 5060 and the Client Access server starts in TCP mode. The SIP TCP listening port can't be configured by using the EAC. You must configure the SIP TCP listening port number using the **Set-UMCallRouterSettings** cmdlet.

You may have to configure the TCP listening port to 5061 if your VoIP gateways, IP PBXs, or session border controllers (SBCs) are configured to use a TCP port other than the SIP standard 5060.

You can only configure Client Access server TCP and TLS ports. You can't configure the ports for an Exchange 2013 Mailbox server. However, you can use the **Set-UMService** cmdlet to configure the TCP and TLS listening ports for Exchange 2010 UM servers.

For additional tasks related to Unified Messaging and Client Access servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access server (UM call router service)" entry in the Unified Messaging permissions topic.
- Verify that you have correctly installed Client Access and Mailbox servers.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the TCP listening port on a Client Access server

1. In the EAC, navigate to **Servers** > **Servers**.
2. In the list view, select the Exchange server you want to modify, and then click **Edit** .
3. On the **Exchange Server** page, click **Unified Messaging**.
4. Under **UM Call Router settings**, under **TCP listening port**, enter the number for the TCP port, and click **Save**.

Use the Shell to configure the TCP listening port on a Client Access server

This example sets the TCP listening port on a Client Access server named `MyClientAccessServer` to 5566.

```
Set-UMCallRouterSettings -Server MyClientAccessServer -
SipTCPListeningPort 5566
```

Set the TLS listening port on a Client Access server

Connect your voice mail system to your telephone network > UM services > UM services procedures >

Topic Last Modified: *2013-02-17*

You can configure the Transport Layer Security (TLS) port that's used to listen for SIP requests on a Client Access server running the Microsoft Exchange Unified Messaging Call Router service. By default, when you install a Client Access server, the SIP TLS listening port number is set to 5061.

You may have to configure the TLS listening port to 5061 if you want to:

- Set the VoIP security setting on a UM dial plan to SIP Secured.
- Set the VoIP security setting on a UM dial plan to Secured.
- Integrate with Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server.
- Use mutual Transport Layer Security (mutual TLS) to encrypt network data between Client Access servers, Mailbox servers running the Microsoft Exchange Unified Messaging service, and VoIP

gateways, Private Branch eXchanges (PBXs) enabled for Session Initiation Protocol (SIP), IP PBXs, or session border controllers (SBCs).

If you want to use mutual TLS between a UM IP gateway and a dial plan operating in either SIP Secured or Secured mode, when you create the UM IP gateway you must configure it with a fully qualified domain name (FQDN) and then configure the UM IP gateway to listen on TLS port 5061. You must also verify that any VoIP gateways, PBXs enabled for SIP, IP PBXs, or SBCs have also been configured to listen for mutual TLS requests on port 5061.

You can only configure Client Access server TCP and TLS ports. You can't configure the ports for an Exchange 2013 Mailbox server. However, you can use the **Set-UMService** cmdlet to configure the TCP and TLS listening ports for Exchange 2010 UM servers.

For additional tasks related to Unified Messaging and Client Access servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access server (UM call router service)" entry in the Unified Messaging permissions topic.
- Verify that you have correctly installed Client Access and Mailbox servers.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the TLS listening port on a Client Access server

1. In the EAC, navigate to **Servers** > **Servers**.
2. In the list view, select the Exchange server you want to modify, and then click **Edit** ✎.
3. On the **Exchange Server** page, click **Unified Messaging**.
4. Under **UM Service settings**, under **TLS listening port**, enter the number for the TLS port, and then click **Save**.

Use the Shell to configure the TLS listening port on a Client

Access server

This example sets the TLS listening port on a Client Access server named `MyClientAccessServer` to 5561.

```
Set-UMCallRouterSettings -Server MyClientAccessServer -
SipTlsListeningPort 5561
```

Automatically answer and route incoming calls

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-08-26*

Microsoft Exchange Unified Messaging (UM) enables you to create a single or multiple UM auto attendants, depending on the needs of your organization. Unlike other Unified Messaging components, such as UM dial plans and UM IP gateways, you aren't required to create UM auto attendants. However, auto attendants help internal and external callers locate users or departments that exist in an organization and transfer calls to them. This topic discusses the UM auto attendant feature found in Unified Messaging.

Contents

Auto attendants

In telephony or Unified Messaging environments, an automated attendant or auto attendant menu system transfers callers to the extension of a user or department without the intervention of a receptionist or an operator. In many auto attendant systems, a receptionist or operator can be reached by pressing or saying zero. The automated attendant is a feature in most modern Private

Branch eXchanges (PBXs), IP PBXs, and Unified Messaging solutions.

Some auto attendant systems use message-only information menus and voice menus so an organization can provide business hours, directions to the premises, information about job opportunities, and answers to other frequently asked questions. After the message plays, callers are forwarded to the receptionist or operator, or they can return to the main menu.

In more complex auto attendant systems, the menu system can be used to search for other auto attendant menus, locate a user in the system, or transfer to another outside telephone line. The menu system can also be used to let the caller interact with the system in certain situations, such as when a student enrolls for a college class or checks a grade, or when you activate a credit card over the telephone.

Although auto attendants can be very useful, if they aren't designed and configured correctly, they can confuse and frustrate callers. For example, specifically in large organizations, when auto attendants aren't designed correctly, callers can be led through a lengthy series of questions and menu prompts before they are finally transferred to a person to answer their questions.

UM auto attendants

Unified Messaging enables you to create one or more UM auto attendants depending on the needs of your organization. UM auto attendants can be used to create a voice menu system for an organization that lets external and internal callers move through the UM auto attendant menu system to locate and place or transfer calls to company users or departments in an organization.

When anonymous or unauthenticated users call an external business telephone number, or when internal callers call a defined extension number, they are presented with a series of voice prompts that help them place a call to a user or locate a user in the organization and then place a call to that user. The UM auto attendant is a series of voice prompts or .wav files that callers hear instead of a human operator when they call an organization that has Unified Messaging. The UM auto attendant lets callers move through the menu system, place calls, or locate users by using dual tone multi-frequency (DTMF) or voice inputs. However, for Automatic Speech Recognition (ASR) or voice inputs to be used, you must enable ASR on the UM auto attendant.

A UM auto attendant has the following features:

- It provides corporate or informational greetings.
- It provides custom corporate menus. You can customize these menus to have more than one level.
- It provides a directory search function that enables a caller to search the organization's directory for a name.
- It enables a caller to connect to the telephone of, or leave a message for, members of the organization.

There is no limit to the number of UM auto attendants you can create. Each Unified Messaging auto attendant can support an unlimited number of extensions. A UM auto attendant can reference one, and only one, UM dial plan. UM auto attendants can also reference or link to other UM auto

attendants.

An incoming call received from an external telephone number or an internal telephone extension is passed between Exchange servers, and then sent to a UM auto attendant. The UM auto attendant is configured by the administrator to use prerecorded voice (.wav) files that are played over the telephone to the caller and that enable the caller to move through the Unified Messaging menu system. You can customize all the .wav files used when you configure a UM auto attendant to meet the needs of your organization.

Return to top

Auto attendants with multiple languages

There are situations in which you may have to provide callers with auto attendants that have different languages. The language setting available on a UM auto attendant enables you to configure the default prompt language on the auto attendant. When you are using the default system prompts for the auto attendant, this is the language that the caller will hear when the auto attendant answers the incoming call. This language setting affects only the default system prompts provided. This language setting doesn't affect custom prompts configured on an auto attendant.

For on-premises and hybrid deployments, when you install the U.S. English version, U.S. English is the only language available to configure on UM auto attendants. If you install a localized version, for example, Japanese, you can configure the auto attendant that you create to use Japanese or U.S. English for the default language. Additional UM language packs can be installed on a Unified Messaging server to enable you to use other default languages on an auto attendant.

For example, if you have a business that's based in the United States but requires a menu system that gives callers the options of U.S. English, Spanish, and French, you must first install the UM language packs that you need. In this case, if you have installed the U.S. English version, you would install the UM language packs for Spanish and French. However, because a Unified Messaging auto attendant can have only one language configured at a time, you would create four auto attendants: a main auto attendant configured to use U.S. English and then one auto attendant for each language: U.S. English, Spanish, and French. You would then configure the main auto attendant to have the appropriate key mappings or menu navigation to access the other auto attendants that you created for each language. In this example, the main auto attendant would answer the incoming call and the caller would hear, "Welcome to Contoso, Ltd. For English, press or say 1. For Spanish, press or say 2. For French, press or say 3."

Tip:

In Exchange UM, authenticated and non-authenticated Outlook Voice Access users can’t search for users in the directory using speech inputs in any language. However, callers that call into an auto attendant can use speech inputs in multiple languages to navigate auto attendant menus and search for users in the directory.

Return to top

Non-business hours and business hours custom greetings

After you create a UM auto attendant, a default system prompt will be used for the non-business hours main menu prompt greeting heard by callers after the non-business hours welcome greeting is played. Although the system prompts mustn't be replaced or changed, you probably want to customize the greetings and menu prompts used with UM auto attendants. Frequently, in addition to configuring a customized non-business hours welcome greeting, you also want to create and configure a custom non-business hours main menu prompt greeting. After you configure a custom non-business hours main menu prompt greeting, you must enable key mappings on the UM auto attendant for non-business hours.

A custom non-business hours main menu prompt greeting is a list of options callers hear during non-business hours. To let callers hear a non-business hours main menu prompt greeting, you first must configure the business and non-business hours schedule by using the EAC or the **Set-UMAutoAttendant** cmdlet in the Shell. For example, "You have reached Trey Research after normal business hours. If you are experiencing a medical emergency, please hang up and dial 911. To leave a message for one of our doctors, press 1. To leave a message for one of our physical therapists, press 2. To leave a general message for one of our front office coordinators, press 3. To be connected with an after hours operator, press 0."

By default, when you create a UM auto attendant, the business and non-business hours greetings or prompts aren't configured and no menu navigation entries are defined for business or non-business hours main menu prompts. To correctly configure customized non-business hours main menu greetings and prompts, you must:

1. Configure business and non-business hours on the **Business hours** page.
2. Create the greeting file that will be used for the non-business hours welcome greeting.
3. Configure the non-business hours welcome greeting on the **Greetings** page.
4. Create the greeting file that will be used for the non-business hours main menu prompt greeting.
5. Configure the non-business hours main menu prompt greeting on the **Greetings** page.
6. Enable menu navigation and add menu navigation entries on the **Menu navigation** page.

Return to top

Menu navigation entries

If you use the default main menu prompt greeting and define a menu navigation entry or multiple menu navigation entries, the UM Text-to-Speech (TTS) engine will synthesize a main menu prompt. However, the TTS engine will only synthesize a main menu prompt if the default greeting is configured and at least one menu navigation entry has been defined. The TTS engine will not synthesize a main menu prompt if you're using a custom main menu prompt, for example, "For the sales department, press 1. For the support department, press 2." To create this main menu prompt, you must create two menu navigation entries: one named "Sales Department" and another named "Support Department", and then configure the key mapping entry to play an audio file, transfer to

an extension number, or send the caller to another auto attendant.

When you configure menu navigation entries, you define the options and the operations that will be performed if a caller speaks a phrase while they're using a speech-enabled auto attendant or presses a key on the telephone keypad while they're using an auto attendant that isn't speech-enabled. To configure menu navigation entries for an auto attendant, you must:

- Enable business hours menu navigation.
- Add menu navigation entries.
- Type the name of the menu navigation entry.
- Select an option in the **When this key is pressed** list, and use the **Play the following audio file** box to upload the audio file to play.
- Configure the action you want performed:
  - Transfer to this extension
  - Transfer to this UM auto attendant
  - Leave a voice message for this user
  - Announce business location
  - Announce business hours

Return to top

Auto attendant examples

The following examples demonstrate how you can use UM auto attendants with Unified Messaging:

- **Example 1** At a company called Contoso, Ltd., external customers can use three external telephone numbers: 425-555-0111 (Corporate Offices), 425-555-0122 (Product Support), and 425-555-0133 (Sales). The Human Resources, Administration, and Accounting departments have internal telephone extensions and must be accessed from the Corporate Offices UM auto attendant.

To create a UM auto attendant structure that supports this scenario, create and configure three UM auto attendants that have the appropriate external telephone numbers. Create three other UM auto attendants for each department in the Corporate Offices. You then configure each UM auto attendant based on your requirements, such as the greeting type or other navigational information.

- **Example 2** At a company called Contoso, Ltd., external customers call one main number for the business, 425-555-0100. When an external caller calls the external number, the UM auto attendant answers and prompts the caller by saying, "Welcome to Contoso, Ltd. Please press or say “One” to be transferred to corporate administration. Please press or say “Two” to be transferred to product support. Please press or say “Three” to be transferred to corporate information. Please press or say “Zero” to be transferred to the operator." To create a UM auto attendant structure that supports this scenario, you create a UM auto attendant that has customized extensions that route the call to the appropriate extension number.

Return to top

DTMF interface

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-08-05*

In Unified Messaging (UM), callers can use dual tone multi-frequency (DTMF), also referred to as touchtone, and voice inputs to interact with the system. The methods that callers can use depend on how the UM dial plans and auto attendants are configured.

The DTMF interface enables callers to use the telephone keypad to locate users and navigate the UM voice mail menu system when they call an Outlook Voice Access number configured on a dial plan or when they call a telephone number configured on an auto attendant. This topic discusses the DTMF interface and how it's used by callers to locate users and to navigate the UM voice mail menu system.

Contents

DTMF overview

DTMF requires a caller to press a key on the telephone keypad that corresponds to a Unified Messaging menu option or to input a user's name or email alias by using the letters on the keys to spell the name or alias. Callers might use DTMF because Automatic Speech Recognition (ASR) hasn't been enabled or because they tried to use voice commands and failed. In either case, DTMF inputs are used to navigate menus and search for users.

By default, in UM, DTMF inputs are used on dial plans and are the default caller interface for UM auto attendants.

Callers can use DTMF inputs for:

- Dial plan dial-in access by using Outlook Voice Access.
- Dial plan directory lookups and searches to locate users.
- Auto attendants that aren't speech-enabled.

- Auto attendants that are speech-enabled that do or don't have a DTMF fallback auto attendant configured.
- DTMF fallback auto attendants (not speech-enabled).

UM dial plans and dial by name

When you create a UM dial plan, you can configure the primary and secondary input method that callers will use to look up names when they search for a user or want to contact a user. These settings are located on the dial plan's **Settings** page and are called **Primary way of searching for names** and **Secondary way of searching for names**. The following options are available for both the primary and secondary ways of searching for names:

- Last First
- First Last
- SMTP address

Additionally, **None** is an available option for the secondary way of searching for names.

By default, **Last First** is selected as the primary way of searching for names and **SMTP address** is selected as the secondary way of searching for names Therefore, when a caller dials in to an Outlook Voice Access number configured on the UM dial plan, the dial plan's welcome message is played and the operator says something like, "Welcome to Contoso Outlook Voice Access. To access your mailbox, enter your extension. To contact someone, press the pound key." After the caller presses the # key, the system responds with "Spell the name of the person you are calling, last name first, or to spell their email alias, press the pound key twice." In this scenario, depending on how your dial plan is configured, the system then prompts the caller to enter the user's last name and then the user's first name (Last First) or to spell the email alias, excluding the domain name. For example, if the user's email alias is tsmith@contoso.com, the caller would enter tsmith.

If you want to change this configuration because the default setting doesn't meet your needs, you can change it to enable callers to enter the user's email alias first or the user's first name followed by the last name. In this case, you would configure the **Primary way of searching for names** with the **SMTP address** setting and configure the **Secondary way of searching for names** with the **First Last** setting. The settings for the dial by name methods will also apply to any UM auto attendants that are associated with the dial plan. For callers to be able to enter the name of the user by using DTMF inputs or the keys on the telephone keypad, a DTMF map and values for the user must exist within your organization’s directory.

For more information about how to change the dial by name primary and secondary methods on a UM dial plan, see Configure the primary way for Outlook Voice Access users to search and Configure the secondary way for Outlook Voice Access users to search.

Return to top

DTMF maps

In an Exchange organization, an attribute named **msExchUMDtmfMap** is associated with each user created in the directory. Unified Messaging uses this attribute to map the user's first name, last name, and email alias to a set of numbers. This mapping is referred to as a DTMF map. A DTMF map enables a caller to enter the digits on the telephone keypad that correspond to the letters of the user's name or email alias. This attribute contains the values needed to create a DTMF map for the user's first name followed by the last name, for the user's last name followed by the first name, and for the user's email alias.

The following table shows the DTMF map values that would be stored in Active Directory on the **msExchUMDtmfMap** attribute for a UM-enabled user named Tony Smith with an alias of tsmith@contoso.com.

DTMF values stored for a UM-enabled user named Tony Smith

Directory entry	User's name
• firstNameLastName:866976484	tonysmith
• lastNameFirstName:764848669	smithtony
• emailAddress:876484	tsmith

Names and email aliases may contain other characters that aren't alphanumeric, such as commas, hyphens, underscores, or periods. Characters such as these won't be used in a DTMF map for a user. For example, if the email alias for Tony Smith is tony-smith@contoso.com, the DTMF map value would be 866976484, and the hyphen wouldn't be included. However, if a user's email alias contains a number or numbers, for example, tonysmith123@contoso.com, the numbers would be used in the DTMF map that's created. The DTMF map for tonysmith123 would be 866976484123.

A DTMF map must exist for a user for callers to be able to enter the user's name or email alias. However, not all users will have a DTMF map associated with their user account.

Return to top

DTMF maps for users who aren't enabled for Unified Messaging

Users, including mailbox-enabled users, aren't enabled for Unified Messaging by default. The **msExchUMDtmfMap** attribute is populated with the values needed for DTMF maps for users who haven’t been enabled for UM. By default, the following DTMF maps are created for all users when a mailbox is created for them:

1. emailAddress
2. firstNameLastName
3. lastNameFirstName

If a user doesn’t have DTMF map values defined for their account, callers won’t be able to contact

the user when they press a telephone key from a UM auto attendant menu or perform a directory search. Also, UM-enabled users won't be able to send messages or transfer calls to users who don't have a DTMF map unless they can use Automatic Speech Recognition (ASR). To enable callers to transfer calls or contact users who aren't UM-enabled by using the telephone keypad, you need to create the necessary values for the DTMF map for those users. You can use the **Set-User** cmdlet with the *-CreateDtmfMap* parameter to create and update a single user's DTMF map or update a DTMF map for a user if the name of the user was changed after a DTMF map was created. Optionally, you can create an Exchange Management Shell script by using this cmdlet to update the DTMF map values for multiple users.

For more information about the **Set-User** cmdlet, see Set-User.

Return to top

DTMF maps for users who are enabled for Unified Messaging

By default, a DTMF map is created for a user when they're enabled for Unified Messaging. This makes it possible for calls to be transferred to the UM-enabled user from external callers, from users who aren't enabled for UM, and from other UM-enabled users who use the telephone keypad to spell the user's name or email alias.

After the DTMF map values have been created for a UM-enabled user, callers can use the directory search feature. Callers use directory search when they use the telephone keypad in the following situations:

- To identify or search for a user when they call in to an Outlook Voice Access number.
- To locate or transfer calls to a UM-enabled user when they call in to a UM auto attendant.

For more information about how to enable a user for Unified Messaging, see Enable a user for voice mail.

Sometimes a user's first name, last name, or email alias changes after the user is enabled for UM. The user's DTMF map values aren't updated automatically. If a caller enters the user's new name or email alias and the user's DTMF map hasn't been updated to reflect the change to the name or email alias, the caller won't be able to locate the user in the directory, send a message to the user, or transfer calls to the user. If you have to update a user's DTMF map after the user has been enabled for UM, you can use the **Set-User** cmdlet with the *-CreateDtmfMap* parameter. You can also create an Exchange Management Shell script using this cmdlet if you want to update the DTMF maps for multiple UM-enabled users.

Caution:

We recommend that you don't manually change the DTMF values for users by using a tool such as ADSI Edit because it might result in inconsistent configurations or other errors. We recommend that you use only the **Set-UMService** cmdlet or the **Set-User** cmdlet to create or update DTMF maps for users.

Set up a UM auto attendant

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

In addition to allowing users access to voice mail, Unified Messaging (UM) allows you to create one or more UM auto attendants depending on the needs of your organization. UM auto attendants can be used to create a voice menu system for an organization that lets external and internal callers locate, place, or transfer calls to company users or departments in an organization.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

Auto attendants

In telephony or Unified Messaging environments, an automated attendant or auto attendant menu system transfers callers to the extension of a user or department without the intervention of a receptionist or an operator. In many auto attendant systems, a receptionist or operator can be reached by pressing or saying zero. Some auto attendant systems use message-only information menus and voice menus so an organization can provide business hours, directions to the premises, information about job opportunities, and answers to other frequently asked questions. After the message plays, callers are forwarded to the receptionist or operator, or they can return to the main menu.

Although auto attendants can be very useful, if they aren't designed and configured correctly, they can confuse and frustrate callers. For example, especially in large organizations, when auto attendants aren't designed correctly, callers can be led through a lengthy series of questions and menu prompts before they’re finally transferred to a person to answer their questions.

How do I set up an auto attendant?

In the Exchange Administration Center (EAC), you set up and manage UM auto attendants to automatically answer calls to your organization and allow callers to self-select different options using the keys on their telephone. You can have just one UM auto attendant that provides basic menu navigation for callers to your organization, or you can have multiple nested and branching auto attendants that provide a richer experience for your callers. However, in both cases, you must plan and set up your auto attendants carefully.

To plan and create a new UM auto attendant structure, you need to do the following:

1. Decide whether you want to allow users to interact with the auto attendant using speech inputs.
2. Decide which language you want to use for your main auto attendant and whether you need to create other auto attendants to support more languages.
3. Decide on the business and non-business hours for the auto attendant and set the business hours using **Business hours**. Though it's not required, you can also decide on the holiday schedule for this auto attendant.

Note:
You should also set the time zone on the attendant.

4. Decide whether you want standard system-generated business and non-business hours greetings or to create custom recordings for them.

If you want to use custom greetings, plan and record your business and non-business hour greetings to play to callers during business and non-business hours. If you need to, you can also create a custom informational announcement greeting. For example, for your business hours greeting you could use "Welcome to Contoso. For English, press or say 1, for Spanish, press or say 2." For your non-business hours greeting, you could record the following script: "Welcome to Contoso. Our office is currently closed. We will be open on Monday at 8:00 am."

5. Plan your auto attendant structure based on your business needs. For example, one organization may be a multinational business with offices in both Germany and the UK, and thus need an auto attendant structure based on multiple languages. Another organization might have its corporate office at one site, Sales located at another site, and Customer Service located at a third site, and thus need an auto attendant that directly relates to the structure of the organization.
6. Decide if you'll need DTMF fallback auto attendants or other auto attendants to use when auto attendant voice commands don't work.
7. Plan the menu navigation for business hours and non-business hours. For each auto attendant, including DTMF auto attendants, you'll need to plan and configure menu prompts and menu navigation entries. You'll need to do this for both business and non-business hours.
8. The following is an example of a worksheet you could use to plan non-business hours menu navigation.

Key	Prompt/Navigation menu entry name	Response to record
1	Language selection to use	"Press or say 1 to use English."

	English.	
2	Account balance	“Press or say 2 to get your account balance.”
3	Transfer to Sales	"Press or say 3 to be transferred to our sales department."
4	Transfer to customer service	“Press or say 4 to be transferred to the next customer service representative.”
5	Business hours	No response needed.
6	Business location	No response needed.

9. Using your menu navigation plan, record prompts that inform callers what they can do. For example, depending on the auto attendant structure for the non-business hours menu navigation shown in the table, you might record the following script: "To leave a message for Sales, press one. For our business hours, press two. For our address, press three."
10. Determine how callers will access your organization. Consider how they will search for and contact users in your organization. Also consider how to transfer callers, including how they'll get to a live person or organization representative, and whether callers will access an operator during business and non-business hours.
11. Determine what calls you'll allow callers to make when they're using a specific auto attendant. For example, whether you want to allow callers to make calls to users in a single dial plan, to any extension, or whether you'll allow them to make calls outside your organization.
12. After you've planned your auto attendant settings, greetings and menu navigation, and created audio files that contain your recorded greetings, menu navigation prompts, and menu navigation responses, you're ready to create and configure your auto attendant. Here's how:
    - Create a UM auto attendant
    - Manage a UM auto attendant
13. If you've created the auto attendant structure and settings, enable the UM auto attendant so it can start accepting calls.

Create a UM auto attendant

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-03-08*

After you create a Unified Messaging (UM) auto attendant, incoming calls to an external telephone number that a human operator would ordinarily answer are answered by the auto attendant. Unlike with other Unified Messaging components, such as UM dial plans and UM IP gateways, you aren't required to create UM auto attendants. However, auto attendants help internal and external callers locate users or departments that exist in an organization and transfer calls to them.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to create a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**, select the UM dial plan for which you want to add an auto attendant, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, click **New +**.
3. On the **New UM auto attendant** page, enter the following information:
   - **Name** Use this box to create the display name for the UM auto attendant. A UM auto attendant name is required and must be unique. However, it's used only for display purposes in the EAC and the Shell.

If you have to change the display name of the auto attendant after it's created, you must first delete the existing UM auto attendant and then create another auto attendant that has the appropriate name. If your organization uses multiple UM auto attendants, we recommend that you use meaningful names for your UM auto attendants. The maximum length of a UM auto attendant name is 64 characters, and it can include spaces.

Although you can name a new UM auto attendant to include spaces, if you integrate Unified Messaging with Office Communications Server 2007 R2 or Microsoft Lync Server, the name of the

auto attendant can't include spaces. Therefore, if you created an auto attendant with spaces in the display name, and you're integrating with Office Communications Server 2007 R2 or Lync Server, you must first delete that auto attendant and then create another auto attendant that doesn't include spaces in the display name.

- **Create this auto attendant as enabled** Select this check box to enable the auto attendant to answer incoming calls when you complete the New UM Auto Attendant Wizard. By default, a new auto attendant is created as disabled.

If you decide to create the UM auto attendant as disabled, you can use the EAC or the Shell to enable the auto attendant after you finish the wizard.

- **Set the auto attendant to respond to voice commands** Select this check box to speech-enable the UM auto attendant. If the auto attendant is speech-enabled, callers can respond to the system or custom prompts used by the UM auto attendant using touchtone or voice inputs. By default, the auto attendant won't be speech-enabled when it's created.

For callers to use a speech-enabled auto attendant, you must install the appropriate UM language pack that contains Automatic Speech Recognition (ASR) support and configure the properties of the auto attendant to use this language.

- **Access numbers** Use this box to enter the extension numbers or telephone numbers that callers will use to reach the auto attendant. Type an extension number or telephone number in the box, and then click **Add +** to add the number to the list. The number of digits in the extension number or telephone number that you provide doesn't have to match the number of digits for an extension number configured on the associated UM dial plan. This is because direct calls are allowed to UM auto attendants.

The number of extension numbers or telephone numbers entered is unlimited. However, you may create the new auto attendant without an extension number listed. An extension number or telephone number isn't required.

You can edit or remove an existing extension number or telephone number. To edit an existing extension number or telephone number, click **Edit +**. To remove an existing extension number or telephone number from the list, click **Remove −**.

4. Click **Save**.

Use the Shell to create a UM auto attendant

This example creates a UM auto attendant named `MyUMAutoAttendant` that can accept incoming calls but isn't speech-enabled.

```
New-UMAutoAttendant -Name MyUMAutoAttendant -UMDialPlan
MyUMDialPlan -PilotIdentifierList 55000 -Enabled $false
```

This example creates a speech-enabled UM auto attendant named `MyUMAutoAttendant`.

```
New-UMAutoAttendant -Name MyUMAutoAttendant -UMDialPlan
MyUMDialPlan -PilotIdentifierList 56000,56100 -
```

```
SpeechEnabled $true
```

Add an auto attendant extension number

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You can configure an extension number or multiple extension numbers on a Unified Messaging (UM) auto attendant. When you add an extension number to a UM auto attendant, that number can be used by callers to call into the auto attendant. Also, you may have to add extension numbers because there is more than one extension number that callers can use to access an auto attendant. By default, no extension numbers are configured when you create an auto attendant.

You can create a new auto attendant without setting up an extension number for the auto attendant. You can also associate more than one telephone or extension number with a single auto attendant. You can either add the extension numbers when you create the UM auto attendant or add them after you configure the auto attendant. The number of digits in the extension number you configured on the UM auto attendant must match the number of digits for an extension number that's configured on the UM dial plan associated with the UM auto attendant.

Note:

You can also add a Session Initiation Protocol (SIP) address instead of adding an extension number. A SIP address is used by some IP Private Branch eXchanges (PBXs) and Office Communications Server 2007 R2 or Microsoft Lync Server.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to add an extension or phone numbers for a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to edit and click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to add extension or phone numbers to.
3. On the toolbar, click **Edit** .
4. On the **UM Auto Attendant** page > **General**, under **Access numbers**, in the text box, enter the extension or phone number that you want to use and click **Add +**.
5. Click **Save** to add the number.

Use the Shell to configure an extension number on a UM auto attendant

This example configures a UM auto attendant named `MyUMAutoAttendant` with multiple extension numbers.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
PilotIdentifierList "12345, 72000, 75000"
```

Configure business hours

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-19*

When you configure business hours for a Unified Messaging (UM) auto attendant, you define the

hours of the day that your organization is open, and the business hours greetings and menu prompts callers will hear when they call an extension number that's configured on the auto attendant. If a caller reaches the auto attendant during hours that are outside the business hours you define, the caller will hear the non-business hours prompts and greetings.

Several default schedule options are available in the EAC. For example, most businesses are open from 8:00 A.M. to 5:00 P.M., Monday through Friday. Sometimes the default options won't fit your needs and you'll want to customize the schedule. If your business hours vary from the schedules defined by the system, you can define a customized schedule for the auto attendant.

By default, the UM auto attendant will play the business hours prompts and greetings regardless of the time of day callers dial in to the auto attendant.

Note:

When you set the schedule for business and non-business hours on a UM auto attendant, make sure the time zone is configured correctly.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to specify business hours for a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .

2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to set the business hours, and then click **Edit** .
3. On the **UM Auto Attendant** page > **Business Hours** under **Business hours**, click **Configure business hours**.
4. On the **Configure Business Hours** page, select the hours you want to use as your business hours for each day of the week.
5. Click **OK**, and then click **Save**.

Use the Shell to specify business hours for a UM auto attendant

This example sets the business hours for a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30
```

Create a holiday schedule

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-19*

You can define the dates and times your organization will be closed for holidays and other occasions. Between the start dates and the end dates you specify, callers who reach the Unified Messaging (UM) auto attendant will hear a holiday greeting you specify when you configure the holiday schedule. After the caller hears the holiday greeting you've specified, the non-business hours greeting and menu prompts will be played for the caller.

You can also create a holiday schedule within an existing holiday schedule. When you create multiple holiday schedules, Unified Messaging lets you overlap your scheduled holiday times. For example, you can define a holiday schedule from December 15th through December 31st when your organization will be closed for construction, and you can define another holiday schedule from December 24th through December 26th. When callers call in to the auto attendant from December 15th through December 23rd and from December 27th through December 31st, they'll be presented with the holiday greeting that you've specified for this schedule. For example, "We are currently closed for construction." When callers call in to the auto attendant from December 24th through December 26th, they'll be presented with another holiday greeting, such as "We are currently closed for business so that our employees can enjoy the holidays with their families."

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to specify a holiday schedule for a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then on the toolbar, click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to set the holiday schedule. On the toolbar, click **Edit** .
3. On the **UM Auto Attendant** page > **Business Hours**, under **Holiday schedule**, click **Add +**.
4. On the **New Holiday** page, configure the following:
   - **Name** Enter a name for your holiday schedule.
   - **Holiday greeting** Browse to the .wav file you want to use as your greeting. This is a required field.
   - **Start date** Use this list to select the date you want the holiday to start. The holiday schedule will start at midnight on the date specified in this list.
   - **End date** Use this list to select the date you want the holiday to end. The holiday schedule will end at 11:59 P.M. on the date specified in this list.
5. After you've configured your holiday schedule, click **OK**, and then click **Save**.

Use the Shell to specify a holiday schedule for a UM auto

attendant

This example configures a UM auto attendant named `MyUMAutoAttendant` that has business hours configured to be 10:45 to 13:15 (Sunday), 09:00 to 17:00 (Monday), and 09:00 to 16:30 (Saturday), and holiday times and their associated greetings configured to be "New Year" on January 2, 2013, and "Building Closed for Construction" from April 24, 2013 through April 28, 2013.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30 -HolidaySchedule "New
Year,newyrgrt.wav,1/2/2013","Building Closed for
Construction,construction.wav,4/24/2013,4/28/2013"
```

Enter a business name

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-19*

You can enter the name of your business in the **Business name** box on a UM auto attendant. By default, no business name is entered. If you enter a business name, a default greeting prompt with the business name will be played to callers when they call in to the Unified Messaging (UM) auto attendant.

For additional tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure a business name

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to set a business name, and then, on the toolbar, click **Edit** .
3. On the **UM Auto Attendant** page > **General**, under **Business name**, type the name of the business.
4. Click **Save**.

Use the Shell to configure a business name

This example sets the business name on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessName "Northwind Traders"
```

Set a business location

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-23*

You can specify the location of a business on a Unified Messaging (UM) auto attendant so that the location will be played for callers. By default, no business location is entered.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging

permissions topic.

- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.

This example sets the business location on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessLocation 'Redmond'
```

Configure the time zone

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-17*

By default, the Unified Messaging (UM) auto attendant uses the time zone of the Mailbox server on which it's created. However, there are situations where you may have to change the time zone for a UM auto attendant to a different time zone. For example, if you have two UM dial plans and each

dial plan represents a different time zone, you must configure one UM auto attendant to have the same time zone as the Mailbox server and the other UM auto attendant to have a time zone that differs from the Mailbox server.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the time zone

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to set the time zone, and then click **Edit** .
3. On the **UM Auto Attendant** page, click **Business Hours**, and then, under **Time zone**, select the time zone from the drop-down list.
4. To save your changes, click **OK**, and then click **Save**.

Use the Shell to configure the time zone

This example sets the time zone to the Pacific time zone on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
TimeZoneName Pacific
```

Enable a customized business hours greeting

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-19*

You can enable a customized business hours greeting for a Unified Messaging (UM) auto attendant. The business hours greeting is the first thing callers hear when a UM auto attendant answers their call during business hours. You'll probably want to customize the greeting.

Unified Messaging includes a default system prompt for use during business hours. Although the default system prompt mustn't be replaced or changed, you may want to provide an customized greeting. You can create a customized greeting in the .wav or .wma file format to be used when callers call in to a UM auto attendant during business hours. For example, "You've reached Woodgrove Bank."

If you want to include the name of your organization or business as part of the default greeting, you can enter the name in the **Business name** box on the UM auto attendant. For details, see Enter a business name.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- Create a .wav or .wma file to be used for the greeting.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to enable a customized business hours greeting

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to enable a customized business hours greeting, and then click **Edit** .
3. On the **UM Auto Attendant** page, > **Greetings**, under **Business hours greeting** click **Change**, and then click **Browse** to locate the customized business hours greeting file you created before you started this procedure.

Important:
The file you use for the greeting must be a .wav or .wma file.

4. After you've located the file, click **Open**, and then click **Save**.

Use the Shell to enable a customized business hours greeting

This example enables the business hours greeting that uses a customized greeting named `GreetingFile.wav` for the UM auto attendant `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursWelcomeGreetingEnabled $true -
BusinessHoursWelcomeGreetingFilename GreetingFile.wav
```

This example configures a UM auto attendant named `MyUMAutoAttendant` to have business hours configured to be 10:45 to 13:15 (Sunday), 09:00 to 17:00 (Monday), and 09:00 to 16:30 (Saturday) and holiday times and their associated greetings configured to be "`New Year`" on January 2, 2013, and "`Building Closed for Construction`" from April 24, 2013 through April 28, 2013.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30 -HolidaySchedule "New
Year,newyrgrt.wav,1/2/2013","Building Closed for
Construction,construction.wav,4/24/2013,4/28/2013"
```

This example configures a UM auto attendant named `MyAutoAttendant` and enables business hours key mappings so that when callers press 1, they're forwarded to another UM auto attendant named

SalesAutoAttendant. When they press 2, they're forwarded to extension number 12345 for Support, and when they press 3, they're sent to another auto attendant that plays an audio file.

```
Set-UMAutoAttendant -Identity MyAutoAttendant -
BusinessHoursKeyMappingEnabled $true -
BusinessHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

Enable a customized business hours menu prompt

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-19*

You can customize the menu prompt to be used by a Unified Messaging (UM) auto attendant during business hours. After you create a UM auto attendant, a default system prompt ("Welcome to Unified Messaging") is used as the menu prompt that callers hear after the business hours welcome greeting is played. Although the system prompt mustn't be replaced or changed, you can customize the greetings and menu prompts that are used with UM auto attendants. After you create a customized business hours menu prompt audio file, you must enable menu navigation entries on the UM auto attendant for business hours.

If you only want to include the name of your organization or business as part of the default system prompt, you can enter the name in the **Business name** box on the UM auto attendant. For details, see Enter a business name.

Important:
You must configure business hours on the auto attendant. For details, see Configure business hours.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To

see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.

- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- Create a .wav or .wma file to be used for the menu prompt.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to enable a customized business hours menu prompt

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan that you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to enable a customized business hours menu prompt, and then click **Edit** .
3. On the **UM Auto Attendant** page, > **Menu navigation**, under **Business hours menu navigation** click **Change**, and then click **Browse** to locate the customized business hours menu prompt file.

Important:

The file you use for the menu prompt must be a .wav or .wma file.

4. After you've located the file, click **Open**, and then click **Save**.

Use the Shell to enable a customized business hours menu prompt

This example enables a business hours main menu prompt and uses a customized prompt named `businesshoursprompts.wav` on the UM auto attendant `MyUMAutoAttendant`.

```
Command Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursMainMenuCustomPromptEnabled $true -
BusinessHoursMainMenuCustomPromptFilename
BusinessHoursPrompts.wav
```

This example configures a UM auto attendant named `MyUMAutoAttendant` that has business hours configured to be 10:45 to 13:15 (Sunday), 09:00 to 17:00 (Monday), and 09:00 to 16:30 (Saturday) and holiday times and their associated greetings configured to be "`New Year`" on January 2, 2013, and "`Building Closed for Construction`" from April 24, 2013 through April 28, 2013.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30 -HolidaySchedule "New
Year,newyrgrt.wav,1/2/2013","Building Closed for
Construction,construction.wav,4/24/2013,4/28/2013"
```

This example configures a UM auto attendant named `MyAutoAttendant` and enables business hours navigation menus so that when callers press 1, they're forwarded to another UM auto attendant named `SalesAutoAttendant`. When they press 2, they're forwarded to extension number 12345 for `Support`, and when they press 3, they're sent to another auto attendant that plays an audio file.

```
Set-UMAutoAttendant -Identity MyAutoAttendant -
BusinessHoursKeyMappingEnabled $true -
BusinessHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

Enable a customized non-business hours greeting

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-30*

You can enable a customized non-business hours greeting for a Unified Messaging (UM) auto attendant. The non-business hours greeting is the first thing callers hear when a UM auto attendant answers their call during non-business hours. You'll probably want to customize the greeting.

Unified Messaging includes a default system prompt for use during non-business hours. Although the default system prompt mustn't be replaced or changed, you may want to provide an customized greeting. You can create a customized greeting in the .wav or .wma file format to be used when callers call in to a UM auto attendant during non-business hours. For example, "You've reached Woodgrove Bank after hours."

If you want to include the name of your organization or business as part of the default greeting, you can enter the name in the **Business name** box on the UM auto attendant. For details, see Enter a business name.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- Create a .wav or .wma file to be used for the greeting.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to enable a customized non-business hours greeting

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to enable a customized non-business hours greeting, and then click **Edit** .
3. On the **UM Auto Attendant** page, > **Greetings**, under **Non-business hours greeting**, click **Change**, and then click **Browse** to locate the customized non-business hours greeting file you created before you started this procedure.

Important:

The file you use for the greeting must be a .wav or .wma file.

4. After you've located the file, click **Open**, and then click **Save**.

Use the Shell to enable a customized non-business hours greeting

This example enables the non-business hours greeting that uses a customized greeting named `GreetingFile.wav` for the UM auto attendant `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
AfterHoursWelcomeGreetingEnabled $true -
AfterHoursWelcomeGreetingFilename GreetingFile.wav
```

This example configures a UM auto attendant named `MyUMAutoAttendant` that has business hours configured to be 10:45 to 13:15 (Sunday), 09:00 to 17:00 (Monday), and 09:00 to 16:30 (Saturday) and holiday times and their associated greetings configured to be "`New Year`" on January 2, 2013, and "`Building Closed for Construction`" from April 24, 2013 through April 28, 2013.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30 -HolidaySchedule "New
Year,newyrgrt.wav,1/2/2013","Building Closed for
Construction,construction.wav,4/24/2013,4/28/2013"
```

This example configures a UM auto attendant named `MyAutoAttendant` and enables non-business hours key mappings so that when callers press 1, they're forwarded to another UM auto attendant named `SalesAutoAttendant`. When they press 2, they're forwarded to extension number 12345 for `Support`, and when they press 3, they're sent to another auto attendant that plays an audio file.

```
Set-UMAutoAttendant -Identity MyAutoAttendant -
BusinessHoursKeyMappingEnabled $true -
BusinessHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

Enable a customized non-business hours menu prompt

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-03-22*

You can customize the menu prompt to be used by a Unified Messaging (UM) auto attendant outside business hours. After you create a UM auto attendant, a default system prompt (“Welcome to Unified Messaging”) is used as the menu prompt that callers hear after the non-business hours welcome greeting is played. Although the system prompt mustn't be replaced or changed, you can customize the greetings and menu prompts that are used with UM auto attendants. After you create a customized non-business hours menu prompt audio file, you must enable menu navigation entries on the UM auto attendant for non-business hours.

If you only want to include the name of your organization or business as part of the default system prompt, you can enter the name in the **Business name** box on the UM auto attendant. For details, see Enter a business name.

Important:

You must configure business hours on the auto attendant. When you configure business hours, the non-business hours are set automatically. For details, see Configure business hours.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- Create a .wav or .wma file to be used for the menu prompt.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

AfterHoursKeyMappingEnabled $true -
AfterHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

Enable an informational announcement

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-19*

You can enable an informational announcement for a Unified Messaging (UM) auto attendant. When an informational announcement is enabled, it will play immediately after the business or non-business hours greeting. By default, an informational announcement isn't configured. To enable an informational announcement, create a .wav or .wma file to be used as the informational announcement, and then configure the auto attendant to use this sound file.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- Create a .wav or .wma file to be used for the informational announcement.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable an informational announcement

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan that you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to enable an informational announcement, and then click **Edit** .

3. On the **UM Auto Attendant** page, > **Greetings**, under **Informational announcement** click **Change**, and then click **Browse** to locate the informational announcement file you created before you started this procedure.

Important:
The file you use for the greeting must be a .wav or .wma file.

4. After you've located the file, click **Open**, and then click **Save**.

Use the Shell to enable an informational announcement

This example enables an informational announcement that uses the `MyInfoAnnouncement.wav` file for the UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
InfoAnnouncementEnabled $true -InfoAnnouncementFilename
MyInfoAnnouncement.wav
```

Create menu navigation

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You can use the **New menu navigation entry** page to create single or multiple key mappings for business or non-business hours main menu prompts for auto attendants. You can define the action that will be performed when a key on the telephone keypad is pressed, for example, transferring the call to an extension number or another auto attendant.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure UM auto attendant navigation menus

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to create menu navigation. On the toolbar, click **Edit** .
3. On the **UM Auto Attendant** page, click **Menu navigation**, select either **Enable business hours menu navigation** or **Enable non-business hours menu navigation**, and then click **Add +**.
4. On the **New menu navigation entry** page, configure the following:
   - **Prompt** Use this box to type the name of the new navigation menu. The navigation menu name is used for display purposes only. This is a required field.

Because you may want to specify multiple new navigation menus, we recommend that you use meaningful names for your key mappings. The maximum length of the name for the key mapping is 64 characters, and it can include spaces. However, it can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.

   - **When this key is pressed** Use this list to enable key mapping. The key mapping is the number key that a caller presses to have the auto attendant perform a specific operation, for example, forwarding the caller to another auto attendant or to an operator. By default, no entries are defined.

Use the drop-down list to select the numeric key (from 1 through 9) that the caller must press. Zero (0) is reserved for the auto attendant operator.

If you select **Time Out** from the drop down list, it enables callers to be transferred to an extension number or to another auto attendant if they don't press a key on the telephone keypad. For example, "Please stay on the line and your call will be answered by the next available representative." The default setting is 5 seconds. If you enable this option, a blank key mapping will be created.

   - **Play the following audio file** Use this option to select a previously recorded audio file for callers. Click **Change**, and then click **Browse** to locate the audio file.
   - **Perform this additional action** Select one of the following options to define the action that you want the auto attendant to perform for the caller:
     - **None** If you don’t want to the auto attendant to transfer the call to an extension or to

another auto attendant, or leave a message for a user, use this option.

- **Transfer to this extension** Select this option to enable calls to be transferred to an extension number. If you enable this option, use the box to type the extension where the call will be transferred. This field allows only numeric characters. It can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.
- **Transfer to this UM auto attendant** Select this option to transfer the call to an auto attendant. Click **Browse** to locate the auto attendant that you want to use. Before you enable this option, you must first create and configure the auto attendant. This option is used when you create a parent/child structure of UM auto attendants.
- **Leave a voice message for this user** Select this option to enable a caller to leave a voice mail message for a user that's on the same dial plan as the UM auto attendant that you're configuring. When a caller chooses this option from an auto attendant menu, they'll be prompted to leave a voice message for the user that was selected. Click **Browse** to locate the UM-enabled user.
- **Announce business location** Select this option to enable a caller to choose an auto attendant menu option and hear the location of the business that's configured on the UM auto attendant. To enable this to work correctly, you must first enter the business location in the **Business location** box on the **General** page on the UM auto attendant.
- **Announce business hours** Select this option to enable a caller to choose an auto attendant menu option and hear the hours of operation for the business that's configured on the UM auto attendant. To enable this to work correctly, you must first configure the business hours on the **Business hours** page on the UM auto attendant.

5. Click **OK** to create the new menu navigation.
6. On the **UM Auto Attendant** page, click **Save** to save your changes.

Use the Shell to configure UM auto attendant key mappings

This example enables business hours key mappings so that:

- When callers press 1, they will be forwarded to another UM auto attendant named `SalesAutoAttendant`.
- When they press 2, they will be forwarded to extension number 12345 for Support.
- When they press 3, they will be sent to another auto attendant that will play an audio file.

```
Set-UMAutoAttendant -id MyAutoAttendant -
BusinessHoursKeyMappingEnabled $true -
BusinessHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

This example sets key mappings defined in a comma-separated value (.csv) file. You must first create the .csv file with the following headings and the correct entry: <key>,<description>,

[<extension>],[<autoattendant name>],[<promptfilenamepath>],[<asrphrase1;asrphrase2>], [<leavevoicemailfor>],[<transfertomailbox>]. The values in brackets are optional. After creating the .csv file, import the .csv file using the **Import-csv** cmdlet.

```
$o = Import-csv -path "C:\UMFiles\AutoAttendants
\keymappings.csv"
Set-UMAutoAttendant MyAutoAttendant -
BusinessHoursKeyMapping $o
```

This example exports key mappings from an existing UM auto attendant into a .csv file, and then imports the same key mappings into another UM auto attendant. You could also export the key mappings to a .csv file, edit or modify the key mappings in the .csv file, and then import those key mappings into another UM auto attendant.

```
$aa = Get-UMAutoAttendant -id MyAutoAttendant
$aa1 = Get-UMAutoAttendant -id MyAutoAttendant2
$aa.BusinessHoursKeyMapping | Export-csv -path "C:\UMFiles
\AutoAttendants\keymappings.csv"
$aa1.BusinessHoursKeyMapping = (Import-csv -path "C:
\UMFiles\AutoAttendants\keymappings.csv")
```

Create business hours navigation menus

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You can enable business hours key mappings for a Unified Messaging (UM) auto attendant. After you create a UM auto attendant, a default system prompt will be used for the business hours main menu prompt greeting that callers hear after the business hours welcome greeting is played. The default business hours main menu prompt says, "Welcome to the Microsoft Exchange auto attendant." Because no key mappings are defined by default, no menu options are available to callers, and they hear only the default main menu prompt.

When you configure key mappings, you define the options and the operations that will be performed if a caller speaks a phrase while they're using a speech-enabled auto attendant or presses a key on the telephone keypad while they're using an auto attendant that isn't speech-

enabled.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to enable business hours key mappings on a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to create a business hours navigation menu. On the toolbar, click **Edit** .
3. On the **UM Auto Attendant** page, click **Menu navigation**, under **Business hours menu navigation**, select **Enable business hours menu navigation**, and then click **Add +**.
4. On the **New menu navigation entry** page, use the following options to create a new navigation entry:
   - **Prompt** Use this box to type the name of the new navigation menu. The navigation menu name is used for display purposes only. This is a required field.

Because you may want to specify multiple new navigation menus, we recommend that you use meaningful names for your key mappings. The maximum length of the name for the key mapping is 64 characters, and it can include spaces. However, it can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.

   - **When this key is pressed** Use this list to enable key mapping. The key mapping is the

number key that a caller presses to have the auto attendant perform a specific operation, for example, forwarding the caller to another auto attendant or to an operator. By default, no entries are defined.

Use the drop down list to select the numeric key (from 1 through 9) that the caller must press. Zero (0) is reserved for the auto attendant operator.

If you select **Time Out** from the drop down list, it enables callers to be transferred to an extension number or to another auto attendant if they don't press a key on the telephone keypad. For example, "Please stay on the line and your call will be answered by the next available representative." The default setting is 5 seconds. If you enable this option, a blank key mapping will be created.

- **Play the following audio file** Use this option to select a previously recorded audio file for callers. Click **Change**, and then click **Browse** to locate the audio file. If you leave the audio file as the default <None>, the Unified Messaging TTS (Text to Speech) engine will synthesize a business hours main menu prompt. Alternatively, you can create a customized audio file that can be used for the business hours main menu prompt for a speech-enabled auto attendant. For example, it might say, "To leave a voice message for sales, say 1. To leave a voice message for technical support, say 2. To leave a voice message for administration, say 3."
- **Perform this additional action** Select one of the following options to define the action that you want the auto attendant to perform for the caller:
  - **None** If you don’t want the auto attendant to transfer the call to an extension or to another auto attendant, or leave a message for a user, use this option.
  - **Transfer to this extension** Select this option to enable calls to be transferred to an extension number. If you enable this option, use the box to type the extension number where the call will be transferred. This field allows only numeric characters. It can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.
  - **Transfer to this UM auto attendant** Select this option to transfer the call to an auto attendant. Click **Browse** to locate the auto attendant that you want to use. Before you enable this option, you must first create and configure the auto attendant. This option is used when you create a parent/child structure of UM auto attendants.
  - **Leave a voice message for this user** Select this option to enable a caller to leave a voice mail message for a user that's on the same dial plan as the UM auto attendant that you're configuring. When a caller chooses this option from an auto attendant menu, they'll be prompted to leave a voice message for the user that was selected. Click **Browse** to locate the UM-enabled user.
  - **Announce business location** Select this option to enable a caller to choose an auto attendant menu option and hear the location of the business that's configured on the UM auto attendant. To enable this to work correctly, you must first enter the business location in the **Business location** box on the **General** page on the UM auto attendant.
  - **Announce business hours** Select this option to enable a caller to choose an auto attendant menu option and hear the hours of operation for the business that's configured on the UM auto attendant. To enable this to work correctly, you must first configure the business hours on the **Business hours** page on the UM auto attendant.

5. Click **OK** to create the new menu navigation.
6. On the **UM Auto Attendant** page, click **Save** to save your changes.

Use the Shell to enable business hours key mappings on a UM auto attendant

This example configures a UM auto attendant named `MyAutoAttendant` and enables business hours key mappings so that when callers press 1, they're forwarded to another UM auto attendant named `SalesAutoAttendant`. When they press 2, they're forwarded to extension number 12345 for Support, and when they press 3, they're sent to another auto attendant that plays an audio file.

```
Set-UMAutoAttendant -Identity MyAutoAttendant -
BusinessHoursKeyMappingEnabled $true -
BusinessHoursKeyMapping
"1,Sales,,SalesAutoAttendant","2,Support,12345","3,Directio
ns,,,directions.wav"
```

Create non-business hours navigation menus

Automatically answer and route incoming calls > UM auto attendant procedures > Set up a UM auto attendant >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You can enable non-business hours key mappings for a Unified Messaging (UM) auto attendant. After you create a UM auto attendant, a default system prompt will be used for the non-business hours main menu prompt greeting that callers hear after the non-business hours welcome greeting is played. The default non-business hours main menu prompt says, "Welcome to the Microsoft Exchange after hours auto attendant." Because no key mappings are defined by default, no menu options are available to callers and they hear only the default non-business hours main menu prompt.

When you configure key mappings, you define the options and the operations that will be performed if a caller speaks a phrase while they're using a speech-enabled auto attendant or presses a key on the telephone keypad while they're using an auto attendant that isn't speech-enabled.

For additional management tasks related to UM auto attendants, see UM auto attendant

procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable non-business hours key mappings on a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to create a non-business hours navigation menu. On the toolbar, click **Edit** .
3. On the **UM Auto Attendant** page, click **Menu navigation**, under **Non-business hours menu navigation**, select **Enable non-business hours menu navigation**, and then click **Add +**.
4. On the **New menu navigation entry** page, use the following options to create a new menu navigation entry:
   - **Prompt** Use this box to type the name of the new navigation menu. The navigation menu name is used for display purposes only. This is a required field.

Because you may want to specify multiple new navigation menus, we recommend that you use meaningful names for your key mappings. The maximum length of the name for the key mapping is 64 characters, and it can include spaces. However, it can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.

   - **When this key is pressed** Use this list to enable key mapping. The key mapping is the number key that a caller presses to have the auto attendant perform a specific operation, for example, forwarding the caller to another auto attendant or to an operator. By default, no

entries are defined.

Use the drop down list to select the numeric key (from 1 through 9) that the caller must press. Zero (0) is reserved for the auto attendant operator.

If you select **Time Out** from the drop down list, it enables callers to be transferred to an extension number or to another auto attendant if they don't press a key on the telephone keypad. For example, "Please stay on the line and your call will be answered by the next available representative." The default setting is 5 seconds. If you enable this option, a blank key mapping will be created.

- **Play the following audio file** Use this option to select a previously recorded audio file for callers. Click **Change**, and then click **Browse** to locate the audio file. If you leave the audio file as the default <None>, the Unified Messaging TTS (Text to Speech) engine will synthesize a non-business hours main menu prompt. Alternatively, you can create a customized audio file that can be used for the non-business hours main menu prompt for a speech-enabled auto attendant that would say, for example, "You have reached Contoso during non-business hours. To leave a voice message for sales, say 1. To leave a voice message for technical support, say 2. To leave a voice message for administration, say 3. To reach an after hours operator, press zero."
- **Perform this additional action** Select one of the following options to define the action that you want the auto attendant to perform for the caller:
  - **None** If you don’t want the auto attendant to transfer the call to an extension or to another auto attendant, or leave a message for a user, use this option.
  - **Transfer to this extension** Select this option to enable calls to be transferred to an extension number. If you enable this option, use the box to type the extension number where the call will be transferred. This field allows only numeric characters. It can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.
  - **Transfer to this UM auto attendant** Select this option to transfer the call to an existing auto attendant. Click **Browse** to locate the auto attendant that you want to use. Before you enable this option, you must first create and configure the auto attendant. This option is used when you create a parent/child structure of UM auto attendants.
  - **Leave a voice message for this user** Select this option to enable a caller to leave a voice mail message for a user that's on the same dial plan as the UM auto attendant that you're configuring. When a caller chooses this option from an auto attendant menu, they'll be prompted to leave a voice message for the user that was selected. Click **Browse** to locate the UM-enabled user.
  - **Announce business location** Select this option to enable a caller to choose an auto attendant menu option and hear the location of the business that's configured on the UM auto attendant. To enable this to work correctly, you must first enter the business location in the **Business location** box on the **General** page on the UM auto attendant.
  - **Announce business hours** Select this option to enable a caller to choose an auto attendant menu option and hear the hours of operation for the business that's configured on the UM auto attendant. To enable this to work correctly, you must first configure the business hours on the **Business hours** page on the UM auto attendant.

5. Click **OK** to create the new menu navigation.
6. On the **UM Auto Attendant** page, click **Save** to save your changes.

Use the Shell to enable non-business hours key mappings on a UM auto attendant

This example configures a UM auto attendant named `MyAutoAttendant` and enables non-business hours key mappings so that when callers say "After Hours" they will be forwarded to extension number 12345, and if they say "Directions" they will be forwarded to extension number 23456.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
AfterHoursKeyMappingEnabled $true -AfterHoursKeyMapping
"AfterhoursOperator,12345","Directions,23456"
```

Manage a UM auto attendant

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-30*

After you create a Unified Messaging (UM) auto attendant, you can view or configure a variety of settings. For example, you can add, remove, and edit extension numbers associated with the auto attendant. You can also enable or disable Automatic Speech Recognition (ASR) for the auto attendant and change the greetings used for business and non-business hours.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see

Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to view or configure UM auto attendant settings

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to view or configure, and then on the toolbar, click **Edit** .
3. On the **UM Auto Attendant** page, click **General** to view display-only information about the UM auto attendant and to perform management tasks on the UM auto attendant, as follows:
   - **UM dial plan** This box displays the UM dial plan associated with the auto attendant. After you create an auto attendant, the dial plan associated with the auto attendant can't be changed. If you need to associate an auto attendant with a different dial plan, you must delete the dial plan and then associate the auto attendant with the correct dial plan after you re-create it.
   - **Name** This box shows the name that was assigned to the auto attendant when it was created. This is the name that will appear in the EAC.
   - **Status** This box shows whether the UM auto attendant is enabled or disabled. To enable or disable the auto attendant, close the **UM Auto Attendant** page and use the toolbar under **UM Auto Attendants** on the **UM Dial Plan** page.
   - **Access numbers** Use this box to enter an extension number or access number that leads callers to the auto attendant. By default, no extension or access numbers are configured when you create an auto attendant.

The number of digits in the extension numbers or access numbers you provide must match the number of digits for an extension number configured on the UM dial plan associated with the UM auto attendant. You can also add a Session Initiation Protocol (SIP) address to this box. A SIP address is used by some IP Private Branch eXchanges (PBXs), SIP-enabled PBXs, and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server.

You can create a new auto attendant without listing an extension number or access number. To add an extension number, type the number in this box, and then click **Add +**. You can associate more than one number with an auto attendant. You can also edit or remove an existing access number. To edit an existing number, select it and click **Edit** . To remove an existing extension number from the list, select it and click **Remove −**.

   - **Set the auto attendant to respond to voice commands** Select this check box to enable

callers to respond verbally to auto attendant prompts to navigate the menu system. By default, when an auto attendant is created, it isn't speech-enabled.

If you decide to create the UM auto attendant but not to speech-enable it, you can use the EAC or the Shell to speech-enable it after it is created.

- **Use this auto attendant when voice commands don’t work correctly** Click **Browse** to select the auto attendant that you want to use in the case that voice commands don’t work. This is also referred to as a DTMF fallback auto attendant. A DTMF fallback auto attendant can be used only if the **Set the auto attendant to respond to voice commands don’t work correctly** option is selected. You must first create a DTMF fallback auto attendant, and then click **Browse** to locate the appropriate DTMF auto attendant.

A DTMF fallback auto attendant is used when the UM speech-enabled auto attendant can't understand or recognize the speech inputs from the caller. If the DTMF auto attendant is used, the caller is required to use DTMF inputs to navigate the menu system, spell a user's name, or use a custom menu prompt. A caller won't be able to use voice commands to navigate this auto attendant.

If you don't configure a DTMF fallback auto attendant, we recommend that you configure an operator extension number on the auto attendant. If you don't configure an operator extension number, when callers use a speech-enabled auto attendant and the system doesn't recognize their voice inputs, they won't be able to navigate the system or be transferred to an operator for help.

Although not required, we recommend that you configure the DTMF fallback auto attendant to have the same configuration as the speech-enabled auto attendant. The DTMF fallback auto attendant shouldn't be speech-enabled.

- **Language for automated voice interface** Use this list to select the language that callers hear when they reach the auto attendant. The default language is determined when you install Microsoft Exchange. For on-premises and hybrid deployments, by default, U.S. English is used because the auto attendant uses the language setting on the UM dial plan. To have other language options available, you must install the UM language packs for the languages you want to include. For more information about how to install a UM language pack, see Install a UM language pack. For UM in Office 365, it’s not required that you install any additional UM language packs.

Although you can select a language other than the language selected on the UM dial plan associated with the auto attendant, we recommend that the language settings on the dial plan and the auto attendant match. If language settings don't match, when callers call an extension number defined on the dial plan, they will be presented with prompts in one language, and when they dial an extension number associated with an auto attendant, they will be presented with prompts in a different language.

- **Business name** Use this box to enter the name of the business. By default, no business name is entered. If you enter a business name in this box, a prompt with the business name will be played to callers instead of the default greeting.
- **Business location** Use this box to enter the location of the business. By default, no business location is entered. If you enter the location of the business in this box, the business location will be played for callers.

4. Use **Greetings** on the auto attendant to manage recorded greetings. You can select default greetings or previously recorded custom greetings for business hours and non-business hours. You can configure the following:
   - **Business hours greeting** This is the initial greeting that is played when a caller calls the auto attendant during your organization's business hours. By default, business hours are from 12:00 A.M. to 12:00 A.M. and no non-business hours are set. If you don't specify a custom greeting, a system prompt that says, "Welcome to the Exchange auto attendant" is played for callers. The business and non-business hours are configured on the auto attendant **Business hours**.

You may want to customize this greeting to represent your company, for example, "Thank you for calling Woodgrove Bank." You can configure a customized business hours greeting by clicking **Change** to select a previously recorded custom greeting file. The custom greeting must already have been recorded as a .wav or .wma file.

   - **Non-business hours greeting** This is the initial greeting played when a caller calls the auto attendant during your organization's non-business hours. By default, no non-business hours are configured. Therefore, there is no default non-business hours greeting. You can configure the business and non-business hours on the auto attendant **Business hours**.

You may want to customize this greeting to represent your company, for example, "Thank you for calling Woodgrove Bank but we are now closed." or "You have reached Contoso, Ltd. after business hours. Our business hours are from 8:00 A.M. until 5:00 P.M., Monday through Friday." You can configure a customized non-business hours greeting by clicking **Change** to select a previously recorded custom greeting file. The custom greeting must already have been recorded as a .wav or .wma file.

   - **Informational announcement** When enabled, this optional recording plays immediately after the business or non-business hours greeting. An informational announcement may state the organization's hours of operation, for example, "Our business hours are 8:30 A.M. to 5:30 P.M., Monday through Friday and 8:30 A.M. to 1:00 P.M. on Saturday." An informational announcement can also provide information required for compliance with company policy, for example, "Calls may be monitored for training purposes." If it's important that callers hear the whole informational announcement, it can be marked as uninterruptible, requiring the caller to listen to the whole announcement.

By default, there's no informational announcement configured on UM dial plans or auto attendants. If you enable an informational announcement and use a custom audio file specific to your organization, the **Allow announcement to be interrupted** option will be made available. The recordings must already have been recorded as .wav or .wma files. Click **Change** to locate a custom informational announcement file previously recorded.

Allow announcement to be interrupted Select this check box to enable the caller to interrupt the informational announcement. This should be enabled if you have long informational announcements. Callers may become frustrated if the informational announcement is long and they can't interrupt it to access the options provided by the auto attendant.

5. Use **Business hours** to determine the organization's open business hours. During business hours, callers hear the default business hours greeting or a customized greeting, and the business hours main menu prompt if the appropriate business hours key mappings are configured on **Menu**

navigation. You can configure the following:

- **Time zone** Use this list to select your time zone. Consider whether the dial plan associated with the auto attendant covers more than one time zone when you set your schedule.

For on-premises and hybrid deployments, by default, the time zone is configured using the local server's system time when the Mailbox server that is running the Microsoft Exchange Unified Messaging service was installed.

- **Business hours** Click **Configure business hours**, and then, on the **Configure Business Hours** page, use the grid to configure your organization's business hours.
- **Holiday schedule** Use this to define days, from 00:00 through 23:59 (12:00 A.M. through 11:59 P.M.), on which your organization will be closed for a holiday. Callers who reach the auto attendant during the times that you specify on the **New holiday** page hear a custom holiday greeting audio file that you define. When you configure the holiday schedule, you must define the holiday name, the audio file for the recorded holiday greeting, and the **Start date** and **End date**. The greetings must already have been recorded as .wav or .wma files.

6. Use **Menu navigation** to specify the menu options that are offered to callers during business and non-business hours. If you want to enable menu navigation, you must do it separately for business and non-business hours. For example, if you want to enable business hours navigation, you must add a menu prompt custom audio recording, select the **Enable business hours menu navigation** check box, click **Add +**, and then set the options on the **New menu navigation entry** page.
   - **Business hours menu navigation** This is the list of options that callers hear during the business hours that are defined on the **Business hours** page. For example, "For technical support, press or say 1. For corporate offices and administration, press or say 2. For sales, press or say 3."

To enable business hours menu navigation, you must perform the following steps:

a. **Menu prompt** Use this to specify a custom menu prompt audio file. To use a custom or previously recorded business hours menu prompt, click **Change**, and then click **Browse** to locate the menu prompt recording.

b. **Enable business hours menu navigation** Select this check box to enable options for menu navigation that will be used during business hours. When you enable business hours menu navigation, you can add new menu navigation entries for business hours.

c. Click **Add +** to create a new menu navigation entry. On the **New menu navigation entry** page, use the following options to create a new menu navigation entry:

- **Prompt** Use this box to type the name of the new navigation menu. The navigation menu name is used for display purposes only. This is a required field.

Because you may want to specify multiple new navigation menus, we recommend that you use meaningful names for your key mappings. The maximum length of the name for the key mapping is 64 characters, and it can include spaces. However, it can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.

- **When this key is pressed** Use this list to enable key mapping. The key mapping is the number key that a caller presses to have the auto attendant perform a specific operation, for example, forwarding the caller to another auto attendant or to an operator. By

default, no entries are defined.

Use the drop down list to select the numeric key (from 1 through 9) that the caller must press. Zero (0) is reserved for the auto attendant operator.

If you select **Time Out** from the drop down list, it enables callers to be transferred to an extension number or to another auto attendant if they don't press a key on the telephone keypad. For example, "Please stay on the line and your call will be answered by the next available representative." The default setting is 5 seconds. If you enable this option, a blank key mapping will be created.

- **Play the following audio file** Use this option to select a previously recorded audio file for callers. Click **Change**, and then click **Browse** to locate the audio file. If you leave the audio file as the default <None>, the Unified Messaging TTS (Text to Speech) engine will synthesize a business hours main menu prompt. Alternatively, you can create a customized audio file that can be used for the business hours main menu prompt for a speech-enabled auto attendant. For example, it might say, "To leave a voice message for sales, say 1. To leave a voice message for technical support, say 2. To leave a voice message for administration, say 3."
- **Perform this additional action** Select one of the following options to define the action that you want the auto attendant to perform for the caller:
  - **None** If you don’t want the auto attendant to transfer the call to an extension or to another auto attendant, or leave a message for a user, use this option.
  - **Transfer to this extension** Select this option to enable calls to be transferred to an extension number. If you enable this option, use the box to type the extension where the call will be transferred. This field allows only numeric characters. It can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.
  - **Transfer to this UM auto attendant** Select this option to transfer the call to an auto attendant. Click **Browse** to locate the auto attendant that you want to use. Before you enable this option, you must first create and configure the auto attendant. This option is used when you create a parent/child structure of UM auto attendants.
  - **Leave a voice message for this user** Select this option to enable a caller to leave a voice mail message for a user that's on the same dial plan as the UM auto attendant that you're configuring. When a caller chooses this option from an auto attendant menu, they'll be prompted to leave a voice message for the user that was selected. Click **Browse** to locate the UM-enabled user.
  - **Announce business location** Select this option to enable a caller to choose an auto attendant menu option and hear the location of the business that's configured on the UM auto attendant. To enable this to work correctly, you must first enter the business location in the **Business location** box on the **General** page on the UM auto attendant.
  - **Announce business hours** Select this option to enable a caller to choose an auto attendant menu option and hear the hours of operation for the business that's configured on the UM auto attendant. To enable this to work correctly, you must first configure the business hours on the **Business hours** page on the UM auto attendant.

- **Non-Business hours menu navigation** This is the list of options callers hear during the non-

business hours that are defined on the **Business hours** page. For example, "Your call is very important to us. However, you have reached Woodgrove Bank after normal business hours. If you want to leave a message, please press or say 1 and we will return your call as soon as possible."

To enable non-business hours menu navigation, you must perform the following steps:

a. **Menu prompt** Use this to specify a custom menu prompt audio file. To use a custom or previously recorded non-business hours menu prompt, click **Browse**.

b. **Enable non-business hours menu navigation** Select this check box to enable options for menu navigation that will be used during non-business hours. When you enable non-business hours menu navigation, you can add new menu navigation entries for non-business hours.

c. Click **Add +** to create a new menu navigation entry. On the **New menu navigation entry** page, use the following options to create a new menu navigation entry:

- **Prompt** Use this box to type the name of the new navigation menu. The navigation menu name is used for display purposes only. This is a required field.

Because you may want to specify multiple new navigation menus, we recommend that you use meaningful names for your key mappings. The maximum length of the name for the key mapping is 64 characters, and it can include spaces. However, it can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.

- **When this key is pressed** Use this list to enable key mapping. The key mapping is the number key that a caller presses to have the auto attendant perform a specific operation, for example, forwarding the caller to another auto attendant or to an operator. By default, no entries are defined.

Use the drop down list to select the numeric key (from 1 through 9) that the caller must press. Zero (0) is reserved for the auto attendant operator.

If you select **Time Out** from the drop down list, it enables callers to be transferred to an extension number or to another auto attendant if they don't press a key on the telephone keypad. For example, "Please stay on the line and your call will be answered by the next available representative." The default setting is 5 seconds. If you enable this option, a blank key mapping will be created.

- **Play the following audio file** Use this option to select a previously recorded audio file for callers. Click **Change**, and then click **Browse** to locate the audio file. If you leave the audio file as the default <None>, the Unified Messaging TTS (Text to Speech) engine will synthesize a non-business hours main menu prompt. Alternatively, you can create a customized audio file that can be used for the non-business hours main menu prompt for a speech-enabled auto attendant that would say, for example, "You have reached Contoso during non-business hours. To leave a voice message for sales, say 1. To leave a voice message for technical support, say 2. To leave a voice message for administration, say 3. To reach an after hours operator, press zero."
- **Perform this additional action** Select one of the following options to define the action that you want the auto attendant to perform for the caller:
  - **None** If you don’t want the auto attendant to transfer the call to an extension or to

another auto attendant, or leave a message for a user, use this option.

- **Transfer to this extension** Select this option to enable calls to be transferred to an extension number. If you enable this option, use the box to type the extension number where the call will be transferred. This field allows only numeric characters. It can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.
- **Transfer to this UM auto attendant** Select this option to transfer the call to an existing auto attendant. Click **Browse** to locate the auto attendant that you want to use. Before you enable this option, you must first create and configure the auto attendant. This option is used when you create a parent/child structure of UM auto attendants.
- **Leave a voice message for this user** Select this option to enable a caller to leave a voice mail message for a user that's on the same dial plan as the UM auto attendant that you're configuring. When a caller chooses this option from an auto attendant menu, they'll be prompted to leave a voice message for the user that was selected. Click **Browse** to locate the UM-enabled user.
- **Announce business location** Select this option to enable a caller to choose an auto attendant menu option and hear the location of the business that's configured on the UM auto attendant. To enable this to work correctly, you must first enter the business location in the **Business location** box on the **General** page on the UM auto attendant.
- **Announce business hours** Select this option to enable a caller to choose an auto attendant menu option and hear the hours of operation for the business that's configured on the UM auto attendant. To enable this to work correctly, you must first configure the business hours on the **Business hours** page on the UM auto attendant.

7. Use **Address book and operator access** to define the features available to callers who dial in to the UM auto attendant. You can configure auto attendant features such as the language used when callers call in to the auto attendant and the ability for callers to transfer to an operator's extension number. You can configure the following:
   - **Options for contacting users** Use these options to determine how callers can contact users with voice mail when they call into a UM auto attendant
     a. **Allow callers to dial users** Select this check box to enable callers to transfer calls to users. By default, this option is enabled, and lets users who are associated with the dial plan transfer calls to users in the same UM dial plan. After you select this check box, you can set the group of users to whom callers can transfer by selecting the appropriate option under the **Options for searching the address book** section on this page.

If you disable this option and disable the **Allow callers to leave voice messages for users** option, the options under **Options for searching the address book** are also disabled.

     b. **Allow callers to leave voice messages for users** Select this check box to enable callers to send voice messages to users. By default, this option is enabled, and lets users who are associated with the dial plan send voice messages to users in the same UM dial plan. After you select this check box, you can set the group of users to whom callers can send voice messages by selecting the appropriate option under the **Options for searching the address book** section on this page.

If you disable this option and disable the **Allow callers to dial users** option, the options under

Options for searching the address book are also disabled.

If you disable this option, the auto attendant won't invite callers to send a voice message during a system prompt.

- **Options for searching the address book** Use these options to determine a grouping of users. By default, **Allow callers to search for user by name or alias** is selected, along with the **In this dial plan only** option. However, you can change the grouping of users to allow callers to transfer calls or send voice messages to users who are located in the global address list (GAL) for an organization. You can choose from the following:
  a. **Allow callers to search for users by name or alias** By default, this option is selected. It allows callers that call into this auto attendant to do a directory search for users by name or by their alias. An alias is assigned to a user when a mailbox is created for them. The alias is the first part of an SMTP address, for example, tonysmith@contoso.com. The SMTP address is tonysmith@contoso.com, while the alias is tonysmith. Choosing this option only affects callers that use this auto attendant and not those who use Outlook Voice Access.
     - **In this dial plan only** Select this option to allow callers who connect to the UM auto attendant to locate and contact users who are in the same dial plan that is associated with this UM auto attendant. By default, this option is enabled on the dial plan and on the auto attendant. This means that both Outlook Voice Access users and callers into the auto attendant are able to search for users within the same dial plan.
     - **In the entire organization** Select this option to allow callers who call into this UM auto attendant to search for and contact anyone listed in the GAL for the organization. This includes not only UM-enabled users but all users who are mailbox-enabled. This option allows callers to contact users in multiple dial plans. It isn't enabled by default. This setting is also available on a dial plan for Outlook Voice Access users.
  b. **Information to include for similar names** Use this drop-down list to select the option used for the UM auto attendant when users have the same or similar names. This setting is used when two or more users who have the same name exist in the directory. This is also called a matched name or disambiguation field. You can configure this setting, or you can leave the default setting on the auto attendant. By default, the auto attendant will inherit this setting from the setting on the dial plan that is linked to the auto attendant. The following is an example of a speech-enabled auto attendant:
     - System: "Welcome to Contoso. If you know the name of the person you are calling, please tell me their name at any time."
     - Caller says "Tony Smith."
     - There are multiple people with this name. Please select from one of the options: For Tony Smith, research, press 1. For Tony Smith, administration, press 2. For Tony Smith, technical support, press 3."
     - Caller presses the appropriate key on the key pad and the call is transferred to the user.

Note:
On a non-speech-enabled auto attendant, the system will tell the caller to use the key pad to input the user's name (last name first) and then search for the user. If there are multiple people in the directory with the same name, the caller is instructed to press the appropriate key to be

transferred to the user. You could optionally create a DTMF fallback auto attendant that uses only the key pad to enter a name or alias.

For these settings to be used, you must add the correct information to the user. For example, if you want the auto attendant to use a title for two users with the same name, you must add this information to the user's account. Select one of the following methods that provide more information to help the caller select the correct user in the organization:

- **Inherit From dial plan** Select this option to have the auto attendant use the default setting from the dial plan associated with the auto attendant.
- **Title** Select this option to have the auto attendant include each user's title when listing matches.
- **Department** Select this option to have the auto attendant include each user's department when listing matches.
- **Location** Select this option to have the auto attendant include each user's location when listing matches.
- **None** Select this option to have no additional information given when listing matches.
- **Prompt for alias** Select this option to have the auto attendant prompt the caller for the user's alias.

8. Under **Operator access**, you can specify auto attendant operator settings including the following:
   - **Operator extension** Use this box to type the extension number used to call an operator. This extension number can connect the caller to a human operator or a UM-enabled mailbox, or can be configured to call an external telephone number. By default, an operator extension isn't included in this box.
   - **Allow transfer to operator during business hours** Select this check box to enable callers to be transferred to a human operator during business hours by using the extension number that you configure in the **Operator extension** box. By default, this option is disabled.

It's useful to enable this option so that when a caller is unsuccessful at using the menu prompts or directory search to locate the required person during business hours, the caller can leave a voice message or connect to a human operator. After you enable this option, you can configure the operator extension number on a UM-enabled mailbox that's monitored. The caller can leave a voice message, or a human operator who has the extension number can help the caller.

   - **Allow transfer to operator during non-business hours** Select this check box to enable callers to be transferred to a human operator after business hours by using the extension number that you configure in the **Operator extension** box. By default, this option is disabled.

It's useful to enable this option so that when a caller is unsuccessful at using the menu prompts or directory search to locate the required person after business hours, the caller can leave a voice message or connect to a human operator. After you enable this option, you can configure the operator extension number configured on a UM-enabled mailbox that's monitored. The caller can leave a voice message, or a human operator who has the extension number can help the caller.

9. Use **Dialing authorization** to configure dialing rules for callers who call in to a UM auto attendant. You can use these settings to control the extension numbers that can be reached from an auto attendant or control the telephone numbers that can be dialed by callers that have

dialed into the auto attendant. You can configure the following:

- **Calls in the same UM dial plan** Select this check box to allow users who call in to an auto attendant to place or transfer calls to an extension number associated with a UM-enabled user who is associated with the same dial plan as the auto attendant. By default, this setting is enabled.

When you disable this setting, users who call in to an auto attendant can place or transfer calls to users who aren't UM-enabled or to other extension numbers not associated with a UM-enabled user. Users can't transfer calls to UM-enabled users who are associated with the same dial plan as the auto attendant. This is because the **Allow calls to any extension** setting is enabled by default.

- **Allow calls to any extension** When this setting is disabled, users who call in to an auto attendant can't place calls to users who aren't UM-enabled or to other extension numbers not associated with a UM-enabled user. However, they can place calls or transfer calls to extension numbers associated with UM-enabled users. This is because the **Calls in the same UM dial plan** setting is enabled by default. The **Allow calls to any extension** setting is enabled by default.

When this setting is enabled, users who call in to an auto attendant can place calls to users who aren't UM-enabled, to other extension numbers not associated with a UM-enabled user, and to UM-enabled users. This is because the **Calls within the same UM dial plan** setting is enabled by default.

You can enable this setting in an environment where not all users have been UM-enabled. This setting is also useful when you want to allow users who call in to a telephone number configured on an auto attendant to call extension numbers not associated with a UM-enabled user.

- **Authorized in-country/region dialing rule groups** Use this section to add or remove allowed in-country/region dialing rule groups. By default, there are no in-country/region dialing rule groups configured on UM auto attendants.

In-country/region dialing rule groups are used to allow or restrict the telephone numbers within a country or region that any user who has dialed in to the UM auto attendant can dial. This helps prevent unnecessary or unauthorized telephone calls and charges.

To add in-country/region dialing rule groups, you must first create the appropriate in-country/region dialing rule groups on the dial plan associated with the UM auto attendant, and then add the appropriate dialing rule group.

In-country/region dialing rule groups can be used by Unified Messaging to allow or restrict access to telephone numbers within a country or region. This is applied to any user who has called in to an auto attendant. For more information about outdialing, see Allow users to make calls.

- **Authorized international dialing rule groups** Use this section to add or remove allowed international dialing rule groups. By default, there are no international dialing rule groups configured on UM auto attendants.

International dialing rule groups are used to allow or restrict the telephone numbers outside a country or region that any user who has dialed in to the UM auto attendant can dial. This helps prevent unnecessary or unauthorized telephone calls and charges.

To add international dialing rule groups, you must first create the appropriate international dialing

rule groups on the dial plan associated with the UM auto attendant. After you create the required dialing rule groups on the dial plan, you must then add the dialing rule groups to the list of authorized dialing rule groups on the UM auto attendant.

International dialing rule groups can be used by Unified Messaging to allow or restrict access to telephone numbers outside a country or region. This is applied to any user who has called in to an auto attendant. For more information about outdialing, see Allow users to make calls.

10.Click **OK** to create the new menu navigation.

11.On the **UM Auto Attendant** page, click **Save** to save your changes.

Use the Shell to configure UM auto attendant properties

This example configures a UM auto attendant named `MySpeechEnabledAA` to fall back to the `MyDTMFAA` auto attendant, sets the operator's extension to 50100, and enables transfers to this extension number after business hours.

```
Set-UMAutoAttendant -Identity MySpeechEnabledAA -
DTMFFallbackAutoAttendant MyDTMFAA -OperatorExtension 50100
-AfterHoursTransferToOperatorEnabled $true
```

This example configures a UM auto attendant named `MyUMAutoAttendant` that has: Business hours configured as 10:45 to 13:15 (10:45 A.M. to 1:15 P.M.) on Sunday, 09:00 to 17:00 (9:00 A.M. to 5:00 P.M.) on Monday, and 09:00 to 16:30 (9:00 A.M. to 4:30 P.M.) on Saturday; holiday times and their associated greetings configured as "New Year" on January 2, 2013; and "Building Closed for Construction" configured from April 24 through April 28, 2013.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
BusinessHoursSchedule 0.10:45-0.13:15,1.09:00-
1.17:00,6.09:00-6.16:30 -HolidaySchedule "New
Year,newyrgrt.wav,1/2/2013","Building Closed for
Construction,construction.wav,4/24/2013,4/28/2013"
```

Use the Shell to view UM auto attendant properties

This example returns a formatted list of all UM auto attendants.

```
Get-UMAutoAttendant | Format-List
```

This example displays the properties of a UM auto attendant named MyUMAutoAttendant.

```
Get-UMAutoAttendant -Identity MyUMAutoAttendant
```

Configure a DTMF fallback auto attendant

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-30*

You can configure a speech-enabled Unified Messaging (UM) auto attendant that has a dual tone multi-frequency (DTMF) fallback auto attendant. A DTMF fallback auto attendant is used when the UM speech-enabled auto attendant can't understand or recognize the speech inputs provided by a caller. If a DTMF fallback auto attendant has been configured, the caller has to use DTMF inputs, also known as touchtone inputs, to navigate the auto attendant menu system, spell a user's name, or use a custom menu prompt. If no DTMF fallback auto attendant has been configured, and the maximum number of speech inputs is exceeded because the system didn't understand what the caller said, the system will respond with this prompt: "Sorry, I couldn't help. Please call back later."

By default, an auto attendant isn't speech-enabled when you create it. After you speech-enable the auto attendant, callers can use only voice commands to navigate the auto attendant menu system, and touchtone inputs can't be used. Although it isn't required, we recommend that you configure a DTMF fallback auto attendant for each speech-enabled auto attendant so callers can use touchtone inputs if the speech-enabled auto attendant doesn't recognize or understand the words they say. We also recommend that you don't speech-enable a DTMF fallback auto attendant.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to configure a speech-enabled auto attendant with a DTMF fallback auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change and click **Edit** ✎.
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to create a DTMF fallback auto attendant. On the toolbar, click **Edit** ✎.
3. On the **UM Auto Attendant** page > **General**, select the check box next to **Use this auto attendant when voice commands don't work correctly**, and then click **Browse**.
4. On the **Select a UM Auto Attendant** page, select the auto attendant you want to use as a DTMF fallback auto attendant, and then click **Save**.

Important:

You must first speech-enable the auto attendant before you can browse for a DTMF fallback auto attendant you have set up.

Use the Shell to configure a speech-enabled auto attendant with a DTMF fallback auto attendant

This example configures a UM auto attendant named `MySpeechEnabledAA` to use a DTMF fallback auto attendant named `MyDTMFAA`.

```
Set-UMAutoAttendant -Identity MySpeechEnabledAA -
DTMFFallbackAutoAttendant MyDTMFAA
```

Enable a UM auto attendant

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

By default, when a Unified Messaging (UM) auto attendant is created, its status is set to disabled.

After you create the UM auto attendant, you can change its status to enable it to answer incoming calls.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change and click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to enable. On the toolbar, click the **Up arrow** .
3. On the **Warning** page, click **Yes**.

Use the Shell to enable a UM auto attendant

This example enables the UM auto attendant named `MyUMAutoAttendant` to answer incoming calls.

```
Enable-UMAutoAttendant -Identity MyUMAutoAttendant
```

Disable a UM auto attendant

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

By default, when a Unified Messaging (UM) auto attendant is created, its status is set to disabled. After you create the UM auto attendant, you can change its status to control whether it can answer incoming calls. For example, you might want to disable the UM auto attendant when you're recording or re-recording customized prompts and messages.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant. Also confirm that the status of the UM auto attendant is set to enabled.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to disable a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the dial plan you want to change, and on the toolbar, click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to disable. On the toolbar, click **Down arrow**
3. On the **Warning** page, click **Yes**.

Use the Shell to disable a UM auto attendant

This example disables a UM auto attendant named `MyUMAutoAttendant`.

```
Disable-UMAutoAttendant -Identity MyUMAutoAttendant
```

Delete a UM auto attendant

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-30*

After you delete a Unified Messaging (UM) auto attendant, the incoming calls that were answered by the UM auto attendant must be answered by a human operator. A UM auto attendant can't be deleted if it's associated with a UM dial plan as the default UM auto attendant.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to delete a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to edit, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to delete. On the toolbar, click **Delete** . On the **Warning** page, click **Yes**.

Use the Shell to delete a UM auto attendant

This example deletes a UM auto attendant named `MyUMAutoAttendant`.

```
Remove-UMAutoAttendant -Identity MyUMAutoAttendant
```

Enable or disable automatic speech recognition

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-12*

You can enable your Unified Messaging (UM) auto attendant for Automatic Speech Recognition (ASR). After you speech-enable a UM auto attendant, callers can respond verbally to auto attendant prompts and move through the menu system of the auto attendant. By default, an auto attendant isn't speech-enabled when you create it. After you speech-enable the auto attendant, callers can use only voice commands to navigate the auto attendant menu system, and touchtone inputs can't be used.

Although it isn't required, we recommend that you configure a dual tone multi-frequency (DTMF) fallback auto attendant for each speech-enabled auto attendant so callers can use touchtone inputs if the speech-enabled auto attendant doesn't recognize or understand the words they say. If a DTMF fallback auto attendant is configured, callers can use DTMF inputs, also known as touchtone inputs, to navigate the auto attendant menu system, spell a user's name, or use a custom menu prompt. We don't recommend that you speech-enable a DTMF fallback auto attendant.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For

detailed steps, see Create a UM auto attendant.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to speech-enable a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to speech enable, and then click **Edit** .
3. On the **UM Auto Attendant** page > **General**, select the check box next to **Set the auto attendant to respond to voice commands** to enable speech recognition. To disable automatic speech recognition, clear this check box.
4. Click **Save**.

Use the Shell to speech-enable a UM auto attendant

This example enables ASR on a UM auto attendant named `MySpeechEnabled AA`.

```
Set-UMAutoAttendant -Identity MySpeechEnabledAA -
SpeechEnabled $true
```

Enable or prevent transferring calls from an auto attendant

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable callers to transfer calls to users through an auto attendant, or prevent them from doing so. By default this option is enabled, and lets callers transfer calls to UM-enabled users in the Unified Messaging (UM) dial plan that's associated with the UM auto attendant.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or prevent call transfers to users from a UM auto attendant

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to configure call transfer, and then click **Edit** .
3. On the **UM Auto Attendant** page > **Address book and operator access**, under **Options for contacting users**, select the check box next to **Allow callers to dial users** to enable calls to be transferred. To prevent call transfers, clear the check box.
4. Click **Save**.

Note:

If you clear this check box and also clear the **Allow callers to leave voice messages for users** check box, the **Options for searching the address book** are disabled.

Use the Shell to enable or prevent call transfers to users from a UM auto attendant

This example prevents call transfers on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
AllowDialPlanSubscribers $false
```

This example enables call transfers on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
AllowDialPlanSubscribers $true
```

Enable or disable sending voice messages to users

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-13*

You can enable callers to send voice messages to users from a Unified Messaging (UM) auto attendant, or prevent them from doing so. By default, this option is enabled and lets callers send voice messages to users in the UM dial plan that's associated with the UM auto attendant. If you disable this option, the auto attendant won't invite callers to send a voice message during a system prompt.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable callers to send voice messages or prevent them from doing so

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to manage, and then click **Edit** .
3. On the **UM Auto Attendant** page > **Address book and operator access**, under **Options for contacting users**, select the check box next to **Allow callers to leave voice messages for users** to enable callers to leave voice messages. To prevent callers from leaving voice messages, clear the check box.
4. Click **Save**.

Note:

If you disable this option and also disable the **Allow callers to dial users** option, the **Options for searching the address book** are also disabled.

Use the Shell to enable callers to send voice messages or prevent them from doing so

This example prevents callers who call in to a UM auto attendant named `MyUMAutoAttendant` from sending voice messages.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
SendVoiceMsgEnabled $false
```

This example enables callers who call in to a UM auto attendant named `MyUMAutoAttendant` to send voice messages.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
SendVoiceMsgEnabled $true
```

Enable or disable directory lookups

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable directory lookups so that callers who call in to a Unified Messaging (UM) auto attendant can look up names in the directory using their telephone keypad but not be able to search the directory using voice inputs. This setting is enabled by default. If this setting is disabled, callers won't be able to search the directory for a specific person using touchtone or voice commands.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or disable directory lookups

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to enable or disable directory lookups, and then click **Edit** .
3. On the **UM Auto Attendant** page > **Address book and operator access**, under **Options for**

searching the address book, select the check box next to **Allow callers to search for users by name or alias** to enable callers to search for users. To disable callers from searching for users, clear this check box.

4. Click **Save**.

Use the Shell to enable or disable directory lookups

This example disables directory lookups on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
NameLookupEnabled $false
```

Configure the group of users that can be contacted

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-09*

You can specify the group of users that callers can contact when calling into a Unified Messaging (UM) auto attendant. By default, callers can contact users within the same dial plan that's associated with the UM auto attendant. However, you can change the grouping of users to allow callers to transfer calls or send voice messages to users who are located in the organization's address book or to a specific set of users.

For additional management tasks related to UM auto attendants, see Manage a UM auto attendant.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to configure the group of users that callers can contact

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want to configure, and then click **Edit** .
3. On the **UM Auto Attendant** page > **Address book and operator access**, under **Options for searching the address book**, choose from the following options:
   - **In this dial plan only** Select this option to allow callers who connect to the UM auto attendant to locate and contact users who are in the dial plan associated with the UM auto attendant.
   - **In the entire organization** Select this option to allow callers who connect to the UM auto attendant to locate and contact anyone listed in the organization's address book. This includes all users who are mailbox-enabled.
4. Click **Save**.

Use the Shell to configure the group of users that callers can contact

This example sets the scope of the users that callers can contact to all users in the organization's address book on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
ContactScope GlobalAddressList
```

Configure an auto attendant for users who have similar names

Unified Messaging > Automatically answer and route incoming calls > UM auto attendant

procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-16*

You can configure the method to use for users with similar names on an auto attendant's **Address book and operator access** options, or you can leave the default setting on the auto attendant and configure this setting on the dial plan associated with the auto attendant. By default, an auto attendant can disambiguate between two or more users who have the same or similar names because the default setting on the auto attendant is **Inherit from dial plan**.

Note:

For the information that will be included for users with similar names to work correctly, you must provide the title, department, and location information for the recipients in your Microsoft Exchange organization.

For additional management tasks related to UM auto attendants, see UM auto attendant procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure a UM auto attendant for users with similar names

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant you want

to configure, and then click **Edit** .

3. On the **UM Auto Attendant** page, click **Address book and operator access**, and under **Information to include for users with the same name**, select one of the following:
   - **Title** The auto attendant will include each user's title when it lists matches.
   - **Department** The auto attendant will include each user's department when it lists matches.
   - **Location** The auto attendant will include each user's location when it lists matches.
   - **None** The auto attendant won't include any additional information when it lists matches.
   - **Prompt For alias** The auto attendant will prompt the caller for the user's alias.
   - **Inherit from dial plan** The auto attendant will use the default setting from the dial plan associated with the auto attendant.
4. Click **Save**.

Use the Shell to configure a UM auto attendant for users with similar names

This example sets the information to be included with users with similar names to Prompt for Alias for a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
MatchedNameSelectionMethod PromptForAlias
```

This example sets the information to be included with users with similar names to the title of the users, enables name lookups, and enables callers that dial into the auto attendant to press * to be presented with the Outlook Voice Access welcome greeting for a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
MatchedNameSelectionMethod Title -NameLookupEnabled $true -
StarOutToDialPlanEnabled $true
```

Set up voice mail for users

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-10-13*

After you've connected your telephony network or integrated Microsoft Lync Server with Exchange Unified Messaging (UM) and created and configured the required UM components, you'll need to set up voice mail for your users.

When you're enabling users for voice mail, you'll need to link the user to a UM mailbox policy. UM mailbox policies are used to apply common settings to a group of UM- enabled users. These settings include PIN policies, outbound calling restrictions, text to send with messages, and other related settings. You can either use a default UM mailbox policy or create and customize a UM mailbox policy based on the needs of your organization.

Setting up voice mail for users

Before you enable users for UM, you must consider the type of dial plan to use, the extension numbers that will be used, and determine what PIN policies, Outlook Voice Access, and other features you'll allow users to have access to. For details, see Voice mail for users.

UM mailbox policies

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-15*

Unified Messaging (UM) mailbox policies are required when you enable users for Unified Messaging. You create UM mailbox policies to apply a common set of policies or security settings to a collection of voice mail users' mailboxes. UM mailbox policies are used to specify UM settings like the following:

- PIN policies
- Dialing restrictions
- Other general UM mailbox policy properties

For example, you can create a UM mailbox policy to increase the level of PIN security by reducing the maximum number of sign-in failures for a specific group of UM-enabled users, such as executives.

UM mailbox policies

At least one UM mailbox policy must have been created before you can enable users for Unified Messaging. You can create additional UM mailbox policies to apply a common set of settings for groups of users.

You create UM mailbox policies by using the Exchange Management Shell or the Exchange Administration Center (EAC). By default, a single UM mailbox policy is created every time you create a UM dial plan. The new UM mailbox policy is automatically associated with the UM dial plan, and part of the dial plan name is included in the display name of the UM mailbox policy. You can edit this default UM mailbox policy.

Multiple UM-enabled users can be linked to a single UM mailbox policy. However, the mailbox for each UM-enabled user must be linked to a single UM mailbox policy. This lets you control PIN security settings such as the minimum number of digits in a PIN or the maximum number of sign-in attempts for the UM-enabled users who are associated with the UM mailbox policy. You can also control message text settings or dialing restrictions for the same UM-enabled mailboxes.

Create a UM mailbox policy

Set up voice mail for users > UM mailbox policies > UM mailbox policy procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-03-08*

You can create a Unified Messaging (UM) mailbox policy to apply a common set of UM policy settings, such as PIN policy settings or dialing restrictions, to a collection of UM-enabled mailboxes. UM mailbox policies link a UM-enabled user with a UM dial plan and apply a common set of policies or security settings to a collection of UM-enabled mailboxes. UM mailbox policies are useful for applying and standardizing UM configuration settings for UM-enabled users.

By default, when a UM dial plan is created, a UM mailbox policy is also created. You may have to create additional UM mailbox policies or modify existing UM mailbox policies after you deploy Unified Messaging in your organization.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to create a UM mailbox policy

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, click **New +**.
3. On the **New UM mailbox policy** page, in the **Name** box, enter the name of the new UM mailbox policy.

Use this box to specify a unique name for the UM mailbox policy. This is a display name that appears in the EAC. If you need to change the display name of the UM mailbox policy after it's been created, you must first delete the existing UM mailbox policy, and then create another UM mailbox policy that has the appropriate name. You can't delete a UM mailbox policy if any UM-enabled users are associated with it.

The UM mailbox policy name is required, but it's used for display purposes only. Because your organization may use multiple UM mailbox policies, we recommend that you use meaningful names for your UM mailbox policies. The maximum length of a UM mailbox policy name is 64 characters, and it can include spaces. However, it cannot include any of the following characters: " / \ [ ] : ; | = , + * ? < >.

4. Click **Save** to save the new UM mailbox policy. When you save the UM mailbox policy, all of the default settings including PIN policies, voice mail features, and Protected Voice Mail settings are enabled. If you want to customize or change any default settings, use the **Set-UMMailbox** cmdlet to change the settings for the UM mailbox policy you just created.

Use the Shell to create a UM mailbox policy

This example creates a UM mailbox policy named `MyUMMailboxPolicy` associated with a UM dial plan named `MyUMDialPlan`.

```
New-UMMailboxPolicy -Name MyUMMailboxPolicy -UMDialPlan
```

Manage a UM mailbox policy

Set up voice mail for users > UM mailbox policies > UM mailbox policy procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

After you create a Unified Messaging (UM) mailbox policy, you can view and configure a variety of settings. For example, you can configure UM features like Voice Mail Preview or Play on Phone and other security-related options such as Protected Voice Mail and PIN policy settings.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to manage a UM mailbox policy

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM dial plan** page, under **UM Mailbox Policies**, on the toolbar, click **Edit** .
   - Use **General** to view and configure settings for a UM mailbox policy. For example, you can view the dial plans associated with the UM mailbox policy or disable missed call notifications

for users who are associated with a specific UM mailbox policy. When you modify the settings on a UM mailbox policy, the settings are applied to all users who are associated with the UM mailbox policy. You can view or configure the following:

- **UM dial plan** Displays the name of the dial plan associated with the UM mailbox policy. This is the name of the dial plan displayed in the Shell.

When a new UM mailbox policy is created, it must be associated with a dial plan. After the UM mailbox policy is created and associated with a dial plan, the settings defined on the mailbox policy are applied to the users who are associated with the dial plan. By default, when you create a UM dial plan using the Shell, it will also create a UM mailbox policy.

- **Name** Type the name of the dial plan. A UM dial plan name is required and must be unique. However, it's used only for display in the EAC and the Shell. If you have to change the display name of the dial plan after it's been created, you must first delete the existing UM dial plan and then create another dial plan that has the appropriate name. If your organization uses multiple UM dial plans, we recommend that you use meaningful names for your UM dial plans. The maximum length of a UM dial plan name is 64 characters, and it can include spaces. (If you're integrating with Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server it's not recommended that you use spaces.) However, it can't include any of the following characters: " / \ [ ] : ; | = , + * ? < >.
- **Limit on personal greetings (minutes)** Use this text box to enter the maximum number of minutes that users who are associated with the UM mailbox policy can use when they record their voice mail greeting. You can modify this setting after the UM mailbox policy is created. Only numeric characters are allowed. The valid range for the greeting is from 1 through 10 minutes. The default setting is 5 minutes.
- **Allow voice mail preview** Select or clear this check box to enable or disable the Voice Mail Preview feature for users associated with the UM mailbox policy. Enabling this setting allows users to receive the text of a voice mail message in the message body of an email or text message. The default setting is enabled.
- **Allow users to configure call answering rules** Select this check box to allow users who are associated with the UM mailbox policy to create call answering rules. If this option is disabled on the UM dial plan, this feature won't be available to UM-enabled users associated with the UM mailbox policy. The default setting is enabled.
- **Allow message waiting indicator** Select or clear this check box to enable or disable Message Waiting Indicator for users associated with the UM mailbox policy. Message Waiting Indicator is a feature found in most legacy voice mail systems. In its most common form, it lights a lamp on the voice mail user's phone to indicate the presence of a new voice message. Message Waiting Indicator can also send a text message to the UM-enabled user's mobile phone. The default setting is enabled.
- **Allow Outlook Voice Access** Select or clear this check box to enable or disable access to Outlook Voice Access for UM-enabled users who are associated with this UM mailbox policy. Outlook Voice Access is a feature used by UM-enabled users to access their mailbox over a phone. By default, this setting is enabled.
- **Allow missed call notifications** Select or clear this check box to enable or disable missed

call notifications for users associated with the UM mailbox policy. A missed call notification is an email message sent to a user's mailbox when the user doesn't answer an incoming call. This is a different email message than the email message that contains the voice message left for a user.

Note:

When you're integrating Unified Messaging and Lync Server on-premises, missed call notifications aren't available to users who have a mailbox located on an Exchange 2007 or Exchange 2010 Mailbox server. A missed call notification is generated when a user disconnects before the call is sent to Unified Messaging.

Typically, when a user misses an incoming call, the user receives two email messages: a message that contains the voice message and a missed call notification message. By default, missed call notifications are enabled when a UM mailbox policy is created.

- **Allow Play on Phone for voice mail** Select or clear this check box to enable or disable the Play on Phone feature for users associated with the UM mailbox policy. This option is enabled by default and allows users to play their voice messages over any phone, including an office or mobile phone.
- **Allow inbound faxes** Select or clear this check box to enable or disable inbound faxes for users associated with the UM mailbox policy. By default, when you enable users for UM, their mailbox is able to receive faxes. However, if this option is disabled on the UM dial plan, UM-enabled users associated with the UM mailbox policy won't be able to receive faxes. The default setting on the UM mailbox policy is disabled.

After you have enabled the **Allow inbound faxes** setting, you will need to specify the URI for the partner fax server. If the UM mailbox policy is linked to a dial plan that can use TCP and TLS, you will need to enter URIs for both TCP and TLS.

- **Help Microsoft improve voice mail preview** These options allow Microsoft to improve the quality of Voice Mail Preview. You can enable the following settings:
  - **Allow analysis of voice messages left by callers** Use this option to help improve the quality of Voice Mail Preview in future releases of Microsoft Exchange by forwarding copies of voice messages to Microsoft for analysis. You can't set this option if all voice messages are protected.
  - **Tell callers that voice messages may be analyzed** Use this option to tell callers that the messages they leave may be analyzed by Microsoft to improve the quality of Voice Mail Preview, and allow them to opt out.

- Use **Message Text** to configure message text settings for users who are associated with a UM mailbox policy. For example, you can specify the email message text sent to users after they reset their UM PIN. You can configure the following:
  - **When a user is enabled for Unified Messaging** The text entered in this text box appears in the email message sent to users when they are enabled for UM. When a recipient's mailbox is enabled for UM and they are enabled for voice mail, an email message that welcomes the user to Unified Messaging is sent to the user. This text box is limited to 512 characters and can contain simple HTML formatting. By default, no text is defined in this text box.

This welcome message contains welcome text and the PIN information that the user will use to access the UM or voice mail system. The text entered in this text box is included at the bottom of this welcome message. You can use this text box to include information such as the voice mail technical support telephone numbers or Outlook Voice Access numbers.

If text isn't entered in this text box, the default text generated by the UM or voice mail system is included in the email message.

The text that you provide in this text box can be plain. It can also contain simple HTML formatting tags if you want to emphasize text or add hyperlinks to other content.

Example 1: If you have any questions or suggestions about voice mail service, please call the help desk at extension 4200.

Example 2: If you have any questions or suggestions about voice mail service, please call the help desk at extension 4200 or visit our website at .

- **When a user's Outlook Voice Access PIN is reset** The text entered in this text box is included in the email message sent to UM-enabled users when their UM PIN is reset.

A PIN is reset by the UM or voice mail system if the number of failed sign-in attempts exceeds 10 (by default) or if users reset their PIN using the UM features included with Microsoft Outlook, Outlook Web App, or Outlook Voice Access from a telephone. You can use this text box to include information such as security notices or other security-related information in the email message.

If text isn't entered in this text box, the default text generated by the UM system is included in the email message.

This text box is limited to 512 characters. By default, no text is defined in this text box.

The text that you provide in this text box can be plain. It can also contain simple HTML formatting tags if you want to emphasize text or add hyperlinks to other content.

- **When a user receives a voice message** The text entered in this text box is included in the email message sent to users when they receive a voice message from an incoming caller. For example, this text can include disclaimers that contain information about forwarding voice messages or system security policies that describe the correct way to handle voice messages in your organization.

If text isn't entered in this text box, the default text generated by the system is included in the email message. This text box is limited to 512 characters. By default, no text is defined in this text box.

The text that you provide in this text box can be plain. It can also contain simple HTML formatting tags if you want to emphasize text or add hyperlinks to other content.

- **When a user receives a fax message** The text entered in this text box is included in the email message sent to users when they receive an incoming fax message in their Inbox. You can use this text box to include disclaimers that contain information about forwarding fax messages or other system security policies about the correct way to handle fax messages in your organization.

If text isn't entered in this text box, the default text generated by the system is included in the email message. This text box is limited to 512 characters. By default, no text is defined in this text box.

- Use **PIN Policies** to configure PIN settings for users who are associated with a UM mailbox

policy. UM PINs enable users to access their Inboxes by using a telephone. By configuring settings on this page, you can specify the minimum number of digits for a UM PIN or the number of failed sign-in attempts before users are locked out of their UM mailbox.

Make sure that you plan carefully for the UM PIN policies that you implement in your environment. If you don't plan and implement the appropriate UM PIN policies, you may introduce security threats and mistakenly allow unauthorized access to your network. You can configure the following:

- **Minimum PIN length (digits)** Use this text box to specify the minimum number of digits that a UM user's PIN can contain. The default setting is six digits. The range is from 4 through 24 numeric digits. This setting can't be disabled.

Increasing the number of digits required for a PIN increases the level of security for your UM system. Decreasing the number of digits required for a PIN reduces the level of security for your network. The fewer the digits that are required in a PIN, the easier it is for a potential attacker to guess a user's PIN.

If this setting is set too high, users might have problems remembering their PINs. However, if the setting is too low, you risk unauthorized access to the UM system.

- **PIN recycle count** Use this setting to set the number of unique PINs that users must use before they can reuse an old PIN. For most organizations, this value should be set to the default of 5, the number of PINs that the system will remember. PIN history can't be disabled.

You can set this value from 1 through 20. Setting this value too high can frustrate users because it can be difficult to memorize many PINs. Setting it too low may introduce a security threat to your network.

- **Allow common PIN patterns** Use this setting to set PIN complexity requirements for UM. These complexity requirements are enforced on PIN changes or when new PINs are created.

If this option is disabled, sequential and repeated numbers and the suffix of the mailbox extension will be rejected. If this option is enabled, only the suffix of the mailbox extension will be rejected.

As a security best practice, we recommend that you disable this setting. If this setting is disabled, user PINs can't contain the following:

Sequential numbers, such as 123456 or 456789.

Repeated numbers, such as 111111 or 8888888.

Suffix of the mailbox extension.

- **Enforce PIN lifetime (days)** Use this text box to configure the number of days until the UM-enabled user's PIN expires. After the PIN expires, the user must create a new UM PIN. For most organizations, this value should be set to the default of 60 days.

The value of this setting can be from 0 through 999. If it's set to 0, PINs never expire. Setting this value too low can frustrate users because they are required to create and memorize new PINS too frequently.

- **Number of sign-in failures before PIN reset** Use this text box to enter the number of sequential unsuccessful or failed sign-in attempts that can occur before the UM system automatically resets a user's PIN. For most organizations, this value should be set to the default of 5 attempts.

The value of this setting can be from 0 through 999. If it's set to 0, this setting is disabled and the system won't automatically reset users' PINs. Setting this value too low can frustrate users; setting it too high gives malicious users more attempts to determine the PIN.

This setting must be set to a number lower than the number configured in the **Number of sign-in failures before lockout** setting. This setting is designed to help prevent a brute force attack on user PINs.

- **Number of sign-in failures before lockout** Use this text box to enter the maximum number of sequential unsuccessful or failed sign-in attempts before users are locked out of their mailboxes.

For example, if a user tries to sign in to the mailbox unsuccessfully five times, based on the **Number of sign-in failures before PIN reset** setting, the system will reset the user's PIN. If the user tries to use the new PIN five more times unsuccessfully, the system will again reset the PIN. If the user tries to use this new PIN five more times unsuccessfully, the user is then locked out of the mailbox. After a user is locked out, an administrator must manually reset or unlock the mailbox for the user.

This value can be set from 1 through 999. Setting this value too low can frustrate users; setting it too high gives malicious users more attempts to determine the PIN. For most organizations, this value should be set to the default of 15 attempts.

This number must be greater than the number set in the **Number of sign-in failures before PIN reset** setting. This setting is designed to help prevent a brute force attack on user PINs.

- Use **Dialing authorization** to configure dialing rules for UM-enabled users who are associated with this UM mailbox policy.

You can use these settings to control the extension numbers that can be reached or the telephone numbers that can be dialed by UM-enabled users who are associated with the UM mailbox policy. You can configure the following:

- **Calls in the same UM dial plan** Select this check box to allow UM-enabled users who call in to a subscriber access number configured on a dial plan and successfully sign in to their mailbox to place calls or transfer to UM-enabled users who have extension numbers within the same dial plan. By default, this setting is enabled.

When you disable this setting, UM-enabled users who call in to a subscriber access number configured on a dial plan and successfully sign in to their mailbox can place calls or transfer calls to users who aren't UM-enabled or to other extension numbers not associated with a UM-enabled user. However, they can't transfer to UM-enabled users who are within the same dial plan. This is because the **Calls to any extension** setting is enabled by default.

- **Calls to any extension** When this setting is enabled, users who call in to a subscriber access number configured on a dial plan and successfully sign in to their mailbox can place calls to users who aren't UM-enabled, to other extension numbers not associated with a UM-enabled user, and to UM-enabled users within the same dial plan. This is because the **Calls in the same UM dial plan** setting is enabled by default.

When this setting is disabled, users who call in to an Outlook Voice Access number configured on a dial plan and successfully sign in to their mailbox can't place calls to users who aren't UM-enabled or to other extension numbers not associated with a UM-enabled user. However, they can place

calls or transfer calls to extension numbers associated with UM-enabled users. This is because the **Calls in the same UM dial plan** setting is enabled by default. The **Calls to any extension** setting is enabled by default.

You can enable this setting in an environment where not all users have been UM-enabled. This setting is also useful when you want to allow users who call in to an Outlook Voice Access number configured on a dial plan to call extension numbers not associated with a UM-enabled user.

- **Authorized in-country/region dialing rule groups** Use this section to add or remove allowed in-country/region dialing rule groups. By default, there are no in-country/region dialing rule groups configured on UM mailbox policies.

In-country/region dialing rule groups are used to allow or restrict the telephone numbers within a country or region that Outlook Voice Access users can dial. This helps prevent unnecessary or unauthorized telephone calls and charges.

To add in-country/region dialing rule groups, you must first create the appropriate in-country/region dialing rule groups on the dial plan associated with the UM mailbox policy, and then add the appropriate dialing rule entries on the dialing rule group. After you create the required dialing rule groups on the dial plan, you must then add the dialing rule groups to the list of dialing restrictions under **Dialing authorization** on the UM mailbox policy.

In-country/region dialing rule groups can be used to enable Unified Messaging to allow or restrict access to telephone numbers within a country or region. This is applied to Outlook Voice Access users who have called in to an Outlook Voice Access number.

- **Authorized international dialing rule groups** Use this section to add or remove allowed international dialing rule groups. By default, there are no international dialing rule groups configured on UM mailbox policies.

To add international dialing rule groups, you must first create the appropriate international dialing rule groups on the dial plan associated with the UM mailbox policy, and then add the appropriate dialing rule entries on the dialing rule group. After you create the required dialing rule groups, you must add the dialing rule groups to the dialing restrictions on the UM mailbox policy.

International dialing rule groups can be used to enable Unified Messaging to allow or restrict access to telephone numbers outside a country or region. This is applied to Outlook Voice Access users who have called in to a Outlook Voice Access number.

International dialing rule groups are used to allow or restrict the telephone numbers outside a country or region that Outlook Voice Access users can dial. This helps prevent unnecessary or unauthorized telephone calls and charges.

- Use **Protected Voice Mail** to configure the following settings:
  - **Protect voice messages from unauthenticated callers** Select one of the following options from the drop-down list to determine whether an incoming call answered by Unified Messaging will protect voice messages. This setting applies to voice messages sent to UM-enabled users when they don't answer their phone. This setting also applies to voice messages sent directly to UM-enabled users when the caller uses a UM auto attendant. You can configure the following:

None Use this setting to not have protection applied to any voice messages sent to UM-enabled

users.

Private Use this setting when you want to apply protection only to voice messages that have been marked as private by the caller.

All Use this setting when you want to apply protection to all voice messages, including those not marked as private.

- **Protect voice messages from authenticated callers** Select one of the following options from the drop-down list to determine whether an incoming call answered by Unified Messaging will protect voice messages. This setting applies to voice messages sent to UM-enabled users when they don't answer their phone. This setting also applies when callers sign in to their mailbox using Outlook Voice Access, and then create and send a voice message. You can configure the following:

None Use this setting to not have protection applied to any voice messages sent to UM-enabled users.

Private Use this setting when you want to apply protection only to voice messages that have been marked as private by the caller.

All Use this setting when you want to apply protection to all voice messages, including those not marked as private.

- **Require Play on Phone for protected voice messages** Select this check box if you want to force users who receive protected voice messages to use the Play on Phone feature. Or, if the client software doesn't support rights management, users must use Outlook Voice Access. The Play on Phone feature only applies to clients using a version of Outlook that supports rights management. For Outlook 2007 and earlier versions that don't support rights management, and for Outlook Web App clients, Outlook Voice Access is the only way that users can listen to protected voice mail.

The default setting requires all users associated with the UM mailbox policy to use the Play on Phone feature to listen to voice messages that are protected. By doing this, it prevents other people from hearing the voice message from a media player over computer speakers or from a media player on a mobile phone. Even if this is enabled, a UM-enabled user can still use Outlook Voice Access to hear the protected voice mail.

This is especially useful when UM-enabled users use public computers, laptops in public places, or their mobile phone's media player to listen to protected voice mail that can contain private information.

- **Allow voice responses to email and calendar items** Use this option to allow UM-enabled users to send voice responses to protected voice mail messages. The default is enabled. If you disable this, if a UM-enabled user receives a protected voice mail message, they will not be able to use Outlook Voice Access to reply to email and calendar items.
- **Message to send to users who don’t have Windows Rights Management support** Protected voice mail can only be accessed by email clients that support Information Rights Management (IRM), or if a UM-enabled user uses Outlook Voice Access to access the protected voice mail message.

If a protected voice mail message is sent to an email client that doesn't support IRM, the text that

you include in this box will be sent to the user in an email message. This information should include instructions about what to do to be able to receive the protected voice mail message.

Use the Shell to manage a UM mailbox policy

This example sets the PIN settings for users who are associated with a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 8 -MaxLogonAttempts 12 -
MinPINLength 8 -PINHistoryCount 10 -PINLifetime 60 -
ResetPINText "The PIN that is used to allow you access to
your mailbox using Outlook Voice Access has been reset."
```

This example selects the in-country or region groups and international groups from those configured on the UM dial plan associated with the UM mailbox policy. UM-enabled users associated with this UM mailbox policy will be able to place outbound calls according to the rules defined on these groups.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowDialPlanSubscribers $true -
AllowedInCountryOrRegionGroups InCountry/
RegionGroup1,InCountry/RegionGroup2 -
AllowedInternationalGroups
InternationalGroup1,InternationalGroup2 -AllowExtensions
$true
```

This example configures the text of voice messages sent to UM-enabled users and the text included in an email message sent to a user who has been UM-enabled.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
UMEnabledText "You have been enabled for Unified
Messaging." -VoiceMailText "You have received a voice
message from Microsoft Exchange 2013 Unified Messaging."
```

Use the Shell to view UM mailbox policy properties

This example returns a formatted list of all UM mailbox policies in the Active Directory forest.

```
Get-UMMailboxPolicy | Format-List
```

This example returns the properties and values for a UM mailbox policy named `MyUMMailboxPolicy`.

```
Get-UMMailboxPolicy -Identity MyUMMailboxPolicy
```

Delete a UM mailbox policy

Set up voice mail for users > UM mailbox policies > UM mailbox policy procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

When you delete a Unified Messaging (UM) mailbox policy, the UM mailbox policy will no longer be available to be associated with recipients who are being enabled for UM. You can't delete a UM mailbox policy if it's referenced by any UM-enabled mailboxes, and you can't delete a UM dial plan if a UM mailbox policy is associated with it.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to delete a UM mailbox policy

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM dial plan** page, under **UM Mailbox Policies**, on the toolbar, click **Delete** .

Use the Shell to delete a UM mailbox policy

This example deletes a UM mailbox policy named `MyUMMailboxPolicy`.

```
Remove-UMMailboxPolicy -Identity MyUMMailboxPolicy
```

Voice mail for users

Exchange Server 2013 > Unified Messaging > Set up voice mail for users >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-19*

With Unified Messaging (UM), users in an Exchange organization can receive all their email and voice messages in one mailbox. The Unified Messaging functionality and voice mail features increase user productivity and enable more flexible messaging throughout an organization.

When you're adding a user to your organization, you're given the option of creating a mailbox or connecting the user to an existing mailbox. After the mailbox is created for the user or the user is connected to an existing mailbox, you can enable the mailbox for Unified Messaging so the user can use the voice mail system and the features included with voice mail. After the user is enabled for Unified Messaging, all email, voice mail, and fax messages will be delivered to the user's mailbox. By using Microsoft Office Outlook 2007 or later versions, Outlook Web App, a mobile phone enabled for Microsoft Exchange ActiveSync, or a regular or mobile phone, users can access their email, voice messages, personal contacts, and calendaring information.

Contents

Voice mail user properties

A user must have a mailbox before they can be enabled for Unified Messaging. But, by default, a user who has a mailbox isn't enabled for Unified Messaging. After the user is UM-enabled, you can manage, modify, and configure the UM properties and voice mail features for them. You can enable a user for Unified Messaging using EAC or the Shell. For details, see Enable a user for voice mail. To enable multiple UM users, use the EAC or the **Enable-UMMailbox** cmdlet in the Exchange

Management Shell.

The relationship between a voice mail user and other UM components

When you enable a user for Unified Messaging, the user must be associated with or linked to an existing UM mailbox policy, and you must provide an extension number for them. You can associate a user with a UM mailbox policy by using the **Enable-UMMailbox** cmdlet in the Shell or by selecting the UM mailbox policy when you enable the user for Unified Messaging. By default, when you create a UM dial plan, a new UM mailbox policy is created. This policy can be modified or another policy can be created and linked to the dial plan to determine what features or settings will be applied to a user or group of users.

A UM mailbox policy contains settings such as the dialing restrictions and PIN policies for a user. When a UM mailbox policy is created, it must be associated with only one UM dial plan. Any Exchange server can answering incoming calls and provide voice mail services for any UM-enabled users who are linked with the UM dial plan. After the user is enabled for Unified Messaging, the settings from a UM mailbox policy are applied to the UM-enabled user.

Extension numbers and SIP addresses

When you enable a user for Unified Messaging, you must define at least one extension number that Unified Messaging will use when voice mail is submitted to the user's mailbox. After you enable the user for Unified Messaging, you can add secondary extension numbers to the user's mailbox, or modify or remove them by configuring the Exchange Unified Messaging proxy address (EUM proxy address) on the user's mailbox or add or remove additional or secondary extensions for the user in the EAC. You can remove the primary extension number in the EAC by removing the EUM proxy address, but it’s recommended that you don’t remove it. Removing the primary extension number won’t allow calls to be forwarded correctly to the user’s mailbox.

Note:
There's no limit to the number of secondary extension numbers that you can add for a UM-enabled user but there can only be one primary extension number per user.

The mailbox of a UM-enabled user can be associated with only one UM dial plan. The UM-enabled user can be assigned the following:

- A single primary extension number, Session Initiation Protocol (SIP) address, or E.164 address on a single dial plan.
- Multiple secondary extension numbers, SIP addresses, or E.164 addresses on a single dial plan.
- Multiple primary extension numbers, SIP addresses, or E.164 addresses on two separate dial plans.

Note:
Each extension number, SIP address, and E.164 number must be unique within a dial plan and

the number of digits in the dial plan will used for all users that are linked with the dial plan.

For example, a UM-enabled user travels frequently from New York to Tokyo. The user's mailbox is associated with the New York dial plan and a single extension number is configured on the user's mailbox. A second extension number is configured on the user's mailbox for the Tokyo dial plan. When callers dial either extension number and leave a voice message for the user, the voice message will be delivered to the same UM-enabled mailbox.

Return to top

Using the EAC to enable a user for UM and voice mail

After you create an Exchange mailbox for the user, you can configure the UM mailbox settings by using **View Details** under **Unified Messaging** in the EAC. When you enable a user, there are several settings that you need to configure:

1. **SIP address** This is the SIP address for the user. You'll see this setting if the user that you're enabling for UM is assigned to a UM mailbox policy that's linked to a SIP URI dial plan. SIP URI dial plans are used when you're integrating Office Communications Server 2007 R2 or Microsoft Lync Server. When you assign the user to a UM mailbox policy that's linked to a SIP URI or E.164 dial plan, you must still also enter an extension number for the user. The primary extension number is used by the user to access Outlook Voice Access.
2. **Extension number** You must manually enter the extension number for the user you're enabling for UM.

You must provide a valid extension number for the user and match the number of digits specified on the dial plan. You can only enter numeric characters or digits from 1 through 20. The typical extension number is 3 to 7 digits long, and is configured on the dial plan with which the UM mailbox policy is linked and assigned to the user.

3. **PIN settings for the user:**
   - **Automatically generate PIN** This setting automatically generates a PIN for the UM-enabled user to use for voice mail access via Outlook Voice Access. This is the default setting. When you click this button, a PIN is automatically generated based on the PIN policies configured on the UM mailbox policy assigned to the user. We recommend that you use this setting to help protect the user's PIN. The PIN is sent to the user in the welcome message they receive after they're enabled for UM. By default, they'll have to change this PIN when they first sign in to their mailbox to get their voice mail.
   - **Type a PIN** This setting enables you to manually specify a PIN that the user will use to access the voice mail system.

The PIN must comply with the PIN policy settings configured on the UM mailbox policy associated with this UM-enabled user. For example, if the UM mailbox policy is configured to accept only PINs that contain seven or more digits, the PIN you enter in this box must be at least seven digits long.

   - **Require the user to reset their PIN the first time they sign in** This setting forces the user to reset their voice mail PIN when they access the voice mail system from a telephone using

Outlook Voice Access for the first time. They will be prompted to enter a PIN that's more familiar to them.It's a security best practice to force UM-enabled users to change their PIN when they first sign in to help protect against unauthorized access to their data and Inbox. This check box is selected by default.

Using the Shell to enable a user for UM and voice mail

This example enables Unified Messaging and voice mail on the mailbox for tonysmith@contoso.com, sets the extension and manually sets the PIN for the user, and then assigns the user to a UM mailbox policy named `MyUMMailboxPolicy`.

```
Enable-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy -Extensions 51234 -PIN
5643892 -PINExpired $true
```

This example enables Unified Messaging and voice mail on a mailbox for tonysmith@contoso.com, assigns the user to a UM mailbox policy named `MyUMMailboxPolicy`, and sets the extension number, SIP address, and manually sets the PIN for the user.

```
Enable-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy -Extensions 51234 -PIN
5643892 -SIPResourceIdentifier "tonysmith@contoso.com" -
PINExpired $true
```

Disabling UM for a user

When you disable Unified Messaging for a user, the user's account may still be listed when a caller performs a directory search using a UM auto attendant menu or using Outlook Voice Access. Callers may be able to locate a user in the directory, but when they try to contact the user, they're taken back to the main menu in Unified Messaging. This may cause callers to become frustrated with the system. You can prevent callers from using a directory search to contact a user who's been disabled for Unified Messaging by connecting the user to another voice mail system, removing the user from the UM auto attendant directory search, or removing the user's account.

After a UM-enabled user account is disabled for Unified Messaging, the user may still have access to the individual UM-enabled mailbox using Outlook Voice Access or Microsoft Outlook. This can occur when all the changes aren't consistent in the directory. To lessen the risk of a user gaining access to the mailbox even though the account has been disabled for Unified Messaging, you can manually force replication to occur or remove all Unified Messaging information from the user's mailbox when the user is disabled for Unified Messaging.

Topic Last Modified: *2013-02-22*

When you enable a user for Unified Messaging (UM), a default set of properties are applied to the user, and the user will be able to use the voice mail features included with Unified Messaging. After you enable a user for voice mail, you have the option of adding a Session Initiation Protocol (SIP) address for the user if they're assigned to a UM mailbox policy that's linked to a SIP URI dial plan. Or, you can add an E.164 number for the user if they're assigned to a UM mailbox policy that's linked to an E.164 dial plan. In both cases, the user must still have an extension number configured.

An extension number is required for each user that's associated with a telephone extension, SIP Uniform Resource Identifier (URI), or E.164 dial plan. The extension number must be the correct number of digits, as specified in the UM dial plan for the UM mailbox policy.

Note:

You must add, remove, or modify extension numbers for all UM-enabled users by using the EAC or the Shell, even if they're linked to a SIP URI or E.164 dial plan. To add, remove or modify SIP address or E.164 numbers for users, you'll need to use the Shell because those options aren't available in the EAC.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable a user for voice mail

1. In the EAC, click **Recipients**.
2. In the List view, select the user whose mailbox you want to enable for Unified Messaging.
3. In the Details pane, under **Phone and Voice Features**, click **Enable**.

4. On the **Enable UM mailbox** page, click the **Browse** button next to **UM mailbox policy**, locate the UM mailbox policy to assign the user from the list, and then click **OK**.
5. On the **Enable UM mailbox** page, complete the following boxes:
    - **SIP address** or **E.164 number** In the **SIP address** or **E.164 number** text box, enter the SIP address or E.164 number for the user. These options are available if the user that you enable for Unified Messaging is assigned to a UM mailbox policy that's linked to either a SIP URI or an E.164 dial plan. You can't add a SIP address or E.164 number for a user if the user is associated with a telephone extension dial plan.

When you assign a user to a UM mailbox policy that's linked to a SIP URI or E.164 dial plan, you must enter an extension number for the user. The user will use this extension number when accessing their mailbox via Outlook Voice Access. The number of digits that you configure in this box must match the number of digits configured on the SIP URI or E.164 dial plan.

- **Extension number** Use this text box to manually enter the extension number for the user you're enabling for UM.

You must provide a valid extension number for the user and must match the number of digits specified on the dial plan. You can only enter digits from 1 through 20. The typical extension number is 3 to 7 digits long. The number of digits in the extension is set on the dial plan that's linked to the UM mailbox policy that's assigned to the user.

- Under **PIN settings**, complete the following:
    - **Automatically generate PIN** Click this button to automatically generate a PIN for the UM-enabled user to use for voice mail access via Outlook Voice Access. This is the default setting. The PIN is automatically generated based on the PIN policies configured on the UM mailbox policy assigned to the user. Using this setting will help protect the user's PIN. The PIN is sent to the user in the welcome message they receive after they're enabled for UM. By default, they'll have to change this PIN when they first sign in to their mailbox to get their voice mail.
    - **Type a PIN** Click this button to enter a PIN that the user will use to access the voice mail system. The PIN must comply with the PIN policy settings configured on the UM mailbox policy associated with this UM-enabled user. For example, if the UM mailbox policy is configured to accept only PINs that contain seven or more digits, the PIN you enter in this box must be at least seven digits long.
    - **Require the user to reset their PIN the first time they sign in** Select this check box to force the user to reset their voice mail PIN when they access the voice mail system from a telephone using Outlook Voice Access for the first time. They will be prompted to enter a PIN that's more familiar to them.It's a security best practice to force UM-enabled users to change their PIN when they first sign in to help protect against unauthorized access to their data and Inbox. This check box is selected by default.
6. On the **Enable UM mailbox** page, review your settings. Click **Finish** to enable the user for voice mail. Click **Back** to make configuration changes.

Use the Shell to enable a user for voice mail

This example enables Unified Messaging on the mailbox of tonysmith@contoso.com, sets the extension number to 51234, sets the PIN for the user to 5643892, and assigns the user to a UM mailbox policy named `MyUMMailboxPolicy`.

```
Enable-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy -Extensions 51234 -PIN
5643892 -PINExpired $true
```

This example enables Unified Messaging on the mailbox of tonysmith@contoso.com, assigns the user to a UM mailbox policy named `MyUMMailboxPolicy`, and sets the extension number, SIP address, and PIN for the user.

```
Enable-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy -Extensions 51234 -PIN
5643892 -SIPResourceIdentifier "tonysmith@contoso.com" -
PINExpired $true
```

Include text with the email message sent when a user Is enabled for voice mail

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-16*

When a user's mailbox is enabled for Unified Messaging (UM) voice mail, an email message is sent that welcomes the user to Unified Messaging. This message contains the PIN information the user will use to first access the voice mail system.

You can customize the text that's sent in the welcome email message by adding text in the **When a user is enabled for Unified Messaging** box on a UM mailbox policy. You can include such information as the UM technical support telephone numbers or additional Outlook Voice Access numbers. After you add the text, it will be included in the email message sent when users associated with the UM mailbox policy are enabled for Unified Messaging.

Note:
The custom text you add to the welcome message is limited to 512 characters, and it can include simple HTML text.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to customize the text sent when a mailbox is enabled for Unified Messaging

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Message text**, in the text box for **When a user is enabled for Unified Messaging**, enter the text you want to include in the email message that's sent when users are enabled for Unified Messaging voice mail.
4. Click **Save**.

Use the Shell to customize the text sent when a mailbox is enabled for Unified Messaging

This example enables UM-enabled users who are associated with a UM mailbox policy to receive additional instructions about UM and the Outlook Voice Access number that they can use to access their mailbox over a phone.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
UMEnabledText "You've been enabled for Unified Messaging
voice mail. To access your Exchange mailbox, call your
internal telephone extension number. From outside your
office, call 425-555-1234."
```

Manage voice mail settings for a user

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can view or set the Unified Messaging (UM) and voice mail features and configuration settings for a user that's been enabled for UM and voice mail. For example, you can do the following:

- Reset their Outlook Voice Access PIN.
- Add a personal operator extension number.
- Add other extension numbers.
- Enable or disable Automatic Speech Recognition (ASR).
- Enable or disable Call Answering Rules.
- Enable or disable access to their email or calendar.

Note:

Some of the settings and features can only be configured by using the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the existing user is currently enabled for Unified Messaging. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to view or configure a UM-enabled user's properties

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to change the UM mailbox policy.
3. In the details pane, under **Phone and Voice Features** > **Unified Messaging**, click **View details**.
4. On the **UM Mailbox** page, click **UM mailbox settings** to view or change the following UM properties for an existing UM-enabled user:
   - **PIN Status** This display-only field shows the status of the user's mailbox. By default, when a user is UM-enabled, the PIN status is listed as **Not locked out**. However, if the user has input an incorrect Outlook Voice Access PIN multiple times, the status is listed as **Locked Out**.
   - **UM mailbox policy** This box shows the name of the UM mailbox policy associated with the UM-enabled user. You can click **Browse** to locate and specify the UM mailbox policy to be associated with this UM mailbox.
   - **Personal operator extension** Use this box to specify the operator extension number for the user. By default, an extension number isn't configured. The length of the extension number can be from 1 through 20 characters. This enables incoming calls for the UM-enabled user to be forwarded to the extension number that you specify in this box.

You can configure other types of operator extension numbers on dial plans and auto attendants. However, those extensions are generally meant for company-wide receptionists or operators. The personal operator extension setting could be used when an administrative assistant or personal assistant answers incoming calls before they're answered for a particular user.

5. On the **UM Mailbox** page, under **Other extensions**, you can add, change, and view extension numbers for the user.
   - To add an extension number, click **Add +**. On the **Add another extension** page, use **Browse** to select the UM dial plan, and then enter the extension number in the **Extension number** box.
   - To remove an extension number, select the extension number you want to remove, and then click **Remove −**.
6. If you make any changes, click **Save**.

Use the Shell to configure features for a UM-enabled user

This example disables Play on Phone and missed call notifications, but enables text message (SMS) notifications.

Note:

For on-premises and hybrid deployments, when you're integrating Unified Messaging and Lync Server, missed call notifications aren't available to users who have a mailbox located on an Exchange 2007 or Exchange 2010 Mailbox server. A missed call notification is generated when a user disconnects before the call is sent to a Mailbox server.

```
Set-UMMailbox -Identity tony@contoso.com -UMEnabled $true -
UMMailboxPolicy AdminPolicy -MissedCallNotificationEnabled
$false -PlayonPhoneEnabled $false -
SMSMessageWaitingNotificationEnabled $true
```

This example prevents a user from accessing the calendar, but enables access to email when the user is using Outlook Voice Access.

```
Set-UMMailbox -Identity tony@contoso.com -UMEnabled $true -
UMMailboxPolicy AdminPolicy -Extension 523456 -FAXEnabled
$true -TUIAccessToCal $false -TUIAccessToEmail True
```

This example prevents a user from accessing the calendar and email when the user is using Outlook Voice Access.

```
Set-UMMailbox -Identity tony@contoso.com -
TUIAccessToCalendarEnabled $false -TUIAccessToEmailEnabled
$false
```

This example prevents a user from creating call answering rules, receiving incoming faxes, and using Outlook Voice Access, but enables Automatic Speech Recognition (ASR).

```
Set-UMMailbox -Identity tony@contoso.com -
AutomaticSpeechRecognitionEnabled $true -
CallAnsweringRulesEnabled $false -FaxEnabled $false -
SubscriberAccessEnabled $false
```

Use the Shell to view a UM-enabled user's properties

This example displays a list of all the UM-enabled mailboxes in the forest in a formatted list.

```
Get-UMMailbox | Format-List
```

This example displays the UM mailbox properties for tonysmith@contoso.com.

```
Get-UMMailbox -Identity tonysmith@contoso.com
```

Important:

When you're running Exchange 2007 and Exchange 2013 and the user's mailbox is located on an Exchange 2007 Mailbox server, running the **Get-UMMailbox** cmdlet won't work correctly. To resolve the issue, run the **Get-UMMailbox** cmdlet from an Exchange 2007 server or a computer running the Exchange 2007 administrative tools.

Assign a UM mailbox policy

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-30*

When you enable a user for Unified Messaging (UM) and voice mail, you must select the UM mailbox policy that will be associated with the user's mailbox. You can change the UM mailbox policy associated with the user's mailbox after the user has been enabled for UM.

You create UM mailbox policies to apply a common set of policies or security settings to a collection of mailboxes of UM-enabled users. You can use UM mailbox policies to apply settings such as the following:

- PIN policies
- Dialing restrictions
- Other general UM mailbox policy properties

Note:

A default UM mailbox policy is created every time you create a UM dial plan. You can delete the default UM mailbox policies or create additional UM mailbox policies based on the needs of your organization.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user is enabled for Unified Messaging. For detailed steps, see Enable a user for voice mail.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to change the UM mailbox policy assigned to a UM-enabled user

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to change the UM mailbox policy.
3. In the details pane, under **Phone and Voice Features** > **Unified Messaging**, click **View details**.
4. On the **UM Mailbox** page, click **UM mailbox settings**, and then click **Edit** .
5. On the **UM Mailbox** page > next to **UM mailbox policy**, click **Browse** to locate the UM mailbox policy for the user.
6. Click **Save**.

Use the Shell to change the UM mailbox policy assigned to a UM-enabled user

This example associates a UM-enabled user named Tony Smith with a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailbox -Identity tonysmith@contoso.com -
UMMailboxPolicy MyUMMailboxPolicy
```

Change the UM dial plan

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You may need to move a user who is enabled for Unified Messaging (UM) to a different UM dial plan or change the dial plan that's associated with the user. For example, you might want to move a UM-enabled user from a Telephone Extension dial plan to a SIP URI dial plan.

To change the UM dial plan, you'll have to disable the user for Unified Messaging and then enable the user for Unified Messaging on the new UM dial plan. This is because different dial plans may have different settings and requirements, such as different extension lengths or different URI types. For example, SIP URI dial plans require a SIP Resource Identifier to be assigned to each UM-enabled mailbox, but Telephone Extension dial plans don't. Also, each UM mailbox contains references to both the UM dial plan and the UM mailbox policy. The UM mailbox policy, in turn, contains references to the UM dial plan. If you change the primary proxy address for a UM-enabled user to point to a different dial plan, the UM mailbox is in an inconsistent state.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the existing Exchange recipient is enabled for Unified Messaging. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

How do you do this?

Step 1: Create the new UM dial plan

Important:

If you're migrating UM-enabled users to Microsoft Office Communications Server 2007 R2 or to Microsoft Lync Server, you must first create a SIP URI dial plan.

For detailed instructions, see Create a UM dial plan.

Step 2: Disable the user for Unified Messaging

For detailed instructions, see Disable voice mail for a user.

Step 3: Enable the user for Unified Messaging on the new UM dial plan

Important:
If you're moving users to an environment with Office Communications Server 2007 R2 or Lync Server, you must also include a SIP Resource Identifier for the user when you enable them for UM. You must also select the UM mailbox policy that's associated with a SIP dial plan.

For detailed instructions, see Enable a user for voice mail.

Enable calls from users who aren't UM-enabled

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You can enable or disable calls from users who aren't enabled for Unified Messaging (UM). By default, Unified Messaging allows incoming calls from unauthenticated callers through an auto attendant to be transferred to UM-enabled users. With this option enabled, users from outside an organization can transfer calls to UM-enabled users.

If this setting has been disabled for a UM-enabled user, the user's mailbox can still be located using a directory search. However, if an external caller tries to transfer to the user, the system says, "I'm sorry, I am unable to transfer the call to this user." The caller is then transferred to the operator, if an operator has been configured on the auto attendant. If no operator has been configured on the auto attendant, the call is transferred to a dial plan operator, if one has been configured. If no operator extension has been configured on the speech-enabled auto attendant, the dual tone multi-frequency (DTMF) fallback auto attendant, or the dial plan, the system responds by saying, "Sorry. Neither the operator or the touchtone service are available."

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Use the Shell to disable calls from users who aren't UM-enabled

This example prevents Tony Smith from receiving voice calls from callers who aren't UM-enabled.

```
Set UMMailbox -Identity tony@contoso.com -
AllowUMCallsFromNonUsers None
```

Allow callers without a caller ID to leave a voice message

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can allow UM-enabled users to receive voice mail messages from anonymous callers or prevent them from doing so. By default, when users are enabled for Unified Messaging (UM) and voice mail, they can receive calls that are anonymous and don't contain caller ID information.

In most cases, calls received by Unified Messaging contain a caller ID that can be used to determine the source of the incoming call. However, incoming calls may not include caller ID information for the following reasons:

- Your organization's telephony equipment is configured not to include caller ID information.
- The incoming call is from a mobile or external telephone.
- The caller has disabled caller ID on their telephone.

Because the *AnonymousCallersCanLeaveMessages* parameter is enabled by default, a UM-enabled user can receive a voice message even if caller ID information isn't included. If the *AnonymousCallersCanLeaveMessages* option is disabled, and the UM-enabled user receives a call that doesn't include a caller ID, the call will be identified as anonymous, and the UM-enabled user won't receive a voice message.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to allow voice messages from anonymous

callers to be received

This example allows UM-enabled user tonysmith@contoso.com to receive voice messages from incoming calls that don't contain caller ID information.

```
Set-UMMailbox -Identity tonysmith@contoso.com -
AnonymousCallersCanLeaveMessages $true
```

Include text with the email message sent when a voice message Is received

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-16*

You can include additional text in the email message that's sent when a voice mail message is received by a user who is enabled for Unified Messaging (UM) voice mail. By default, the text that's included with a voice message indicates only that the user has received a voice message. However, you can create a custom message by adding text in the **When a user receives a voice message** box on a UM mailbox policy. For example, the text can include information about system security policies and describe the correct way to handle voice messages in your organization. After you add the text, it will be included in each email message that's sent when UM-enabled users associated with the UM mailbox policy receive a voice message.

Note:
The custom text that accompanies a voice message is limited to 512 characters, and can include simple HTML text.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.

- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the text included with a voice message

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Message text**, in the text box for **When a user receives a voice message**, enter the text you want to include in the email message that's sent when users receive a voice message.
4. Click **Save**.

Use the Shell to change the text included with a voice message

This example includes the additional text, "Do not forward voice messages to users outside this organization", with voice messages sent to users who are associated with the UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
VoiceMailText "Do not forward voice messages to users
outside this organization."
```

Prevent callers without a caller ID from leaving a voice message

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can allow UM-enabled users to receive voice messages from anonymous callers or prevent them from doing so. By default, when users are enabled for Unified Messaging (UM) and voice mail, they can receive calls that are anonymous and don't contain caller ID information.

In most cases, calls received by Exchange servers contain a caller ID that can be used to determine the source of the incoming call. However, incoming calls may not include caller ID information for the following reasons:

- Your organization's telephony equipment is configured not to include caller ID information.
- The incoming call is from a mobile or external telephone.
- The caller has disabled caller ID on their telephone.

Because the *AnonymousCallersCanLeaveMessages* parameter is enabled by default, a UM-enabled user can receive a voice message even if caller ID information isn't included. If the *AnonymousCallersCanLeaveMessages* option is disabled, and the UM-enabled user receives a call that doesn't include a caller ID, the call will be identified as anonymous, and the UM-enabled user won't receive a voice message.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Use the Shell to prevent voice messages from anonymous

callers from being received

This example prevents UM-enabled user tonysmith@contoso.com from receiving voice messages from calls that don't contain caller ID information.

```
Set-UMMailbox -Identity tonysmith@contoso.com -
AnonymousCallersCanLeaveMessages $false
```

Disable voice mail for a user

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

You can disable Unified Messaging (UM) for a UM-enabled user. When you do this, the user can no longer use the voice mail features found in Unified Messaging. If you prefer, when you disable UM for a user, you can keep the UM settings for the user.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the existing user is currently enabled for Unified Messaging. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to disable Unified Messaging and voice mail for a user

1. In the EAC, click **Recipients**.
2. In the list view, select the user whose mailbox you want to disable for Unified Messaging.
3. In the Details pane, under **Phone and Voice Features**, under **Unified Messaging**, click **Disable**.
4. In the **Warning** box, click **Yes** to confirm that Unified Messaging will be disabled for the user.

Use the Shell to disable Unified Messaging and voice mail for a user

This example disables Unified Messaging and voice mail for the user tonysmith@contoso.com, but keeps the UM mailbox settings.

```
Disable-UMMailbox -Identity tonysmith@contoso.com -
KeepProperties $True
```

Change a SIP address

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to a SIP URI dial plan, two EUM proxy addresses are created. One contains the user's extension number and the other contains a SIP address for the user. The extension number is used when the user calls in to an Outlook Voice Access number.

SIP URI dial plans and SIP addresses are used when you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server. The SIP address is used by Communications Server or Lync Server to route incoming calls and send voice mail to the user. By default, the SIP address that's used by UM will be the SIP address that's used by Communications Server or Lync Server.

You can change the primary SIP address that was added when the user was enabled for UM or a secondary SIP address that was added later, along with the EUM proxy addresses for the user. The primary SIP address you added when the user was enabled for UM will be listed as the primary EUM

proxy address. Any additional secondary SIP addresses you added will be listed as secondary EUM proxy addresses. When secondary SIP addresses are changed, callers can leave voice mail for the user at all SIP endpoints that the user is signed in to using the new SIP addresses. All the voice messages will be delivered to the same user's mailbox.

You can use the EAC or the Shell to change a primary or a secondary SIP address. You can use the **Email Address** page on the user's mailbox in the EAC to change a primary or a secondary SIP address. You can't use the **UM Mailbox** page in the EAC to change a primary or secondary SIP address.

You can view the primary and secondary SIP addresses for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a SIP URI UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the existing user is enabled for UM and linked to a SIP URI dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the SIP address that will be assigned to the user is valid and formatted correctly.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the primary or a secondary SIP address

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to change a SIP address, and then click **Edit**

.

3. On the **User Mailbox** page, under **Email address**, select the SIP address you want to change, and then click **Edit** . The primary SIP address is listed in bold letters and numbers.
4. On the **Email address** page, in the **Address/Extension** box, enter the new SIP address for the user, and then click **OK**. If you need to select a new UM dial plan, you can click **Browse**.
5. Click **Save**.

Use the Shell to change the primary or a secondary SIP address

This example changes a SIP address for Tony Smith.

Note:
Before you change a SIP address using the Shell, you need to determine the position of the EUM proxy address that you want to change. To determine the position, use the **$mbx.EmailAddresses** command. The first EUM proxy address is the default (primary) SIP address and it will be 0 in the list.

```
$mbx=Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(1)="eum:tsmith@contoso.com;phone-context=MySIPDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Change an extension number

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to a telephone extension dial plan, an EUM proxy address is created for the user that contains the user's extension number. You must define at least one extension number for UM to use so voice mail can be sent to the user's mailbox. The extension number is also used when the user calls in to an Outlook Voice Access number.

You can change the primary extension number that was added when the user was enabled for UM or a secondary extension number that was added later, along with the related EUM proxy addresses for the user. The primary extension number you added when the user was enabled for UM will be listed as the primary EUM proxy address. Any additional secondary extension numbers you added will be listed as secondary EUM proxy addresses. When extension numbers have been changed, callers can leave voice mail for the user at all the new extension numbers that have been set. All the

voice messages will be delivered to the same user's mailbox.

You can use the EAC or the Shell to change a primary or a secondary extension number for a user. You can use the **Email Address** page on the user's mailbox in the EAC to change a primary or secondary extension number. You can't use the **UM Mailbox** page in the EAC to change a primary extension number, but you can use it to change a secondary extension number. If you want to change a secondary extension number, you must first remove the existing secondary extension number and then add the correct secondary extension number for the user.

You can view the primary and secondary extension numbers for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a telephone extension UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to a telephone extension dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the extension number that will be assigned to the user contains the correct number of digits set on the UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the primary or secondary extension number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to change an extension number, and then click **Edit** ✎.

3. On the **User Mailbox** page, under **Email address**, select the extension number you want to change, and then click **Edit** . The primary extension number is listed in bold letters and numbers.
4. On the **Email address** page, in the **Address/Extension** box, enter the new extension number for the user. If you need to select a new UM dial plan, you can click **Browse**.
5. Click **Save**.

Use the Shell to change the primary or secondary extension number

This example changes the extension number to 22222 for Tony Smith, a UM-enabled user.

Note:

Before you change an extension number using the Shell, you need to determine the position of the EUM proxy address that you want to change. To determine the position, use the **$mbx.EmailAddresses** command. The first EUM proxy address is the default (primary) extension number and it will be 0 in the list.

```
$mbx=Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(0)="eum:22222;phone-
context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Add a SIP address

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to a SIP URI dial plan, two EUM proxy addresses are created. One contains the user's extension number and the other contains a SIP address for the user. The extension number is used when the user calls in to an Outlook Voice Access number.

SIP URI dial plans and SIP addresses are used when you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server. The SIP address is used by Communications Server or Lync Server to route incoming calls and send voice mail to the user. By default, the SIP address that's used by UM will be the SIP address that's used by Communications Server or Lync Server.

The primary SIP address you added when the user was enabled for UM will be listed as the primary EUM proxy address. If the primary SIP address was removed, the first EUM proxy address you add

that contains the user's SIP address will be listed as the primary EUM proxy address. Any additional SIP addresses you add will be listed as secondary EUM proxy addresses. When secondary SIP addresses are added, callers can leave voice mail for the user at SIP endpoints that the user is signed in to using the SIP addresses. All the voice messages will be delivered to the same user's mailbox.

You can use the EAC or the Shell to add a primary or a secondary SIP address for a user. You can use the **Email Address** page on the user's mailbox in the EAC to add a primary or secondary SIP address. You can't use the **UM Mailbox** page in the EAC to add a primary or secondary SIP address.

You can view the primary and secondary SIP addresses for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a SIP URI UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the existing user is enabled for UM and linked to a SIP URI dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the SIP address that will be assigned to the user is valid and formatted correctly.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to add a primary or secondary SIP address

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to add a SIP address, and then click **Edit** ✎.
3. On the **User Mailbox** page, under **Email address**, click **Add +**.
4. On the **New email address** page, select **EUM** and, in the **Address/Extension** box, enter the new

SIP address for the user.

5. On the **New email address** page, under **Dial plan**, click **Browse** to select the SIP URI dial plan, and then click **OK**.
6. Click **Save**.

Use the Shell to add a SIP address

This example adds a SIP address for Tony Smith, a UM-enabled user.

Note:
Before you add a SIP address using the Shell, you need to determine the position of the EUM proxy address that you want to add. To determine the position, use the **$mbx.EmailAddresses** command. The first proxy address in the list will be 0.

```
$mbx=Get-Mailbox tony.smith
$mbx.EmailAddresses +="eum:tsmit@contoso.com;phone-
context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Remove a SIP address

Applies to: *Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to a SIP URI dial plan, two EUM proxy addresses are created. One contains the user's extension number and the other contains a SIP address for the user. The extension number is used when the user calls in to an Outlook Voice Access number.

SIP URI dial plans and SIP addresses are used when you're integrating UM and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server. The SIP address is used by Communications Server or Lync Server to route incoming calls and send voice mail to the user. By default, the SIP address that's used by UM will be the SIP address that's used by Communications Server or Lync Server.

You can remove the primary SIP address that was added when the user was enabled for UM or a secondary SIP address that was added later, along with the EUM proxy address for the user. The primary SIP address you added when the user was enabled for UM will be listed as the primary EUM proxy address. Any additional SIP addresses you added will be listed as secondary EUM proxy addresses. When a SIP address is removed, callers can no longer leave voice mail for the user at the SIP address that was removed even if the user is signed in with the SIP address assigned to the user in Communications Server or Lync Server.

If you remove the primary SIP address, UM won't be able to send voice mail to the user's mailbox and call answering rules won't be processed. After the primary SIP address has been removed, the EUM proxy address for the user will be listed as **Null** on the user's mailbox in the EAC and when you run the **Get-Mailbox** cmdlet in the Shell. Also, when you run the **Get-UMMailbox** cmdlet, the *Extensions*, *PhoneNumber*, and *CallAnsweringRulesExtensions* parameters will be blank or null.

You can use the EAC or the Shell to remove a primary or a secondary SIP address. You can use the **Email Address** page on the user's mailbox in the EAC to remove a primary or a secondary SIP address. You can't use the **UM Mailbox** page in the EAC to remove a primary or secondary SIP address.

You can view the primary and secondary SIP addresses for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to a SIP URI dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the primary and secondary SIP addresses are configured for the user.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to remove the primary or a secondary SIP address

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox from which you want to remove a SIP address, and then click **Edit** .

3. On the **User Mailbox** page, under **Email address**, select the SIP address that you want to remove from the list, and then click **Delete** 🗑. The primary EUM proxy address or SIP address is listed in bold letters and numbers.
4. Click **Save**.

Use the Shell to remove the primary or a secondary SIP address

This example removes the SIP address tsmith@contoso.com from the mailbox of Tony Smith, a UM-enabled user.

Note:

Before you remove a SIP address using the Shell, you need to determine the position of the EUM proxy address that you want to modify. To determine the position, use the **$mbx.EmailAddresses** command. The first EUM proxy address in the list will be 0.

```
$mbx = Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(1) -
="eum:tsmith@contoso.com;phone-
context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Add an extension number

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to a telephone extension dial plan, an EUM proxy address is created for the user that contains the user's extension number. You must define at least one extension number for UM to use so voice mail can be sent to the user's mailbox. The extension number is also used when the user calls in to an Outlook Voice Access number.

The primary extension number you added when the user was enabled for UM will be listed as the primary EUM proxy address. If the primary extension number was removed, the first EUM proxy address you add that contains the user's extension number will become the primary EUM proxy address. Any additional extension numbers you add will be listed as secondary EUM proxy addresses. When additional secondary extension numbers are added, callers can leave voice mail for the user at all extension numbers that have been set. All the voice messages will be delivered to the same user's mailbox.

You can use the EAC or the Shell to add a primary or a secondary extension number for a user. You can use the **Email Address** page on the user's mailbox in the EAC to add a primary or secondary extension number. You can't use the **UM Mailbox** page in the EAC to add a primary extension number, but you can use that page to add secondary extension numbers.

You can view the primary and secondary extension numbers for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a telephone extension UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to a telephone extension dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the extension number that will be assigned to the user contains the correct number of digits set on the UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to add a secondary extension number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox to which you want to add an extension number.
3. In the details pane, **Phone and Voice Features**, under **Unified Messaging**, click **View details**.
4. On the **UM Mailbox** page, click **Other Extensions**, and then click **Add +**.
5. On the **Other extensions** page, next to the **UM dial plan** box, click **Browse** and locate the dial plan for the user.
6. On the **Other extensions** page, in the **Extension number** box, type the extension number, and then click **OK**.

7. Click **Save**.

Use the EAC to add a primary or secondary extension number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox to which you want to add an extension number, and then click **Edit** .
3. On the **User Mailbox** page, under **Email address**, click **Add +**.
4. On the **New email address** page, select **EUM** and, in the **Address/Extension** box, enter the extension number for the user.
5. On the **New email address** page, under **Dial plan**, click **Browse** to select the telephone extension dial plan, and then click **OK**.
6. Click **Save**.

Use the Shell to add an extension number

This example adds an extension number 22222 for Tony Smith, a UM-enabled user.

Note:
Before you add an extension number using the Shell, you need to determine the position of the EUM proxy address that you want to add. To determine the position, use the **$mbx.EmailAddresses** command. The first proxy address in the list will be 0.

```
$mbx=Get-Mailbox tony.smith
$mbx.EmailAddresses +="eum:22222;phone-
context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Remove an extension number

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to a telephone extension dial plan, an EUM proxy address is created for the user that contains the user's extension number. You must define at least one extension number for UM to use so voice mail can be sent to the user's mailbox. The extension number is also used when the user calls in to an Outlook Voice Access number.

You can remove the primary extension number that was added when the user was enabled for UM

or a secondary extension number that was added later, along with the related EUM proxy addresses for the user. The primary extension number you added when the user was enabled for UM will be listed as the primary EUM proxy address. Any additional extension numbers you added will be listed as secondary EUM proxy addresses. When an extension number is removed, callers can no longer leave voice mail for the user at the extension number that was removed.

If you remove the primary extension number, UM won't be able to send voice mail to the user's mailbox and call answering rules won't be processed. After the primary extension number has been removed, the EUM proxy address for the user will be listed as **Null** on the user's mailbox in the EAC and when you run the **Get-Mailbox** cmdlet in the Shell. Also, when you run the **Get-UMMailbox** cmdlet, the *Extensions*, *PhoneNumber*, and *CallAnsweringRulesExtensions* parameters will be blank or null.

You can use the EAC or the Shell to remove a primary or a secondary extension number. You can use the **Email Address** page on the user's mailbox in the EAC to remove a primary or a secondary extension number. You can't use the **UM Mailbox** page in the EAC to remove a primary extension number, but you can use it to remove a secondary extension number.

You can view the primary and secondary extension numbers for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to a telephone extension dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the primary and secondary extension numbers are configured for the user.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to remove the primary or secondary extension number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox from which you want to remove an extension number, and then click **Edit** .
3. On the **User Mailbox** page, under **Email address**, select the extension number that you want to remove from the list, and then click **Delete** . The primary EUM proxy address or extension number is listed in bold letters and numbers.
4. Click **Save**.

Use the EAC to remove a secondary extension number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the user whose mailbox you want to remove an extension number from.
3. In the details pane, under **Phone and Voice Features** > **Unified Messaging**, click **View details**.
4. On the **Other extensions** page, in the **Extension number** box, select the extension number you want to remove, and then click **Delete** .
5. Click **Save**.

Use the Shell to remove an extension number

This example removes the extension number 12345 from the mailbox of Tony Smith, a UM-enabled user.

Note:

Before you remove an extension number using the Shell, you need to determine the position of the EUM proxy address that you want to modify. To determine the position, use the **$mbx.EmailAddresses** command. The first EUM proxy address in the list will be 0.

```
$mbx = Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(1) -="eum:12345;phone-
context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Change an E.164 number

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to an E.164 dial plan, two EUM proxy addresses are created. One contains the user's extension number and the other contains the E.164 number for the user. The extension number is used when the user calls in to an Outlook Voice Access number.

You can change the primary E.164 number that was added when the user was enabled for UM or a secondary E.164 number that was added later, along with the EUM proxy addresses for the user. The primary E.164 number you added when the user was enabled for UM will be listed as the primary EUM proxy address. Any additional secondary E.164 numbers you added will be listed as secondary EUM proxy addresses. When E.164 numbers have been changed, callers can leave voice mail for the user at all the new E.164 numbers that have been set. All the voice messages will be delivered to the same user's mailbox.

You can use the EAC or the Shell to change the primary and secondary E.164 numbers for a user. You can use the **Email Address** page on the user's mailbox to change a primary or secondary E.164 number. However, you can't use the **UM Mailbox** page in the EAC to change a primary or secondary E.164 number.

You can view the primary and secondary E.164 numbers for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that an E.164 UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to an E.164 dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the E.164 number that will be assigned to the UM-enabled user is valid.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server,

Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the primary or a secondary E.164 number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to change an E.164 number, and then click **Edit** .
3. On the **User Mailbox** page, under **Email address**, select the E.164 number you want to change, and then click **Edit** . The primary E.164 number is listed in bold letters and numbers.
4. On the **Email address** page, in the **Address/Extension** box, enter the new E.164 number for the user, and then click **OK**. If you need to select a new UM dial plan, you can click **Browse**.
5. Click **Save**.

Use the Shell to change the primary or a secondary E.164 number

This example changes an E.164 number for Tony Smith, a UM-enabled user.

Note:

Before you change an E.164 number using the Shell, you need to determine the position of the EUM proxy address that you want to change. To determine the position, use the **$mbx.EmailAddresses** command. The first EUM proxy address is the default (primary) E.164 number and it will be 0 in the list.

```
$mbx=Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(1)="eum:+14255550123;phone-
context=MyE.164DialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Add an E.164 number

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to an E.164 dial plan, two EUM proxy addresses are created. One contains the user's extension number and the other contains the E.164 number for the user. The extension number is used when the user calls in to an Outlook Voice Access number.

The primary E.164 number you added when the user was enabled for UM will be listed as the primary EUM proxy address. If the primary E.164 number was removed, the first EUM proxy address you add that contains the user's E.164 number will be listed as the primary EUM proxy address. Any additional E.164 numbers you add will be listed as secondary EUM proxy addresses. When additional E.164 numbers are added, callers can leave voice mail for the user at all E.164 numbers that have been set. All the voice messages will be delivered to the same user's mailbox.

You can use the EAC or the Shell to add a primary or a secondary E.164 number for a user. You can use the **Email Address** page on the user's mailbox in the EAC to add a primary or secondary E.164 number. You can't use the **UM Mailbox** page in the EAC to add a primary or secondary E.164 number.

You can view the primary and secondary E.164 numbers for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that an E.164 UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to an E.164 dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the E.164 number that will be assigned to the user is valid and formatted correctly.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to add a primary or secondary E.164 number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox for which you want to add an E.164 number, and then click **Edit** .
3. On the **User Mailbox** page, under **Email address**, click **Add +**.
4. On the **New email address** page, select **EUM** and, in the **Address/Extension** box, enter the new E.164 number for the user.
5. On the **New email address** page, under **Dial plan**, click **Browse** to select the E.164 dial plan and then click **OK**.
6. Click **Save**.

Use the Shell to add an E.164 number

This example adds an E.164 number for Tony Smith, a UM-enabled user.

Note:

Before you add an E.164 number using the Shell, you need to determine the position of the EUM proxy address that you want to add. To determine the position, use the **$mbx.EmailAddresses** command. The first proxy address in the list will be 0.

```
$mbx=Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(2)="eum:+14255550123;phone-context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Remove an E.164 number

Set up voice mail for users > Voice mail for users > Voice mail-enabled user procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-14*

When you enable a user for UM and link them to an E.164 dial plan, two EUM proxy addresses are created. One contains the user's extension number and the other contains the E.164 number for the user. The extension number is used when the user calls in to an Outlook Voice Access number.

You can remove the primary E.164 number that was added when the user was enabled for UM or a secondary E.164 number that was added later, along with the EUM proxy addresses for the user. The primary E.164 number you added when the user was enabled for UM will be listed as the primary EUM proxy address. Any additional E.164 numbers you added will be listed as secondary EUM proxy addresses. When an E.164 number is removed, callers can no longer leave voice mail for the

user at the E.164 number that was removed.

If you remove the primary E.164 number, UM won't be able to send voice mail to the user's mailbox and call answering rules won't be processed. After you remove the primary E.164 number, the EUM proxy address for the user will be listed as **Null** on the user's mailbox in the EAC and when you run the **Get-Mailbox** cmdlet in the Shell. Also, when you run the **Get-UMMailbox** cmdlet, the *Extensions*, *PhoneNumber*, and *CallAnsweringRulesExtensions* parameters will be blank or null.

You can use the EAC or the Shell to remove a primary or a secondary E.164 number for a user. You can use the **Email Address** page on the user's mailbox in the EAC to remove a primary or a secondary E.164 number. You can't use the **UM Mailbox** page in the EAC to remove a primary or secondary E.164 number.

You can view the primary and secondary E.164 numbers for a user by using the **Get-UMMailbox** cmdlet or the **Get-Mailbox** cmdlet in the Shell.

For additional management tasks related to users who are enabled for voice mail, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that an E.164 UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been enabled for UM and linked to an E.164 dial plan. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that the primary and secondary E.164 numbers are configured for the user.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to remove the primary or a secondary E.164

number

1. In the EAC, navigate to **Recipients** > **Mailboxes**.
2. In the list view, select the mailbox from which you want to remove an E.164 number, and then click **Edit** .
3. On the **User Mailbox** page, under **Email address**, select the E.164 number that you want to remove from the list, and then click **Delete** . The primary EUM proxy address or E.164 number is listed in bold letters and numbers.
4. Click **Save**.

Use the Shell to remove the primary or a secondary E.164 number

This example removes the E.164 number +14255551010 from the mailbox of Tony Smith, a UM-enabled user.

Note:

Before you remove an E.164 number using the Shell, you need to determine the position of the EUM proxy address that you want to modify. To determine the position, use the **$mbx.EmailAddresses** command. The first EUM proxy address in the list will be 0.

```
$mbx = Get-Mailbox tony.smith
$mbx.EmailAddresses.Item(1) -="eum:+14255551010;phone-context=MyDialPlan.contoso.com"
Set-Mailbox tony.smith -EmailAddresses $mbx.EmailAddresses
```

Set up client voice mail features

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-20*

This topic describes the client features that give users who are enabled for Exchange Unified Messaging (UM) access to the email and voice mail messages in their mailbox. These features let you offer your users simplified access to voice mail and email and an improved overall user experience.

Contents

Outlook Voice Access

Forwarding calls

Voice Mail Preview

Receiving faxes

Voice mail client support

Exchange ActiveSync clients The Microsoft Exchange ActiveSync protocol is used to connect mobile clients, such as those found on Internet-capable mobile devices, to an Exchange mailbox. Users can use mobile devices to access their mailbox and view email messages, view and change calendar and contact information, and listen to their voice mail messages. They can also synchronize email, voice mail, calendar items, and contact information with other devices.

Integration with Outlook Microsoft Outlook enables users to access their Exchange mailbox and view email messages in their Inbox, view and change calendar information, and listen to voice messages by using Microsoft Windows Media Player, which is embedded inside the email messages. By using a supported email client, users gain additional features, such as the Play on Phone functionality.

Integration with Outlook Web App Microsoft Outlook Web App provides users with a set of UM interfaces and tools comparable to a full-featured email client like Outlook. With Outlook Web App, users can access their Exchange mailbox by using a compliant web browser. Like Outlook, Outlook Web App provides Windows Media Player embedded in email messages so that users can listen to voice messages, and enables users to access other features such as Play on Phone.

Outlook Voice Access

In Exchange UM, a UM-enabled user can call in to an internal or external telephone number that's configured on a UM dial plan to access their mailbox and use the Outlook Voice Access menu system. Using this menu, UM-enabled users can read email, listen to voice messages, interact with their Outlook calendar, access their personal contacts, and perform tasks such as configuring their Outlook Voice Access PIN or recording their voice mail greetings. For details, see Setting up Outlook Voice Access.

Forwarding calls

A UM-enabled user can create and configure call answering rules using Outlook or Outlook Web App. Call answering rules let users control how their incoming calls should be handled. The rules are applied to incoming calls similar to the way Inbox rules are applied to incoming email messages, and are stored along with other voice settings in the user's mailbox. Up to nine call answering rules can be set up for each UM-enabled mailbox. These rules are independent of the Inbox rules and

don't take up part of the user's Inbox rules storage quota. For details, see Allow voice mail users to forward calls.

Voice Mail Preview

Voice Mail Preview is a feature that's available to users who receive their voice mail messages from the UM voice mail system. Voice Mail Preview enhances the voice mail experience by providing a text version of audio recordings. For details, see Allow users to see a voice mail transcript.

Receiving faxes

UM forwards incoming fax calls for a UM-enabled user to a dedicated fax partner solution, which establishes the fax call with the fax sender and receives the fax on behalf of the user. Before your UM-enabled users can receive fax messages in their mailbox, you must do the following:

- Enable inbound faxing on the UM dial plan linked to the users by setting the *FaxEnabled* parameter to `$true`.
- Enable inbound faxing on the UM dial plan linked to the users by setting the *Allowfax* parameter to `$true`.
- Enable inbound faxing for the users by setting the *FaxEnabled* parameter to `$true`.
- Set the partner fax server URI to allow inbound faxing.
- Configure authentication between the Mailbox server and the fax partner server.

Setting up Outlook Voice Access

Exchange Server 2013 > Unified Messaging > Set up client voice mail features >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-20*

Microsoft Outlook Voice Access lets users who are enabled for Exchange Unified Messaging (UM) access their mailboxes by using analog, digital, or cellular telephones.

An Outlook Voice Access user (also called a *subscriber*), is a user in an organization who's enabled for Unified Messaging. Subscribers use Outlook Voice Access to access their mailboxes by telephone to retrieve email, voice mail messages, personal contacts, and calendar information.

Contents

Distribution groups and contact groups

Choosing a language

Controlling Outlook Voice Access features

Outlook Voice Access overview

In Microsoft Exchange UM, a UM-enabled user can call in to an internal or external telephone number that's configured on a UM dial plan to access their mailbox and use the Outlook Voice Access menu system. Using this menu, UM-enabled users can read email, listen to voice messages, interact with their Outlook calendar, access their personal contacts, and perform tasks such as configuring their Outlook Voice Access PIN and recording their voice mail greetings.

Two types of users, authenticated and unauthenticated, can call in to an Outlook Voice Access number. When an unauthenticated user calls into an Outlook Voice Access number that is set on a UM dial plan, they are only able to do directory searches for users. Authenticated users, those that input their PIN, can perform directory searches and sign in to their mailbox to listen to email, calendar items, and voice mail, and to search personal contacts. When they are searching for a user in the directory or personal contacts, after the user is located, they can transfer calls to a user or ring the user's extension.

Outlook Voice Access interfaces

Two Unified Messaging user interfaces are available to Outlook Voice Access users: the telephone user interface (TUI) and the voice user interface (VUI) that uses Automatic Speech Recognition (ASR).

Before users can use the VUI in Outlook Voice Access, it must be enabled on the UM dial plan and on the UM mailbox policy and also be enabled for the user. By default, when you create a dial plan and a UM mailbox policy and enable voice mail for a user, the user can use ASR or the Outlook Voice Access VUI to navigate menus, messages, and other options. However, even if the user is able to use the VUI, they will have to use the telephone key pad to enter their PIN, navigate personal options, and perform a directory search. The default settings are listed in the following table.

UM component	Default setting	Exchange Management Shell example to enable VUI access
UM dial plan	Enabled	`Set-UMDialPlan -id MyUMDialPlan -AutomaticSpeechRecognitionEnabled $true`
UM mailbox policy	Enabled	`Set-UMMaiboxPolicy -id MyUMPolicy -AllowAutomaticSpeechRecognition $true`

User's mailbox	Enabled	`Set-UMMailbox -id tonysmith -AutomaticSpeechRecognitionEnabled $true`

The following section includes scenarios that describe the VUI functionality.

Return to top

Outlook Voice Access scenarios

Here are examples of how Outlook Voice Access can be used from a telephone:

- **Access email** An Outlook Voice Access user places a call to an Outlook Voice Access number from a telephone and wants to access their email. The voice prompt says, "Welcome. You're connected to Microsoft Exchange. To access your mailbox, please enter your extension. To contact someone, press the pound key." After the user enters a mailbox extension number, the voice prompt says, "Please enter your PIN and press the pound key." After the user enters a PIN, the voice prompt says, "You have two new voice mails, 10 new email messages, and your next meeting is at 10:00 A.M. Please say voice mail, email, calendar, personal contacts, directory, or personal options." When the user says "Email," the voice mail system reads the message header and then the name, subject, time, and priority for the messages that are in the user's mailbox.
- **Access calendar** An Outlook Voice Access user places a call to an Outlook Voice Access number from a telephone and wants to access their calendar. The voice prompt says, "Welcome. You're connected to Microsoft Exchange. To access your mailbox, please enter your extension. To contact someone, press the pound key." After the user enters a mailbox extension number, the voice prompt says, "Please enter your PIN and press the pound key." After the user enters a PIN, the voice prompt says, "You have two new voice mails, 10 new email messages, and your next meeting is at 10:00 A.M. Please say voice mail, email, calendar, personal contacts, directory, or personal options." When the user says "Calendar," the voice mail system says, "Sure, and which day should I open?" The user says, "Today's calendar." The voice mail system responds by saying, "Opening today's calendar." The voice mail system reads each calendar appointment for that day for the user.

Note:

If a Mailbox server running the Microsoft Exchange Unified Messaging service encounters a corrupted calendar item in a user's mailbox, it will fail to read the item, return the caller to the Outlook Voice Access main menu, and skip reading any additional meetings that may be scheduled for the rest of the day.

- **Access voice mail** An Outlook Voice Access user places a call to an Outlook Voice Access number from a telephone and wants to access voice mail. The voice prompt says, "Welcome. You're connected to Microsoft Exchange. To access your mailbox, please enter your extension. To contact someone, press the pound key." After the user enters a mailbox extension number, the voice prompt says, "Please enter your PIN and press the pound key." After the user enters a PIN, the voice prompt says, "You have two new voice mails, 10 new email messages, and your next meeting is at 10:00 A.M. Please say voice mail, email, calendar, personal contacts, directory, or

personal options." The user says "Voice mail," and the voice mail system reads the message header and then the name, subject, time, and priority for the voice messages that are in the user's mailbox.

Note:
If speech recognition is enabled, users can access their UM-enabled mailbox using speech input. Subscribers can also use touchtone, also known as dual tone multi-frequency (DTMF), by pressing 0. Speech recognition isn't enabled for PIN input.

- **Locate a user in the directory** An Outlook Voice Access user places a call to an Outlook Voice Access number from a telephone and wants to locate a person in the directory by spelling their email alias. The voice prompt says, "Welcome. You're connected to Microsoft Exchange. To contact someone, press the pound key." The user presses the pound key, and then uses touchtone inputs to spell the SMTP address of the person.

Note:
The directory search feature with an Outlook Voice Access number isn't speech-enabled. Users can spell the name of the person they want to contact only by using touchtone inputs.

Important:
In some companies (especially in East Asia), office telephones may not have letters on the keys of the telephone. This makes the spell-the-name feature that uses the touchtone interface almost impossible to use without a working knowledge of the key mappings. By default, Unified Messaging uses the E.161 key mapping. For example, 2=ABC, 3=DEF, 4=GHI, 5=JKL, 6=MNO, 7=PQRS, 8=TUV, 9=WXYZ.

When inputting a combination of letters and numbers, for example, Mike1092, the numeric digits are mapped to themselves. For an email alias of Mike1092 to be entered correctly, the user must press the numbers 64531092. Also, for characters other than A-Z and 0-9, there isn't a telephone key equivalent. Therefore, these characters shouldn't be entered. For example, the email alias jim.wilson would be entered as 546945766. Even though there are 10 characters to be input, the user enters only 9 digits because there's no digit equivalent for the period (.).

Return to top

Distribution groups and contact groups

Users can use Outlook Voice Access to send or forward a voice message, an email message, or a meeting request. They can send or forward the message or meeting request to any of the following:

- A person in their personal Contacts folder
- A person in their organization's shared address book
- A contact group they've created in their Contacts folder
- A distribution group included in their organization's shared address book

They can send messages and meeting requests by using the VUI (if ASR has been turned on) or by using touchtone inputs on their telephone keypad. They can also use Outlook Voice Access to listen to details about a group, including the members of the group.

Note:

If a user tries to send a message to a group (either a distribution group in their shared address book or a contact group in their personal Contacts folder) that doesn't include any members, the voice mail system won't give them the option to send or forward the message or meeting request. If they try to add a group with no members as one of the recipients of a message or meeting request that they're creating over the phone, the voice mail system won't add the group to the message, and will say "The message could not be sent because the contact does not appear to have a valid email address."

Choosing a language

Users can't change the language that Outlook Voice Access uses to speak to them and that they use when they reply to it. The voice mail system tries to find and use the best match for the language the user chose when they signed in to Microsoft Outlook Web App or the language they chose on the regional settings in Outlook Web App. If the language they chose isn't supported by Outlook Voice Access, the voice mail system will use the same language that callers hear when they're prompted to leave a voice message.

Return to top

Controlling Outlook Voice Access features

By default, when users dial in to Outlook Voice Access, they can use the telephone to access their calendar, email, and personal contacts, and to search the directory. You can use the Shell to prevent users from accessing one or more of these features when they use Outlook Voice Access to access their mailbox. When you modify Outlook Voice Access features on a UM mailbox policy, your changes affect all users who are associated with the UM mailbox policy. You can also disable some features on a single user's mailbox, although other features can only be disabled on a UM mailbox policy and aren't available on an individual mailbox.

Note:

You can use only the Shell to modify the Outlook Voice Access TUI settings for UM-enabled mailboxes or UM mailbox policies.

UM mailbox policy settings You can disable users' access to the following Outlook Voice Access features on a UM mailbox policy:

- Automatic Speech Recognition
- PIN-less access to voice mail
- Voice responses to other messages
- TUI access to their calendar
- TUI access to the directory
- TUI access to their email
- TUI access to their personal Contacts

UM-enabled mailbox settings You can disable a user's access to the following Outlook Voice

Access features on the user's mailbox:

- TUI access to the calendar
- TUI access to email
- Automatic Speech Recognition

You can prevent users from receiving voice mail, but let them retain the ability to access their mailbox using Outlook Voice Access. You can enable a user for UM and configure the user's mailbox with an extension number that isn't currently being used by another user in the organization.

Outlook Voice Access commands

Topic Last Modified: *2013-04-30*

Outlook Voice Access lets Unified Messaging (UM)-enabled users access their mailbox using analog, digital, or mobile telephones. Using the menu system found in Outlook Voice Access, UM-enabled users can read email, listen to voice messages, interact with their Outlook calendar, access their personal contacts, and manage personal options such as configuring their Outlook Voice Access PIN or recording their voice mail messages. This topic contains a list of the Outlook Voice Access commands and how users can use them when they access their mailbox by calling an Outlook Voice Access number.

Outlook Voice Access user interfaces

Outlook Voice Access consists of two user interfaces: the Telephone User Interface (TUI) that uses a telephone keypad and the Voice User Interface (VUI) that uses voice commands. Users can use Outlook Voice Access to access the voice mail system from an external or internal telephone to access their personal email, voice messages, contacts, and calendaring information in their mailbox.

Email and voice mail commands reference

As an Outlook Voice Access user, when you dial in to an Outlook Voice Access number, you're presented with menu options that enable you to access your mailbox and manage your email and voice mail. The following table lists the commands that are available for managing your email and voice mail.

Email and voice mail commands

Voice command	Touchtone command	Description

"Play"		Plays the current email or voice mail message.
"Next"	#	Reads the next email or voice mail message.
"Next unread"	00 followed by ##	Reads the next unread email message. Available only for email.
"Delete"	7	Deletes the current email or voice mail message.
"Reply"	8	Replies to the user who sent the current email or voice mail message.
"Reply all"	00 followed by 88	Replies to all the users on the current email message. Not an available option for voice mail messages.
"Mark as unread"	9	Marks the email message as Unread.
"End"	33	Stops reading and goes to the end of the current email or voice mail message.
"More options"	00	Opens the More Options menu.
"Previous"	00 followed by 11	Reads the previous email or voice mail message.
"Read the header"		Reads the header of the email or voice mail message.
"Call sender"	00 followed by 2	Places a call to the user who

		sent the current email or voice mail message.
"Forward"	00 followed by 6	Forwards the current email or voice mail message to other email recipients or groups.
"Flag for follow-up"	00 followed by 44	Marks or flags the current email or voice mail message for follow-up.
"Find by name"		Uses the user's name to locate email or voice mail messages in the user's mailbox.
"Delete conversation"	00 followed by 77	Deletes all the email messages that are associated with an email conversation. Available only for email.
"Hide conversation"	00 followed by 99	Hides additional email messages that are contained within the same email conversation. Available only for email.
"Envelope information"	00 followed by 5	Reads the envelope information for the email or voice mail message.
"Select language"	00 followed by 55	Lets you select the language in which you want the email or voice mail message to be read.
"Rewind" or "Repeat"	1	Rewinds or repeats the current email or voice mail message. Available only while the

		message is being played.
"Pause"	2	Pauses the current email or voice mail message. Available only while the message is being played.
"Fast forward"	3	Fast forwards the current email or voice mail message. Available only while the message is being played.
"Slow down"	4	Plays or reads the current email or voice mail message more slowly. Available only while the message is being played.
"Faster"	6	Plays or reads the current email or voice mail message faster. Available only while the message is being played.
"Previous"	11	Reads the previous email message from the beginning. Available only for email.
"Replay"	00 followed by 1	Replays the current email or voice mail message.
"Repeat"	0	Repeats the current menu options.
"Main menu"	*	Exits to the main menu.

Important:
If you need to access an email message after you delete it using Outlook Voice Access, you can use Outlook Web App or Outlook to move the email message back into the appropriate folder

from the Deleted Items folder. You can't use Outlook Voice Access to access the Deleted Items folder.

Calendar options command reference

As an Outlook Voice Access user, when you dial in to an Outlook Voice Access number, you're presented with menu options that enable you to access your mailbox and manage your calendar. The following table lists the commands that are available for managing your calendar.

Calendar commands

Voice command	Touchtone command	Description
"Next"	#	Reads the next calendar appointment.
"Next day"	##	Opens and reads the calendar appointments for the next day.
"Repeat"	0	Repeats the menu options that are available. Or, if you're using the VUI, the system reads the calendar appointment again.
"More options"	00	Plays the more calendar options menu.
"Repeat"	1	Reads the calendar appointment again.
"Previous meeting"	00 followed by 11	Opens the previous meeting that's scheduled.
"Call location"	2	Calls the telephone number that's listed for the meeting location.
"Call organizer"	00 followed by 22	Calls the telephone number that's listed for the organizer of the meeting.

"I'll be late"	3	Sends an I'll be late message to all the meeting attendees.
"Accept" or "Tentative accept"	4	Accepts or tentatively accepts the meeting request.
"Meeting details"	5	Reads or plays back the details of the meeting that's currently being read.
"Attendance details"	00 followed by 55	Reads or plays the details of a meeting that's scheduled.
"Forward"	00 followed by 6	Forwards a meeting request for the meeting to another user.
"Decline" or "Cancel"	7	Declines or cancels the meeting request.
"Clear my calendar"	00 followed by 77	Clears your calendar for a specific time period for that day.
"Reply"	00 followed by 8	Replies to the meeting organizer.
"Reply all"	00 followed by 88	Replies to all the meeting attendees.
"Repeat menu"	5 followed by 0	Repeats the menu options that are available.
"Rewind"	5 followed by 1	Rewinds the meeting details.
	5 followed by 11	Returns to the beginning of the meeting details.
	5 followed by 2	Pauses and resumes playback of the meeting details.

"Fast forward"	5 followed by 3	Skips forward within the meeting details.
"End"	5 followed by 33	Skips to the end of the meeting details.
	5 followed by 4	Plays or reads the meeting details slower.
	5 followed by 55	Selects the language that will be used to read the meeting details.
	5 followed by 6	Plays or reads the meeting details faster.
"Main menu"	*	Exits to the main menu.

Find a contact commands reference

As an Outlook Voice Access user, when you dial in to an Outlook Voice Access number, you're presented with menu options that enable you to access your mailbox, change personal options, or call or send a message to a contact. If you choose to use your voice, which is selected by default, and select the contacts menu option, the voice mail system you to use the telephone keypad to navigate the find a contact options. You can also locate a user in the directory or a contact by using the telephone keypad. The following table lists the commands that are available for managing your contacts or searching for a user.

Contact commands

Voice command	Touchtone command	Description
"Directory"	00	Searches the directory for a user.
"Play details"	1	Plays the details of the personal contact, such as the telephone numbers that are listed for the personal contact.

"Send a message"	3	Sends a message to the personal contact that's selected.
"Find another contact"	4	Finds another personal contact.
"Call the cell"	2 followed by 1	Calls the mobile telephone number that's listed for the personal contact.
"Call the office"	2 followed by 2	Calls the business or office telephone number that's listed for the personal contact.
"Call home"	2 followed by 3	Calls the home telephone number that's listed for the personal contact.
	##	Lets you enter the email alias or name for the user in the directory if using the directory search feature.
"Main menu"	*	Exits to the main menu.

Personal options commands reference

As an Outlook Voice Access user, when you dial in to an Outlook Voice Access number, you're presented with menu options that enable you to access your mailbox and manage your personal options. When you configure personal options using Outlook Voice Access, you can only use the telephone keypad to navigate the menus. Using your voice to navigate the menus is not available for configuring personal options. The following table lists the commands that are available for managing your personal options.

Personal options commands

Voice command	Touchtone command	Description
	1	Turns on or off the telephone Out of Office greeting.

	2	Records the personal voice mail or Out of Office voice mail greeting.
	3	Changes the PIN that's used for Outlook Voice Access.
	4	Starts using the VUI or touchtone interface.
	5	Sets the local time zone to use.
	6	Chooses the 12-hour or 24-hour time format.
	*	Returns to the main menu.
	0	Repeats the menu options that are available.

Setting up Outlook Voice Access

Set up client voice mail features

Navigating menus with Outlook Voice Access

Topic Last Modified: *2013-04-23*

Outlook Voice Access is a feature in Unified Messaging (UM) that enables users to retrieve email and voice mail messages and manage their calendar and personal contacts by using an analog, digital, or mobile telephone. They can interact with their mailbox using their telephone keypad or voice commands, but must use the keypad on their telephone to search for a user in the directory for your organization.

When UM-enabled users call in to an Outlook Voice Access number, they can sign in to their mailbox using a telephone and are presented with a series of voice prompts. These voice prompts help them navigate the voice mail system menus and enable them to access their mailbox. Outlook Voice Access lets users do the following:

- Retrieve, listen to, reply to, create, and forward voice or email messages.
- Listen to or change calendar information.
- Change personal options, such as a PIN, or call or send a voice message to a personal contact.

An Outlook Voice Access number is assigned to a user when they're enabled for UM. The user can find an Outlook Voice Access number to access their mailbox in the welcome message that's sent to them when they're enabled for UM or by signing in to their mailbox using Outlook Web App, going to **Options** > **Telephone**, and locating the Outlook Voice Access number or numbers in the **Outlook Voice Access** section.

After a user enters their extension number and PIN, the voice mail system will let them know how many new voice mail and email messages they have and when their next meeting is. After the voice mail system has played this prompt, an Outlook Voice Access main menu will be read to the user and the user can say one of the following:

- Voice mail
- Email
- Calendar
- Personal options

Contents

Reading and reviewing email

Users can listen to, reply to, create, and forward unread email messages using the telephone. For example, if a user is expecting an important email message, and does not have access to the Internet, they can use a mobile telephone to dial an Outlook Voice Access number.

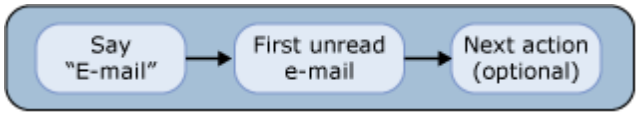
Listen to email messages

To listen to email messages using their voice, the user must dial an Outlook Voice Access number, enter their extension number and PIN, and then do the following:

1. Say "Email" to access their email.
2. The voice mail system will read the name, subject, time, and priority of the first unread email message.
3. The user can then say one of the following options:
   - "Next message" to mark the message as Read and go to the next email message.

- "Mark unread" to keep the message marked as Unread and go to the next message.
- "End" to jump to the end of the message.
- "Delete" to delete the message.

This process is shown in the following figure.



To listen to email messages using the telephone keypad, users must dial an Outlook Voice Access number, enter their extension number and PIN, and then do the following:

1. Press 2 to access their email.
2. The voice mail system will read the name, subject, time, and priority of the first unread email message.
3. The user can then press one of the following options:
   - Pound (#) key to mark the message as Read and go to the next email message.
   - 9 to keep the message marked as Unread and go to the next message.
   - 33 to jump to the end of the message.
   - 7 to delete the message.

This process is shown in the following figure.

Return to top

Reply to email messages

To listen to email messages and then reply using their voice, users must do the following:

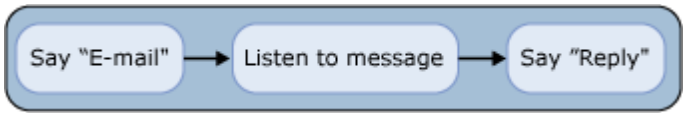
1. Say "Email."
2. Say "Next message" repeatedly until they reach the email message to which they want to reply.
3. Listen to the message or say "End" to go to the end of the message.
4. Say one of the following:
   - "Reply" to reply to the sender.
   - "Reply all" to reply to the sender and all other recipients.
   - "Forward" to forward the message to another user or group.
5. Record a reply and then hang up, remain silent, or press any key. To accept the reply message and send it, say "Send it."

This process is shown in the following figure.

To listen to email messages and then reply using the telephone keypad, users must do the following:

1. Press 2.
2. Press # repeatedly until they reach the email message to which they want to reply.
3. Listen to the message or press 33 to go to the end of the message.
4. Press one of the following:
   - 8 to reply to the sender.
   - 88 to reply to the sender and all other recipients.
   - 6 to forward the message to another user or group.
5. Record a reply, and then press #. To accept the reply message and send it, press 1.

This process is shown in the following figure.



Return to top

Listen to the next unread email message

To listen to an email message and then go to the next unread message using their voice, users must do the following:

1. Say "Email."
2. Say "Next unread." Say "Mark unread" if they want to mark the message as Unread.

This process is shown in the following figure.

To listen to an email message and then go to the next unread message using the telephone keypad, users must do the following:

1. Press 2.
2. Press ## to listen to the next unread message. Press 9 to mark the message as Unread.

This process is shown in the following figure.

Return to top

Flag an email message for follow-up

To listen to email messages and flag messages for follow-up using their voice, users must do the following:

1. Say "Email."
2. Say "Next message" repeatedly until they reach the email message that they want to flag for follow-up. Say "Mark unread" to mark the message as Unread.

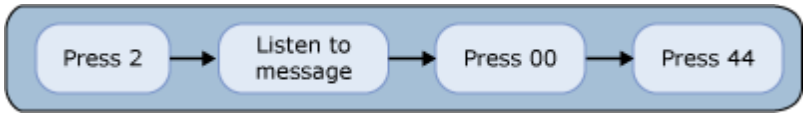
3. Listen to the message or say "End" to go to the end of the message.
4. Say "Flag" or "Flag for follow-up" to flag the message for follow-up.

This process is shown in the following figure.

To listen to email messages and flag messages for follow-up using the telephone keypad, users must do the following:

1. Press 2.
2. Press # repeatedly until they reach the email message that they want to flag for follow-up. Press 9 to mark the message as Unread.
3. Listen to the message or press 33 to go to the end of the message.
4. Press 0 (zero) twice to access more options.
5. Press 44 to flag the message for follow-up.

This process is shown in the following figure.



Return to top

Hide a conversation

To listen to email messages and hide a conversation so that the voice mail system will not continue to read other email messages that are in the same email conversation using their voice, users must do the following:

1. Say "Email."
2. Say "Next message" repeatedly until they reach the email message that they want. Say "Mark unread" to mark the message as Unread.
3. Listen to the message or say "End" to go to the end of the message.
4. Say "Hide" or "Hide conversation" to hide the conversation. The next email message from a different conversation will be read.

This process is shown in the following figure.

To listen to email messages and hide a conversation so that the voice mail system will not continue to read other email messages that are in the same email conversation using the telephone keypad, users must do the following:

1. Press 2.
2. Press # repeatedly until they reach the email message that they want to hide. Press 9 to mark the message as Unread.

3. Listen to the message or press 33 to go to the end of the message.
4. Press 99 to hide the conversation. The next email message from a different conversation will be read.

This process is shown in the following figure.

Note:

When a conversation is hidden, it is hidden only for the current session. If users sign out and then sign in to their mailbox again, the voice mail system will read email messages that are in the same conversation.

Return to top

Managing calendar meetings and appointments

Users can listen to, reply to, create, and forward meeting requests and appointments in their calendar over the telephone.

For example, a user has a meeting at 10:00 A.M. However, because of some unexpected delays, the user will be 15 minutes late. The user can inform the other meeting attendees by calling the telephone number for Outlook Voice Access, signing in to their mailbox, and then accessing the list of meetings for that day in the calendar. After the voice mail system reads the meeting request for the 10:00 A.M. meeting, the user can use the *I'll be late* feature to inform all the meeting attendees that the user will be 15 minutes late. Each attendee will receive an email message that informs them that the user will be 15 minutes late. The user also has the option to attach a voice mail message.

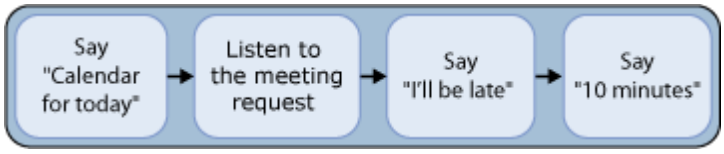
In another example, a user may have an important client who decides to schedule an all-day meeting on very short notice. The user must cancel all other meetings for that day in the simplest possible way. Using the *Clear my calendar* feature, users can quickly and easily clear their calendar for the whole day.

Send an I'll be late message

To send an I'll be late message to meeting participants using their voice, users must dial an Outlook Voice Access number, enter their extension number and PIN, and then do the following:

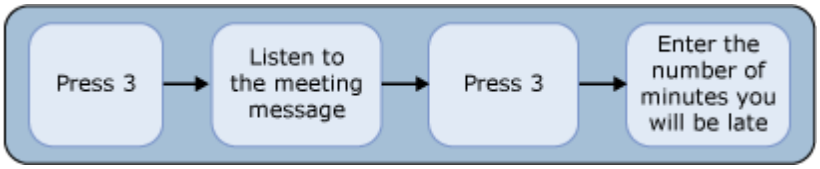
1. Say "Calendar for today" to access their calendar.
2. Listen to the meeting requests to locate the meeting for which to send an I'll be late message.
3. After the meeting request has been read, say "I'll be late."
4. The voice mail system asks, "How late?" Say "10 minutes."
5. The voice mail system asks, "Do you want to record a message?" If so, say "Yes," record the message, and then say "Send it." If not, say "No."

This process is shown in the following figure.



To send an I'll be late message to meeting participants using the telephone keypad, users must dial an Outlook Voice Access number, enter their extension number and PIN, and then do the following:

1. Press 3 to access their calendar.
2. Listen to the meeting requests to locate the meeting for which to send an I'll be late message.
3. After the meeting request has been read, press 3.
4. The voice mail system asks, "How late?" Enter 10 on the telephone key pad.



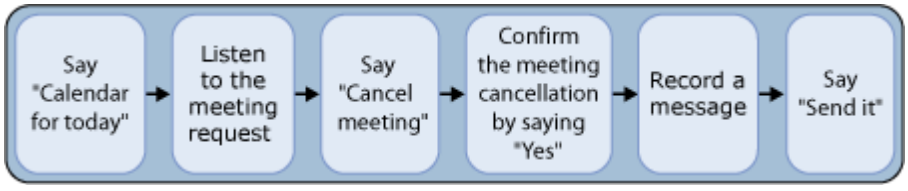
Return to top

Cancel a meeting

To cancel a meeting, the user must be the meeting organizer. To cancel the meeting using their voice, meeting organizers must do the following:

1. Say "Calendar for today."
2. Listen to the meeting requests to locate the meeting to cancel.
3. After the meeting request has been read, say "Cancel meeting."
4. Confirm the meeting cancellation by saying "Yes."
5. If the meeting organizer chooses to send a voice message, they can then say "Yes," record the message, and then say "Send it."

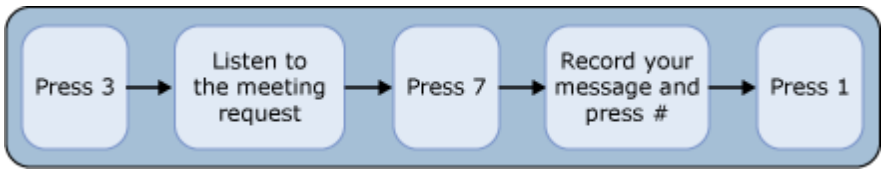
This process is shown in the following figure.



To cancel a meeting, the user must be the meeting organizer. To cancel the meeting using the telephone keypad, meeting organizers must do the following:

1. Press 3.
2. Listen to the meeting requests to locate the meeting to cancel.
3. Press 7 to cancel the meeting.
4. If the meeting organizer chooses to send a voice message, they can then press one of the following options:
   - # to stop recording the message.
   - 1 to accept the recorded message.

This process is shown in the following figure.



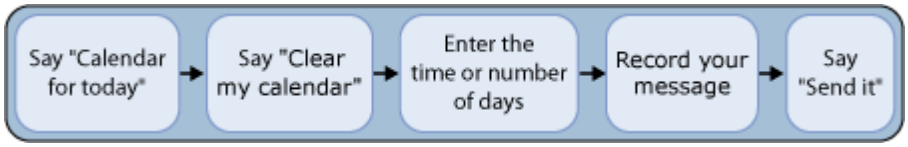
Return to top

Clear a calendar

To clear their calendar using their voice, users must do the following:

1. Say "Calendar for today."
2. Say "Clear my calendar."
3. Enter the time or the number of days to be cleared.
4. The voice mail system asks whether they want to attach a recorded voice message. If so, say "Yes," record the message, and then say "Send it." If not, say "No."

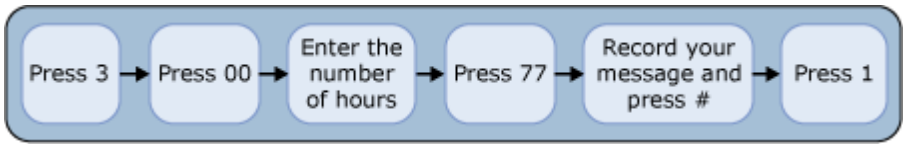
This process is shown in the following figure.



To clear their calendar using the telephone keypad, users must do the following:

1. Press 3.
2. Press 00 to go to the More Options menu.
3. Press 77 to clear their calendar.
4. Enter the number of hours to clear from the calendar.
5. If users choose to send a voice message, they can do one of the following:
   - Press # to not send a voice message.
   - Record the voice message when prompted, press # to stop recording the message, and then press 1 to accept the recorded message.

This process is shown in the following figure.



Return to top

Accept a meeting request

To accept a meeting request using their voice, users must do the following:

1. Say "Email" to access their email.
2. Listen to the email message that contains a meeting request.
3. Say "Accept" to accept the meeting request.

This process is shown in the following figure.

To accept a meeting request using the telephone keypad, users must do the following:

1. Press 2 to access their email.
2. Listen to the email message that contains a meeting request.
3. Press 4 to accept the meeting request.

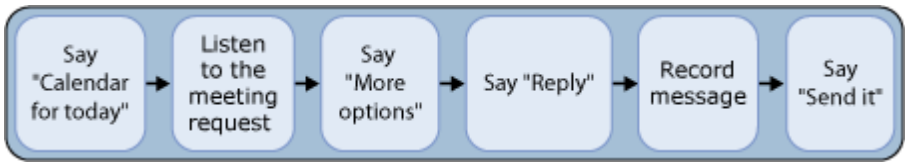
This process is shown in the following figure.

Reply to a meeting request

To reply to a meeting request using their voice, users must do the following:

1. Say "Calendar for today."
2. Listen to the meeting requests to locate the meeting request to reply to.
3. Say "More options" to open the More Options menu.
4. Say "Reply" to reply to the meeting organizer.
5. Record a message.
6. Say "Send it."

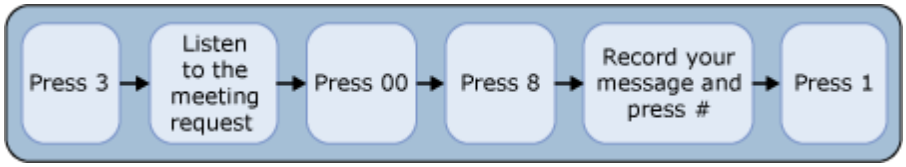
This process is shown in the following figure.



To reply to a meeting request using the telephone keypad, users must do the following:

1. Press 3.
2. Listen to the meeting requests to locate the meeting request to reply to.
3. Press 00 for more options.
4. Press 8 to reply to the meeting organizer.
5. Record a message, and then press #.
6. Press 1 to accept the recording and send the message.

This process is shown in the following figure.



Return to top

Managing personal options and contacts

Users can manage their personal options and contacts using Outlook Voice Access. They can:

- Call a personal contact.
- Locate and call a user in the directory.
- Configure personal options, such as changing their PIN over the telephone.

When users first set up their mailbox, they must create personal and Automatic Replies greetings that callers will hear when users are unable to answer their telephone. If, for example, users realize that they have forgotten to turn on an Automatic Replies voice greeting that will give callers an alternative number to call if they have an immediate issue, users can use Outlook Voice Access to access their personal options and record and turn on an Automatic Replies greeting from any telephone.

If a user has to contact an account manager with important information about a client, the user can call the number that is used for Outlook Voice Access, use the directory search feature using their telephone keypad to locate the account manager, and then place the call.

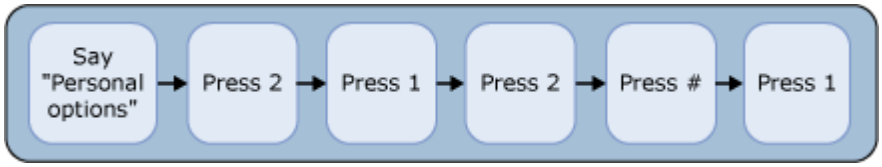
Note:
When users access the Personal Options menu, they must use the telephone keypad.

Record a personal greeting

To record a personal greeting using their voice, users must dial an Outlook Voice Access number, enter their extension number and PIN, and then do the following:

1. Say "Personal options" to access personal options.
2. Press 2 to record greetings.
3. Press 1 to record a personal greeting. Press 2 if they need to re-record the personal greeting.
4. Press # to stop recording the personal greeting.
5. Press 1 to accept the personal greeting.

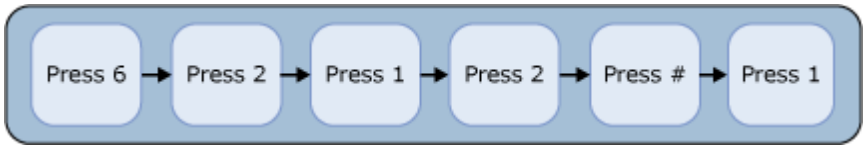
This process is shown in the following figure.



To record a personal greeting using the telephone keypad, users must dial an Outlook Voice Access number, enter their extension number and PIN, and then do the following:

1. Press 6 to access personal options.
2. Press 2 to record greetings.
3. Press 1 to record a personal greeting. Press 2 if they need to re-record the personal greeting.
4. Press # to stop recording the personal greeting.
5. Press 1 to accept the personal greeting.

This process is shown in the following figure.



Note:

When users change their telephone greeting, they are also given the option to turn on or off their email automatic reply message.

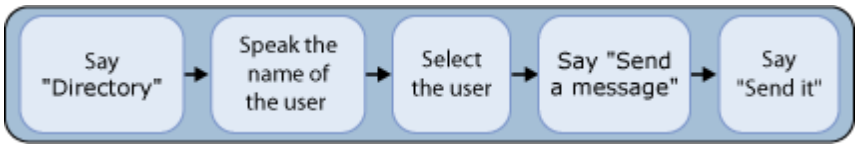
Return to top

Send a voice message to a user

To locate and send a voice message to another UM-enabled user using their voice, users must do the following:

1. Say "Directory."
2. Say the name of the person to locate.
3. Select the correct person from the list.
4. Say "Send a message," and then record the voice message.
5. Say "Send it" to send the message.

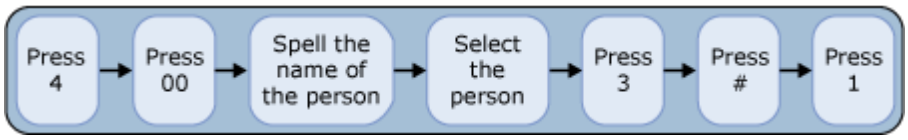
This process is shown in the following figure.



To locate and send a voice message to another UM-enabled user using the telephone keypad, users must do the following:

1. Press 4 to search for a contact.
2. Press 00 to locate the person in the directory.
3. Use the telephone keypad to spell the name of the person to locate.
4. Select the correct person from the list.
5. Press 3 to send a voice message to the person.
6. Record the voice message, and then press # to stop recording.
7. Press 1 to accept the voice message and send it.

This process is shown in the following figure.



Change a PIN

To change their PIN using their voice, users must do the following:

1. Say "Personal options."

2. Press 3 to change the PIN.
3. Enter the new PIN, and then press #.
4. Press # to confirm the new PIN.

This process is shown in the following figure.

To change their PIN using the telephone keypad, users must do the following:

1. Press 6 to access personal options.
2. Press 3 to change the PIN.
3. Enter the new PIN, and then press #.
4. Press # to confirm the new PIN.

This process is shown in the following figure.

Play on Phone

Unified Messaging > Set up client voice mail features > Setting up Outlook Voice Access >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-25*

After a voice mail message arrives, users can choose either to listen to the voice mail message through their computer speakers or headphones or to use the Play on Phone feature. The Play on Phone feature is included with Microsoft Outlook and Outlook Web App, and settings for Play on Phone are available in the **Play on phone** section under **Voice mail** options. This topic discusses how a Unified Messaging (UM)-enabled user can use the Play on Phone feature.

What is Play on Phone?

The Play on Phone feature lets UM-enabled users play voice messages over a telephone. If a UM-enabled user sits in an office cubicle, is using a public computer or a computer that's not enabled for multimedia, or is listening to a voice message that's confidential, the user might not want to—or be able to—listen to a voice message through their computer speakers. Alternatively, they can play back the voice mail message using any telephone, including home, office, or mobile phones. To review settings for Play on Phone, in Outlook, go to **File** > **Info** > **Manage voice mail**. Clicking the **Manage voice mail** button will automatically sign you in to Outlook Web App. or you can sign in to

Outlook Web App using a web browser. In Outlook Web App, go to **Options** > **Phone** > **Voice Mail** > **Play on Phone** section on the **Voice Mail** page.

When the user clicks the Play on Phone toolbar option in the voice mail form, the **Play on Phone** dialog box appears. The **Play on Phone** box provides the controls for selecting or inputting the telephone number to use to play a voice message, starting and ending the call, and a status message for monitoring the call. If the user is linked to a SIP URI dial plan, their SIP address will appear in the **Dial** box. If they are linked to an E.164 dial plan, their full E.164 number will appear in the **Dial** box.

Note:

Only one voice message can be played at a time. If the user tries to start a second Play on Phone call while a previous call is still in progress, an error message will appear.

Most recently used telephone number list

Users can see a list of telephone numbers they used most recently in the **Dial** box. The telephone number specified in the **Play on phone** section is always displayed as the top entry and is automatically selected for the user as the primary number. Users can use the drop-down menu to select other telephone numbers to dial instead of the telephone number that's configured as the primary number.

Note:

To enable users who are using the Play on Phone feature to dial an external telephone number without using an outside line access code, for example 425-555-1234 instead of 9-425-555-1234, configure in-country/region dialing rules on a UM dial plan that include the following line: group1, 9xxxxxxxxx, 91xxxxxxxxx. After you've configured the in-country/region dialing rules, add this list to the UM mailbox policy.

Play on Phone buttons

The **Play on Phone** dialog box gives users the option to **Dial** and **Hang-up**. When the **Play on Phone** dialog box is first opened, the **Dial** button is enabled and the **Hang-up** button is disabled. After a call is placed, the **Dial** button becomes disabled until the call has ended. The call can be ended either by clicking the **Hang-up** button or by physically hanging up the telephone. Closing the **Play on Phone** dialog box using the **Close** button ends the call if one is in progress. The **Play on Phone** option and other options are also available in **Reading pane** preview in Outlook. If you open the voice mail message in a separate window, the **Play on Phone** button is on the toolbar.

Subject, sent, and status section

The bottom section of the **Play on Phone** dialog box displays the subject of the voice message, the date and time sent, and a message that displays the current state of the call. Any errors specific to

the Play on Phone operation are displayed to the user in this section of the **Play on Phone** dialog box.

Phone number validation

Play on Phone performs only simple validation on input into the **Play on Phone** dialog box. Play on Phone does not validate telephone numbers. If a telephone number is not valid, Unified Messaging returns a meaningful error code to the user.

Enable or disable Outlook Voice Access for users

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-12*

You can enable or disable access to Outlook Voice Access for UM-enabled users who are associated with a Unified Messaging (UM) mailbox policy. Outlook Voice Access is a feature used by UM-enabled users to access their mailbox over a phone. By default, this setting is enabled.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or disable Outlook Voice Access

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. Under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .

3. On the **UM Mailbox Policy** page, select or clear the check box next to **Allow Outlook Voice Access**.
4. Click **Save**.

Use the Shell to enable or disable Outlook Voice Access

This example allows users who are associated with the UM mailbox policy `MyUMMailboxPolicy` to use Outlook Voice Access.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowSubscriberAccess $true
```

This example prevents users who are associated with the UM mailbox policy `MyUMMailboxPolicy` from using Outlook Voice Access.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowSubscriberAccess $false
```

Configure an Outlook Voice Access number

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

An Outlook Voice Access number lets a user who is enabled for Unified Messaging (UM) and voice mail access their mailbox using Outlook Voice Access. When you configure an Outlook Voice Access or subscriber access number on a dial plan, UM-enabled users can call in to the number, sign in to their mailbox, and access their email, voice mail, calendar, and personal contact information.

By default, when you create a UM dial plan, an Outlook Voice Access number isn't configured. To configure an Outlook Voice Access number, you first need to create the dial plan, and then configure an Outlook Voice Access number under the dial plan's **Outlook Voice Access** option. Although an Outlook Voice Access number isn't required, you need to configure at least one Outlook Voice Access number to enable a UM-enabled user to use Outlook Voice Access to access their mailbox. You can configure multiple Outlook Voice Access numbers for a single dial plan.

Outlook Voice Access numbers can contain alphabetical, numeric, and special characters, separators, and spaces. For example:

- +14255551010

- +1-425-555-1010
- 4255551010
- +1 425 555 1010
- 1-800-555-CALL

For more information about the menu options available for Outlook Voice Access users, see the Quick Reference Guide for Outlook Voice Access, which is available from the Microsoft Download Center.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure an Outlook Voice Access number

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to modify and on the toolbar, click **Edit** .
3. On the **UM dial plan** page, click **Configure**.
4. In **Outlook Voice Access**, under **Outlook Voice Access numbers**, use the box to enter the number you want to use, and then click **Add +**.
5. Click **Save**.

Use the Shell to configure an Outlook Voice Access number

This example sets the Outlook Voice Access number to 4255550100 for a UM dial plan named

MyUMDialPlan.

```
Set-UMDialPlan -identity MyUMDialPlan -
AccessTelephoneNumbers 4255550100
```

Disable selected features for Outlook Voice Access users

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Outlook Voice Access contains two interfaces: the telephone user interface (TUI) and the voice user interface (VUI). By default, when users dial in to Outlook Voice Access, they can access their calendar, email, and personal contacts, and search the directory. You can use the Shell to prevent users from accessing one or more of these features when they use Outlook Voice Access to access their mailbox. When you modify Outlook Voice Access features on a Unified Messaging (UM) mailbox policy, your changes affect all users who are associated with the UM mailbox policy.

You can disable users' access to the following Outlook Voice Access features on a UM mailbox policy:

- Calendar
- Directory
- Email
- Personal contacts

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

You can also use the Shell to disable Outlook Voice Access features on the mailbox of a single UM-enabled user. When you do this, the features will be disabled only for that user. Although you can't disable all the Outlook Voice Access features that are found on a UM mailbox policy for a single user, you can disable access to their calendar and to their email.

For additional management tasks related to UM mailboxes, see Voice mail for users.

Note:
You can use only the Shell to modify the Outlook Voice Access features for UM-enabled users on a UM mailbox policy or on the mailbox of a single UM-enabled user.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.
- Procedures in this topic require specific permissions. See each procedure for its permissions information.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that a user has been enabled for UM. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the Shell to disable selected Outlook Voice Access features for UM-enabled users on a UM mailbox policy

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.

This example prevents users associated with a UM mailbox policy named `MyUMMailboxPolicy` from accessing their calendar when they dial in to Outlook Voice Access.

```
Set-UMMailboxPolicy -id MyUMMailboxPolicy -
AllowTUIAccessToCalendar $false
```

This example prevents users associated with the UM mailbox policy named `MyUMMailboxPolicy` from accessing the directory when they dial in to Outlook Voice Access.

```
Set-UMMailboxPolicy -id MyUMMailboxPolicy -
AllowTUIAccessToDirectory $false
```

This example prevents users associated with the UM mailbox policy named `MyUMMailboxPolicy` from accessing their email when they dial in to Outlook Voice Access.

```
Set-UMMailboxPolicy -id MyUMMailboxPolicy -
AllowTUIAccessToEmail -$false
```

This example prevents users associated with the UM mailbox policy named `MyUMMailboxPolicy` from accessing personal contacts when they dial in to Outlook Voice Access.

```
Set-UMMailboxPolicy -id MyUMMailboxPolicy -
AllowTUIAccessToPersonalContacts $false
```

Use the Shell to disable selected Outlook Voice Access features on the mailbox of a single UM-enabled user

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

This example disables access to the calendar on a UM mailbox named tony@contoso.com when the user dials in to Outlook Voice Access.

```
Set-UMMailbox -id tony@contoso.com -
TUIAccessToCalendarEnabled $false
```

This example disables access to email on a UM mailbox named tony@contoso.com when the user dials in to Outlook Voice Access.

```
Set-UMMailbox -id tony@contoso.com -TUIAccessToEmailEnabled
$false
```

Set mailbox features for Outlook Voice Access users

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Outlook Voice Access contains two interfaces: a telephone user interface (TUI) and a voice user interface (VUI). You can configure a UM-enabled user's TUI settings when the user accesses a mailbox using the Unified Messaging (UM) system in Exchange 2013. When you modify a UM-

enabled user's TUI settings on a UM mailbox policy, the changes affect all users who are associated with the UM mailbox policy. You can modify the following TUI settings on a UM mailbox policy:

- PIN-less access to voice mail
- Voice responses to other messages
- TUI access to their calendar
- TUI access to the directory
- TUI access to their email
- TUI access to their personal contacts

Note:

You can use only the Shell to modify the Outlook Voice Access TUI settings for UM-enabled users.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to modify TUI settings on a UM mailbox policy

This example sets TUI-related settings on a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailbox -identity MyUMMailboxPolicy -
AllowSubscriberAccess $true -AllowTUIAccessToCalendar
$false -AllowTUIAccessToDirectory $false -
AllowTUIAccessToEmail -$true -
AllowTUIAccessToPersonalContacts $true
```

Set mailbox features for an Outlook Voice Access user

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Telephone user interface (TUI) settings are used when a user accesses the Unified Messaging (UM) system by using Outlook Voice Access. When you modify a UM-enabled user's TUI configuration settings, you modify properties and their values on the UM-enabled user's mailbox.

You can change the following TUI settings for a UM-enabled user:

- Allow subscriber access
- Allow TUI access to the calendar
- Allow TUI access to email
- Allow Automatic Speech Recognition

For additional management tasks related to UM users, see Set mailbox features for an Outlook Voice Access user.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that the existing Exchange recipient is enabled for Unified Messaging and voice mail. For detailed steps, see Enable a user for voice mail.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to modify a single UM-enabled user's TUI

settings

This example enables calendar and email access using the TUI for a UM-enabled user named Tony Smith.

```
Set-UMMailbox -Identity tony@contoso.com TUIAccessToCal
True -TUIAccessToEmail True -OperatorNumber 111111 -
DisableMissedCallNotification False -AnonCallBlock True
```

Note:

TUI settings for users are also available on UM mailbox policies. Modifying TUI settings on a UM mailbox policy affects all users who are associated with the UM mailbox policy. For more information about how to modify TUI settings on a UM mailbox policy, see Set mailbox features for Outlook Voice Access users.

Enable or disable automatic speech recognition for an Outlook Voice Access user

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure Automatic Speech Recognition (ASR) for a user who's enabled for Unified Messaging (UM) and voice mail. When ASR is enabled on the mailbox of an Outlook Voice Access user, the user can move through the mailbox menus using voice commands. ASR is enabled by default. If ASR is disabled, the user must use dual tone multi-frequency (DTMF), also known as touchtone, inputs to move through the menus.

Note:

You can't use the EAC to configure this feature. You must use the Shell to enable or disable ASR for a voice mail user.

For additional management tasks related to UM or voice mail users, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to enable or disable ASR for a UM-enabled user

This example enables ASR for a UM-enabled user named `tonysmith`.

```
Set-UMMailbox -Identity tonysmith@contoso.com -
AutomaticSpeechRecognitionEnabled $true
```

This example disables ASR for a UM-enabled user named `tonysmith`.

```
Set-UMMailbox -Identity tonysmith@contoso.com -
AutomaticSpeechRecognitionEnabled $false
```

Enable an informational announcement for Outlook Voice Access users

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-30*

You can enable an informational announcement on a Unified Messaging (UM) dial plan.

Informational announcements are used for general announcements that change more frequently than the welcome greeting does, or for announcements that are required by corporate compliance policies.

By default, callers, including Outlook Voice Access users who dial in to an Outlook Voice Access number that's been configured, don't hear an informational announcement. If you want one to be played, you must create a .wav or .wma file to use for the informational announcement after you create a UM dial plan, and then enable the informational announcement on the dial plan.

When it's important that the whole informational announcement is heard, you can configure the announcement to be uninterruptible. This prevents a caller from pressing a key or speaking a command to interrupt and stop the announcement.

For more information about the menu options that are available for Outlook Voice Access users, see the Quick Reference Guide for Outlook Voice Access, which is available from the Microsoft Download Center.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable an informational announcement

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan that you want to modify, and then click **Edit** .
3. On the **UM dial plan** page, click **Configure**.
4. In **Outlook Voice Access**, under **Informational announcement**, click **Change**, and then click **Browse** to locate the announcement file.

Important:

The file you use for the informational announcement must be a .wav or .wma file.

5. After you've located the file, click **Open**, and then click **Save**.

Use the Shell to enable an informational announcement

This example enables an informational announcement that uses the informational.wav informational announcement file on a UM dial plan named `MyUMDialPlan`.

```
Set-UMDialPlan -Identity MyUMDialPlan -
InfoAnnouncementEnabled $true-InfoAnnouncementFilename c:
\UMGreetings\informational.wav
```

Enable a customized greeting for Outlook Voice Access users

Set up client voice mail features > Setting up Outlook Voice Access > Outlook Voice Access procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-03-15*

By default, each Unified Messaging (UM) dial plan uses a standard .wav file for the welcome greeting that's played to callers, including Outlook Voice Access users who dial in to an Outlook Voice Access number that's been configured. However, you can create a .wav or .wma file for the welcome greeting, and then enable it on the UM dial plan.

For example, you might want to change the default welcome greeting and instead provide a welcome greeting that's specific to your company, such as "Welcome to Outlook Voice Access for Woodgrove Bank." To do this, you record the customized welcome greeting and save it as a .wav or .wma file. Then you configure the dial plan to use the customized welcome greeting.

For more information about the menu options available for Outlook Voice Access users, see the Quick Reference Guide for Outlook Voice Access, which is available from the Microsoft Download Center.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.

- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable a customized welcome greeting

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan that you want to modify, and then click **Edit** .
3. On the **UM dial plan** page, click **Configure**.
4. In **Outlook Voice Access**, under **Welcome greeting**, click **Change**, and then click **Browse** to locate the greeting file.

Important:
The file you use for the welcome greeting must be a .wav or .wma file.

5. After you've located the file, click **Open**, and then click **Save**.

Use the Shell to enable a customized welcome greeting

This example enables a welcome greeting that uses the C:\UMPrompts\welcome.wav file on a UM dial plan named `MyUMDialPlan`.

```
Set-UMDialPlan -Identity MyUMDialPlan -
WelcomeGreetingEnabled $true -WelcomeGreetingFilename c:
\UMPrompts\welcome.wav
```

Enable or disable Play on Phone for Outlook Voice Access users

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-12*

You can enable or disable the Play on Phone feature for users associated with a Unified Messaging (UM) mailbox policy. This option is enabled by default and allows users to play their voice mail messages over any phone. This option isn't available to UM-enabled users who have a mailbox on a Microsoft Exchange Server 2007 server.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or disable Play on Phone

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page, select or clear the check box next to **Allow Play on Phone for voice mail**.
4. Click **Save**.

Use the Shell to enable or disable Play on Phone

This example enables the Play on Phone feature for users who are associated with the UM mailbox policy `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
```

```
AllowPlayOnPhone $true
```

This example disables the Play on Phone feature for users who are associated with the UM mailbox policy `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowPlayOnPhone $false
```

Enable or disable sending voice messages from Outlook Voice Access

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-13*

You can enable Outlook Voice Access users to send voice mail messages to other UM-enabled users who are associated with the same dial plan, or prevent them from doing so.

By default, this setting is enabled. If you disable this setting, Outlook Voice Access users that call into an Outlook Voice Access number won't be able to send voice messages to users within the same dial plan.

For additional tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or prevent Outlook Voice Access users sending voice messages to users in the same dial plan

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, click **Configure**.
4. In **Transfer & search**, under **Allow callers to**, select **Leave voice messages without ringing a user's phone** to allow sending voice messages. If you want to prevent sending voice messages for users, clear this setting.
5. Click **Save**.

Use the Shell to enable or prevent Outlook Voice Access users sending voice messages to users in the same dial plan

This example enables Outlook Voice Access users associated with the UM dial plan named `MyUMDialPlan` to send voice messages to users associated with the same dial plan.

```
Set-UMDialPlan -identity MyUMDialPlan -SendVoiceMsgEnabled $true
```

This example prevents Outlook Voice Access users associated with the UM dial plan named `MyUMDialPlan` from sending voice messages to users associated with the same dial plan.

```
Set-UMDialPlan -identity MyUMDialPlan -SendVoiceMsgEnabled $false
```

Enable or prevent transferring calls from Outlook Voice Access

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable Outlook Voice Access users to transfer calls to a user who's associated with a Unified Messaging (UM) dial plan, or prevent them from doing so. By default, both this option and the **Leave voice messages without ringing a user's phone** option are enabled, so that Outlook Voice Access users can transfer calls to users in the same UM dial plan and leave voice messages for them. This setting only applies to Outlook Voice Access users who have entered their PIN and are authenticated.

For additional tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or prevent Outlook Voice Access users from transferring calls

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan that you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, click **Configure**.
3. In **transfer & search**, under **Allow callers to**, select the check box next to **transfer to users** to enable callers to transfer calls to other users within the dial plan. If you want to prevent Outlook Voice Access users from transferring calls to users, clear this check box.
4. Click **Save**.

Use the Shell to enable or prevent Outlook Voice Access users from transferring calls

This example enables Outlook Voice Access users to transfer calls to users in the same dial plan on a UM dial plan named `MyUMDialPlan`.

```
Set-UMDialPlan -identity MyUMDialPlan -
AllowDialPlanSubscribers $true
```

This example prevents Outlook Voice Access users from transferring calls to users in the same dial plan on a UM dial plan named `MyUMDialPlan`.

```
Set-UMDialPlan -identity MyUMDialPlan -
AllowDialPlanSubscribers $false
```

Configure the group of users that Outlook Voice Access users can contact

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-09*

You can specify which users can receive transferred calls or voice mail messages from Outlook Voice Access users. By default, the **In this dial plan only** option is selected. You can change this setting to allow Outlook Voice Access users to transfer calls or send voice messages to users located in the entire organization, to an existing UM auto attendant, or to a specific extension number.

For additional tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the group of users that Outlook Voice Access users can contact

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to modify, and then click **Edit** ✎.
3. On the **UM dial plan** page, click **Configure**.
4. In **Transfer & search**, under **Allow callers to search for users by name or alias**, select one of the following options:
   - **In this dial plan only** Use this option to allow Outlook Voice Access users who call in to an Outlook Voice Access number to locate and contact users who are within the same dial plan.
   - **In the entire organization** Use this option to allow Outlook Voice Access users who call in to an Outlook Voice Access number to locate and contact anyone in the entire organization. This includes all users who are mailbox-enabled.
   - **Only on this auto attendant** Use this option to allow Outlook Voice Access users who call in to an Outlook Voice Access number to connect to a specific auto attendant. You must create the auto attendant before you specify it here. This allows Outlook Voice Access users to be transferred to another auto attendant. The auto attendant you choose here can be a speech-enabled or non-speech-enabled auto attendant.
   - **Only for this extension** Use this option to allow Outlook Voice Access users to connect to an extension number that you specify. You can use only numeric digits for the extension. The number of digits that you define in this field must match the number of digits in the extension numbers that are configured on the UM dial plan.
5. Click **Save**.

Use the Shell to configure the group of users that Outlook Voice Access users can contact

This example sets the group of users that Outlook Voice Access users can contact for a UM dial plan named `MyUMDialPlan` to the entire organization.

```
Set-UMDialPlan -Identity MyUMDialPlan -ContactScope
'GlobalAddressList' -UMAutoAttendant $null -
AllowDialPlanSubscribers $false -AllowExtensions $false
```

This example sets the group of users that Outlook Voice Access users can contact for a UM dial plan

named `MyUMDialPlan` to the `DialPlan`.

```
Set-UMDialPlan -Identity MyUMDialPlan -ContactScope
DialPlan -AllowDialPlanSubscribers $false -AllowExtensions
$false
```

Configure the primary way for Outlook Voice Access users to search

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

When you create a Unified Messaging (UM) dial plan, you can configure the primary and secondary ways that callers can search for names to locate a user when they call an Outlook Voice Access number or a UM auto attendant that's associated with the dial plan. Callers can use touchtone inputs to locate a UM-enabled user.

Note:

None isn't an available option for the primary way callers can search for names. When **None** is selected for the secondary way they can search for names, only the primary way will be available to callers. If you configure both the primary and secondary ways that callers can search for names, they will be prompted for both ways.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the primary dial by name method

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, click **Configure**.
4. In **Settings**, under **Primary way to search for names**, use the drop-down list to select the option you want:
   - **Last first** (default)
   - **First last**
   - **SMTP address**
5. Click **Save**.

Use the Shell to change the primary dial by name method

This example sets the primary dial by name method to `FirstLast`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their first and then last name.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNamePrimary
FirstLast
```

This example sets the primary dial by name method to `LastFirst`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their last and then first name.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNamePrimary
LastFirst
```

This example sets the primary dial by name method to `SMTP address`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their SMTP address.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNamePrimary
SMTPAddress
```

Configure the secondary way for

Outlook Voice Access users to search

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

When you create a dial plan, you can configure the primary and secondary *dial by name methods* or ways that callers can search for names. Callers use these dial by name methods to look up names to locate and contact a user when they call in to an Outlook Voice Access number or when they call in to a UM auto attendant that's associated with the dial plan. Callers can use touchtone inputs to locate a UM-enabled user.

Note:

If **None** is selected as the secondary way for callers to search for names, only the primary way of searching for names will be available to callers who want to locate users. If you configure both the primary and secondary ways that callers can search for names, callers will be prompted for both ways.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the secondary dial by name method

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.

2. In the list view, select the UM dial plan you want to change, and then click **Edit** ✎.
3. On the **UM Dial Plan** page, click **Configure**.
4. In **Settings**, under **Secondary way to search for names**, use the drop-down list to select the option you want:
   - **Last first** (default)
   - **First last**
   - **SMTP address**
   - **None**
5. Click **Save**.

Use the Shell to change the secondary dial by name method

This example sets the secondary dial by name method to `FirstLast`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their first and then last name.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNameSecondary FirstLast
```

This example sets the secondary dial by name method to `LastFirst`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their last and then first name.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNameSecondary LastFirst
```

This example sets the secondary dial by name method to `SMTP address`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their SMTP address.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNameSecondary SMTPAddress
```

This example sets the secondary dial by name method to `None` and the primary dial by name method to `SMTP address`. This enables callers who call the Outlook Voice Access number or a UM auto attendant associated with the dial plan to search for a UM-enabled user by their SMTP address only.

```
Set-UMDialPlan -Identity MyUMDialPlan -DialByNamePrimary SMTPAddress -DialByNameSecondary None
```

Configure the number of sign-in failures before Outlook Voice Access users are disconnected

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-09*

You can specify the number of sequential unsuccessful sign-in attempts that are allowed before a caller is disconnected. The value of this setting can be from 1 through 20. Setting this value too low can frustrate users. For most organizations, this value should be set to the default of three attempts.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the number of sign-in failures before users are disconnected

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
3. On the **UM dial plan** page, click **Configure**.

4. In **Settings**, under **Number of sign-in failures before disconnecting**, enter the number of sign-in failures.
5. Click **Save**.

Use the Shell to configure the number of sign-in failures before users are disconnected

This example sets the number of sign-in failures before users are disconnected to 5 for a UM dial plan named `MyUMDialPlan`.

```
Set-UMDialPlan -identity MyUMDialPlan -
LogonFailuresBeforeDisconnect 5
```

Configure the number of input failures before Outlook Voice Access users are disconnected

Set up client voice mail features > Setting up Outlook Voice Access > Outlook Voice Access procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-09*

You can configure the number of times that users who call in to an Outlook Voice Access number can enter incorrect data before they're disconnected. This setting applies to both Outlook Voice Access users and unauthenticated callers who use directory search.

The following are examples of types of data that are considered incorrect:

- A caller requests an extension number that isn't found in the system.
- The system can't locate the user's extension number to transfer the call.
- A caller presses a menu option that isn't valid.

The value of this setting can be from 1 through 20. For most organizations, this value should be set to the default of three attempts. Setting this value too low may prematurely disconnect callers.

For additional management tasks related to UM dial plans, see UM dial plan procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the input failures before disconnect

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
3. On the **UM dial plan** page, click **Configure**.
4. In **Settings**, under **Number of input failures before disconnecting**, enter the number of input failures.
5. Click **Save**.

Use the Shell to configure the input failures before disconnect

This example sets the input failures before disconnect to 5 on a UM dial plan named `MyUMDialPlan`.

```
Set-UMDialPlan -identity MyUMDialPlan -
InputFailuresBeforeDisconnect 5
```

Configure the limit on personal greetings for Outlook Voice Access users

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-05*

The **Limit on personal greetings (minutes)** setting enables you to enter the maximum number of minutes that users associated with the Unified Messaging (UM) mailbox policy can use to record their voice mail greetings. This setting applies to both their standard voice mail and their Out of Office voice mail greetings. By default, the maximum greeting duration is set to 5 minutes. However, you can configure the maximum greeting duration to any setting between 1 and 10 minutes.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the maximum greeting duration

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then on the toolbar, click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then on the toolbar, click **Edit** .
3. On the **UM mailbox policy** page > **General**, under **Limit on personal greetings (minutes)**, enter the length of time, in minutes, allowed for personal greetings for voice mail users.
4. Click **Save**.

Use the Shell to change the maximum greeting duration

This example configures the maximum greeting duration on the UM mailbox policy `MyUMMailboxPolicy` to 3 minutes.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy
MaxGreetingDuration 3
```

Allow voice mail users to forward calls

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

The Call Answering Rules feature was first introduced in Exchange 2010. Using this feature, users who are enabled for voice mail can control how their incoming calls should be handled. Call answering rules are applied to incoming calls similar to the way Inbox rules are applied to incoming email messages.

Call answering rules are created and configured by a voice mail-enabled user using Outlook or Outlook Web App. The rules are stored along with other voice settings in the user's mailbox. A total of nine call answering rules can be set up for each UM-enabled mailbox. These rules are independent of the Inbox rules that are set up by users, and don't take up part of the Inbox rules storage quota for the user.

By default, when a user is enabled for Unified Messaging (UM) and voice mail, no call answering rules are configured. If an incoming call is answered by the voice mail system, the caller is prompted to leave a voice message or if the caller doesn't get prompted, the caller will also be able to leave a voice message for the user.

If your users want to have the voice mail system just answer their incoming calls and record a voice message, you don't have to create any call answering rules. However, if you decide that you want to set up conditions or actions, you can set them up by using the **Call Answering Rules** section on the **Voice Mail** page in Outlook Web App. Use the **Call Answering Rules** section to create, edit, and delete call answering rules.

Anatomy of call answering rules

A call answering rule consists of two parts: conditions and actions. You can associate one or more conditions with a single call answering rule. The call answering rule will only be processed if all the conditions for the rule are met. You can also associate one or more actions with a single call

answering rule. These actions determine what options will be offered to the caller when the call answering rule is processed.

Call Answering Rules supports the following conditions:

- Who the incoming call is from
- The time of day
- Calendar free/busy status
- Whether automatic replies are turned on for email

The following actions are supported:

- Find me
- Transfer the caller to someone else
- Leave a voice message

If a user records a custom greeting for a call answering rule, they must include the menu option as part of the custom greeting when they configure the call answering rule. If they don't, Unified Messaging won't generate a menu prompt that lets the caller know what his or her choices are. After the custom greeting is played, the server will wait for the caller's input. If a menu option isn't included in the greeting, the caller won't input anything and the server will prompt them, asking "Are you still there?"

Conditions

Conditions are rules that you can apply to call answering rules. By using a combination of conditions, you can create multiple call answering rules that will trigger when the conditions are met. To create a default rule that will be applied to every call, you create a rule that doesn't contain any conditions.

There are three conditions that can be used when you set up call answering rules, including:

- Caller ID
- Time-of-the-day
- Free/busy status

Actions

Actions are used to define what you want to happen when a condition is met. The two kinds of actions are:

- Find Me
- Call Transfer

Adding a Find Me action

When a caller selects Find Me, the voice mail system will attempt to locate you at up to two different phone numbers, and then connect the caller to you if you're available at one of the phone numbers.

- You can specify text that will be read to the caller. For example, if you enter “Urgent Matters” to

inform your callers that they should only select this action if they have important things to discuss with you, the voice mail system will say "For Urgent Matters, press the 1 key."

- You have to associate the Find Me action with the number on the telephone keypad that the caller will press to select this action. In the example above, the **1** telephone key is the number callers will press to reach you at one of the phone number or numbers you specify.
- Next, you have to specify the one or two phone numbers that the voice mail system will dial. If you specify two telephone numbers, the second number will be dialed if you're not available at the first. Each phone number that you specify has an associated duration. The duration is the time period during which the voice mail system will try to dial the phone number before it moves on to the next number. Or, if you can't be contacted, the voice mail system will go back to the options menu.
- After you've entered this information, click **Apply** to save the Find Me settings.

Adding Call Transfer actions

By setting a Call Transfer action, you provide callers with the option to be transferred to another person's phone number. There are several options that are available when you want to transfer an incoming call to another phone or contact.

- You can specify text that will be read to the caller. For example, you can enter “Important Matters” to inform your callers that they should choose this option if they have an important matter to discuss and need to speak to someone.
- You have to associate the **Call Transfer** action with the number on the telephone keypad that the caller will press to select this action.
- When you choose the Call Transfer action, you have to specify a person or phone number for the caller to be transferred to. You can choose a phone number or select a contact to be called when the caller presses the correct key on the telephone keypad. If you specify a contact who's within your company directory, the voice mail system will try to transfer the call to the extension number of that contact.
- In addition to specifying a person or number for the caller to be transferred to, you also need to specify the number on the telephone keypad that the caller will press to select the Call Transfer action.
- After you've entered this information, click **Apply** to save the Call Transfer settings.

Selecting a call answering rule for each incoming call

After you create and configure Call Answering Rules, Unified Messaging will:

1. Determine whether the user has created any call answering rules. If not, UM will offer the caller the option of leaving a voice message.
2. If one or more call answering rules have been configured, UM will evaluate each of these rules. The first rule whose conditions are met will be processed.
3. After evaluating all the rules, if UM doesn't find a rule whose conditions are met, UM will ask the caller to leave a voice message.

Dialing rules

Depending on how a call answering rule is configured, an incoming call may result in a call transfer. When this happens, the transfer target phone number will be subject to the dialing rules and restrictions on the UM mailbox policy that the called party is associated with. For more information about outdialing and dialing rules and restrictions, see Allow users to make calls.

Enabling/disabling Call Answering Rules

By default, Call Answering Rules is automatically enabled for UM-enabled users. However, you can disable call answering rules for users by disabling the feature on a UM mailbox policy or the user's mailbox. For details about how to enable or disable Call Answering Rules, see the following topics:

- Allow or prevent users in the same UM mailbox policy from creating call answering rules
- Allow or prevent a user from creating call answering rules

Forwarding calls procedures

Set up client voice mail features > Allow voice mail users to forward calls > Forwarding calls procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can specify whether you want individual users to be able to create and manage their own call answering rules by configuring their mailbox properties. By default, they can create call answering rules.

You can enable or disable Call Answering Rules for multiple users that are enabled for Unified Messaging (UM) by configuring Call Answering Rules on a UM dial plan or UM mailbox policy.

Note:

You can't use the EAC to configure this feature. You must use the Shell to enable or disable Call Answering Rules for a voice mail user.

For additional management tasks related to allowing users to forward calls, see Forwarding calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to enable or disable call answering rules for a UM-enabled user

This example enables Call Answering Rules for the user tony@contoso.com.

```
Set-UMMailbox -Identity tony@contoso.com -
CallAnsweringRulesEnabled $true
```

This example disables Call Answering Rules for the user tony@contoso.com.

```
Set-UMMailbox -Identity tony@contoso.com -
CallAnsweringRulesEnabled $false
```

Allow or prevent users in the same UM mailbox policy from creating call answering rules

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can allow users who are associated with a Unified Messaging (UM) mailbox policy to configure call answering rules, or prevent them from doing so. If the option to configure call answering rules is disabled on a UM dial plan, the Call Answering Rules feature won't be available to UM-enabled users associated with the UM mailbox policy. The default setting is enabled.

For additional management tasks related to allowing users to forward calls, see Forwarding calls procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to enable or disable call answering rules on a UM mailbox policy

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. Under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page, select or clear the check box next to **Allow users to configure call answering rules**.
4. Click **Save**.

Use the Shell to enable or disable call answering rules on a UM mailbox policy

This example allows users who are associated with the UM mailbox policy `MyUMMailboxPolicy` to create call answering rules.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowCallAnsweringRules $true
```

This example prevents users who are associated with the UM mailbox policy `MyUMMailboxPolicy` from creating call answering rules.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowCallAnsweringRules $false
```

Create a call answering rule

Set up client voice mail features > Allow voice mail users to forward calls > Forwarding calls procedures >

Topic Last Modified: *2013-05-07*

You can use the Shell to create one or more call answering rules for a user. You can also use the **New-UMCallAnsweringRule** cmdlet in an Exchange Management Shell script to create call answering rules for multiple users.

Call answering rules are applied to incoming calls similar to the way Inbox rules are applied to incoming email messages. By default, when a user is enabled for Unified Messaging (UM), no call answering rules are configured. Even so, incoming calls are answered by the mail system and callers are prompted to leave a voice message.

Note:
Users that are UM-enabled can sign in to Outlook Web App to create, manage, and remove call answering rules.

For additional management tasks related to Call Answering Rules, see Forwarding calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- You can only use the Shell to perform this procedure.To learn how to open the Shell in your on-premises Exchange organization, see Open the Shell.To learn how to use Windows PowerShell to connect to Exchange Online, see **Connect to Exchange Online using remote PowerShell**.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to create a call answering rule

This example creates the call answering rule `MyCallAnsweringRule` in the mailbox for Tony Smith with the priority of 2.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith
```

This example creates the call answering rule `MyCallAnsweringRule` in the mailbox for Tony Smith and performs the following actions:

- Sets the call answering rule to two caller IDs.
- Sets the priority of the call answering rule to 2.

- Sets the call answering rule to allow callers to interrupt the greeting.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -
CallerIds "1,4255550100,,","1,4255550123,," -Priority 2 -
CallersCanInterruptGreeting $true -Mailbox tonysmith
```

This example creates the call answering rule `MyCallAnsweringRule` in the mailbox for Tony Smith and performs the following actions:

Sets the priority of the call answering rule to 2.

Creates key mappings for the call answering rule.

If the caller reaches the voice mail for the user and the status of the user is set to Busy, the caller can:

- Press the 1 key and be transferred to a receptionist at extension 45678.
- Press the 2 key so the Find Me feature will be used for urgent issues, ring extension 23456 first, and then ring extension 45671.

```
New-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith -ScheduleStatus 0x4 - -KeyMappings
"1,1,Receptionist,,,,,45678,","5,2,Urgent
Issues,23456,23,45671,50,,"
```

View and manage a call answering rule

Set up client voice mail features > Allow voice mail users to forward calls > Forwarding calls procedures >

Topic Last Modified: *2013-05-07*

You can use the Shell to view or configure one or more call answering rules for a user. You can also use the **Get-UMCallAnsweringRule** or **Set-UMCallAnsweringRule** cmdlets in an Exchange Management Shell script to view or manage call answering rules for multiple users.

Call answering rules are applied to incoming calls similar to the way Inbox rules are applied to incoming email messages. By default, when a user is enabled for Unified Messaging (UM), no call answering rules are configured. Even so, incoming calls are answered by the mail system and callers are prompted to leave a voice message.

Important:
Users that are UM-enabled can sign in to Outlook Web App to create, manage, and remove call

answering rules.

For additional management tasks related to Call Answering Rules, see Forwarding calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- You can only use the Shell to perform this procedure.To learn how to open the Shell in your on-premises Exchange organization, see Open the Shell.To learn how to use Windows PowerShell to connect to Exchange Online, see **Connect to Exchange Online using remote PowerShell**.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the Shell to view a call answering rule

You can retrieve the properties for a single call answering rule or a list of call answering rules in a UM-enabled user's mailbox.

This example returns a formatted list of call answering rules in a user's UM-enabled mailbox.

```
Get-UMCallAnsweringRule-Mailbox tonysmith | Format-List
```

This example displays the properties of the call answering rule `MyUMCallAnsweringRule`.

```
Get-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
```

Use the Shell to configure a call answering rule

You can configure or change a call answering rule that's stored in a user's mailbox. You can specify

the following conditions:

- Who the incoming call is from
- Time of day
- Calendar free/busy status
- Whether automatic replies are turned on for email

You can also specify the following actions:

- Find me
- Transfer the caller to someone else
- Leave a voice message

This example sets the priority to 2 on the call answering rule `MyCallAnsweringRule` that exists in the mailbox for Tony Smith.

```
Set-UMCallAnsweringRule -Mailbox tonysmith -Name
MyCallAnsweringRule -Priority 2
```

This example performs the following actions on the call answering rule `MyCallAnsweringRule` in the mailbox for Tony Smith:

- Sets the call answering rule to two caller IDs.
- Sets the priority of the call answering rule to 2.
- Sets the call answering rule to allow callers to interrupt the greeting.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -
CallerIds "1,4255550100,,","1,4255550123,," -Priority 2 -
CallersCanInterruptGreeting $true -Mailbox tonysmith
```

This example changes the free/busy status to Away on the call answering rule `MyCallAnsweringRule` in the mailbox for Tony Smith and sets the priority to 2.

```
Set-UMCallAnsweringRule -Name MyCallAnsweringRule -Priority
2 -Mailbox tonysmith@contoso.com -ScheduleStatus 0x8
```

Enable or disable a call answering rule for a user

Set up client voice mail features > Allow voice mail users to forward calls > Forwarding calls procedures >

Topic Last Modified: *2013-05-07*

You can use the Shell to enable or disable one or more call answering rules for a user. You can also

use the **Enable-UMCallAnsweringRule** or **Disable-UMCallAnsweringRule** cmdlets in an Exchange Management Shell script to enable or disable one or more call answering rules for multiple users.

Call answering rules are applied to incoming calls similar to the way Inbox rules are applied to incoming email messages. By default, when a user is enabled for Unified Messaging (UM), no call answering rules are configured. Even so, incoming calls are answered by the mail system and callers are prompted to leave a voice message.

For additional management tasks related to call answering rules, see Forwarding calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- You can only use the Shell to perform this procedure.To learn how to open the Shell in your on-premises Exchange organization, see Open the Shell.To learn how to use Windows PowerShell to connect to Exchange Online, see **Connect to Exchange Online using remote PowerShell**.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the Shell to enable a call answering rule

When a call answering rule is created, it's enabled. You can use the Shell to enable a call answering rule that was previously disabled. Enabling a call answering rule enables the **Enable-UMCallAnsweringRule** cmdlet to retrieve the call answering rule, including the conditions and actions for a specified call answering rule.

This example enables the call answering rule `MyUMCallAnsweringRule` in the mailbox for Tony Smith.

```
Enable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
```

```
-Mailbox tonysmith
```

The example uses the *WhatIf* switch to test whether the call answering rule `MyUMCallAnsweringRule` in the mailbox for Tony Smith is ready to be enabled and if there are any errors within the command.

```
Enable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith -WhatIf
```

This example enables the call answering rule `MyUMCallAnsweringRule` in the mailbox for Tony Smith and prompts the signed-in user to confirm that the call answering rule is to be enabled.

```
Enable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith -Confirm
```

Use the Shell to disable a call answering rule

Disabling a call answering rule prevents it from being retrieved and processed when an incoming call is received. When you create a call answering rule, you should disable it while you're setting up conditions and actions. This prevents the call answering rule from being processed when an incoming call is received before you've correctly configured the call answering rule.

This example disables the call answering rule `MyUMCallAnsweringRule` in the mailbox for Tony Smith.

```
Disable -UMCallAnsweringRule -Identity
MyUMCallAnsweringRule -Mailbox tonysmith
```

This example uses the *WhatIf* switch to test whether the call answering rule `MyUMCallAnsweringRule` in the mailbox for Tony Smith is ready to be disabled and if there are any errors within the command.

```
Disable -UMCallAnsweringRule -Identity
MyUMCallAnsweringRule -Mailbox tonysmith -WhatIf
```

This example disables the call answering rule `MyUMCallAnsweringRule` in the mailbox for Tony Smith and prompts the signed-in user to confirm that they're disabling the call answering rule.

```
Disable-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith -Confirm
```

Remove a call answering rule for a user

Set up client voice mail features > Allow voice mail users to forward calls > Forwarding calls procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-05-07*

You can use the Shell to remove one or more call answering rules for a user. You can also use the **Remove-UMCallAnsweringRule** cmdlet in an Exchange Management Shell script to remove one or more call answering rules for multiple users.

Call answering rules are applied to incoming calls similar to the way Inbox rules are applied to incoming email messages. By default, when a user is enabled for Unified Messaging (UM), no call answering rules are configured. Even so, incoming calls are answered by the mail system and callers are prompted to leave a voice message.

Note:

Users that are UM-enabled can sign in to Outlook Web App to create, manage, and remove call answering rules.

For additional management tasks related to Call Answering Rules, see Forwarding calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM call answering rules" entry in the Unified Messaging permissions topic.
- Before you perform this procedure, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform this procedure, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- You can only use the Shell to perform this procedure.To learn how to open the Shell in your on-premises Exchange organization, see Open the Shell.To learn how to use Windows PowerShell to connect to Exchange Online, see **Connect to Exchange Online using remote PowerShell**.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Use the Shell to remove a call answering rule

This example removes the call answering rule `MyUMCallAnsweringRule` from a user's mailbox. The user's mailbox is the mailbox of the user running the cmdlet.

```
Remove-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
```

This example removes the call answering rule `MyUMCallAnsweringRule` from the mailbox of Tony Smith.

```
Remove-UMCallAnsweringRule -Identity MyUMCallAnsweringRule
-Mailbox tonysmith
```

Allow users to make calls

Exchange Server 2013 > Unified Messaging > Set up client voice mail features >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-29*

Outdialing is the process by which users call in to a UM dial plan using an Outlook Voice Access number and place or transfer a call to an internal or external telephone number. Unified Messaging uses many outdialing settings to dial calls for users. To configure outdialing, you must configure dialing rules, dialing rule groups, and dialing authorizations on Unified Messaging (UM) dial plans and then authorize outdialing on UM dial plans, UM mailbox policies, and auto attendants. You can also configure UM dial plans to have dialing or access codes, a national number prefix, and in-country/region or international number formats that enable you to control outdialing in your organization. This topic discusses dialing rules, dialing rule groups, and dialing authorizations and how they are used to authorize and control outdialing for your organization.

Contents

Overview

Outdialing happens when:

- A call is placed to an external telephone number.
- A call is transferred to an auto attendant.
- A call is transferred to a user in your organization.

- A UM-enabled user uses the Play on Phone feature.

For outdialing to work correctly, the following settings must be configured correctly:

- **Dialing rules** Dialing rules define the number that is dialed by the UM-enabled user and the number that will be dialed by the Private Branch eXchange (PBX) or IP PBX.
- **Dialing rule groups** Dialing rule groups determine the types of calls that users within a dialing group can make.
- **Dialing authorizations** Dialing authorizations determine the restrictions that will be applied to prevent users from incurring unnecessary telephone charges or from dialing long-distance calls.

To enable outdialing for users who call in to a dial plan or an auto attendant, you must:

- Make sure the VoIP gateways represented by a UM IP gateway that is linked with a dial plan will allow outgoing calls.
- Create dialing rule groups by creating dialing rules on the UM dial plan.
- Add dialing authorizations for in-country/region and international dialing rule groups on the UM dial plan, UM mailbox policy, or auto attendant associated with the same dial plan as the UM IP gateway.

Types of users

Two types of users can use the outdialing feature in Unified Messaging: authenticated and unauthenticated. All users who call in to a UM auto attendant are unauthenticated. When users call in to an Outlook Voice Access number, they're considered unauthenticated because they haven't provided their extension number and PIN and signed in to their mailbox. Users are authenticated after they provide their extension number and PIN and successfully sign in to their mailbox.

When users call in to an Outlook Voice Access number configured on a UM dial plan and try to place or transfer a call without signing in to their mailbox, only the UM dial plan outdialing settings are applied to the call. When anonymous or unauthenticated users call in to a UM auto attendant, both the outdialing settings configured on the auto attendant and the outdialing settings configured on the dial plan associated with the auto attendant are applied to the call.

When users call in to the Outlook Voice Access number configured on a dial plan and successfully sign in to their mailbox, they become authenticated users. When they're authenticated, the outdialing call settings use the dialing rules and dialing authorization settings on the UM mailbox policy that's linked to those users.

Return to top

Outdialing settings

You need to configure several settings to apply outdialing rules for your organization. In addition to configuring the UM dial plans, UM auto attendants, and UM mailbox policies that you've created with the correct dialing rules and dialing authorizations, you need to configure access codes, number prefixes, and number formats on the UM dial plans. The following outdialing settings are

configured on dial plans, auto attendants, and UM mailbox policies:

- Outside line, country/region, and international access codes
- National number prefixes
- In-country/region and international number formats
- Configured in-country/region and international dialing rule groups
- Allowed in-country/region and international dialing rule groups
- Dialing rule entries
- Dialing authorizations

For you to successfully configure outdialing for your organization, you first need to understand how each component can be used with outdialing and how the component must be configured. The following table introduces each component that needs to be configured on UM dial plans, UM auto attendants, and UM mailbox policies before outdialing will work correctly.

Outdialing components

Component	Description
Dial codes, number prefixes, and number formats	UM uses dial codes, number prefixes, and number formats to determine the correct number to dial when placing an outgoing call. You can configure dial codes, number prefixes, and number formats to restrict outgoing calls for users who dial in to a UM auto attendant associated with a UM dial plan or for users who dial in to an Outlook Voice Access number configured on the dial plan.
Dialing rule groups	Dialing rule groups are created to enable telephone numbers to be modified before they're sent to the PBX for outgoing calls. Dialing rule groups remove numbers from or add numbers to telephone numbers being called by UM. For example, you can create a dialing rule group that automatically adds a 9 as a prefix to a 7-digit telephone number to provide access to an outside line. In this example, users who place outgoing calls don't have to dial the 9 before the telephone number to reach someone external to the organization.

	Each dialing rule group contains dialing rules that determine the types of in-country/region and international calls that users within a dialing rule group can make. Dialing rule groups apply to the users who are associated with a UM dial plan or to UM auto attendants and UM mailbox policies associated with the UM dial plan. Each dialing rule group must contain at least one dialing rule.
Dialing rule entries	A dialing rule is used to determine the types of calls that users within a dialing rule group can make. When you create a dialing rule group, you configure one or more dialing rules. When you configure each dialing rule, you must enter the dialing rule name, number pattern to transform (*number mask*), and dialed number. You can also enter a comment. Comments can be used to describe how the dialing rule will be used or to describe a group of users to whom the dialing rule will apply. When you add a number mask and the dialed number to a dialing rule, you can substitute the letter x for a digit in a telephone number, for example, 91425xxxxxxx. You can also use an asterisk (*) symbol as a wildcard character, for example, 91425*.
Dialing authorizations	A dialing authorization uses dialing rule groups to apply dialing restrictions for users who are associated with a specific UM mailbox policy, dial plan, or auto attendant. They can also be used when you want to let users place calls to in-country/region or international telephone

	numbers. After you create dialing rules on a UM dial plan, you add the dialing rule group to a UM mailbox policy, dial plan, or auto attendant. After the dialing rule group is added to a UM mailbox policy, all settings or rules defined will apply to UM-enabled users who are linked with the UM mailbox policy.

Return to top

Configuring outdialing

A dialing rule group is a collection of one or more dialing rules configured on a UM dial plan. Two types of dialing rule groups can be configured on a UM dial plan: in-country/region and international. In-country/region dialing rule groups apply to telephone numbers dialed within the same country or region. International dialing rule groups apply to international telephone numbers dialed from one country or region to another country or region.

Each UM dial plan can contain one or more dialing rule groups. To apply a dialing rule group to a set of users, after you create the dialing rule group, you must add it to the list of allowed dialing rule groups on the UM dial plan and on the UM auto attendants and UM mailbox policies associated with the UM dial plan.

Dialing rule groups enable you to specify dialing rules that you want to apply to a group of UM-enabled users who fall into a specific category. For example, you can use dialing rule groups to specify which group of users can place international calls and which group can make only in-state or local calls. You can create a dialing rule group using the Exchange Administration Center (EAC) or the **Set-UMDialPlan** cmdlet in the Exchange Management Shell. When you create a dialing rule group, you must define at least one dialing rule for the group.

When a user dials a telephone number, UM takes the number and looks for a match in the dialing rules. If a match is found, UM uses the dialing rule to determine the number to dial by looking at the telephone number or digits listed in the **Dialed Number** section of the dialing rule. The number listed in the **Dialed Number** box of the dialing rule will be dialed.

The following table shows an example of dialing rule groups and dialing rules. In this example, Local-Calls-Only and Low-Rate are the dialing rule groups that have been created. The dialing rule group Local-Calls-Only has two dialing rules: 91425* and 91206*, and the dialing rule group Low-Rate also has two dialing rules: 91509* and 91360*.

Dialing rule groups and dialing rules

Name	NumberMask	DialedNumber	Comment
Local-Calls-Only	91425*	91*	Local calls
Local-Calls-Only	91206*	91*	Local calls
Low-Rate	91509*	9*	In-state calls
Low-Rate	91360*	9*	In-state calls

For example, when a user dials 9-1-425-555-1234, UM dials 4255551234. UM removes any nonnumeric characters (in this example, the hyphens) and applies the number mask from the dialing rule. In this example, UM applies the number mask 91*. This tells UM not to dial the 9 or the 1, but to dial all the other numbers in the telephone number that appear to the right of the number 1. This includes all the numbers represented by the asterisk (*).

You can use the EAC or the Shell to create and configure single or multiple in-country/region and international dialing rule groups and dialing rules. However, if you're creating many or complex dialing rule groups and dialing rules, you can use a comma-separated value (.csv) file in the Shell. You can import or export a list of dialing rule groups and dialing rules.

To import a list of dialing rule groups and dialing rules that you've defined in a .csv file, run the **Set-UMDialPlan** cmdlet, as follows.

```
Set-UMDialPlan "MyUMDialPlan" -
ConfiguredInCountryOrRegionGroups $(IMPORT-CSV c:\dialrules
\InCountryRegion.csv)
```

To retrieve a list of the dialing rule groups configured on a UM dial plan, run the **Get-UMDialPlan** cmdlet, as follows.

```
(Get-UMDialPlan -id
"MyUMDialPlan").ConfiguredInCountryOrRegionGroups | EXPORT-
CSV C:\incountryorregion.csv
```

The .csv file must be created and saved in the correct format. Each line in the .csv file represents one dialing rule. However, each dialing rule is configured on the same dialing rule group. Each rule in the file will have four sections separated by commas. These sections are name, number mask, dialed number, and comment. Each section is required, and you must enter the correct information in each section except for the comment section. There should be no spaces between the text entry and the comma for the next section, nor should there be any blank lines between the rules or at the end. The following is an example of a .csv file that can be used to create in-country/region dialing rule groups and dialing rules.

Name,NumberMask,DialedNumber,Comment

Low-rate,91425xxxxxxx,9xxxxxxx,Local call

Low-rate,9425xxxxxxx,9xxxxxxx,Local call

Low-rate,9xxxxxxx,9xxxxxxx,Local call

Any,91*,91*,Open access to in-country/region numbers

Long-distance,91408*,91408*,long distance

The following is an example of a .csv file that can be used to create international dialing rule groups and dialing rule entries.

Name,NumberMask,DialedNumber,Comment

International, 901144*, 901144*, international call

International, 901133*, 901133*, international call

Return to top

Applying configured dialing rule groups

Dialing rule groups are created on a UM dial plan. You can create in-country/region or international dialing rule groups using the EAC or the **Set-UMDialPlan** cmdlet in the Shell. After you create the appropriate dialing rule groups on a UM dial plan and define the dialing rules, you can apply the dialing rule groups that you created to a UM dial plan, a UM auto attendant, or to users who are associated with a UM mailbox policy, and authorize outdialing depending on how the user accesses the voice mail system.

You can apply the dialing rule groups that you created on a UM dial plan to the following:

- **Same dial plan** The settings will apply to all users who call in to an Outlook Voice Access number but don't sign in to their mailbox. To apply an in-country/region dialing rule group named `MyAllowedDialRuleGroup` to the same dial plan, use the Shell **Set-UMDialPlan** cmdlet, as follows.

```
Set-UMDialPlan -Identity MyUMDialPlan -
AllowedInCountryOrRegionGroups MyAllowedDialRuleGroup
```

- **Single or multiple UM mailbox policies** The settings that are configured on a UM mailbox policy will apply to all users who are linked with that UM mailbox policy. The settings configured on a UM mailbox policy apply to users who call in to an Outlook Voice Access number and sign in to their mailbox. To apply an in-country/region dialing rule group named `MyAllowedDialRuleGroup` to a single UM mailbox policy, use the **Dialing authorization** page on the UM mailbox policy in the EAC or use the **Set-UMMailboxPolicy** cmdlet in the Shell, as follows.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
AllowedInCountryOrRegionGroups MyAllowedDialRuleGroup
```

- **Single or multiple auto attendants associated with the UM dial plan** This will apply to all users who call in to a UM auto attendant. To apply the in-country/region dialing rule group

named `MyAllowedDialRuleGroup` to a single UM auto attendant, use the **Dialing authorization** page on the auto attendant in the EAC or the **Set-UMAutoAttendant** cmdlet in the Shell, as follows.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
AllowedInCountryOrRegionGroups MyAllowedDialRuleGroup
```

The following table summarizes the way that dialing rule groups are applied in Unified Messaging.

Applying outdialing rules

Caller type	Scope	Outdialing settings applied
Outlook Voice Access number	User calls a dial plan Outlook Voice Access number and signs in to the mailbox	UM mailbox policy
Anonymous caller	User calls a dial plan Outlook Voice Access number	UM dial plan
Anonymous caller	User calls an auto attendant pilot or extension number	UM auto attendant
Caller from inside the organization	User calls the Play on Phone number	UM mailbox policy

Return to top

Applying dialing rules

The outdialing process happens when:

- Unified Messaging places a call to an external telephone number for a caller.
- Unified Messaging transfers a call to an auto attendant.
- Unified Messaging transfers a call to a user in your organization.
- A UM-enabled user uses the Play on Phone feature.

In each outdialing scenario, UM will apply the dialing rules that have been configured, and then place the call for the user. However, depending on the scenario and how the call is initiated by the user, UM may apply only some of the dialing rules to the telephone number being dialed. In other outdialing scenarios, UM may apply all the outdialing rules configured to the telephone number being dialed.

Return to top

Dial codes, number prefixes, and number formats

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-11-18*

You can configure several dialing codes that Unified Messaging (UM) uses to dial internal and external calls for UM-enabled users. Frequently, you want to configure a dial plan together with the dialing or access codes, a national number prefix, or in-country/region or international number formats so that you can control outdialing for users in your organization. This topic discusses dial codes, number prefixes, and number formats and how you can use them to control outdialing for your organization.

Contents

Overview

Outdialing is the process in which users call in to a UM dial plan or UM auto attendant and then place a call to an internal or external telephone number. When a user calls in to a UM dial plan or a UM auto attendant and then places a call, Unified Messaging uses the settings configured on the dial plan, auto attendant, and UM mailbox policies to place the call. UM places an outgoing call in the following situations:

- When it places a call to an external telephone number for a caller
- When it transfers a call to an auto attendant
- When it transfers a call to a user (either UM-enabled or not) in your organization
- When a UM-enabled user uses the Play on Phone feature

Two types of users use outdialing: authenticated users and unauthenticated users. Unauthenticated users call in to an Outlook Voice Access number configured on a UM dial plan but don't sign in to their mailbox. Unauthenticated users also call in to a number configured on a UM auto attendant. Authenticated users call in to an Outlook Voice Access number and successfully sign in to their

mailbox. When users call in to an Outlook Voice Access number, they are initially considered unauthenticated because they haven't provided their extension number and PIN and signed in to their mailbox. They are authenticated after they provide their extension number and PIN and successfully sign in to their mailbox.

When an unauthenticated user calls in to a UM auto attendant and places a call using outdialing, the outdialing settings configured on the UM dial plan and the auto attendant are used. When an unauthenticated user calls in to an Outlook Voice Access number configured on a dial plan, only the settings configured on the dial plan are used. When a user has successfully signed in to their mailbox, configuration settings from the dial plan and the UM mailbox policy associated with the authenticated user are applied to the authenticated user.

You need to configure several settings to control outdialing for your organization. To control outdialing, you need to configure the UM dial plans, auto attendants, and UM mailbox policies in Unified Messaging. The following settings can be configured on UM dial plans, auto attendants, and UM mailbox policies to control outdialing:

- Outside line, in-country/region, and international access codes
- National number prefixes
- In-country/region and international number formats
- In-country/region and international dialing rule groups
- Allowed in-country/region and international dialing rule groups
- Dialing rule entries

You configure access codes, number prefixes, and number formats on a UM dial plan on the **Dial Codes** page in the Exchange admin center (EAC). You can also configure the settings using the **Set-UMDialPlan** cmdlet in the Exchange Management Shell. You can choose to configure all the settings, none of the settings, or only some of the settings. Each setting controls a specific part of the outdialing process.

UM uses access codes, number prefixes, and number formats to determine the correct number to dial. They can be configured to restrict outgoing calls for users who dial in to a UM auto attendant associated with a UM dial plan or who dial in to the Outlook Voice Access number configured on the dial plan.

For more information about outdialing in Unified Messaging, see Dial codes, number prefixes, and number formats.

Return to top

Outside line access code

You can configure an outside line access code, also known as a *trunk access code*, on each dial plan that you create. This is the number used to gain access to an outside telephone line. This number is also configured on the Private Branch eXchanges (PBXs) or IP PBXs in your organization. In most telephony networks, users dial the number 9 to gain access to an outside line and place a call to an external telephone number.

You should configure an outside line access code on each dial plan that you create. This dialing code will apply to all users who are linked with a UM mailbox policy that's linked with the UM dial plan. When a caller who's linked with the dial plan places a call and the dial plan dials the outgoing call, UM adds the outside line access code (usually 9) in front of the dialed number string so that the PBX or IP PBX can dial the number correctly. If you don't configure the outside line access code, the PBX or IP PBX may not recognize the number that's sent.. For example, as stated earlier, in many organizations, the access code that users dial to gain access to an outside line is 9, and this is configured on a PBX or IP PBX. Unified Messaging must add the outside line access code (9) before the telephone number string for the PBX or IP PBX to correctly dial the outgoing number. If you configure the dialing code so that Unified Messaging will add the outside line access code, Unified Messaging will be able to use the outside line access code to access an outside line before it dials the external telephone number string. The dialing code that you configure will apply to all users who are linked with a UM mailbox policy linked with the UM dial plan.

National number prefix

The national number prefix and the country/region code can also be configured on a UM dial plan. Unified Messaging uses the number you enter to dial the correct national number prefix or country/region code when a user dials an outgoing call destined within the same country/region or an international call. For example, when a user from North America places an outgoing international call to Europe, UM will add the national number prefix before the number string that it sends to the PBX or IP PBX to place the outgoing call. The number 1 is used as the national number prefix for North America.

In-Country/region access code

A country/region code can be configured on a UM dial plan. The country/region access code consists of the digits associated with a specific country or region. Unified Messaging uses the country/region access code to dial the correct telephone number when a call is placed to a telephone number from inside the same country or region. UM will add this number before the number string that it sends to the PBX or IP PBX when it places the outgoing call. For example, UM will add the number 1 to a call placed from the United States and destined for the United States. For the United Kingdom, the country/region code is 44.

International access code

An international access code can be configured on a UM dial plan. The international access code consists of the digits used to access international telephone numbers. Unified Messaging uses the international access code to dial the correct international access code when a call is placed from a telephone number within a country/region and the number being dialed is located in another country/region. UM will add this number before the number string that it sends to the PBX or IP PBX

when it places the outgoing call. For example, UM will use 011 as the international access code for the United States. For Europe, the international access code is 00.

Return to top

In-Country/region and international number formats

You can configure the incoming call configuration for country/region and international number formats on a UM dial plan. After you configure these settings, Unified Messaging will be able to recognize incoming calls from inside a country/region and internationally between UM dial plans within the same organization. You can also add number formats for incoming calls that are placed within a single dial plan. Configuring these options enables your organization to save money by preventing outgoing calls that shouldn't be made by users from inside your organization, and helps to prevent toll fraud. UM will use the information that you configure to examine the number format of the incoming call and verify that the number pattern matches before it accepts the call. For example, you may have multiple dial plans inside an organization. If you have one dial plan for the United States and another for the United Kingdom, you may want to let users in the United States dial plan have UM place calls to users who are located in the United Kingdom dial plan, but not let the users in the United States dial plan place calls directly to other countries/regions or internationally.

Allowing users to make calls procedures

Topic Last Modified: *2013-05-03*

Enable outgoing calls on UM IP gateways

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-13*

You can enable outgoing calls for a Unified Messaging (UM) IP gateway if outgoing calls have been disabled. When you select the **Allow outgoing calls through this UM IP gateway** option on the properties for the UM IP gateway, you configure the UM IP gateway to accept and send outgoing calls to a Voice over IP (VoIP) gateway, Private Branch eXchange (PBX) enabled for Session Initiation Protocol (SIP), IP PBX, or session border controller (SBC). Although the **Allow outgoing calls through this UM IP gateway** setting controls whether the UM IP gateway is able to initiate outgoing calls for users, it doesn't affect call transfers or incoming calls from a VoIP gateway, PBX enabled for SIP, IP PBX, or SBC.

Outdialing is the term used to describe a situation in which a user in one UM dial plan initiates a call to a UM-enabled user in another dial plan or to an external telephone number.

To allow outdialing for UM-enabled users, you must:

- Verify that the UM IP gateway allows outgoing calls.
- Create dialing rule groups by creating dialing rule entries on the UM dial plan associated with the UM IP gateway.
- Add the correct dialing rule groups to the list of dialing restrictions in **Dialing authorization** on the UM dial plan, auto attendant, or UM mailbox policy.

For additional management tasks related to UM IP gateways, see UM IP gateway procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM IP gateway has been created. For detailed steps, see Create a UM IP gateway.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable outgoing calls for a UM IP gateway

1. In the EAC, navigate to **Unified Messaging** > **UM IP Gateways**, select the UM IP gateway you want to change, and then click **Edit** .
2. On the **UM IP Gateway** page, select the check box next to **Allow outgoing calls through this UM IP gateway**.
3. Click **Save**.

Use the Shell to enable outgoing calls for a UM IP gateway

This example enables outgoing calls on a UM IP gateway named `MyUMIPGateway`.

```
Set-UMIPGateway -Identity MyUMIPGateway -OutcallsAllowed
$true
```

Disable outgoing calls on UM IP gateways

Set up client voice mail features > Allow users to make calls > Allowing users to make calls procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-13*

You can enable or disable outgoing calls for a Unified Messaging (UM) IP gateway. When you clear the **Allow outgoing calls through this UM IP gateway** option on the properties for the UM IP gateway, you configure the UM IP gateway to not accept and send outgoing calls to a Voice over IP (VoIP) gateway, IP PBX, or session border controller (SBC). Although the **Allow outgoing calls through this UM IP gateway** setting controls whether the UM IP gateway is able to initiate outgoing calls for users, it doesn't affect call transfers or incoming calls from a VoIP gateway, IP PBX, or SBC.

For additional management tasks related to UM IP gateways, see UM IP gateway procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM IP gateway has been created. For detailed steps, see Create a UM IP gateway.

$false
```

Configure dial codes

Set up client voice mail features > Allow users to make calls > Allowing users to make calls procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure dial codes, number prefixes, and number formats that are used by Unified Messaging to dial incoming and outgoing calls for users who are enabled for UM. In most cases, you'll configure a dial plan with the dial codes, prefixes, and number formats currently configured on your telephony network.

Dial codes and number prefixes are used to determine the correct number to dial for an outgoing call that's placed by a UM-enabled user. *Outdialing* is the term used to describe the process by which a user in a UM dial plan initiates an outgoing call. Number formats are used for incoming calls within a country or region, international calls, or calls that are placed within a dial plan. You can configure a dial plan to match the incoming call number format for both in-country/region and international numbers. When you configure the in-country/region and international number formats, you can restrict incoming calls for users linked with a dial plan.

For additional management tasks related to outdialing, see Allowing users to make calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure dial codes, prefixes, and number formats

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. Select the UM dial plan you want to manage, and then click **Edit** .
3. On the **UM Dial Plan** page, click **Configure**.
4. On the **UM dial plan** page > **Dial codes**, configure the following options:
   - **Outside line access code**
   - **International access code**

- **National number prefix**
- **Country/Region code**

5. Under **Number formats for dialing between dial plans**, configure the following:
   - **Country/Region number format**
   - **International number format**
   - **Number formats for incoming calls within the same dial plan** To add a number format, click **Add +**.
6. Click **Save** to save your changes.

Use the Shell to configure dial codes, prefixes, and number formats

This example configures a UM dial plan named `MyUMDialPlan` with an in-country or region number format, an international number format, and the following dial codes:

- 9 for the outside line access code
- 011 for the international access code
- 1 for the national number prefix
- 1 for the country or region code

```
Set-UMDialPlan -Identity MyUMDialPlan -
OutsideLineAccessCode 9 -InternationalAccessCode 011 -
NationalNumberPrefix 1 CountryorRegionCode 1 -
InCountryOrRegionNumberFormat 1425xxxxxxx -
InternationalNumberFormat 441425xxxxxxx
```

Create dialing rules for users

Set up client voice mail features > Allow users to make calls > Allowing users to make calls procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Dialing rule groups consist of dialing rule entries. Dialing rules are used to modify a phone number before sending it to an on-premises telephone system (PBX) or IP PBX for outgoing calls. Dialing rules serve two purposes:

- They specify the numbers that can be dialed for outgoing calls. When you create a dialing rule, you specify the number formats that can be dialed. Any number that doesn't match one of the formats you specified is rejected. If you don't set any dialing rules, callers can place calls within your organization but can't make any outgoing calls.

- They transform the numbers dialed before sending them out to your on-premises telephone system. Dialing rules can strip numbers from or add numbers to the number dialed. For example, you can use dialing rules to add the outside line access code for your telephone system or to add or remove the in-country/region code for long-distance or local numbers.

To specify the types of outgoing calls you want to allow for a UM dial plan, you create a dialing rule group with dialing rules and then use them to authorize outgoing calls for Outlook Voice Access users and callers that dial into a UM auto attendant. You create separate dialing rule groups for in-country/region and for international calls.

Note:

If you are integrating UM with Microsoft Lync Server, we recommend that you create at least one dialing rule group and authorize that dialing rule group on the SIP URI dial plans, UM mailbox policies, and UM auto attendants to allow all outgoing calls to be forwarded to Lync Servers.

For other management tasks for outdialing, see Allowing users to make calls procedures.

Examples of commonly used dialing rules

Number pattern	Dialed number	When would you use this dialing rule?
*	*	Allow all outgoing calls.
1425xxxxxxx	91425xxxxxxx	Prevent users from getting an internal extension or an error when they forget to dial the outside access line number.
1xxxxxxxxxx	1xxxxxxxxxx	Allow all numbers that start with 1.
xxxxxxx	1425xxxxxxx	Add 1 and the local area code 425 to 7-digit numbers.

What do you need to know before you begin?

- Estimated time to complete: Less than 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed

steps, see Create a UM dial plan.

- If you will be applying dialing rule groups to UM mailbox policies, you will need to confirm that a UM mailbox policy is created. For detailed steps, see Create a UM mailbox policy.
- If you will be applying dialing rule groups to UM auto attendants, you will need to confirm that a UM auto attendant is created. For detailed steps, see Create a UM auto attendant.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Use the EAC to create a dialing rule

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, click **Configure**.
3. On the **UM Dial Plan** page > **Dialing rules**, click **Add +** under **In-country/region dialing rules** or **International dialing rules**.
4. On the **New Dialing Rule** page, enter the following information:
   - **Dialing rule name** Enter the name of the dialing rule group you want this rule to be a part of. To combine it with other rules, use the same group name. To create a new dialing rule group, enter a new unique name.
   - **Number pattern to transform (number mask)** Enter the number pattern to transform before dialing, for example, 91425xxxxxxx. If a caller dials a number that matches, UM transforms it to the dialed number before placing the call. Enter only numbers and the wildcard (x). The number pattern is also called a *number mask*.
   - **Dialed number** Enter the number to dial. Use only numbers and the wildcard (x), as in the number pattern 9xxxxxxx. Wildcards (x) are substituted with the digits from the original number dialed by the user. Make sure the number of wildcards in the dialed number is the same as the number of wildcards in the number pattern.
   - **Comment** Enter a comment or description for this dialing rule. You can use the comment to describe what the rule does, for example, "Add a 9 to outgoing calls."
5. Click **OK** to save the dialing rule. You can continue to enter rules, using the same dialing rule group name for rules that you want to authorize together.

Authorize calls using dialing rules

Set up client voice mail features > Allow users to make calls > Allowing users to make calls procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

By default, users aren't able to place outgoing calls. To specify the kinds of calls users can make, you first create dialing rules, then authorize groups of these dialing rules on UM dial plans, UM mailbox policies, or UM auto attendants. Before you can authorize dialing rule groups, you have to define dialing rules on a UM dial plan. For details, see Create dialing rules for users.

Each dialing rule that you create will contain the types of calls or number patterns that you want to give users access to. You can allow different types of users to make different types of calls. The calls you allow can be within a country or region, or they can be international.

To authorize or restrict dialing, the following settings must be configured correctly:

- **Dialing rules** Dialing rules define the number that UM-enabled users dial and the number that will be sent from Unified Messaging and dialed by the Private Branch eXchange (PBX) or IP PBX. You create a dialing rule group by adding a dialing rule. After you create a dialing rule group, you add it to the list of authorized calls for an in-country/region or international dialing rule group.
- **Dialing rule groups** Dialing rule groups determine the types of calls that users within the dialing group can make.
- **Dialing authorizations** Dialing authorizations are used to determine the restrictions that will be applied to prevent users from incurring unnecessary telephone charges or from dialing long-distance calls.

How do I authorize a dialing rule group?

Where you authorize dialing rule groups depends on the types of callers that you want to allow to make outgoing calls. For example, if you want only Outlook Voice Access users to place outgoing calls, you would create your dialing rules and then authorize those dialing rule groups to the UM mailbox policy that the Outlook Voice Access users are linked to. The following table shows how to authorize calls for different types of callers.

Type of caller	Authorize dialing rule groups here
Unauthenticated callers who call in to an Outlook Voice Access number and don't enter a PIN	UM dial plan. For details, see Authorize calls for users in a dial plan.
Authenticated callers who call in to an Outlook Voice Access number and enter a PIN	UM mailbox policy for the caller. For details, see Authorize calls for a group of users.
Unauthenticated callers who call in to a telephone number	UM auto attendant. For details, see Authorize calls for auto

that's configured on a UM auto attendant	attendant callers.	

Depending on which users you're authorizing to make outbound calls, you'll use the **Dialing authorization** page in the Exchange admin center (EAC) for the dial plan, the auto attendant, or the UM mailbox policy.

Authorize calls for auto attendant callers

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

You can enable dialing authorizations on a Unified Messaging (UM) auto attendant. Dialing authorizations on an auto attendant are used to prohibit users who call in to the auto attendant from making in-country/region or international telephone calls, or *outdialing*. Outdialing happens when Unified Messaging makes an outgoing call for a user after they've called into a phone number that is configured on a UM auto attendant.

For additional management tasks related to outdialing, see Allowing users to make calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM auto attendants" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM auto attendant has been created. For detailed steps, see Create a UM auto attendant.
- Before you perform these procedures, confirm that in-country/region and international dialing rules have been created on a UM dial plan. For detailed steps, see Create dialing rules for users.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable dialing authorizations on a UM auto attendant for in-country/region rule groups

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** ✎.
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to create a dialing authorization, and then click **Edit** ✎.
3. On the **UM Auto Attendant** page > **Dialing authorization**, click **Add +** under **Authorized in-country/region dialing rule groups**.
4. On the **Select Dialing Rule Groups to Allow** page, select the dialing rule group, click **OK**, and then click **Save**.

Use the EAC to enable dialing authorizations on a UM auto attendant for international rule groups

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** ✎.
2. On the **UM Dial Plan** page, under **UM Auto Attendants**, select the UM auto attendant for which you want to create a dialing authorization, and then click **Edit** ✎.
3. On the **UM Auto Attendant** page > **Dialing authorization**, click **Add +** under **Authorized international dialing rule groups**.
4. On the **Select Dialing Rule Groups to Allow** page, select the dialing rule group, click **OK**, and then click **Save**.

Use the Shell to enable in-country/region and international dialing authorizations on a UM auto attendant

This example enables the InCountry/RegionGroup1, InCountry/RegionGroup2. InternationalGroup1, and InternationalGroup2 dialing authorizations on a UM auto attendant named `MyUMAutoAttendant`.

```
Set-UMAutoAttendant -Identity MyUMAutoAttendant -
AllowedInCountryOrRegionGroups InCountry/
RegionGroup1,InCountry/RegionGroup2 -
AllowedInternationalGroups
```

InternationalGroup1,InternationalGroup2

Authorize calls for users in a dial plan

Allow users to make calls > Allowing users to make calls procedures > Authorize calls using dialing rules >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

You can enable dialing authorizations on a Unified Messaging (UM) dial plan. Dialing authorizations on a dial plan are used to prohibit unauthenticated Outlook Voice Access users from making in-country/region or international telephone calls, or *outdialing*. Outdialing happens when Unified Messaging places an outgoing call for a user after they've called in to an Outlook Voice Access phone number that is configured on a UM dial plan. When you configure a setting on a UM dial plan, that setting applies to all unauthenticated users that call in to an Outlook Voice Access number.

For additional management tasks related to outdialing, see Allowing users to make calls procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform this procedure, confirm that in-country/region and international dialing rules have been created on a UM dial plan. For detailed steps, see Create dialing rules for users.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to enable dialing authorizations on a UM mailbox policy for in-country/region dialing rule groups

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy for which you want to create a dialing authorization, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Dialing authorization**, click **Add +** under **Authorized in-country/region dialing rule groups**.
4. On the **Select Dialing Rule Groups to Allow** page, select the dialing rule group, click **OK**, and then click **Save**.

Use the EAC to enable dialing authorizations on a UM mailbox policy for international dialing rule groups

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy for which you want to create a dialing authorization, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Dialing authorization**, click **Add +** under **Authorized international dialing rule groups**.
4. On the **Select Dialing Rule Groups to Allow** page, select the dialing rule group, click **OK**, and then click **Save**.

Use the Shell to enable in-country/region and international dialing authorizations on a UM mailbox policy

This example enables the InCountry/RegionGroup1, InCountry/RegionGroup2, InternationalGroup1, and InternationalGroup2 dialing authorizations on a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
AllowedInCountryOrRegionGroups InCountry/
RegionGroup1,InCountry/RegionGroup2 -
AllowedInternationalGroups
InternationalGroup1,InternationalGroup2
```

Allow users to see a voice mail transcript

Exchange Server 2013 > Unified Messaging > Set up client voice mail features >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-23*

Voice Mail Preview is a feature that's available to users who receive their voice mail messages from Unified Messaging (UM). Voice Mail Preview enhances the existing UM voice mail functionality by providing a text version of audio recordings. The voice mail text is displayed in email messages within Microsoft Outlook Web App, Outlook 2010 and later versions, and in other supported email programs. For more information, see Microsoft Speech Technologies.

Do users need to use a specific email program?

No. Voice Mail Preview is included in the message body text of any email program, including mobile programs. Although users can use other email programs to receive voice messages, Outlook and Outlook Web App provide a better experience. For example, in Outlook 2010 and later versions, when a specific word is clicked in the Voice Mail Preview text, the audio playback of the voice message will start to play at that word. This is useful for listening to a specific part of a voice message.

Can users search for specific voice mail messages?

Yes. Words and phrases in the Voice Mail Preview text are automatically indexed, so voice messages will appear in search results. In Outlook 2010 and later versions or in Outlook Web App, users can also use the **Audio Notes** box to add text about a voice message. These notes are also included in searches, to make it easier to locate a message.

Why is this feature called “Voice Mail Preview”?

It’s important to set users’ expectations correctly. Voice Mail Preview doesn't necessarily produce text that’s the same as what callers say in their voice messages. In fact, it's usually inaccurate in some way. To call it transcription would suggest a more perfect result than can generally be achieved. Preview suggests that the reader should be able to understand the gist of the voice content, which is closer to the real capability of the feature.

What makes the Voice Mail Preview text more or less accurate?

The accuracy of the Voice Mail Preview text depends by many factors and sometimes those factors can't be controlled. However, Voice Mail Preview text is likely to be more accurate when:

- The caller leaves a simple voice message that doesn't include slang terms, technical jargon, or unusual words or phrases.
- The caller uses a language that's easily recognized and translated by the voice mail system. Generally, voice messages left by callers who don't speak too quickly or too softly and who don't have strong accents will produce more accurate sentences and phrases.
- The voice message is free of background noise, echo, and the audio doesn't drop out.

Which languages can be used with Voice Mail Preview?

Voice Mail Preview text is available in the following languages:

- English (US) (en-US)
- English (Canada) (en-CA)
- French (France) (fr-FR)
- Italian (it-IT)
- Polish (pl-PL)
- Portuguese (Portugal) (pt-PT)
- Spanish (Spain) (es-ES)

If you have an on-premises or hybrid deployment of UM, you can download the UM language packs from the Microsoft Download Center.

If you have an on-premises or hybrid deployment, after you install a UM language pack, the dial plans and auto attendants can be configured to use the language you've chosen. For online customers, you don't have to install any UM language packs. Many companies have only one UM dial plan. UM will try to create a voice mail preview in the default dial plan language, but will only be successful if the default language supports Voice Mail Preview. A UM dial plan can only be configured to create voice mail previews in one language at a time.

To configure UM to provide voice mail previews in a language other than en-US, follow these steps:

1. Verify that Voice Mail Preview is supported in the language you want to use.
2. If you have an on-premises or hybrid deployment, download and install the appropriate UM language pack. Downloading and installing the language pack doesn't configure the dial plan default language.
3. Configure the dial plan with the language that will be used for Voice Mail Preview. For more information, see Set the default language on a dial plan.

How Voice Mail Preview displays text in the supported languages depends on the type of voice message that's sent. There are two types:

- **Voice messages that are recorded when a user doesn't answer their phone**

For these messages, the language used for Voice Mail Preview is determined by the caller's spoken language and whether the language is supported. For example, if a caller leaves a voice message in Italian, the Voice Mail Preview text will appear in Italian if Italian has been configured on the dial plan. However, if a caller leaves a message in Japanese, no Voice Mail Preview text will be included with the message because Japanese isn't available.

- **Voice messages that are sent to by an Outlook Voice Access user**

For messages sent by an Outlook Voice Access user, the language that's used for Voice Mail Preview is controlled by the voice mail administrator. Thus, the Voice Mail Preview text will be in the same language as the voice mail system. However, if a caller speaking a language that's not supported for Voice Mail Preview uses Outlook Voice Access to leave a message, no Voice Mail Preview text will be included with the message. To learn more about Outlook Voice Access, see Setting up Outlook Voice Access.

Does UM know when a voice mail preview is inaccurate?

The confidence level is determined for each voice mail preview included with a voice message. The

voice mail system measures how well the sounds in the recording match the words, numbers, and phrases. If matches are found easily, the confidence level is high. A higher level of confidence is generally associated with a higher accuracy.

If the confidence level is determined to be lower than a certain value, the phrase **Voice Mail Preview (confidence is low)** is included above the Voice Mail Preview text. If the confidence level is low, it's likely that the Voice Mail Preview text will be inaccurate.

Unified Messaging uses Automatic Speech Recognition (ASR) to calculate its confidence in the preview, but it has no way to determine which words are wrong and which are correct.

However, UM does try to learn to improve accuracy of its voice mail previews. For example, it tries to match the caller's telephone number (if provided) with the user's personal Contacts and your organization's address book or contacts from social networks. If UM finds a match, it will include the name of the caller, along with its standard lists of names and words, when running ASR on the voice recording.

Can Voice Mail Preview be used if it isn't completely accurate?

Users may have a better experience with Voice Mail Preview if they don't try to read the preview too carefully, word by word. Instead, they should look for names, phone numbers, and phrases such as "Call me back" or "I need to talk" that may provide clues about the purpose of the call.

Voice Mail Preview isn't expected to dictate messages exactly, but it can help users answer questions such as the following:

- Is this voice message related to my work?
- Is this voice message important to me?
- Did the caller leave a number? Is it different from any numbers that I may have listed for them?
- Does the caller consider this voice message urgent?
- Should I step out of a meeting to call this person back?
- I was expecting a call to confirm my request. Is this the confirmation call?

Can Voice Mail Preview be turned on or off?

Yes. If you've enabled Voice Mail Preview, users can turn it on or off using Outlook 2010 or a later version or Outlook Web App. However, the dial plan language must support Voice Mail Preview and the UM language pack for that language must be installed.

Although Voice Mail Preview settings are the same whether a user is using Outlook 2010 or a later version or Outlook Web App, they'll access them differently:

Outlook Web App

To access the Voice Mail Preview settings in Outlook Web App, users click **Settings** > **phone** > **Voice mail**. On the **Voice mail** page, the settings are available under **voice mail preview**.

By default, both Voice Mail Preview options are available when a user is enabled for Unified Messaging. If the UM dial plan is configured to use a UM language pack that supports Voice Mail Preview, Unified Messaging will create voice mail previews for users when:

- A caller leaves a voice mail message because the user doesn't answer their phone.
- A UM-enabled user signs in to Outlook Voice Access and records a voice message for one or more recipients.

When a caller leaves a voice message, and **Include preview text with voice messages I receive** is selected, Unified Messaging will create a voice mail preview in the email message, attach the audio file, and send it to the recipient's mailbox. You may want to disable this option if the language that's configured on the dial plan doesn't include Voice Mail Preview support and you don't want voice mail previews included in voice mail messages.

When users sign in to Outlook Voice Access and they send a voice message to another user, they may want to clear the **Include preview text with voice messages I send through Outlook Voice Access** check box. For example, they might want to do this if they're sending voice messages in a language that Voice Mail Preview doesn't support or if they don't want to include the voice mail preview with the voice message because it's too long.

Voice Mail Preview advisor

Unified Messaging > Set up client voice mail features > Allow users to see a voice mail transcript >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Microsoft Exchange Unified Messaging (UM) includes a feature called Voice Mail Preview, which uses automatic speech recognition (ASR) to add a text version of the voice mail audio file to voice mail messages. ASR isn't entirely accurate, especially when it's used to record audio over a phone that contains unknown voices and noises. Some organizations require consistently error-free (or near-error-free) transcripts of voice messages. The Voice Mail Preview Partner program can help such organizations meet those requirements.

Voice Mail Preview uses Microsoft speech technologies to provide a text version of audio recordings. The voice mail text is displayed in email messages within Microsoft Outlook Web App, Outlook 2010 or later versions, and other email programs.

By default, when you enable a user for UM in an on-premises or hybrid deployment, voice mail previews will be sent if a supported UM language pack is installed. When you enable a user for UM in Exchange Online, all the UM language packs are installed. However, Voice Mail Preview isn't supported in all languages that are installed.

There are Voice Mail Preview partners that offer enhanced transcription support and services for the

Voice Mail Preview feature. These partners employ people to correct voice mail transcriptions that were created using ASR. Each Voice Mail Preview partner must meet a set of requirements to be certified to interoperate with Exchange UM.

If you determine that the voice mail previews sent to your users aren't accurate enough, you can contact one of the certified Voice Mail Preview partners listed at Microsoft Pinpoint and sign up with them at an additional cost.

Contents

Overview

When Unified Messaging records the audio for a voice message, it uses ASR to create voice mail preview text from the audio file, and then submits the whole voice message for delivery to the user. For each voice message that's created, Unified Messaging determines a confidence level for the voice mail preview included with the message. It measures how well the sounds in the recording match the words, numbers, and phrases in the message. If the system finds matches easily, the confidence level will be high. A higher level of confidence is generally associated with a higher accuracy.

The accuracy of voice mail preview text depends on many factors, and sometimes those factors can't be controlled. However, the text is likely to be more accurate when:

- A simple voice message is left, and the caller doesn't use slang terms, technical jargon, or unusual words or phrases.
- The caller uses a language that's easily recognized and translated by the voice mail system. Generally, voice messages left by callers who don't speak too quickly or too softly and who don't have strong accents will produce more accurate sentences and phrases.
- The voice message is free of background noise and echoes, and the audio doesn't drop out.

Most customers who use Unified Messaging find that the voice mail previews are accurate enough for their users. However, when ASR is applied to recordings made over the phone by unknown voices and background noises, the voice mail preview text usually isn't completely accurate. If the level of confidence is consistently low or the voice mail previews that are received aren't very accurate, you can increase the accuracy of the voice mail previews that users receive as follows:

- Sign up for a voice transcription service from a Voice Mail Preview partner.
- After you've signed up with a Voice Mail Preview partner, set the partner up to work with UM. For more information about how to configure UM for a Voice Mail Preview partner, see Configure Voice Mail Preview partner services for users.

When you've signed up with a Voice Mail Preview partner, the Exchange servers in your organization redirect voice messages with the audio file attached to the Voice Mail Preview partner instead of generating voice mail preview text for voice messages and submitting the voice messages to the user's mailbox. The email message with the voice mail preview text produced by the Voice Mail Preview partner is then submitted to the Exchange servers in your organization for delivery to the recipient's mailbox.

Important:
We recommend that all customers who plan to deploy Unified Messaging obtain the assistance of a UM specialist. A UM specialist helps you ensure that there's a smooth transition to UM from a legacy voice mail system. Performing a new deployment or upgrading a legacy voice mail system requires significant knowledge about VoIP gateways, IP PBXs, PBXs, session border controllers (SBCs), and Unified Messaging. For more information about how to contact a UM specialist, see the Microsoft Exchange Server 2013 Unified Messaging (UM) Specialists or Microsoft Pinpoint for Unified Messaging.

Exchange Unified Messaging Voice Mail Partner program

To become certified as a Voice Mail Preview partner that interoperates with Exchange UM, the partner must implement the requirements contained in the Voice Mail Preview Interoperability Specification, and the partner solution must be certified by an independent certification vendor. If you're interested in certifying your transcription service to work with Exchange UM, submit a request to Voice Mail Preview Partners for Exchange Unified Messaging.

Voice Mail Preview partners certified for Exchange Unified Messaging

If you've already deployed Unified Messaging in your organization and you're looking for a certified Voice Mail Preview partner to provide transcription support services, see Microsoft PinPoint. These software vendors have been certified as interoperable with Exchange UM.

Configuring Voice Mail Preview partners

After UM has been configured, it forwards voice messages with the audio to a dedicated Voice Mail Preview partner, which then takes the audio file and creates the voice mail preview text. However, to allow users to receive the voice mail preview with their voice message in their mailbox, you must configure a UM mailbox policy, associate users with the UM mailbox policy, and then have the users verify that they can receive voice mail previews in their voice messages in Outlook 2010 or a later version or Outlook Web App. For more information about how to configure UM for a Voice Mail

Preview partner, see Configure Voice Mail Preview partner services for users.

VoIP or media gateways and IP PBX support

Configuring VoIP gateways and IP PBXs for your organization is a difficult deployment task that must be completed correctly to successfully deploy Unified Messaging with a Voice Mail Preview partner. For information that can help you configure your VoIP gateways and IP PBXs, and for the most up-to-date information about how to configure them, see Telephony advisor for Exchange 2013 or Configuration notes for supported VoIP gateways, IP PBXs, and PBXs.

Testing interoperability of Exchange UM with VoIP gateways has been integrated with the Microsoft Unified Communications Open Interoperability Program. For more information, see Microsoft Unified Communications Open Interoperability Program.

You can configure a Voice Mail Preview partner on a Unified Messaging (UM) mailbox policy. After you've configured Voice Mail Preview partner settings, such as the Voice Mail Preview partner ID and Voice Mail Preview partner address, on a UM mailbox policy, the settings you configure will apply to all UM-enabled users who are linked with that mailbox policy.

Note:
You must use the Shell to configure a Voice Mail Preview partner.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

How do you do this?

Step 1: Sign up with a partner service

To find the list of certified partners and detailed instructions for how to sign up, see Voice Mail Preview advisor or see the Microsoft PinPoint website. After you've signed up, the Voice Mail Preview partner will provide you a partner ID and the SMTP address to use to forward the voice messages.

In Step 2, you'll apply the Partner ID and SMTP address you acquired in Step 1 to the required UM mailbox policies.

Step 2: Set the Voice Mail Preview partner address and ID

This example sets the Voice Mail Preview partner address to exumvmp@fabrikam.com and the Voice Mail Preview partner ID to CON123-2010 on a UM mailbox policy named *MyUMMailboxPolicy*.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
VoiceMailPreviewPartnerAddress exumvmp@fabrikam.com
-VoiceMailPreviewPartnerAssignedID CON123-2010
```

Step 3: Configure advanced Voice Mail Preview partner settings

If the partner requires custom settings, you may want to set two additional parameters for a Voice Mail Preview partner as follows:

- *VoiceMailPreviewPartnerMaxMessageDuration*
- *VoiceMailPreviewPartnerMaxDeliveryDelay*

This example sets the maximum message duration to 300 seconds (5 minutes) and the maximum delivery delay to 600 seconds (10 minutes) on a UM mailbox policy named *MyUMMailboxPolicy*.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
VoiceMailPreviewPartnerMaxMessageDuration 300 -
VoiceMailPreviewPartnerMaxDeliveryDelay 600
```

Step 4: Assign a UM-enabled user to the UM mailbox policy for a Voice Mail Preview partner

If you want to configure the Voice Mail Preview partner service for some, but not all, UM-enabled users in a UM dial plan, you must create a new UM mailbox policy and configure the partner settings. When you've finished, you can apply the new policy to selected UM-enabled users. For more information about how to assign a UM-enabled user to a UM mailbox policy, see the following topics:

- Assign a UM mailbox policy
- Set-UMMailbox

For more information about the Voice Mail Preview partner program, see Voice Mail Preview advisor.

Set the Voice Mail Preview partner address

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-13*

You can set a Voice Mail Preview partner address on a Unified Messaging (UM) mailbox policy. After you've set the Voice Mail Preview partner address on a UM mailbox policy, the setting will apply to all UM-enabled users who are linked with that mailbox policy.

Note:

You must use the Shell to set a Voice Mail Preview partner address.

For more information about the Voice Mail Preview partner program, see Voice Mail Preview advisor.

For additional management tasks related to Voice Mail Preview, see Voice Mail Preview procedures.

What do you need to know before you begin?

- Estimated time to complete: 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM mailbox policy.

Use the Shell to set the maximum delivery delay for a Voice Mail Preview partner

This example sets the maximum delivery delay to 600 seconds (10 minutes) on a UM mailbox policy named *MyUMMailboxPolicy*.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
VoiceMailPreviewPartnerMaxDeliveryDelay 600
```

Enable Voice Mail Preview for users

Set up client voice mail features > Allow users to see a voice mail transcript > Voice Mail Preview procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

You can enable the Voice Mail Preview feature for users associated with a Unified Messaging (UM) mailbox policy if it has been disabled. Enabling this setting allows users to receive the text of a voice mail message in the message body of an email or text message. The default setting is enabled.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.

- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable Voice Mail Preview

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **General**, select the check box next to **Allow voice mail preview**.
4. Click **Save**.

Use the Shell to enable Voice Mail Preview

This example allows users who are associated with the UM mailbox policy `MyUMMailboxPolicy` to use the Voice Mail Preview feature.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowVoiceMailPreview $true
```

Disable Voice Mail Preview for users

Set up client voice mail features > Allow users to see a voice mail transcript > Voice Mail Preview procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

You can disable the Voice Mail Preview feature for users associated with a Unified Messaging (UM) mailbox policy. Disabling this setting prevents users from receiving the text of a voice mail message in the message body of an email or text message. The default setting is enabled.

For additional management tasks related to UM mailbox policies, see UM mailbox policy

procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to disable Voice Mail Preview

1. In the EAC, navigate to **Unified Messaging** > **UM Dial plans**, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **General**, clear the check box next to **Allow voice mail preview**.
4. Click **Save**.

Use the Shell to disable Voice Mail Preview

This example prevents users who are associated with the UM mailbox policy `MyUMMailboxPolicy` from using the Voice Mail Preview feature.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowVoiceMailPreview $false
```

Enable voice mail users to receive faxes

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Microsoft Exchange Unified Messaging (UM) enables voice mail messages to be delivered to a user's mailbox and also lets users receive faxes in their mailbox. In UM, a fax is sent to the user's mailbox as an email message that has an image file with a .tif extension attached. The user can open the attached file by using a software application that can open and view image files that have a .tif extension. This topic discusses faxing and how it works in UM.

Note:

Although Unified Messaging doesn't let users send outgoing faxes, many third-party solutions, such as an Internet fax service, an email faxing service, or a third-party fax server application, can be used to send outgoing faxes.

Contents

Overview of faxing

Fax is an abbreviation for the word facsimile. It's a technology that's used to electronically transfer documents. Generally, faxes are sent and received by fax machines or computer fax modems by using the Public Switched Telephone Network (PSTN), which is a telephony or circuit-based network. However, other options can be used to send and receive faxes.

Most organizations today want their users to be able to send and receive faxes. Organizations use one or more of the methods described in the following list to send or receive faxes over the PSTN or over the Internet. There are advantages and disadvantages to each of these methods.

- Traditional fax machines and computer-based faxing
- Faxing by using fax servers or fax gateways
- Faxing by using a Voice over IP (VoIP) network
- Faxing by using an email client application

To send a fax message, users in an organization may have to do the following:

- Print a hard copy of the document to be faxed and use a physical fax machine to send it.
- Save the document on their computer and use a fax modem to send the fax, but this requires a phone line connected to the computer.
- Use an Internet fax service that lets them fax a document from a vendor-specific software application.
- Send an outgoing fax to a fax server by using a software application that's configured to use the fax server.

To receive a fax, users in an organization may have to do the following:

- Receive a fax on a physical fax machine within the organization.
- Receive a fax by using a fax modem that's installed on their computer.
- Receive a fax from an Internet faxing service.
- Receive a fax from a fax server that's configured on a network.
- Receive a fax from a fax partner's server that uses Unified Messaging to deliver the fax using a VoIP network.

Return to top

Faxing methods

There are several options for sending and receiving faxes, including the following:

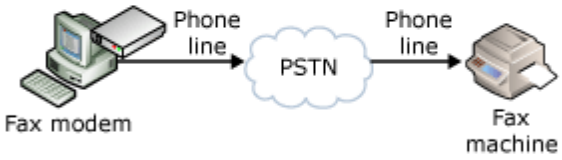
Traditional fax machines and computer-based faxing A scanner, a fax modem in a computer, a printer with built-in faxing capabilities, or a dedicated fax machine can be used to send and receive faxes. All of these can be used to transmit data in the form of pulses by using a telephone line to another fax device, usually another fax machine or computer that has a fax modem. The pulses are then transformed into images or used to print the image on paper.

The traditional fax method requires at least a single telephone line on the sending and receiving device, and only one fax can be sent or received at a time. A disadvantage of sending and receiving faxes by using a fax modem is that the computer must be turned on and running fax software or a fax service. This kind of computer-based faxing doesn't use the Internet to send or receive faxes.

Traditional and computer-based faxing

Traditional fax machine

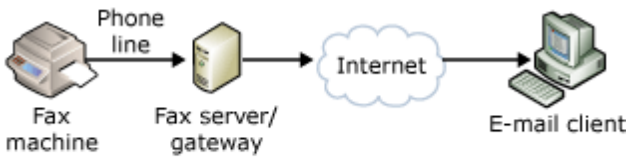
Fax modem



Fax servers or gateways and Internet fax services There are several ways to send and receive faxes over the Internet. These include using a software application on a computer or using an email client to receive faxes. In most cases, this kind of faxing involves using a fax server or fax gateway to convert between faxes and email. This method has become increasingly popular because it enables organizations to remove or avoid purchasing additional fax machines. It also eliminates the need to install additional telephone lines. This kind of faxing involves creating a document, including a fax cover page with the correct identifying information, and then sending the document to a traditional fax machine. For example, the user uses a software application such as Microsoft Word or Microsoft Outlook to create and send the fax to the fax server or gateway. The fax server or gateway receives the fax and then sends it by using a traditional telephone line to a fax machine or a fax modem that's installed on a computer.

Faxing by using fax servers or gateways

Fax Receiving



Sending a fax

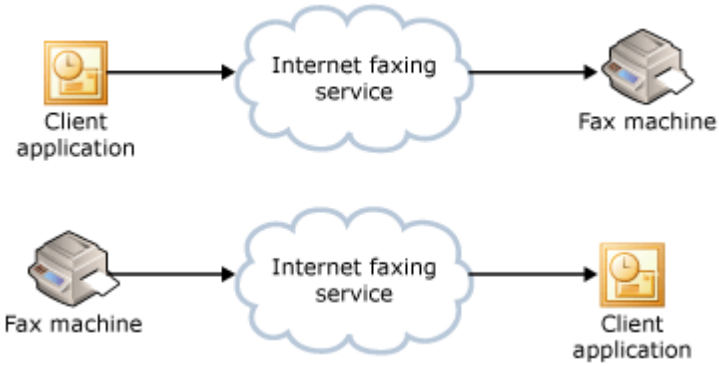
Internet fax services let a user send faxes from a computer by using the Internet. A software application such as Word or Outlook can be used to create and send the fax to an Internet fax service. Many companies offer Internet fax services on a subscription basis or by charging for each fax message that's sent. Internet fax services offer the following advantages:

- No fax machine is required.
- No software or hardware must be installed.

- No dedicated telephone lines are required.
- Confidentiality.
- Multiple faxes can be sent at the same time.
- Faxes can be received when the computer is turned off.

The following figure shows how Internet fax services can be used to send and receive faxes.

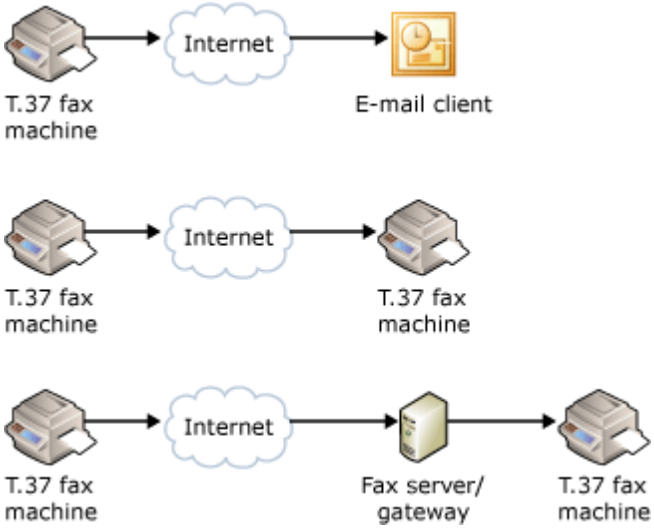
Internet fax services



Faxing by using an email client application Faxes can be sent and received by a fax machine over the Internet and then received by an email client such as Outlook.

The T.37 protocol was designed to enable a fax machine to send fax messages over the Internet to an email client. The faxes are sent over the Internet as email attachments, typically as .tif or .pdf files. In this kind of faxing, a fax machine that supports iFax or T.37 is required, in addition to an email address for the sending and receiving fax machines. To work with traditional fax machines and fax modems, all T.37 fax machines support standard faxing by using a telephone line. However, in some cases, T.37 fax machines can be used when a fax gateway is also being used. The following figure shows how T.37-based fax machines and email clients can be used to send and receive faxes.

Faxing with email



Faxing by using a VoIP network VoIP is a technology that provides hardware and software that enables people to use an IP-based network as the transmission medium for telephone calls. On a VoIP network, voice and fax data is sent in packets by using IP instead of traditional circuit transmissions or the circuit-switched telephone lines of the PSTN. A VoIP gateway that you connect to your IP network uses VoIP to send voice data packets between a Client Access server running the

Microsoft Exchange Unified Messaging Call Router service and a Mailbox server running the Microsoft Exchange Unified Messaging service and a Private Branch eXchange (PBX) system. You can also use an IP PBX to perform the functions of both a VoIP gateway and a PBX.

There are two basic types of networks: circuit-switched and packet-switched. A circuit-switched network is a network in which there exists a dedicated connection. A dedicated connection is a circuit or channel that's set up between two nodes so that they can communicate. After a call is established between two nodes, the connection can be used only by these two nodes. When the call is ended by one of the nodes, the connection is canceled. In circuit-switched networks, such as the PSTN, multiple calls are transmitted across the same transmission medium. Frequently, the medium that's used in the PSTN is copper. However, fiber optic cable might also be used.

In packet-switched networks such as the Internet or a local area network (LAN), packets are routed to their destination through the most expedient route, but not all packets traveling between two hosts travel the same route, even those from a single message. This almost guarantees that the packets will arrive at different times and out of order. In a packet-switched network, packets (messages or fragments of messages) are individually routed between nodes over data links that may be shared by other nodes. With packet switching, unlike circuit switching, multiple connections to nodes on the network share the available bandwidth. Packet-switched networking has made it possible for the Internet to exist and, at the same time, has made data networks—especially LAN-based IP and VoIP networks—more available and widespread.

Return to top

T.38

T.38 is a faxing standard and protocol that enables faxing over an IP-based network. An IP-based network that uses the T.38 protocol uses Simple Mail Transfer Protocol (SMTP) and Multipurpose Internet Mail Extension (MIME) to send a message to a recipient's mailbox. T.38 allows for IP fax transmissions for IP-enabled fax devices and fax gateways. The devices can include IP network-based hosts such as client computers and printers. In Exchange Unified Messaging, the fax images are separate documents encoded as .tif files and attached to an email message. Both the email message and the .tif file attachment are sent to the user’s UM-enabled mailbox.

Unified Messaging relies on the gateway's abilities to translate or convert Time Division Multiplex (TDM) or telephony circuit-switched based protocols like Integrated Services Digital Network (ISDN) and QSIG from a PBX to IP-based or VoIP-based protocols like Session Initiation Protocol (SIP), Real-Time Transport Protocol (RTP), or T.38 for receiving fax messages. The VoIP gateway is integral to the functionality and operation of Unified Messaging. The VoIP gateway is responsible for sensing fax tones. Client Access and Mailbox servers rely on the VoIP gateway to send a notification that a fax has been detected. Then the Client Access and Mailbox servers will renegotiate the media session and use the T.38 protocol.

Return to top

Overview of faxing with Unified Messaging

In Unified Messaging, the user receives fax images as separate documents encoded as .tif image files that are attached to an email message. Both the email message and the .tif attachment are sent to the user's UM-enabled mailbox.

There are several advantages to sending a fax message to the user's mailbox. These advantages include the following:

- You can reduce the number of physical or traditional fax machines.
- The number of telephone lines used for faxing in an organization can be reduced, because the Mailbox server can queue many faxes and send each fax when one of the telephone lines becomes available.
- Faxes that are received as a .tif image file are better quality than a traditional fax. Incoming faxes can be printed by a local or shared printer.
- Faxes sent to the user's mailbox are more secure because they're less likely than hard-copy faxes to be picked up by someone other than the recipient.
- Users can receive faxes without leaving their desk.
- Fax messages that are received can be monitored to make sure that they comply with an organization's security policies.

A single fax message can be sent only to a single UM-enabled user. Unified Messaging can't forward fax messages to a distribution list. If you need to have this functionality, you must follow these steps:

1. Create a mailbox to answer the fax call. This will be the mailbox for the distribution list.
2. UM-enable the distribution list mailbox.
3. Create a rule for this UM-enabled mailbox. The rule will be configured to forward all messages to the selected distribution list.

Return to top

Receiving incoming faxes

Receiving a fax on a VoIP network differs from receiving a fax on a standard fax machine or by using a fax server that's located on an IP-based network. To enable faxes to be sent and received over a VoIP network, you must have a VoIP gateway or an IP PBX that supports the T.38 protocol and a server that also supports T.38. T.38 allows for IP-based fax transmissions for IP network-based hosts, for example, client computers, printers with built-in faxing capabilities, and servers such as a Mailbox server.

Important:
Sending and receiving faxes using T.38 or G.711 isn't supported in an environment where Unified Messaging and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server are integrated.

When a PBX receives a call, it forwards the call to the appropriate extension. If there is no answer at the user's extension number, the PBX forwards the call to a VoIP gateway, and the gateway forwards the call to the appropriate Mailbox server. The Mailbox server determines whether the call is a voice call or a fax call, based on the protocol that's used for the call. When the SIP protocol is used, the Mailbox server processes the call as a voice message. However, if the T.38 protocol is used from the VoIP gateway, the Mailbox server recognizes that the call is for a fax and processes it as described in the following paragraph. A Mailbox server forwards incoming fax calls to a dedicated fax partner server, which then establishes the fax call with the fax sender and receives the fax on behalf of the UM-enabled user. The fax partner server then sends the fax included as a .tif attachment in an SMTP message to the recipient's mailbox.

When a Mailbox server receives an incoming T.38 fax signal from a VoIP gateway, the Mailbox server queries the directory using the Lightweight Directory Access Protocol (LDAP) to determine if the intended recipient of the incoming fax call is allowed to receive incoming fax messages and to determine the SIP address of the fax partner server. After it has checked this information, the Mailbox server sends a fax call referral request to the VoIP gateway or SIP peer, which then forwards the fax request on to the fax partner server. After the fax call has been successfully established, the fax sender sends the fax media and data to the fax partner server. After the fax partner server receives the fax media and data, it uses SMTP to send an email message to a Mailbox server. This message contains a .tif image of the fax message and special X-headers to the intended fax recipient.

After the fax message is authenticated and is sent from a valid fax partner server, the UM mailbox assistant on the Mailbox server issues an RPC call to the Microsoft Exchange Unified Messaging service. This ensures that the fax message properties match those of fax messages that are created by a Mailbox server. Finally, the Mailbox server again submits the final fax message, which includes the email message and .tif attachment for the incoming fax. Then, using MAPI RPC, the completed and formatted version of the fax message is delivered to the Mailbox server that contains the intended recipient's mailbox.

Return to top

Fax call referral methods

An incoming fax call can be signaled to a Mailbox server through SIP re-INVITE from the VoIP gateway or SIP peer (media gateway), CNG (calling fax tone) notification by the SIP peer, or CNG detection by the Mailbox server. The following subsections detail the fax call referral in each case.

Re-INVITE from a SIP peer

An incoming call to a UM pilot number is directed to UM as an INVITE with a voice (RTP/audio) SDP profile

1. UM accepts the invitation and media streams are established. After the call has been established, fax transmission is initiated by the caller.

2. The SIP peer detects the calling fax tone (CNG). The SIP peer issues a re-INVITE to the Mailbox server, this time specifying a fax (T.38 or G.711) profile in the SDP.
3. UM responds to the invitation with a 200 OK that places the SIP peer “on hold”.
4. UM issues a REFER, referring the SIP (CNG) peer to a fax partner solution end point, obtained from its configuration data.
5. The SIP peer sends the fax session INVITE to the fax partner solution.
6. The fax partner solution accepts the invitation, and a media session is established with the SIP peer.

CNG notification by a SIP peer

An incoming call to a UM pilot number is directed to UM as an INVITE with a voice (RTP/audio) SDP profile.

1. UM accepts the invitation and media streams are established. After the call has been established, fax transmission is initiated by the caller.
2. The SIP peer detects the calling fax tone (CNG).The SIP peer notifies the UM server of the fax by sending a CNG notification in the RTP stream, compliant with RFC 4733.
3. UM responds to the notification by immediately issuing a REFER and referring the SIP peer to a fax partner solution end point, obtained from its configuration data.
4. The SIP peer sends the fax session INVITE to the fax partner solution.
5. The fax partner solution accepts the invitation.
6. A media session is established with the SIP peer.

CNG detection by a Mailbox server

An incoming call to a UM pilot number is directed to UM as an INVITE with a voice (RTP/audio) SDP profile. UM accepts the invitation and media streams are established.

1. After the call has been established, fax transmission is initiated by the caller.
2. The Mailbox server detects the fax tone (CNG) in the RTP audio stream.
3. UM responds to the notification by immediately issuing a REFER and referring the SIP peer to a fax partner solution end point, obtained from its configuration data.
4. The SIP peer sends the fax session INVITE to the fax partner solution.
5. The fax partner solution accepts the invitation.
6. A media session is established with the SIP peer.

Return to top

Configuring faxing

By default, when you install the Mailbox server, the server isn't configured to allow incoming fax calls to be processed or delivered to a UM-enabled user. To configure UM with a fax partner server, you must configure the UM mailbox policy and configure authentication between the Mailbox server and the fax partner server. For more information, see Setting up incoming faxing.

Return to top

Telephone numbers and faxing

Exchange Unified Messaging offers the following options when you're configuring UM-enabled users to receive fax messages:

- A Direct Inward Dial (DID) telephone number for an individual user that's used for both faxes and voice mail.
- A separate DID telephone number for an individual user that's used for receiving faxes.
- A central fax telephone number for all users that receives all faxes.

A single DID telephone number

When you enable a user for Unified Messaging by using the **Enable UM mailbox** page or the **Enable-UMMailbox** cmdlet, you must specify at least a single extension number for the user. This extension number is enabled on a per-user basis and must be unique within a given dial plan. The extension is used by Unified Messaging to locate the correct user and to deliver voice and fax messages to the user's mailbox. For more information, see Enable-UMMailbox.

Using a single DID number, you can configure faxing so that a user uses a single DID number for both voice and fax. This configuration is easy to administer and doesn't waste additional DID numbers. If the user is away or on the phone when a fax call arrives, UM answers the call, detects the fax tone, creates the fax message, and sends it to the user.

If a user whose faxing is configured using a single DID telephone number receives a call from a fax machine when they’re not away or on the phone, they can:

- Not answer the telephone when it rings so that the fax call will be forwarded and answered by a Mailbox server and the fax message will be created and forwarded to the user's mailbox.
- Answer the fax call, and then transfer it to himself or herself so that the call will be forwarded and answered by a Mailbox server and the fax message will be created and forwarded to the user's mailbox.
- Wait for the caller to retry sending the fax and let the fax call be transferred to a Mailbox server.

In summary, using a single DID number requires the user to perform additional actions to be able to receive fax messages.

Return to top

Multiple DID telephone numbers

When you enable a user for Unified Messaging, you must enter at least a single extension number for that user. You can add multiple extension numbers for a UM-enabled user by using the Exchange Administration Center (EAC). For more information, see Add an extension number.

Adding multiple extension numbers is useful when a UM-enabled user:

- Receives many faxes.
- Doesn't want to be bothered with answering the phone to receive a fax.
- Doesn't want to hear a fax tone when they answer their phone.

Adding multiple extensions is more complex than using a single extension and may require additional configuration settings on a PBX or an IP PBX. To configure multiple extension numbers for a UM-enabled user, you must have DID extension numbers available that aren't being used in your organization. It isn't a good idea to use multiple numbers for a UM-enabled user if your organization has a limited number of DID extension numbers available.

The benefit of using multiple DID extension numbers is that a UM-enabled user receives voice calls on one DID extension number and fax calls on the another DID extension number. Using separate DID numbers for voice mail and fax calls is easier for the user.

If you configure two DID extension numbers for a specific user, the DID extension numbers can come from separate UM dial plans. To use two DID numbers, you can create a dial plan and use a Mailbox server as a dedicated server that will receive fax calls and forward fax messages to users. For more information, see Create a UM dial plan.

You have the following options when you're configuring multiple DID extension numbers for UM-enabled users:

- **One extension for fax without Unified Messaging and one for voice** This type of configuration is enabled on a per-user basis and is used when you have extra or unused DID extension numbers available. One DID extension number is published as the user's voice mail number and the other DID extension number is published as the user's fax number. Voice calls that are answered because the user doesn't answer the phone or a busy signal is encountered are forwarded to a Mailbox server, and a voice message is created and sent to the UM-enabled user's mailbox. The other extension number can be connected to a fax machine or to another computer that has a fax modem. With this configuration, a Mailbox server doesn't process fax calls, and fax messages aren't sent to the UM-enabled user's mailbox.
- **One extension for fax and one for voice** This type of configuration is enabled on a per-user basis and can be used when your organization has many DID extension numbers available. In this configuration, both DID extension numbers that are answered because the user doesn't answer the phone or a busy signal is encountered are forwarded to a Mailbox server, which creates a voice or fax message depending on the DID extension number that's called. Although the user publishes one number for voice and one for fax, the Mailbox server detects the type of call that's being received on the DID extension number and can create a voice or fax message from calls to either of the DID extension numbers. This is very useful when a user doesn't have a separate fax machine or a dedicated computer that has a fax modem to answer incoming fax calls.
- **One "phantom" extension for fax and one for voice** This type of configuration is enabled on a per-user basis. It's essentially the same as the configuration that uses two DID numbers (one for fax and one for voice). However, in this configuration, the number that's published for fax calls for the UM-enabled user is configured on the PBX as a "phantom" extension. Incoming calls that are received on this "phantom" DID extension number are always forwarded to a Mailbox server.

The advantage of this type of configuration is that incoming fax calls are answered by a Mailbox

server. When the phone rings but isn't answered, a fax is created and forwarded by the Mailbox server to the UM-enabled user's mailbox without disturbing the user. This happens automatically because no telephone or fax device is positioned close to the user, and the user doesn't hear the ring of the incoming call.

The disadvantages of this kind of configuration are that you must have additional DID extensions available and you must configure the PBX or IP PBX to forward the call to a Mailbox server.

Central fax telephone number

When you enable a user for Unified Messaging by using the **Enable UM Mailbox** page or the **Enable-UMMailbox** cmdlet, you must specify at least a single extension number for the user. However, if you need to configure a central fax number for incoming faxes, you must set up a separate UM enabled mailbox that is used to receive all faxes.

In some organizations, especially those that receive many faxes each day, you might want to publish one fax number for the whole organization. This fax number would be used by all callers when they submit faxes to users in the organization.

Publishing one fax number for the whole organization enables your organization to control the types of faxes that are received by users. The advantage of this configuration is that it requires only a single DID extension number or an external telephone number. Also, it doesn't require a separate DID number for faxing for each UM-enabled user. However, it does require a "fax secretary" or other person to distribute the incoming faxes to users within the organization based on information that's included on the fax cover page or in the fax message itself.

Note:
Using a central fax number with optical character recognition (OCR) isn't available in Exchange Unified Messaging. This kind of configuration can use a central fax number. However, instead of having to be routed to the recipient by a person, the faxing software receives the fax, performs OCR, and then tries to locate the recipient based on the information on the cover page or fax message.

Using a single fax number for the whole organization is useful in the following situations:

- A user within the organization receives too many faxes in their mailbox to manage them effectively.
- A user receives too many spam faxes in their mailbox.
- Business needs are too complex to warrant creating a transport rule to accept incoming faxes and route them to the intended mailbox. This might not be practical, for example, if your organization requires that you route certain faxes to one group and other faxes to another group. For more information, see Transport rules.
- Filtering fax messages by using Outlook isn't effective.

Return to top

Journaling UM fax messages

Many organizations that implement journaling may also use Unified Messaging to consolidate their email, voice mail, and fax infrastructure. However, you may not want the journaling process to generate journal reports for messages that are generated by Unified Messaging. In this case, you can decide whether to journal voice mail messages and missed call notification messages that are handled by a Mailbox server or to skip such messages. If your organization doesn't require journaling of voice mail and missed call notifications, you can reduce the hard disk space that's required to store journal reports by skipping such messages. When you enable or disable the journaling of voice mail messages and missed call notification messages, your change is applied to all Transport services in your organization. For more information, see Journaling.

Note:

Messages that contain faxes that are generated by a Mailbox server are always journaled, even if you configure a journal rule that specifies not to journal Unified Messaging voice mail and missed call notification messages.

Return to top

Fax advisor for Exchange UM

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

Microsoft Unified Messaging (UM) relies on certified fax partner solutions for enhanced fax functionality such as outbound fax or fax routing. By default, users aren't configured to allow incoming fax messages to be delivered to a UM-enabled user. Exchange servers send the fax requests to a certified fax partner solution. The fax partner's server receives the fax data and then sends it to the recipient's mailbox in an email message with the fax included as a .tif attachment. For details, see Enable voice mail users to receive faxes.

Important:

We recommend that all customers who plan to deploy Unified Messaging obtain the assistance of a Unified Messaging specialist. A Unified Messaging specialist helps you ensure that there's a smooth transition to Unified Messaging from a legacy voice mail system. Performing a new deployment or upgrading a legacy voice mail system requires significant knowledge about PBXs and Unified Messaging. For more information about how to contact a Unified Messaging specialist, see the Microsoft Exchange Server 2013 Unified Messaging (UM) Specialists or Microsoft Pinpoint for Unified Messaging.

Exchange Unified Messaging Fax Partner Program

To become a fax partner certified for interoperability with Exchange UM, the partner must implement the requirements contained in the Fax Partner Interoperability Specification and the fax solution must be certified by an independent certification vendor. For more information about certifying a fax product to work with Exchange Unified Messaging, submit a request to Fax Partners for Unified Messaging.

Fax partner solutions certified as interoperable with Unified Messaging

If you've already deployed Exchange Unified Messaging and are looking for a fax partner that can enable incoming faxes for your organization, see Microsoft Pinpoint for Fax Partners. These software vendors have been certified as interoperable with Exchange Server and include certified software solutions for Unified Messaging.

VoIP, media gateway, and IP PBX support

Correctly configuring VoIP gateways for your organization is a difficult deployment task that must be completed to successfully deploy Exchange Unified Messaging with incoming faxing. To help answer questions and get the most up-to-date VoIP gateway configuration information, see Telephony advisor for Exchange 2013. Configuration notes for supported VoIP gateways, IP PBXs, and PBXs provides VoIP gateway configuration notes and files that you must have to correctly configure your organization's VoIP gateways, IP PBXs, and SBCs to work with Exchange Unified Messaging.

Interoperability testing of Exchange Unified Messaging with VoIP gateways is now integrated with the Microsoft Unified Communications Open Interoperability Program. For more information, see Microsoft Unified Communications Open Interoperability Program.

The Microsoft Unified Communications Open Interoperability Program qualification program for VoIP gateways and IP PBXs ensures that customers have a seamless setup and support experience when they're using qualified telephony gateways and IP PBXs with Microsoft Unified Communications software.

Important:
Sending and receiving faxes using T.38 or G.711 isn't supported in an environment where Unified Messaging and Communications Server 2007 R2 or Microsoft Lync Server are integrated.

Deploying and configuring faxing

UM forwards incoming fax calls to a dedicated fax partner solution, which then establishes the fax call with the fax sender and receives the fax on behalf of the UM-enabled user. However, to allow

UM-enabled users to receive fax messages in their mailbox, you must configure the fax partner server, and then configure the UM dial plans, UM mailbox policies, and enable UM-enabled users to receive faxes. For details, see Setting up incoming faxing.

Setting up incoming faxing

Unified Messaging > Set up client voice mail features > Enable voice mail users to receive faxes >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

Microsoft Exchange Unified Messaging (UM) relies on certified fax partner solutions for enhanced fax features such as outbound fax or fax routing. By default, Exchange servers aren't configured to allow incoming faxes to be delivered to a user that's enabled for UM. Instead, an Exchange server redirects incoming fax calls to a certified fax partner solution. The fax partner's server receives the fax data and then sends it to the user's mailbox in an email message with the fax included as a .tif attachment.

For more information about fax partners, see Microsoft Pinpoint for Fax Partners

Deploying and configuring faxing

UM forwards incoming fax calls to a dedicated fax partner solution, which then establishes the fax call with the fax sender and receives the fax on behalf of the UM-enabled user. However, to allow UM-enabled users to receive fax messages in their mailboxes, you must first enable incoming faxing and set the fax partner's URI on the UM mailbox policy that's linked to the UM-enabled user or users. You can allow or prevent incoming faxing on UM dial plans, UM mailbox policies, and on the mailbox for a UM-enabled user. For details, see the following topics:

- Allow users in the same dial plan to receive faxes
- Prevent users in the same dial plan from receiving faxes
- Enable faxing for a group of users
- Disable faxing for a group of users
- Enable a user to receive faxes
- Prevent a user from receiving faxes

Step 1: Deploy Unified Messaging

Before you can set up faxing for your on-premises or hybrid organization, you need to successfully deploy Client Access and Mailbox servers and configure your supported Voice over IP (VoIP) gateways to allow faxing. For details about how to deploy UM, see Deploy Exchange 2013 UM. For

details about how to deploy VoIP gateways and IP Private Branch eXchanges (PBXs), see Connect UM to your telephone system.

Important:

Sending and receiving faxes using T.38 or G.711 isn't supported in an environment where Unified Messaging and Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server are integrated.

Step 2: Configure fax partner servers

Next, you need to enable incoming faxing and configure the fax partner's URI on each UM mailbox policy that you require in your organization. To successfully deploy incoming faxing, you must integrate a certified fax partner solution with Exchange Unified Messaging. For details, see Fax advisor for Exchange UM. For a list of certified fax partners, see Microsoft Pinpoint for Fax Partners

Note:

Because the fax partner server is external to your organization, firewall ports must be configured to allow the T.38 protocol ports that enable faxing over an IP-based network. By default, the T.38 protocol uses TCP port 6004. It can also use User Datagram Protocol (UDP) port 6044, but this will be defined by the hardware manufacturer. The firewall ports must be configured to allow fax data that uses the TCP or UDP ports or port ranges defined by the manufacturer.

Step 3: Enable faxing on Unified Messaging

Three components must be configured correctly for users to be able to receive faxes by using Unified Messaging:

- UM dial plans
- UM mailbox policies
- UM mailboxes

Faxing can be enabled or disabled on UM dial plans, UM mailbox policies, or on an individual UM-enabled user's mailbox. UM mailbox policies can be enabled or disabled for faxing using either the Exchange Administration Center (EAC) or the Exchange Management Shell. Enabling and disabling of dial plans and individual UM-enabled users needs to be done using the Exchange Management Shell. The following table shows the options that are available and the cmdlets and parameters that are used for enabling and disabling faxing.

UM component	Enable/disable using the EAC?	Shell example for enabling faxing
Dial plan	No	`Set-UMDialPlan -id MyUMDialPlan -faxenabled $true`
UM mailbox policy	Yes	`Set-UMMaiboxPolicy -id MyPolicy -AllowFax $true`

UM-enabled user	No	`Set-UMMailbox -id tonysmith -faxenabled $true`

By default, although the UM dial plan and the user's mailbox allow incoming faxes, you must first enable inbound faxing on the UM mailbox policy that's assigned to the UM-enabled user and then enter the fax partner server's URI.

To enable UM-enabled users to receive faxes, you must do the following:

- Verify that each UM dial plan allows the users who are associated with the dial plan to receive faxes. By default, all users who are associated with a dial plan can receive faxes. For UM-enabled users to receive fax messages in their mailbox, each VoIP gateway or IP PBX must be configured to accept incoming fax calls. You must also enable fax messages to be received by users who are linked with the dial plan. For more information about how to enable users linked with a dial plan to receive faxes or to prevent them from doing this, see Enable a user to receive faxes.

Note:
If you prevent fax messages from being received on a dial plan, no users who are associated with the dial plan will be able to receive faxes, even if you configure an individual user's properties to allow them to receive faxes. Enabling or disabling faxing on a UM dial plan takes precedence over the settings for an individual UM-enabled user.

- Configure the UM mailbox policy that's associated with the UM-enabled user. The UM mailbox policy must be configured to allow incoming faxes, including the fax partner's URI and the name of the fax partner's server. The *FaxServerURI* parameter must use the following form: sip:<*fax server URI*>:<*port*>;<*transport*>, where "fax server URI" is either a fully qualified domain name (FQDN) or an IP address of the fax partner server. The "port" is the port on which the fax server listens for incoming fax calls and "transport" is the transport protocol that's used for the incoming fax (UDP, TCP, or Transport Layer Security (TLS)). For example, you might configure a UM mailbox policy to receive a fax as follows.

```
Set-UMMailboxPolicy MyUMMailboxPolicy -AllowFax $true -
FaxServerURI "sip:faxserver.abc.com:5060;transport=tcp"
```

- For details, see Set the partner fax server URI to allow faxing.

Warning:
Although you can include multiple entries in the format for the *FaxServerURI* by separating them with a semicolon, only one entry will be used. This parameter allows only one entry to be used, and adding multiple entries won't enable you to load balance fax requests.

- Verify that the mailbox that's UM-enabled can receive fax messages. By default, all users who are associated with a dial plan can receive faxes. However, there may be situations when a user can't receive faxes because the ability to receive faxes has been disabled on their mailbox. For more information about how to enable a UM-enabled user to receive faxes, see Enable a user to receive faxes.

You can prevent an individual user who's associated with a dial plan from receiving fax messages. To do this, configure the properties for the user by using the **Set-UMMailbox** cmdlet in the Shell. You can also use the **Set-UMMailboxPolicy** cmdlet to prevent multiple users from receiving fax

messages. For more information about how to prevent a user or users from receiving fax messages, see Prevent a user from receiving faxes.

Step 4: Configure authentication

In addition to configuring your UM dial plans, UM mailbox policies, and UM-enabled users, you have to configure authentication between your Exchange servers and the fax partner server. The Exchange servers must be able to authenticate the origin of the messages that claim to be coming from the fax partner server. Any unauthenticated messages claiming to have come from a fax partner server won't be processed by an Exchange server.

To authenticate the connection from the fax partner server to the Exchange servers, you can use:

- Mutual TLS
- Sender ID validation
- A dedicated receive connector

A receive connector should be sufficient for authenticating the fax partner servers deployed in your organization. The receive connector will ensure that the Exchange servers treats all traffic coming from the fax partner server as authenticated.

The receive connector will be configured on an Exchange server that's used by the fax partner server to submit SMTP fax messages, and must be configured with the following values:

- *AuthMechanism: ExternalAuthoritative*
- *PermissionGroups: ExchangeServers, PartnersFax*
- *RemoteIPRanges: {the fax server's IP address}*
- *RequireTLS: False*
- *EnableAuthGSSAPI: False*
- *LiveCredentialEnabled: False*

For details, see Connectors.

If the fax partner server sends network traffic to an Exchange server over a public network, for example, a service-based fax partner server hosted in the cloud, it's a good idea to authenticate the fax partner server using a sender ID check. This type of authentication ensures that the IP address that the fax message came from is authorized to send email messages on behalf of the fax partner domain that the message claims to have come from. DNS is used to store the sender ID records (or sender policy framework (SPF) records) and fax partners must publish their SPF records in the DNS forward lookup zone. Exchange will validate the IP addresses by querying DNS. However, the sender ID agent must be running on a Mailbox server to be able to perform the DNS query.

You can also use TLS to encrypt the network traffic, or mutual TLS for encryption and authentication between the fax partner server and Exchange servers.

Faxing procedures

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-15*

Set the partner fax server URI to allow faxing

Applies to: *Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable and disable inbound faxes for users associated with a Unified Messaging (UM) mailbox policy. By default, when you enable users for UM, users can't receive fax messages until you enable inbound faxing on the UM mailbox policy and specify the URI for the partner fax server. If the URIs are configured on the UM mailbox policy but the option to allow incoming faxes is disabled on the UM dial plan or for an individual user, UM-enabled users linked to the UM mailbox policy still won't be able to receive faxes.

For more information about fax partners, see Microsoft PinPoint for Fax Partners.

For additional management tasks related to faxing, see Faxing procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.

- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to set the fax partner URI

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM dial plan** page, under **UM Mailbox Policies**, select the policy you want to modify, and then click **Edit** .
3. On the **UM mailbox policy** page > **General**, in the **Partner fax server URI** box, enter the TCP or TLS URI. For example: *sip:faxserver1.contoso.com:5060;transport=tcp* or *sip:faxserver2.contoso.com:5061;transport=tls*

Note:

Although the box can contain more than one fax server URI, only one will be used. If you enter two URIs, only the first will be used.

4. Click **Save** to save your changes.

Use the Shell to set the fax partner URI

This example allows users who are linked with the UM mailbox policy `UMDialPlan Default Policy` to use TCP with port 5060 for the partner fax server `faxserver1`.

```
Set-UMMailboxPolicy "UMDialPlan Default Policy" -
FaxServerURI sip:faxserver1.contoso.com:5060;transport=tcp
```

This example allows users who are linked with the UM mailbox policy `UMDialPlan Default Policy` to use TLS with port 5061 for the partner fax server `faxserver2`.

```
Set-UMMailboxPolicy "UMDialPlan Default Policy" -
FaxServerURI sip:faxserver2.contoso.com:5061;transport=tls
```

Include text with the email message sent when a fax message is received

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can include additional text in the email message that's sent when a fax message is received by a user who is enabled for Unified Messaging (UM) voice mail and is fax-enabled, and when the UM mailbox policy has been configured correctly to use a fax partner provider. By default, the text included when a UM-enabled user receives a fax message indicates only that the user has received a fax message. However, you can create a custom message by adding text in the **When a user receives a fax message** box on a UM mailbox policy. For example, the text can include information about system security policies and describe the correct way to handle fax messages in your organization. After you add the text, it will be included in each email message that's sent when UM-enabled users who are associated with the UM mailbox policy receive a fax message.

Note:

The custom text that accompanies a fax message is limited to 512 characters, and can include simple HTML text.

For more information about fax partners, see Microsoft PinPoint for Fax Partners.

For additional management tasks related to faxing, see Faxing procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the text included with a fax message

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Message text**, in the text box for **When a user receives a fax message**, enter the text you want to include in the email message that's sent when users receive a fax message in their mailbox.
4. Click **Save**.

Use the Shell to change the text included with a fax message

This example enables UM-enabled users who are associated with a UM mailbox policy to receive additional instructions on how to open a fax message that they've received in their mailbox.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
FaxMessageText "To open this fax message, double-click the
file attachment."
```

Allow users in the same dial plan to receive faxes

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable all users who are linked with a Unified Messaging (UM) dial plan to receive fax messages in their mailboxes. By default, users who are enabled for Unified Messaging and are linked with a UM dial plan can receive fax messages. To allow UM-enabled users to receive fax messages in their mailboxes, the dial plan must be configured to accept incoming fax calls. You must also enable faxing on the UM mailbox policy and for the user. By default, faxing is enabled on

dial plans, UM mailbox policies, and for users. However, there may be times when these default settings have changed and UM-enabled users can't receive fax messages.

If you prevent fax messages from being received on a dial plan, all users who are associated with the dial plan won't be able to receive fax messages, even if you configure an individual user's properties to allow them to receive fax messages. Enabling or disabling faxing on a UM dial plan takes precedence over the settings for faxing on a UM mailbox policy or an individual UM-enabled user.

Note:

You can use the EAC to configure fax settings on a UM mailbox policy. However, you must use the Shell to configure fax settings on dial plans or for individual users.

For more information about fax partners, see Microsoft PinPoint for Fax Partners.

For additional management tasks related to faxing, see Faxing procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to allow users who are linked to a dial plan to receive faxes

This example enables UM-enabled users who are linked with the UM dial plan named `MyUMDialPlan` to receive incoming faxes.

```
Set-UMDialPlan -Identity MyUMDialPlan -FaxEnabled $true
```

Prevent users in the same dial plan from receiving faxes

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can prevent UM-enabled users who are linked with a Unified Messaging (UM) dial plan from receiving fax messages. By default, users who are enabled for Unified Messaging and are linked with a UM dial plan can receive fax messages. However, there may be times when you want to prevent users who are associated with a specific UM dial plan from receiving faxes.

You can prevent UM-enabled users from receiving faxes by configuring the UM dial plan, the UM mailbox policy, or the UM-enabled user's mailbox. If you disable incoming fax message delivery on a UM dial plan, all users who are associated with the dial plan will be prevented from receiving fax messages. Enabling or disabling faxing on a UM dial plan takes precedence over the settings for an individual UM-enabled user.

Note:

You can use the EAC to configure fax settings on a UM mailbox policy. However, you must use the Shell to configure fax settings on dial plans or for individual users.

For more information about fax partners, see Microsoft PinPoint for Fax Partners.

For additional management tasks related to faxing, see Faxing procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM dial plan** page, under **UM Mailbox Policies**, select the mailbox policy you want to modify, and then click **Edit** .
3. On the **UM mailbox policy** page > **General**, clear the check box next to **Allow inbound faxes**.
4. Click **Save** to save your changes.

Use the Shell to disable inbound faxing

This example prevents users who are linked with the UM mailbox policy `MyUMMailboxPolicy` from using inbound faxing.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -AllowFax $false
```

Enable a user to receive faxes

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable a Unified Messaging (UM) user to receive faxes. By default, when you enable a user for Unified Messaging, they will be able to receive faxes if you enable faxing and configure a fax partner's URI on the UM mailbox policy that is linked to the user. Faxing can be enabled or disabled on UM dial plans, UM mailbox policies, or the UM-enabled user's mailbox.

By default, the user's mailbox and the dial plan that is linked with the user allow incoming faxes. However, for a user to receive faxes you must first enable inbound faxing on the UM mailbox policy that's associated with the UM-enabled user and enter the fax partner's URI.

Note:

You can use the EAC to configure fax settings on a UM mailbox policy. However, you must use the Shell to configure fax settings on dial plans or for individual users.

For more information about fax partners, see Microsoft PinPoint for Fax Partners.

For additional management tasks related to faxing, see Faxing procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the UM mailbox policy assigned to the user has faxing enabled and the fax partner's URI is properly configured.
- Before you perform these procedures, confirm that the user is enabled for Unified Messaging. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Use the Shell to prevent UM-enabled user from receiving faxes

This example prevents a UM-enabled user named Tony from receiving fax messages in his mailbox.

```
Set-UMMailbox -Identity tony@contoso.com -FaxEnabled $false
```

Protect voice mail

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-16*

Some legacy Private Branch eXchange (PBX) and IP PBX telephony systems allow the caller to mark a voice mail message as private, blocking the intended recipient of the message from forwarding it to others. In integrated voice mail systems, a voice message can be accessed in multiple ways, which makes it more of a challenge to prevent voice messages marked private from being exposed to unintended listeners.

Unified Messaging (UM) can be configured to use Active Directory Rights Management Services (AD RMS) to protect voice messages for an organization. This feature is known as Protected Voice Mail.

When a voice message is protected, the recipient is not only blocked from forwarding the message, but UM also ensures that only the intended recipient or recipients of the message can access its content. Protected voice messages can be accessed by using Microsoft Outlook 2010 or later, Outlook Web App, or Outlook Voice Access.

Contents

Overview of Protected Voice Mail

The Protected Voice Mail feature is available with Exchange 2010 and later versions of Unified Messaging (UM). It can be configured on a UM mailbox policy, and all Protected Voice Mail settings can be configured by using the Exchange Management Console or the Shell in Exchange 2010 or by using the Exchange admin center (EAC) or cmdlets in the Shell in Exchange 2013.

Protected Voice Mail is implemented by applying Information Rights Management (IRM) to voice messages. When voice messages are protected by UM:

- Users can reply to protected voice messages.
- Recipients of a voice message can't forward it.
- Users can't save a copy of the voice message.
- Users can't save or copy the attached audio of the voice message.
- A voice message can be opened only by the intended recipient or recipients.

Both call-answering voice messages and interpersonal voice messages (voice messages that are

sent to a user using Outlook Voice Access) can be protected by UM. However, protection won't be applied to the following types of messages:

- Fax messages.
- Non-voice messages. For example, email messages or meeting requests, even when they're created using Outlook Voice Access (voice replies).

Return to top

Overview of Active Directory Rights Management Services

AD RMS, a component of Windows Server 2008 and later versions, is available to help protect files so that only the users who the sender intends to view a file can do so. AD RMS protects a file by specifying the rights that a user must have to access the file. Rights can be configured to allow a user to open, modify, print, forward, or take other actions with the rights-managed information. With AD RMS, you can safeguard data when it's distributed outside your network.

An AD RMS system has both a server and a client component, including the following:

- A server that has Windows Server 2008 R2 or a later version installed that’s running the Active Directory Rights Management Services server role, which handles certificates and licensing.
- A database server.
- The AD RMS client. The latest version of the AD RMS client is included as part of the Windows 7 and Windows 8 operating systems.

The server component is made up of several web services that run on a Microsoft server such as Windows Server 2008 or a later version. The client component can be run on either a client or server operating system and includes functions that enable an application to encrypt and decrypt content, retrieve templates and revocation lists, and acquire licenses and certificates from a server.

By using AD RMS and the AD RMS client, you can augment an organization's security strategy by protecting information through persistent usage policies that remain with the information, regardless of where it's moved. You can use AD RMS to help prevent sensitive information—such as financial reports, product specifications, customer data, and confidential email and voice mail messages—from intentionally or accidentally getting into the wrong hands. For detailed information, see AD RMS Overview.

In Exchange UM you can use Information Rights Management (IRM) features to apply persistent protection to messages and attachments.

Using the IRM features and Protected Voice Mail, your organization and your users can control the rights recipients have to access email and voice mail messages. IRM can be also used to restrict recipient actions such as forwarding a message to other recipients, printing a message or attachment, or extracting message or attachment content by copying and pasting.

IRM requirements

Before you can implement IRM in Exchange, you must first deploy and configure your AD RMS

infrastructure. For detailed information, see Active Directory Rights Management Services. To implement IRM to support Protected Voice Mail in your Exchange organization, your deployment must meet the following requirements.

Server	Requirement
AD RMS Cluster	• Windows Server 2008 R2 Standard or Enterprise with SP1 or Windows Server 2012 Standard or Datacenter. For more information about system requirements, see Exchange 2013 system requirements. • **Service connection point (SCP)** Exchange 2013 and AD RMS-aware applications use the SCP registered in Active Directory to discover AD RMS clusters and URLs. AD RMS allows you to register the SCP within AD RMS setup. If the account used to set up AD RMS isn't a member of the Enterprise Admins security group, SCP registration can be performed after setup. There is only one SCP for AD RMS in an Active Directory forest. • **Permissions** Servers in the Exchange servers group or individual Exchange servers must be assigned Read and Execute permissions to the AD RMS server certification pipeline. The default path is \inetpub\wwwroot_wmcs \certification\ServerCertification.asmx on AD RMS servers. • **AD RMS super users** To enable transport decryption, journal report decryption, IRM in Outlook Web App, and IRM for Exchange Search, you must add the Federated Delivery mailbox, a system mailbox created by Exchange Setup, to the AD RMS super users group on the AD RMS cluster. For detailed information, see Add the Federation Mailbox to the AD RMS

	Super Users Group.

Configuring and testing IRM

You must use the Shell to configure IRM features. To configure individual IRM features, use the Set-IRMConfiguration cmdlet. For more information about how to configure IRM features, see Information Rights Management procedures.

After you've set up an Exchange server, you can use the Test-IRMConfiguration cmdlet to perform end-to-end tests of your IRM deployment. This cmdlet verifies the IRM configuration for an organization and should be run before enabling Protected Voice Mail. The **Test-IRMConfiguration** cmdlet performs the following tests:

- Inspects the IRM configuration for your Exchange organization.
- Checks the AD RMS server for version and hotfix information.
- Verifies whether an Exchange server can be activated for RMS by retrieving a Rights Account Certificate and Client Licensor Certificate (CLC).
- Acquires AD RMS rights policy templates from the AD RMS server.
- Verifies that the specified sender can send IRM-protected messages.
- Retrieves a super user use license for the specified recipient.
- Acquires a pre-license for the specified recipient.

Return to top

Client support and end-user features

The email client software that's used to listen to a Protected Voice Mail message must support IRM and know how to read a UM-protected voice message. Email clients that are supported include Microsoft Outlook 2010 or later versions, Outlook Web App, and Outlook Voice Access. The following table contains a list of email clients and whether they're supported.

Email client	Description
Outlook	• Protected voice messages are supported in Outlook 2010 and later versions.
Outlook Web App	• Outlook Web App in Exchange 2010 or later versions supports Protected Voice Mail messages. Earlier versions of Outlook Web App, known as Outlook Web Access, don't support them.
Outlook Voice Access	• Outlook Voice Access in Exchange 2010 and later versions supports Protected Voice Mail. Outlook Voice Access included with Exchange

	2007 doesn't support Protected Voice Mail. • The user's mailbox must reside on a Mailbox server in Exchange 2010 or a later version.
Windows Mobile or Windows Phone	• Windows Mobile doesn't support Protected Voice Mail. However, Windows Phone 7 and Windows Phone 8 support Protected Voice Mail.
Exchange ActiveSync	• Protected Voice Mail is supported in Exchange 2010 SP1 and later versions.
Other email clients	• Protected Voice Mail isn't supported.

Return to top

Protected voice message structure

There are actually two messages involved for each Protected Voice Mail message. The first message is the outer message, which isn't encrypted. It contains an attachment named message.rpmsg. The attachment contains the IRM-protected voice message and internal rights management control data. The rights management control data includes a content key and rights information that specifies who can access the voice message and how those users can access it.

Protected voice messages are shown in the user's Inbox in the **Voice Mail** search folder. The user can listen to the voice messages by using the embedded audio player just as they would listen to a regular voice message, except that the Forward button will be disabled and a note will be shown at the top of the message stating that it's protected and that it can't be forwarded.

For email clients that don't support Protected Voice Mail, the body of the outer message will be displayed. Administrators can include text when the client's software doesn't support Protected Voice Mail by using UM mailbox policies. You can customize the default text that's included in the email message by configuring a UM mailbox policy. For example, you could configure the UM mailbox policy with customized text such as, "*You can't open this voice mail message because it's protected. To view or listen to this voice message, sign in to your mailbox at https://mail.contoso.com or call +1 (425) 555-1234 to call in to Outlook Voice Access.*"

Return to top

Composing a Protected Voice Mail message

There are two situations in which protected voice messages can be created:

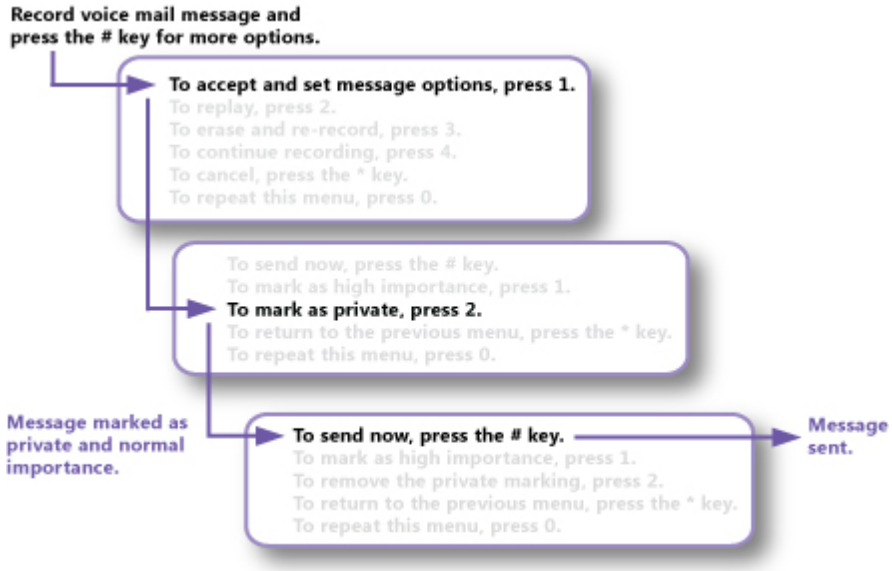
- **Call answering** Call answering occurs when a caller calls a UM-enabled user, but the user isn't available to answer the call or forwards it directly to voice mail. In call-answering scenarios, the

voice mail system will play a series of voice prompts after the caller records a voice message. The caller can then choose from additional message options, including the option to mark the voice message as private by pressing the pound (#) key. If the caller presses the # key, they can follow the instructions provided by UM to mark the message as private, remove the private marking from the private voice message, or mark the voice message with High importance. The following diagram shows the menu options that are available to callers when they leave a private voice message for a user.

Note:

For call-answering calls, UM uses the Protected Voice Mail settings on the UM mailbox policy of the intended recipient of the message, because the caller isn't authenticated.

Create a Protected Voice Mail message using Call Answering



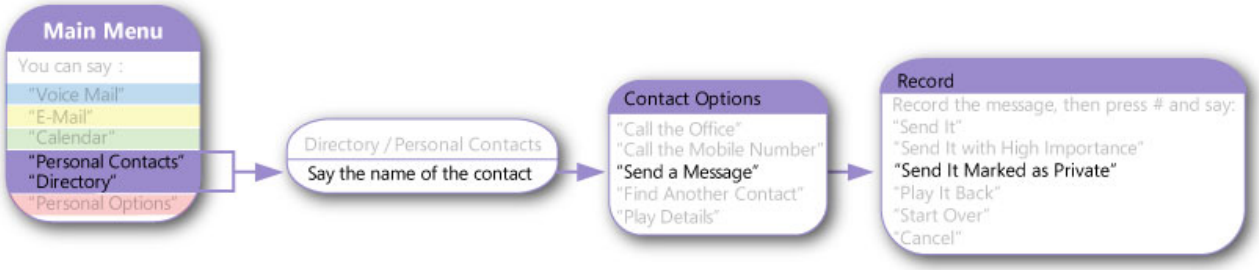
- **Outlook Voice Access** Outlook Voice Access lets UM-enabled users access their mailbox using analog, digital, or cellular telephones by dialing their Outlook Voice Access number. There are two Unified Messaging user interfaces available to UM-enabled users: the telephone user interface (TUI) and the voice user interface (VUI).

Outlook Voice Access users can search for contacts in the directory and send them voice messages. If Protected Voice Mail has been enabled for the UM-enabled recipients, callers can mark the messages as private after they're recorded. Alternatively, administrators can configure a UM mailbox policy to ensure that all voice messages sent by authenticated users are protected by UM.

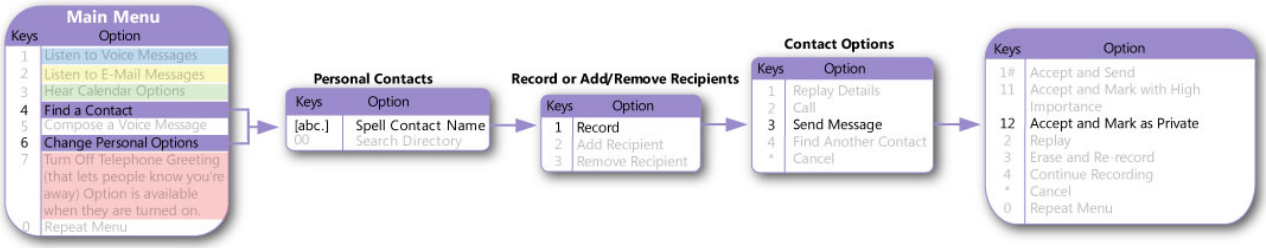
Note:

If a caller is authenticated, the Protected Voice Mail settings on the UM mailbox policy that's linked to the caller are applied, regardless of the UM mailbox policy settings for the intended recipient of the voice message.

Create a Protected Voice Mail message using the voice user interface



Create a Protected Voice Mail message using the telephone user interface



Return to top

UM mailbox policies

You can create a Unified Messaging mailbox policy to apply a common set of UM policy settings, such as PIN policy settings, dialing restrictions, and Protected Voice Mail settings, to a collection of UM-enabled mailboxes. To learn more about UM mailbox policies, see Manage a UM mailbox policy.

You can use the EAC or the **Set-UMMailboxPolicy** cmdlet in the Shell to configure Protected Voice Mail options. The following table lists the settings that can be configured for Protected Voice Mail.

Protected Voice Mail settings

Shell parameter	Setting available in EAC?	Description
ProtectAuthenticatedVoiceMail	Yes	The *ProtectAuthenticatedVoiceMail* parameter specifies whether UM-enabled users can send protected voice messages when they're accessing their mailbox using Outlook Voice Access. The default setting is None. This means that no protection is applied when voice messages are composed and that callers won't have the

		option to mark voice messages as Private. If the value is set to `Private`, only messages marked as Private by the caller are protected. If the value is set to `All`, every voice message is protected, regardless of the option chosen by the caller.
ProtectUnauthenticatedVoiceMail	Yes	The *ProtectUnauthenticatedVoiceMail* parameter specifies whether the Mailbox servers that answer calls for UM-enabled users associated with a UM mailbox policy create protected voice messages. This setting also applies when a message is sent from a UM auto attendant to a UM-enabled user. The default setting is `None`. This means that no protection is applied to voice messages and that the caller won't be offered the option to mark the message as Private. If the value is set to `Private`, only messages marked as Private by the caller are protected. If the value is set to `All`, every voice message is protected, regardless of whether if the message has been marked as

		private by the caller.
ProtectedVoiceMailText	Yes	The *ProtectedVoiceMailText* parameter specifies the text to be included in the body of the outer message of a Protected Voice Mail message. This text will be shown in all email client applications that don't support Protected Voice Mail messages. Note that a default message is always provided by UM when this property is set to `Null` or is empty.
RequireProtectedPlayOnPhone	Yes	The *RequireProtectedPlayOnPhone* parameter specifies whether users associated with the UM mailbox policy will be forced to listen to the protected voice message over the phone (using Play On Phone). The default value is `$false`. When the value is set to `$true`, the audio media player on Protected Voice Mail forms in Outlook or Outlook Web App will be shown as disabled. Note that the preview text for the voice message can always be accessed. The user can't play the audio file using any media player software or use the

		embedded media player to listen to the voice message.
AllowVoiceResponseToOtherMessageTypes	Yes	The *AllowVoiceResponseToOtherMessageTypes* parameter specifies whether callers who have authenticated to Outlook Voice Access to access their email will be able to compose a voice reply to email messages and meeting requests.

For more information about how to manage Protected Voice Mail settings, see Protected Voice Mail procedures or Set-UMMailboxPolicy.

Return to top

Text message notifications and Protected Voice Mail

Users who configure their UM account to send text message notifications (also called SMS notifications) to their mobile phone when voice messages are received will also receive audio transcription (Voice Mail Preview) text as part of the body of the text message. However, for protected voice messages, this represents a security issue because the content of the voice messages should always be protected.

When UM creates a text message notification for a voice message that's protected, it checks whether the voice message is marked as Private. If so, it won't add the transcribed audio text to the text message that it sends to the mobile phone. The following text will be included in the text message instead: "Use Outlook Voice Access to access this protected voice mail message."

Protected Voice Mail procedures

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-01-30*

Configure Protected Voice Mail from authenticated callers

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure Unified Messaging to answer an incoming call, and then determine whether it will apply protection to voice mail messages by using encryption. When a voice message is protected:

- The message is marked as Private in Microsoft Outlook and Outlook Web App.
- The voice message can be opened only by the intended recipient of the voice message.
- The recipient can reply to the voice message, but can't forward it to someone who wasn't included on the original voice message.

This setting applies to voice messages sent to UM-enabled users when they don't answer their phone. This setting also applies when callers sign in to their mailbox using Outlook Voice Access, and then create and send a voice message.

For additional management tasks related to Protected Voice Mail procedures, see Protected Voice Mail procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure Protected Voice Mail from authenticated callers

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Protected voice mail**, under **Protect voice message from authenticated callers**, select one of the following options:
   - **None** Use this setting when you don't want protection applied to any voice messages sent to UM-enabled users.
   - **Private** Use this setting when you want Unified Messaging to apply protection only to voice messages that have been marked as private by the caller.
   - **All** Use this setting when you want Unified Messaging to apply protection to all voice messages, including those not marked as private.
4. Click **Save**.

Use the Shell to configure Protected Voice Mail from authenticated callers

This example protects voice messages from all authenticated callers on the UM mailbox policy `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy
ProtectAuthenticatedVoiceMail -All
```

Configure Protected Voice Mail from unauthenticated callers

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure Unified Messaging to answer an incoming call, and then determine whether it will apply protection to voice mail messages by using encryption. When a voice mail message is protected:

- The message is marked as Private in Microsoft Outlook and Outlook Web App.
- The voice message can be opened only by the intended recipient of the voice message.
- The recipient can reply to the voice message, but can't forward it to someone who wasn't included on the original voice message.

This setting applies to voice messages sent to UM-enabled users when they don't answer their phone. This setting also applies to voice messages sent directly to UM-enabled users when the caller uses a UM auto attendant.

For additional management tasks related to Protected Voice Mail procedures, see Protected Voice Mail procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to configure Protected Voice Mail from unauthenticated callers

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want

to manage, and then click **Edit** .

3. On the **UM Mailbox Policy** page > **Protected voice mail**, under **Protect voice message from unauthenticated callers**, select one of the following options:
   - **None** Use this setting when you don't want protection applied to any voice messages sent to UM-enabled users.
   - **Private** Use this setting when you want Unified Messaging to apply protection only to voice messages that have been marked as private by the caller.
   - **All** Use this setting when you want Unified Messaging to apply protection to all voice messages, including those not marked as private.
4. Click **Save**.

Use the Shell to configure Protected Voice Mail from unauthenticated callers

This example protects all voice messages from all unauthenticated callers on the UM mailbox policy `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
ProtectUnauthenticatedVoiceMail -All
```

Enable or disable multimedia playback of protected voice messages

Set up client voice mail features > Protect voice mail > Protected Voice Mail procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can force users who receive protected voice mail messages to use the Play on Phone feature to listen to their messages. Or, if the client software doesn't support rights management, users must use Outlook Voice Access to listen to messages.

To listen to voice messages, Unified Messaging (UM)-enabled users can use the Play on Phone feature or use multimedia software on a computer or mobile device. Multimedia playback allows a UM-enabled user to use a media player over computer speakers or use a media player on a mobile device to hear the voice message.

Note:
Protected voice mail is available only on clients that are using a version of Outlook that supports rights management. If the client software doesn't support rights management, users

must use Outlook Voice Access to listen to their calls.

By default, the value of the **RequireProtectedPlayOnPhone** property on a UM mailbox policy is set to false. This means that UM-enabled users that are associated with that UM mailbox policy can listen to protected voice messages by:

- Using Outlook Voice Access.
- Using the built-in media player or the Play on Phone button in Outlook 2010 or a later version.
- Using the built-in media player or the Play on Phone button in Outlook Web App.

If this value is set to true, multimedia playback of protected voice mail isn't allowed. UM-enabled users associated with a UM mailbox policy on which this value is set to true can listen to protected voice messages only by:

- Using Outlook Voice Access.
- Using the Play on Phone button in Outlook 2010 or a later version.
- Using the Play on Phone button in Outlook Web App.

This setting is especially useful when UM-enabled users use public computers, laptops in public places, or their mobile device's media player to listen to protected voice mail that can contain private information.

For additional management tasks related to Protected Voice Mail procedures, see Protected Voice Mail procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable or disable multimedia playback of

protected voice messages

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. Under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Protected voice mail**, select the check box next to **Require Play on Phone for protected voice messages** to enable this setting. Clear the check box to disable this setting.
4. Click **Save**.

Use the Shell to enable or disable multimedia playback of protected voice messages

This example allows users who are associated with the UM mailbox policy named `MyUMMailboxPolicy` to play back protected voice messages using a media player.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
RequireProtectedPlayOnPhone $false
```

This example prevents users who are associated with the UM mailbox policy named `MyUMMailboxPolicy` from playing back protected voice messages using a media player.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
RequireProtectedPlayOnPhone $true
```

Specify the text to display for email clients that don't support Windows Rights Management

Set up client voice mail features > Protect voice mail > Protected Voice Mail procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can specify the text that will be sent to a user when they receive a protected voice message but their email client doesn't support Information Rights Management (IRM) or Windows Rights Management.

Protected Voice Mail can be accessed only by email clients that support Windows Rights Management or when a UM–enabled user uses Outlook Voice Access to access a protected voice message.

Protected Voice Mail is encrypted. When a voice message is protected:

- The message is marked as Private in Microsoft Outlook and Outlook Web App.
- The voice message can be opened only by the intended recipient of the voice message.
- The recipient can reply to the voice message, but can't forward it to someone who wasn't included on the original voice message.

If a protected voice message is sent to someone whose email client doesn't support Windows Rights Management and isn't accessing the message using Outlook Voice Access, an email message will be sent to them that includes the text you specify. This text should include instructions about what the called party should do to be able to receive the protected voice message.

For additional management tasks related to Protected Voice Mail procedures, see Protected Voice Mail procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use EAC to specify the text to display for email clients that don't support Windows Rights Management

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** ✎.
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** ✎.

3. On the **UM Mailbox Policy** page > **Protected voice mail**, under **Message to send to users who don’t have Windows Rights Management support**, type the message text in the text box.
4. Click **Save**.

Use the Shell to specify the text to display for email clients that don't support Windows Rights Management

This example specifies the text to display to users associated with the UM mailbox policy named `MyUMMailboxPolicy` who have email clients that don't support Windows Rights Management.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
ProtectedVoiceMailText "Your email client software does not
support Protected Voice Mail. Please contact the Help
Desk."
```

Allow Message Waiting Indicator

Exchange Server 2013 > Unified Messaging > Set up client voice mail features >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-25*

Message Waiting Indicator (MWI) is a feature that's found in most legacy voice mail systems. It lets users know that they have new or unheard voice mail messages. In its most common form, this feature lights a lamp on a user's phone to indicate the presence of a new or unheard voice message.

Contents

Overview

MWI notifications can include any mechanism that indicates the existence of a new or unheard

voice message. The message can be in a new email message or one that's marked as unread. The MWI notification might take any of the following forms:

- A new voice message seen from Microsoft Outlook or Outlook Web App.
- A text or Short Messaging Service (SMS) message sent to a mobile phone that's configured to receive text messages.
- An outbound call made from Exchange Unified Messaging (UM).
- A lamp on a phone.
- A special dial tone.
- Icons or buttons on the display screen of a phone.
- A highlighted notification within a software application.

In Unified Messaging, a user's voice mail is stored in their mailbox. It can be accessed from a telephone using Outlook Voice Access, from a desktop or portable computer using Outlook or Outlook Web App, and from mobile phone clients. When a user receives a new voice message, the message appears in their Voice Mail search folder. If the voice message is accessed using Outlook or Outlook Web App, an email message will be included with the voice message.

When previous versions of UM were deployed in an organization, MWI was supported in either a traditional VoIP gateway environment or an IP PBX environment by using a third-party solution or application, or it was included as part of Exchange UM. In Exchange 2010 or later, MWI is also supported when UM is deployed with Microsoft Lync Server. The MWI notification mechanism used by Lync Server depends on the type of VoIP-based phone that's used by the Enterprise Voice and UM-enabled user, and can be located on any of the following:

- A phone
- A phone display
- A dial pad button

By default, MWI is turned on for all users who are enabled for UM. It's controlled through settings on a UM mailbox policy or on the UM IP gateways that have been created and linked to a UM dial plan. MWI also works with protected voice messages.

To implement MWI in a traditional telephony environment with VoIP gateways, IP PBXs, or SIP-enabled PBXs, a Mailbox server running the Microsoft Exchange Unified Messaging service sends an MWI Session Initiation Protocol (SIP) NOTIFY message to a *SIP peer*, which is either an IP PBX, a VoIP gateway used with a legacy PBX, a SIP-enabled PBX, or if you have deployed Lync Server, Lync servers are also considered SIP peers. The IP PBX or PBX lights the lamp on the desktop phone to notify the user of a new or unheard voice message.

There are two ways callers can leave voice messages: using call answering and Outlook Voice Access. With call answering, a Mailbox server answers an incoming call and allows the caller to leave a voice message for a user. With Outlook Voice Access, when a caller calls an Outlook Voice Access number, they can use the menu system to leave a voice message for a UM-enabled user.

Return to top

The Mailbox server's role in MWI

When a caller calls a UM-enabled user and the user doesn't answer their phone, the Microsoft Exchange Unified Messaging service on a Mailbox server receives MWI state change information and uses a SIP NOTIFY message to send the request for a change of notification to a VoIP gateway, IP PBX, or SIP-enabled PBX. The change of notification includes the following information:

- Message Waiting Indicator enabled (Yes or No).
- Number of new voice messages or voice messages marked unheard.
- Number of old voice messages or voice messages marked heard.
- Number of new urgent voice messages or urgent voice messages marked unheard.
- Number of old urgent voice messages or urgent voice messages marked heard.
- The primary extension number on the primary UM dial plan.
- The IP address or fully qualified domain name (FQDN) of the SIP peer to be used for SIP NOTIFY messages.
- The security type of the UM dial plan (Unsecured, SIP secured, or Secured). This information will be used to determine whether the connection to the VoIP gateway or IP PBX must be SIP over TCP or SIP over TLS. Transport Layer Security (TLS) is supported for MWI SIP NOTIFY.

A Mailbox server uses the diversion information on the header of the incoming call to determine the extension number or phone number of the UM-enabled user. When the extension or phone number is determined, the Mailbox server sends the request to the SIP peer. The SIP peer then changes the MWI state and turns on the notification on the user's phone.

Note:

Although PBX outages should be rare, UM automatically refreshes the MWI state for every mailbox at least once every 12 hours. There is no way to force a refresh, but if the PBX or IP PBX is powered off and all the MWI lamps go off, all lamps should be restored to the correct state within six hours.

Return to top

MWI SIP NOTIFY messages

MWI notifications use SIP NOTIFY messages to communicate with SIP peers. MWI state change information is included in the SIP NOTIFY message and indicates whether MWI notifications will be sent to users. Whenever there's a change in the MWI state, the Mailbox Assistant sends this information to the Microsoft Exchange Unified Messaging service running on a Mailbox server. After the Unified Messaging service receives this information, it parses the message to obtain the target SIP peer and the MWI state change information. It then forms a SIP NOTIFY message with the MWI state change information in the message body and sends this information on to the SIP peer.

MWI is based on RFC 3842. RFC 3842 states that SIP event notifications must be used for message-waiting notifications. MWI is based on the SIP model, and is driven by the endpoints found in a unified messaging system. SIP endpoints, also called SIP peers, that obtain MWI information must

send a SIP SUBSCRIBE message to the Unified Messaging service. The service replies with a NOTIFY message indicating that the subscription has been accepted. All MWI state change information will be conveyed from the Unified Messaging system to a SIP endpoint using NOTIFY messages that are embedded within the subscription that was previously created. The exact syntax of the SIP NOTIFY message to be sent to the SIP peer. is based on the format described in RFC 3842.

When the Unified Messaging service on a Mailbox server sends an MWI NOTIFY message to the SIP peer, the event header is set to “message-summary”, which indicates that this is an MWI-related NOTIFY message. The To header field indicates the SIP endpoint for which the MWI service must be provided. The Subscription-State header must be set to “terminated” instead of “active”. The following actions occur in response to the SIP NOTIFY message:

1. The SIP peer conveys this information to the PBX using a circuit-switched protocol such as SMDI.
2. The PBX sends a success message over a circuit-switched protocol.
3. The SIP peer can respond with either of the following messages: 200 OK (Success) or 480 (Temporarily Unavailable). A Mailbox server can handle both these responses and additional failure responses.

MWI in a traditional telephony environment

In a traditional telephony environment, an incoming call is received by the PBX and then sent on to the VoIP gateway, or is received by the IP PBX or SIP-enabled PBX. The Mailbox server and the Mailbox Assistant are used to determine the MWI state for the UM-enabled user. They're responsible for delivering the SIP notification back to the VoIP gateway and legacy PBX, IP PBX, or SIP-enabled PBX.

In a traditional telephony environment, the call flow and MWI notification are as follows:

1. The incoming call is received by the legacy PBX, forwarded to the VoIP gateway, or to an IP PBX or SIP-enabled PBX, and then forwarded to the extension number of the UM-enabled user. The user doesn't answer and the caller is prompted to leave a voice message.
2. The VoIP gateway or IP PBX submits the call to a Mailbox server running the Microsoft Exchange Unified Messaging service.
3. The Mailbox server performs an LDAP query to locate the UM-enabled user's information, such as the user’s extension number and personal greetings. The greetings for the UM-enabled user are played.
4. The voice message that was created by the Unified Messaging service is submitted to the Microsoft Exchange Transport service on the same Mailbox server.
5. The Transport service on the Mailbox server submits the voice message to the Mailbox server that contains the user’s mailbox. The Mailbox Assistant receives a MAPI event for a new voice message.
6. The Mailbox Assistant reads the UM dial plan and the UM mailbox policy to determine whether MWI notifications should be sent to the UM-enabled user. The Mailbox Assistant queries for all Mailbox servers that are associated with the UM dial plan of the UM-enabled user. The Mailbox Assistant tries to send the RPC event to the first Mailbox server that's returned. If this fails, it tries

the next one. It will keep retrying for five minutes, or until all Mailbox servers have been tried. If all the RPC calls fail, the Mailbox Assistant logs the error in Event Viewer. The Mailbox server queries for all UM IP gateways that are associated with the UM dial plan of the UM-enabled user's mailbox.

7. UM sends a SIP NOTIFY message to the first VoIP gateway or IP PBX that's returned from the query. If this fails, the Mailbox server will choose the next VoIP gateway or IP PBX. The Mailbox server will keep trying for a VoIP gateway or IP PBX for five minutes. If all attempts to find a VoIP gateway or IP PBX fail, the Mailbox server will log an error. If a VoIP gateway or IP PBX is located successfully, the VoIP gateway will send the notification to the PBX, and the PBX in turn will send a notification of the MWI event to the user's phone to light the phone lamp. If an IP PBX is used, the MWI notification is processed by the IP PBX and it will then light the user's phone lamp. Other MWI notification mechanisms are listed in the Overview section. The type of notification depends on the PBX or IP PBX hardware vendor and whether Lync Server is being used. It also depends on the type of phone—analog, digital, or VoIP—that's being used.

Return to top

MWI in a Lync Server environment

In telephony environments that include Lync Server, an incoming call can be sent from an external phone to a Mediation Server, sent from a Lync client, or sent from a unified communications (UC) or other VoIP-based phone. After the call is received, it's sent to the Lync Server front-end server pool. The Mailbox server and the Mailbox Assistant are used to determine the MWI state for the UM-enabled user and to deliver this notification to the Lync client, analog or digital or UC or VoIP-based phone.

In a telephony environment with Lync Server, the call flow and MWI notification are as follows:

1. The call is sent from one of the following:
   - A phone external to the organization (sent to a Mediation Server)
   - A Lync-based client
   - A UC or other VoIP-based phone
2. The incoming call is received by the Lync Server front-end server pool and sent on to the phone or SIP endpoint of the UM-enabled user. The user doesn't answer and the caller is prompted to leave a voice message.
3. The Lync Server front-end server pool submits the call to a Mailbox server within the on-premises network and the user's mailbox is found.
4. The Mailbox server performs an LDAP query to locate information for the UM-enabled user, such as their extension number and greetings. The greetings are played, and the caller is prompted to leave a voice message.
5. The voice message that was created by the Unified Messaging service is submitted to the Transport service on the same Mailbox server within the same site.
6. The Transport service submits the voice message to the Mailbox server that contains the user's mailbox. The Mailbox Assistant receives a MAPI event for the new voice message.

7. The Mailbox Assistant reads the UM dial plan and the UM mailbox policy to decide whether MWI notifications should be sent to the user. The Mailbox Assistant queries for all Mailbox servers that are associated with UM dial plan of the user. The Mailbox Assistant tries to send the RPC event to the first Mailbox server that's returned. If this attempt fails, the Mailbox Assistant tries the next one. It will keep trying to find a Mailbox server for five minutes or until all servers have been tried. If all the RPC calls fail, the Mailbox Assistant will log an error in the Event Viewer. The Mailbox server queries Active Directory for all UM IP gateways that are associated with the UM dial plan of the UM-enabled user.
8. UM sends a SIP NOTIFY message to the first VoIP gateway or IP PBX that's returned from the query. If this fails, the Mailbox server will choose the next VoIP gateway or IP PBX. The Mailbox server will keep trying to find a VoIP gateway or IP PBX for five minutes. If all attempts to contact the VoIP gateway or IP PBX fail, the Mailbox server will log an error. If it's successful, the VoIP gateway or IP PBX will send the notification to the Lync Server front-end server pool, which in turn will send a notification of the MWI event to a SIP endpoint used by the user, the user's phone, or a Lync client.

Return to top

MWI resilience

When you're deploying Mailbox and Client Access servers, UM dial plans, and UM IP gateways, and you’re using MWI for UM-enabled users, it's best to deploy multiple Mailbox and Client Access servers as well as multiple VoIP gateways and IP PBXs to create fault tolerance and resilience. Doing this also creates MWI resilience because it provides multiple ways to send MWI notifications, as described in the preceding section.

To enable fault tolerance for MWI in Unified Messaging, you must create and configure one or more of the following:

- A UM dial plan that's linked with the UM-enabled user who will receive MWI notifications.
- A UM mailbox policy that's linked with the UM-enabled user who will receive MWI notifications.
- A UM IP gateway that's linked with the UM dial plan that's linked with the UM-enabled user who will receive MWI notifications.
- If Lync Server is used, all the Client Access and Mailbox servers must be added to the UM SIP URI dial plan that's linked with the UM-enabled user who will receive MWI notifications.

MWI administration

MWI can be administered by configuring settings on two UM components: UM mailbox policies and UM IP gateways. For both UM components, you can enable or disable MWI notifications by using the **Set-UMMailboxPolicy** cmdlet or the **Set-UMIPgateway** cmdlet in the Exchange Management Shell. You can also configure the settings by using the Exchange Admin Center (EAC). You can view the status of MWI notifications by using the **Get-UMMailboxPolicy** cmdlet and the **Get-UMIPgateway** cmdlet in the Shell, or by viewing the settings in the EAC.

UM mailbox policies and MWI

You can create a UM mailbox policy to apply a common set of UM policy settings to a collection of UM-enabled mailboxes. For example, you can use a UM mailbox policy to apply PIN policy settings, dialing restrictions, and MWI notifications settings. If you enable or disable MWI on a UM mailbox policy, it will be enabled or disabled for all UM-enabled users who are linked with that UM mailbox policy. The MWI setting can also apply to a subset of the users who are linked with a UM dial plan. To learn more about UM mailbox policies, including how to enable or disable MWI for a group of UM-enabled users, see UM mailbox policy procedures.

You can use the EAC or the **Set-UMMailboxPolicy** cmdlet in the Shell to configure the MWI setting, as shown in the following table.

Message Waiting Indicator setting on a UM mailbox policy

Shell parameter	Setting available in the EAC?	Description
AllowMessageWaitingIndicator	Yes	The *AllowMessageWaitingIndicator* parameter specifies whether users who are linked with a UM mailbox policy can receive MWI notifications when they receive a new voice message. The default value is `$true`. When this setting is enabled, MWI notifications are sent to users who are linked with a single UM mailbox policy for calls taken by a UM IP gateway. This setting allows the UM IP gateway to receive and send SIP NOTIFY messages to UM-enabled users' phones or SIP endpoints.

For more information about how to manage MWI settings on a UM mailbox policy, see the following topics:

- Manage a UM mailbox policy
- Enable Message Waiting Indicator (MWI) for users

- Disable Message Waiting Indicator (MWI) for users
- Set-UMMailboxPolicy

UM IP gateways and MWI

If you disable MWI on a UM IP gateway, you'll disable MWI notifications for all users who connect to the VoIP gateway or IP PBX that's represented by the UM IP gateway. Disabling MWI on a single UM IP gateway that's linked to a UM dial plan can disable MWI notifications for all UM-enabled users associated with a single or multiple UM dial plans or a single or multiple UM mailbox policies. To learn more about UM mailbox policies, including how to enable or disable MWI for a group of UM-enabled users, see Manage a UM mailbox policy.

You can use the EAC or the **Set-UMMailboxPolicy** cmdlet in the Shell to configure the MWI setting, as shown in the following table.

Message Waiting Indicator setting on a UM IP gateway

Shell parameter	Setting available in the EAC?	Description
MessageWaitingIndicatorAllowed	Yes	The *MessageWaitingIndicatorAllowed* parameter specifies whether to enable the UM IP gateway to allow SIP NOTIFY messages to be sent to users associated with a UM dial plan. The default value is `$true`. When this setting is enabled, voice mail notifications can be sent to users for calls that are received by the UM IP gateway. This setting allows the UM IP gateway to send message-waiting notifications to UM-enabled users.

For more information about how to manage MWI settings, see the following topics:

- Manage a UM IP gateway
- Allow Message Waiting Indicator (MWI) on a UM IP gateway
- Prevent Message Waiting Indicator (MWI) on a UM IP gateway
- Set-UMIPGateway

Return to top

Text message (SMS) notifications for voice mail messages and missed calls

As mentioned earlier, an MWI notification is any mechanism that indicates the existence of a new voice mail message. In addition to the mechanisms already discussed, users can be notified that they have a voice message waiting via a text message, also called an SMS (Short Message Service) message. This is a different type of MWI notification for new voice messages than the traditional light or other mechanisms.

A text message is sent to a user's mobile phone when a caller leaves a new voice message. Users can also receive a text message that notifies them when they miss a phone call and a voice message isn't left. The missed call notification text message can be sent to the user along with the new voice mail notification.

Note:
The text message that's sent to a user includes voice mail preview.

Text message notifications use different settings than the MWI settings on the UM IP gateway or the UM mailbox policy. Text message notifications for new voice mail and missed calls are configured on UM mailbox policies and UM mailboxes. You can enable or disable text message notifications by using the **Set-UMMailboxPolicy** cmdlet and the **Set-UMMailbox** cmdlet in the Shell. You can view the status of text message notifications by using the **Get-UMMailboxPolicy** cmdlet and the **Get-UMMailbox** cmdlet. It's not possible to configure text message notifications in the EAC.

The following table shows the parameter on a UM mailbox that must be configured for a user to receive text messages for voice mail and missed call notifications:

Text message notification settings on a user's mailbox

UMSMSNotificationOption	No	The *UMSMSNotificationOption* parameter specifies whether a UM-enabled user can receive text message notifications for voice mail only, for voice mail and missed calls, or isn't allowed to receive notifications. The values for this parameter are: `VoiceMail`, `VoiceMailAndMissedCalls`,

		and `None`. The default value is `None`.

For more information about how to manage text message notification settings on a user's mailbox, see the following topics:

- Manage voice mail settings for a user
- Set-UMMailbox

The following table shows the parameter on a UM mailbox policy that must be configured for a user to receive text messages for voice mail and missed call notifications:

Text message and missed call notification settings on a UM mailbox policy

Shell parameter	Setting available in the EAC?	Description
AllowSMSNotification	No	The *AllowSMSNotification* parameter specifies whether UM-enabled users whose mailboxes are associated with the UM mailbox policy are allowed to receive text message notifications on their mobile phones. If this parameter is set to `$true`, you must also use the **Set-UMMailbox** cmdlet and set the *UMSMSNotificationOption* parameter for the UM-enabled user to either `voicemail` or `VoiceMailAndMissedCalls`. The default value is `$true`.

For more information about how to manage text message notification settings, see the following topics:

- Manage a UM mailbox policy
- Set-UMMailboxPolicy

For text message notifications for voice mail and missed calls to work correctly, you must perform the following tasks:

1. Use either the EAC or the Shell to enable the user for UM and link them to the correct UM mailbox policy.
2. On the UM mailbox policy that's linked to the user, verify that the *AllowSMSNotification*

parameter is set to `$true`. To set the parameter to `$true`, run the following command: `Set-UMMailboxPolicy -id MyUMMailboxPolicy - AllowSMSNotification $true`.

3. On the user's mailbox, enable text message notifications by setting the *UMSMSNotificationOption* parameter to `VoiceMailAndMissedCalls` or `VoiceMail`.
4. Because the default setting is `None`, you must run the following command from the Shell and set the text message notification option to either `VoiceMailAndMissedCalls` or `VoiceMail`. For example: `Set-UMMailbox- -id MyUMMailbox -UMSMSNotificationOption VoiceMailAndMissedCalls`.

Important:
The *AllowSMSNotification* parameter on the UM mailbox policy and the *UMSMSNotificationOption* parameter on the user's mailbox must both be set to `$true` for SMS notifications to work.

In addition to your configuring the UM mailbox policy and the user's mailbox to enable text message notifications for new voice mail and missed calls, the user must enable and configure text message notifications when they sign in to Outlook Web App. To set up and configure text message notifications, the user must:

1. Sign in to Outlook Web App and go to **Options** > **Phone** > **Voice mail**.
2. On the **Voice Mail** page, under **Notifications**, click **Set up notifications**.
3. On the **Text messaging** page, click the **Turn on notifications** button.

Warning:
Don't click **Voice mail notifications** or it will take you back to the **Voice mail** page.

4. On the **Text messaging** page, under **Locale**, use the drop-down list to select the locale or location of the text messaging mobile operator.
5. On the **Text messaging** page, under **Mobile operator**, use the drop-down list to select the text messaging mobile operator, and then click **Next**.
6. On the **Text messaging** page, in the **Enter your phone number and click Next** box, enter the mobile phone number that's used for text message notifications, and then click **Next**. A six-digit passcode will be sent to the mobile phone. If you didn't receive a passcode, click **I didn't receive a passcode and need it sent again**.
7. Enter the passcode in the **Passcode** box, and then click **Finish**.
8. After the user enables text message notifications, they can click **Set up voice mail notifications** on the **Text Messaging** page. They'll be taken back to the voice mail page, where they can scroll down to the **Notifications** section and set up text message notification options for missed calls and voice mail.

Allow Message Waiting Indicator procedures

Topic Last Modified: *2013-05-03*

Allow Message Waiting Indicator (MWI) on a UM IP gateway

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-23*

You can allow or prevent voice mail notifications to users for calls received by a Unified Messaging (UM) IP gateway. If you enable this setting, the UM IP gateway can receive and send SIP NOTIFY messages for users. Message Waiting Indicator (MWI) is enabled by default and allows message waiting notifications to be sent to users, but you can turn it off depending on your needs.

A message waiting indicator notifies a user about a new or unheard voice message. It appears in the Inbox in clients such as Outlook and Outlook Web App. It can also be a text (SMS) message sent to a registered mobile phone, an outgoing call made from an Exchange server to a number that's been configured for playing new messages, or a lighted lamp on a user's desktop phone.

Tip:
MWI notifications can also be enabled and disabled on a UM mailbox policy for a group of users.

For additional management tasks related to UM IP gateways, see UM IP gateway procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM IP gateways" entry in the Unified Messaging

permissions topic.

- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM IP gateway has been created. For detailed steps, see Create a UM IP gateway.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to allow Message Waiting Indicator

1. In the EAC, navigate to **Unified Messaging** > **UM IP Gateways**, select the UM IP gateway you want to change, and then click **Edit** .
2. On the **UM IP Gateway** page, select the check box next to **Allow message waiting indicator**.
3. Click **Save**.

Use the Shell to allow Message Waiting Indicator

This example allows the message waiting indicator to appear for users who are associated with the UM IP gateway named `MyUMIPGateway` with an IP address of 10.10.10.1.

```
Set-UMIPGateway -Identity MyUMIPGateway -Address 10.10.10.1
-MessageWaitingIndicatorAllowed $true
```

Prevent Message Waiting Indicator (MWI) on a UM IP gateway

Set up client voice mail features > Allow Message Waiting Indicator > Allow Message Waiting Indicator procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

You can prevent voice mail notifications to users for calls received by a Unified Messaging (UM) IP gateway. If you enable this setting, the UM IP gateway can receive and send SIP NOTIFY messages

for users. Message Waiting Indicator (MWI) is enabled by default and allows message waiting notifications to be sent to users, but you can turn it off depending on your needs.

A message waiting indicator notifies a user about a new or unheard voice message. It appears in the Inbox in clients such as Outlook and Outlook Web App. It can also be a text (SMS) message sent to a registered mobile phone, an outgoing call made from an Exchange server to a number that's been configured for playing new messages, or a lighted lamp on a user's desktop phone.

Tip:

MWI notifications can also be enabled and disabled on a UM mailbox policy for a group of users.

For additional management tasks related to UM IP gateways, see UM IP gateway procedures.

What do you need to know before you begin?

What do you want to do?

Use the EAC to prevent Message Waiting Indicator

1. In the EAC, navigate to **Unified Messaging** > **UM IP Gateways**, select the UM IP gateway you want to change, and then click **Edit** ✎.
2. On the **UM IP Gateway** page, clear the check box next to **Allow message waiting indicator**.
3. Click **Save**.

Use the Shell to prevent Message Waiting Indicator

This example prevents the message waiting indicator from appearing for users who are associated with the UM IP gateway named `MyUMIPGateway` with an IP address of 10.10.10.1.

```
Set-UMIPGateway -Identity MyUMIPGateway -Address 10.10.10.1
-MessageWaitingIndicatorAllowed $false
```

Enable Message Waiting Indicator (MWI) for users

Set up client voice mail features > Allow Message Waiting Indicator > Allow Message Waiting Indicator procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

You can enable or disable Message Waiting Indicator for users associated with a Unified Messaging (UM) mailbox policy. Message Waiting Indicator is a feature found in most legacy voice mail systems. In its most common form, it lights a lamp on a voice mail subscriber's phone to indicate the presence of a new voice mail message. Message Waiting Indicator can also send a text message to a UM-enabled user's mobile phone. The default setting is enabled.

If Message Waiting Indicator is disabled on the UM IP gateway, the feature isn't available to UM-enabled users associated with the UM mailbox policy.

For additional management tasks related to UM mailbox policies, see UM mailbox policy procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowMessageWaitingIndicator $false
```

Enable missed call notifications for a user

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-12-09*

You can enable or disable missed call notifications for a Unified Messaging (UM) mailbox policy by using the Shell or the EAC. A missed call notification is an email message that's sent to a user when the user doesn't answer an incoming call and the caller doesn't leave a voice mail message. This is a different email message than the message that contains the voice message that's left for a user.

When you disable missed call notifications on a UM mailbox policy, you prevent all users associated with the UM mailbox policy from receiving an email message when they don't answer an incoming call and the caller doesn't leave a voice message. By default, missed call notifications are enabled for each UM mailbox policy that's created. Also by default, a UM mailbox policy is created every time you create a UM dial plan.

Note:

When you're integrating Unified Messaging and Microsoft Lync Server, missed call notifications aren't available to users that have a mailbox located on an Exchange 2007 or Exchange 2010 Mailbox server when a user disconnects before the call is sent to a Mailbox server running the Microsoft Exchange Unified Messaging service.

For additional management tasks related to UM mailbox policies, see Manage a UM mailbox policy.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable missed call notifications for a UM mailbox policy

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **General**, select the check box next to **Allow missed call notifications**.
4. Click **Save**.

Use the Shell to enable missed call notifications for a UM mailbox policy

This example enables missed call notifications for a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowMissedCallNotifications $true
```

Disable missed call notifications for a user

Set up client voice mail features > Allow Message Waiting Indicator > Allow Message Waiting Indicator procedures >

Applies to: *Exchange Online*

Topic Last Modified: *2012-12-09*

You can enable or disable missed call notifications for a Unified Messaging (UM) mailbox policy by using the Shell or the EAC. A missed call notification is an email message that's sent to a user when the user doesn't answer an incoming call and the caller doesn't leave a voice message. This is a different email message than the one that contains the voice message that's left for a user.

When you disable missed call notifications on a UM mailbox policy, you prevent all users associated with the UM mailbox policy from receiving an email message when they don't answer an incoming call and the caller doesn't leave a voice message. By default, missed call notifications are enabled for each UM mailbox policy that's created. Also by default, a UM mailbox policy is created every time you create a UM dial plan.

Note:

When you're integrating Unified Messaging and Microsoft Lync Server, missed call notifications aren't available to users that have a mailbox located on an Exchange 2007 or Exchange 2010 Mailbox server when a user disconnects before the call is sent to a Mailbox server running the Microsoft Exchange Unified Messaging service.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
AllowMissedCallNotifications $false
```

Set Outlook Voice Access PIN security

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-16*

When Unified Messaging (UM) users connect to the voice mail system by telephone, they use Outlook Voice Access to navigate the menu system. Before users can access the voice mail system, the system prompts them to enter their PIN. As the administrator, you can configure PIN settings and requirements and perform PIN management tasks. After a user has been enabled for voice mail and a PIN has been generated, the user's PIN is stored encrypted in the user's mailbox.

Note:
Outlook Voice Access users must use touchtone (also called dual tone multi-frequency (DTMF)) inputs to enter their PIN to access their UM-enabled mailbox. Speech recognition isn't available for PIN entry.

Contents

PIN overview

A PIN is a numeric string that's used in certain systems so that a user can be authenticated and gain access to the system. PINs are most frequently used for automatic teller machines (ATMs). They're also used instead of alphanumeric passwords for voice mail systems. The strength of a PIN depends on its length, how well it's protected, and how difficult it is to guess.

In Unified Messaging, Outlook Voice Access users enter their PIN on an analog, digital, or mobile telephone so that they can access email, voice mail, contact, and calendaring information in their Exchange Server mailbox.

In UM, PIN policies are defined and configured on a UM mailbox policy. You can create multiple UM mailbox policies depending on your requirements. When you enable a user for voice mail, you

link the user to an existing UM mailbox policy. The UM PIN policies that are configured on the UM mailbox policy should be based on the security requirements of your organization.

PIN requirements

The following are several PIN configuration settings that you can set on a UM mailbox policy.

Minimum PIN length

The **Minimum PIN length** setting specifies the minimum number of digits that a mailbox PIN must contain. The range is 4 through 24, and the default is 6. If you enter 0, users aren't required to enter a PIN.

Important:
Configuring this setting with zero isn't a recommended practice. If you configure the setting to zero, you greatly decrease the level of security for your network.

If you change the minimum PIN length to a higher value, current Outlook Voice Access users will be prompted to create a new PIN that contains the new minimum number of digits before they can continue.

Note:
Increasing this number creates a more secure UM environment. However, setting it too high can result in users forgetting their PIN.

Enforce PIN lifetime

The **Enforce PIN lifetime** setting controls the time interval, in days, from the date Outlook Voice Access users last changed their PIN to the date they'll be forced to change their PIN again. The range is 0 through 999, and the default is 60 days. If 0 is entered, the PIN won't expire.

Note:
Unified Messaging won't notify users when their PIN is about to expire.

Number of sign-in failures before PIN reset

The **Number of sign-in failures before PIN reset** setting specifies the number of sequential unsuccessful sign-in attempts before the mailbox PIN is automatically reset. To disable this feature, set this setting to unlimited. Otherwise, it must be set to a number lower than the **Number of sign-in failures before lockout** setting. The range is 1 through 998, and the default is 5.

Note:
To increase security for UM-enabled users, enter a number that's less than 5.

Number of sign-in failures before lockout

The **Number of sign-in failures before lockout** setting specifies how many PIN entry errors in successive calls Outlook Voice Access users can make before they're locked out of their mailbox. By default, after 5 attempts are made, the PIN is automatically reset. The range is 1 through 999, and the default is 15.

Note:

To increase security, decrease the number of failed attempts that are allowed. But remember that decreasing it to a number much lower than the default may result in users being locked out unnecessarily. Unified Messaging will generate warning events that can be viewed using Event Viewer if PIN authentication fails for a UM-enabled user or the user is unsuccessful in trying to sign in to the system.

Allow common PIN patterns

The **Allow common PIN patterns** setting is used to either enable or disable the use of common number patterns when creating a PIN. By default, this setting is disabled and won't allow Outlook Voice Access users to enter the following number patterns:

- **Sequential numbers** PIN values that consist completely of consecutive numbers. Examples of sequential numbers for a PIN are 1234 and 65432.
- **Repeated numbers** PIN values that consist of repeated numbers. Examples of repeated numbers are 11111 and 22222.
- **Suffix of mailbox extension** PIN values that consist of the suffix of a user's mailbox extension. If the mailbox extension is 36697, the PIN can't be 6697.

PIN recycle count

The **PIN recycle count** setting configures the number of different PINs a user must use before any PINs that were previously used can be reused. The range is 1 through 20, and the default is 5.

Managing Outlook Voice Access PINs

When planning for Outlook Voice Access PINs, you must choose the appropriate levels of security for your organization. You must carefully consider the Outlook Voice Access PIN requirements and how your PIN security settings meet or exceed your organization's security policy.

Important:

It's a security best practice to implement strong PIN requirements for Outlook Voice Access users. This can be enforced by creating UM mailbox policy PIN policies that require six or more digits for PINs, which increases the level of security for your network.

After you set the Outlook Voice Access PIN requirements, you must create and configure a UM mailbox policy to enforce your organizational PIN requirements. For details about how to create a

UM mailbox policy, see Create a UM mailbox policy. For details about how to manage UM mailbox policies, see Manage a UM mailbox policy.

Note:

After you create the UM mailbox policy, you must link the UM-enabled user or users with the appropriate UM mailbox policy. You can do this by using the **Enable-UMMailbox** cmdlet in the Exchange Management Shell or by using the Exchange Administration Center (EAC). For more information about the Exchange Management Shell cmdlet, see Enable-UMMailbox.

There are situations in which Outlook Voice Access users forget their PIN or are locked out of voice mail access to their mailbox. In either case, it may be necessary for you to reset a UM-enabled user's PIN. For details, see Reset a voice mail PIN.

You can retrieve PIN information for a user who is enabled for Unified Messaging. The information returned to you is calculated by using the encrypted PIN data stored in the user's mailbox. This lets you view PIN information for the user and also indicates whether the user has been locked out of their mailbox. For details, see Retrieve voice mail PIN information.

PIN security procedures

Exchange Server 2013 > Unified Messaging > Set Outlook Voice Access PIN security >

Applies to: *Exchange Online*

Topic Last Modified: *2013-04-16*

Set Outlook Voice Access PIN policies

Reset a voice mail PIN

Retrieve voice mail PIN information

Include text with the email message sent when a PIN Is reset

Set the minimum PIN length for voice mail

Set the PIN lifetime for voice mail

Set the number of previous voice mail PINs to recycle

Disable common PIN patterns for voice mail

Enable common PIN patterns for voice mail

Set the number of sign-in failures before a voice mail PIN is reset

Set the number of sign-in failures before a voice mail user Is locked out

Enable PIN-less sign-Ins for voice mail

Set Outlook Voice Access PIN policies

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can set PIN policies on a Unified Messaging (UM) mailbox policy. UM mailbox policies can be configured to increase the level of security for UM-enabled users that use Outlook Voice Access by requiring users to comply with the predefined PIN policies for your organization.

To set PIN policies for Outlook Voice Access users, you can either create a new UM mailbox policy or modify an existing UM mailbox policy. After a new UM mailbox policy is created, you can then configure the UM mailbox policy by configuring the following PIN settings:

- `MinPasswordLength`
- `PINLifetime`
- `LogonFailuresBeforePINReset`
- `MaxLogonAttempts`
- `AllowCommonPatterns`
- `PINHistoryCount`

It's a security best practice to implement strong PIN requirements for UM users. This can be enforced by creating UM PIN policies that require 6 or more digits for PINs and increase the level of security for your network.

When you change the PIN policy, the new PIN setting is applied to users who are currently associated with the UM mailbox policy. For example, if you modify the UM mailbox policy and change the minimum PIN length from 7 to 10 digits, the next time users log on they'll be forced to change their PIN to comply with the changed PIN requirement.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

What do you want to do?

Use the EAC to set PIN policies for Outlook Voice Access users

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, click the UM dial plan you want to edit, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to edit, and then click **Edit** .
3. Click **Properties**.
4. On the **UM mailbox policy** page, click **PIN policies**.
5. On the **PIN Policies** page, configure the PIN settings for the Outlook Voice Access users associated with this UM mailbox policy, and then click **Save**.

Use the Shell to set PIN policies for Outlook Voice Access users

This example sets the PIN settings for users associated with the UM mailbox policy `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 8 -MaxLogonAttempts 12 -
MinPINLength 8 -PINHistoryCount 10 -PINLifetime 60 -
ResetPINText "The PIN used to allow you access to your
mailbox using Outlook Voice Access has been reset."
```

Reset a voice mail PIN

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

When a Unified Messaging (UM)-enabled voice mail user is locked out of their mailbox using

Outlook Voice Access because they tried to sign in using an incorrect PIN multiple times or they forgot their PIN, you can use one of the following procedures to reset the user's PIN. When you reset a user's Outlook Voice Access PIN, you can configure UM to automatically generate a PIN or you can manually specify the PIN. The new PIN is sent to the user in email. You can specify additional PIN options such as requiring the user to reset their PIN when they first sign in. Users can also reset their UM PIN using Outlook or Outlook Web App.

Note:

To access their UM-enabled mailboxes, Outlook Voice Access users need to use touchtone, also known as dual tone multi-frequency (DTMF), inputs. Speech recognition isn't available for PIN input.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to reset a Unified Messaging PIN

1. In the EAC, navigate to **Recipients**. In the list view, select the user mailbox that you want to view.
2. In the details pane, under **Phone and Voice Features**, under **Unified Messaging**, click **View details**.
3. On the **UM Mailbox** page, under **UM mailbox settings**, click **Reset PIN**.
4. On the **Reset UM Mailbox PIN** page, use the following options to reset the UM-enabled user's PIN:
   - **Automatically generate a PIN** Use this option to automatically generate the PIN that's used by the user to gain access to their mailbox using Outlook Voice Access. By default, this setting is enabled.

The automatically generated PIN will be sent in an email message to the user's mailbox. After they receive the PIN and sign in to their mailbox, they'll be prompted to change the PIN to a PIN that's more familiar to them.

Outlook Web App and Microsoft Outlook also let the user reset their PIN. The PIN is automatically

generated based on the PIN policies that are configured on the UM mailbox policy that's associated with the user's mailbox. We recommend that you automatically generate PINs for Outlook Voice Access users.

- **Type a PIN** Use this option to manually specify a PIN for an Outlook Voice Access user. By default, this setting is disabled.

If you specify a PIN for a user, the PIN will be sent in an email message to the user's mailbox. After they receive the PIN and sign in to their mailbox, they can change the PIN by configuring personal options in Outlook Voice Access. However, in Outlook Web App and Microsoft Outlook, there is no option to manually specify a PIN.

- **Require the user to reset their PIN the first time they sign in** Use this option to require the user to reset their PIN when they first sign in to Outlook Voice Access. By default, this option is enabled.

If you select the option to automatically generate a PIN for a user, you can enable this option to require users to change their PIN when they first sign in to Outlook Voice Access. This helps protect the user's PIN.

5. Click **Save**.

Use the Shell to reset a Unified Messaging PIN

This example resets the voice mail PIN for Tony Smith to 1985848. However, this PIN must be changed when the user first signs in to Outlook Voice Access.

```
Set-UMMailboxPIN -Identity tonysmith@contoso.com -PIN
1985848 -PinExpired $true
```

Retrieve voice mail PIN information

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-03*

You can retrieve PIN information for a user who is enabled for Unified Messaging (UM). After a user has been enabled for UM-enabled and a PIN is generated or created, the PIN is encrypted and stored in the user's mailbox.

When you retrieve PIN information for a UM-enabled user, the information returned to you is calculated by using the encrypted PIN data stored in the user's mailbox. This lets you view information from the user's mailbox and also indicates whether the user has been locked out of the mailbox.

For additional tasks related to PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM dial plans" entry in the Unified Messaging permissions topic.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user's mailbox has been UM-enabled. For detailed steps, see Enable a user for voice mail.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to retrieve PIN information for a UM-enabled user

1. In the EAC, navigate to **Recipients**. In the list view, select the user mailbox that you want to view.
2. In the details pane, under **Phone and Voice Features**, click **View details**.
3. On the **UM Mailbox** page > **UM mailbox settings**, view the **PIN status** for the user. On this page, you can also reset the voice mail PIN for the user.

Use the Shell to retrieve PIN information for a UM-enabled user

This example displays the user ID, whether a PIN is expired, whether the UM mailbox is locked out, and whether Tony is a first-time user.

```
Get-UMMailboxPIN -identity tony@contoso.com
```

Include text with the email message sent when a PIN Is reset

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can include additional text in the email message that's sent to users when their Unified Messaging (UM) or voice mail PIN is reset. You do this by entering custom text in the **When a user's Outlook Voice Access PIN is reset** box on a UM mailbox policy. The customized text can include, for example, security-related information for UM-enabled users.

By default, a PIN used for Outlook Voice Access is reset by the Unified Messaging or voice mail system if the number of failed sign-in attempts exceeds 5. Users can also reset their PINs using the UM features included with Outlook Web App or Outlook 2010 or later, or by using Outlook Voice Access from a telephone.

Note:

The text you enter in this box is limited to 512 characters, and can include simple HTML text.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to add text to the email message sent to users when their PIN is reset

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to change, and then click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then click **Edit** .
3. On the **UM Mailbox Policy** page > **Message text**, in the text box for **When a user's Outlook Voice Access PIN is reset**, enter the text you want to include in the email message that's sent when a user's PIN is reset.
4. Click **Save**.

Use the Shell to add text to the email message sent to users when their PIN is reset

This example includes the additional text, "Do not share your PIN with other users. Doing so may result in disciplinary action", in the email message sent to users who are associated with the UM mailbox policy `MyUMMailboxPolicy` when their PIN is reset.

```
Set-UMMailboxPolicy -identity MyUMMailboxPolicy -
ResetPINText "Do not share your PIN with other users. Doing
so may result in disciplinary action."
```

Set the minimum PIN length for voice mail

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure the minimum PIN length for your Outlook Voice Access users who are enabled for Unified Messaging (UM). The PIN settings that you configure on a UM mailbox policy will apply to all UM-enabled users associated with the UM mailbox policy.

Outlook Voice Access is used by UM-enabled users to access their voice mail, email, calendar, and personal contact information located in their mailbox. However, before they can access their mailbox, they must enter a PIN so they can be authenticated by the voice mail system.

Note:

If you change the minimum PIN length value, existing Outlook Voice Access users will be prompted to enter a new PIN that contains the new minimum number of digits before they can continue. The default is 6.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the minimum PIN length for Outlook Voice Access

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to change, and then click **Edit** .
4. Click **PIN policies**, and next to **Minimum PIN length**, enter a value between 4 and 24.
5. Click **Save**.

Use the Shell to configure the minimum PIN length for Outlook Voice Access

This example sets the minimum PIN length to 8 digits for Outlook Voice Access users who are associated with the UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
MinPINLength 8
```

This example sets the minimum PIN length to 8 digits and sets the number of times a sign-in can fail before the user's PIN is reset to 3. This applies to UM-enabled users who are associated with the UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 3 -MinPINLength 8
```

Set the PIN lifetime for voice mail

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure the PIN lifetime for users who are enabled for Unified Messaging (UM). The PIN lifetime is the maximum time that an Outlook Voice Access PIN will be valid for UM-enabled recipients. The PIN lifetime setting is configured on a UM mailbox policy and applies to all UM-enabled users associated with the UM mailbox policy.

Several PIN-related settings can be configured on a UM mailbox policy. The PIN lifetime setting controls the time interval, in days, from the date Outlook Voice Access users last changed their PIN to the date they'll be forced to change their PIN again. The range is 0 through 999, and the default is 60 days. If you enter 0, the user's PIN won't expire. We recommend that you don’t configure this setting to 0, because by doing so you greatly reduce the security of your network.

Important:
Unified Messaging doesn't notify users when their PIN is about to expire.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For

detailed steps, see Create a UM mailbox policy.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the PIN lifetime

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to change, and then click **Edit** .
4. Click **PIN policies**, and next to **Enforce PIN lifetime (days)**, enter a value between 0 and 999.
5. Click **Save**.

Use the Shell to configure the PIN lifetime

This example sets the number of days that a PIN can be used for Outlook Voice Access users who are associated with a UM mailbox policy named `MyUMMailboxPolicy` to 30.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
PINLifetime 30
```

This example configures the following PIN-related settings for Outlook Voice Access users who are associated with a UM mailbox policy named `MyUMMailboxPolicy`:

- Sets the number of logon failures before the user's PIN is reset to 3.
- Sets the maximum number of logon attempts to 5.
- Sets the minimum PIN length to 9 digits.
- Sets the PIN to expire in 40 days.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 3
-MaxLogonAttempts 5 -MinPINLength 9 -PINLifetime 40
```

Set the number of previous voice mail

PINs to recycle

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

When Outlook Voice Access users dial in to an Outlook Voice Access number, they're prompted to enter their PIN so that the voice mail system can authenticate them. After they're authenticated, they can access the voice mail, email, calendaring, and personal contact information in their mailbox from any telephone.

Several PIN-related settings can be configured on a Unified Messaging (UM) mailbox policy. The **PIN recycle count** setting specifies the number of unique PINs users must use before they can reuse an old PIN. You can set the value of this setting between 1 and 20. For most organizations, this value should be set to 5 PINs, which is the default. Setting this value too high can frustrate users because it can be difficult for users to create and memorize many PINs. Setting it too low may introduce a security threat to your network.

Important:
The PIN recycle count can't be disabled.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to change the PIN recycle count

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to change, and then click **Edit** .
4. Click **PIN policies**, and next to **PIN recycle count**, enter a value between 1 and 20.
5. Click **Save**.

Use the Shell to change the PIN recycle count

This example sets the PIN recycle count on the UM mailbox policy `MyUMMailboxPolicy` to 10.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
PINHistoryCount 10
```

Disable common PIN patterns for voice mail

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable or disable common Unified Messaging (UM) PIN patterns for Outlook Voice Access users. If you enable or disable the common PIN patterns setting on a UM mailbox policy, the setting will apply to all UM-enabled users associated with the UM mailbox policy. By default, UM-enabled users can't use common patterns when they create a PIN.

You can configure several PIN-related settings on a UM mailbox policy. The **Allow Common PIN Patterns** setting is used to allow or prevent the use of common number patterns when users create a PIN. By default, this setting is disabled and prevents users from using the following number patterns:

- **Sequential numbers** These are PIN values that include only consecutive numbers. Examples of consecutive numbers for a PIN are 1234 and 65432.
- **Repeated numbers** These are PIN values that include only repeated numbers. Examples of repeated numbers are 11111 and 22222.
- **Suffix of mailbox extension** These are PIN values that include the suffix of a user's mailbox extension. For example, if a user's mailbox extension is 36697, the user's PIN cannot be 3669712.

Note:
If the **Allow Common PIN Patterns** setting is enabled, only the suffix of the mailbox extension will be rejected.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to disable common PIN patterns

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then on the toolbar, click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then on the toolbar, click **Edit** .
3. On the **UM Mailbox Policy** page, under **PIN polices**, clear the check box next to **Allow common PIN patterns**.
4. Click **Save**.

Use the Shell to disable common PIN patterns

This example prevents users associated with the UM mailbox policy named `MyUMMailboxPolicy` from using PINs that contain common patterns.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
AllowCommonPatterns $false
```

Enable common PIN patterns for voice

mail

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can enable or disable common Unified Messaging (UM) PIN patterns for Outlook Voice Access users. If you enable or disable the common PIN patterns setting on a UM mailbox policy, the setting will apply to all UM-enabled users associated with the UM mailbox policy. By default, UM-enabled users can't use common patterns when they create a PIN.

You can configure several PIN-related settings on a UM mailbox policy. The **Allow Common PIN Patterns** setting is used to allow or prevent the use of common number patterns when users create a PIN. By default, this setting is disabled and prevents users from using the following number patterns:

- **Sequential numbers** These are PIN values that include only consecutive numbers. Examples of consecutive numbers for a PIN are 1234 and 65432.
- **Repeated numbers** These are PIN values that include only repeated numbers. Examples of repeated numbers are 11111 and 22222.
- **Suffix of mailbox extension** These are PIN values that include the suffix of a user's mailbox extension. For example, if a user's mailbox extension is 36697, the user's PIN cannot be 3669712.

Note:

If the **Allow Common PIN Patterns** setting is enabled, only the suffix of the mailbox extension will be rejected.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable common PIN patterns

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**. In the list view, select the UM dial plan you want to modify, and then on the toolbar, click **Edit** .
2. On the **UM Dial Plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to manage, and then on the toolbar, click **Edit** .
3. On the **UM Mailbox Policy** page, under **PIN polices** select the check box next to **Allow common PIN patterns**.
4. Click **Save**.

Use the Shell to enable common PIN patterns

This example allows users associated with the UM mailbox policy named `MyUMMailboxPolicy` to use PINs that contain common patterns.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
AllowCommonPatterns $true
```

Set the number of sign-in failures before a voice mail PIN is reset

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure the number of sign-in failures allowed before the PIN is reset for an Outlook Voice Access user to a value from 1 through 998. The default is 5. The number of sign-in failures allowed before a PIN is reset is configured on a Unified Messaging (UM) mailbox policy and applies to all Outlook Voice Access users associated with the UM mailbox policy.

Note:

You can increase security by configuring the **Number of sign-in failures before PIN reset** setting to a number less than 5. You decrease security if you configure it to a number more than 5.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the number of sign-in failures before a PIN is reset

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to change, and then click **Edit** .
4. Click **PIN policies**, and next to **Number of sign-in failures before PIN reset**, enter a value between 0 and 999.
5. Click **Save**.

Use the Shell to configure the number of sign-in failures before a PIN is reset

This example sets the number of sign-in failures before the user's PIN is reset to 3 for UM-enabled users who are associated with a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 3
```

This example sets the number of sign-in failures before the user's PIN is reset to 3, the maximum

number of sign-in attempts to 5, and the minimum PIN length to 9 for UM-enabled users who are associated with a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 3 -MaxLogonAttempts 5 -
MinPINLength 9
```

Set the number of sign-in failures before a voice mail user Is locked out

Unified Messaging > Set Outlook Voice Access PIN security > PIN security procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

You can configure the number of sign-in failures allowed before an Outlook Voice Access user is locked out of their mailbox. The number of sign-in failures allowed before a voice mail user is locked out is configured on a Unified Messaging (UM) mailbox policy, and applies to all UM-enabled users associated with the UM mailbox policy. By default it is set to 15.

To increase security, decrease the maximum number of failed attempts. However, remember that if you decrease it to a number much lower than the default, users may be locked out unnecessarily. Unified Messaging will generate warning events you can view using Event Viewer if PIN authentication fails for UM-enabled users or if users are unsuccessful when they try to sign in to the system. This setting must be larger than the setting for the number of sign-in failures before the PIN is reset.

For additional tasks related to Outlook Voice Access PIN security, see PIN security procedures.

What do you need to know before you begin?

- Estimated time to complete: Less than 1 minute.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the number of sign-in failures before a voice mail user is locked out

1. In the EAC, navigate to **Unified Messaging** > **UM dial plans**.
2. In the list view, select the UM dial plan you want to change, and then click **Edit** .
3. On the **UM dial plan** page, under **UM Mailbox Policies**, select the UM mailbox policy you want to change, and then click **Edit** .
4. Click **PIN policies**, and next to **Number of sign-in failures before lockout**, enter a value between 1 and 999.
5. Click **Save**.

Use the Shell to configure the number of sign-in failures before a voice mail user is locked out

This example sets the maximum number sign-in attempts to 10 for UM-enabled users who are associated with a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
MaxLogonAttempts 10
```

This example sets the number of sign-in failures before the Outlook Voice Access user's PIN is reset to 3, the maximum number of sign-in attempts to 5, and a minimum PIN length to 9 for UM-enabled users who are associated with a UM mailbox policy named `MyUMMailboxPolicy`.

```
Set-UMMailboxPolicy -Identity MyUMMailboxPolicy -
LogonFailuresBeforePINReset 3
-MaxLogonAttempts 5 -MinPINLength 9
```

Enable PIN-less sign-Ins for voice mail

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-04-16*

You can set up Unified Messaging (UM) so that your users can sign in to their voice mail without using a PIN. By default, Outlook Voice Access users are prompted to enter a PIN to sign in to their mailbox and access their voice mail, email, calendar, personal contacts, the directory, and personal options.

Warning:
Enabling PIN-less sign-ins for a single user or a group of users that are enabled for voice mail decreases the level of security for voice mail and poses a security risk to your organization.

To enable PIN-less sign-ins, you must set the parameter *AllowPinlessVoiceMailAccess* to `$true` on the UM mailbox policy and set the parameter *PinlessAccessToVoiceMailEnabled* to `$true` on the UM mailbox. By default, both parameters are set to `$false`, which requires an Outlook Voice Access user to enter their PIN when they access their voice mail.

Setting both parameters to `$true` allows you to enable PIN-less sign-ins to voice mail for a large group of users who are associated with a UM mailbox and also enable PIN-less sign-ins for a single UM mailbox or a subset of UM mailboxes. Even if you enable PIN-less sign-ins to voice mail for a group of UM-enabled users or a single UM-enabled user, when they access their email, calendar, personal contacts, the directory, or personal options, they'll be prompted to enter their PIN.

To enable PIN-less sign-ins to voice mail for a user, the following conditions must be met:

- You've run the following cmdlet on the UM mailbox policy: `Set-UMMailboxPolicy -id MyUMMailboxPolicy -AllowPinlessVoiceMailAccess $true`
- You've run the following cmdlet on the mailbox of the UM-enabled user: `Set-UMMailbox -id tonys@contoso.com -PinlessAccessToVoiceMailEnabled $true`
- The UM-enabled user is associated with the same UM mailbox policy for which you enabled PIN-less sign-ins.
- The UM-enabled user dials in to Outlook Voice Access from a phone number that's been assigned to them.
- You can only use the Shell to perform this procedure. To learn how to open the Shell in your on-premises Exchange organization, see Open the Shell. To learn how to use Windows PowerShell to connect to Exchange Online, see **Connect to Exchange Online using remote PowerShell**.

For additional tasks related to UM mailbox policies, see UM mailbox policy procedures.

For additional tasks related to UM mailboxes, see Voice mail-enabled user procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM mailbox policies" entry in the Unified Messaging permissions topic.
- You need to be assigned permissions before you can perform this procedure or procedures. To

see what permissions you need, see the "UM mailboxes" entry in the Unified Messaging permissions topic.

- Before you perform these procedures, confirm that a UM dial plan has been created. For detailed steps, see Create a UM dial plan.
- Before you perform these procedures, confirm that a UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
- Before you perform these procedures, confirm that the user or users have been enabled for UM and voice mail. For detailed steps, see Enable a user for voice mail.

What do you want to do?

Use the Shell to enable PIN-less access to voice mail for UM-enabled users on a UM mailbox policy

This example enables PIN-less voice mail access on a UM mailbox policy named `MyUMMailboxPolicy` for users associated with the mailbox policy who dial in to Outlook Voice Access.

```
Set-UMMailboxPolicy -id MyUMMailboxPolicy -
AllowPinlessVoiceMailAccess $true
```

Use the Shell to enable PIN-less access to voice mail on a UM-enabled user's mailbox

This example enables PIN-less voice mail access for the user who dials in to Outlook Voice Access to reach the mailbox named `tonys@contoso.com`.

```
Set-UMMailbox -id tonys@contoso.com -
PinlessAccessToVoiceMailEnabled $true
```

Run reports for voice mail calls

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Online*

Topic Last Modified: *2013-02-22*

Unified Messaging (UM) call reports provide information about the calls forwarded to or placed by UM. Use these reports to monitor, troubleshoot, and report on UM for your organization. You can

access Unified Messaging call statistic reports by using the Call Statistics tool and access call logs for UM-enabled users by using the User Call Logs tool.

The reports provide aggregated statistical information about calls for Exchange servers and calls for UM-enabled users in your organization. These reports:

- Give on-premises, hybrid, and online administrators the ability to gather statistics about the UM services and UM-enabled users in their organizations.
- Provide summaries from the data that's gathered. This data can be stored for 90 days and archived for up to two years to meet retention requirements.
- Verify the overall audio quality for incoming calls to Exchange servers that are deployed.
- Easily verify the availability of the voice mail system and UM services in the organization for a given period of time.
- Plan for Unified Messaging capacity for an on-premises or hybrid organization.
- Verify how UM services in an organization are used over a given period of time.

You can use the following topics to help you gather call statistics and reports and interpret those results to monitor and troubleshoot UM services in your organization:

- Review the voice mail calls in your organization Use the UM Call Statistics report to monitor the availability and audio quality of UM and to track usage for capacity planning.
- Review the voice mail calls for a user Use user call logs to see details about the calls for a user for the last 90 days.
- Investigate the audio quality of voice calls in your organization If your organization is experiencing problems with the audio quality of UM calls, use the audio quality details from the UM Call Statistics report to help you understand what's causing the problems.
- Investigate the audio quality of voice calls for a user If a user is experiencing problems with the audio quality of UM calls, use the audio quality details from the user call logs to help you understand what's causing the problems.
- Interpret voice mail call records Export more detailed data to diagnose problems with audio quality or rejected calls, and to provide information for audits or reports about your UM service.

You can use the Call Statistics report to view information about the type and status of incoming calls handled by the Exchange servers in your organization. The report provides statistical information about the calls forwarded to or placed by Unified Messaging (UM) for your organization. You can use this information to track usage for capacity planning, monitor and troubleshoot the availability and audio quality of UM, and to troubleshoot failed calls.

This topic answers these questions:

- How do I get call statistics for UM?
- How do I interpret UM call statistics?

For additional tasks related to UM reporting, see UM reports procedures.

How do I get call statistics for UM?

1. In the Exchange admin center (EAC), click **Unified messaging** > **More options** ··· > **Call statistics**.
2. Choose the information you want to include in the report. The report automatically updates as you select any of the following options:
   - **Show** Choose what type of call statistics to view:
     - **Daily (90 days)** Select Daily to see details for all calls in the past 90 days.
     - **Monthly (12 months)** Select Monthly to see a summary of calls by month for the last 12 months.
     - **All** Select All to see the combined statistics for all calls received since UM started handling calls.
   - **UM dial plan** If you want to limit the data in the report to only calls in a specific UM dial plan, select that dial plan.
   - **UM IP gateway** If you want to limit the data in the report to only calls in a specific UM IP gateway, select that gateway. If you select a UM dial plan first, only the UM IP gateways associated with the selected UM dial plan are available in the list.
3. To get more details about the audio quality for a row in the report, select the row and click

Audio Quality Details. For more information about how to interpret audio quality, see Investigate the audio quality of voice calls in your organization.

4. To copy the report to the Clipboard, click **Copy**.
5. For Daily reports, you can export the details for a specific day to a .csv file.
   - Select the day and click **Export day**.
   - In the **File Download** confirmation box, click **Open** or **Save**.

The exported file will be named um_cdr_*YYYY-MM-DD*.csv, where *YYYY-MM-DD* is the year, month, and day the report was run. For more information, see Interpret voice mail call records.

Note:
On the report page, you can download a Microsoft Excel template that you can use to import the .csv file for a specific day.

Return to top

How do I interpret UM call statistics?

The UM Call Statistics report includes the following information:

- **DATE** The UTC date for the call data. The date format depends on the type of report you've chosen and your locale settings. You can choose from the following options:
  - **---** All calls are shown.
  - **MMM/YY** The month of the calls. For example, Jan/13.
  - **MM/DD/YY** The day of the calls. For example, 6/23/13.
- **TOTAL** The total number of calls for the selected UM dial plan or UM IP gateway for that date.
- **VOICE MESSAGE** The percentage of incoming calls answered by UM on behalf of users in which callers left a voice message.
- **MISSED** The percentage of incoming calls answered by UM on behalf of users in which callers didn't leave a voice message, resulting in a missed call notification.
- **OUTLOOK VOICE ACCESS** The percentage of incoming calls where users signed in to UM (and were authenticated) to access their email messages, calendars, and voice messages.
- **OUTGOING** The percentage of calls that were placed or transferred by UM on behalf of authenticated or unauthenticated users. This statistic includes Find Me, Play on Phone, and Play on Phone Greetings call types.
- **AUTO ATTENDANT** The percentage of incoming calls that were answered by UM auto attendants.
- **FAX** The percentage of incoming calls that were redirected to a fax partner.
- **OTHER** The percentage of any other incoming or placed calls that do not fall in any of the above categories. These calls include calls made to Outlook Voice Access numbers where the users didn't sign in and weren't authenticated.
- **FAILED OR REJECTED** The percentage of calls that either failed or were rejected by UM. Note that failed calls aren't counted twice. For example, if a call to Outlook Voice Access fails, it is only counted as a Failed call, and not also as an Outlook Voice Access call.
- **AUDIO QUALITY** A graphical representation of the overall audio quality for the selected period

of time for the organization.

Return to top

Investigate the audio quality of voice calls in your organization

Interpret voice mail call records

Review the voice mail calls for a user

Unified Messaging > Run reports for voice mail calls > UM reports procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-22*

User call logs are used to view the following information about specific Unified Messaging (UM) users:

- Details about the UM calls for a user over the last 90 days.
- Audio quality of each call. Audio quality metrics might not be available for all calls, because the metrics depend on several factors, such as the type and length of the call.

For additional tasks related to UM reporting, see UM reports procedures.

How do I get call logs for a UM-enabled user?

1. In the Exchange Administration Center (EAC), select **Unified messaging** > **More options** ··· > **User call logs**.
2. Click **Select a user**, and then select the user you want data for.
3. To get more details about the audio quality for a row in the report, select the row and click **Audio Quality Details**. For more information about how to interpret audio quality, see Investigate the audio quality of voice calls for a user.
4. To copy the report to the Clipboard, click **Copy all rows to the clipboard.**

How do I interpret the UM user call log?

The user call log includes the following information for each call:

- **DATE AND TIME** The date and time of the call, in the time zone that the selected user has set in Microsoft Outlook Web App.
- **DURATION** How long the call lasted in minutes (MM) and seconds (SS), in the following format: MM:SS.
- **CALL TYPE** The type of call:

- **Call Answering** The call wasn't answered and was forwarded to the Mailbox servers, and the caller left a voice message.
- **Call Answering Missed Call** The call wasn't answered and was forwarded to the Mailbox servers, and the caller didn't leave a voice message.
- **Subscriber Access** A call was made to the subscriber access number. The caller signed in and was authenticated to UM with their extension and password to access email messages, calendars, and voice messages over the phone.
- **Auto Attendant** The call was answered by a UM auto attendant. These calls are typically calls in which the caller dialed your organization's main phone number.
- **Fax** A call was received in which a fax tone was detected. If you've configured fax partners, this call was sent to the partner.
- **PlayonPhone** A call was placed by UM because the user clicked the Play on Phone button in a voice message in Microsoft Outlook Web App or Outlook.
- **FindMe** An outbound call was placed by UM as a result of a Find Me rule in a call answering rule.
- **Unauthenticated Pilot Number** A call was placed to the Outlook Voice Access number. The caller didn't sign in and wasn't authenticated.
- **Greetings Recording** A call was placed by UM to record personal greetings for a user.
- **None** A call was placed but the type wasn't defined.

- **CALLING NUMBER** The phone number or SIP address of the caller.
- **CALLED NUMBER** The phone number or SIP address (for users in SIP dial plans, such as Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server users) of the intended recipient of the call.
- **UM IP GATEWAY** The UM IP gateway that took the call.
- **AUDIO QUALITY** The overall audio quality of the call. For more details about audio quality, select the row and click **Audio Quality Details**.

Investigate the audio quality of voice calls in your organization

Unified Messaging > Run reports for voice mail calls > UM reports procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

If your organization is experiencing problems with the audio quality of Unified Messaging (UM) calls and voice mail messages, use the Call Statistics report to help you understand what's causing the problems.

Note:

The audio quality of a call can be affected by factors that aren't covered in the reports. For example, if your Exchange servers are experiencing a heavy memory load or CPU load, users may report poor call quality, even though the reports show excellent audio quality.

For additional tasks related to call statistics see UM reports procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM call data and summary report cmdlets" entry in the Unified Messaging permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the EAC to get audio quality statistics for your organization

1. In the EAC, navigate to **Unified messaging** > **More options** ··· > **Call statistics**.
2. Choose the call statistics to include in the report. The report automatically updates as you select any of the following options.
   - **Show** Choose what type of call statistics to view:
     - **Daily (90 days)** Select Daily to see details for all calls in the past 90 days.
     - **Monthly (12 months)** Select Monthly to see a summary of calls by month for the last 12 months.
     - **All** Select All to see the combined statistics for all calls received since UM started handling calls.
   - **UM dial plan** If you want to limit the data in the report to only calls in a specific UM dial plan, select that dial plan.
   - **UM IP gateway** If you want to limit the data in the report to only calls in a specific UM IP gateway, select that UM IP gateway. If you select a UM dial plan first, only the UM IP gateways associated with the selected UM dial plan are available in the list.
3. To get more details about the audio quality for a row in the report, select the row and click **Audio Quality Details**. The following information is available:
   - **DATE AND TIME** The UTC date and time that the call statistics were captured.
   - **UM DIAL PLAN** The dial plan for the calls included in the statistics.
   - **UM IP GATEWAY** The UM IP gateway that took the calls included in the statistics.
   - **NMOS** The Network Mean Opinion Score (NMOS) for the call. The NMOS indicates how good the audio quality was on the call as a number on a scale from 1 to 5, with 5 being excellent.

Note:
The maximum NMOS possible for a call is dependent on the audio codec being used. The NMOS may not be available for very short calls that are less than 10 seconds long.

- **NMOS DEGRADATION** The amount of audio degradation of the NMOS from the top value possible for the audio codec being used. For example, if the NMOS degradation value for a call was 1.2 and the NMOS reported for the call was 3.3, the maximum NMOS for that particular call would be 4.5 (1.2 + 3.3).
- **JITTER** The average variation in the arrival of data packets for the call.
- **PACKET LOSS** The average percentage of data packet loss for the selected call. Packet loss is an indication of the reliability of the connection.
- **ROUND TRIP** The average round trip score, in milliseconds, for audio on the selected call. The round-trip score measures latency on the connection.
- **BURST LOSS DURATION** The average duration of packet loss during bursts of losses for the selected call.
- **NUMBER OF SAMPLES** The number of calls that were sampled to calculate the averages.

4. For detailed audio quality metrics for specific calls, see Investigate the audio quality of voice calls for a user.

Investigate the audio quality of voice calls for a user

Unified Messaging > Run reports for voice mail calls > UM reports procedures >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-21*

If a user reports problems with the audio quality of their Unified Messaging (UM) calls, you can use the User Call Logs report to help you understand what's causing the problems.

Note:
The audio quality of a call can be affected by factors that aren't covered in the reports. For example, if your Exchange servers are experiencing a heavy memory or CPU load, users may report poor call quality, even though the reports show excellent audio quality.

For additional tasks related to UM reports, see UM reports procedures

What do you need to know before you begin?

- Estimated time to complete: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM call data and summary report cmdlets" entry in the

Unified Messaging permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the EAC to get call logs for a UM-enabled user

1. In the EAC, navigate to **Unified Messaging** > **More options** ··· > **User call logs**.
2. Click **Select a user**, and then select the user you want data for.
3. To get more details about the audio quality for a row in the report, select the row and click **Audio Quality Details**. The following information is available:
   - **DATE AND TIME** The date and time of the call, in the time zone that the selected user has set in Outlook Web App.
   - **USER** The selected user.
   - **UM DIAL PLAN** The dial plan for the call.
   - **UM IP GATEWAY** The UM IP gateway that was used for the call.
   - **AUDIO CODEC** The audio codec that was used during the call.
   - **NMOS** The Network Mean Opinion Score (NMOS) for the call. The NMOS indicates how good the audio quality was on the call as a number on a scale from 1 to 5, with 5 being excellent.

Note:

The maximum NMOS possible for a call depends on the audio codec being used. The NMOS may not be available for very short calls that are less than 10 seconds long.

   - **NMOS DEGRADATION** The amount of audio degradation of the NMOS from the top value possible for the audio codec being used. For example, if the NMOS degradation value for a call was 1.2 and the NMOS reported for the call was 3.3, the maximum NMOS for that particular call would be 4.5 (1.2 + 3.3).
   - **JITTER** The average variation in the arrival of data packets for the call.
   - **PACKET LOSS** The average percentage of data packet loss for the selected call. Packet loss is an indication of the reliability of the connection.
   - **ROUND TRIP** The average round trip score, in milliseconds, for audio on the selected call. The round-trip score measures latency on the connection.
   - **BURST LOSS DURATION** The average duration of packet loss during bursts of losses for the selected call.

Interpret voice mail call records

Applies to: *Exchange Online*

Topic Last Modified: *2013-02-22*

To view detailed information about calls handled by the Exchange servers on a specific day, export the call data for that day from the Call Statistics report. Daily call data, which is available for the past 90 days, can help you diagnose problems with audio quality or rejected calls, and provide information for audits or reports on Exchange servers in your organization.

For additional tasks related to UM reporting, see UM reports procedures.

Use the EAC to export daily UM call records

1. In the EAC, navigate to **Unified messaging** > **More options** ··· > **Call statistics**.
2. Under **Show**, click **Daily (90 days)**, and then choose the UM dial plan or UM IP gateway, or both, if you want. The report automatically updates as you choose options.
3. Select the day for which you want to export call records, and then click **Export day**.
4. In the **File Download** confirmation box, click **Open** or **Save**.

The exported file will be named um_cdr_*YYYY-MM-DD*.csv, where *YYYY-MM-DD* is the year, month, and day the report was run.

Note:
On the report page, you can download a Microsoft Excel template that you can use to import the .csv file for a specific day.

5. Use an application such as Excel to process the .csv file and build your own custom reports.

Interpret UM call data

The UM call data that you export includes the following detailed information about each call that UM handled on that day.

Note:
In the Call Statistics report, the days are in UTC time.

- **CallStartTime** The date and time that UM handled the call, in UTC. The UTC time and date is represented in the following format: *YYYY-MM-DD hh:mm:SSZ*, where *YYYY* = year, *MM* = month, *DD* = day, *hh* = hour, in 24-hour time, *mm* = minutes, ss = seconds. Z signifies Zulu, which is a way to denote UTC (like *+hh:mm* or *-hh:mm*, which gives the time offset from UTC). Because all call times in this report are in UTC time, this will always be Z.

For example, for a call placed on June 23, 2013 at 2:23pm, the call start time is shown as 2013-06-23 14:23:11Z.

- **Call Type** The type of call:
  - **Call Answering Voice Message** The call wasn't answered and was forwarded to the Exchange servers, and the caller left a voice message.
  - **Call Answering Missed Call** The call wasn't answered and was forwarded to the Exchange servers, and the caller didn't leave a voice message.

- **Subscriber Access** A call was made to the subscriber access number. The caller signed in and was authenticated to UM with their extension and password to access email messages, calendars, and voice messages over the phone.
- **Auto Attendant** The call was answered by a UM auto attendant. These calls are typically calls in which the caller dialed your organization's main phone number.
- **Fax** A call was received in which a fax tone was detected. If you've configured fax partners, this call was sent to the fax partner.
- **PlayOnPhone** A call was placed by UM because the user clicked the Play on Phone button in a voice message in either Microsoft Outlook Web App or Outlook.
- **Find Me** An outbound call was placed by UM as a result of a Find Me rule in a call answering rule.
- **Unauthenticated Pilot Number** A call was placed to the Outlook Voice Access number. The caller didn't sign in and wasn't authenticated.
- **Greetings Recording** A call was placed by UM to record personal greetings for a user.
- **None** A call was placed but the type wasn't defined.

- **CallIdentity** The SIP call identity, as provided by the UM IP gateway.
- **ParentCallIdentity** The SIP Session Identity of the session that originated this call. This box is used when using the Call Answering Rules Find Me feature or call transfer calls, including call transfers between UM auto attendants.
- **UMServerName** The name of the Mailbox server handling the call, if any. This information is provided only when you have an on-premises Mailbox server.
- **DialPlanName** The UM dial plan that handled the call.
- **Call Duration** The total duration of the call.
- **IPGatewayAddress** The fully qualified domain name (FQDN) of the IP gateway that handled the call.
- **CalledPhoneNumber** The phone number or SIP address of the intended recipient of the call (for users in SIP dial plans with Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server) .
- **CallerPhoneNumber** The phone number or SIP address of the caller.
- **OfferResult** The status of the call:
  - **Answer** UM successfully answered or placed a call. The call was neither transferred nor redirected. These calls include completed calls to Outlook Voice Access, Play on Phone, or UM auto attendants, and calls that UM handled when the called extension didn't answer the phone.
  - **Failed** UM accepted or placed a call, but the call failed. These calls include calls where the called number or address is busy, doesn't answer, or doesn't exist; where the caller hung up before the call was connected; where the UM dial plan or UM mailbox policy settings prevented the call; or where the VoIP gateway or IP PBX on your telephone system couldn't be reached.
  - **Rejected** UM rejected the call, usually because of a configuration error. These calls include calls where the UM IP gateway isn't associated with a UM dial plan, or where there are incompatibility issues.
  - **Redirected** UM accepted the call, but redirected it to another Mailbox server. These calls include calls where the caller used the UM menu to call a contact in the directory or personal

contacts, or where the caller called an Outlook Voice Access number using a phone number that isn't associated with the user's mailbox. In these cases, UM transfers the call to the Exchange server that's associated with that user's account.
  - **None** The call status is unknown.
- **DropCallReason** The reason the call was disconnected, if UM was able to determine the reason. For example, if the caller hung up, this shows Graceful Hangup.
- **ReasonForCall** How the call was connected:
  - **Direct** The caller dialed the called number directly.
  - **DivertForward** The caller dialed a number, and the person being called redirected the call to UM voice mail.
  - **DivertBusy** The caller dialed a number, and the phone was busy, so the call was redirected to UM voice mail.
  - **DivertNoAnswer** The caller dialed a number, and the person didn't answer, so the call was redirected to UM voice mail.
  - **Outbound** The call was placed by UM, for example, to play a voice message using Play on Phone.
  - **None** No reason was reported for the call.
- **DialedString** The address or phone number of the person to whom this call was either referred or transferred. This value also refers to the address or phone number called for Play on Phone calls.
- **CallerMailboxAlias** The mailbox alias (the portion of the email address that precedes the @ symbol) of the caller. This value is only available if the caller signed in to Outlook Voice Access.
- **CallerMailboxAlias** The mailbox alias of the intended recipient of the call, if the intended recipient is a UM-enabled user.
- **Auto Attendant Name** The name of the auto attendant related to this call.
- **NMOS Score** The Network Mean Opinion Score (NMOS) for the call. The NMOS indicates how good the audio quality was on the call as a number on a scale from 1 to 5, with 5 being excellent.

Note:
Note The maximum NMOS possible for a call depends on the audio codec being used. The NMOS may not be available for very short calls that are less than 10 seconds long.

- **NMOSDegradation** The amount of audio degradation of the NMOS from the top value possible for the audio codec being used. For example, if the NMOS degradation value for a call was 1.2 and the NMOS reported for the call was 3.3, the maximum NMOS for that particular call would be 4.5 (1.2 + 3.3).
- **NMOSDegradation Jitter** The total NMOS degradation due to jitter.
- **NMOSDegradation PacketLoss** The total NMOS degradation because of packet loss.
- **Jitter** The average variation in the arrival of data packets for the call.
- **PacketLoss** The average percentage of data packet loss for the selected call. Packet loss is an indication of the reliability of the connection.
- **Round Trip** The average round trip, in milliseconds, for audio on the selected call. The round-trip score measures latency on the connection.
- **BurstDensity** The percentage of packets lost and discarded within a burst (high loss rate) period.
- **Burst Gap duration** The average duration of packet loss during bursts of losses for the selected

call.
- **Audio Codec** The audio codec used during the call.

Test and troubleshoot voice mail

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-06-25*

After you've installed Client Access and Mailbox servers in your organization, you may have to test the functionality of Unified Messaging (UM). The following are situations in which you will use the diagnostic tools and cmdlets included with Exchange 2013 or the UM Troubleshooting Tool:
- Troubleshooting errors and events.
- Testing the Client Access and Mailbox servers to make sure that the UM services are available and running.
- Testing whether VoIP gateways, PBXs, IP PBXs, SBCs, and Microsoft Lync Server are functioning correctly.

The following topics will help you test and troubleshoot Unified Messaging:
- Testing and troubleshooting with the UM Troubleshooting Tool
- Testing and troubleshooting with the Test-UMConnectivity cmdlet

Testing and troubleshooting with the UM Troubleshooting Tool

Exchange Server 2013 > Unified Messaging > Test and troubleshoot voice mail >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-06-26*

The Microsoft Exchange 2010 UM Troubleshooting Tool is an Exchange Management Shell cmdlet named **Test-ExchangeUMCallFlow**. You can use the cmdlet to diagnose configuration errors specific to call answering scenarios and to test whether voice mail is functioning correctly in both on-premises and cross-premises Microsoft Exchange Server 2010 Service Pack 1 (SP1) or later UM deployments. You can use this cmdlet in deployments with Microsoft Office Microsoft Lync Server 2010 or later or in UM deployments with Vo IP gateways, IP PBXs or session border controllers (SBCs).

Overview

This cmdlet emulates calls and runs a series of diagnostic tests that help on-premises administrators to identify configuration errors in telephony equipment, Exchange 2010 SP1 or later Unified Messaging settings, and connectivity issues between on-premises and cross-premises deployments of Exchange 2010 SP1 or later Unified Messaging.

When you run the cmdlet, it states the reason and possible solutions for issues that have been detected. It also outputs general audio quality metrics for diagnosing audio quality issues related to network connectivity, such as jitter and average packet loss. The **Test-ExchangeUMCallFlow** cmdlet supports testing UM components in `Secured`, `SIP Secured`, and `Unsecured` calls, and it can be run either in `Gateway` or `SIPClient` modes.

By default, when you're running the UM Troubleshooting Tool, it uses the credentials that are used when you log on to the computer. The credentials used are those that are specified for the calling party. You must set or specify the credentials to be used when you're running the UM Troubleshooting Tool in `SIPClient` mode. However, you don't need to set the credentials when running the UM Troubleshooting Tool in `Gateway` mode. If you will be using the UM Troubleshooting Tool in `SIPClient` mode, several other Office Communications Server 2007 R2 or Lync Server requirements and prerequisites must be met. For more information, see Checklist: Deploy Office Communications Server 2007 R2 and Exchange 2010 Unified Messaging or Checklist: Integrate Exchange 2013 UM with Lync Server.

Important:
The **Test-ExchangeUMCallFlow** cmdlet must be used to test only the voice mail functionality of a Microsoft Exchange Server 2010 Unified Messaging server that has Exchange 2010 Service Pack 1 (SP1) installed or Microsoft Exchange 2013.

The **Test-ExchangeUMCallFlow** cmdlet can be installed on a local Exchange 2010 Unified Messaging server, an Exchange 2013 Mailbox server, or on another 64-bit computer running:

- The Windows 7 or Windows 8 operating system
- The Windows Server 2008 or Windows Server 2008 R2 operating system
- The Windows Server 2012 or Windows Server 2012 R2 operating system

The **Test-ExchangeUMCallFlow** cmdlet requires the following components to be installed on a Windows 7, Windows 8, Windows Server 2008, or Windows Server 2012 64-bit computer before installing the cmdlet:

- Microsoft .NET Framework 3.5 Service Pack 1 (SP1). To download the service pack, see Microsoft .NET Framework 3.5 Service Pack 1.
- Microsoft .NET Framework 3.5 Family Update for Windows Vista x64 and Windows Server 2008 x64 updates if the tool will be run on a Windows Vista or Windows Server 2008 computer. To download the update, see Microsoft .NET Framework 3.5 Family Update for Windows Vista x64, and Windows Server 2008 x64.
- Windows Remote Management (WinRM) 2.0 and Windows PowerShell V2 (Windows6.0-KB968930.msu). For more information, see Microsoft Knowledge Base article 968930, Windows

Management Framework core package (Windows PowerShell 2.0 and WinRM 2.0).
- Unified Communications Managed AP1 2.0, Core Runtime (64-bit). To download the UcmaRuntimeWebDownloadX64.msi program file, see Unified Communications Managed API 2.0, Core Runtime (64-bit).

The **Test-ExchangeUMCallFlow** cmdlet isn't included on the Exchange 2010 SP1 DVD, the Exchange 2010 SP1-only download, or the Exchange 2013 installation media; however, you can download the cmdlet from the Microsoft Download Center.

For more information about syntax and parameters, see Test-ExchangeUMCallFlow.

Learn about the Exchange UM Troubleshooting Tool

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-06-27*

The Microsoft Exchange 2010 Unified Messaging Troubleshooting Tool is an Exchange Management Shell cmdlet named **Test-ExchangeUMCallFlow**. You can use this tool to conduct a series of diagnostic tests for Unified Messaging (UM) in your organization. If any of the tests fail, the tool reports the reason for the failure and possible solutions to fix the problem. You can only use the UM Troubleshooting Tool on Exchange 2010 or later servers.

The UM Troubleshooting Tool can be used to test whether voice mail is functioning correctly in both on-premises and cross-premises deployments. You can use this tool in UM deployments that include Microsoft Office Communications Server 2007 R2 or Microsoft Lync Server 2010 or later, or in UM deployments that include VoIP gateways, IP Private Branch eXchanges (IP PBXs), or session border controllers (SBCs).

Note:

The UM Troubleshooting Tool is used for testing and troubleshooting. The **Test-UMConnectivity** cmdlet, on the other hand, should be used for monitoring. The **Test-UMConnectivity** cmdlet is used with System Center Operations Manager (SCOM) management packs that are used for monitoring Exchange 2010 UM servers or Exchange 2013 Client Access and Mailbox servers and the telephony components. The **Test-UMConnectivity** cmdlet performs local SIP tests and local logon tests to mailboxes, and can be run as an SCOM task.

To download the UM Troubleshooting Tool, see Unified Messaging Troubleshooting Tool.

Contents

Overview

The UM Troubleshooting Tool simplifies testing and troubleshooting in UM deployments. When the UM Troubleshooting Tool is run, it automatically generates a set of trace files that are stored in the C:\Users\%UserProfile%\AppData\Roaming\Microsoft Exchange 2010 UM Troubleshooting folder. The following trace files are generated by the tool:

- **UMTool_Collaboration** Includes RTC stack traces.
- **UMTool_DiagnosticLog** Lists all the tests that are run and their results.
- **UMTool_S4** Includes the S4: signaling stack traces.
- **UMTool_SIPMessageLogs** Includes the full SIP traces for the test call that's made.

The UM Troubleshooting Tool connects directly to an on-premises session border controller (SBC), if one exists, or connects to an SBC in a datacenter and emulates an incoming call as if the call was coming from a PBX through a VoIP gateway or an IP PBX. The UM Troubleshooting tool can be used to diagnose:

- Incorrect settings in on-premises or cross-premises UM deployments in which Office Communications Server 2007 R2 or Microsoft Lync Server is deployed.
- Incorrect settings on on-premises or cross-premises telephony equipment that includes VoIP gateways and PBXs or IP PBXs.
- Issues with Domain Name System (DNS).
- Certificate issues when you're using SIP secured or Secured UM dial plans.
- Signaling and media issues for DTMF (also known as touchtone) and audio.

If the UM Troubleshooting Tool detects a failure in your configuration, the tool reports the reason for the error and the possible solutions for the issues that have been detected. The errors that can be reported when the UM Troubleshooting Tool is used in an on-premises deployment include the following:

- The maximum call limit has been reached.
- The user isn't enabled for Unified Messaging.
- The UM IP gateway, dial plan, or hunt group information can't be located.
- The security type doesn't match the UM dial plan.
- There are no worker processes available to process the call.
- The UM service or UM Call Router services are stopped.
- The Active Directory forest couldn't be located.

- No disk space is available.
- Invalid SIP headers were used in the request.
- A call was made to an Office Communications Server 2007 R2 server or Lync Server server.
- The UM IP gateway is disabled.
- The URI for the user who is being called isn't valid.

When the UM Troubleshooting Tool is used in a cross-premises deployment, the errors that can be reported include the following:

- The user isn't enabled for Unified Messaging.
- The UM IP gateway is disabled.
- The URI for the user is invalid.
- The security type doesn't match the UM dial plan.
- Invalid SIP headers were used in the request.
- The UM IP gateway, dial plan, or hunt group information can't be located.

The UM Troubleshooting Tool sends a sample .wav file for 15 seconds. After the audio file and RTP audio stream are sent and played back, the tool reports general audio quality metrics for diagnosing audio quality issues related to network connectivity, such as jitter and average packet loss. These reports include the media stream quality to and from a UM server and contain the following:

- Network Mean Opinion Score (NMOS)
- Codec
- Latency in milliseconds (ms)
- Jitter in milliseconds (ms)
- % of packet loss
- The NMOS classification and rating that will be used to determine the audio quality will be:
  - NMOS less than 2 = Poor
  - NMOS greater than 2 but less than 3 = Average
  - NMOS greater than 3 but less than 4 = Good
  - NMOS greater than 4 but less than 5 = Excellent

The UM Troubleshooting Tool supports testing UM dial plans that use Secured, SIP Secured, and Unsecured calls. If you choose Secured or SIP Secured, the thumbprint of the certificate that's used is checked to determine whether the certificate is expired and the type of certificate that's used for TLS (Transport Layer Security) communications. The certificate is used to correctly identify and ensure the identity of the remote computer. When Secured or SIP Secured mode is selected, the UM Troubleshooting Tool verifies whether the following are true:

- The local certificate was found in the local computer store.
- The certificate being used is trusted.
- The target name specified in the certificate is valid.
- The certificate has expired.
- The remote computer trusts the certificate.
- The certificate has been revoked.
- The certificate doesn't have the required enhanced key usage.

The UM Troubleshooting Tool can be run in either Gateway or SIPClient mode, depending on whether Office Communications Server 2007 R2 or Lync Server is deployed or whether VoIP gateways and PBXs or IP PBXs are used with Unified Messaging servers. When either Gateway or SIPClient mode is used, the UM Troubleshooting Tool supports making calls using the following formats. The format that's used depends on the URI type of the UM dial plan:

- Telephone extension 425-555-1010
- E.164 phone numbers +1 (425) 555-1010
- SIP addresses tonysmith@contoso.com

When SIPClient mode is used, the UM Troubleshooting Tool makes a voice memo call. This is a call that doesn't ring a phone or a Unified Communications (UC) endpoint. Instead, it sends the call directly to voice mail. When the UM Troubleshooting Tool is run in SIPClient mode, it will determine:

- Which target user is being called.
- Whether the SIP call was established successfully.
- Whether the SIP call was accepted by an Exchange 2010 Unified Messaging server or Exchange 2013 Mailbox server.
- Whether the correct DTMF sequence was received.
- Whether the diagnostic .wav file was sent and received by an Exchange 2010 UM server or Exchange 2013 Mailbox server.
- The metrics that were used when the media or audio quality stream was received.

The UM Troubleshooting Tool emulates incoming calls and runs a series of diagnostic tests that help on-premises administrators and tenant administrators test call flow for call answering and identify configuration errors. Although the UM Troubleshooting Tool can be used in call answering scenarios, it can't be used to test the following types of calls:

- Outlook Voice Access calls, including calls that access voice mail, email, calendar, the directory, personal contacts, or personal options
- UM auto attendants
- Play on Phone
- Call Answering Rules
- Faxing
- Prompt provisioning

Return to top

UM troubleshooting architecture

The UM Troubleshooting Tool can help you troubleshoot, diagnose, and repair configuration issues in cross-premises deployments, and you can also use it in on-premises Unified Messaging deployments. In cross-premises deployments, the tool also validates onsite SBC configurations. The administrator can test all the Unified Messaging components that are used by Unified Messaging, including the SBCs.

VoIP gateway and IP PBX deployments

In the following example, Gateway mode is used to test call flow in an environment that doesn't include Office Communications Server 2007 R2 or Lync Server. This example tests the telephony equipment, including VoIP gateways, PBXs and IP PBXs, and the Unified Messaging components. This example sets the Voice over IP (VoIP) security mode to Unsecured, uses the IP address 10.1.1.1 as the next hop, and includes an extension number in the diversion information.

```
Test-ExchangeUMCallFlow -Mode Gateway -VoIPSecurity
Unsecured -NextHop 10.1.1.1 -Diversion 12345
```

Return to top

Office Communications Server 2007 R2 and Microsoft Lync Server deployments

The UM Troubleshooting Tool can be used in on-premises or cross-premises deployments that include Office Communications Server 2007 R2 or Microsoft Lync Server when SIPClient mode is set. The following example uses SIPClient mode and tests the call flow with a secured UM dial plan in an environment that contains Office Communications Server 2007 R2 or Lync Server servers. By default, when you run the UM Troubleshooting Tool, it uses the credentials of the user who is currently logged on to the computer. When you run the following example, you'll be prompted for the credentials you want to use when you run the UM Troubleshooting Tool. For details, see Set the credentials to use with the Exchange UM Troubleshooting Tool.

```
Test-ExchangeUMCallFlow -Mode SIPClient -VoIPSecurity
Secured -CallingParty tony@contoso.com -CalledParty
david@contoso.com -Credential $get
```

Installing the UM Troubleshooting Tool

The UM Troubleshooting Tool can be installed on a local Unified Messaging server or on another 64-bit computer running either:

- The Windows 7 or Windows 8 operating systems.
- The Windows Server 2008 or Windows Server 2008 R2 operating systems.
- The Windows Server 2012 or Windows Server 2012 R2 operating systems.

If you're using the UM Troubleshooting Tool on a 64-bit version of Windows 7, Windows 8, or the 64-bit edition of Windows Server 2008, the following components must be installed before you can install the UM Troubleshooting Tool:

- Microsoft .NET Framework 3.5 Service Pack 1 (SP1) See Microsoft .NET Framework 3.5 Service

Pack 1.

Note:
If the tool will be run on a Windows Vista or Windows Server 2008 computer, see Microsoft .NET Framework 3.5 Family Update for Windows Vista x64, and Windows Server 2008 x64.

- Windows Remote Management (WinRM) 2.0 and Windows PowerShell V2 (Windows6.0-KB968930.msu) See Microsoft Knowledge Base article 968930, Windows Management Framework Core package (Windows PowerShell 2.0 and WinRM 2.0).
- Microsoft Unified Communications Managed API 2.0 Core Runtime (UcmaRuntimeWebDownloadX64.msi) See Unified Communications Managed API 2.0, Core Runtime (64-bit).

The UM Troubleshooting Tool (**Test-ExchangeUMCallFlow** cmdlet) isn't included on the Exchange 2010 SP1 DVD, the download that only includes Exchange 2010, or the Exchange 2013 installation media. However you can download the UM Troubleshooting Tool from the Microsoft Download Center.

For details, see Install the Exchange UM Troubleshooting Tool.

Cmdlet parameters

The following table includes the parameters you can use with the **Test-ExchangeUMCallFlow** cmdlet and descriptions of those parameters. You can also use the Shell command `Get-help Test-ExchangeUMCallFlow -detailed` to find detailed information about each parameter that can be used with the **Test-ExchangeUMCallFlow** cmdlet, along with usage examples.

Parameters

Parameter	Description
CalledParty	The *CalledParty* parameter specifies the SIP URI of the Office Communications Server 2007 R2 or Lync Server user who has been enabled for Enterprise Voice. This is the user who the **Test-ExchangeUMCallFlow** cmdlet will make the voice call to, for example: `-CalledParty tonysmith@contoso.com`. Use this parameter if you're running the tool in SIPClient mode.
CallingParty	The *CallingParty* parameter specifies the SIP URI of the Office Communications Server 2007 R2 or Lync Server user who has been enabled for

	Enterprise Voice. This is the user who's making the incoming call, for example: `-CallingParty tonysmith@contoso.com`. Use this parameter if you're running the tool in SIPClient mode.
Diversion	The *Diversion* parameter specifies the string that should be sent as diversion information for the incoming call. This can be in the form of a Diversion or History-Info header. The diversion information that is included in the incoming call can be an extension number or can include additional diversion information. When you provide diversion information as a History-Info header, verify the following: • There are at least two different entries with different user parts. • The last entry contains the pilot number of the user's associated UM dial plan. • The second-to-last entry includes a UM-enabled user's extension number. This entry must also include the appropriate Reason text. This text must be escaped correctly in accordance with standard URL parameter escaping rules.
Mode	The *Mode* parameter specifies whether the VoIP gateway, IP PBX, or Office Communications Server 2007 R2 or Lync Server mode is to be used. You can specify either Gateway mode when your UM deployment includes VoIP gateways or IP PBXs or SIPClient mode when your UM deployment includes Office Communications Server 2007 R2 or Lync Server.

NextHop	The *NextHop* parameter specifies the IP address or fully qualified domain name (FQDN) of the next hop and can also include the TCP port of the next hop that the **Test-ExchangeUMCallFlow** cmdlet must connect to while emulating the VoIP gateway or IP PBX. When you include the TCP port, you must specify either port 5060 for Unsecured mode or port 5061 for Secured or SIP Secured mode. For example: `gateway.contoso.com:5061`.
CertificateThumbprint	The *CertificateThumbprint* parameter specifies the thumbprint of the certificate used for TLS. This is required if either SIP Secured or Secured mode is configured on the UM dial plan. This certificate thumbprint is the certificate that was exported from the VoIP gateway, IP PBX, or SBC. Also, the computer that has the UM Troubleshooting Tool installed and is being used to test for call flow must trust the certificate of authority for the next hop.
Credential	The *Credential* parameter specifies the credentials that will be used to run the cmdlet.
HuntGroup	The *HuntGroup* parameter specifies the UM hunt group associated with the VoIP gateway that's being emulated. This is typically an extension number. Use this parameter if you're running the tool in Gateway mode.
VoIPSecurity	The *VoIPSecurity* parameter specifies the security mode when using the cmdlet in Gateway mode. You can use one of the following VoIP security modes:

	• Secured (TLS/SRTP) • Unsecured (TCP/RTP) (default) • SIP Secured (TLS/RTP)

Return to top

Run the Exchange UM Troubleshooting Tool on Windows 7 or Windows 8

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-06-27*

The Microsoft Exchange 2010 UM Troubleshooting Tool is an Exchange Management Shell cmdlet named **Test-ExchangeUMCallFlow**. You can use the cmdlet to diagnose configuration errors specific to call answering scenarios and to test whether voice mail is functioning correctly in both on-premises and cross-premises Microsoft Exchange Server 2010 Service Pack 1 (SP1) or later UM deployments. You can use this cmdlet in deployments with Microsoft Office Microsoft Lync Server 2010 or later or in UM deployments with Vo IP gateways, IP PBXs or session border controllers (SBCs).

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM server" or “UM services” entry in the Unified Messaging permissions topic.
- Make sure your Exchange 2010 or Exchange 2013 organization meets the following requirements:
  - A UM dial plan has been created. For detailed steps, see Create a UM dial plan.
  - A UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
  - A UM IP gateway has been created. For detailed steps, see Create a UM IP gateway.
  - An Exchange 2010 UM server has been added to UM dial plan. If you are using Exchange 2013 with Lync Server, add all Client Access and Mailbox servers to the SIP URI dial plans. For detailed steps, see Add a UM Server to a Dial Plan or Add Mailbox and Client Access servers to a SIP URI dial plan.
- If you're running the UM Troubleshooting Tool on a local UM server with Exchange 2010 SP1 or later or on an Exchange 2013 Mailbox server, you may not have to install all the prerequisites listed below. They may have already been installed along with the UM server role. However, if

you're installing the UM Troubleshooting Tool on a 64-bit computer other than a server that is running the UM server role, you will need to install the following components:
  - Microsoft .NET Framework 3.5 Service Pack 1 (SP1). See Microsoft .NET Framework 3.5 Service Pack 1.
  - If the tool will be run on a Windows Vista or Windows Server 2008 computer, see Microsoft .NET Framework 3.5 Family Update for Windows Vista x64, and Windows Server 2008 x64.
  - Windows Remote Management (WinRM) 2.0 and Windows PowerShell V2 (Windows6.0-KB968930.msu). See Microsoft Knowledge Base article 968930, Windows Management Framework Core package (Windows PowerShell 2.0 and WinRM 2.0).
  - Microsoft Unified Communications Managed API 2.0 Core Runtime (UcmaRuntimeWebDownloadX64.msi). See Unified Communications Managed API 2.0, Core Runtime (64-bit).
- Download and install the UM Troubleshooting Tool.
  - Download Unified Messaging Troubleshooting Tool from the Microsoft Download Center.
  - Install the tool. For details, see Install the Exchange UM Troubleshooting Tool.

Important:

If you will be using the UM Troubleshooting Tool in `SIPClient` mode, there are several other Office Communications Server 2007 R2 or Microsoft Lync Server requirements and prerequisites that must be met. For more information, see Checklist: Deploy Office Communications Server 2007 R2 and Exchange 2010 Unified Messaging.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Run the UM Troubleshooting Tool on Windows Vista, Windows 7, or Windows 8

1. Click **Start** > **All Programs** > **Accessories** > **Windows PowerShell**.
2. Right-click **Windows PowerShell**, and from the pop-up menu select **Run as administrator**.
3. At the Windows PowerShell command prompt, go to the folder where the UM Troubleshooting Tool was installed and run the following.

```
C:\Windows\System32\WindowsPowerShell\v1.0\powershell.exe -
psconsolefile .
\Microsoft.Exchange.UM.TroubleshootingToolsnapin.psc1 -
noexit -command ". '.
\Microsoft.Exchange.UM.TroubleshootingTool.ps1' "
```

4. If you're running the UM Troubleshooting Tool on Windows Vista, Windows 7, or Windows 8, at

the Windows PowerShell command prompt, run the following.

```
Set-ExecutionPolicy RemoteSigned
```

5. From the **Start** menu, open the **Microsoft Exchange 2010 UM Troubleshooting Tool**.
6. In the **Microsoft Exchange 2010 UM Troubleshooting Tool** window, at the prompt, type the following and press Enter.

```
$cred=Get-Credential
```

7. In the **Windows PowerShell Credential Request** window, type the domain\user name and password, and then click **OK**.
8. In the **Microsoft Exchange 2010 UM Troubleshooting Tool** window, specify the necessary cmdlet parameters to test for call flow. For example:

```
Test-ExchangeUMCallFlow -Mode SIPClient -CallingParty
tonysmith@contoso.com - CalledParty jamiestark@contoso.com
NextHop ocsfe.contoso.com -Credential $cred
```

Set the credentials to use with the Exchange UM Troubleshooting Tool

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-06-27*

The Microsoft Exchange 2010 UM Troubleshooting Tool is an Exchange Management Shell cmdlet named **Test-ExchangeUMCallFlow**. You can use the cmdlet to diagnose configuration errors specific to call answering scenarios and to test whether voice mail is functioning correctly in both on-premises and cross-premises Microsoft Exchange Server 2010 Service Pack 1 (SP1) or later UM deployments. You can use this cmdlet in deployments with Microsoft Office Microsoft Lync Server 2010 or later or in UM deployments with Vo IP gateways, IP PBXs or session border controllers (SBCs).

By default, when you're running the UM Troubleshooting Tool, it uses the credentials that are used when you log on to the computer. The credentials used are those that are specified for the calling party. You must set or specify the credentials to be used when you're running the UM Troubleshooting Tool in `SIPClient` mode. However, you don't need to set the credentials when running the UM Troubleshooting Tool in `Gateway` mode.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "UM server" or “UM services” entry in the Unified Messaging permissions topic.
- Make sure your Exchange 2010 or Exchange 2013 organization meets the following requirements:
  - A UM dial plan has been created. For detailed steps, see Create a UM dial plan.
  - A UM mailbox policy has been created. For detailed steps, see Create a UM mailbox policy.
  - A UM IP gateway has been created. For detailed steps, see Create a UM IP gateway.
  - An Exchange 2010 UM server has been added to the UM dial plan. If you’re using Exchange 2013 with Lync Server, add all Client Access and Mailbox servers to the SIP URI dial plans. For detailed steps, see Add a UM Server to a Dial Plan or Add Mailbox and Client Access servers to a SIP URI dial plan.
- Install the UM Troubleshooting Tool. For detailed steps, see Install the Exchange UM Troubleshooting Tool.

Important:

If you will be using the UM Troubleshooting Tool in `SIPClient` mode, there are several other Office Communications Server 2007 R2 or Microsoft Lync Server requirements and prerequisites. For more information, see Checklist: Deploy Office Communications Server 2007 R2 and Exchange 2010 Unified Messaging or Checklist: Integrate Exchange 2013 UM with Lync Server.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Set the credentials to use with the UM Troubleshooting Tool

1. From the **Start** menu, open the **Microsoft Exchange 2010 UM Troubleshooting Tool**.
2. In the **Microsoft Exchange 2010 UM Troubleshooting Tool** window, at the prompt, type the following and press Enter.

```
$cred=Get-Credential
```

3. In the **Windows PowerShell Credential Request** window, type the domain\user name and password, and then click **OK**.
4. In the **Microsoft Exchange 2010 UM Troubleshooting Tool** window, specify the necessary cmdlet parameters to test for call flow. For example:

```
Test-ExchangeUMCallFlow -Mode SIPClient -CallingParty
tonysmith@contoso.com - CalledParty jamiestark@contoso.com
NextHop ocsfe.contoso.com -Credential $cred
```

Install the Exchange UM Troubleshooting Tool

Unified Messaging > Test and troubleshoot voice mail > Testing and troubleshooting with the UM Troubleshooting Tool >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-06-25*

The Microsoft Exchange 2010 UM Troubleshooting Tool is an Exchange Management Shell cmdlet named **Test-ExchangeUMCallFlow**. You can use the cmdlet to diagnose configuration errors specific to call answering scenarios and to test whether voice mail is functioning correctly in both on-premises and cross-premises Microsoft Exchange Server 2010 Service Pack 1 (SP1) or later UM deployments. You can use this cmdlet in deployments with Microsoft Office Microsoft Lync Server 2010 or later or in UM deployments with Vo IP gateways, IP PBXs or session border controllers (SBCs).

The UM Troubleshooting tool can be installed on a local Unified Messaging server, an Exchange 2013 Mailbox server, or on another 64-bit computer.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes
- The UM Troubleshooting tool requires that the following components be installed on a computer running Windows Vista, Windows 7, Windows 8, or the 64-bit edition of Windows Server 2008 or Windows Server 2012 or later before the tool is installed:
  - Microsoft .NET Framework 3.5 Service Pack 1 (SP1) See Microsoft .NET Framework 3.5 Service Pack 1.
  - If the tool will be run on a Windows Vista or Windows Server 2008 computer, see Microsoft .NET Framework 3.5 Family Update for Windows Vista x64, and Windows Server 2008 x64.
  - Windows Remote Management (WinRM) 2.0 and Windows PowerShell V2 (Windows6.0-KB968930.msu). See Microsoft Knowledge Base article 968930, Windows Management Framework Core package (Windows PowerShell 2.0 and WinRM 2.0).
  - Microsoft Unified Communications Managed API 2.0 Core Runtime (UcmaRuntimeWebDownloadX64.msi). See Unified Communications Managed API 2.0, Core Runtime (64-bit).

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Install the UM Troubleshooting Tool

1. Download the Unified Messaging Troubleshooting Tool from the Microsoft Download Center, and then double-click the MicrosoftExchange2010UMTroubleshootingTool.msi installation folder.
2. On the **Welcome to the Microsoft Exchange 2010 UM Troubleshooting Tool Setup Wizard** page, click **Next**.
3. On the **End-User License Agreement** page, review the software license terms, and if you agree, click **I accept the terms in the license agreement** and then click **Next**.
4. On the **Select Installation Folder** page, verify the path to the installation folder and click **Next**.
5. On the **Confirm Installation** page, click **Next** to start installation.
6. On the **Installation Complete** page, click **Close**.

Testing and troubleshooting with the Test-UMConnectivity cmdlet

Exchange Server 2013 > Unified Messaging > Test and troubleshoot voice mail >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-06-25*

After you install the Client Access and Mailbox servers and configure Unified Messaging, you can use multiple diagnostic tests and a software-based telephone application to test telephony connectivity and the operation of the Unified Messaging services.

Test-UMConnectivity

The **Test-UMConnectivity** cmdlet can be used to check connectivity to Client Access and Mailbox servers in several ways, depending on the parameters used with the cmdlet. For testing Unified Messaging functionality, you can use these tests:

- **Local** The **Test-UMConnectivity** cmdlet verifies Voice over IP (VoIP) communication with the Mailbox servers running on the same local computer.
- **Local with TUILogon** The **Test-UMConnectivity** cmdlet tries to establish VoIP communication with the Mailbox server running on the same computer. If it connects, it tries to sign in to one or

more UM-enabled mailboxes by sending the extension number and PIN of the mailbox. If the –*TUILogon* parameter is supplied, the following parameter values must also be supplied with the appropriate information for the test mailbox:
  - *–Phone* This parameter must contain the extension number for the test mailbox.
  - *–PIN* This parameter must contain the PIN of the UM-enabled mailbox.
  - *–UMDialPlan* This parameter must contain the dial plan linked with the test mailbox.
- **Remote** The **Test-UMConnectivity** cmdlet tries to connect to a remote Client Access server by placing a call through a VoIP gateway. After it connects, it performs connectivity checks on the remote Client Access server and the media paths.

Note:

If you receive the following message, you should restart the Microsoft Exchange Unified Messaging service because it has stopped or is not responding: "The Test-UMConnectivity task encountered an error while trying to make a call. Details: Unable to establish a connection."

Test UM operation

Unified Messaging > Test and troubleshoot voice mail > Testing and troubleshooting with the Test-UMConnectivity cmdlet >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-06-25*

This topic explains how to use the Shell to test the operation of your voice mail system. When you perform the following procedure, the Mailbox server running the Microsoft Exchange Unified Messaging service initiates a diagnostic Session Initiation Protocol (SIP) call, and then returns a health state variable of UM services.

This diagnostic test can be run only on a local Mailbox server, and you can't test the operation of the Mailbox server using the EAC.

For additional management tasks related to Client Access and Mailbox servers, see UM services procedures.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox server (UM service)" and “Client Access Server (UM call router service)” entries in the Unified Messaging permissions topic.
- To perform the following procedures, you must log on to the Mailbox server by using an account that's a member of the local Administrators group.
- Verify that the Mailbox server is installed, either on the same computer as the Client Access server or on a separate computer.

- Verify that the Client Access server is installed, either on the same computer as the Mailbox server or on a separate computer.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to test the operation of the Unified Messaging services

This example performs connectivity and operational tests on the local Mailbox server, and then displays the Voice over IP (VoIP) connectivity information.

```
Test-UMConnectivity
```

This example tests the ability for a local Client Access server to listen for incoming unencrypted SIP requests on TCP port 5060.

```
Test-UMConnectivity -ListenPort 5060
```

This example tests the ability for a local Client Access server to listen for incoming encrypted SIP requests on TCP port 5061.

```
Test-UMConnectivity -ListenPort 5061
```

Note:
Use mode 1 when the `-UMIPGateway` parameter isn't specified.

Note:
You can set the `-Timeout` parameter with a value of less than 5 seconds. However, we recommend that you always configure this parameter with a value of 5 seconds or more.

Test UM connectivity to VoIP gateways and PBXs

Unified Messaging > Test and troubleshoot voice mail > Testing and troubleshooting with the Test-UMConnectivity cmdlet >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-06-25*

You can test the operation of Unified Messaging (UM) and related connected telephony equipment. When you perform the following procedure, the Client Access and Mailbox server tests the full end-to-end operation of the voice mail system. This includes the telephony components connected to the Client Access and Mailbox servers, including VoIP gateways, Private Branch eXchanges (PBXs), IP PBXs, and cabling.

For additional management tasks related to troubleshooting UM, see **Manage Voice Mail Services (Archive)**.

What do you need to know before you begin?

- Estimated time to complete: 3 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox server (UM service)" and “Client Access Server (UM call router service)” entries in the Unified Messaging permissions topic.
- To perform the following procedures, you must log on to the Mailbox server by using an account that's a member of the local Administrators group.
- Verify that the Mailbox server is installed, either on the same computer as the Client Access server or on a separate computer.
- Verify that the Client Access server is installed, either on the same computer as the Mailbox server or on a separate computer.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to test the operation of the Unified Messaging and telephony components

This example tests the ability of the UM IP gateway to listen on TCP port 5060 for incoming SIP requests.

```
Test-UMConnectivity -ListenPort 5060 -UMIPGateway
MyIPGateway
```

This example tests the ability of the local Mailbox server to use an unsecured TCP connection instead of a secured mutual TLS connection to place a call through a UM IP gateway named `MyUMIPGateway` by using the telephone number 56780.

```
Test-UMConnectivity -UMIPGateway MyUMIPGateway -Phone 56780
-Secured $false
```

This example tests the Outlook Voice Access number on a dial plan by using a SIP URI. This example can be used in an environment that includes Lync Server.

```
Test-UMConnectivity -UMIPGateway OCSGateway1 -Phone
"sip:SIPdialplan.contoso.com@contoso.com"
```

Note:

You can set the `-Timeout` parameter with a value of less than 5 seconds. However, we recommend that you always configure this parameter with a value of 5 seconds or more. Use mode 2 when the `UMIPGateway` parameter is specified in the command-line syntax.

UM and voice mail terminology

Exchange Server 2013 > Unified Messaging >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-22*

This topic contains the terms and definitions that are used with Unified Messaging.

audio codec

A digital encoding of an analog voice signal. Most audio codecs provide compression of the data, at the cost of some loss of fidelity when the data is recovered. Audio codecs vary in their perceived sound quality, the bandwidth that is required to use them, and the system requirements that are needed to do the encoding.

audio notes

Text-based notes that can be added to a voice mail message that has been received in Outlook or Outlook Web App.

auto attendant

A software system that answers calls, plays prompts or instructions, and then collects input from the caller as touchtones or speech. Auto attendants can direct a call to telephone numbers or named users or to entities (for example, departments) that the caller specifies, without intervention from a human operator.

Automatic Speech Recognition (ASR)

A technology that enables a computer to match human speech to a predefined set of words or phrases.

call answering

The process by which a caller interacts with a voice mail system if the number they originally called isn't answered. Typically, the system will play a greeting or other prompt, and allow the caller to record a voice message.

Call Answering Rules

A form of call answering in which the user for whom the call is being answered can specify rules to determine the behavior callers experience. The user can specify conditions to be evaluated, greetings, and choices to be provided to the caller, and actions (for example, transfer or leave a message) to be taken as a result of the caller's choice.

circuit-switched network

A network in which there exists a dedicated connection. A dedicated connection is a circuit or channel set up between two nodes so that they can communicate.

conditional call forwarding

A set of conditions that are chosen by a user to be used when they receive an incoming call. The call is redirected based on the conditions that are set.

Dial by Name

A feature that enables a caller to spell a person’s name using the keys on a telephone (ABC=2, DEF=3, etc.).

dial plan

For Unified Messaging, this is a set of telephony-capable endpoints that share a common numbering plan. The details of the plan are determined by the telephone system to which UM is connected. In the simplest case, this can be a private branch exchange (PBX) with its extensions, each with a unique, fixed-length number.

dialing rule group

Dialing rule groups are created to enable telephone numbers to be modified before they're sent to a traditional or SIP-enabled PBX or IP PBX for outgoing calls. Dialing rule groups may remove digits from or add digits to telephone numbers that are being used to place calls by a Unified Messaging server.

Each dialing rule group contains dialing rule entries that determine the types of in-country/region and international calls that users within a dialing rule group can make. Each dialing rule group must contain at least one dialing rule entry.

fax partner

UM fax partners provide applications or services that can accept calls handed off by UM when a fax tone is detected. The partner's product or service then receives the fax data, creates a message, and delivers it to the UM-enabled user as an email message with a .tif attachment. These messages will appear in the Fax search folder in Outlook and Outlook Web App.

hunt group

A set of extensions that are organized into a group, over which a traditional or SIP-enabled PBX or

IP PBX “hunts” to find an available extension. A hunt group is used to direct calls to identically capable endpoints or to an application, such as voice mail.

in-country/region number format

The in-country/region number format specifies how a user's telephone number should be dialed by Unified Messaging from one dial plan to a different dial plan that has the same country code. This is used by an auto attendant and when an Outlook Voice Access user searches and tries to call the user in the directory.

This entry consists of a number prefix and a variable number of characters (for example, 020xxxxxxx).

informational announcement

An audio message that is played when a caller first dials in to a voice mail system, which may describe some item of interest.

international access code

The prefix that is used to direct a call internationally. The international access code is 011 in the United States and 00 in much of the rest of the world.

international number format

The string of digits that is used to define how to dial someone from outside a specific country.

Internet Protocol Private Branch eXchange (IP PBX)

A telephone switch that natively supports voice over IP (VoIP). An IP PBX uses VoIP-based protocols to communicate with IP-based hosts such as VoIP telephones over a packet-switched network. Some IP PBXs can also support the use of traditional analog and digital phones.

matched name selection method

The mechanism used to help a caller differentiate between users with names that match the touchtone or speech input.

message waiting indicator

A signal that indicates the presence of one or more unread voice messages. For voice mail systems, this is often a lamp on the phone or a stutter dial tone.

Microsoft Exchange Unified Messaging Call Router service

A service that directs incoming calls for UM-enabled users to the Microsoft Exchange Unified Messaging service.

Microsoft Exchange Unified Messaging service

A service that implements Unified Messaging capabilities for UM-enabled users.

missed call notification

An email message that is sent to a UM-enabled user that indicates that someone called but did not leave a voice message.

national number prefix

A prefix that is used to direct a call as an in-country call. In the United States, this prefix is 1. In the United Kingdom and most of the rest of the world, this prefix is 0.

number mask

A set of numbers and wildcard characters that is used to determine the telephone number that the Mailbox server will dial. An "X" represents a single digit (0 … 9). An asterisk (*) represents any number of such digits.

numeric extension

A string of digits that doesn't contain a "+" or a country/region code. In dial plans, extensions are required to have a specified length.

outdialing

A process in which Unified Messaging (UM) dials or transfers calls. UM generally receives calls, but sometimes dials calls. For example, outdialing occurs when a UM auto attendant transfers a call to a user's extension, or when a UM-enabled user uses Play on Phone from Outlook.

Outlook Voice Access

A series of voice prompts that allows authenticated callers to access their email, voice mail, calendar, and contact information using a standard analog, digital, or mobile telephone. Outlook Voice Access also enables authenticated callers to navigate their personal information in their mailbox, place calls, locate users, and navigate the system prompts and menus using DTMF, also known as touchtone, or voice inputs.

outside line access code

The prefix that is used by UM (or a person using an internal extension on the PBX or IP PBX) to access an outside line. This prefix is typically 9.

packet switching

A technique that divides a data message into smaller units called packets. Packets are sent to their destination by the best route available, and then they are reassembled at the receiving end.

pilot identifier

A telephone number that points to a hunt group and is the access number for calls that are routed to Unified Messaging. This is also sometimes called a pilot number.

PIN

A passcode that a user enters on the telephone to access their mailbox.

Play on Phone

A Unified Messaging feature that users can use to play their voice messages or play and record personalized voice mail greetings over a telephone.

Private Branch eXchange (PBX)

A private telephone network in an organization. Individual telephone numbers or extension numbers are supported, and calls are automatically routed to them. Users can call each other using

extensions, even across distributed locations.

prompt

An audio message played over the telephone to explain valid options to users.

Protected Voice Mail

A UM feature that uses information rights management to encrypt the contents of voice messages and specify the operations permitted on them. Protection can be caused by caller action (marking the message as private), or by system policy.

public switched telephone network (PSTN)

PSTN is a grouping of the world's public circuit-switched telephone networks. This grouping resembles the way that the Internet is a grouping of the world's public IP-based packet-switched networks.

reset

When a PIN or a password is reset, the system randomly chooses a new, temporary PIN or password. The user is required to change the temporary PIN the next time that they sign in to Outlook Voice Access.

reverse number lookup (RNL)

A method used to try to locate the name of a person, from a directory or other information store, based on a telephone number.

RTAudio codec

An advanced speech codec that is designed for real-time two-way VoIP applications such as gaming, audio conferencing, and wireless applications over IP. RTAudio is the preferred Microsoft audio codec and is the default codec for Microsoft Lync Server platforms.

SIP-enabled PBX

A SIP-enabled PBX is a telephony device that acts as a networking switch for switching calls in a telephony or circuit-switched network. However, the difference between a SIP-enabled PBX and a traditional PBX is that the SIP-enabled PBX can connect to the Internet and use the SIP protocol to make calls over the Internet.

SIP notification

A SIP notification is a SIP message sent from one SIP peer to another to advise it of a change.

SIP peer

A SIP-enabled device that provides telephony communications between a VoIP gateway, IP PBX, SIP-enabled PBX, Microsoft Lync servers, or VoIP phones and Unified Messaging services.

star out

An action a caller can perform when they are dialed in to a Unified Messaging auto attendant but they want to be able to get to Outlook Voice Access to get their email and voice mail. To do this, they press the star (*) key while the auto attendant prompts are being played.

subscriber access number (Outlook Voice Access number)

A number that is configured in a traditional or SIP-enabled PBX or IP PBX and on a UM dial plan that allows users to access their mailbox using Outlook Voice Access. In some cases, this may be configured to be the same number as the subscriber access number or pilot number (also called a pilot identifier) on the traditional or SIP-enabled PBX or IP PBX and the UM hunt group.

system prompt

A short audio recording for Unified Messaging, which is played to callers by the server. System prompts are used to welcome callers and to inform them of their options when they use the voice mail system.

telephone user interface (TUI)

An interface that is used to navigate the menus of a voice mail system using DTMF, also known as touchtone, inputs.

Text-to-Speech (TTS)

Technologies for translating or converting typewritten text into speech.

UM IP gateway

(See IP gateway.) A UM IP gateway is the Exchange Unified Messaging representation of any SIP peer with which it can communicate using VoIP protocols. It may represent a device that interfaces with a traditional or SIP-enabled PBX, an IP PBX, or Microsoft Lync Server.

UM worker process

A process that's created during the startup of the Microsoft Exchange Unified Messaging service. The UM service, on receiving a request to handle an incoming call, immediately redirects the request to a UM worker process, which carries out all subsequent interactions with the caller.

UM Worker Process Manager

A component that handles the creation and monitoring of all the UM worker processes that are created.

Unified Messaging

An application that consolidates a user's voice mail and email into one mailbox, so that the user only needs to check a single location for messages, regardless of type. The email server is used as the platform for all types of messages, making it unnecessary to maintain separate voice mail and email infrastructures.

voice mail

A system that records and stores telephone messages in a user mailbox.

Voice Mail Preview

A feature that provides text, transcribed from the audio recording, on a voice message when it is delivered.

voice message

An electronic message with a primary content of digitized audio.

Voice over IP (VoIP)

The practice of using an IP data network to transmit voice calls.

voice user interface (VUI)

An interface that is used to navigate the menus of a voice mail system using speech inputs.

VoIP gateway

1. A third-party hardware device or product that connects a legacy PBX to a LAN. A VoIP gateway translates or converts TDM or telephony circuit-switched protocols to packet-switched protocols that can be used on a VoIP-based network.
2. The Exchange Unified Messaging representation of any SIP peer with which it can communicate using VoIP protocols. It may represent a device that interfaces with a legacy PBX, an IP PBX, or Microsoft Lync Server.

welcome greeting

A greeting that is played when an external caller calls in to a UM auto attendant or when an Outlook Voice Access user or another caller calls a subscriber access number that is configured on a UM dial plan. The default welcome greetings can be changed by a customer to make them specific to an organization or location.

Mailbox and Client Access servers

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-15*

In Microsoft Exchange Server 2013, the five server roles from Exchange 2010 have been replaced by two main types of servers: Mailbox servers and Client Access servers. The Client Access server is a thin, stateless server that serves as a proxy for client connections to the Mailbox server. The Mailbox server handles the processing for all client connections to the active mailbox database.

Mailbox and Client Access server documentation

The following table contains links to topics that will help you learn about and manage Mailbox and Client Access servers in Exchange 2013.

Topic	Description
Mailbox server	Learn about the Mailbox server, which is responsible for client processing and houses an

	active or passive copy of the mailbox database.
Manage mailbox databases in Exchange 2013	Learn about the management tasks you can perform on a mailbox database after you create at least one database on a Mailbox server.
Client Access server	Learn about the Client Access server, which provides proxying and limited redirection for incoming client connections to the Mailbox server.
Mailbox import and export requests	Learn about importing and exporting information into mailboxes in your Exchange organization.

Mailbox server

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-19*

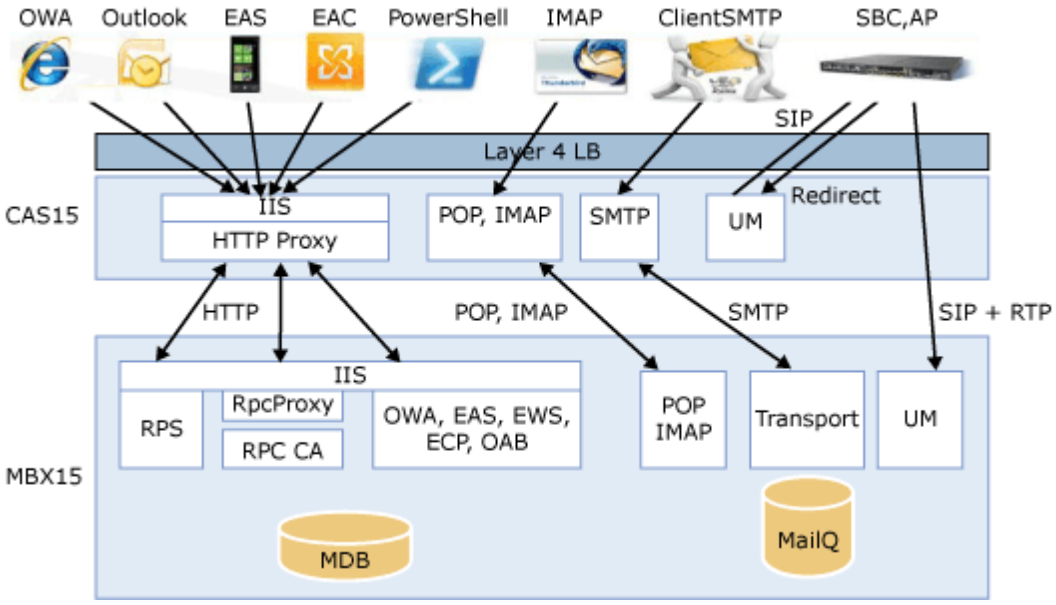
In Microsoft Exchange Server 2010, the Mailbox server role hosted both mailbox and public folder databases and also provided email message storage. Now, in Exchange Server 2013, the Mailbox server role also includes the Client Access protocols, Transport service, mailbox databases, and Unified Messaging components.

In Exchange 2013, the Mailbox server role interacts directly with Active Directory, the Client Access server, and Microsoft Outlook clients in the following process:

- The Mailbox server uses LDAP to access recipient, server, and organization configuration information from Active Directory.
- The Client Access server sends requests from clients to the Mailbox server and returns data from the Mailbox server to the clients. The Client Access server also accesses online address book (OAB) files on the Mailbox server through NetBIOS file sharing. The Client Access server sends messages, free/busy data, client profile settings, and OAB data between the client and the Mailbox server.
- Outlook clients inside your firewall access the Client Access server to send and retrieve messages. Outlook clients outside the firewall can access the Client Access server by using Outlook Anywhere (which uses the RPC over HTTP Proxy component).

- Public folder mailboxes are accessible via RPC over HTTP, regardless of whether the client is outside or inside the firewall.
- The administrator-only computer retrieves Active Directory topology information from the Microsoft Exchange Active Directory Topology service. It also retrieves email address policy information and address list information.
- The Client Access server uses LDAP or Name Service Provider Interface (NSPI) to contact the Active Directory server and retrieve users' Active Directory information.

Mailbox and Client Access server interaction and architecture



For more details, see the “Exchange 2013 architecture” section in What's new in Exchange 2013.

New Mailbox features

The following list briefly describes some new and some improved features in the Mailbox role for Exchange 2013:

- Evolution of the Exchange 2010 database availability group (DAG):
  - Transaction log code has been refactored for fast failover with deep checkpoint on passive database copies.
  - To support enhanced site resiliency, servers can be in different locations.
- Exchange 2013 now hosts some Client Access components, the Transport components, and the Unified Messaging components.
- The Exchange Store has been re-written in managed code to improve performance in additional I/O reduction and reliability.
- Each Exchange 2013 database now runs under its own process.
- Smart Search has replaced the Exchange 2010 multi-mailbox search infrastructure.

Securing Mailbox servers

By default, HTTP, Microsoft Exchange ActiveSync, POP3, and IMAP4 communication between the Mailbox servers and other Exchange server roles, domain controllers, and global catalog servers is

encrypted. In addition, make sure that your Mailbox servers aren't accessible to the Internet.

Managed Store

Exchange Server 2013 > Mailbox and Client Access servers > Mailbox server >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

All previous versions of Exchange Server, from Exchange Server 4.0 to Exchange Server 2010, have supported running a single instance of the Information Store process (Store.exe) on the Mailbox server role. This single Store instance hosts all databases on the server: active, passive, lagged, and recovery. In the previous Exchange architectures, there is little, if any, isolation between the different databases hosted on a Mailbox server. An issue with a single mailbox database has the potential to negatively affect all other databases, and crashes resulting from a mailbox corruption can affect service for all users whose databases are hosted on that server.

Another challenge with a single Store instance in previous versions of Exchange is that the Extensible Storage Engine (ESE) scales well to 8-12 processor cores, but beyond that, cross-processor communication and cache synchronization issues lead to negative scale. Given today's much larger servers, with 16+ core systems available, this would mean impose the administrative challenge of managing the affinity of 8-12 cores for ESE and using the other cores for non-Store processes (for example, Assistants, Search Foundation, Managed Availability, etc.). Moreover, the previous architecture restricted scale-up for the Store process.

The Store.exe process has evolved considerably throughout the years as Exchange Server itself evolved, but as a single process, ultimately its scalability is limited, and it represents a single point

of failure. Because of these limits, Store.exe is gone in Exchange 2013 and replaced by the Managed Store.

Managed Store

The Managed Store is the name for the Information Store (aka the Store) processes in Exchange Server 2013. The Managed Store uses a controller/worker process model that provides storage process isolation and faster database failover. The Managed Store also includes a new static database caching mechanism that replaces the dynamic buffer algorithm in previous versions of Exchange Server. In the multi-process model used by the Managed Store, there is a single store service controller process (in this case, Microsoft.Exchange.Store.Service.exe aka MSExchangeIS), and one worker process (in this case, Microsoft.Exchange.Store.Worker.exe) for each mounted database. When a database is mounted, a new worker process is instantiated that services only that database. When a database is dismounted, the worker process for that database is terminated.

For example, if you have 40 databases mounted on a server, there will be 41 processes running for the Managed Store, one for each database, and one for the store service process controller.

The store service process controller is very thin and very reliable, but if it dies or is terminated, all of its worker processes die (they will detect the service controller process is gone and exit). The store process controller monitors the health of all store worker processes on the server. A forcible or unexpected termination the Microsoft.Exchange.Store.Service.exe causes an immediate failover of all active database copies. The Managed Store is also tightly integrated with the Microsoft Exchange Replication service (MSExchangeRepl.exe) and Active Manager. The controller process, worker processes, and Replication service work together to provide greater availability and reliability:

- Microsoft Exchange Replication service process (MSExchangeRepl.exe)
  - Responsible for issuing mount and dismount operations to the Store
  - Initiates recovery action on storage or database failures reported by the Store, the Extensible Storage Engine (ESE), and Managed Availability responders
  - Detects unexpected database failures
  - Provides the administrative interface for management tasks
- Store service process/controller (Microsoft.Exchange.Store.Service.exe)
  - Manages each worker process lifetime based on the mount and dismount operations received from the Replication service
  - Handles incoming requests from the Windows Service Control Manager
  - Logs failure items when store worker process problems detected (for example, hang or unexpected exit)
  - Terminates store worker processes in response failover event
- Store worker process (Microsoft.Exchange.Store.Worker.exe)
  - Responsible for executing RPC operations for mailboxes on a database
  - RPC endpoint instance within worker process is the database GUID
  - Provides database cache for a database

Static Database Caching Algorithm

The database caching algorithm known as dynamic buffer allocation that was introduced in Exchange Server 5.5 and also used by the Information Store in Exchange 2000 Server, Exchange Server 2003, Exchange Server 2007 and Exchange Server 2010, is also gone from Exchange 2013. Exchange 2013 uses a very simple and straightforward algorithm for determining database cache. The Managed Store no longer dynamically reallocates cache between databases when failover occurs, which greatly simplifies internal cache management. Instead, the memory allocated for each database cache (e.g., each store worker process) is based on number of local database copies and value of *MaximumActiveDatabases*, if configured. If the value of *MaximumActiveDatabases* is greater than number of current database copies, then the cache calculation is based on the number of database copies.

The static algorithm used by Exchange 2013 allocates memory for each store worker process' ESE cache based on physical RAM. This is referred to as a database's *Max Cache Target*. 25% of total server memory is allocated to the ESE cache. This is referred to as the *Server Cache Size Target*.

Note:

The Server Cache Size Target, and therefore the amount of memory allocated to the Store for ESE cache, can be overridden using *msExchESEParamCacheSizeMax* attribute of the *InformationStore* object in Active Directory (the value configured is the number of 32 KB pages to allocate across all store processes).

A static amount of this cache is allocated to active and passive copies. The store worker process will be allocated the Max Cache Target only when servicing an active database copy. Passive database copies are allocated 20 percent of the Max Cache Target. The remainder is reserved by the Store, and allocated to the worker process if the database transitions from passive to active.

Max Cache Target is calculated only at Store startup. Therefore, if you add or remove databases or database copies, you must restart the Store controller service (MSExchangeIS) so that the cache can be adjusted accordingly. If the service is not restarted, then newly created databases will have a smaller cache size target than databases created prior to the service startup. In this event, the sum of database cache size targets will likely exceed the Server Cache Size Target until MSExchangeIS is restarted.

Example Database Cache Calculations

Below are example database caching calculations that are based on a Mailbox server's memory and database configuration.

Example 1

In this example, the Mailbox server has 48 GB of memory, and it hosts two active databases and two passive databases. In addition, the *MaximumActiveDatabases* parameter is not configured. In this configuration, the amount of database cache is 3 GB for each active database copy worker

process and 0.6 GB for each passive database copy worker process. Here's how these values were obtained.

To get the Server Cache Size Target, multiply the amount memory by 25%:

48 GB X 25% = 12 GB

To get the Database Max Cache Target, divide the Server Cache Size Target by the total number of active and passive databases:

12 GB / 4 databases = 3 GB

To determine the amount of memory used for the passive database copies, multiply the Database Max Cache Target by 20%:

3 GB X 20% = 0.6 GB

Out of the 12 GB of memory assigned to the Server Cache Size Target, 7.2 GB will be in use by database worker processes, and 4.8 GB will be reserved by the Information Store for the two passive database copies in case they become active copies. In that event, they will use their Max Cache Target of 3 GB.

Example 2

In this example, the Mailbox server also has 48 GB of memory and hosts two active databases and two passive databases; however, the *MaximumActiveDatabases* parameter is configured with a value of 2. In this configuration, the amount of database cache is 5 GB for each active database copy worker process and 0.2 GB for each passive database copy worker process. Here's how these values were obtained.

To get the Server Cache Size Target, multiply the amount memory by 25%:

48 GB X 25% = 12 GB

To get the Database Max Cache Target, divide the Server Cache Size Target by the total number of active database plus the total number of passive databases multiplied by 20%:

12 GB / (2A + (2P X 20%)) = 5 GB

To determine the amount of memory used for the passive database copies, multiply the Database Max Cache Target by 20%:

5 GB X 20% = 1 GB

Out of the 12 GB of memory assigned to the Server Cache Size Target, 12 GB will be in use by database worker processes, and no memory will be reserved by the Information Store for the two passive database copies because they cannot become active copies in this configuration (because *MaximumActiveDatabases* is configured with a value of 2, and there are already 2 active database copies on the server).

Manage mailbox databases in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-04-29*

A mailbox database is a unit of granularity where mailboxes are created and stored. A mailbox database is stored as an Exchange database (.edb) file. In Microsoft Exchange Server 2013, each mailbox database has its own properties that you can configure.

This topic shows you how to perform configuration tasks related to managing your mailbox databases in Microsoft Exchange Server 2013.

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Create a mailbox database

Use the EAC to create a mailbox database

1. From the Exchange admin center, navigate to **Servers**.
2. Select **Databases**, and then click the **+** symbol to create a database.
3. Use the new database wizard to create your database.

Use the Shell to create a mailbox database

For an example of how to create a mailbox database, see Example 1 in New-MailboxDatabase.

How do you know this worked?

To verify that you have successfully created a database, do the following:

- From the EAC, verify that the mailbox database you created is listed in the **Databases** page.
- From the Shell, verify that the database was created on server Mailbox01 by running the following command.

```
Get-MailboxDatabase -Server "Mailbox01"
```

Get mailbox database properties

For detailed syntax and parameter information, see Get-MailboxDatabase.

Use the Shell to get mailbox database properties

For an example of how to get mailbox database properties, see Example 2 in New-MailboxDatabase.

How do you know this worked?

To verify that you have successfully retrieved your mailbox database information, do the following:

From the Shell, verify that all your mailbox database information is represented correctly.

Set mailbox database properties

Use the EAC to set mailbox database properties

1. From the EAC, navigate to **Servers**.
2. Select **Databases**, and then click to select the mailbox database you want to configure.
3. Click **Edit** to configure the attributes of a mailbox database.
4. Use the **General** tab to view status about the mailbox database, including the mailbox database path, last backup, and mailbox database status:
   - **Database path** This read-only field displays the full path to the Exchange 2013 database (.edb) file for the selected mailbox database. To view the entire path, you may have to click the path and use the Right Arrow key. You can't use this field to change the path. To change the location of the database files, use the Move-DatabasePath cmdlet.
   - **Last full backup** This read-only field displays the date and time of the last complete backup of the mailbox database.
   - **Last incremental backup** This read-only field displays the date and time of the last incremental backup of the mailbox database.
   - **Status** This read-only field displays whether the mailbox database is mounted or dismounted.
   - **Mounted on server** This read-only field displays which server the database is mounted on.
   - **Master** This read-only field displays the master server for the mailbox database. The Mailbox server that hosts the active copy of a database is referred to as the mailbox database master.
   - **Master type** This read-only field displays the type of mailbox database master.

- **Modified** This read-only field displays the date and time the database was last modified.
- **Servers hosting a copy of this database** This read-only field displays the other servers that have a copy of this database.

5. Use the **Maintenance** tab to configure mailbox database settings, including specifying a journal recipient, setting a maintenance schedule, and mounting the database at startup:
   - **Journal Recipient** Click **Browse** to specify a recipient to enable journaling on this mailbox database. Remove the recipient listed to disable journaling.
   - **Maintenance schedule** Use this list to select one of the preset maintenance schedules. You can also configure a custom schedule. To configure a custom schedule, click **Customize**.
   - **Enable background database maintenance (24 x 7 ESE scanning)** Select this check box to enable online database scanning, which runs continuously in the background. Online database scanning performs a checksum calculation of the database and performs operations that allow Exchange to scan for lost space on the database and recover it. If you select this check box, Exchange scans the database no more than one time per day and will issue a warning event if it can't finish scanning the database in a seven-day period.
   - **Don't mount this database at startup** Select this check box to prevent Exchange from mounting this mailbox database when it starts.
   - **This database can be overwritten by a restore** Select this check box to allow the mailbox database to be overwritten during a restore process.
   - **Enable circular logging** Select this check box to enable circular logging.
6. Use the **Limits** tab to specify the storage limits, the warning message interval, and the deletion settings for a mailbox database:
   - **Issue warning at (GB)** Select this check box to automatically warn mailbox users that their mailbox is approaching its storage limit. To specify the storage limit, select the check box, and then specify in gigabytes (GB) how much content can be stored in the mailbox before a warning email message is sent to the mailbox users. You can enter a value from 0 through 2,097,151 megabytes (MB) (2.0 terabytes).
   - **Prohibit send at (GB)** Select this check box to prevent users from sending new email messages after the size of their mailbox reaches the specified limit. To specify this limit, select the check box, and then type the size of the mailbox in GB at which you want to prohibit the sending of new email messages and notify the user. You can enter a value from 0 through 2,097,151 MB (2.0 terabytes).
   - **Prohibit send and receive at (GB)** Select this check box to prevent users from sending and receiving email messages after their mailbox size reaches the specified limit. To specify this limit, select the check box, and then type the size of the mailbox in GB at which you want to prohibit the sending and receiving of email messages and notify the user. You can enter a value from 0 through 2,097,151 MB (2.0 terabytes).
   - **Keep deleted items for (days)** Select this check box to set the number of days that deleted items are retained in a mailbox. You can enter a value from 0 through 24,855 days.
   - **Keep deleted mailboxes for (days)** Select this check box to set the number of days that deleted mailboxes are retained. You can enter a value from 0 through 24,855 days.
   - **Don't permanently delete items until the database has been backed up** Select this check

box to prevent mailboxes and email messages from being deleted until after the mailbox database has been backed up.

7. Use the **Client Settings** tab to select the offline address book (OAB) for the mailbox:
   - **Offline address book** To select an offline address book, click **Browse**, and then select the offline address book.

Use the Shell to set mailbox database properties

For an example of how to set mailbox database properties, see Example 1 in Set-MailboxDatabase.

How do you know this worked?

To verify that you have successfully set the attributes, do the following:

- Verify that your changes are saved in the EAC.
- From the Shell, run the following command to retrieve mailbox database properties.

```
Get-MailboxDatabase -Identity MailboxDatabase01 -Status | Format-List
```

Move a mailbox database path

For detailed syntax and parameter information, see Move-DatabasePath.

Use the Shell to move a mailbox database path

For an example of how to set mailbox database properties, see Example 1 in Move-DatabasePath.

How do you know this worked?

To verify that you have successfully moved the database path, do the following:

1. From the EAC, select **Servers** > **Databases**, and then click to select the appropriate mailbox.
2. Click the **pen** symbol and verify that the database path is correct.

Mount a mailbox database

For detailed syntax and parameter information, see Mount-Database.

Use the Shell to mount a mailbox database

For an example of how to mount a mailbox database, see Example 1 in Mount-Database.

How do you know this worked?

To verify that you have successfully mounted the mailbox database, do the following.

- From the Shell, run the following command to retrieve mailbox database properties for all mailbox databases.

```
Get-MailboxDatabase -IncludePreExchange2013
```

Dismount a mailbox database

For detailed syntax and parameter information, see Dismount-Database.

Use the Shell to dismount a mailbox database

For an example of how to dismount a mailbox database, see Example 1 in Dismount-Database.

How do you know this worked?

To verify that you have successfully dismounted the database, do the following:
1. From EAC, select **Servers** > **Databases**, and then click to select the appropriate mailbox.
2. Click the **pen** symbol, and verify that the database status is **Dismounted**.

Remove a mailbox database

Use the EAC to remove a mailbox database

1. From the EAC, select **Servers** > **Databases**, and then click to select the appropriate mailbox.
2. Click **Delete** to remove the mailbox database.

Use the Shell to remove a mailbox database

For detailed syntax and parameter information, see Remove-MailboxDatabase.
1. Run the following command to remove the mailbox database MyDatabase.

```
Remove-MailboxDatabase -Identity "MyDatabase"
```

2. When you're prompted about whether you're sure that you want to perform the action, type **Y**.
3. When the dialog box appears stating that the database was removed successfully, note the location of the Exchange 2013 database (.edb) file. If you want to remove this file from the hard drive, you must remove it manually.

How do you know this worked?

To verify that you have successfully removed the mailbox database, do the following:
- From the EAC, select **Servers** > **Databases**.
- Verify that the mailbox database has been removed.

Configure circular logging for a mailbox database

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-24*

When you enable circular logging for a mailbox database, the type of circular logging you get depends on whether or not the mailbox database is replicated using continuous replication:

- If the mailbox database is not replicated, it will use JET circular logging. In this case, enabling or disabling JET circular logging will require a dismount and mount of the database.
- If the mailbox database is replicated, it will use continuous replication circular logging (CRCL). In this case, enabling or disabling CRCL takes effect dynamically; there is no need to dismount and re-mount the database.

For more information about circular logging and CRCL, see Exchange Native Data Protection.

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox Database Permissions" entry in the Recipients Permissions topic.

Use the EAC to configure circular logging for a database

1. In the EAC, go to **Servers** > **databases**.
2. Select the mailbox database you want to configure and click ✎.
3. Check or uncheck the **Enable circular logging** checkbox, and then click **save**.
4. If a dismount and mount operation are required, a warning message will appear. Click **OK** to close the warning message.
   a. To dismount the database, click **More** ⋯, and then click **Dismount**. Click **yes** when the warning message appears.
   b. To mount the database, click **More** ⋯, and then click **Mount**. Click **yes** when the warning message appears.

Use the Shell to configure circular logging for a database

This example enables circular logging for database DB1.

```
Set-MailboxDatabase DB1 -CircularLoggingEnabled $True
```

This example disables circular logging for database DB1.

```
Set-MailboxDatabase DB1 -CircularLoggingEnabled $False
```

See Set-MailboxDatabase for other mailbox database parameters you can configure.

Understanding Exchange 2013 page zeroing

Topic Last Modified: *2014-05-09*

Page Zeroing in Exchange 2013

Zeroing is a security mechanism that writes either zeros or a binary pattern over deleted data so that the deleted data more difficult to recover. In Exchange Server 2013, an ESE database uses *pages* as its unit of storage, and as a result it implements *page zeroing*. Page zeroing is enabled by default, and it cannot be disabled. Page zeroing operations are recorded in the transaction log files so that all copies of a database are page-zeroed in a similar manner. Zeroing a page on an active database causes the page to get zeroed on a passive copy of the database.

Note:

There is no mechanism for the Extensible Storage Engine (ESE) to prioritize the reutilization of zeroed pages over allocating new space. Tables which have sequential space allocation assigned will intentionally skip fragmented or zeroed pages in favor of using new or free sequential pages. This approach reduces database IOPs.

In Exchange 2013 page zeroing reduces the performance impact on servers when they're performing zeroing functions. This includes:

- **Optimized storage and network capacity** ESE writes a page-zeroing record to the transaction log file instead of logging the entire page image. This approach reduces log write I/O, and reduces the bandwidth requirements for shipping log files.
- **Optimized database disk I/O** In Exchange 2010 RTM and earlier, page zeroing occurred only during a backup, or during scheduled maintenance, and it caused significant database disk I/O. In Exchange 2010 SP1 and later (including Exchange 2013), page zeroing occurs by default and happens at transaction time. In the majority of cases, zeroing occurs immediately after a hard delete. This design allows the database to leverage the checkpoint depth capability of the engine, which ensures that dirty pages stay in the database cache for a certain amount of time so that additional page updates that occur in close time proximity don't cause additional database write I/Os. Because of this design, page zeroing has no significant database I/O impact, which is why it's enabled by default.

Implementation of Page Zeroing in the ESE Database

Page zeroing writes a binary pattern over a hard-deleted record. The page-zeroing pattern is specific to the ESE engine operation and it is different for run-time operations versus maintenance operations. The following table lists the fill patterns that correspond to specific run-time operations.

Fill pattern of page zeroing during ESE run-time

ESE run-time operation	Fill pattern
Replace	R
Record/long value delete	D
Freed page space	H

The following table lists the fill patterns that correspond to specific operations that occur during ESE background database maintenance.

Fill pattern of page zeroing during ESE background database maintenance

ESE background database maintenance operation	Fill pattern
Record delete	D
Long value delete	L
Freed page space of partially used page	Z
Freed page space of unused page	U

Background Database Maintenance

Background database maintenance is a process that continuously checksums and scans each database. Its primary function is to checksum database pages, but it also handles cleaning up space and zeroing out records and pages that were not zeroed out because of a Store crash. Background database maintenance processes approximately 1 MB per second per database. If timely page zeroing is a priority, you can reduce database sizes to ensure page zeroing occurs for the crash recovery cases in a shorter time period (for example, 24 hours).

Background database maintenance is a continuous process, so there are no events associated with its start and completion. You can track the progress of background database maintenance by reading the value of a performance counter:

- MSExchange Database -> Instances -> Database Maintenance Duration

This counter indicates the number of seconds that have passed since maintenance last completed for a given database.

Process of ESE Database Page Zeroing

The following table discusses database delete scenarios, and when page zeroing functions occur.

ESE background database maintenance

Database delete scenario	ESE process and timeframe to zero database data
• Scenario 1: Single item recovery is disabled and user purges item from the Recoverable Items folder. • Scenario 2: Single item recovery is disabled and the Recoverable Items retention period is set to zero. • Scenario 3: Single item recovery is enabled and the item expires based on the deleted item retention period.	An asynchronous thread writes a binary pattern over the deleted data. This action occurs within milliseconds of the record deletion. If the Store process crashes while the asynchronous zeroing work is still outstanding (or version store cleanup is cancelled due to version store growth), the zeroing is completed when background database maintenance processes that section of the database.
View Scenario: Expiration of items from Outlook/ Outlook Web App folder view (for example, Conversation view)	Data zeroing occurs when background database maintenance processes that section of the database.
Move Mailbox/Delete Mailbox Scenario: Source mailbox deleted (expiry of deleted mailbox from dumpster)	Data zeroing occurs when background database maintenance processes that section of the database.

Monitoring Page Zeroing Behavior

You can measure and monitor page zeroing functionality by viewing two ESE counters:

- MSExchange Database -> Database Maintenance Pages Zeroed: Indicates the number of pages zeroed by the database engine since the performance counter was invoked.
- MSExchange Database -> Database Maintenance Pages Zeroed/sec: Indicates the rate at which pages are zeroed.

Note:
To learn how to enable these counters, see How to Enable Extended ESE Performance Counters.

Page zeroing is a database maintenance function, so performance information related to both page zeroing for run-time transactions and page zeroing due to background database maintenance is included in these counters.

Mailbox Data Types without Page Zeroing

The following Mailbox data types have no provisions for page zeroing:

- Mailbox database transaction logs (.log)

When transaction logs are deleted (due to truncation via backup or circular logging), there is no process to zero the blocks in the NTFS file system that stored the deleted log file(s). It's likely that NTFS will quickly re-utilize that free space for newly created logs, but there is no guarantee that this will happen.

- Content index catalog files

Exchange 2013 uses Search Foundation for search indexing functionality. The search index catalog is comprised of several dozen files stored on the same volume as the mailbox database file. When a message is hard-deleted from the mailbox database, the associated content in the search catalog isn't immediately deleted. Content deletion occurs when Search Foundation does a shadow, or master merge, of many small catalog files in to a single larger file. After the master merge completes, the smaller catalog files are deleted. There is no process to zero the blocks which stored the deleted catalog files.

Exchange Search

Exchange Server 2013 > Mailbox and Client Access servers > Mailbox server >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2014-04-24*

With increasing mailbox sizes and increasing amounts of data being stored in mailboxes in the form of messages and attachments, it's crucial for users to be able to quickly search and locate the messages they need. In-Place Archiving helps you reduce or eliminate the use of .pst files by moving old and infrequently accessed items to the archive. This results in more mailbox data being stored by a user, and it makes searching across the user's primary and archive mailboxes an important productivity tool. In-Place eDiscovery allows authorized users to search content in mailboxes across on-premises and cloud-based Exchange organizations to comply with electronic discovery (eDiscovery) requests, regulatory audits, or internal investigations. In-Place eDiscovery also uses the content indexes created by Exchange Search.

Exchange Search is different from full-text indexing available in Exchange Server 2003. Improvements were made to performance, content indexing, and search. New items are indexed in the transport pipeline or almost immediately after they're created or delivered to the mailbox, providing users with a fast, stable, and more reliable way of searching mailbox data. Content indexing is enabled by default, and there's no initial setup or configuration required.

Looking for management tasks related to Exchange Search? See Exchange Search procedures.

What's New

Exchange 2013 introduces the following changes to Exchange Search:

- The underlying content indexing engine has been replaced with Microsoft Search Foundation, which provides performance and functionality improvements and serves as the common underlying content indexing engine in Exchange and SharePoint. The management interface, however, remain the same.
- By default, the Search Foundation handles the most common file formats in email attachments. You no longer need to install Microsoft Office Filter Packs for Exchange Search. For a list of the file formats handled by Exchange Search, see File formats indexed by Exchange Search.

You can add support for any additional file formats by install IFilters, as in Exchange 2010.

- Content indexing is more efficient because it now processes messages in the transport pipeline. As a result, messages addressed to multiple recipients or distribution groups are processed only once. An annotation stream is attached to the message, significantly speeding up content indexing while consuming fewer resources.

File formats indexed by Exchange Search

Mailbox and Client Access servers > Mailbox server > Exchange Search >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-21*

In Microsoft Exchange Server 2013 and Exchange Online, Exchange Search includes filters for indexing most common types of file formats included as message attachments. You can also install filters to index additional file types.

Note:
In Exchange 2013, it isn't required to install and register Microsoft Office Filter Pack.

When managing or using Exchange Search and the dependent features (such as In-Place eDiscovery), consider the difference between unsearchable items and file formats that are disabled

for indexing or contain content that can't be indexed:

- **Unsearchable items** When Exchange Search can't index a particular file type for any reason (for example, if a filter isn't installed), the search for the file type fails. Messages containing such attachments are marked as *partially indexed*. Unsearchable items can be retrieved using the Get-FailedContentIndexDocuments cmdlet. When copying In-Place eDiscovery search results to a discovery mailbox or exporting search results to a PST file, you can include unsearchable items. For more information, see Unsearchable items in Exchange eDiscovery.
- **File formats with content that can't be indexed** Certain file types such as Windows Media Video (WMV) don't contain content that can be indexed and therefore aren't indexed. Messages containing attachments of such file types are also returned as unsearchable items in In-Place eDiscovery searches.
- **Disabled file formats** In on-premises organizations, an administrator can disable indexing of a specified file format. Messages that contain an attachment that is of a disabled format are returned as unsearchable items.

Important:
Although a message attachment may be unsearchable or is of a file format that can't be indexed, the message subject, message body and other metadata may be indexed so that the message can be returned in searches.

For additional management tasks related to Exchange Search in on-premises organizations, see Exchange Search procedures.

Default filters

The following table lists the default search filters installed on an Exchange 2013 Mailbox server and in Exchange Online. You can retrieve the list of default filters by using the Get-SearchDocumentFormat cmdlet.

Filter	File extension
Email message	.eml
Graphics Interchange Format	.gif
JPEG	.jpeg
Microsoft Excel	.xls, .xlt, .xlsx, .xlsm, .xlb, .xlc, .xlsb
Excel File	odbcexcel
Microsoft InfoPath	.infopathml
Microsoft Office Binder	.obt, obd

Microsoft PowerPoint	.pptx, .pptm, .ppt, .ppsx, .ppsm, .pps, .ppam, .potm, .pot, .potx
Microsoft Publisher	.pub
Microsoft Word	.doc, .docm, .dotx, .dotm, .dot, .docx
Microsoft XML Paper Specification	.xps
OneNote	.one
OpenDocument Presentation	.odp
OpenDocument Spreadsheet	.ods
OpenDocument Text	.odt
Outlook Item	.msg
Portable Document Format	.pdf
Rich Text	.rtf
Text	.txt
vCalendar	.vcs
vCard	.vcf
Visio	.vdw, .vsd, .vss, .vst, .vsx, .vtx, .vssx, .vssm, .vsdm, .vstx, .vstm, .vdx
Web archive	.mhtml
Web page	.html
XML document	.xml
ZIP archive	.zip

Disabled file formats

The following table lists the search filters that are disabled for indexing by default on an Exchange 2013 Mailbox server and in Exchange Online. In Exchange 2013, administrators can disable or re-enable a supported file format for indexing by using the Set-SearchDocumentFormat cmdlet. This cmdlet isn't available in Exchange Online.

Filter	File extension
AVI	.avi
Bitmap	.bmp
MP3	.mp3
MPEG	.mpeg
PNG	.png
Microsoft Windows Wave Audio	.wav

Message properties indexed by Exchange Search

Mailbox and Client Access servers > Mailbox server > Exchange Search >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-02-13*

Exchange Search indexes many item properties, including sender, recipients, message body, and attachments for email messages.

Properties indexed by Exchange Search

The following table includes a list of all item properties indexed by Exchange Search.

Property	Type	Queryable	Searchable	Retrievable
Account	String	Yes	Yes	No
Assistantname	String	Yes	Yes	No
Attachmentfilenames	String	Yes	Yes	No

Attachmentmetaproperties	String	No	Yes	No
Attachmentcount	Integer	No	No	Yes
Bcc	String	Yes	Yes	No
Body	String	No	Yes	No
Businessaddress	String	Yes	Yes	No
Businessmainphone	String	Yes	Yes	No
Businessphonenumber	String	Yes	Yes	No
Carphonenumber	String	Yes	Yes	No
Categories	String	Yes	Yes	No
Cc	String	Yes	Yes	No
Companyname	String	Yes	Yes	No
Compositeitemid	String	No	No	Yes
Conversationid	Integer	No	No	Yes
Conversationtopic	String	Yes	Yes	No
Departmentname	String	Yes	Yes	No
Displayname	String	Yes	Yes	No
Displaynameprefix	String	Yes	Yes	No
Documentid	Integer	Yes	No	Yes
Emailaddress	String	Yes	Yes	No
Emaildisplayname	String	Yes	Yes	No

Emailoriginaldisplayname	String	Yes	Yes	No
Errorcode	Integer	Yes	No	Yes
Fileas	String	Yes	Yes	No
Firstname	String	Yes	Yes	No
Folderid	String	Yes	No	No
From	String	Yes	Yes	No
Homeaddress	String	Yes	Yes	No
Homephone	String	Yes	Yes	No
Importance	Integer	Yes	No	No
Ispartiallyprocessed	Boolean	Yes	No	Yes
Ispermanentfailure	Boolean	Yes	No	Yes
Itemclass	String	Yes	No	No
Lastattempttime	DateTime	Yes	No	Yes
Lastname	String	Yes	Yes	No
Mailboxguid	String	Yes	No	Yes
Manager	String	Yes	Yes	No
Meetinglocation	String	Yes	Yes	No
Middlename	String	Yes	Yes	No
Mobilephonenumber	String	Yes	Yes	No

Nickname	String	Yes	Yes	No
Officelocation	String	Yes	Yes	No
Otheraddress	String	Yes	Yes	No
Primarytelephonenumber	String	Yes	Yes	No
Received	DateTime	Yes	No	No
Receivedby	String	Yes	Yes	No
Receivedrepresenting	String	Yes	Yes	No
Recipients	String	Yes	Yes	No
Sent	DateTime	Yes	No	No
Sharinginfo	String	Yes	No	No
Size	Integer	Yes	No	No
Subject	String	Yes	Yes	No
Tasktitle	String	Yes	Yes	No
Title	String	Yes	Yes	No
To	String	Yes	Yes	No
Umaudionotes	String	Yes	Yes	No
Watermark	Integer	No	No	Yes
Yomicompanyname	String	Yes	No	Yes
Yomifirstname	String	Yes	Yes	No
Yomilastname	String	Yes	Yes	No

Notes about indexed properties:

- **Queryable properties** can be used in search queries (either programmatically or in KQL queries) for In-Place eDiscovery and in AQS queries by search clients such as Outlook Web App in `property:value` pairs, for example, `from:bsuneja@cotoso.com`.
- **Searchable properties** are properties that can't be specified in `property:value` pairs, but a keyword search returns the value if found in any searchable property. For example, you can't use `body:Contoso` to search for the string `contoso` in the message body only. However, a search for that string will return all items where the property is found in any searchable property.
- **Retrievable properties** such as `documenteid` and `ispartiallyprocessed` are returned with every search.

Disable or enable Exchange Search

Diagnose Exchange Search issues

Reseed the search catalog

Disable or enable Exchange Search

Mailbox server > Exchange Search > Exchange Search procedures >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-07*

By default, Exchange Search is enabled for all new mailbox databases and doesn't require additional configuration. However, if you want to stop Exchange Search from indexing mailbox content, you can disable it for individual mailbox databases or for an entire Mailbox server.

Caution:
Disabling Exchange Search impacts the functionality and performance of the full-text searches that are performed by your users using Outlook in online mode or on Windows mobile devices. In-Place eDiscovery also relies on Exchange Search. If you disable Exchange Search for a mailbox database or for a Mailbox server, In-Place eDiscovery searches won't return any messages from the database or server.

For additional management tasks related to Exchange Search, see Exchange Search procedures.

What do you need to know before you begin?

- Estimated time to complete each procedure: 1 minute
- Procedures in this topic require specific permissions. See each procedure for its permissions information.
- You can enable or disable Exchange Search for servers or mailbox databases but not for individual mailbox users.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Disable or enable Exchange Search for a mailbox database

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Search" entry in the Recipients Permissions topic.

Note:
You can't use the EAC to disable or enable Exchange Search for a mailbox database.

This command disables Exchange Search for a mailbox database named EXCH01.

```
Set-MailboxDatabase "Mailbox Database (EXCH01)" -
IndexEnabled $false
```

This command enables Exchange Search for a mailbox database named EXCH01.

```
Set-MailboxDatabase "Mailbox Database (EXCH01)" -
IndexEnabled $true
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

Disable or enable Exchange Search for a Mailbox server

To disable Exchange Search for a Mailbox server, you have to disable and stop the Microsoft Exchange Search service. Similarly, to enable Exchange Search for a Mailbox server, you have to enable and start the Microsoft Exchange Search service. You can use either the Services console or the Shell to do this.

You need to be assigned permissions before you can perform this procedure or procedures. To see

what permissions you need, see the "Manage Exchange Search service on a Mailbox server" entry in the Recipients Permissions topic.

Use the Services console

1. Go to **Start** > **Administrative Tools** > **Services**.
2. In the **Services** details pane, right-click the **Microsoft Exchange Search** service, and then select **Properties**.
3. On the **General** tab, in the **Startup type** list, select **Disabled** to disable the service or **Automatic** to start it automatically.

Note:

The startup type impacts the service the next time an attempt is made to start it, either automatically after the server is restarted or by manually starting the service. In the next step, the service is stopped or started manually.

4. Click **Stop** to stop the service or **Start** to start the service.
5. Click **OK** to save the changes.

Use the Shell

Run the following commands to stop and disable the Microsoft Exchange Search service.

```
Stop-Service MSExchangeFastSearch

Set-Service MSExchangeFastSearch -StartupType Disabled
```

Run the following commands to configure the Exchange Search service to start automatically and then start the service.

```
Set-Service MSExchangeFastSearch -StartupType Automatic

Start-Service MSExchangeFastSearch
```

Diagnose Exchange Search issues

Mailbox server > Exchange Search > Exchange Search procedures >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-09*

Exchange Search indexes mailboxes and supported attachments in Exchange mailboxes. With increasing volumes of e-mail, increasing mailbox sizes and storage quotas, provisioning of personal archive mailboxes for users, and the introduction of Multi-Mailbox Search for performing discovery searches, Exchange Search is a critical component of the Mailbox servers in your Microsoft

Exchange Server 2010 organization. Issues with Exchange Search can affect user productivity and impact Multi-Mailbox Search functionality.

To learn more about Exchange Search, see Exchange Search.

Looking for management tasks related to managing Exchange Search? See Exchange Search procedures.

Using the Test-ExchangeSearch Cmdlet

Step 5 of the procedure in this topic describes running the **Test-ExchangeSearch** cmdlet to help diagnose Exchange Search issues. You can use the **Test-ExchangeSearch** cmdlet to test Exchange Search functionality for a Mailbox server, a mailbox database, or a specific mailbox. The cmdlet delivers a test message to the specified mailbox (or to a database's system mailbox if a mailbox isn't specified), and then performs a search to determine whether the message is indexed, including the time taken to index it. Under normal conditions, Exchange Search indexes a message within about 10 seconds of the message being created or delivered to a mailbox. The test message is automatically deleted after the test.

Exchange 2010 includes the following enhancements to the **Test-ExchangeSearch** cmdlet:

- The *Mailbox* parameter has been added to the standard output.
- When you specify a server name, the cmdlet simultaneously tests all mailbox databases on the Mailbox server. For databases that are replicated to other Mailbox servers in a database availability group (DAG), if you run the command on a Mailbox server that doesn't contain the active database copy, the test is automatically performed against the server that contains the active database copy.
- When you use the cmdlet with the *MonitoringContext* parameter, it provides additional data that can be used by monitoring software such as Microsoft System Center Operations Manager 2007.
- When you use the cmdlet with the *Verbose* switch, the cmdlet returns detailed results and status for every step, and additional diagnostic information to help you troubleshoot issues related to search.

For detailed syntax and parameter information, see Test-ExchangeSearch.

Retrieving Unsearchable Items

You can use the **Get-FailedContentIndexDocuments** cmdlet to retrieve a list of unsearchable mailbox items that couldn't be successfully indexed by Exchange Search. You can run the cmdlet against a Mailbox server, a mailbox database, or a specific mailbox. The cmdlet returns details about each item that couldn't be searched. There are several reasons why a mailbox item can't be searched; for example, an e-mail message includes an attachment file type for which a search filter isn't installed. If a search filter for that file type is available, you can install it on your Exchange servers.

Important:

Search filters provided by Microsoft are tested and supported by Microsoft. We recommend that you test any third-party search filters in a test environment before installing them on Exchange servers in a production environment.

Note:

Messages that contain an attachment file format that's listed on the safe list aren't returned in the list of unsearchable items. For more details, see "Exchange Search and Attachments" in Exchange Search.

For detailed syntax and parameter information, see Get-FailedContentIndexDocuments.

Diagnose Exchange Search Issues

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Search" entry in the Recipients Permissions topic.

1. **Check service state** Is the Microsoft Exchange Search (MSExchangeFastSearch) service started on the Mailbox server? If yes, go to Step 2. If no, use the Services MMC snap-in to verify that the MSExchangeFastSearch service is running as follows:
   a. Click **Start**, point to **Administrative Tools**, and then click **Services**.
   b. In **Services**, verify that the **Status** for the **Microsoft Exchange Search** service is listed as **Started**.
2. **Check mailbox database configuration** Is the *IndexEnabled* parameter set to true for the user's mailbox database? If yes, go to Step 3. If no, run the following command in the Shell to verify that the *IndexEnabled* flag is set to true.

```
Get-MailboxDatabase | Format-Table Name,IndexEnabled
```

For detailed syntax and parameter information, see Get-MailboxDatabase.

3. **Check mailbox database crawl state** Has the Exchange database been crawled? If yes, go to Step 4. If no, use Reliability and Performance Monitor to check the **Crawler: Mailboxes Remaining** counter of the **MSExchange Search Indexes** performance object. Perform the following steps:
   a. Open Reliability and Performance Monitor (perfmon.exe).
   b. In the console tree, under **Monitoring Tools**, click **Performance Monitor**.
   c. In the Performance Monitor pane, click **Add** (green plus sign).
   d. In **Add Counters**, in the **Select counters from computer** list, select the server on which the mailbox database you want to monitor is located.
   e. In the unlabeled box below the **Select counters from computer** list, select the **MSExchange Search Indexes** performance object.
   f. In the **Instances of selected object** box, select the instance for the user's mailbox database.
   g. Click **Add**, and then click **OK**.

In the Performance Monitor pane, the **MSExchange Search Indexes** performance object is listed in the **Object** column, and its various counters are listed in the **Counter** column.

h. View the **Crawler: Mailboxes Remaining** counter. Any value of 1 or higher indicates that mailboxes in the database are still being crawled. When the crawl is complete, the value is **0**.

For information about using Performance Monitor, see Performance and Reliability Monitoring Step-by-Step Guide for Windows Server 2008

4. **Check the database copy indexing health** Is the content index healthy? Use the **Get-MailboxDatabaseCopyStatus** cmdlet to check the content indexing health for a database copy.

```
Get-MailboxDatabaseCopyStatus -Server $env:ComputerName |
Format-Table Name,Status,ContentIndex* -Auto
```

For detailed syntax and parameter information, see Get-MailboxDatabaseCopyStatus.

5. **Run the Test-ExchangeSearch cmdlet** If the mailbox database has already been crawled, you can run the **Test-ExchangeSearch** cmdlet for the mailbox database or for a specific mailbox.

```
Test-ExchangeSearch -Identity AlanBrewer@contoso.com
```

For detailed syntax and parameter information, see Test-ExchangeSearch.

6. **Check the Application event log** Using Event Viewer or the Shell, check the Application event log for search-related error messages. Check the **Source: MSExchangeSearch Indexer** and **msftesql-Exchange** events. For more information, follow the link in the event log entry.
7. **Restart the Microsoft Exchange Search service** Use the Services MMC snap-in or the Shell to stop and then restart the Microsoft Exchange Search (MSExchangeFastSearch) service:
   a. Click **Start**, point to **Administrative Tools**, and then click **Services**.
   b. In **Services**, right-click **Microsoft Exchange Search**, and then click **Stop**. After the service is stopped, right-click the service again, and then click **Start**.
8. **Reseed the search catalog** In some cases, such as when the search catalog is corrupted, you may need to reseed the catalog. When a search catalog needs to be reseeded, Exchange Search notifies you by logging entries in the Application event log. For more information about reseeding the Search catalog, see Reseed the search catalog.

Reseed the search catalog

Mailbox server > Exchange Search > Exchange Search procedures >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-04*

If the content index catalog for a mailbox database copy gets corrupted, you may need to reseed the catalog. Corrupted content indexes are indicated in the Application event log by the following event.

Event ID	Level	Source	Details

123	Error	ExchangeStoreDB	At <*timestamp*> the Microsoft Exchange Information Store Database <*identity*> copy on this server experienced a corrupted search catalog. Consult the event log on the server for other "ExchangeStoreDb" and "MSExchange Search Indexer" events for more specific information about the failure. Reseeding the catalog is recommended via the 'Update-MailboxDatabaseCopy' task.

If the mailbox database copy is located on a server that is part of a database availability group (DAG), you can reseed the content index catalog from another DAG member.

If the mailbox database copy is the only copy, you have to manually create a new content index catalog.

For other management tasks related to Exchange Search, see Exchange Search procedures.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes. Actual reseeding time may vary depending on the size of the content index catalog being reseeded.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Search" entry in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see

Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Reseed the content index catalog if the mailbox database is part of a DAG

Use one of the following procedures if the mailbox database is located on a server that is part of a DAG.

Reseed the content index catalog from any source

This example reseeds the content index catalog for the database copy DB1 on Mailbox server MBX1 from any source server in the DAG that has a copy of the database.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -CatalogOnly
```

For detailed syntax and parameter information, see Update-MailboxDatabaseCopy.

Reseed the content index catalog from a specific source

This example reseeds the content index catalog for the database copy DB1 on Mailbox server MBX1 from Mailbox server MBX2, which also has a copy of the database.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -SourceServer
MBX2 -CatalogOnly
```

For detailed syntax and parameter information, see Update-MailboxDatabaseCopy.

Reseed the content index catalog if there is only one copy of the mailbox database

If there is only one copy of the mailbox database, you have to manually reseed the search catalog by recreating the content index catalog.

1. Run the following commands to stop the Microsoft Exchange Search and Microsoft Exchange Search Host Controller services.

```
Stop-Service MSExchangeFastSearch

Stop-Service HostControllerService
```

2. Delete, move, or rename the folder that contains the Exchange content index catalog. This folder is named `%ExchangeInstallPath\Mailbox\<name of mailbox database>_Catalog\<GUID>12.1.Single`. For example, you might rename the folder `C:\Program Files\Microsoft\Exchange Server\V15\Mailbox\Mailbox Database 0657134726_Catalog\F0627A72-9F1D-494A-839A-D7C915C279DB12.1.Single_OLD`.

Note:
Deleting this folder will make additional disk space available. Alternatively, you might want to rename or move the folder to keep it for troubleshooting purposes.

3. Run the following commands to restart the Microsoft Exchange Search and Microsoft Exchange Search Host Controller services.

```
Start-Service MSExchangeFastSearch

Start-Service HostControllerService
```

After you restart these services, Exchange Search will rebuild the content index catalog.

How do you know this worked?

It might take a while for Exchange Search to reseed the content index catalog. Run the following command to display the status of the reseeding process.

```
Get-MailboxDatabaseCopyStatus | FL Name,*Index*
```

When the reseeding of the search catalog is in progress, the value of the *ContentIndexState* property is **Crawling**. When the reseeding is complete, this value is changed to **Healthy**.

Mailbox moves in Exchange 2013

Exchange Server 2013 > Mailbox and Client Access servers > Mailbox server >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-25*

When you move a mailbox, you're moving it from a *source mailbox database* to a *target mailbox database*. The target mailbox database can be on the same server, on a different server, in a different domain, in a different Active Directory site, or in another forest.

Reasons for moving mailboxes

You may need to move mailboxes in the following scenarios:

- **Upgrade** When you upgrade from an existing Microsoft Exchange Server 2007 or Exchange Server 2010 organization to Exchange Server 2013, you move mailboxes from the existing Exchange servers to an Exchange 2013 Mailbox server.
- **Realignment** You can move mailboxes for realignment purposes. For example, you may want to move a mailbox from one database to a database that has a larger mailbox size limit.
- **Investigate an issue** If you need to investigate an issue with a mailbox, you can move that mailbox to a different server. For example, you can move all mailboxes that have high activity to another server.
- **Corrupted mailboxes** If you encounter corrupted mailboxes, you can move the mailboxes to a different server or database. The corrupted messages won't be moved.
- **Physical location changes** You can move mailboxes to a server in a different Active Directory site. For example, if a user moves to a different physical location, you can move that user's mailbox to a server closer to the new location.
- **Separation of administrative roles** You may want to separate Exchange administration from Windows operating system account administration. To do this, you can move mailboxes from a single forest into a resource forest scenario. In this scenario, the Exchange mailboxes reside in one forest and their associated Windows user accounts reside in a separate forest.
- **Outsource email administration** You may want to outsource the administration of email and retain the administration of Windows user accounts. To do this, you can move mailboxes from a single forest into a resource forest scenario.
- **Integrate email and user account administration** You may want to change from a separated or outsourced email administration model to a model in which email and user accounts can be managed from within the same forest. To do this, you can move mailboxes from a resource forest scenario to a single forest. In this scenario, the Exchange mailboxes and Windows user accounts reside in the same forest.

Exchange 2013 moves

Microsoft Exchange Server 2013 introduces the concept of *batch moves* and *migration endpoints*. Migration endpoints are management objects that describe the remote server and the connections that can be associated with one or more batches. And, the new batch move architecture improves on Mailbox Replication service (MRS) moves with enhanced management capability. Batch moves architecture in Exchange 2013 features the following capabilities:

- Ability to move multiple mailboxes in large batches.
- Email notification during move with reporting.
- Automatic retry and automatic prioritization of moves.
- Primary and personal archive mailboxes can be moved together or separately.
- Option for manual move request finalization, which allows you to review your move before you complete it.
- Periodic incremental syncs to update migration changes.

In Exchange 2013 you must move mailboxes between Exchange 2007 and Exchange 2010 and Exchange 2013 from the Exchange 2013 admin center (EAC) and the Exchange Management Shell.

Note:
You can still perform single mailbox moves in Exchange 2013 similar to Exchange Server 2010 by using either the EAC or the move request or migration batch cmdlets.

Note:
You can't move on-premises mailboxes from Exchange Server 2003 to Exchange 2013.

For more information about managing new and existing moves, see Manage on-premises moves.

Migration endpoints

Migration endpoints capture the remote server information and persist the required credentials for migrating the data and the source throttling settings. You can use migration endpoints to configure settings for remote and cross-forest moves. Local moves don't require the use of an endpoint. (Local moves are moves that move mailboxes between two different on-premises Exchange databases.)

The following list shows the types of moves that support migration endpoints:

- **Cross-forest move** Move mailboxes between two different on-premises Exchange forests. Cross-forest moves require the use of a Exchange RemoteMove endpoint.
- **Remote move** In a hybrid deployment, a remote move involves *onboarding* or *offboarding* migrations. Remote moves require the use of a RemoteMove endpoint. Onboarding moves mailboxes from an on-premises Exchange organization to Exchange Online in Microsoft Office 365, and uses a RemoteMove endpoint as the source endpoint of the migration batch. Offboarding moves mailboxes from Exchange Online in Office 365 to an on-premises Exchange organization and uses a Exchange RemoteMove endpoint as the target endpoint of the migration batch.

The following table shows the migration endpoint types and values that you can manage in Exchange 2013.

Values of migration endpoint types

Exchange RemoteMove	Exchange LocalMove
MaxConcurrentMigrations	MaxConcurrentMigrations
RemoteServer	Site
ArchiveDomain	Database
BadItemLimit	ArchiveDatabase
LargeItemLimit	BadItemLimit
Databases	LargeItemLimit

TargetDeliveryDomain	PrimaryOnly
PrimaryOnly	ArchiveDatabase
ArchiveDatabase	DAG
ArchiveOnly	Forest

For more information about migration endpoints, see the **Migration** user interface in the EAC and New-MigrationEndpoint.

For more information about managing new and existing moves, see Manage on-premises moves.

Manage on-premises moves

Mailbox and Client Access servers > Mailbox server > Mailbox moves in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-25*

A move request is the process of moving a mailbox from one mailbox database to another. A local move request is a mailbox move that occurs within a single forest. In Microsoft Exchange Server 2013, mailboxes and personal archive mailboxes can reside on separate databases. Using the move request functionality, you can move the primary mailbox and the associated archive to the same database or to separate ones. The procedures in this topic will help you with on-premises mailbox moves.

Use the following procedures to move mailboxes in your on-premises organization. These procedures use the Exchange Management Shell and the Exchange Center (EAC).

When you use move request to move mailboxes, the move requests are processed by the following two services:

- Microsoft Exchange Mailbox Replication service
- Microsoft Exchange Mailbox Replication Proxy

For more information about the Mailbox replication server and proxy, see Learn more about MRS Proxy.

For more information about mailbox moves, see Mailbox moves in Exchange 2013.

What do you need to know before you begin?

- Estimated time to complete each procedure: 20 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To

see what permissions you need, see the "Mailbox Move and Migration Permissions " entry in Recipients Permissions.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Test whether a mailbox is ready to move

This example uses the *WhatIf* switch to test whether Tony Smith's mailbox is ready to move to the new database DB01 and if there are any errors within the command. When you use the *WhatIf* switch, the system performs checks on the mailbox. If the mailbox isn't ready to move, you receive an error.

```
New-MoveRequest -Identity 'tony@alpineskihouse.com' -
TargetDatabase DB01 -WhatIf
```

For detailed syntax and parameter information, see New-MigrationBatch and New-MoveRequest.

Create a local move request

Use the EAC to create a local move request

To create a local move request, log in to the EAC and perform the following steps:

1. In the EAC, navigate to **Recipients** > **Migration**, and then click **Add +**.
2. In the **New local mailbox move** wizard, select the user you want to move click **OK** and then click **Next**.
3. On the **Move configuration** page, specify a name for the new batch. Select which options you want for the archive mailbox, and mailbox database location and click **New**.

Use the Shell to create a local move request

For an example of how to create a local move request, see Example 2 in New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- In the EAC, navigate to **Recipients** > **Migration**.
- Verify that your move was successful in the EAC by clicking **Status For All Batches**.
- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Create a batch move request

Use the EAC to create a batch move request

log in to the EAC and perform the following steps:

1. In the EAC, navigate to **Recipients** > **Migration**, and then click **Add +**.
2. In the **New local mailbox move** wizard, select the users you want to move, click **OK** and then click **Next**.
3. On the **Move configuration** page, specify a name for the new batch. Select which options you want for the archive mailbox, and mailbox database location and click **New**.

⚠**Warning:**
Make sure that you don't set the Bad Item Limit to over 50 items. If you do, the move may fail. If you want to set the Bad Item Limit over 50 items, you must use the Exchange Management Shell and set the *–AcceptLargeDataLoss* parameter to true.

Use the Shell to create a batch move request

This example creates a migration batch for a local move, where the mailboxes in the specified .csv file are moved to a different mailbox database. This .csv file contains a single column that contains the email address for each of the mailboxes that will be moved. The header for this column must be named **EmailAddress**. The migration batch in this example must be started manually by using the **Start-MigrationBatch** cmdlet or the Exchange Administration Center (EAC). Alternatively, you can use the *AutoStart* parameter to start the migration batch automatically.

```
New-MigrationBatch -Local -Name LocalMove1 -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\LocalMove1.csv")) -TargetDatabases MBXDB2 -
TimeZone "Pacific Standard Time"

Start-MigrationBatch -Identity LocalMove1
```

For detailed syntax and parameter information, see New-MigrationBatch and Start-MigrationBatch.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- Verify that your move was successful in the EAC by clicking **Status For All Batches**.
- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Display migration batches

For an example of how to use the Shell to display a migration batch, see Example 2 in Get-MigrationBatch.

Move only a user's primary mailbox

Use the EAC to move only a user's primary mailbox

1. In the EAC, navigate to **Recipients** > **Migration**, and then click **Add +**.
2. In the **New local mailbox move** wizard, select the user whose primary mailbox you want to move, click **OK** and then click **next**.
3. On the **Move configuration** page, specify a name for the new batch. Select **Move primary mailbox only**, select which options you want for the mailbox database location, and then click **New**.

Use the Shell to move only a user's primary mailbox

This example moves only Tony Smith's primary mailbox to DB01. The archive isn't moved.

```
New-MoveRequest -Identity 'tony@alpineskihouse.com' -
PrimaryOnly -TargetDatabase "DB01"
```

For detailed syntax and parameter information, see New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- In the EAC, click **Status For All Batches**.
- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Create a cross-forest move using a .csv batch file

This example configures the migration endpoint, and then creates a cross-forest batch move from

the source forest to the target forest using a .csv file.

```
New-MigrationEndpoint -Name Fabrikam -ExchangeRemote -
Autodiscover -EmailAddress tonysmith@fabrikam.com -
Credentials (Get-Credential fabrikam\tonysmith)
$csvData=[System.IO.File]::ReadAllBytes("C:\Users
\Administrator\Desktop\batch.csv")
New-MigrationBatch -CSVData $csvData -Timezone "Pacific
Standard Time" -Name FabrikamMerger -SourceEndpoint
Fabrikam -TargetDeliveryDomain "mail.contoso.com"
```

For more information about preparing your forest for cross-forest moves, see the following topics:

- Prepare mailboxes for cross-forest move requests
- Prepare mailboxes for cross-forest moves using sample code
- Prepare mailboxes for cross-forest moves using the Prepare-MoveRequest.ps1 script in the Shell

For detailed syntax and parameter information, see New-MigrationBatch and New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Move only an archive mailbox

Use the EAC to move only an archive mailbox

1. In the EAC, navigate to **Recipients** > **Migration**, and then click **Add +**.
2. In the **New local mailbox move** wizard, select the user whose archive mailbox you want to move, click **OK** and then click **Next**.
3. On the **Move configuration** page, specify a name for the new batch. Select **Move archive mailbox only**, select which options you want for the mailbox database location, and then click **New**.

Use the Shell to move only an archive mailbox

This example moves only Tony Smith's archive mailbox to DB03. The primary mailbox isn't moved.

```
New-MoveRequest -Identity 'tony@alpineskihouse.com' -
ArchiveOnly -ArchiveTargetDatabase "DB03"
```

For detailed syntax and parameter information, see New-MigrationBatch and New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Move a user's primary mailbox and archive mailbox to separate databases

This example moves Ayla's primary mailbox and archive mailbox to separate databases. The primary database is moved to DB01, and the archive is moved to DB03.

```
New-MoveRequest -Identity 'ayla@humongousinsurance.com' -
TargetDatabase DB01 -ArchiveTargetDatabase -DB03
```

For detailed syntax and parameter information, see New-MigrationBatch and New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Move a user's primary mailbox and allow a large bad item limit

Use the EAC to move a user's primary mailbox and allow a large bad item limit

1. In the EAC, navigate to **Recipients** > **Migration**, and then click **Add +**.
2. In the **New local mailbox move** wizard, select the user whose primary mailbox you want to move, click **OK**, and then click **Next**.
3. On the **Move configuration** page, specify a name for the new batch. Select **Move primary mailbox only**, and then select which options you want for the mailbox database location.

4. Click **More Options** ⋯, enter the bad item limit, and then click **OK**.

Use the Shell to move a user's primary mailbox and allow a large bad item limit

This example moves Lisa's primary mailbox to mailbox database DB01 and sets the bad item limit to 100. To set a large bad item limit, you must use the *AcceptLargeDataLoss* parameter.

```
New-MoveRequest -Identity 'Lisa' -PrimaryOnly -
TargetDatabase "DB01" -BadItemLimit 100 -
AcceptLargeDataLoss
```

For detailed syntax and parameter information, see New-MigrationBatch and New-MoveRequest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- From the Shell, run the following command to retrieve mailbox move information.

```
Get-MigrationUserStatistics -Identity BatchName -Status |
Format-List
```

For more information, see Get-MigrationUserStatistics.

Move the Exchange 2010 system mailbox to Exchange 2013

Mailbox and Client Access servers > Mailbox server > Mailbox moves in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-06-06*

In Exchange 2010, the Microsoft Exchange system mailbox is an arbitration mailbox used to store organization-wide data such as administrator audit logs, metadata for eDiscovery searches, and Unified Messaging data, such as menus, dial plans, and custom greetings. The Microsoft Exchange system mailbox is named **SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}**; the display name is **Microsoft Exchange**.

When you upgrade your existing Exchange 2010 organization to Exchange 2013, you have to move the Microsoft Exchange system mailbox to a mailbox database on an Exchange 2013 Mailbox server. You should move this mailbox after you've installed and verified Exchange 2013. If you don't move this system mailbox to Exchange 2013, the following issues will occur when Exchange 2010 and Exchange 2013 coexist in your Exchange organization:

- Exchange 2013 tasks aren't saved to the administrator audit log. When you run the **Search-**

AdminAuditLog cmdlet or try to export the administrator audit log in the EAC, you'll receive an error that says you can't create an administrator audit log search because the system mailbox, SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}, is located on a server that isn't running Exchange 2013. A Microsoft Exchange error with an Event ID of 5000 is also logged in the Windows Application log each time a command is run.

- You can't run eDiscovery searches using the EAC or the Shell in Exchange 2013. Mailbox searches can be created and queued, but they can't be started. An error with an Event ID of 6 is logged in the MsExchange Management log, stating that the **Start-MailboxSearch** cmdlet failed. However, you can search mailboxes using the Shell and the Exchange Control Panel (ECP) in Exchange 2010.

You also have to move the Microsoft Exchange system mailbox to Exchange 2013 as part of upgrading Exchange 2010 Unified Messaging to Exchange 2013.

For more information about upgrading to Exchange 2013, see the following topics:

- Upgrade from Exchange 2010 to Exchange 2013
- Upgrade Exchange 2010 UM to Exchange 2013 UM

What do you need to know before you begin?

- Estimated time to complete: 20 minutes. The actual time may vary depending on the size of the system mailbox.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox Move and Migration Permissions" entry in Recipients Permissions.
- Run the following command in Exchange 2013 to obtain the identity and version of the Exchange servers and mailbox databases that contain the system mailboxes in your organization.

```
Get-Mailbox -Arbitration | FL
Name,DisplayName,ServerName,Database,AdminDisplayVersion
```

The **AdminDisplayVersion** property indicates the version of Exchange that the server is running. The value `Version 14.x` indicates Exchange 2010; the value `Version 15.x` indicates Exchange 2013.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to move the system mailbox

1. In the EAC, go to **Recipients** > **Migration**.
2. Click **New +**, and then click **Move to a different database**.

3. On the **New local mailbox move** page, click **Select the users that you want to move**, and then click **Add +**.
4. On the **Select Mailbox** page, add the mailbox that has the following properties:
   - The display name is **Microsoft Exchange**.
   - The alias of the mailbox's email address is **SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9}**.
5. Click **OK**, and then click **Next**.
6. On the **Move configuration** page, type the name of the migration batch, and then click **Browse** next to the **Target database** box.
7. On the **Select Mailbox Database** page, add the mailbox database to move the system mailbox to. Verify that the version of the mailbox database that you select is Version 15. x, which indicates that the database is located on an Exchange 2013 server.
8. Click **OK**, and then click **Next**.
9. On the **Start the batch** page, select the options to automatically start and complete the migration request, and then click **New**.

Use the Shell to move the system mailbox

First, run the following command in Exchange 2013 to obtain the names and versions of all mailbox databases in your organization.

```
Get-MailboxDatabase -IncludePreExchange2013 | FL
Name,Server,AdminDisplayVersion
```

After you identify the name of the mailbox databases in your organization, run the following command in Exchange 2013 to move the Microsoft Exchange system mailbox to a mailbox database located on an Exchange 2013 server.

```
Get-Mailbox -Arbitration -Identity "SystemMailbox{e0dc1c29-
89c3-4034-b678-e6c29d823ed9}" | New-MoveRequest -
TargetDatabase <name of Exchange 2013 database>
```

How do you know this worked?

To verify that you've successfully moved the Microsoft Exchange system mailbox to a mailbox database located on an Exchange 2013 server, run the following command in the Shell.

```
Get-Mailbox -Arbitration -Identity "SystemMailbox{e0dc1c29-
89c3-4034-b678-e6c29d823ed9}" | FL
Database,ServerName,AdminDisplayVersion
```

If the value of the **AdminDisplayVersion** property is **Version 15.x (Build xxx.x)**, this verifies that the system mailbox resides on a mailbox database that is located on an Exchange 2013 server.

After you move the Microsoft Exchange system mailbox to Exchange 2013, you'll also be able to successfully perform the following administrative tasks:

- Run the **Search-AdminAuditLog** cmdlet.
- Export the administrator audit log in the EAC.
- Successfully create and start eDiscovery searches using the EAC or the Shell in Exchange 2013.

Prepare mailboxes for cross-forest move requests

Mailbox and Client Access servers > Mailbox server > Mailbox moves in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-09*

Microsoft Exchange 2013 supports mailbox moves and migrations using the Exchange Management Shell, specifically the **New-MoveRequest** and **New-MigrationBatch** cmdlets. You can also move the mailbox via the Exchange Administration Center (EAC).

To move a mailbox from an Exchange 2013 forest to another Exchange 2013 forest, the Exchange 2013 target forest must contain a valid mail-enabled user with a specified set of Active Directory attributes. If there is at least one Exchange 2013 Client Access server deployed in the forest, the forest is considered an Exchange 2013 forest.

To prepare for the mailbox move, you must create mail-enabled users with the required attributes in the target forest. Here are two recommended approaches to creating mail-enable users with the necessary attributes:

- If you deployed Microsoft Identity Lifecycle Manager (ILM) for cross-forest global address list (GAL) synchronization, the recommended approach to creating the mail-enabled user is to use Service Pack 1 (SP1) for ILM 2007 Feature Pack 1 (FP1). We've created sample code that you can use to learn how to customize ILM to synchronize the source mailbox user and target mail user.

For more information, including how to download the sample code, see Prepare mailboxes for cross-forest moves using sample code.

- If you created the target mail user using an Active Directory tool other than ILM/MIIS, use the **Update-Recipient** cmdlet with the *Identity* parameter to run the Address List service to generate the **LegacyExchangeDN** for the target mail user. We have created a sample Windows PowerShell script that reads from and writes to Active Directory and calls the **Update-Recipient** cmdlet.

For more information about using the sample script, see Prepare mailboxes for cross-forest moves using the Prepare-MoveRequest.ps1 script in the Shell.

After creating the target mail user, you can then run the **New-MoveRequest** or the **New-MigrationBatch** cmdlets to move the mailbox to the target Exchange 2013 forest.

For more information about remote move requests, see the following topics:

- New-MigrationBatch
- New-MoveRequest

For more information about remote mailbox moves and remote legacy moves, see Mailbox moves in Exchange 2013.

The remainder of this topic describes the Active Directory mail user attributes that are required for a mailbox move. These attributes are configured for you when you use either the code or the script to prepare for the mailbox move. However, you can manually copy these attributes using an Active Directory editor.

Active Directory user attributes required for a mailbox move

To support a remote mailbox move, the mail user object in the target Exchange 2013 forest must have the Active Directory attributes that are described in this section:

- Mandatory attributes
- Optional attributes
- Linked attributes
- Linked user attributes
- Resource mailbox attributes
- Additional attributes

Mandatory attributes

The following table lists the minimum set of attributes that need to be configured in ILM on the target mail user for the **New-MoveRequest** cmdlet to function correctly.

Mail user's attributes

Mail user's Active Directory attributes	Action
displayName	Copy the corresponding attribute of the source mailbox or generate a new value.
Mail	Directly copy the corresponding attribute of the source mailbox.
mailNickname	Copy the corresponding attribute of the source mailbox or generate a new value.
msExchArchiveGUID and	Directly copy the corresponding attribute of the

msExchArchiveName	source mailbox. Attributes are only available if the source mailbox is Exchange 2010.
msExchMailboxGUID	Directly copy the corresponding attribute of the source mailbox.
msExchRecipientDisplayType	-2147483642 (decimal) //equivalent to 0x80000006 (hex).
msExchRecipientTypeDetails	128 (decimal) /0x80 (hex).
msExchUserCulture	Directly copy the corresponding attribute of the source mailbox.
msExchVersion	44220983382016 (decimal).
cn	Copy the corresponding attribute of the source mailbox or generate a new value.
proxyAddresses	Copy source mailbox's **proxyAddresses** attribute. Additionally, copy source mailbox's **LegacyExchangeDN** as an X500 address in the **proxyAddresses** attribute of the target mail user. **Note:** The **proxyAddresses** of the source mailbox user must contain an SMTP address that matches the authoritative domain of the target forest. This allows the **New-MoveRequest** cmdlet to correctly select the **targetAddress** of the source mail-enabled user (converted from the source mailbox user after the mailbox move request is complete) to ensure that mail routing is still functional.
sAMAccountName	Copy the corresponding attribute of the source mailbox or generate a new value. Ensure that the value is unique within the target forest domain that the target mail user belongs

	to.
targetAddress	Set to an SMTP address in the **proxyAddresses** attribute of the source mailbox. This SMTP address must belong to the authoritative domain of the source forest.
userAccountControl	Constant: 514 //equivalent to 0x202, ACCOUNTDISABLE | NORMAL_ACCOUNT.
userPrincipalName	Copy the corresponding attribute of the source mailbox or generate a new value. Because the mail user is logon disabled, this **userPrincipalName** isn't used.

Optional attributes

It isn't mandatory that the following attributes are configured for the **New-MoveRequest** cmdlet to function correctly; however, synchronizing them provides a better end-to-end user experience after moving the mailbox. Because the GAL in the target forest displays this target mail user, you should set the following GAL-related attributes.

GAL-related attributes

Mail user's Active Directory attributes	Action
c	Directly copy the corresponding attribute of the source mailbox.
co	Directly copy the corresponding attribute of the source mailbox.
countryCode	Directly copy the corresponding attribute of the source mailbox.
company	Directly copy the corresponding attribute of the source mailbox.
department	Directly copy the corresponding attribute of the source mailbox.

facsimileTelephoneNumber	Directly copy the corresponding attribute of the source mailbox.
givenName	Directly copy the corresponding attribute of the source mailbox.
homePhone	Directly copy the corresponding attribute of the source mailbox.
info	Directly copy the corresponding attribute of the source mailbox.
initials	Directly copy the corresponding attribute of the source mailbox.
l	Directly copy the corresponding attribute of the source mailbox.
mobile	Directly copy the corresponding attribute of the source mailbox.
msExchAssistantName	Directly copy the corresponding attribute of the source mailbox.
msExchHideFromAddressLists	Directly copy the corresponding attribute of the source mailbox.
otherHomePhone	Directly copy the corresponding attribute of the source mailbox.
otherTelephone	Directly copy the corresponding attribute of the source mailbox.
pager	Directly copy the corresponding attribute of the source mailbox.
physicalDeliveryOfficeName	Directly copy the corresponding attribute of the source mailbox.

postalCode	Directly copy the corresponding attribute of the source mailbox.
sn	Directly copy the corresponding attribute of the source mailbox.
st	Directly copy the corresponding attribute of the source mailbox.
streetAddress	Directly copy the corresponding attribute of the source mailbox.
telephoneAssistant	Directly copy the corresponding attribute of the source mailbox.
telephoneNumber	Directly copy the corresponding attribute of the source mailbox.
title	Directly copy the corresponding attribute of the source mailbox.

Linked attributes

A linked attribute is an Active Directory attribute that references other Active Directory objects in the local forest. You can't directly copy the linked attribute values from a mailbox in the source forest to a mail user in the target forest. First, you must find the Active Directory objects in the source forest that the source mailbox attribute refers to. Then, you must find the corresponding Active Directory objects in the target forest for the above-mentioned Active Directory object in the source forest. And finally, set the target mail user's attribute to refer to the Active Directory objects in the target forest.

Linked attributes

Mail User's Active Directory attributes	Action
altRecipient	Correspond to the source mailbox's **altRecipient** attribute.
deliverAndRedirect	Directly copy the corresponding attribute of the source mailbox. This attribute is a Boolean value that should be set along with

	altRecipient.
Manager (and its backlinks)	Correspond to the source mailbox's manager attribute.
MemberOf (backlinks)	This is the backlink of group member attribute.
publicDelegates (and its backlinks)	Correspond to the source mailbox's **publicDelegates** attribute.

Linked user attributes

If you want to move a mailbox to an Exchange 2013 resource forest, the mailbox in the resource forest is considered a *linked mailbox*. In this scenario, you need to create a linked mail user in the (target) resource forest. To create a linked mail user, you need to set the attributes shown in the following table.

Linked mail user attributes

Mail user's Active Directory attributes	Action
msExchMasterAccountHistory	Directly copy the corresponding attribute of the source mailbox.
msExchMasterAccountSid	If the source mailbox has **msExchMasterAccountSid**, copy it. Otherwise, copy the source mailbox's **objectSid**.
msExchRecipientDisplayType	Constant:-1073741818 (decimal) //equivalent to *unsigned* 0xC0000006.

Note:
A linked mailbox can only be created if there's forest trust between the source forest and target forest.

If the source object is disabled and the **msExchMasterAccountSid** attribute is set to self (resource mailbox, shared mailbox), don't stamp anything on the target user.

If the source object is disabled and the **msExchMasterAccountSid** attribute isn't set, the mailbox is invalid.

If the source object is enabled and the **msExchMasterAccountSid** attribute is set, the mailbox is

invalid.

Resource mailbox attributes

If you want to move a resource mailbox to an Exchange 2013 forest, you need to set the attributes shown in the following table on the target mail user.

Resource mailbox attributes

Mail user's Active Directory attributes	Action

msExchRecipientDisplayType	If the source mailbox is a conference room:
	• **Constant** -2147481850 (decimal) // equivalent to *unsigned* 0x80000706.
	If the source mailbox is an equipment mailbox:
	• **Constant** -2147481594 (decimal) // equivalent to *unsigned* 0x80000806.

msExchResourceCapacity	Directly copy the corresponding attribute of the source mailbox.
msExchResourceDisplay	Directly copy the corresponding attribute of the source mailbox.
msExchResourceMetaData	Directly copy the corresponding attribute of the source mailbox.
msExchResourceSearchProperties	Directly copy the corresponding attribute of the source mailbox.

Additional attributes

In Exchange 2007, the **Move-Mailbox** cmdlet also copied the attributes shown in the following table when moving a mailbox. You can optionally copy these attribute if required by your organization.

Resource mailbox attributes

Mail User's Active Directory attributes	Description
comment	Directly copy the corresponding attribute of the source mailbox.

deletedItemFlags	Directly copy the corresponding attribute of the source mailbox.
delivContLength	Directly copy the corresponding attribute of the source mailbox.
departmentNumber	Directly copy the corresponding attribute of the source mailbox.
description	Directly copy the corresponding attribute of the source mailbox.
division	Directly copy the corresponding attribute of the source mailbox.
employeeID	Directly copy the corresponding attribute of the source mailbox.
employeeNumber	Directly copy the corresponding attribute of the source mailbox.
employeeType	Directly copy the corresponding attribute of the source mailbox.
extensionAttribute1-15	Directly copy the corresponding attribute of the source mailbox.
homePostalAddress	Directly copy the corresponding attribute of the source mailbox.
internationalISDNNumber	Directly copy the corresponding attribute of the source mailbox.
ipPhone	Directly copy the corresponding attribute of the source mailbox.
language	Directly copy the corresponding attribute of the source mailbox.

lmPwdHistory	Directly copy the corresponding attribute of the source mailbox.
localeID	Directly copy the corresponding attribute of the source mailbox.
mAPIRecipient	Directly copy the corresponding attribute of the source mailbox.
middleName	Directly copy the corresponding attribute of the source mailbox.
msDS-PhoneticCompanyName	Directly copy the corresponding attribute of the source mailbox.
msDS-PhoneticDepartment	Directly copy the corresponding attribute of the source mailbox.
msDS-PhoneticDisplayName	Directly copy the corresponding attribute of the source mailbox.
msDS-PhoneticFirstName	Directly copy the corresponding attribute of the source mailbox.
msDS-PhoneticLastName	Directly copy the corresponding attribute of the source mailbox.
msExchBlockedSendersHash	Directly copy the corresponding attribute of the source mailbox.
msExchELCExpirySuspensionEnd	Directly copy the corresponding attribute of the source mailbox.
msExchELCExpirySuspensionStart	Directly copy the corresponding attribute of the source mailbox.
msExchELCMailboxFlags	Directly copy the corresponding attribute of the source mailbox.

msExchExternalOOFOptions	Directly copy the corresponding attribute of the source mailbox.
msExchMessageHygieneFlags	Directly copy the corresponding attribute of the source mailbox.
msExchMessageHygieneSCLDeleteThreshold	Directly copy the corresponding attribute of the source mailbox.
msExchMessageHygieneSCLJunkThreshold	Directly copy the corresponding attribute of the source mailbox.
msExchMessageHygieneSCLQuarantineThreshold	Directly copy the corresponding attribute of the source mailbox.
msExchMessageHygieneSCLRejectThreshold	Directly copy the corresponding attribute of the source mailbox.
msExchMDBRulesQuota	Directly copy the corresponding attribute of the source mailbox.
msExchPoliciesExcluded	Directly copy the corresponding attribute of the source mailbox.
msExchSafeRecipientsHash	Directly copy the corresponding attribute of the source mailbox.
msExchSafeSendersHash	Directly copy the corresponding attribute of the source mailbox.
msExchUMSpokenName	Directly copy the corresponding attribute of the source mailbox.
otherFacsimileTelephoneNumber	Directly copy the corresponding attribute of the source mailbox.
otherIpPhone	Directly copy the corresponding attribute of the source mailbox.

otherMobile	Directly copy the corresponding attribute of the source mailbox.
otherPager	Directly copy the corresponding attribute of the source mailbox.
preferredDeliveryMethod	Directly copy the corresponding attribute of the source mailbox.
personalPager	Directly copy the corresponding attribute of the source mailbox.
personalTitle	Directly copy the corresponding attribute of the source mailbox.
photo	Directly copy the corresponding attribute of the source mailbox.
pOPCharacterSet	Directly copy the corresponding attribute of the source mailbox.
pOPContentFormat	Directly copy the corresponding attribute of the source mailbox.
postalAddress	Directly copy the corresponding attribute of the source mailbox.
postOfficeBox	Directly copy the corresponding attribute of the source mailbox.
primaryInternationalISDNNumber	Directly copy the corresponding attribute of the source mailbox.
primaryTelexNumber	Directly copy the corresponding attribute of the source mailbox.
showInAdvancedViewOnly	Directly copy the corresponding attribute of the source mailbox.

street	Directly copy the corresponding attribute of the source mailbox.
terminalServer	Directly copy the corresponding attribute of the source mailbox.
textEncodedORAddress	Directly copy the corresponding attribute of the source mailbox.
thumbnailLogo	Directly copy the corresponding attribute of the source mailbox.
thumbnailPhoto	Directly copy the corresponding attribute of the source mailbox.
url	Directly copy the corresponding attribute of the source mailbox.
userCert	Directly copy the corresponding attribute of the source mailbox.
userCertificate	Directly copy the corresponding attribute of the source mailbox.
userSMIMECertificate	Directly copy the corresponding attribute of the source mailbox.
wWWHomePage	Directly copy the corresponding attribute of the source mailbox.

Prepare mailboxes for cross-forest moves using the Prepare-MoveRequest.ps1 script in the Shell

requests >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-04-30*

Microsoft Exchange 2013 supports mailbox moves and migrations using the **New-MoveRequest** and **New-MigrationBatch** cmdlets. You can also move the mailbox via the Exchange Administration Center (EAC). You can move a mailbox from a source Exchange forest to a target Exchange 2013 forest.

To run the **New-MoveRequest** and **New-MigrationBatch** cmdlets, a mail user must exist in the target Exchange forest, and the mail user must have a minimum set of required Active Directory attributes.

The sample Windows PowerShell script described in this topic supports this task by synchronizing mailbox users from an Exchange 2013 source forest to Exchange 2013 target forests as mail-enabled users. The script copies the Active Directory attributes of the mailbox users in the source forest to the target forest, and then uses the **Update-Recipient** cmdlet to turn the target objects into mail-enabled users.

For more information about using and writing scripts, see Scripting with the Exchange Management Shell. For more information about preparing for cross-forest moves, see Prepare mailboxes for cross-forest move requests.

Looking for other management tasks related to remote move requests? Check out Manage on-premises moves.

What do you need to know before you begin?

- Locate the script in the following location: Program Files\Microsoft\Exchange Server\V15\Scripts
- To run the sample script, you need the following:
  - A source forest running Exchange 2013, where the mailbox currently resides.
  - A target forest with Exchange 2013 installed, where the mailbox will be moved to.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Prepare-MoveRequest.ps1 script to prepare mailboxes for cross-forest moves

Run the script from the Shell on a server role running Exchange 2013 in the target Exchange 2013 forest. The script copies the mailbox attributes from the source forest.

To assign a specific authentication credential for the remote forest domain controller, you must first run the Windows PowerShell **Get-Credential** cmdlet and store the user input in a temporary

variable. When you run the **Get-Credential** cmdlet, the cmdlet asks for the user name and password of the account used during authentication with the remote forest domain controller. You can then use the temporary variable in the Prepare-MoveRequest.ps1 script. For more information about the **Get-Credential** cmdlet, see Get-Credential.

Note:
Make sure that you use two separate credentials for the local forest and the remote forest when calling this script.

1. Run the following commands to get the local forest and remote forest credentials.

```
$LocalCredentials = Get-Credential
$RemoteCredentials = Get-Credential
```

2. Run the following commands to pass the credential information to the *LocalForestCredential* and *RemoteForestCredential* parameters in the Prepare-MoveRequest.ps1 script.

```
Prepare-MoveRequest.ps1 -Identity JohnSmith@Fabrikan.com -
RemoteForestDomainController DC001.Fabrikam.com -
RemoteForestCredential $RemoteCredentials -
LocalForestDomainController DC001.Contoso.com -
LocalForestCredential $LocalCredentials
```

Parameter set of the script

The following table describes the parameter set for the script.

Parameter set of the Prepare-MoveRequest.ps1 script

Parameter	Required	Description
Identity	Required	The *Identity* parameter uniquely identifies a mailbox in the source forest. Identity can be any of the following: • Common name (CN) • Alias • **proxyAddress** property • **objectGuid** property • **DisplayName** property
RemoteForestCredential	Required	The *RemoteForestCredential* parameter specifies the

		administrator who has permissions to copy data from the source forest Active Directory.
RemoteForestDomainController	Required	The *RemoteForestDomainController* parameter specifies a domain controller in the source forest where the mailbox resides.
DisableEmailAddressPolicy	Optional	The *DisableEmailAddressPolicy* parameter specifies whether the Email Address Policy (EAP) should be disabled when creating a **MailUser** object in the target forest. When you specify this parameter, the EAP in the target forest won't be applied. **Note:** When you specify this parameter, the **MailUser** object won't have e-mail address mapping in the local forest domain stamped. This is usually stamped by the EAP.
LinkedMailUser	Optional	The *LinkedMailUser* switch specifies whether to create a linked MailUser in the local forest for the mailbox user in the remote forest. If the switch is provided, the script creates a target **MailUser** object linked to the source mailbox. If the switch is omitted, the script

		creates a regular target **MailUser** object.
LocalForestCredential	Optional	The *LocalForestCredential* parameter specifies the administrator with permissions to write data to the target forest Active Directory. We recommend that you explicitly specify this parameter to avoid Active Directory permission issues. If the remote forest and the local forest have a trusted relationship configured, don't use a user account from the remote forest as the local forest credential, even though the remote user account may have permission to modify Active Directory in the local forest.
LocalForestDomainController	Optional	The *LocalForestDomainController* parameter specifies a domain controller in the target forest where the mail-enabled user will be created. We recommend that you specify this parameter to avoid possible domain controller replication delay issues in the local forest that could occur if a random domain controller is selected.
MailboxDeliveryDomain	Optional	The *MailboxDeliveryDomain*

		parameter specifies an authoritative domain of the source forest so that the script can select the correct source mailbox user's **proxyAddress** property as the target mail-enabled user's **targetAddress** property. By default, the primary SMTP address of the source mailbox user is set as the **targetAddress** property of the target mail-enabled user.
OverWriteLocalObject	Optional	The *OverWriteLocalObject* parameter is used for users created by the Active Directory Migration Tool. The properties are copied from the existing mail contact to the newly created mail user. However, after this copy, the script also copies the properties from the source forest user to the newly created mail user.
TargetMailUserOU	Optional	The *TargetMailuserOU* parameter specifies the organizational unit (OU) under which the target mail-enabled user will be created.
UseLocalObject	Optional	The *UseLocalObject* parameter specifies whether to convert the existing local object to the required target mail-enabled user

		if the script detects an object in the local forest that conflicts with the to-be-created mail-enabled user.

Examples

This section contains several examples of how you can use the Prepare-MoveRequest.ps1 script.

Example: Single linked mail-enabled user

This example provisions a single linked mail-enabled user in the local forest, when there is forest trust between the remote forest and local forest.

1. Run the following commands to get the local forest and remote forest credentials.

```
$LocalCredentials = Get-Credential
$RemoteCredentials = Get-Credential
```

2. Run the following command to pass the credential information to the *LocalForestCredential* and *RemoteForestCredential* parameters in the Prepare-MoveRequest.ps1 script.

```
Prepare-MoveRequest.ps1 -Identity JamesAlvord@Contoso.com -
RemoteForestDomainController DC001.Fabrikam.com -
RemoteForestCredential $RemoteCredentials -
LocalForestDomainController DC001.Contoso.com -
LocalForestCredential $LocalCredentials -LinkedMailUser
```

Example: Pipelining

This example supports pipelining if you supply a list of mailbox identities.

1. Run the following command.

```
$UserCredentials = Get-Credential
```

2. Run the following command to pass the credential information to the *RemoteForestCredential* parameter in the Prepare-MoveRequest.ps1 script.

```
"IanP@Contoso.com", "JoeAn@Contoso.com" | Prepare-
MoveRequest.ps1 -RemoteForestDomainController
DC001.Fabrikam.com -RemoteForestCredential $UserCredentials
```

Example: Use a .csv file to bulk-create mail-enabled users

You can generate a .csv file containing a list of mailbox identities from the source forest, which allows you to pipe the content of this file into the script to bulk-create the target mail-enabled users.

For example, the content of the .csv file can be:

Identity

Ian@contoso.com

John@contoso.com

Cindy@contoso.com

This example calls a .csv file to bulk create the target mail-enabled users.

1. Run the following command to get the remote forest credentials.

```
$UserCredentials = Get-Credential
```

2. Run the following command to pass the credential information to the *RemoteForestCredential* parameter in the Prepare-MoveRequest.ps1 script.

```
Import-Csv Test.csv | Prepare-MoveRequest.ps1 -
RemoteForestDomainController DC001.Fabrikam.com -
RemoteForestCredential $UserCredentials
```

Script behavior per target object

This section describes how the script performs in relation to several scenarios for target objects.

Duplicate target mail-enabled object

When the script attempts to create a target mail-enabled user from the source mailbox user, and it detects a duplicate local mail-enabled object, it uses the following logic:

- If the source mailbox user's **masterAccountSid** attribute equals any target object's **objectSid** or **masterAccountSid** attribute:
  - If the target object isn't mail-enabled, the script returns an error because the script doesn't support converting an object that isn't mail-enabled to a mail-enabled user.
  - If the target object is mail-enabled, the target object is a duplicate.
- If an address in the source mailbox user's **proxyAddress** properties (smtp/x500 only) equals an address in a target object's **proxyAddress** properties (smtp/x500 only), the target object is a duplicate.

The script prompts the user about the duplicate objects.

If the target mail-enabled object is a mail-enabled user or contact, which is most likely created by a cross-forest (Identity Lifecycle Management 2007 Service Pack 1-based) global address list (GAL) synchronization deployment, the user can run the script again with the *UseLocalObject* parameter to use the target mail-enabled object for mailbox migration.

Mail-enabled user

If the target object is a mail-enabled user, the script copies the following attributes from the source mailbox user to the target mail-enabled user:

- **msExchMailboxGUID**
- **msExchArchiveGUID**
- **msExchArchiveName**

If the *LinkedMailUser* parameter is set, the script copies the source **objectSid**/**masterAccountSid** attribute.

Mail-enabled contact

If the target object is a mail-enabled contact, the script deletes the existing contact and copies all its attributes to a new mail-enabled user. The script also copies the following attributes from the source mailbox user:

- **msExchMailboxGUID**
- **msExchArchiveGUID**
- **msExchArchiveName**
- **sAMAccountName**
- **userAccountControl** (set to 514 //equivalent to 0x202, ACCOUNTDISABLE | NORMAL_ACCOUNT)
- **userPrincipalName**

If the *LinkedMailUser* parameter is set, the script copies the source **objectSid**/**masterAccountSid** attribute.

LegacyExchangeDN attribute

When the **Update-Recipient** cmdlet is called to convert the target object into a mail-enabled user, a new **LegacyExchangeDN** attribute is generated for the target mail-enabled user. The script copies the **LegacyExchangeDN** attribute of the target mail-enabled user as an x500 address to the **proxyAddress** properties of the source mailbox user.

Prepare mailboxes for cross-forest

moves using sample code

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-03-15*

Microsoft Exchange 2013 supports mailbox moves and migrations using the **New-MoveRequest** and **New-MigrationBatch** cmdlets. You can also move the mailbox via the Exchange admin center (EAC). You can move a mailbox from a source Exchange forest to a target Exchange 2010 forest.

To run **New-MoveRequest**, a mail user must exist in the target Exchange forest and the mail user must have a minimum set of required Active Directory attributes. You can create the required mail user in the target Exchange forest by customizing your Microsoft Identity Lifecycle Manager (ILM) 2007 deployment. The ILM-based rules extension sample code described in this topic demonstrates how to customize your current ILM deployment to create the required mail-enabled users in the target Exchange 2013 forest.

For more information about preparing for cross-forest moves, including descriptions of the required Active Directory attributes, see Prepare mailboxes for cross-forest move requests.

What do you need to know before you begin?

- Download the sample code from the Prepare for Online Mailbox Move page in the Microsoft Download Center.
- To run the sample code, you need ILM 2007 Feature Pack 1 Service Pack 1 (SP1). To download the feature pack, see Microsoft Knowledge Base article 977791, Service Pack 1 (build 3.3.1139.2) is available for Identity Lifecycle Manager 2007 Feature Pack 1.
- You also need the following:
  - A source forest running Exchange 2013, where the mailbox currently resides.
  - A target forest with Exchange 2013 installed, where the mailbox will be moved to.
- To connect to the Exchange 2013 target forest, you must have the appropriate permission to call the **UpdateRecipient** cmdlet. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

How do you do this?

Step 1: Install the ILM sample code

1. In Microsoft Visual Studio 2008, open Microsoft.Exchange.Sample.OneWayGALSync.sln to view the sample code. The sample code includes the following:
   - Microsoft.MetadirectoryServicesEx.dll is the binary file that is shipped with ILM 2007 FP1 SP1 under "\Program Files\Microsoft Identity Integration Server\Bin\Assemblies". It's referenced by the sample code.
   - OneWaySync.xml is referenced by the sample code.
   - The ILMServerConfig folder contains the ILM configuration files for the source management agent (MA), target MA, and the ILM Metaverse (MV).
   - Microsoft.Exchange.Sample.OneWayGALSync.MARules.dll and Microsoft.Exchange.Sample.OneWayGALSync.MVRules.dll (built from the sample code) are under "\obj\Debug"
2. On the ILM server, copy the following to \Program Files\Microsoft Identity Integration Server \Extensions:
   - OneWaySync.xml
   - Microsoft.Exchange.Sample.OneWayGALSync.MARules.dll
   - Microsoft.Exchange.Sample.OneWayGALSync.MVRules.dll
3. Edit the file OneWaySync.xml that you copied to the ILM Extensions folder in step 1 to specify the distinguishedName (DN) of the TargetOU container in the target Exchange forest in which you want to create the mail users. You can use LDP.exe or ADSIEdit.exe to browse for the TargetOU container if you don't know what its name is.

Note:

If you're using this sample together with ILM GalSync 2007 exclude this container from the list of containers managed by GalSync2007.

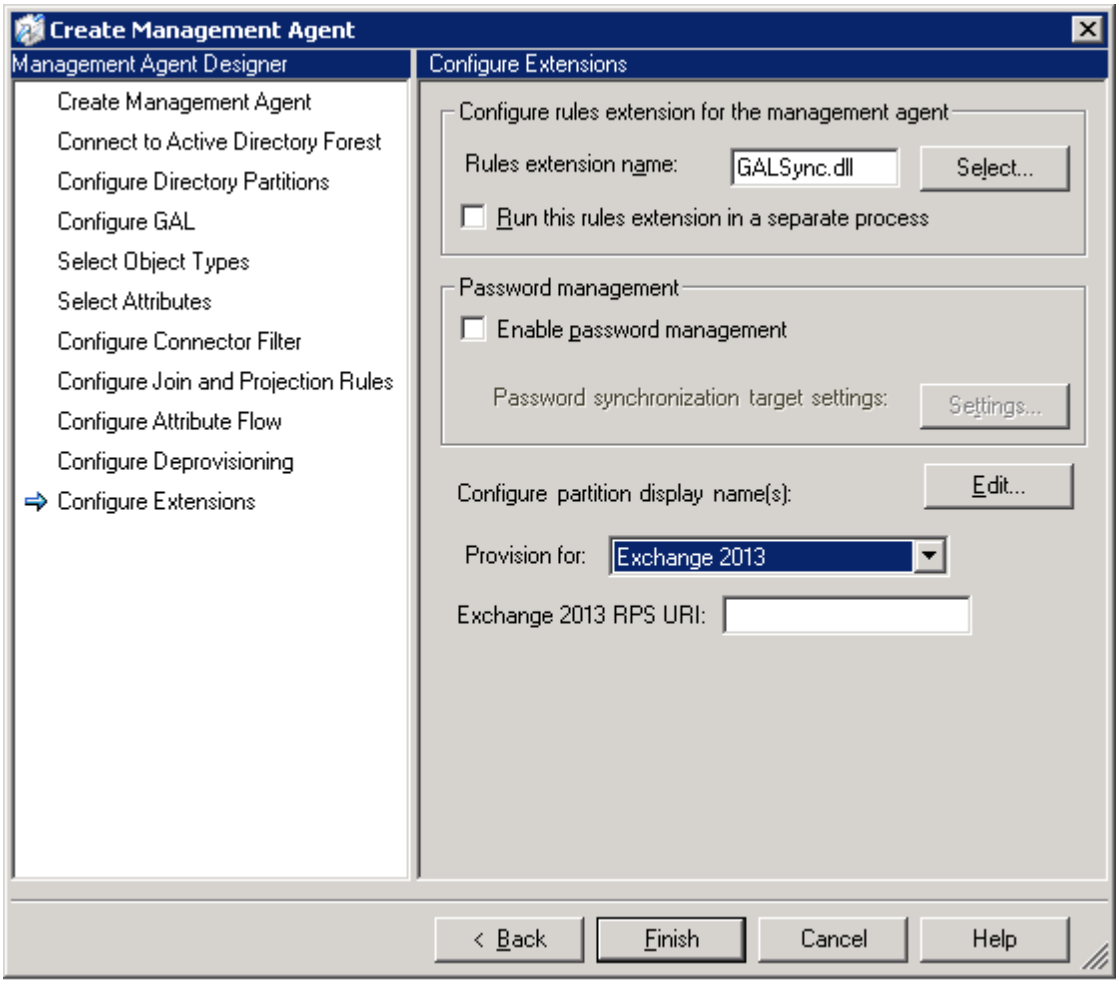
4. On the ILM Identity Manager Console, go to **File** > **Import Server Configuration** to import the ILM server configuration from the folder ILMServerConfig. This action will import two Active Directory Management Agents along with the Metaverse schema and the provisioning rule.

Note:

During the import, you must provide the forest name and credentials and match the partitions of the imported Active Directory Management Agent (ADMA) to the partition name in your configuration for both the source and target ADMAs.

5. For the ADMA to support the Exchange 2013 target forest, on the **Create Management Agent** page, on the **Configure Extensions** pane, select **Exchange 2013** in the **Provision for** drop-down and then enter the remote Windows PowerShell URI of an Exchange 2010 Client Access server in **Exchange 2013 RPS URI**.

Create Management Agent page



6. On the ILM Identity Manager Console on the **Create Management Agent** pane, open the **Properties** for the Source Forest Management Agent. Select the **Configure Directory Partitions** wizard, and then click **Containers** to select the container that will contain the mailboxes you will be moving to the target forest. Clear the selections for all other containers, that is, scope the management agent to only manage this one container. Similarly, for the target forest MA, select the container to which mail-enabled users will be provisioned, that is, the TargetOU specified in step 2.

Note:

If you're using this sample together with ILM GalSync 2007, exclude both of these containers from the list of containers managed by GalSync 2007.

7. Perform an initial Full Import (stage only) on the target MAs so that ILM can discover the TargetOU specified in step 2.

Step 2: Create mail user in target Exchange forest

Now that you've installed the sample code, use the following procedure to create the required mail user in the target Exchange forest so that **New-MoveRequest** can be run to perform an online mailbox move.

1. In the source forest, use the Exchange admin center to create mailbox users in the container selected in step 4 of "Install the ILM sample code". You can also use Active Directory Users and Computers to move existing mailbox users to the container.
2. Perform Delta Import and Delta Sync run on the source MA to discover the mailboxes added to

the source container, and provision mail users to the target MA.
3. Perform Export run on the target MA to export the mail users provisioned in step 1 to the target Active Directory.
4. Perform Delta Import on the target MA to confirm the changes exported in step 2.
5. In the target forest, open the Exchange Management Shell and use the **New-MoveRequest** cmdlet to move mailboxes from the source forest.

How do you know this worked?

To verify that you have successfully completed your migration, do the following:

- From the target forest, verify that the users that you moved from the source forest are present in the target forest.

Enable the MRS Proxy endpoint for remote moves

Mailbox and Client Access servers > Mailbox server > Mailbox moves in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-07-02*

The Mailbox Replication Service Proxy (MRS Proxy) facilitates cross-forest mailbox moves and remote move migrations between your on-premises Exchange organization and Exchange Online. In Exchange 2013, MRS Proxy is included in the Mailbox server role (also called the *Mailbox server*). During cross-forest and remote move migrations, a Client Access server acts as a proxy for incoming move requests for the Mailbox server. The ability of a Client Access server to accept these requests is disabled by default. To allow the Client Access server to accept incoming move requests, you have to enable the MRS Proxy endpoint.

The Client Access server on which to enable the MRS Proxy endpoint depends on the type and direction of the mailbox move.

- **Cross-forest enterprise moves** For cross-forest moves that are initiated from the target environment (known as a *pull* move type), you have to enable the MRS Proxy endpoint on Client Access servers in the source environment. For cross-forest moves that are initiated from the source environment (known as a *push* move type), you have to enable the MRS Proxy endpoint on Client Access servers in the target environment.
- **Remote move migrations between an on-premises Exchange organization and Exchange Online** For both onboarding and offboarding remote move migrations, you have to enable the MRS Proxy endpoint on Client Access servers in your on-premises organization.

Note:

If you use the EAC to move mailboxes, cross-forest moves and onboarding remote move migrations are pull move types because the request is initiated from the target environment. Offboarding remote move migrations are a push move type because the request is initiated from the source environment.

What do you need to know before you begin?

- Estimated time to complete: 2 minutes per server.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange Web Services permissions" section in the Clients and mobile devices permissions topic.
- If you've deployed more than one Client Access server in your Exchange organization, you should enable the MRS Proxy endpoint on each one. If you add additional Client Access servers, be sure to enable the MRS Proxy endpoint on the new servers. Cross-forest moves and remote move migrations can fail if the MRS Proxy endpoint isn't enabled on all Client Access servers.
- If you don't perform cross-forest moves or remote move migrations, keep MRS Proxy endpoints disabled to reduce the attack surface of your organization.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to enable the MRS Proxy endpoint

1. In the EAC, navigate to **Recipients** > **Servers** > **Virtual Directories**.
2. In the **Select server** drop-down list, select the name of the Client Access server on which you want to enable the MRS Proxy endpoint. Or select **All servers** to display the virtual directories on all Client Access servers in your organization.
3. In the **Select type** drop-down list, select **EWS** to display the Exchange Web Service (EWS) virtual directory for the selected server.
4. In the list of virtual directories, click **EWS (Default Web Site)** for the Client Access server that you want to configure, and then click **Edit** .
5. On the **EWS (Default Web Site)** properties page, select the **Enable MRS Proxy endpoint** check box, and then click **Save**.

Use the Shell to enable the MRS Proxy endpoint

The following command enables the MRS Proxy endpoint on a Client Access server named EXCH-SRV-01.

```
Set-WebServicesVirtualDirectory -Identity "EXCH-SRV-01\EWS
(Default Web Site)" -MRSProxyEnabled $true
```

The following command enables the MRS Proxy endpoint on all Client Access servers in your Exchange organization.

```
Get-WebServicesVirtualDirectory | Set-
WebServicesVirtualDirectory -MRSProxyEnabled $true
```

Important:
As previously stated, the MRS Proxy endpoint should be enabled on each Client Access server in your organization. Run the preceding command after adding a new Client Access server to your organization.

How do you know this worked?

To verify that you've successfully enabled the MRS Proxy endpoint, do one of the following:

1. In the EAC, navigate to **Recipients** > **Servers** > **Virtual Directories**.
2. In the list of virtual directories, click **EWS (Default Web Site)** and verify in the details pane that the MRS Proxy endpoint is enabled.

Alternatively, you can click **Edit** to view the **EWS (Default Web Site)** properties page and verify that the **Enable MRS Proxy endpoint** check box is selected.

Or

Run the following command in the Shell:

```
Get-WebServicesVirtualDirectory | FL
Identity,MRSProxyEnabled
```

Verify that the *MRSProxyEnabled* parameter is set to `True`.

Another way to verify that the MRS Proxy endpoint is enabled is to use the **Test-MigrationServerAvailability** cmdlet to test the ability to communicate with the remote server that hosts the mailboxes that you want to move, or in the case of offboarding Exchange Online mailboxes to your on-premises organization, a server in your on-premises organization. For more information, see Test-MigrationServerAvailability.

The following example tests the connection to a server in the corp.contoso.com forest.

```
$Credentials = Get-Credential

Test-MigrationServerAvailability -ExchangeRemoteMove -
Autodiscover -EmailAddress administrator@corp.contoso.com -
Credentials $Credentials
```

To run this command successfully, the MRS Proxy endpoint must be enabled.

CSV files for mailbox migration

Mailbox and Client Access servers > Mailbox server > Mailbox moves in Exchange 2013 >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-04-25*

You can use a CSV file to bulk migrate a large number of user mailboxes. You can specify a CSV file when you use the Exchange admin center (EAC) or the **New-MigrationBatch** cmdlet in the Exchange Management Shell to create a migration batch. Using a CSV to specify multiple users to migrate in a migration batch is supported in the following migration scenarios:

- **Moves in on-premises Exchange organizations**
  - **Local move:** A local move is where you move mailboxes from one mailbox database to another. A local move occurs within a single forest.
  - **Cross-forest enterprise move:** In a cross-forest enterprise move, mailboxes are moved to a different forest. Cross-forest moves are initiated either from the target forest, which is the forest that you want to move the mailboxes to, or from the source forest, which is the forest that currently hosts the mailboxes.
- **Onboarding and offboarding in Exchange Online**
  - **Onboarding remote move migration:** In an Exchange hybrid deployment, you can move mailboxes from an on-premises Exchange organization to Exchange Online. This is also known as an *onboarding* remote move migration because you onboard mailboxes to Exchange Online.
  - **Offboarding remote move migration:** You can also perform an *offboarding* remote move migration, where you migrate Exchange Online mailboxes to your on-premises Exchange organization.

Note:
Both onboarding and offboarding remote move migrations are initiated from your Exchange Online organization.

  - **Staged Exchange migration:** You can also migrate a subset of mailboxes from an on-premises Exchange organization to Exchange Online. This is another type of onboarding migration. You can migrate only Exchange 2003 and Exchange 2007 mailboxes using a staged Exchange migration. Migrating Exchange 2010 and Exchange 2013 mailboxes isn't supported using a staged migration. Prior to running a staged migration, you have to use directory synchronization or some other method to provision mail users in your Exchange Online organization.
  - **IMAP migration:** This onboarding migration type migrates mailbox data from an IMAP server (including Exchange) to Exchange Online. For an IMAP migration, you must provision mailboxes in Exchange Online before you can migrate mailbox data.

Note:

A cutover Exchange migration doesn't support a using a CSV file because all on-premises user mailboxes are migrated to Exchange Online in a single batch.

Supported attributes for CSV files for bulk moves or migrations

The first row, or header row, of a CSV file used for migrating users lists the names of the attributes, or fields, specified on the rows that follow. Each attribute name is separated by a comma. Each row under the header row represents an individual user and supplies the information required for the migration. The attributes in each individual user row must be in the same order as the attribute names in the header row. Each attribute value is separated by a comma. If the attribute value for a particular record is null, don't type anything for that attribute. However, make sure that you include the comma to separate the null value from the next attribute.

Attribute values in the CSV file override the value of the corresponding parameter when that same parameter is used when creating a migration batch with the EAC or the Shell. For more information and examples, see the section Attribute values in the CSV file override the values for the migration batch.

Tip:

You can use any text editor to create the CSV file, but using an application like Microsoft Excel will make it easier to import data and configure and organize CSV files. Be sure to save CSV files as a .csv or .txt file.

The following sections describe the supported attributes for the header row of a CSV file for each migration type. Each section includes a table that lists each supported attribute, whether it's required, an example of a value to use for the attribute, and a description.

Note:

In the following sections, *source environment* denotes the current location of a user mailbox or a database. *Target environment* denotes the location that the mailbox will be migrated to or the database that the mailbox will be moved to.

Local moves

The following table describes the supported attributes for a CSV file for local moves. For more information, see Manage on-premises moves.

Attribute	Required or optional	Accepted values	Description
EmailAddress	Required	SMTP address for the user	Specifies the user that will be moved.

TargetDatabase	Optional	Database name	Specifies the mailbox database that the user's primary mailbox will be moved to. You can specify a different database in the different rows of the CSV file, which lets you move mailboxes in the same migration batch to different databases.
TargetArchiveDatabase	Optional	Database name	Specifies the mailbox database that the user's archive mailbox will be moved to. You can specify a different database in the different rows of the CSV file, which lets you move archive mailboxes in the same migration batch to different databases. **Note:** If you specify a specific archive database, the archive mailbox (if it exists) will be moved to the same database as the primary mailbox.
BadItemLimit	Optional	`Unlimited` or a non-negative integer from `0` (the default) to a maximum value of	Specifies the number of bad items to skip if the migration service

		2147483647	encounters a corrupted item in the mailbox. If you include this attribute in the CSV file, it will override the default value or a value you specify if you include the *BadItemLimit* parameter when creating the migration batch using the EAC or the Shell. **Tip:** We recommend that you use the default value of 0 and only increase the bad item limit for a particular user if the move or migration for that user fails.
MailboxType	Optional	Use one of the following values: • `PrimaryOnly` • `ArchiveOnly` • `PrimaryAndArchive` (the default value)	Specifies whether to move the user's primary mailbox, archive mailbox, or both.

Onboarding remote move migrations in a hybrid deployment

In a hybrid deployment, you can move mailboxes from an on-premises Exchange organization to Exchange Online. When onboarding mailboxes, the migration batch is created in the Exchange Online organization and initiated by an Exchange Online administrator. For more information, see **Move mailboxes between on-premises and Exchange Online organizations in 2013 hybrid deployments**.

The following table describes the supported attributes for a CSV file for onboarding remote move migrations.

Attribute	Required or optional	Accepted values	Description
EmailAddress	Required	SMTP address for the user	Specifies the email address for the mail-enabled user in the Exchange Online organization that corresponds to the on-premises user mailbox that will be migrated.
BadItemLimit	Optional	`Unlimited` or a non-negative integer from `0` (the default) to a maximum value of `2147483647`	Specifies the number of bad items to skip if the migration service encounters a corrupted item in the mailbox. If you include this attribute in the CSV file, it will override the default value or the value you specify if you include the *BadItemLimit* parameter when creating the migration batch using the EAC or the Shell. **Tip:** We recommend that you use the default value of 0 and only increase the bad item limit for a particular user if the move or

			migration for that user fails.
LargeItemLimit	Optional	`Unlimited` or a non-negative integer from `0` (the default) to a maximum value.	Specifies the number of large items in the user's mailbox that will be skipped. When the number of large items exceeds this value, the migration for the mailbox fails. The default value is 0, which means that the migration fails if the mailbox contains any large items. When onboarding mailboxes to Exchange Online, items up to 35 MB are migrated.
MailboxType	Optional	Use one of the following values: • `PrimaryOnly` • `ArchiveOnly` • `PrimaryAndArchive` (the default value)	Specifies whether to move the user's primary mailbox, archive mailbox, or both.

Cross-forest enterprise moves and offboarding remote move migrations in a hybrid deployment

As previously stated, cross-forest moves are initiated either from the target forest or from the source forest. Offboarding remote move migrations are initiated from your Exchange Online organization. For more information, see:

- Prepare mailboxes for cross-forest move requests
- **Move mailboxes between on-premises and Exchange Online organizations in 2013 hybrid**

deployments

The following table describes the supported attributes for a CSV file for cross-forest enterprise moves and for offboarding remote move migrations in an Exchange hybrid deployment.

Attribute	Required or optional	Accepted values	Description
EmailAddress	Required	SMTP address for the user	For cross-forest enterprise moves, this specifies the mailbox or mail-enabled user in the source forest. For offboarding remote move migrations, it specifies the Exchange Online mailbox.
TargetDatabase	Required for offboarding remote move migrations and for cross-forest enterprise moves that are initiated from the source forest. Alternatively, this attribute can be specified when creating the migration batch in the EAC or using the Shell. This attribute is optional for cross-forest enterprise moves that are initiated from the	Database name	Specifies the mailbox database in the target forest that the user's primary mailbox will be moved to. You can specify a different database in the different rows of the CSV file, which lets you move mailboxes in the same migration batch to different databases.

	target forest.		
TargetArchiveDatabase	Optional	Database name	Specifies the mailbox database in the target forest that the user's archive mailbox will be moved to. You can specify a different database in the different rows of the CSV file, which lets you move archive mailboxes in the same migration batch to different databases.
BadItemLimit	Optional	`Unlimited` or a non-negative integer from `0` (the default) to a maximum value of `2147483647`	Specifies the number of bad items to skip if the migration service encounters a corrupted item in the mailbox. If you include this attribute in the CSV file, it will override the default value or the value you specify if you include the *BadItemLimit* parameter when creating the migration batch using the EAC or the Shell. **Tip:** We recommend that

			you use the default value of 0 and only increase the bad item limit for a particular user if the move or migration for that user fails.
LargeItemLimit	Optional	`Unlimited` or a non-negative integer from `0` (the default) to a maximum value.	Specifies the number of large items in the user's mailbox that will be skipped. When the number of large items exceeds this value, the migration for the mailbox fails. The default value is 0, which means that the migration fails if the mailbox contains any large items. When onboarding mailboxes to Exchange Online, items up to 35 MB are migrated.
MailboxType	Optional	Use one of the following values: • `PrimaryOnly` • `ArchiveOnly` • `PrimaryAndArchive` (the default value)	Specifies whether to move the user's primary mailbox, archive mailbox, or both.

Staged Exchange migrations

You have to use a CSV file to identify the group of users for a migration batch when you want to use a staged Exchange migration to migrate Exchange 2003 and Exchange 2007 on-premises mailboxes to Exchange Online. There isn't a limit for the number of mailboxes that you can migrate

to the cloud using a staged Exchange migration. However, the CSV file for a migration batch can contain a maximum of 1,000 rows. To migrate more than 1,000 mailboxes, you have to create additional CSV files, and then use each one to create a new migration batch. For more information about staged Exchange migrations, see **Migrate mailboxes to Exchange Online with a staged migration**.

The following table describes the supported attributes for a CSV file for a staged Exchange migration.

Attribute	Required or optional	Accepted values	Description
EmailAddress	Required	SMTP address for the user	Specifies the email address for the mail-enabled user (or a mailbox if you're retrying the migration) in Exchange Online that corresponds to the on-premises user mailbox that will be migrated. Mail-enabled users are created in Exchange Online as a result of directory synchronization or another provisioning process. The email address of the mail-enabled user must match the *WindowsEmailAddress* property for the corresponding on-premises mailbox.
Password	Optional	A password has to have a minimum length of eight	This password is set on the user account when the corresponding mail-

		characters, and satisfy any password restrictions that are applied to your Office 365 organization.	enabled user in Exchange Online is converted to a mailbox during the migration.
ForceChangePassword	Optional	`True` or `False`	Specifies whether a user must change the password the first time they sign in to their Exchange Online mailbox. **Note:** If you've implemented a single sign-on solution by deploying Active Directory Federation Services 2.0 (AD FS 2.0) in your on-premises organization, you must use `False` for the value of this attribute.

IMAP migrations

A CSV file for an IMAP migration batch can have maximum of 50,000 rows. But it's a good idea to migrate users in several smaller batches. For more information about IMAP migrations, see the following topics:

- **Migrate Email from an IMAP Server to Exchange Online Mailboxes**
- **CSV files for IMAP migration batches**

The following table describes the supported attributes for a CSV file for an IMAP migration.

Attribute	Required or optional	Accepted values	Description
EmailAddress	Required	SMTP address for the user.	Specifies the user ID for the user's Exchange Online mailbox
UserName	Required	String that identifies the user on the IMAP	Specifies the logon name for the user's

		messaging system, in a format supported by the IMAP server.	account in the IMAP messaging system (the source environment). In addition to the user name, you can use the credentials of an account that has been assigned the necessary permissions to access mailboxes on the IMAP server. For more information, see **CSV files for IMAP migration batches**.
Password	Required	Password string.	Specifies the password for the user account specified by the UserName attribute.

Attribute values in the CSV file override the values for the migration batch

Attribute values in the CSV file override the value of the corresponding parameter when that same parameter is used when creating a migration batch with the EAC or the Shell. If you want the migration batch value to be applied to a user, you would leave that cell blank in the CSV file. This lets you mix and match certain attribute values for selected users in one migration batch.

For example, let's say you create a batch in the Shell for a cross-forest enterprise move to move users' primary and archive mailboxes to the target forest with the following Shell command.

```
New-MigrationBatch -Name CrossForestBatch1 -SourceEndpoint
ForestEndpoint1 -TargetDeliveryDomain forest2.contoso.com -
TargetDatabases @(EXCH-MBX-02,EXCH-MBX-03) -
TargetArchiveDatabases @(EXCH-MBX-A02,EXCH-MBX-A03) -
CSVData ([System.IO.File]::ReadAllBytes("C:\Users
```

```
\Administrator\Desktop\CrossForestBatch1.csv")) -AutoStart
```

Note:

Because the default is to move primary and archive mailboxes, you don't have to explicitly specify it in the Shell command.

A portion of the CrossForestBatch1.csv file for this migration batch looks like this:

```
EmailAddress,TargetDatabase,TargetArchiveDatabase
user1@contoso.com,EXCH-MBX-01,EXCH-MBX-A01
user2@contoso.com,,
user3@contoso.com,EXCH-MBX-01,
...
```

Because the values in the CSV file override the values for the migration batch, the primary and archive mailboxes for user1 are moved to EXCH-MBX-01 and EXCH-MBX-A01, respectively, in the target forest. The primary and archive mailboxes for user2 are moved to either EXCH-MBX-02 or EXCH-MBX-03. The primary mailbox for user3 is moved to EXCH-MBX-01 and the archive mailbox is moved to either EXCH-MBX-A02 or EXCH-MBX-A03.

In another example, let's say you create a batch for an onboarding remote move migration in a hybrid deployment to move archive mailboxes to Exchange Online with the following command.

```
New-MigrationBatch -Name OnBoarding1 -SourceEndpoint
RemoteEndpoint1 -TargetDeliveryDomain cloud.contoso.com -
CSVData ([System.IO.File]::ReadAllBytes("C:\Users
\Administrator\Desktop\OnBoarding1.csv")) -MailboxType
ArchiveOnly -AutoStart
```

But you also want to move the primary mailboxes for selected users, so a portion of the OnBoarding1.csv file for this migration batch would look like this:

```
EmailAddress,MailboxType
user1@contoso.com,
user2@contoso.com,
user3@cloud.contoso.com,PrimaryAndArchive
user4@cloud.contoso.com,PrimaryAndArchive
...
```

Because the value for mailbox type in the CSV file overrides the values for the *MailboxType* parameter in the command to create the batch, only the archive mailbox for user1 and user2 is migrated to Exchange Online. But the primary and archive mailboxes for user3 and user4 are moved to Exchange Online.

Mailbox import and export requests

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-10*

Using the **MailboxImportRequest** or **MailboxExportRequest** cmdlet sets in the Exchange Management Shell, you can import data from or export data to .pst files. After you initiate a mailbox import or export request, the process is completed asynchronously by the Microsoft Exchange Mailbox Replication service (MRS). MRS resides on all Exchange 2010 Client Access servers and is the service responsible for moving mailboxes and importing and exporting .pst files.

Contents

Reasons to import or export mailbox data

You may want to import or export mailbox data for the following reasons:

- **Satisfy compliance requirements** You can export mailbox content to a .pst file for legal discovery purposes. After the export is complete, you can import the content to a mailbox used specifically for compliance purposes.
- **Create a point-in-time snapshot of a mailbox** By creating a snapshot of specific mailboxes, you avoid having to retain an entire backup set for a mailbox database.
- **Move a user's .pst file into his or her mailbox or personal archive** Microsoft Outlook users can save their email locally as .pst files. Using the New-MailboxImportRequest cmdlet, you can move data from a user's .pst file to his or her mailbox or personal archive. This is an easy method for transferring email from a user's local computer to Exchange servers.

Advantages to using import and export requests

Advantages to using import and export requests in Exchange 2013 include the following:

- A .pst provider is included in Exchange 2013 that can read and write .pst files.
- Import and export requests are asynchronous. The process is performed by MRS, which takes advantage of the queuing and throttling frameworks.
- The .pst files can be imported directly to a user's personal archive.

- Multiple .pst files can be imported or exported at the same time.
- The .pst files can reside on any shared network drive accessible by your Exchange servers.
- Exchange 2013 supports these .pst files: Unicode files created by Office Outlook 2007 and Outlook 2010

Considerations

Before you import or export mailbox data, consider the following:

- To import or export mailbox data, a network shared folder accessible by your Exchange servers must be set up. You must also grant read/write permissions to the Exchange Trusted Subsystem group so that the group can access the network share where you import and export mailbox data. If you don't grant this permission, you will receive an error message stating that Exchange is unable to establish a connection to the target mailbox.
- The maximum .pst file size supported by Outlook is 50 gigabytes (GB). Therefore, we recommend that you don't import a .pst file larger than 50 GB. You can create multiple .pst files for mailboxes larger than 50 GB by specifying specific folders to include or exclude or by using a content filter.
- Import and export requests are performed by MRS, which also processes move requests and mailbox restore requests. All requests are queued and throttled by MRS.
- Importing and exporting mailbox data may take several hours depending on file size, network bandwidth, and MRS throttling.
- Data can't be imported to a public folder or public folder database.

Importing mailbox data

Use the **MailboxImportRequest** cmdlet set to import data from a .pst file to a mailbox or personal archive. The following is a list of options you can specify when importing mailbox data from a .pst file:

Note:
The mailbox to which you import the data must exist. You can't import data to a user account that doesn't have a mailbox.

- You can import data to a different user account than the one from which it was exported. For example, you can export data from john@contoso.com and import it to legaldiscovery@contoso.com.
- You can import items to only the user's personal archive by specifying the *IsArchive* parameter.
- If associated folder messages exist in the .pst file, you can import them using the *AssociatedMessagesCopyOption* parameter. Associated messages contain hidden data with information about rules, views, and forms. If they exist in the .pst file, all messages from the safety net are imported.
- You can include or exclude specific folders using the *IncludeFolders* or *ExcludeFolders* parameter.
- You can exclude the Recoverable Items folder using the *ExcludeDumpster* parameter. By default, an import request includes the user's Recoverable Items folder if it's present in the .pst file.

Mailbox import request cmdlets

Use the following cmdlets for mailbox import requests.

Cmdlet	Description
New-MailboxImportRequest	Starts the process of importing a .pst file to a mailbox or personal archive. You can create more than one import request per mailbox. Each request must have a unique name.
Set-MailboxImportRequest	Changes import request options after the request is created or recover from a failed request.
Suspend-MailboxImportRequest	Suspends an import request any time after the request is created but before the request reaches the status of Completed.
Resume-MailboxImportRequest	Resumes an import request that's suspended or failed.
Remove-MailboxImportRequest	Removes fully or partially completed import requests. Completed import requests aren't automatically cleared. You must use this cmdlet to remove them.
Get-MailboxImportRequest	View general information about an import request.
Get-MailboxImportRequestStatistics	View detailed information about an import request.

Exporting mailbox data

Use the **MailboxExportRequest** cmdlet set to export mailbox data to a .pst file. You can export one mailbox or several mailboxes, but only one request is written to each .pst file at a time. The following is a list of options you can specify when exporting mailbox data to a .pst file:

- You can export personal archive data using the *IsArchive* parameter.

- You can filter the messages that are exported using the *ContentFilter* parameter. You can filter by message content, attachment, senders, recipients, Inbox category, importance, message type, message size, and when the message was sent, received, or expired.
- You can specify folders to include or exclude using the *IncludeFolders* or *ExcludeFolders* parameter. If exporting data from an Exchange 2013 mailbox, you can also exclude the Recoverable Items folder using the *ExcludeDumpster* parameter.
- You can export associated messages using the *AssociatedMessagesCopyOption* parameter. Associated messages contain hidden data with information about rules, views, and forms. By default, associated items aren't copied to the .pst file.

Mailbox export request cmdlets

Use the following cmdlets for mailbox export requests.

Cmdlet	Description
New-MailboxExportRequest	Starts the process of exporting data from a primary mailbox or personal archive to a .pst file. You can create more than one export request per mailbox. Each request must have a unique name.
Set-MailboxExportRequest	Changes export request options after the request is created or recover from a failed request.
Suspend-MailboxExportRequest	Suspends an export request any time after the request is created but before the request reaches the status of Completed.
Resume-MailboxExportRequest	Resumes an export request that's suspended or failed.
Remove-MailboxExportRequest	Removes fully or partially completed export requests. Completed export requests aren't automatically cleared. You must use this cmdlet to remove them.
Get-MailboxExportRequest	View general information about an export request.

Get-MailboxExportRequestStatistics	View detailed information about an export request.

Recoverable Items folder

Exchange Server 2013 > Mailbox and Client Access servers > Mailbox server >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-12*

To protect from accidental or malicious deletion and to facilitate discovery efforts commonly undertaken before or during litigation or investigations, Microsoft Exchange Server 2013 uses the Recoverable Items folder. The Recoverable Items folder replaces the feature known as the dumpster in Exchange Server 2007. The Recoverable Items folder is used by the following Exchange features:

- Deleted item retention
- Single item recovery
- In-Place Hold
- Litigation hold
- Mailbox audit logging
- Calendar logging

Contents

Terminology

Knowledge of the following terms will help you understand the content in this topic.

Delete

Describes when an item is deleted from any folder and placed in the Deleted Items default folder.

Soft delete

Describes when an item is deleted from the Deleted Items default folder and placed in the Recoverable Items folder. Additionally describes when a Microsoft Outlook user deletes an item by pressing Shift+Delete, which bypasses the Deleted Items folder and places the item directly in the Recoverable Items folder.

Hard delete

Describes when an item is marked to be purged from the mailbox database. This is also known as

a *store hard delete*.

Recoverable Items folder

To better meet customers' legal compliance requirements, the dumpster is reinvented as the Recoverable Items folder in Exchange 2010. The Recoverable Items folder resides in the non-IPM subtree of each mailbox. The non-IPM subtree is a storage area within the mailbox that contains operational data about the mailbox. This subtree isn't visible to users using Outlook, Microsoft Office Outlook Web App, or other e-mail clients.

This architectural change provides the following key benefits:

- When a mailbox is moved to another mailbox database, the Recoverable Items folder moves with it.
- The Recoverable Items folder is indexed by Exchange Search and can be discovered using In-Place eDiscovery.
- The Recoverable Items folder has its own storage quota.
- Exchange can prevent data from being purged from the Recoverable Items folder.
- Exchange can track edits of certain content.

The Recoverable Items folder contains the following subfolders:

- **Deletions** This subfolder contains all items deleted from the Deleted Items folder. (In Outlook, you can soft delete an item by pressing Shift+Delete.) This subfolder is exposed to users through the Recover Deleted Items feature in Outlook and Outlook Web App.
- **Versions** If In-Place Hold, litigation hold, or single item recovery is enabled, this subfolder contains the original and modified copies of the deleted items. This folder isn't visible to end users.
- **Purges** If either litigation hold or single item recovery is enabled, this subfolder contains all items that are hard deleted. This folder isn't visible to end users.
- **DiscoveryHolds** If In-Place Hold is enabled, this subfolder contains all items that meet the hold query parameters and are hard deleted.
- **Audits** If mailbox audit logging is enabled for a mailbox, this subfolder contains the audit log entries. To learn more about mailbox audit logging, see Mailbox audit logging.
- **Calendar Logging** This subfolder contains calendar changes that occur within a mailbox. This folder isn't available to users.

Deleted item retention

An item is considered to be soft deleted in the following cases:

- A user deletes an item or empties all items from the Deleted Items folder.
- A user presses Shift+Delete to delete an item from any other mailbox folder.

Soft-deleted items are moved to the Deletions subfolder of the Recoverable Items folder. This provides an additional layer of protection so users can recover deleted items without requiring Help desk intervention. Users can use the Recover Deleted Items feature in Outlook or Outlook Web

App to recover a deleted item. Users can also use this feature to permanently delete an item.

Items remain in the Deletions subfolder until the deleted item retention period is reached. The default deleted item retention period for a mailbox database is 14 days. You can modify this period for a mailbox database or for a specific mailbox. In addition to a deleted item retention period, the Recoverable Items folder is also subject to quotas. To learn more, see Recoverable Items Mailbox Quotas later in this topic.

After the deleted item retention period elapses, the item is moved to the Purges folder and is no longer visible to the user. When the Managed Folder Assistant processes the mailbox, items in the Purges subfolder are purged from the mailbox database.

Single item recovery

If an item is removed from the Deletions subfolder, either using the Recover Deleted Items feature or by an automated process such as the Managed Folder Assistant, the item can't be recovered by the user. In previous versions of Exchange, recovering these items required the administrator to restore the mailbox database or a mailbox from backup copies. This process generally delayed recovery by minutes or hours, depending on the backup mechanism used.

In Exchange 2013, you can use *single item recovery* to recover items without having to restore the mailbox databases using backup media. This results in considerably shorter recovery periods. When the Managed Folder Assistant processes the Recoverable Items folder for a mailbox that has single item recovery enabled, any item in the Purges subfolder isn't purged if the deleted item retention period hasn't elapsed for that item.

The following table lists the contents of and actions that can be performed in the Recoverable Items folder if single item recovery is enabled.

Recoverable Items folder and single item recovery

State of single item recovery	Recoverable Items folder contains soft-deleted items	Recoverable Items folder contains hard-deleted items	Users can purge items from the Recoverable Items folder	Managed Folder Assistant automatically purges items from the Recoverable Items folder
Enabled	Yes	Yes	No	Yes. By default, all items are purged after 14 days, with the exception of calendar items, which are purged

				after 120 days.
Disabled	Yes	No	Yes	Yes. By default, all items are purged after 14 days, with the exception of calendar items, which are purged after 120 days. If the Recoverable Items warning quota is reached before the deleted item retention period elapses, messages are deleted in first in, first out (FIFO) order.

Single item recovery isn't enabled by default for new mailboxes or mailboxes moved from a previous version of Exchange. You must use the Exchange Management Shell to enable single item recovery for a mailbox, and then configure or modify the deleted item retention period. For details about how to perform a single item recovery, see Perform single item recovery.

In-Place Hold and litigation hold

In Exchange 2013, discovery managers can use In-Place eDiscovery with delegated Discovery Management permissions to perform eDiscovery searches of mailbox content. Exchange 2013 also introduces In-Place Hold, which you can use to preserve mailbox items that match query parameters and protect the items from deletion by users or automated processes. You can also use litigation hold, the preservation feature introduced in Exchange 2010, to preserve all items in user mailboxes and protect the items from deletion by users or automated processes.

Placing a mailbox on In-Place Hold or litigation hold stops the Managed Folder Assistant from automatically purging messages from the DiscoveryHolds and Purges subfolders. Additionally, copy-on-write page protection is also enabled for the mailbox. Copy-on-write page protection creates a copy of the original item before any modifications are written to the Exchange store.

After the mailbox is removed from litigation hold, the Managed Folder Assistant resumes automated purging.

The following table lists the contents of and actions that can be performed in the Recoverable Items folder if litigation hold is enabled.

Recoverable Items folder and holds

State of litigation hold	Recoverable Items folder contains soft-deleted items	Recoverable Items folder contains modified and hard-deleted items	Users can purge items from the Recoverable Items folder	Managed Folder Assistant automatically purges items from the Recoverable Items folder
Enabled	Yes	Yes	No	No
Disabled	Yes	No	Yes	Yes

To learn more about In-Place eDiscovery, In-Place Hold, and litigation hold, see the following topics:

- In-Place eDiscovery
- In-Place Hold

Copy-on-write page protection and modified items

If a user who is placed on In-Place Hold or litigation hold modifies specific properties of a mailbox item, a copy of the original mailbox item is created before the changed item is written. The original copy is saved in the Versions subfolder. This process is known as copy-on-write page protection. Copy-on-write page protection applies to items residing in any mailbox folder. The Versions subfolder isn't visible to users.

The following table lists the message properties that trigger copy-on-write page protection.

Properties that trigger copy-on-write page protection

Item type	Properties that trigger copy-on-write page protection
Messages (IPM.Note*) Posts (IPM.Post*)	• Subject • Body • Attachments • Senders and recipients • Sent and received dates
Items other than messages and posts	Any change to a visible property, except the

	following: • Item location (when an item is moved between folders) • Item status change (read or unread) • Changes to a retention tag applied to an item
Items in the Drafts default folder	None. Items in the Drafts folder are exempt from copy-on-write page protection.

Important:
Copy-on-write page protection doesn't save a version of the meeting when a meeting organizer receives responses from attendees and the meeting's tracking information is updated. Also, changes to RSS feeds aren't captured by copy-on-write page protection.

When a mailbox is no longer on In-Place Hold or litigation hold, copies of modified items stored in the Versions folder are removed.

Recoverable Items mailbox quotas

When an item is moved to the Recoverable Items folder, its size is deducted from the mailbox quota and added to the size of the Recoverable Items folder. In Exchange 2010, mailbox databases have a configurable Recoverable Items warning quota (*soft limit*) of 20 gigabytes (GB) and a Recoverable Items quota (*hard limit*) of 30 GB. By default, these limits are inherited by all mailboxes in the database. However, you can configure individual mailboxes with different quotas. To learn more, see Configure Deleted Item retention and Recoverable Items quotas.

When the Recoverable Items folder for a mailbox reaches the Recoverable Items quota, no more items can be stored in the folder. This impacts mailbox functionality in the following ways:

- Mailbox users can't delete items.
- The Managed Folder Assistant can't delete items based on retention tag or managed folder settings.
- For mailboxes that have single item recovery, In-Place Hold or litigation hold enabled, the copy-on-write page protection process can't maintain versions of items edited by the user.
- For mailboxes that have mailbox audit logging enabled, no mailbox audit log entries can be saved in the Audits subfolder.

For mailboxes that aren't placed on In-Place Hold or litigation hold, the Managed Folder Assistant automatically purges items from the Recoverable Items folder when the deleted item retention period elapses. If the folder reaches the Recoverable Items warning quota, the assistant automatically purges items in FIFO order.

When the Recoverable Items folder reaches the soft and hard limit defaults, you are notified by means of an event log and a Microsoft System Center Operations Manager alert. This alert fires

when the Recoverable Items folder first reaches the soft and hard limit defaults, and then once daily afterward.

The following table lists the events logged when the Recoverable Items folder reaches the soft and hard limit defaults.

Recoverable Items quota warnings and errors

Event ID	Type	Source	Message
10024	Warning	MSExchangeIS Mailbox Store	The mailbox for *<mailbox user>* (*GUID*) has exceeded the Recoverable Items Warning Quota. Please remove items from Recoverable Items or increase the Recoverable Items Warning Quota and Recoverable Items Quota. If the Recoverable Items Quota is exceeded, the user will be unable to delete items from the mailbox.
10023	Error	MSExchangeIS Mailbox Store	The mailbox for *<mailbox user>* (*GUID*) has exceeded the maximum Recoverable Items Quota. Items cannot be deleted from this mailbox. The mailbox owner should be notified about the condition of the

			mailbox as soon as possible. Please remove items from Recoverable Items or increase the Recoverable Items Quota to restore functionality.
10023	Warning	MSExchangeMailboxAssistants	The mailbox:<*mailbox user*> Recoverable Items size has exceeded the warning quota limit. Items were deleted from Recoverable Items folders to prevent mailbox outage. Recoverable Items Warning Quota: 20 GB (21,474,836,480 bytes) Original Recoverable Items size: 21475005311 Current Recoverable Items size: 21474823820 Folder stats: - Folders processed: RecoverableItemsRoot, RecoverableItemsVersions, RecoverableItemsPurges,

			RecoverableItemsDeletions - Original folder sizes: 21391661934, 55190914, 1987247, 26157788 (item counts: 276828, 400, 84, 646) - Current folder sizes: 21391480443, 55190914, 1987247, 26157788 (item counts: 276817, 400, 84, 646)

If the mailbox is placed on In-Place Hold or litigation hold, copy-on-write page protection can't maintain versions of modified items. To maintain versions of modified items, you must reduce the size of the Recoverable Items folder. You can use the Search-Mailbox cmdlet to copy messages from the Recoverable Items folder of a mailbox to a discovery mailbox, and then delete the items from the mailbox. Alternatively, you can also raise the Recoverable Items quota for the mailbox. For details, see Clean up the Recoverable Items folder.

More Info

- In Exchange Online and Exchange 2013, copy-on-write is only enabled when a mailbox is on In-Place Hold or Litigation Hold.

Clean up the Recoverable Items folder

Mailbox and Client Access servers > Mailbox server > Recoverable Items folder >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-11*

The Recoverable Items folder (known in earlier versions of Exchange as the dumpster) exists to protect from accidental or malicious deletions and to facilitate discovery efforts commonly undertaken before or during litigation or investigations. To learn more about the Recoverable Items folder, see Recoverable Items folder.

How you clean up a mailbox's Recoverable Items folder depends on whether the mailbox is placed on In-Place Hold or litigation hold, or had single item recovery enabled:

- If a mailbox isn't placed on In-Place Hold or litigation hold or doesn't have single item recovery enabled, you can simply delete items from the Recoverable Items folder. After being deleted, you can't use single item recovery to recover the items.
- If the mailbox is placed on In-Place Hold or litigation hold or has single item recovery enabled, it's important to preserve the mailbox data until the hold is removed or single item recovery is disabled. In this case, you need to perform more detailed steps to clean up the Recoverable Items folder.

To learn more about In-Place Hold and litigation hold, see In-Place Hold. To learn more about single item recovery, see "Single Item Recovery" in Recoverable Items folder.

To learn more about the Recoverable Items folder, see Recoverable Items folder.

What do you need to know before you begin?

- Estimated time to complete this procedure: 30 minutes. This may vary depending on the size of the Recoverable Items folder
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Delete mailbox content" entry in the Messaging policy and compliance permissions topic.
- Because incorrectly cleaning up the Recoverable Items folder can result in data loss, it’s important that you're familiar with the Recoverable Items folder and the impact of removing its contents. Before performing this procedure, we recommend that you review the information in Recoverable Items folder.
- You can't use the Exchange Administration Center (EAC) to perform these procedures. You must use the Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Shell to delete items from the Recoverable Items folder for mailboxes that aren't placed on In-Place Hold or litigation hold or don't have single item recovery enabled

This example permanently deletes items from Gurinder Singh's Recoverable Items folder and also copies the items to the GurinderSingh-RecoverableItems folder in the Discovery Search Mailbox (a discovery mailbox created by Exchange Setup).

```
Search-Mailbox -Identity "Gurinder Singh" -
SearchDumpsterOnly -TargetMailbox "Discovery Search
Mailbox" -TargetFolder "GurinderSingh-RecoverableItems" -
DeleteContent
```

Note:

To delete items from the mailbox without copying them to another mailbox, use the preceding command without the *TargetMailbox* and *TargetFolder* parameters.

For detailed syntax and parameter information, see Search-Mailbox.

Use the Shell to clean up the Recoverable Items folder for mailboxes that are placed on In-Place Hold or litigation hold or have single item recovery enabled

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Delete mailbox content" entry in the Messaging policy and compliance permissions topic.

If a mailbox reaches its Recoverable Items quota, we recommend that you raise the quota and not delete items from the folder. You can also monitor events in the Application log related to the Recoverable Items warning quota and take necessary actions (such as raising the quota or investigating dumpster growth for mailboxes that reach the warning quota).

If storage constraints or similar issues prevent you from raising the Recoverable Items quota, and you need to delete messages from the Recoverable Items folder of a mailbox on In-Place Hold or litigation hold or has single item recovery enabled, we recommend that you first copy data from the user's Recoverable Items folder to another mailbox. If you're deleting items due to storage constraints on one volume, you can copy items to a mailbox located on a volume that has adequate storage.

This procedure copies items from Gurinder Singh's Recoverable Items folder to the GurinderSingh-RecoverableItems folder in the Discovery Search Mailbox. Before you copy and delete items from the Recoverable Items folder, you must first perform several steps to make sure items aren't deleted from the Recoverable Items folder. After you copy items to a discovery or backup mailbox and clean up the folder, you can revert to the mailbox's previous settings.

1. Retrieve the following quota settings. Be sure to note the values so you can revert to these settings after cleaning up the Recoverable Items folder:
   - *RecoverableItemsQuota*
   - *RecoverableItemsWarningQuota*
   - *ProhibitSendQuota*
   - *ProhibitSendReceiveQuota*

- *UseDatabaseQuotaDefaults*
- *RetainDeletedItemsFor*
- *UseDatabaseRetentionDefaults*

Note:

If the *UseDatabaseQuotaDefaults* parameter is set to `$true`, the previous quota settings aren't applied. The corresponding quota settings configured on the mailbox database are applied, even if individual mailbox settings are populated.

```
Get-Mailbox "Gurinder Singh" | Format-List
RecoverableItemsQuota, RecoverableItemsWarningQuota,
ProhibitSendQuota, ProhibitSendReceiveQuota,
UseDatabaseQuotaDefaults, RetainDeletedItemsFor,
UseDatabaseRetentionDefaults
```

2. Retrieve the mailbox access settings for the mailbox. Be sure to note these settings for later.

```
Get-CASMailbox "Gurinder Singh" | Format-List EwsEnabled,
ActiveSyncEnabled, MAPIEnabled, OWAEnabled, ImapEnabled,
PopEnabled
```

3. Retrieve the current size of the Recoverable Items folder. Note the size so you can raise the quotas in Step 6.

```
Get-MailboxFolderStatistics "Gurinder Singh" -FolderScope
RecoverableItems | Format-List Name,FolderAndSubfolderSize
```

4. Retrieve the current Managed Folder Assistant work cycle configuration. Be sure to note the setting for later.

```
Get-MailboxServer "My Mailbox Server" | Format-List
Name,ManagedFolderWorkCycle
```

5. Disable client access to the mailbox to make sure no changes can be made to mailbox data for the duration of this procedure.

```
Set-CASMailbox "Gurinder Singh" -EwsEnabled $false -
ActiveSyncEnabled $false -MAPIEnabled $false -OWAEnabled
$false -ImapEnabled $false -PopEnabled $false
```

6. To make sure no items are deleted from the Recoverable Items folder, increase the Recoverable Items quota, increase the Recoverable Items warning quota, and set the deleted item retention period to a value higher than the current size of the user's Recoverable Items folder. This is particularly important for preserving messages for mailboxes placed on In-Place Hold or litigation hold. We recommend raising these settings to twice their current size.

```
Set-Mailbox "Gurinder Singh" -RecoverableItemsQuota 50Gb -
RecoverableItemsWarningQuota 50Gb -RetainDeletedItemsFor
3650 -ProhibitSendQuota 50Gb -ProhibitSendRecieveQuota 50Gb
-UseDatabaseQuotaDefaults $false -
UseDatabaseRetentionDefaults $false
```

7. Disable the Managed Folder Assistant on the Mailbox server.

```
Set-MailboxServer MyMailboxServer -ManagedFolderWorkCycle
$null
```

Important:

If the mailbox resides on a mailbox database in a database availability group (DAG), you must disable the Managed Folder Assistant on each DAG member that hosts a copy of the database. If the database fails over to another server, this prevents the Managed Folder Assistant on that server from deleting mailbox data.

8. Disable single item recovery and remove the mailbox from litigation hold.

```
Set-Mailbox "Gurinder Singh" -SingleItemRecoveryEnabled
$false -LitigationHoldEnabled $false
```

Important:

After you run this command, it may take up to one hour to disable single item recovery or litigation hold. We recommend that you perform the next step only after this period has elapsed.

9. Copy items from the Recoverable Items folder to a folder in the Discovery Search Mailbox and delete the contents from the source mailbox.

```
Search-Mailbox -Identity "Gurinder Singh" -
SearchDumpsterOnly -TargetMailbox "Discovery Search
Mailbox" -TargetFolder "GurinderSingh-RecoverableItems" -
DeleteContent
```

If you need to delete only messages that match specified conditions, use the *SearchQuery* parameter to specify the conditions. This example deletes messages that have the string "Your bank statement" in the **Subject** field.

```
Search-Mailbox -Identity "Gurinder Singh" -SearchQuery
"Subject:'Your bank statement'" -SearchDumpsterOnly -
TargetMailbox "Discovery Search Mailbox" -TargetFolder
"GurinderSingh-RecoverableItems" -DeleteContent
```

Note:

It isn't required to copy items to the Discovery Search Mailbox. You can copy messages to any

mailbox. However, to prevent access to potentially sensitive mailbox data, we recommend copying messages to a mailbox that has access restricted to authorized records managers. By default, access to the default Discovery Search Mailbox is restricted to members of the Discovery Management role group. For details, see In-Place eDiscovery.

10.If the mailbox was placed on litigation hold or had single item recovery enabled earlier, enable these features again.

```
Set-Mailbox "Gurinder Singh" -SingleItemRecoveryEnabled $true -LitigationHoldEnabled $true
```

Important:

After you run this command, it may take up to one hour to enable single item recovery or litigation hold. We recommend that you enable the Managed Folder Assistant and allow client access (Steps 11 and 12) only after this period has elapsed.

11.Revert the following quotas to the values noted in Step 1:

- *RecoverableItemsQuota*
- *RecoverableItemsWarningQuota*
- *ProhibitSendQuota*
- *ProhibitSendReceiveQuota*
- *UseDatabaseQuotaDefaults*
- *RetainDeletedItemsFor*
- *UseDatabaseRetentionDefaults*

In this example, the mailbox is removed from retention hold, the deleted item retention period is reset to the default value of 14 days, and the Recoverable Items quota is configured to use the same value as the mailbox database. If the values you noted in Step 1 are different, you must use the preceding parameters to specify each value and set the *UseDatabaseQuotaDefaults* parameter to `$false`. If the *RetainDeletedItemsFor and UseDatabaseRetentionDefaults* parameters were previously set to a different value, you must also revert them to the values noted in Step 1.

```
Set-Mailbox "Gurinder Singh" -RetentionHoldEnabled $false -RetainDeletedItemsFor 14 -RecoverableItemsQuota unlimited -UseDatabaseQuotaDefaults $true
```

12.Enable the Managed Folder Assistant by setting the work cycle back to the value you noted in Step 4. This example sets the work cycle to one day.

```
Set-MailboxServer MyMailboxServer -ManagedFolderWorkCycle 1
```

13.Enable client access.

```
Set-CASMailbox -ActiveSyncEnabled $true -EwsEnabled $true -MAPIEnabled $true -OWAEnabled $true -ImapEnabled $true -PopEnabled $true
```

For detailed syntax and parameter information, see the following topics:

- Get-Mailbox
- Get-CASMailbox
- Get-MailboxFolderStatistics
- Get-MailboxServer
- Set-CASMailbox
- Set-Mailbox
- Set-MailboxServer
- Search-Mailbox

How do you know this worked?

To verify that you have successfully cleaned up the Recoverable Items folder of a mailbox, use Get-MailboxFolderStatistics cmdlet the check the size of the Recoverable Items folder.

This example retrieves the size of the Recoverable Items folder and its subfolders and an item count in the folder and each subfolder.

```
Get-MailboxFolderStatistics -Identity "Gurinder Singh" -
FolderScope RecoverableItems | Format-Table
Name,FolderAndSubfolderSize,ItemsInFolderAndSubfolders -
Auto
```

Configure Deleted Item retention and Recoverable Items quotas

Mailbox and Client Access servers > Mailbox server > Recoverable Items folder >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2012-12-11*

When a user deletes items from the Deleted Items default folder by using the Delete, Shift+Delete, or **Empty Deleted Items Folder** actions, the items are moved to the **Recoverable Items\Deletions** folder. The duration that deleted items remain in this folder is based on the deleted item retention settings configured for the mailbox database or the mailbox. By default, a mailbox database is configured to retain deleted items for 14 days, and the recoverable items warning quota and recoverable items quota are set to 20 gigabytes (GB) and 30 GB respectively.

Note:
Before the retention time for deleted items elapses, Microsoft Outlook and Microsoft Office

Outlook Web App users can recover deleted items by using the Recover Deleted Items feature. To learn more about these features, see the "Recover deleted items" topic for Outlook or Outlook Web App.

You can use the Shell to configure deleted item retention settings and recoverable items quotas for a mailbox or mailbox database. Deleted item retention settings are ignored when a mailbox is placed on In-Place Hold or litigation hold.

To learn more about deleted item retention, the Recoverable Items folder, In-Place Hold, and litigation hold, see Recoverable Items folder.

What do you need to know before you begin?

- Estimated time to completion: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Configure deleted item retention for a mailbox

Use the EAC to configure deleted item retention for a mailbox

1. Navigate to **Recipients** > **Mailboxes**.
2. In the list view, select a mailbox, and then click **Edit** .
3. On the mailbox property page, click **Mailbox usage**, click **More options**, and then select one of the following
   - **Use the default retention settings from the mailbox database** Use this setting to use the deleted item retention setting that's configured for the mailbox database.
   - **Customize the settings for this mailbox** Use this setting to configure deleted item retention settings for the mailbox.

Keep deleted items for (days) This box displays the length of time that deleted items are retained before they're permanently deleted and can't be recovered by the user. When the mailbox is created, this value is based on the deleted item retention settings configured for the mailbox database. By default, a mailbox database is configured to retain deleted items for 14 days. The value range for this property is from 0 through 24,855 days.

   - **Don't permanently delete items until the database is backed up** Select this check box to prevent mailboxes and email messages from being deleted until after the mailbox database

on which the mailbox is located has been backed up.

Use the Shell to configure deleted item retention for a mailbox

This example configures April Stewart's mailbox to retain deleted items for 30 days.

```
Set-Mailbox -Identity - "April Stewart" -
RetainDeletedItemsFor 30
```

For detailed syntax and parameter information, see Set-Mailbox.

Use the Shell to configure recoverable items quotas for a mailbox

Note:
You can't use the EAC to configure recoverable items quotas for a mailbox.

This example configures a recoverable items warning quota of 12 GB and a recoverable items quota of 15 GB for April Stewart's mailbox.

```
Set-Mailbox -Identity "April Stewar"t -
RecoverableItemsWarningQuota 12GB -RecoverableItemsQuota
15GB -UseDatabaseQuotaDefaults $false
```

Note:
To configure a mailbox to use different recoverable items quotas than the mailbox database in which it resides, you must set the *UseDatabaseQuotaDefaults* parameter to `$false`.

For detailed syntax and parameter information, see Set-Mailbox.

Use the Shell to configure deleted item retention for a mailbox database

Note:
You can't use the EAC to configure deleted item retention for a mailbox database.

This example configures a deleted item retention period of 10 days for the mailbox database MDB2.

```
Set-MailboxDatabase -Identity MDB2 -DeletedItemRetention 10
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

Use the Shell to configure recoverable items quotas for a mailbox database

Note:
You can't use the EAC to configure recoverable items quotas for a mailbox database

This example configures a recoverable items warning quota of 15 GB and a recoverable items quota of 20 GB on mailbox database MDB2.

```
Set-MailboxDatabase -Identity MDB2 -
RecoverableItemsWarningQuota 15GB -RecoverableItemsQuota
20GB
```

For detailed syntax and parameter information, see Set-MailboxDatabase.

Perform single item recovery

Mailbox and Client Access servers > Mailbox server > Recoverable Items folder >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2012-12-11*

Single item recovery provides an additional layer of protection so that you can recover items that were accidentally deleted by a user or by automated processes such as the Managed Folder Assistant. Single item recovery simplifies recovery and reduces recovery time because you can recover items without recovering an entire mailbox or mailbox database from backup media. To learn more, see "Single item recovery" in Recoverable Items folder.

Note:
In addition to using this procedure to search for and recover deleted items (which are moved to the Recoverable Items\Purges folder if either single item recovery or litigation hold is enabled), you can also use this procedure to search for items residing in other folders in the mailbox and to delete items from the source mailbox (also known as *search and destroy*).

This topic shows you how to use the **Search-Mailbox** cmdlet in the Shell to search for and recover missing items. If the mailbox has a standard CAL, this is the only method you can use. If you use this cmdlet, you can search only one mailbox at a time. If you want to search multiple mailboxes simultaneously, you can use the In-Place eDiscovery feature in the Exchange Administration Center (EAC) or the New-MailboxSearch cmdlet in the Shell.

What you need to know before you begin?

- Estimated time to complete: 15-30 minutes.
- Procedures in this topic require specific permissions. See each procedure for its permissions information.
- Single item recovery must be enabled for a mailbox before the item you want to recover is deleted.
- To search for and recover items, you must have the following information:
  - **Source mailbox** This is the mailbox being searched.
  - **Target mailbox** This is the discovery mailbox in which messages will be recovered. Exchange Setup creates a default discovery mailbox. If required, you can create additional discovery mailboxes. For details, see Create a discovery mailbox.

Note:

When using the **Search-Mailbox** cmdlet, you can also specify a target mailbox that isn't a discovery mailbox. However, you can't specify the same mailbox as the source and target mailbox.

  - **Search criteria** Criteria include sender or recipient, or keywords (words or phrases) in the message.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Step 1: Search for and recover missing items

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions topic.

Note:

You can use In-Place eDiscovery in the EAC to search for missing items. However, when using the EAC, you can’t restrict the search to the Recoverable Items folder. Messages matching your search parameters will be returned even if they’re not deleted. After they’re recovered to the specified discovery mailbox, you may need to review the search results and remove unnecessary messages before recovering the remaining messages to the user’s mailbox or exporting them to a .pst file.

The first step in the recovery process is to search for messages in the source mailbox. Use one of the following methods to search a user mailbox and copy messages to a discovery mailbox.

Use the Shell

This example searches for messages in April Stewart's mailbox that meet the following criteria:

- Sender: Ken Kwok
- Keyword: Seattle

```
Search-Mailbox "April Stewart" -SearchQuery "from:'Ken Kwok' AND seattle" -TargetMailbox "Discovery Search Mailbox" -TargetFolder "April Stewart Recovery" -LogLevel Full
```

Note:

When using the **Search-Mailbox** cmdlet, you can scope the search by using the *SearchQuery* parameter to specify a query formatted using Keyword Query Language (KQL). You can also use the *SearchDumpsterOnly* switch to search only items in the Recoverable Items folder.

For detailed syntax and parameter information, see Search-Mailbox.

Use the EAC to perform an In-Place eDiscovery search

For details about how to use the EAC to perform an In-Place eDiscovery search, see Create an In-Place eDiscovery search.

How do you know this worked?

To verify that you have successfully searched the messages you want to recover, log on to the discovery mailbox you selected as the target mailbox and review the search results.

Step 2: Restore recovered items

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions topic.

Note:

You can't use the EAC to restore recovered items.

After messages have been recovered to a discovery mailbox, you can restore them to the user's mailbox by using the **Search-Mailbox** cmdlet. You can also use the **New-MailboxExportRequest** and **New-MailboxImportRequest** cmdlets to export the messages to or import the messages from a .pst file.

Use the Shell to restore messages

This example restores messages to April Stewart's mailbox and deletes them from the Discovery Search Mailbox.

```
Search-Mailbox "Discovery Search Mailbox" -SearchQuery
"from:'Ken Kwok' AND seattle" -TargetMailbox "April
Stewart" -TargetFolder "Recovered Messages" -LogLevel Full
-DeleteContent
```

For detailed syntax and parameter information, see Search-Mailbox.

How do you know this worked?

To verify that you have successfully recovered messages to the user's mailbox, have the user review messages in the target folder you specified in the above command.

Use the Shell to export and import messages from a .pst file

You can export contents from a mailbox to a .pst file and import the contents of a .pst file to a mailbox. To learn more about mailbox import and export, see Mailbox import and export requests.

This example uses the following settings to export messages from the folder April Stewart Recovery in the Discovery Search Mailbox to a .pst file:

- **Mailbox** Discovery Search Mailbox
- **Source folder** April Stewart Recovery
- **ContentFilter** April travel plans
- **PST file path** \\MYSERVER\HelpDeskPst\AprilStewartRecovery.pst

```
New-MailboxExportRequest -Mailbox "Discovery Search
Mailbox" -SourceRootFolder "April Stewart Recovery" -
ContentFilter {Subject -eq "April travel plans"} -FilePath
\\MYSERVER\HelpDeskPst\AprilStewartRecovery.pst
```

For detailed syntax and parameter information, see New-MailboxExportRequest.

This example uses the following settings to import messages from a .pst file to the folder Recovered By Helpdesk in April Stewart's mailbox:

- **Mailbox** April Stewart
- **Target folder** Recovered By Helpdesk
- **PST file path** \\MYSERVER\HelpDeskPst\AprilStewartRecovery.pst

```
New-MailboxImportRequest -Mailbox "April Stewart" -
TargetRootFolder "Recovered By Helpdesk" -FilePath \
\MYSERVER\HelpDeskPst\AprilStewartRecovery.pst
```

For detailed syntax and parameter information, see New-MailboxImportRequest.

How do you know this worked?

To verify that you have successfully exported messages to a .pst file, use Outlook to open the .pst file and inspect its contents. To verify that you have successfully imported messages from the .pst file, have the user inspect the contents of the target folder you specified in the above command.

Get Recoverable Items folder statistics

Mailbox and Client Access servers > Mailbox server > Recoverable Items folder >

Applies to: *Exchange Server 2010 Service Pack 2 (SP2)*

Topic Last Modified: *2013-02-22*

The Recoverable Items folder contains items deleted by Microsoft Outlook and Microsoft Office Outlook Web App users or by the Mailbox Assistant. The duration that deleted items remain in this folder is based on the deleted item retention settings configured for the mailbox database or the mailbox. By default, a mailbox database is configured to retain deleted items for 14 days, and the Recoverable Items warning quota and Recoverable Items quota are set to 20 gigabytes (GB) and 30 GB respectively. However, if In-Place Hold or litigation hold is enabled for the mailbox, the Recoverable Items folder can accumulate deleted items beyond the specified retention period and can also maintain different versions of modified mailbox items.

When the Recoverable Items folder reaches the Recoverable Items warning quota, a warning event is logged in the Application event log. If the mailbox isn't on litigation hold, items are then removed on a first in, first out (FIFO) basis. However, if the mailbox is on litigation hold, the mailbox is never emptied and upon reaching the Recoverable Items quota, mailbox functionality is impacted.

Therefore, it's important to monitor the event log for alerts generated when mailboxes reach the Recoverable Items quotas. You can also use this procedure to report statistics for the Recoverable Items folder, particularly for mailboxes placed on litigation hold.

To learn more, see the following topics:

- Recoverable Items folder
- In-Place Hold

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox folders" entry in the Recipients Permissions topic.
- You can't use the Exchange admin center (EAC) to get Recoverable Items folder statistics for a

mailbox.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Get Recoverable Items folder statistics for a mailbox

This example gets folder statistics for Soumya Singhi's Recoverable Items folder and displays the output in a list format.

```
Get-MailboxFolderStatistics -Identity "Soumya Singhi" -
FolderScope RecoverableItems | Format-List
```

This example gets folder statistics for Soumya Singhi's Recoverable Items folder and displays the folder name, folder path, number of items in the folder, and folder size in a table format.

```
Get-MailboxFolderStatistics -Identity "Soumya Singhi" -
FolderScope RecoverableItems | Format-Table
Name,FolderPath,ItemsInFolder,FolderAndSubfolderSize
```

For detailed syntax and parameter information, see Get-MailboxFolderStatistics.

Get Recoverable Items folder statistics for all mailboxes on litigation hold

This example retrieves a list of all mailboxes placed on litigation hold and retrieves mailbox folder statistics for the Recoverable Items folder and its subfolders for each mailbox. The **Identity** (mailbox folder identity) and the **FolderAndSubfolderSize** properties are displayed in a table format.

```
Get-Mailbox -ResultSize Unlimited -Filter
{LitigationHoldEnabled -eq $true} | Get-
MailboxFolderStatistics | Format-Table
Identity,FolderAndSubfolderSize
```

For detailed syntax and parameter information, see Get-Mailbox and Get-MailboxFolderStatistics.

Client Access server

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-02*

For Microsoft Exchange 2013, there have been major architectural changes to the Exchange server roles. Instead of the five server roles that were present in Exchange 2010 and Exchange 2007, in Exchange 2013, the number of server roles has been reduced to three: the Client Access server and the Mailbox server, and with Service Pack 1, the Edge Transport server role.

Note:

Exchange 2013 can also work with the Exchange 2010 Edge Transport server role.

The Exchange 2013 Mailbox server includes all many of the server components found in Exchange 2010: client access protocols, transport services, mailbox databases, and Unified Messaging services (the Client Access server redirects SIP traffic generated from incoming calls to the Mailbox server). For more information about the Exchange 2013 Mailbox server, see Mailbox server.

The Client Access server provides authentication, proxy, and limited redirection services, and offers all the usual client access protocols: HTTP, POP, IMAP, and SMTP. The Client Access server is a thin and stateless server that doesn't do any data rendering. There's never anything queued or stored on the Client Access server. For more information about the new Exchange 2013 architecture, see What's new in Exchange 2013.

Warning:

Client Access servers are not supported in perimeter networks, and they must be deployed within your internal Active Directory environment. Every Active Directory site that contains a Mailbox server must also contain a Client Access server.

As a result of these architectural changes, there have been some changes to client connectivity. First, RPC/TCP is no longer a supported direct access protocol. This means that all Outlook connectivity must occur using RPC over HTTPS (also known as Outlook Anywhere), or with Exchange 2013 SP1 and Outlook 2013 SP1, MAPI over HTTP. As a result of these changes, there's no need to have the RPC Client Access service on the Client Access server. In addition, fewer namespaces are required for a site-resilient solution than were required in Exchange 2010, and it's no longer necessary to provide affinity for the RPC Client Access service. Also, Outlook clients no longer connect to a server fully qualified domain name (FQDN) as they've done in all previous versions of Exchange. Using Autodiscover, Outlook finds a new connection point made up of the user's mailbox GUID + @ + the domain portion of the user's primary SMTP address. This change makes it much less likely that users will see the dreaded message "Your administrator has made a change to your mailbox." Only Outlook 2007 and later versions are supported with Exchange 2013.

Client Access server functionality

The Client Access server in Exchange 2013 functions much like a front door, admitting all client requests and routing them to the correct active Mailbox database. The Client Access server provides network security functionality such as Secure Sockets Layer (SSL) and client authentication, and manages client connections through redirection and proxy functionality. The Client Access server authenticates client connections and, in most cases, will proxy a request to the Mailbox server that houses the currently active copy of the database that contains the user's mailbox. In some cases, the Client Access server might redirect the request to a more suitable Client Access server, either in a different location or running a more recent version of Exchange Server.

The Client Access server has the following features:

- **Stateless server** In previous versions of Exchange, many of the Client Access protocols required session affinity. For example, Outlook Web App required that all requests from a particular client be handled by a specific Client Access server within a load balanced array of Client Access servers. In Exchange 2013, the Client Access server is stateless. In other words, because all processing for the mailbox happens on the Mailbox server, it doesn't matter which Client Access server in an array of Client Access servers receives each individual client request. This change in functionality means that session affinity is no longer required at the load balancer level. This allows inbound connections to Client Access servers to be balanced using simple techniques provided by load balancing technology such as DNS round-robin. It also allows hardware load balancing devices to support significantly more concurrent connections.
- **Connection pooling** The Client Access servers handle client authentication and send the AuthN data to the Mailbox server. The account used by the Client Access servers to connect to the Mailbox servers is a privileged account that's a member of the Exchange Servers group. This allows the Client Access servers to pool connections to the Mailbox servers effectively. An array of Client Access servers can handle millions of client connections from the Internet, but far fewer connections are used to proxy the requests to the Mailbox servers than in previous releases of Exchange. This improves processing efficiency and end-to-end latency.

Management tasks on the Client Access server

In Exchange 2013, there are several key tasks that can be performed on the Client Access server. The management of digital certificates is primarily performed on the Client Access server and some of the client protocol management for Exchange ActiveSync, POP3, and IMAP4 is also handled on the Client Access server.

Exchange Remote Connectivity

Analyzer

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-28*

The Microsoft Exchange Remote Connectivity Analyzer (ExRCA) helps you make sure that connectivity for your Exchange servers is set up correctly. If you're having problems, it can also help you find and fix these problems. The ExRCA website can run tests to check for Microsoft Exchange ActiveSync, Exchange Web Services, Microsoft Outlook, and Internet email connectivity.

Remote Connectivity Analyzer tests

You can perform several tests with the ExRCA. The following tests work on Exchange 2007 and later versions:

- Exchange ActiveSync
- Exchange Web Services
- Outlook
- Internet email

Exchange ActiveSync tests

You can run the following tests for Exchange ActiveSync:

- **Exchange ActiveSync:** This test simulates the steps that a mobile device uses to connect to an Exchange server using Exchange ActiveSync.
- **Exchange ActiveSync Autodiscover:** This walks through the steps an Exchange ActiveSync device uses to obtain settings from the Autodiscover service.

Exchange Web Services connectivity tests

The Exchange Web Services tests check the settings for many of the Exchange Web Services. You can run the following tests for ExchangeWeb Services:

- **Synchronization, Notification, Availability, and Automatic Replies:** These tests walk through many basic Exchange Web Services tasks to confirm that they're working. This is useful for IT administrators who want to troubleshoot external access using Entourage EWS or other Web Services clients.
- **Service Account Access (Developers):** This test verifies a service account's ability to access a specified mailbox, create and delete items in it, and access it via Exchange impersonation. This test is primarily used by application developers to test the ability to access mailboxes with alternate credentials.

Microsoft Office Outlook Connectivity tests

You can run the following tests for Outlook connectivity:

- **Outlook Anywhere (RPC over HTTP):** This test walks through the steps Outlook uses to connect via Outlook Anywhere (RPC over HTTP).
- **Outlook Autodiscover:** This test walks through the steps Outlook uses to obtain settings from the Autodiscover service. This test doesn't actually connect to a mailbox.

Internet email tests

You can run the following tests for Internet email:

- **Inbound SMTP E-Mail:** This test walks through the steps an Internet email server uses to send inbound SMTP email to your domain.
- **Outbound SMTP E-Mail:** This test checks your outbound IP address for certain requirements. This includes Reverse DNS, Sender ID, and RBL checks.
- **POP Email:** This test walks through the steps an email client uses to connect to a mailbox using POP3.
- **IMAP Email:** This test walks through the steps an email client uses to connect to a mailbox using IMAP.

Help Identify My Issue with Sending/ Receiving Email on a Mobile Device (Automatic Checks)

Mailbox and Client Access servers > Client Access server > Exchange Remote Connectivity Analyzer >

Topic Last Modified: *2014-07-25*

The check on this page will help identify some of the most common connectivity issues. You can use the automatic check below to validate your connectivity or help determine root cause.

You'll be asked to install an application on your machine and agree to the end user licensing agreement. Depending on the test, you'll be asked for a user account or domain name when the check runs.

Prerequisites

We'll check to see if you have Microsoft .NET Framework 4.5 installed. To obtain Microsoft .NET

Framework 4.5, go to the Microsoft Download Center. See additional perquisite details here.

Mobile Email Check

Application	Symptom	Check
Mobile Email	Cannot send or receive email on my mobile device	Run this check

Help Identify My Issue with Sending/ Receiving Email in Office Outlook (Automatic Checks)

Mailbox and Client Access servers > Client Access server > Exchange Remote Connectivity Analyzer >

Office Outlook Check

Application	Symptom	Check
Outlook	Cannot send or receive email in Outlook	Run this check

Outlook	I think my PC might not be configured correctly for Outlook	1. Sign in to Office 365 2. Select Tools 3. Select **Check your on=premises PC with the Office 365 Best Practices Analyzer**.

Azure: Help Identify My issue with Automatic Checks - DNS Records

Mailbox and Client Access servers > Client Access server > Exchange Remote Connectivity Analyzer >

Topic Last Modified: *2014-07-31*

One of the most common configuration setup issues is incorrectly configuring DNS records. You can use the automatic checks listed below to validate your configuration and help you update your environment.

If you already have an Office 365 user account, select Sign In. You don't need an Azure ID account. You might be asked for a user account again when the checks run. If so, your user account is in the format of username@youroffice365login.domain and your password.

Prerequisites

We'll check to see if you have Windows Azure Active Directory Sign-in Assistant and the Windows Azure Active Directory Module for Windows PowerShell installed.

The Windows Azure Active Directory Sign-in Assistant comes in two versions: 32 bit and 64 bit.

The Windows Azure Active Directory Module for Windows PowerShell comes in two versions: 32 bit and 64 bit.

DNS Records Checks

Application	Symptom	Check
Domains	My custom domain (e.g. contoso.com) doesn't seem to	Run this check

	be configured with Office 365	
Domains	My custom domain (e.g. contoso.com) doesn't seem to be configured with Office 365 (I used a CNAME record)	Run this check
Domains	My custom domain (e.g. contoso.com) doesn't seem to be configured with Office 365 (I used a TXT record)	Run this check
Instant Messaging	My users are having trouble getting their Lync client to work	Run this check
Instant Messaging	My users are having trouble getting their Lync client to work with other organizations	Run this check
Mail	I can't get Outlook to automatically configure with Office 365	Run this check
Mail	My email doesn't seem to be routing to Office 365	Run this check
Mail	My organization is getting a good deal of SPAM	Run this check
Mail	I can't seem to get Exchange Hybrid working	Run this check

Help Identify My Issues with Automatic Checks - 3rd Party Tools

Mailbox and Client Access servers > Client Access server > Exchange Remote Connectivity Analyzer >

Topic Last Modified: *2014-07-28*

The check(s) on this page will help identify some of the most common configuration challenges. You can use the automatic check(s) below to validate your configuration and help you update your environment.

You'll be asked to sign-in on a new page. If you already have an Office 365 user account select **sign-in**. You won't need an Azure ID account. You might be asked for a user account again when the checks run. Use your username@youroffice365login.domain and your password.

Prerequisites

We'll check to see if you have the necessary pre-requisites on your Windows 7 x64 or Windows Server 2008 R2 computer automatically.

3rd Party Tools Check

Application	Symptom	Check
3rd Party Tools	Im not sure what 3rd party integrations/applications I have installed in my messaging environment	Run this check

Directory Sync	I'm not sure if I can deploy Office 365 quote limitations.	Run this check
Directory Sync	I'm not sure if I can deploy Office 365 and use the default directory synchronization setup.	Run this check
Directory Sync	I'm not sure if I use Active Directory and can support directory synchronization.	Run this check
Directory Sync	I'm not sure if all of my Active Directory groups meet the requirements for directory synchronization.	Run this check

Exchange 2013 Client Access server configuration

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-29*

After you've installed the Exchange 2013 Client Access server, there are a variety of configuration tasks that you can perform. Although the Client Access server in Exchange 2013 doesn't handle processing for the client protocols, several settings need to be applied to the Client Access server, including virtual directory settings and certificate settings.

Configuring server certificates

In Exchange 2013, you can use the Certificate Wizard to request a digital certificate from a certification authority. After you've requested a digital certificate, you'll need to install it on the Client Access server.

You don't need to install digital certificates on the Mailbox servers in your organization. A self-signed certificate is installed by default on the Mailbox servers, and it doesn't need to be replaced. The Client Access servers in your organization implicitly trust the self-signed certificate on the Mailbox servers. For more information, see Exchange 2013 certificate management UI.

Configuring virtual directories

There are several settings that you can configure on the virtual directories for the Offline Address Book (OAB), Exchange Web Services, Exchange ActiveSync, Outlook Web App, and the Exchange Administration Center. For additional information about virtual directory management, see Virtual directory management. You can configure the virtual directories using the following commands.

- Exchange 2013 provides two sets of HTTP connectivity settings for Outlook Anywhere configuration so that administrators may configure both an internal and external endpoint.

To configure Outlook Anywhere with a single URL for connectivity, you must provide the host name, indicate whether SSL is required, and specify an authpackage using the following command in the Exchange Management Shell:

```
Get-OutlookAnywhere | Set-OutlookAnywhere -InternalHostname
"internalServer.contoso.com" -
InternalClientAuthenticationMethod Ntlm -
InternalClientsRequireSsl $true -IISAuthenticationMethods
Negotiate,NTLM,Basic
```

You may also specify an externally reachable endpoint by using the following command in the Exchange Management Shell:

```
Get-OutlookAnywhere | Set-OutlookAnywhere -InternalHostname
"internalServer.contoso.com" -
InternalClientAuthenticationMethod Ntlm -
```

```
InternalClientsRequireSsl $true -ExternalHostname
"externalServer.company.com" -
ExternalClientAuthenticationMethod Basic -
ExternalClientsRequireSsl $true -IISAuthenticationMethods
Negotiate,NTLM,Basic
```

Tip:

While Exchange 2013 supports Negotiate for Outlook Anywhere HTTP authentication, this should only be used when all servers in the environment are running Exchange 2013.

- To configure Exchange ActiveSync, run the following command.

```
Set-ActiveSyncVirtualDirectory -Identity "<CAS2013>
\Microsoft-Server-ActiveSync (Default Web Site)" -
ExternalUrl "https://mail.contoso.com/Microsoft-Server-
ActiveSync"
```

- To configure the Exchange Web Services virtual directory, run the following command.

```
Set-WebServicesVirtualDirectory -Identity "<CAS2013>\EWS
(Default Web Site)" -ExternalUrl https://mail.contoso.com/
EWS/Exchange.asmx
```

- To configure the Offline Address Book, run the following command.

```
Set-OABVirtualDirectory -Identity "<CAS2013>\OAB (Default
Web Site)" -ExternalUrl "https://mail.contoso.com/OAB"
```

- To configure the Service Connection Point, run the following command.

```
Set-ClientAccessServer -Identity <CAS2013> -
AutoDiscoverServiceInternalURI https://
autodiscover.contoso.com/AutoDiscover/AutoDiscover.xml
```

Upgrade from Exchange 2007 and 2010 Client Access

Use this section to help you configure external access to protocols on the Exchange 2013 Client Access server. Run the Exchange Management Shell commands in the configuring virtual directories section above, as well as the commands below.

You'll have to run the following commands to configure the virtual directories for Exchange 2013.

1. To configure an external URL for Outlook Web App, run the following command in Exchange Management Shell.

```
Set-OwaVirtualDirectory "<CAS2013>\OWA (Default Web Site)"
```

```
-ExternalUrl https://mail.contoso.com/OWA
```

Run the following commands at a command prompt after you set the Outlook Web App virtual directory.

```
Net stop IISAdmin /y

Net start W3SVC
```

2. To configure external EAC access, run the following command in Exchange Management Shell.

```
Set-EcpVirtualDirectory "<CAS2013>\ECP (Default Web Site)"
-ExternalUrl https://mail.contoso.com/ECP -InternalURL
https://mail.contoso.com/ECP
```

3. To configure the Availability service, run the following command in Exchange Management Shell.

```
Set-WebServicesVirtualDirectory -Identity "<CAS2013>\EWS
(Default Web Site)" -ExternalURL https://mail.contoso.com/
EWS/Exchange.asmx
```

To verify that the external URL has been configured correctly for Exchange ActiveSync or Outlook Web App, you can use the Exchange Remote Connectivity Analyzer (ExRCA), a free Web-based tool provided by Microsoft. You can find ExRCA at: https://www.testexchangeconnectivity.com

To verify that authentication has been configured correctly for Exchange ActiveSync or Outlook Web App, you can also use ExRCA.

To verify that direct file access has been configured correctly for Outlook Web App, log on as a user to Outlook Web App using the public computer option and then try to access and save a file attached to an email message.

Configure protocols on the Exchange 2007 Client Access servers

You'll have to run the following commands to configure the virtual directories for Exchange 2007.

- To configure the external URL on the Exchange ActiveSync virtual directory, run the following command in Exchange Management Shell.

```
Set-ActiveSyncVirtualDirectory -Identity "<CAS2007>
\Microsoft-Server-ActiveSync (Default Web Site)" -
ExternalUrl https://mail.contoso.com/Microsoft-Server-
ActiveSync
```

- To configure the external URL on the Outlook Web App virtual directory, run the following

command in Exchange Management Shell.

```
Set-OwaVirtualDirectory -Identity "<CAS2007>\owa (Default
Web Site)" -ExternalUrl https://legacy.contoso.com/owa
```

Autodiscover service

Exchange Server 2013 > Mailbox and Client Access servers > Client Access server >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-07*

Microsoft Exchange 2013 includes a service named the Autodiscover service. This topic gives an overview of the service and explains how it works, how it configures Outlook clients, and what options there are for deploying the Autodiscover service in your messaging environment.

The Autodiscover service does the following:

- Automatically configures user profile settings for clients running Microsoft Office Outlook 2007, Outlook 2010, or Outlook 2013, as well as supported mobile phones. Phones running Windows Mobile 6.1 or a later version are supported. If your phone isn't a Windows Mobile phone, check your mobile phone documentation to see if it's supported.
- Provides access to Exchange features for Outlook 2007, Outlook 2010, or Outlook 2013 clients that are connected to your Exchange messaging environment.
- Uses a user's email address and password to provide profile settings to Outlook 2007, Outlook 2010, or Outlook 2013 clients and supported mobile phones. If the Outlook client is joined to a domain, the user's domain account is used.

Contents

Overview of the Autodiscover service

The Autodiscover service makes it easier to configure Outlook 2007, Outlook 2010, or Outlook 2013 and some mobile phones. You can't use the Autodiscover service with versions of Outlook earlier than Office Outlook 2007. In earlier versions of Microsoft Exchange (Exchange 2003 SP2 or earlier) and Outlook (Outlook 2003 or earlier), you had to configure all user profiles manually to access Exchange. Extra work was required to manage these profiles if changes occurred to the messaging environment. Otherwise, the Outlook clients would stop functioning correctly.

Through the Autodiscover service, Outlook finds a new connection point made up of the user's mailbox GUID + @ + the domain portion of the user's primary SMTP address. The Autodiscover service returns the following information to the client:

- The user's display name
- Separate connection settings for internal and external connectivity
- The location of the user's Mailbox server
- The URLs for various Outlook features that govern functionality such as free/busy information, Unified Messaging, and the offline address book
- Outlook Anywhere server settings

When a user's Exchange information is changed, Outlook automatically reconfigures the user's profile using the Autodiscover service. For example, if a user's mailbox is moved or the client can't connect to the user's mailbox or to available Exchange features, Outlook will contact the Autodiscover service and automatically update the user's profile to include the information that's required to connect to the mailbox and Exchange features.

Return to top

How the Autodiscover service works

When you install a Client Access server in Exchange 2013, a default virtual directory named Autodiscover is created under the default website in Internet Information Services (IIS). This virtual directory handles Autodiscover service requests from Outlook 2007, Outlook 2010, and Outlook 2013 clients and supported mobile phones under the following circumstances:

- When a user account is configured or updated
- When an Outlook client periodically checks for changes to the Exchange Web Services URLs
- When underlying network connection changes occur in your Exchange messaging environment

Additionally, a new Active Directory object named the service connection point (SCP) is created on the server where you install the Client Access server.

The SCP object contains the authoritative list of Autodiscover service URLs for the forest. You can use the **Set-ClientAccessServer** cmdlet to update the SCP object. For more information, see Set-ClientAccessServer.

Important:

Before you run the **Set-ClientAccessServer** cmdlet, make sure the Authenticated Users account on the Client Access server has Read permissions for the SCP object. If users don't have the correct permissions, they can't search for and read items.

For more information about SCP objects, see Publishing with Service Connection Points.

For external access, or using DNS, the client locates the Autodiscover service on the Internet by using the primary SMTP domain address from the user's email address.

Note:

You must provide a host service (SRV) resource record in DNS for Outlook clients to discover

the Autodiscover service by using DNS. For more information, see your Windows documentation for configuring DNS and also see the White Paper: Exchange 2007 Autodiscover Service.

Depending on whether you've configured the Autodiscover service on a separate site, the Autodiscover service URL will be either https://<*smtp-address-domain*>/autodiscover/autodiscover.xml or https://autodiscover.<*smtp-address-domain*>/autodiscover/autodiscover.xml, where ://<*smtp-address-domain*> is the primary SMTP domain address. For example, if the user's email address is tony@contoso.com, the primary SMTP domain address is contoso.com. When the client connects to Active Directory, the client looks for the SCP object created during Setup. In deployments that include multiple Client Access servers, an Autodiscover SCP object is created for each Client Access server. The SCP object contains the *ServiceBindingInfo* attribute with the fully qualified domain name (FQDN) of the Client Access server in the form https://CAS01/autodiscover/autodiscover.xml, where CAS01 is the FQDN for the Client Access server. Using the user credentials, the Outlook 2007, Outlook 2010, or Outlook 2013 client authenticates to Active Directory and searches for the Autodiscover SCP objects. After the client obtains and enumerates the instances of the Autodiscover service, the client connects to the first Client Access server in the enumerated list and obtains the profile information in the form of XML data that's needed to connect to the user's mailbox and available Exchange features.

Return to top

Deployment options for the Autodiscover service

The Autodiscover service must be deployed and configured correctly for Outlook 2007, Outlook 2010, and Outlook 2013 clients to automatically connect to Exchange features such as the offline address book, the Availability service, and Unified Messaging (UM). Deploying the Autodiscover service is only one step in making sure your Exchange services, such as the Availability service, can be accessed by Outlook 2007, Outlook 2010, or Outlook 2013 clients.

Configuring Autodiscover for cross-forest moves

The Autodiscover service can provide user profile information to connecting Outlook clients for mailboxes that have been moved from one Exchange forest to another. For this to happen, you must configure a mail-enabled user in both the original forest where the user's mailbox resided and in the target forest using the **New-MailUser** cmdlet. In the source forest, you should use the *ExternalEmailAddress* parameter in the cmdlet to specify the new email address of the mailbox in the target forest. For more information, see New-MailUser.

When you configure a mail-enabled user, the Autodiscover service in the original forest will redirect the authenticating user to the new email address in the target forest. The connecting Outlook client will then be redirected to the Client Access server in the target forest where the mailbox has been moved.

Load balancing

Topic Last Modified: *2014-02-10*

Load balancing is a way to manage which of your servers receive traffic. Load balancing helps distribute incoming client connections over a variety of endpoints—for example, Client Access servers—to ensure that no one endpoint takes on a disproportional share of the load. Load balancing can also provide failover redundancy in case one or more endpoints fails. By using load balancing with Exchange Server 2013, you ensure that your users continue to receive Exchange service in case of a computer failure. Load balancing also enables your deployment to handle more traffic than one server can process while offering a single host name for your clients.

Load balancing serves two primary purposes. It reduces the impact of a single Client Access server failure within one of your Active Directory sites. In addition, load balancing ensures that the load on each of your Client Access servers is evenly distributed.

Exchange 2013 also includes the following solutions for switchover and failover redundancy:

- **High availability** Exchange 2013 uses database availability groups (DAGs) to keep multiple copies of your mailboxes on different servers synchronized. That way, if a mailbox database fails on one server, users can connect to a synchronized copy of the database on another server.
- **Site resilience** You can deploy two Active Directory sites in separate geographic locations, keep the mailbox data synchronized between the two, and have one of the sites take on the entire load if the other fails.
- **Online mailbox moves** In an online mailbox move, users can access their email accounts during the move. Users are locked out of their accounts for only a brief time at the end of the process, when the final synchronization occurs. You can perform online mailbox moves across forests or in the same forest.
- **Shadow redundancy** Shadow redundancy protects the availability and recoverability of messages while they're in transit. With shadow redundancy, the deletion of a message from the transport databases is delayed until the transport server verifies that all the next hops for that message have completed. If any of the next hops fail before reporting successful delivery, the message is resubmitted for delivery to the hop that didn't complete.

Architectural changes in load balancing for Exchange Server 2013

In Exchange Server 2010, client connections and processing were handled by the Client Access

server role. This required that both external and internal Outlook connections, as well as mobile device and third-party client connections, be load balanced across the array of Client Access servers in a deployment to achieve fault tolerance and efficient utilization of servers. Many Exchange 2010 Client Access protocols required affinity—a relationship between the client and a particular Client Access server. In particular, Outlook Web App, the Exchange Control Panel, Exchange Web Services, Outlook Anywhere, Outlook TCP/IP MAPI connections, Exchange ActiveSync, the Exchange Address Book Service, and Remote PowerShell either required or benefited from client-to-Client Access server affinity. Load balancing options in Exchange 2010 included the following:

- Windows Network Load Balancing with source IP affinity
- Hardware load balancing

Because of the differing needs of client protocols in Exchange 2010, we recommended using a Layer 7 load balancing solution. Layer 7, also known as application-level load balancing, allowed the load balancing solution to use complex rules to determine how to balance each request entering the system, given that the entire conversation between client and server would be available to the load balancer logic. These complex rules ensured that all requests from a specific client went to the same Client Access server endpoint. In Exchange 2010, if all requests from a specific client did not go to the same endpoint for protocols that required affinity, the user experience would be negatively affected. For more information about Exchange 2010 load balancing options, see Understanding Load Balancing in Exchange 2010.

In Exchange Server 2013, there are two primary types of servers—the Client Access server and the Mailbox server. The Client Access servers in Exchange 2013 serve as lightweight, stateless proxy servers, allowing clients to connect to Exchange 2013 Mailbox servers. Exchange 2013 Client Access servers provide a unified namespace and authentication. In addition, Exchange 2013 Client Access servers:

- Support proxy and redirection logic for client protocols.
- Support the use of Layer 4 load balancing.

With session affinity and Layer 7 load balancing, all requests between the client and the server are sent to the same endpoint, as required by various protocols. Requests are distributed at the application layer. With Layer 4 load balancing, the requests are distributed at the transport layer. The load balancing solution distributes requests from the client, which is aware of a single IP address (sometimes called the virtual IP address or VIP), to a set of servers that perform the work. The connection between the client and server must be established before the content of the request is determined, so the load balancer selects a server to receive the request before examining the content of the request. The selection of the target server can be made in various ways such as "round-robin," in which each inbound connection goes to the next target server in a circular list, or "least connections," in which the load balancer sends each new connection to the server that has the fewest established connections at that time. Now that session affinity isn't required, you have more flexibility, choice, and simplicity with respect to the load balancing architecture you deploy. Load balancing without session affinity lets you increase the capacity and utilization of the load balancer, because processing isn't used to maintain more involved affinity options such as cookie-based load balancing or Secure Sockets Layer (SSL) session ID.

Client Access server arrays and Exchange 2013

In Exchange 2010, we introduced the concept of a Client Access array. After a Client Access array was configured for an Active Directory site, all Client Access servers in the site automatically became members of the array. In current builds of Exchange 2013, no configuration of a Client Access array is required, because the deployment of a load balanced and highly available service is much simpler.

Load balancing solutions

The use of hardware load balancers is still supported for Exchange 2013. For information about the hardware load balancing solutions that have completed solution testing with Exchange 2010 and will likely work just as well with Exchange 2013, see Exchange Server 2010 load balancer deployment. Keep in mind that this page shows the more complex Layer-7 configuration of hardware load balancers with Exchange 2010. Load balancing Exchange 2013 traffic can be much simpler, given the architectural changes discussed earlier in this topic. Rather than configuring session affinity for each of the Exchange protocols, inbound connections to Exchange 2013 Client Access Servers can be directed to an available server by the load balancer with no additional affinity processing necessary. The hardware load balancer still has an important role in providing high availability of the Exchange service because it can detect when a specific Client Access server has become unavailable and remove it from the set of servers that will handle inbound connections.

Windows Network Load Balancing

Windows Network Load Balancing (WNLB) is a common software load balancer used for Exchange servers. There are several limitations associated with deploying WNLB with Microsoft Exchange.

- WNLB can't be used on Exchange servers where mailbox DAGs are also being used because WNLB is incompatible with Windows failover clustering. If you're using an Exchange 2013 DAG and you want to use WNLB, you need to have the Client Access server role and the Mailbox server role running on separate servers.
- WNLB doesn't detect service outages. WNLB only detects server outages by IP address. This means that if a particular web service, such as Outlook Web App, fails, but the server is still functioning, WNLB won’t detect the failure and will still route requests to that Client Access server. Manual intervention is required to remove the Client Access server experiencing the outage from the load balancing pool.
- Using WNLB can result in port flooding, which can overwhelm networks.
- Because WNLB only performs client affinity using the source IP address, it's not an effective solution when the source IP pool is small. This can occur when the source IP pool is from a remote network subnet or when your organization is using network address translation.

Configuring Kerberos authentication for load-balanced Client Access servers

Applies to: *Exchange Server 2010 SP2*

Topic Last Modified: *2014-06-12*

To use Kerberos authentication with a load-balanced array of Client Access servers, you'll first need to complete several configuration steps. For more information about how to use Kerberos with a Client Access server array or a load-balancing solution, see **Using Kerberos with a Client Access Server Array or a Load-Balancing Solution**.

Contents

Create the Alternate Service Account Credential in Active Directory

All computers within the Client Access server array must share a service account. In addition, any Client Access servers that may be called on in a fallback scenario must also share the same service account. In general, it's sufficient to have a single service account per forest. This account is referred to as the alternate service account credential (ASA credential).

Note:
If your deployment is complex and extends beyond a single-site family, has multiple-site families configured, has administrator delegation issues, or has multiple forest segments on different Exchange deployment schedules, you may have to create additional accounts. The **RollAlternateServiceAccountCredential**.ps1 script must be run separately for every account created.

Credential Type

You can create a computer account or a user account for the alternate service account. Because a computer account doesn't allow interactive logon, it may have simpler security policies than a user account and therefore be preferable as an ASA credential. If you create a computer account, the password doesn't actually expire, but we still recommend updating the password periodically. Local group policy can specify a maximum account age for computer accounts and there might be scripts scheduled to periodically delete computer accounts that do not meet current policies. Periodically updating the password for computer accounts will ensure that your computer accounts aren't deleted for not meeting local policy. Your local security policy will determine when the password needs to be changed.

Credential Name

There are no particular requirements for the name of the ASA credential. You can use any name that conforms to your naming scheme.

Groups and Roles

The ASA credential doesn't need special security privileges. For enhanced security, it's recommended that you remove this account from as many security groups as possible and give it the lowest possible set of privileges and roles.

Password

The password you provide when you create the account will never actually be used. Instead, the script will reset the password. So when you create the account, you can use any password that conforms to your organization's password requirements.

Cross-Forest Scenarios

If you have a cross-forest or resource-forest deployment, and users are outside the Active Directory forest that contains Exchange, you must configure cross-forest trusts.

If your Exchange servers are in Forest A, and your users are in Forest B, the Forest A inbound trust UPN suffixes that match the name suffixes you'll be handling from Forest B must be explicitly set for the Forest A inbound trust. This can be done using the Active Directory Domains and Trusts snap-in. Forest B must also be updated to ensure that the name-suffix routing rules are correctly configured under Incoming Trusts.

In addition, if there are users in Forest A that must authenticate to services in Forest B, the name-suffix routing rules for Forest A incoming trusts should also be configured to enable all name suffixes used in forest.

Convert the Offline Address Book Virtual Directory to an Application

Out of the box, the Offline Address Book virtual directory isn't a Web application, so it isn't controlled by the Microsoft Exchange Service Host service. Therefore, Kerberos authentication requests to the Offline Address Book virtual directory can't be decrypted by the ASA credential.

To convert the Offline Address Book virtual directory to a Web application, run the ConvertOABDir.ps1 script on each Client Access server member. The script will also create a new application pool for the Offline Address Book virtual directory. The script is located in the Exchange 2010 SP2 Scripts directory, or you can download the script here.

Running the Script

As soon as the ASA credential for Kerberos has been configured, you can run the AlternateServiceAccount credential script in the Exchange Management Shell. For more information, see **Using the RollAlternateserviceAccountPassword.ps1 Script in the Shell**. When the script has run, we recommend that you verify that all of the targeted servers have been properly updated.

Note:
The script is provided in English only.

For help troubleshooting script errors, see **Troubleshooting the RollAlternateServiceAccountPassword.ps1 Script**.

Associate Service Principal Names with the Alternate Service Account

After you create the alternate service account, you must associate Exchange Service Principal Names (SPNs) with the service account. The list of Exchange SPNs may vary with your configuration, but should include at least the following:

- **http/** For Exchange Web Services and the Autodiscover service
- **exchangeMDB/** For RPC Client Access
- **exchangeRFR/** For the Address Book service
- **exchangeAB/** For the Address Book service

The SPNs must be formed to match the service name at the network load balancer rather than at individual servers. For example, you might associate the following SPNs with the ASA account:

- http/autodiscover.contoso.com
- http/mail.contoso.com

- exchangeMDB/mail.contoso.com
- exchangeRFR/mail.contoso.com
- exchangeAB/mail.contoso.com

Before you configure the SPNs, verify that the target SPNs aren't already configured on a different account in the forest. The ASA credential must be the only account in the forest with these SPNs associated with it. You can verify no other account in the forest has the SPNs associated with it by running the following command from the command line.

```
Setspn -q
```

Run this command once for every target SPN. The command should return nothing. If it returns something, another account is already associated with the SPN.

Run the following command from the command line to set the SPNs on the shared ASA credential. This command must be run once for every target SPN.

```
Setspn -S exchangeMDB/mail.contoso.com
newSharedServiceAccountName
```

When you've set the SPNs, verify that they've been added by using the following command.

```
Setspn -L newSharedServiceAccountName$
```

Note:

We recommend that SPNs for the alternate service account include records for the main site as well as any failover sites that are active and might be accessed by a client by name. Add the SPNs as previously described, but with the FQDN of the failover site. For more information about active/active and active/passive setup for Client Access server arrays, see Server Cluster Overview.

Validating Exchange Client Kerberos Authentication

After you've successfully configured Kerberos and deployed the RollAlternateServiceAccountCredential.ps1 script, verify that clients can authenticate successfully.

Validating Authentication from Outlook

To ensure that Outlook is able to connect to the Client Access servers with Kerberos authentication, follow these steps:

1. Confirm that Outlook is configured to point to the correct load-balanced Client Access server array.
2. Configure the e-mail account server security settings to use logon network security **Kerberos Password Authentication** instead of **Negotiate Authentication**.
3. Confirm that Outlook Anywhere isn't enabled for the client. If Outlook fails to authenticate by

using Kerberos, it will try to fall back to Outlook Anywhere, so Outlook Anywhere should be disabled for this test.

4. If Outlook connects successfully, Kerberos has been configured correctly.

Validating Using the Test-OutlookConnectivity Cmdlet

To test whether Kerberos is working, use the **Test-OutlookConnectivity** cmdlet. This is the best way to see if TCP connectivity can be established. By default, the cmdlet will use Negotiate authentication for a TCP connection. So if Kerberos is configured, it will be used. The file KLIST.exe can be used to view the Kerberos tickets on the computer. This can be run from the Client Access server itself, as well as from an automated monitoring tool such as SCOM. When using the **Test-OutlookConnectivity** cmdlet, be sure that the Mailbox database has the RPCClientAccessServer property set to the Client Access server array name. Otherwise the cmdlet will not test the shared ASA credential functionality.

```
Test-OutlookConnectivity -Identity administrator -
MailboxCredential $c -Protocol tcp
```

To make sure that the connection is made using Kerberos, view KLIST.exe to see if there are Kerberos tickets associated with the new SPNs that were added.

Validating Kerberos from the Client Access Server

To confirm that Kerberos is working correctly from the Client Access server, you can examine the protocol logs to verify successful Kerberos connections. You can use these logs in addition to the other validations to confirm that Kerberos is being used.

- On the Client Access server, examine the Address Book protocol logs. These logs are typically located at the following path: C:\Program Files\Microsoft\Exchange server\v14\Logging \AddressBook Service
- Examine the latest log file and look for the word Kerberos after the script has been run. If you see Kerberos traffic, a connection has been made successfully. The line in the log file should look something like the following.

```
2010-06-11T22:58:49.799Z,9,0,/o=First Organization/
ou=Exchange Administrative Group (FYDIBOHF23SPDLT)/
cn=Recipients/
cn=Administrator,,2001:4898:f0:3031:99f:ce35:750a:8b09,EXCH
-A-363,ncacn_ip_tcp,Bind,,6,,,Kerberos,
```

If you see the word Kerberos, then the server is successfully creating Kerberos authenticated connections. For more information about the Address Book service log, see **Understanding the Address Book Service**.

Troubleshooting Authentication Failures

There are several common problems that may occur when you're configuring Kerberos authentication.

Outlook Clients Configured to use Kerberos Authentication Only Can't Connect

If your Outlook client that's configured to use only Kerberos authentication can't connect, follow these troubleshooting steps:

1. Configure Outlook to use NTLM authentication only, and then verify connectivity. If a connection can't be made, verify that the Client Access server array is available or that network connectivity is stable.

If NTLM connectivity is successful, but Kerberos is not, verify that the SPNs aren't registered on any other account besides the alternate service account. Make sure that the Exchange SPNs are registered on the account used by the shared alternate service account by using the setSPN query command as described earlier in this topic.

2. Make sure that the password is coordinated between all Client Access servers and Active Directory. To do this, run the script in attended mode and have it generate a new password.
3. Make sure that the Microsoft Exchange Address Book service is running on your Client Access servers.
4. If authentication still isn't successful, make sure that the virtual directories for the services you want to access with Kerberos have Integrated Windows authentication enabled. You can use the Get-VirtualDirectory cmdlets to verify the authentication methods. For more information on virtual directories, see **Understanding Outlook Web App Virtual Directories** and **Understanding Exchange Web Services Virtual Directories**.

Autodiscover Service Failures

If you notice the following Autodiscover service failure, it's probably because the Autodiscover service request header contains a large Kerberos authentication ticket that caused the header size to exceed the limit configured by the Internet Information Services (IIS) server. The error will be similar to the following.

```
HTTP/1.1 400 Bad Request
Content-Type: text/html; charset=us-ascii
Server: Microsoft-HTTPAPI/2.0
Date: Tue, 09 Mar 2010 18:06:18 GMT
Connection: close
Content-Length: 346
```

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01//EN""http://
www.w3.org/TR/html4/strict.dtd">
<HTML><HEAD><TITLE>Bad Request</TITLE>
<META HTTP-EQUIV="Content-Type" Content="text/html;
charset=us-ascii"></HEAD>
<BODY><h2>Bad Request - Request Too Long</h2>
<hr><p>HTTP Error 400. The size of the request headers is
too long.</p>
</BODY></HTML>
```

To fix this error, increase the IIS header size limit. For more information, see IIS documentation.

Ongoing Maintenance of the ASA Credential

If your local password on the shared ASA credential must be refreshed periodically, see **Using the RollAlternateserviceAccountPassword.ps1 Script in the Shell** for instructions for setting up a scheduled task to perform regular password maintenance. Be sure to monitor the scheduled task to ensure timely password rollovers and prevent possible authentication outages.

Turning Kerberos Authentication Off

To revert your Client Access server array so that it doesn't use Kerberos, remove the SPNs from the shared service account. If the SPNs are removed, Kerberos authentication won't be attempted by your clients, and clients configured to use Negotiate authentication will use NTLM. Clients configured to use only Kerberos will be unable to connect. Once the SPNs are removed you should also delete the shared service account. You can use the maintenance script to clean out credentials from all Client Access server array members by using the *toEntireForest* parameter and using the -copy from server parameter to specify a server that does not have any Kerberos credentials.

Digital certificates and SSL

Exchange Server 2013 > Mailbox and Client Access servers > Client Access server >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-08-26*

Secure Sockets Layer (SSL) is a method for securing communications between a client and a server. For Exchange Server 2013, SSL is used to help secure communications between the server and clients. Clients include mobile phones, computers inside an organization's network, and computers outside an organization's network.

By default, when you install Exchange 2013, client communications are encrypted using SSL when you use Outlook Web App, Exchange ActiveSync, and Outlook Anywhere.

SSL requires you to use digital certificates. This topic summarizes the different types of digital certificates and information about how to configure Exchange 2013 to use these types of digital certificates.

Contents

Overview of digital certificates

Digital certificates are electronic files that work like an online password to verify the identity of a user or a computer. They're used to create the SSL encrypted channel that's used for client communications. A certificate is a digital statement that's issued by a certification authority (CA) that vouches for the identity of the certificate holder and enables the parties to communicate in a secure manner using encryption.

Digital certificates do the following:

- They authenticate that their holders—people, websites, and even network resources such as routers—are truly who or what they claim to be.
- They protect data that's exchanged online from theft or tampering.

Digital certificates can be issued by a trusted third-party CA or a Windows public key infrastructure (PKI) using Certificate Services, or they can be self-signed. Each type of certificate has advantages and disadvantages. Each type of digital certificate is tamper-proof and can't be forged.

Certificates can be issued for several uses. These uses include web user authentication, web server authentication, Secure/Multipurpose Internet Mail Extensions (S/MIME), Internet Protocol security (IPsec), Transport Layer Security (TLS), and code signing.

A certificate contains a public key and attaches that public key to the identity of a person, computer, or service that holds the corresponding private key. The public and private keys are used by the client and the server to encrypt the data before it's transmitted. For Windows-based users, computers, and services, trust in a CA is established when there's a copy of the root certificate in the trusted root certificate store and the certificate contains a valid certification path. For the certificate to be valid, the certificate must not have been revoked and the validity period must not have expired.

Types of certificates

There are three primary types of digital certificates: self-signed certificates, Windows PKI-generated

certificates, and third-party certificates.

Self-signed certificates

When you install Exchange 2013, a self-signed certificate is automatically configured on the Mailbox servers. A self-signed certificate is signed by the application that created it. The subject and the name of the certificate match. The issuer and the subject are defined on the certificate. This self-signed certificate is used to encrypt communications between the Client Access server and the Mailbox server. The Client Access server trusts the self-signed certificate on the Mailbox server automatically, so no third-party certificate is needed on the Mailbox server. When you install Exchange 2013, a self-signed certificate is also created on the Client Access server. This self-signed certificate will allow some client protocols to use SSL for their communications. Exchange ActiveSync and Outlook Web App can establish an SSL connection by using a self-signed certificate. Outlook Anywhere won't work with a self-signed certificate on the Client Access server. Self-signed certificates must be manually copied to the trusted root certificate store on the client computer or mobile device. When a client connects to a server over SSL and the server presents a self-signed certificate, the client will be prompted to verify that the certificate was issued by a trusted authority. The client must explicitly trust the issuing authority. If the client confirms the trust, then SSL communications can continue.

Note:

By default, the digital certificate installed on the Mailbox server or servers is a self-signed certificate. You don’t need to replace the self-signed certificate on the Mailbox servers in your organization with a trusted third-party certificate. The Client Access server automatically trusts the self-signed certificate on the Mailbox server and no other configuration is needed for certificates on the Mailbox server.

Frequently, small organizations decide not to use a third-party certificate or not to install their own PKI to issue their own certificates. They might make this decision because those solutions are too expensive, because their administrators lack the experience and knowledge to create their own certificate hierarchy, or for both reasons. The cost is minimal and the setup is simple when you use self-signed certificates. However, it's much more difficult to establish an infrastructure for certificate life-cycle management, renewal, trust management, and revocation when you use self-signed certificates.

Windows public key infrastructure certificates

The second type of certificate is a Windows PKI-generated certificate. A PKI is a system of digital certificates, certification authorities, and registration authorities (RAs) that verify and authenticate the validity of each party that's involved in an electronic transaction by using public key cryptography. When you implement a PKI in an organization that uses Active Directory, you provide an infrastructure for certificate life-cycle management, renewal, trust management, and revocation. However, there is some additional cost involved in deploying servers and infrastructure to create and manage Windows PKI-generated certificates.

Certificate Services are required to deploy a Windows PKI and can be installed through **Add Or**

Remove Programs in Control Panel. You can install Certificate Services on any server in the domain.

If you obtain certificates from a domain-joined Windows CA, you can use the CA to request or sign certificates to issue to your own servers or computers on your network. This enables you to use a PKI that resembles a third-party certificate vendor, but is less expensive. These PKI certificates can't be deployed publicly, as other types of certificates can be. However, when a PKI CA signs the requestor's certificate by using the private key, the requestor is verified. The public key of this CA is part of the certificate. A server that has this certificate in the trusted root certificate store can use that public key to decrypt the requestor's certificate and authenticate the requestor.

The steps for deploying a PKI-generated certificate resemble those required for deploying a self-signed certificate. You must still install a copy of the trusted root certificate from the PKI to the trusted root certificate store of the computers or mobile devices that you want to be able to establish an SSL connection to Microsoft Exchange.

A Windows PKI enables organizations to publish their own certificates. Clients can request and receive certificates from a Windows PKI on the internal network. The Windows PKI can renew or revoke certificates.

Trusted third-party certificates

Third-party or commercial certificates are certificates that are generated by a third-party or commercial CA and then purchased for you to use on your network servers. One problem with self-signed and PKI-based certificates is that, because the certificate is not automatically trusted by the client computer or mobile device, you must make sure that you import the certificate into the trusted root certificate store on client computers and devices. Third-party or commercial certificates do not have this problem. Most commercial CA certificates are already trusted because the certificate already resides in the trusted root certificate store. Because the issuer is trusted, the certificate is also trusted. Using third-party certificates greatly simplifies deployment.

For larger organizations or organizations that must publicly deploy certificates, the best solution is to use a third-party or commercial certificate, even though there is a cost associated with the certificate. Commercial certificates may not be the best solution for small and medium-size organizations, and you might decide to use one of the other certificate options that are available.

Return to top

Choosing a certificate type

When you choose the type of certificate to install, there are several things to consider. A certificate must be signed to be valid. It can be self-signed or signed by a CA. A self-signed certificate has limitations. For example, not all mobile devices let a user install a digital certificate in the trusted root certificate store. The ability to install certificates on a mobile device depends on the mobile device manufacturer and the mobile service provider. Some manufacturers and mobile service

providers disable access to the trusted root certificate store. In this case, neither a self-signed certificate nor a certificate from a Windows PKI CA can be installed on the mobile device.

Default Exchange certificates

By default, Exchange installs a self-signed certificate on both the Client Access server and the Mailbox server so that all network communication is encrypted. Encrypting all network communication requires that every Exchange server have an X.509 certificate that it can use. You should replace this self-signed certificate on the Client Access server with one that is automatically trusted by your clients.

“Self-signed” means that a certificate was created and signed only by the Exchange server itself. Because it wasn't created and signed by a generally trusted CA, the default self-signed certificate won't be trusted by any software except other Exchange servers in the same organization. The default certificate is enabled for all Exchange services. It has a subject alternative name (SAN) that corresponds to the server name of the Exchange server that it's installed on. It also has a list of SANs that include both the server name and the fully qualified domain name (FQDN) of the server.

Although other Exchange servers in your Exchange organization trust this certificate automatically, clients like web browsers, Outlook clients, mobile phones, and other email clients in addition to external email servers won't automatically trust it. Therefore, consider replacing this certificate with a trusted third-party certificate on your Exchange Client Access servers. If you have your own internal PKI, and all your clients trust that entity, you can also use certificates that you issue yourself.

Certificate requirements by service

Certificates are used for several things in Exchange. Most customers also use certificates on more than one Exchange server. In general, the fewer certificates you have, the easier certificate management becomes.

IIS

All the following Exchange services use the same certificate on a given Exchange Client Access server:

- Outlook Web App
- Exchange Administration Center (EAC)
- Exchange Web Services
- Exchange ActiveSync
- Outlook Anywhere
- Autodiscover
- Outlook Address Book distribution

Because only a single certificate can be associated with a website, and because all these services are offered under a single website by default, all the names that clients of these services use must

be in the certificate (or fall under a wildcard name in the certificate).

POP/IMAP

Certificates that are used for POP or IMAP can be specified separately from the certificate that's used for IIS. However, to simplify administration, we recommend that you include the POP or IMAP service name in your IIS certificate and use a single certificate for all these services.

SMTP

A separate certificate can be used for each receive connector that you configure. The certificate must include the name that SMTP clients (or other SMTP servers) use to reach that connector. To simplify certificate management, consider including all names for which you have to support TLS traffic in a single certificate.

Digital certificates and proxying

Proxying is the method by which one server sends client connections to another server. In the case of Exchange 2013, this happens when the Client Access server proxies an incoming client request to the Mailbox server that contains the active copy of the client's mailbox.

When Client Access servers proxy requests, SSL is used for encryption but not for authentication. The self-signed certificate on the Mailbox server encrypts the traffic between the Client Access server and the Mailbox server.

Reverse proxies and certificates

Many Exchange deployments use reverse proxies to publish Exchange services on the Internet. Reverse proxies can be configured to terminate SSL encryption, examine the traffic in the clear on the server, and then open a new SSL encryption channel from the reverse proxy servers to the Exchange servers behind them. This is known as SSL bridging. Another way to configure the reverse proxy servers is to let the SSL connections pass straight through to the Exchange servers behind the reverse proxy servers. With either deployment model, the clients on the Internet connect to the reverse proxy server using a host name for Exchange access, such as mail.contoso.com. Then the reverse proxy server connects to Exchange using a different host name, such as the machine name of the Exchange Client Access server. You don't have to include the machine name of the Exchange Client Access server on your certificate because most common reverse proxy servers are able to match the original host name that's used by the client to the internal host name of the Exchange Client Access server.

SSL and split DNS

Split DNS is a technology that allows you to configure different IP addresses for the same host name, depending on where the originating DNS request came from. This is also known as split-

horizon DNS, split-view DNS, or split-brain DNS. Split DNS can help you reduce the number of host names that you must manage for Exchange by allowing your clients to connect to Exchange through the same host name whether they're connecting from the Internet or from the intranet. Split DNS allows requests that originate from the intranet to receive a different IP address than requests that originate from the Internet.

Split DNS is usually unnecessary in a small Exchange deployment because users can access the same DNS endpoint whether they're coming from the intranet or the Internet. However, with larger deployments, this configuration will result in too high of a load on your outgoing Internet proxy server and your reverse proxy server. For larger deployments, configure split DNS so that, for example, external users access mail.contoso.com and internal users access internal.contoso.com. Using split DNS for this configuration ensures that your users won't have to remember to use different host names depending on where they're located.

Remote Windows PowerShell

Kerberos authentication and Kerberos encryption are used for remote Windows PowerShell access, from both the Exchange Administration Center (EAC) and the Exchange Management Shell. Therefore, you won't have to configure your SSL certificates for use with remote Windows PowerShell.

Return to top

Digital certificates best practices

Although the configuration of your organization's digital certificates will vary based on its specific needs, information about best practices has been included to help you choose the digital certificate configuration that's right for you.

Best practice: Use a trusted third-party certificate

To prevent clients from receiving errors regarding untrusted certificates, the certificate that's used by your Exchange server must be issued by someone that the client trusts. Although most clients can be configured to trust any certificate or certificate issuer, it's simpler to use a trusted third-party certificate on your Exchange server. This is because most clients already trust their root certificates. There are several third-party certificate issuers that offer certificates configured specifically for Exchange. You can use the EAC to generate certificate requests that work with most certificate issuers.

How to select a certification authority

A certification authority (CA) is a company that issues and ensures the validity of certificates. Client software (for example, browsers such as Microsoft Internet Explorer, or operating systems such as Windows or Mac OS) have a built-in list of CAs they trust. This list can usually be configured to add

and remove CAs, but that configuration is often cumbersome. Use the following criteria when you select a CA to buy your certificates from:

- Ensure the CA is trusted by the client software (operating systems, browsers, and mobile phones) that will connect to your Exchange servers.
- Choose a CA that says it supports "Unified Communications certificates" for use with Exchange server.
- Make sure that the CA supports the kinds of certificates that you'll use. Consider using subject alternative name (SAN) certificates. Not all CAs support SAN certificates, and other CAs don't support as many host names as you might need.
- Make sure that the license you buy for the certificates allows you to put the certificate on the number of servers that you intend to use. Some CAs only allow you to put a certificate on one server.
- Compare certificate prices between CAs.

Best practice: Use SAN certificates

Depending on how you configure the service names in your Exchange deployment, your Exchange server may require a certificate that can represent multiple domain names. Although a wildcard certificate, such as one for *.contoso.com, can resolve this problem, many customers are uncomfortable with the security implications of maintaining a certificate that can be used for any subdomain. A more secure alternative is to list each of the required domains as SANs in the certificate. By default, this approach is used when certificate requests are generated by Exchange.

Best practice: Use the Exchange certificate wizard to request certificates

There are many services in Exchange that use certificates. A common error when requesting certificates is to make the request without including the correct set of service names. The certificate wizard in the Exchange Administration Center will help you include the correct list of names in the certificate request. The wizard lets you specify which services the certificate has to work with and, based on the services selected, includes the names that you must have in the certificate so that it can be used with those services. Run the certificate wizard when you've deployed your initial set of Exchange 2013 servers and determined which host names to use for the different services for your deployment. Ideally you'll only have to run the certificate wizard one time for each Active Directory site where you deploy Exchange.

Instead of worrying about forgetting a host name in the SAN list of the certificate that you purchase, you can use a certification authority that offers, at no charge, a grace period during which you can return a certificate and request the same new certificate with a few additional host names.

Best practice: Use as few host names as possible

In addition to using as few certificates as possible, you should also use as few host names as possible. This practice can save money. Many certificate providers charge a fee based on the number of host names you add to your certificate.

The most important step you can take to reduce the number of host names that you must have and, therefore, the complexity of your certificate management, is not to include individual server host names in your certificate's subject alternative names.

The host names you must include in your Exchange certificates are the host names used by client applications to connect to Exchange. The following is a list of typical host names that would be required for a company named Contoso:

- **Mail.contoso.com** This host name covers most connections to Exchange, including Microsoft Outlook, Outlook Web App, Outlook Anywhere, the Offline Address Book, Exchange Web Services, POP3, IMAP4, SMTP, Exchange Control Panel, and ActiveSync.
- **Autodiscover.contoso.com** This host name is used by clients that support Autodiscover, including Microsoft Office Outlook 2007 and later versions, Exchange ActiveSync, and Exchange Web Services clients.
- **Legacy.contoso.com** This host name is required in a coexistence scenario with Exchange 2007 and Exchange 2013. If you'll have clients with mailboxes on Exchange 2007 and Exchange 2013, configuring a legacy host name prevents your users from having to learn a second URL during the upgrade process.

Understanding wildcard certificates

A wildcard certificate is designed to support a domain and multiple subdomains. For example, configuring a wildcard certificate for *.contoso.com results in a certificate that will work for mail.contoso.com, web.contoso.com, and autodiscover.contoso.com.

Return to top

Create a digital certificate request

Mailbox and Client Access servers > Client Access server > Digital certificates and SSL >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-02-21*

In Exchange Server 2013, you can manage certificates using the EAC or the Shell. The EAC includes a new certificate management user interface. Through this new UI, you can create a new certificate, edit an existing certificate, or remove a certificate.

What do you need to know before you begin?

- Estimated time to complete: 10 minutes plus time for the certification authority response.

- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Client Access server security" entry in the Clients and mobile devices permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to create a new certificate request

1. In the EAC, navigate to **Servers** > **Certificates**.
2. In the **Select server** list, select the server for which you want to create a certificate, and then click **Add +**.
3. In the **New Exchange certificate** wizard, choose either **Create a request for a certificate from a certification authority** or **Create a self-signed certificate**, and then select **Next**.
4. Enter a friendly name for the certificate and select **Next**.
5. If you didn't choose a self-signed certificate and you want a wildcard certificate, select the box marked **Request a wildcard certificate**, enter the root domain, for example *.contoso.com, and then select **Next**. If you chose a self-signed certificate, skip this step.
6. Select the servers that you want to apply this certificate to and select **Next**.
7. Specify the domains you want to be included in your certificate and then select **Next**.
8. Verify that the included domains are correct. If you chose a self-signed certificate, select **Finish**. Otherwise select **Next**.
9. Enter your organization name, department name, city or locality, state or province, and country or region, and then select **Next**.
10. Enter a location to save the certificate request and select **Finish**.

If you didn't select a self-signed certificate, you'll need to send the certificate request file to the certification authority for processing.

Use the Shell to create a new certificate request

Run the following commands.

```
$reqfile = New-ExchangeCertificate -GenerateRequest -
SubjectName "C=US,o=Contoso,cn=contosotocert" -DomainName
"contoso.com" -PrivateKeyExportable $true

$reqfile | out-file c:\certreq.txt
```

How do you know this worked?

If you created a self-signed certificate, the newly created certificate will appear in the certificate management UI. If you created a certificate request from a certification authority, the certificate request file will be in the location you specified. Send this file to the certification authority.

Exchange 2013 certificate management UI

Mailbox and Client Access servers > Client Access server > Digital certificates and SSL >

Topic Last Modified: *2014-04-21*

Managing certificates in an Exchange Server deployment is one of the most important administrative tasks. Ensuring that certificates are appropriately set up and configured is key to delivering a secure messaging infrastructure for the enterprise. In Exchange 2010, the Exchange Management Console (EMC) was the primary method of managing certificates. In Exchange 2013, certificate management functionality is provided in the Exchange Administration Console (EAC), the new Exchange 2013 administrative user interface. In Exchange 2013, the focus is on minimizing the number of certificates that an administrator must manage, minimizing the interaction the administrator must have with certificates, and allowing management of certificates from a central location.

Client Access server certificates

The Client Access server in Exchange 2013 is a stateless thin server designed to accept incoming client connections and proxy them to the correct Mailbox server. The Exchange Certificate Management UI on the Client Access server can help you with a variety of tasks, including requesting new certificates and renewing expired or soon–to-expire certificates.

Understanding the Certificate Management UI

You can access the Exchange Certificate Management UI through the EAC by selecting **Servers** and then **Certificates**. Using the management UI you can perform the following actions:

- **Create a new certificate** Selecting **Add +** launches the New Exchange Certificate wizard.
- **Edit an existing certificate** Selecting **Edit** on a valid certificate allows you to see the certificate's property page.
- **Delete a certificate** Selecting **Delete** when a certificate is selected launches the delete confirmation dialog box.

- **Perform additional actions** Selecting **More options** ••• allows you to export or import a certificate. If you want to export a certificate, the certificate must be valid.

Certificate expiration

In previous versions of Microsoft Exchange, you couldn't easily see when a digital certificate was nearing expiration. In Exchange 2013, the Notifications center displays warnings when a certificate stored on any Exchange 2013 Client Access server is about to expire.

Mailbox server certificates

One key difference between Exchange 2010 and Exchange 2013 is that the certificates that are used on the Exchange 2013 Mailbox server are self-signed certificates. Because all clients connect to an Exchange 2013 Mailbox server through an Exchange 2013 Client Access server, the only certificates that you need to manage are those on the Client Access server. The Client Access server automatically trusts the self-signed certificate on the Mailbox server, so clients will not receive warnings about a self-signed certificate not being trusted, provided that the Client Access server has a non-self-signed certificate from either a Windows certification authority (CA) or a trusted third party. There are no tools or cmdlets available to manage self-signed certificates on the Mailbox server. After the server has been properly installed, you should never need to worry about the certificates on the Mailbox server.

Self-signed certificate expiration

By default, the self-signed certificate that is installed on the Exchange 2013 Mailbox server will expire five years from the date of installation.

Certificate cmdlets

You can use the following cmdlets to manage digital certificates on an Exchange Client Access server:

- **Import-ExchangeCertificate** This cmdlet is used to import certificates to a server. You can import a CA-signed certificate (to complete a pending certificate signing request (CSR)) or a certificate with a private key (PKCS #12 files, generally with a .pfx extension, previously exported from a server along with the private key).
- **Remove-ExchangeCertificate** This cmdlet is used to remove certificates from a server.
- **Enable-ExchangeCertificate** This cmdlet is used to assign services to a certificate.
- **Get-ExchangeCertificate** This cmdlet is used to retrieve an Exchange certificate based on a variety of criteria.
- **New-ExchangeCertificate** This cmdlet is used to create a new self-signed certificate or a CSR.

Configure client-specific message size limits

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-20*

In Microsoft Exchange Server 2013, there are several different message size limits that apply to messages as they travel through your Exchange organization. For more information, see Message size limits.

However, there are client-specific message size limits you can configure for Outlook Web App and email clients that use ActiveSync or Exchange Web Services (EWS). If you change the Exchange organization-wide message size limits, you need to verify that the message size limits for Outlook Web App, ActiveSync, and Exchange Web Services are set accordingly. You configure these values in web.config files on Client Access servers and Mailbox servers. These limits are described in the following tables.

ActiveSync

Server role	Configuration file	Keys and default values	Size
Client Access	`%ExchangeInstallPath%FrontEnd\HttpProxy\Sync\web.config`	`maxRequestLength="10240"`	kilobytes
Mailbox	`%ExchangeInstallPath%ClientAccess\Sync\web.config`	`maxRequestLength="10240"`	kilobytes
Mailbox	`%ExchangeInstallPath%ClientAccess\Sync\web.config`	`<add key="MaxDocumentDataSize" value="10240000">`	bytes

Comments on ActiveSync limits

- To change the maximum message size for ActiveSync clients, you need to change these values in both files.

Exchange Web Services

Serve role	Configuration file	Keys and default values	Size
Client Access	`%ExchangeInstallPath%FrontEnd\HttpProxy\ews\web.config`	`maxAllowedContentLength="67108864"`	bytes

Mailbox	%ExchangeInstallPath%ClientAccess\exchweb\ews\web.config	maxAllowedContentLength="67108864"	bytes
Mailbox	%ExchangeInstallPath%ClientAccess\exchweb\ews\web.config	14 instances of maxReceivedMessageSize="67108864"	bytes

Comments on Exchange Web Services limits

- There are 14 separate instances of the value maxReceivedMessageSize="67108864" that correspond to different combinations of bindings (http and https) and authentication methods.
- To change the maximum message size for Exchange Web Services clients, you need to change the value of *maxAllowedContentLength* in both web.config files, and all 14 instances of maxReceivedMessageSize="67108864" in the web.config file on Mailbox servers.
- In the web.config file on Mailbox servers, there are also two instances of the value maxReceivedMessageSize="1048576" for **UMLegacyMessageEncoderSoap11Element** bindings that you don't need to modify.
- *maxRequestLength* is an ASP.NET setting that's present in both web.config files, but is not used by Exchange Web Services, so you don't need to modify it.

Outlook Web App

Server role	Configuration file	Keys and default values	Size
Client Access	%ExchangeInstallPath%FrontEnd\HttpProxy\owa\web.config	maxAllowedContentLength="35000000"	bytes
Client Access	%ExchangeInstallPath%FrontEnd\HttpProxy\owa\web.config	maxRequestLength="35000"	kilobytes
Mailbox	%ExchangeInstallPath%ClientAccess\Owa\web.config	maxAllowedContentLength="35000000"	bytes
Mailbox	%ExchangeInstallPath%ClientAccess\Owa\web.config	maxRequestLength="35000"	kilobytes
Mailbox	%ExchangeInstallPath%ClientAccess\Owa\web.config	2 instances of maxReceivedMessageSize="35000000"	bytes
Mailbox	%ExchangeInstallPath%ClientAccess\Owa\web.config	2 instances of maxStringContentLength="35000000"	bytes

Comments on Outlook Web App limits

- In the web.config file on Mailbox servers, there are two separate instances of the values maxReceivedMessageSize="35000000" and maxStringContentLength="35000000" that correspond to http and https bindings.

- To change the maximum message size for Outlook Web App clients, you need to change all of these values in both files, including both instances of *maxReceivedMessageSize* and *maxStringContentLength* in the `web.config` file on Mailbox servers.
- In the `web.config` file on Mailbox servers, there is also an instance of the value `maxStringContentLength="102400"` for the **MsOnlineShellService** binding that you don't need to modify.

For all message size limits, you need to set values that are larger than the actual sizes you want enforced. This increase in values is necessary to account for the inevitable message size increase that occurs after the message attachments and any other binary data are Base64 encoded. Base64 encoding increases the size of the message by approximately 33%, so the values you specify for any message size limits are approximately 33% larger than the actual usable message sizes. For example, if you specify a maximum message size value of 64 MB, you can expect a realistic maximum message size value of approximately 48 MB.

What do you need to know before you begin?

- Estimated time to complete: 15 minutes
- Exchange permissions don't apply to the procedures in this topic. These procedures are performed in the operating system of the Exchange Server.
- Changes you save to the Web.config configuration file are applied after you restart IIS.
- To allow for a 33% increase in size due to Base64 encoding, multiply your desired new maximum size value in megabytes by 4/3. To convert the value into kilobytes, multiply by 1024. To convert the value into bytes, multiply by 1048756 (1024*1024). Note that the size increase caused by Base64 encoding could be greater than 33%, and depends on several factors, for example, the attachment file size, type, compression, and the email client used to compose and send the message.
- Any customized per-server settings you make in Exchange XML application configuration files, for example, web.config files on Client Access servers or the EdgeTransport.exe.config file on Mailbox servers, will be overwritten when you install an Exchange Cumulative Update (CU). Make sure that you save this information so you can easily re-configure your server after the install. You must re-configure these settings after you install an Exchange CU.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Use the Command Prompt to configure the client-specific message size limit

1. In a Command prompt window, open the appropriate web.config files in Notepad. For example,

to open the web.config files for Exchange Web services clients, run the following commands:

```
Notepad %ExchangeInstallPath%ClientAccess\exchweb\ews
\web.config
Notepad %ExchangeInstallPath%FrontEnd\HttpProxy\ews
\web.config
```

2. Find the relevant keys in the appropriate web.config files as described in the tables earlier in the topic. For example, for Exchange Web services clients, find the *maxAllowedContentLength* key in both files and all 14 instances of the value `maxReceivedMessageSize="67108864"` in the `web.config` file on Mailbox servers.

```
<requestLimits maxAllowedContentLength="67108864" />
...maxReceivedMessageSize="67108864"...
```

For example, to allow a Base64 encoded maximum message size of approximately 64 MB, change all instances of `67108864` to `89478486` (64*4/3*1048756):

```
<requestLimits maxAllowedContentLength="89478486" />
...maxReceivedMessageSize="89478486"...
```

3. When you are finished, save and close the web.config files.
4. Restart IIS by running the following command:

```
IISReset /noforce
```

How do you know this worked?

To verify that you have successfully configured the client-specific message size limit, you need to send a test message to and from a mailbox that's being accessed by the affected client. You can try a few smaller attachments or one large attachment so the test messages are approximately 33% less than the value you configured. For example, a configured value of 85 MB results in a realistic maximum message size of approximately 64 MB.

Availability service in Exchange 2013

Exchange Server 2013 > Mailbox and Client Access servers > Client Access server >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-10-10*

The Exchange 2013 Availability service makes free/busy information available to Microsoft Outlook and Outlook Web App clients. The Availability service improves information workers' calendaring

and meeting scheduling experience by providing secure, consistent, and up-to-date free/busy information.

Outlook and Outlook Web App use the Availability service to perform the following tasks:

- Retrieve current free/busy information for Exchange 2013 mailboxes
- Retrieve current free/busy information from other Exchange 2013 organizations
- Retrieve published free/busy information from public folders for mailboxes on servers that have previous versions of Exchange
- View attendee working hours
- Show meeting time suggestions

Contents

Overview of the Availability service

The Availability service retrieves free/busy information directly from the target mailbox for users on Exchange 2013, Exchange 2010, or Exchange 2007 and can be configured to retrieve free/busy information for users on earlier versions of Exchange. For topologies that have Exchange 2007, Exchange 2010, or Exchange 2013 mailboxes in which all clients are running Outlook 2007 or higher, the Availability service is used to retrieve free/busy information.

Outlook uses the Exchange Autodiscover service to obtain the URL of the Availability service. For more information about the Autodiscover service, see Autodiscover service.

You can use the Exchange Management Shell to configure the Availability service. You can't use the Exchange Administration Center (EAC) to configure the Availability service.

Information about away status

The Availability service also provides access to automatic-reply messages that users send when they are out of the office or away for an extended period of time.

Information workers use the Automatic Replies feature (formerly known as Out of Office) in Outlook and Outlook Web App to alert others when they're unavailable to respond to email messages. This functionality makes it easier to set and manage automatic-reply messages for both information workers and administrators.

Availability service API

The Availability service is part of the Exchange 2013 programming interface. It's available as a web service to let developers write third-party tools for integration purposes.

Availability service Network Load Balancing

Using Network Load Balancing (NLB) on your Client Access servers that are running the Availability service can improve performance and reliability for your users who rely on free/busy information. Outlook discovers the Availability service URL using the Autodiscover service. To use NLB with the Availability service, you must make changes to your configuration.

The internal URL is used from the intranet, and the external URL is used from the Internet. If you want to use the same URL for both internal and external traffic, make sure that DNS is correctly configured to route internal traffic directly to the internal URL. Also, make sure that the URL can be accessed both internally and externally. For the Autodiscover and Availability services to work, DNS must be configured so that mail.<*domain name*>.com and autodiscover.mail.<*domain name*>.com point to the virtual IP (VIP) of your load-balancing solution, where <*domain name*> is the name of your domain.

Note:

For more information, see Network Load Balancing Technical Reference and Network Load Balancing Clusters. You can also search for third-party load-balancing software websites.

Methods used to retrieve free/busy information

The following table lists the different methods used to retrieve free/busy information in different single-forest topologies.

Client	Mailbox retrieving free/busy information is running	Target mailbox is running	Free/busy retrieval method
Outlook 2013	Exchange 2013, Exchange 2010, or Exchange 2007	Exchange 2013, Exchange 2010, or Exchange 2007	The Availability service reads free/busy information from the target mailbox.
Outlook 2007	Exchange 2013, Exchange 2010, or Exchange 2007	Exchange 2010 or Exchange 2007	The Availability service reads free/busy information from the

			target mailbox.
Outlook 2007	Exchange 2010 or Exchange 2007	Exchange 2003	The Availability service makes HTTP connections to the / public virtual directory of the Exchange 2003 mailbox.
Outlook Web App	Exchange 2013, Exchange 2010, or Exchange 2007	Exchange 2013, Exchange 2010, or Exchange 2007	Outlook Web App in Exchange 2010 or Outlook Web Access in Exchange 2007 calls the Availability service API, which reads the free/busy information from the target mailbox.

Configure the Availability service for cross-forest topologies

Mailbox and Client Access servers > Client Access server > Availability service in Exchange 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-22*

The Availability service improves information workers' free/busy information by providing secure, consistent, and up-to-date free/busy information to clients that are running Microsoft Outlook. By default, this service is installed with Exchange Server 2013. In cross-forest topologies where all connecting clients are running Outlook, the Availability service is the only method of retrieving free/busy information. You can use the Shell to configure the Availability service for cross-forest topologies.

Note:

You can't use the EAC to configure the Availability service for cross-forest topologies.

Using the Availability service in trusted and untrusted forests

You can use the Availability service in cross-forest topologies across trusted or untrusted forests. The type of free/busy information that's available depends on if you're using a trusted or untrusted forest.

Trusted forests In trusted forests, you can configure the Availability service to retrieve free/busy information on a per-user basis. When the Availability service is configured to retrieve free/busy information on a per-user basis, the service can make cross-forest requests on behalf of a particular user. This allows a user in a remote forest to retrieve detailed free/busy information for someone who is not in the same forest.

Untrusted forests In untrusted forests, you can only configure the Availability service to retrieve free/busy information on an organization-wide basis. When the Availability service makes free/busy cross-forest requests at the organizational level, free/busy information is returned for each user in the organization. In untrusted forests, it isn't possible to control the level of free/busy information that's returned on a per-user basis.

Configuring Windows for cross-forest topologies

By default, a global address list (GAL) contains mail recipients from a single forest. If you have a cross-forest environment, we recommend using Microsoft Identity Lifecycle Manager (ILM) 2007 Feature Pack 1 (FP1) to ensure that the GAL in any given forest contains mail recipients from other forests. ILM 2007 FP1 creates mail users that represent recipients from other forests, thereby allowing users to view them in the GAL and send mail. For example, users in Forest A appear as a mail user in Forest B and vice versa. Users in the target forest can then select the mail user object that represents a recipient in another forest to send mail.

To enable GAL synchronization, you create management agents that import mail-enabled users, contacts, and groups from designated Active Directory services into a centralized metadirectory. In the metadirectory, mail-enabled objects are represented as mail users. Groups are represented as contacts without any associated membership. The management agents then export these mail users to an organizational unit in the specified target forest.

What do you need to know before you begin?

- Estimated time to complete each procedure: 5 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Availability Service Permissions" entries in the Clients

and mobile devices permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the Shell to configure per-user free/busy information in a trusted cross-forest topology

This example configures the Availability service to retrieve per-user free/busy information on a Mailbox server in the target forest.

```
Get-MailboxServer | Add-ADPermission -Accessrights
Extendedright -Extendedrights "ms-Exch-
EPI-Token-Serialization" -User "<Remote Forest Domain>
\Mailbox servers"
```

This example defines the free/busy access method that the Availability service uses on the local Mailbox server in the source forest. The local Mailbox server is configured to access free/busy information from the forest ContosoForest.com on a per-user basis. This example uses the service account to retrieve free/busy information.

```
Add-AvailabilityAddressSpace -Forestname ContosoForest.com
-AccessMethod PerUserFB -UseServiceAccount:$true
```

Note:

To configure bidirectional cross-forest availability, repeat these steps in the target forest.

If you choose to configure cross-forest availability with trust, and also choose to use a service account (instead of specifying organization-wide or per-user credentials), you must extend permissions as shown in the example in the "Use the Shell to configure trusted cross-forest availability with a service account" section. Performing that procedure in the target forest gives Mailbox servers in the source forest permission to serialize the original user context.

Use the Shell to configure trusted cross-forest availability with a service account

This example configures trusted cross-forest availability with a service account.

```
Get-MailboxServer | Add-ADPermission -Accessrights
Extendedright -Extendedright "ms-Exch-EPI-Token-
Serialization" -User "<Remote Forest Domain>\Exchange
servers"
```

For detailed information about syntax and parameters, see the following topics:

- Get-MailboxServer
- Add-ADPermission
- Add-AvailabilityAddressSpace
- Set-AvailabilityConfig

Use the Shell to configure organization-wide free/busy information in an untrusted cross-forest topology

This example sets the organization-wide account on the availability configuration object to configure the access level for free/busy information in the target forest.

```
Set-AvailabilityConfig -OrgWideAccount "Contoso.com\User"
```

This example adds the Availability address space configuration object for the source forest.

```
$a = Get-Credential (Enter the credentials for
organization-wide user in Contoso.com domain)
Add-AvailabilityAddressspace -Forestname Contoso.com -
Accessmethod OrgWideFB -Credential:$a
```

Edge Transport servers

Exchange Server 2013 >

Topic Last Modified: *2014-02-21*

Edge Transport servers minimize the attack surface by handling all Internet-facing mail flow, which provides SMTP (Simple Mail Transfer Protocol) relay and smart host services for your Exchange organization. Agents running on the Edge Transport server provide additional layers of message protection and security. These agents provide protection against viruses and spam and apply transport rules to control mail flow.

Because the Edge Transport server is installed in the perimeter network, it's never a member of your

organization's internal Active Directory forest and doesn't have access to Active Directory information. However, the Edge Transport server requires data that resides in Active Directory—for example, connector information for mail flow and recipient information for antispam recipient lookup tasks. This data is synchronized to the Edge Transport server by the Microsoft Exchange EdgeSync service (EdgeSync). EdgeSync is a collection of processes run on an Exchange 2013 Mailbox server to establish one-way replication of recipient and configuration information from Active Directory to the Active Directory Lightweight Directory Services (AD LDS) instance on the Edge Transport server. EdgeSync copies only the information that's required for the Edge Transport server to perform anti-spam configuration tasks and to enable end-to-end mail flow. EdgeSync performs scheduled updates so the information in AD LDS remains current.

You can install more than one Edge Transport server in the perimeter network. Deploying more than one Edge Transport server provides redundancy and failover capabilities for your inbound message flow. You can load balance the SMTP traffic to your organization among Edge Transport servers by defining more than one MX record with the same priority value for your mail domain. You can achieve consistency in the configuration among multiple Edge Transport servers by using cloned configuration scripts.

The Edge Transport server role lets you manage the following message-processing scenarios.

Internet mail flow

Edge Transport servers accept messages coming into the Exchange organization from the Internet. After the messages are processed by the Edge Transport server, where they are routed next depends on the configuration of your internal Exchange servers:

- If the Client Access server and the Mailbox server are installed on separate computers, mail is routed to the Transport service on the Mailbox server. The Client Access server is bypassed for inbound SMTP mail flow.
- If the Client Access server and the Mailbox server are installed on the same computer, mail is routed to the Front End Transport service on the Client Access server and then to the Transport service on the Mailbox server.

All messages sent to the Internet from inside the organization are routed to Edge Transport servers after the messages are processed by the Transport service on the Mailbox server. You can configure the Edge Transport server to use DNS to resolve MX resource records for external SMTP domains, or you can configure the Edge Transport server to forward messages to a smart host for DNS resolution.

Anti-spam and antivirus protection

In Exchange 2013, anti-spam and antivirus features provide services to block viruses and unsolicited commercial email (spam) at the network perimeter. Most viruses use spam-like tactics to gain access to your organization and to entice users to open an email message. If you can filter out most of your spam, you'll also be more likely to quarantine viruses before they enter your organization.

Spammers use a variety of techniques to send spam into your organization. Edge Transport servers help prevent users from ever receiving spam by providing a collection of agents that work together to provide different layers of spam filtering and protection. Establishing tarpitting intervals on connectors makes email harvesting attempts ineffective.

Edge Transport rules

Edge Transport rules are used to control the flow of messages sent to or received from the Internet. Edge Transport rules are configured on each Edge Transport server to help protect corporate network resources and data by applying an action to messages meeting specified conditions. Edge Transport rule conditions are based on data, such as specific words or text patterns in the message subject, body, header, or from address; the spam confidence level (SCL); or the attachment type. Actions determine how the message is processed when a specified condition is true. Possible actions include quarantining a message, dropping or rejecting a message, appending additional recipients, or logging an event. Optional exceptions exempt particular messages from having an action applied.

Address rewriting

Address rewriting presents a consistent email address appearance to external recipients. You configure address rewriting on Edge Transport servers to modify the SMTP addresses on inbound and outbound messages. Address rewriting is especially useful for newly merged organizations that want to present a consistent email address appearance.

For more information about address rewriting, see Address rewriting on Edge Transport servers.

Edge Subscriptions

Topic Last Modified: *2014-07-31*

Edge Transport servers minimize attack surface by handling all Internet-facing mail flow and providing SMTP relay and smart host services for your Exchange organization. Additional layers of message protection and security are provided by a series of agents running on the Edge Transport server in your organization's perimeter network. These agents support features that provide protection against viruses and spam and apply transport rules to control message flow.

Edge Subscriptions are used to populate the Active Directory Lightweight Directory Services (AD LDS) instance on the Edge Transport server with Active Directory data. Although creating an Edge Subscription is optional, subscribing an Edge Transport server to the Exchange organization

provides a simpler management experience and enhances antispam features. You need to create an Edge Subscription if you plan to use recipient lookup or safelist aggregation, or if you plan to help secure SMTP communications with partner domains by using Mutual Transport Layer Security (MTLS).

Contents

Edge Subscription process

An Edge Transport server doesn't have direct access to Active Directory. The configuration and recipient information the Edge Transport server uses to process messages is stored locally in AD LDS. Creating an Edge Subscription establishes secure, automatic replication of information from Active Directory to AD LDS. The Edge Subscription process provisions the credentials used to establish a secure LDAP connection between Exchange 2013 Mailbox servers and a subscribed Edge Transport server. The Microsoft Exchange EdgeSync service (EdgeSync) that runs on Mailbox servers performs periodic one-way synchronization to transfer up-to-date data to AD LDS. This reduces the administration tasks you perform in the perimeter network by letting you configure the Mailbox server and then synchronize that information to the Edge Transport server.

You subscribe an Edge Transport server to the Active Directory site that contains the Mailbox servers responsible for transferring messages to and from your Edge Transport servers. The Edge Subscription process creates an Active Directory site membership affiliation for the Edge Transport server. The site affiliation enables Mailbox servers in the Exchange organization to relay messages to the Edge Transport server for delivery to the Internet without having to configure explicit Send connectors.

One or more Edge Transport servers can be subscribed to a single Active Directory site. However, an Edge Transport server can't be subscribed to more than one Active Directory site. If you have more than one Edge Transport server deployed, each server can be subscribed to a different Active Directory site. Each Edge Transport server requires an individual Edge Subscription.

To deploy an Edge Transport server and subscribe it to an Active Directory site, follow these steps:

1. Install the Edge Transport server role.
2. Verify that the Mailbox servers and the Edge Transport server can locate one another using DNS name resolution.
3. On the Mailbox Server, configure the objects and settings to be replicated to the Edge Transport server.
4. On the Edge Transport server, create and export an Edge Subscription file.
5. Copy the Edge Subscription file to a Mailbox server or a file share that's accessible from the Active Directory site containing your Mailbox servers.

6. Import the Edge Subscription file to the Active Directory site.

What happens when you create a new Edge Subscription

When you create an Edge Subscription file (by running the **New-EdgeSubscription** cmdlet on the Edge Transport server), the following actions occur:

- An AD LDS account called the EdgeSync bootstrap replication account (ESBRA) is created. These ESBRA credentials are used to authenticate the first EdgeSync connection to the Edge Transport server. This account is configured to expire 24 hours after being created. Therefore, you need to complete the six-step subscription process described in the previous section within 24 hours. If the ESBRA expires before the Edge Subscription process is complete, you will need to run the **New-EdgeSubscription** cmdlet again to create a new Edge Subscription file.
- The ESBRA credentials are retrieved from AD LDS and written to the Edge Subscription file. The public key for the Edge Transport server's self-signed certificate is also exported to the Edge Subscription file. The credentials written to the Edge Subscription file are specific to the server that exported the file.
- Any previously created configuration objects on the Edge Transport server that will now be replicated to AD LDS from Active Directory are deleted from AD LDS, and the Exchange Management Shell cmdlets used to configure those objects are disabled. However, you can still use the **Get-*** cmdlets to view those objects. Running the **New-EdgeSubscription** cmdlet disables the following cmdlets on the Edge Transport server:
  - **Set-SendConnector**
  - **New-SendConnector**
  - **Remove-SendConnector**
  - **New-AcceptedDomain**
  - **Set-AcceptedDomain**
  - **Remove-AcceptedDomain**
  - **New-MessageClassification**
  - **Set-MessageClassification**
  - **Remove-MessageClassification**
  - **New-RemoteDomain**
  - **Set-RemoteDomain**
  - **Remove-RemoteDomain**

When you import the Edge Subscription file on the Mailbox server by running the **New-EdgeSubscription** cmdlet on the Mailbox server:

- The Edge Subscription is created, joining an Edge Transport server to an Exchange organization. EdgeSync will propagate configuration data to this Edge Transport Server, creating an Edge configuration object in Active Directory.
- Each Mailbox server in the Active Directory site receives notification from Active Directory that a new Edge Transport server has been subscribed. The Mailbox server retrieves the ESBRA from the Edge Subscription file. The Mailbox server then encrypts the ESBRA by using the public key of the Edge Transport server's self-signed certificate. The encrypted credentials are then written to the

Edge configuration object.

- Each Mailbox server also encrypts the ESBRA using its own public key and then stores the credentials in its own configuration object.
- EdgeSync replication accounts (ESRAs) are created in Active Directory for each Edge Transport-Mailbox server pair. Each Mailbox server stores its ESRA credentials as an attribute of the Mailbox server configuration object.
- Send connectors are automatically created to relay messages outbound from the Edge Transport server to the Internet, and inbound from the Edge Transport server to the Exchange organization.
- The Microsoft Exchange EdgeSync service that runs on Mailbox servers uses the ESBRA credentials to establish a secure LDAP connection between a Mailbox server and the Edge Transport server, and performs the initial replication of data. The following data is replicated to AD LDS:
  - Topology data
  - Configuration data
  - Recipient data
  - ESRA credentials
- The Microsoft Exchange Credential Service that runs on the Edge Transport server installs the ESRA credentials. These credentials are used to authenticate and secure later synchronization connections.
- The EdgeSync synchronization schedule is established.

The Microsoft Exchange EdgeSync service running on the Mailbox servers in the subscribed Active Directory site then performs one-way replication of data from Active Directory to AD LDS on a regular schedule. You can also use the **Start-EdgeSynchronization** cmdlet to override the EdgeSync synchronization schedule and immediately start synchronization.

For more information about ESRA accounts and how they're used to help secure the EdgeSync synchronization process, see Edge Subscription credentials.

This example subscribes an Edge Transport server to the specified site and automatically creates the Internet Send connector and the Send connector from the Edge Transport server to the Mailbox servers.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"C:\EdgeSubscriptionInfo.xml" -Encoding Byte -ReadCount 0))
-CreateInternetSendConnector $true -
CreateInboundSendConnector $true -Site "Default-First-Site-
Name"
```

Note:

The default values of the *CreateInternetSendConnector* and *CreateInboundSendConnector* parameters are both `$true`. They are shown here for demonstration only.

This example exports an Edge Subscription file.

```
New-EdgeSubscription -FileName "C:
```

```
\EdgeSubscriptionInfo.xml"
```

Note:

When the **New-EdgeSubscription** cmdlet is run on the Edge Transport server, you receive a prompt to acknowledge the commands that will be disabled and the configuration that will be overwritten on the Edge Transport server. To bypass this confirmation, you must use the *Force* parameter. This parameter is useful when you script the **New-EdgeSubscription** cmdlet. The *Force* parameter is also used to overwrite an existing file with the same name as the file that you're creating when you resubscribe an Edge Transport server.

For detailed syntax and parameter information, see New-EdgeSubscription.

Send connectors created during the Edge Subscription process

By default, when you complete the recommended Edge Subscription process by importing the Edge Subscription file to a Mailbox server, the Send connectors required to enable end-to-end mail flow between the Internet and the Exchange organization are created automatically, and any existing Send connectors on the Edge Transport server are deleted. In some scenarios, you may choose to suppress automatic creation of Send connectors and configure Send connectors manually. For more information about manually configuring Send connectors, see Manually configure Edge Transport server mail flow and Configure Internet mail flow through an Edge Transport server without using EdgeSync.

The Edge Subscription process provisions the following Send connectors:

- A Send connector configured to relay email messages from the Exchange organization to the Internet.
- A Send connector configured to relay email messages from the Edge Transport server to the Exchange organization.

Also, subscribing an Edge Transport server to the Exchange organization allows the Mailbox servers in the subscribed Active Directory site to use the intra-organization Send connector to relay messages to that Edge Transport server.

Automatically create an inbound Send connector to receive messages from the Internet

By default, when you run the **New-EdgeSubscription** cmdlet on the Mailbox server, the Inbound Send Connector parameter *CreateInboundSendConnector* is set to the value `$true`. This creates the Send connector needed to send messages to the Exchange organization. The following table shows the configuration of this Send connector.

Automatic inbound Send connector configuration

Property	Value
Name	EdgeSync - Inbound to *<Site Name>*
AddressSpaces	`SMTP:--;1` The `--` value in the address space represents all authoritative and internal relay accepted domains for the Exchange organization. Any messages the Edge Transport server receives for these accepted domains are routed to this Send connector and relayed to the smart hosts.
SourceTransportServers	*<Edge Subscription name>*
Enabled	True
DNSRoutingEnabled	False
SmartHosts	`--` The `--` value in the list of smart hosts represents all Mailbox servers in the subscribed Active Directory site. Any Mailbox servers you add to the subscribed Active Directory site after you establish the Edge Subscription don't participate in the EdgeSync synchronization process. However, they are automatically added to the list of smart hosts for the automatically created inbound Send connector. If more than one Mailbox server is located in the subscribed Active Directory site, inbound connections will be load balanced across the smart hosts.

You can't modify the address space or list of smart hosts at creation time for the automatically created inbound Send connector. However, you can set the *CreateInboundSendConnector* parameter to the value `$false` when you create an Edge Subscription. This allows you to manually configure a Send connector from the Edge Transport server to the Exchange organization.

Automatically create an outbound Send connector to send messages to the Internet

By default, when you run the **New-EdgeSubscription** cmdlet on the Mailbox server, the Outbound Send Connector parameter *CreateInternetSendConnector* is set to the value `$true`. This creates the Send connector needed to send messages to the Internet. The following table shows the default configuration of this Send connector.

Automatic Internet Send connector configuration

Property	Value
Name	EdgeSync - <*Site Name*> to Internet
AddressSpaces	`SMTP:*;100`
SourceTransportServers	<*Edge Subscription name*> **Note:** The name of the Edge Subscription is the same as the name of the subscribed Edge Transport server.
Enabled	True
DNSRoutingEnabled	True
DomainSecureEnabled	True

If more than one Edge Transport server is subscribed to the same Active Directory site, no additional Send connectors to the Internet are created. Instead, all Edge Subscriptions are added to the same Send connector as the source server. This load balances outbound connections to the Internet across the subscribed Edge Transport servers.

The outbound Send connector is configured to send email messages from the Exchange organization to all remote SMTP domains, using DNS routing to resolve domain names to MX resource records. For details about manually configuring a connector's configuration, see Manually configure Edge Transport server mail flow.

Microsoft Exchange EdgeSync service

After you subscribe an Edge Transport server to an Active Directory site, EdgeSync will replicate configuration and recipient data to the Edge Transport servers. The service replicates the following data from Active Directory to AD LDS:

- Send connector configuration
- Accepted domains
- Remote domains
- Message classifications
- Safe Senders Lists
- Blocked Senders Lists
- Recipients
- List of send and receive domains used in domain secure communications with partners
- List of SMTP servers listed as internal in your organization's transport configuration
- List of Mailbox servers in the subscribed Active Directory site

For details about the data replicated to AD LDS and how it's used, see EdgeSync replication data.

EdgeSync uses a mutually authenticated and authorized secure LDAP channel to transfer data from the Mailbox server to the Edge Transport server.

To replicate data to AD LDS, the Mailbox server binds to a global catalog server to retrieve updated data. EdgeSync initiates a secure LDAP session between a Mailbox server and the subscribed Edge Transport server over the non-standard TCP port 50636.

When you first subscribe an Edge Transport server to an Active Directory site, the initial replication that populates AD LDS with data from Active Directory can take five minutes or more, depending on the quantity of data in the directory service. After initial replication, EdgeSync only synchronizes new and changed objects, and removes any deleted objects.

Synchronization schedule

Different types of data synchronize on different schedules. The EdgeSync synchronization schedule specifies the maximum interval between EdgeSync synchronizations. EdgeSync synchronization occurs at the following intervals:

- Configuration data: 3 minutes.
- Recipient data: 5 minutes.
- Topology data: 5 minutes

If you want to change these intervals, use the **Set-EdgeSyncServiceConfig** cmdlet. Using the **Start-EdgeSynchronization** cmdlet on the Mailbox server to force Edge Subscription synchronization overrides the timer for the next scheduled EdgeSync synchronization, and starts EdgeSync immediately.

Selection of Mailbox servers

Each subscribed Edge Transport server is associated with a particular Active Directory site. If more than one Mailbox server exists in the site, any of these Mailbox servers can replicate data to the subscribed Edge Transport servers. To avoid contention among Mailbox servers when synchronizing, the preferred Mailbox server is selected as follows:

1. The first Mailbox server in the Active Directory site to perform a topology scan and discover the

new Edge Subscription performs the initial replication. Because this discovery is based on the timing of the topology scan, any Mailbox server in the site may perform the initial replication.
2. The Mailbox server performing the initial replication establishes an EdgeSync lease option and sets a lock on the Edge Subscription. The lease option establishes that particular Mailbox server as the preferred server providing synchronization services to that Edge Transport server. The lock prevents EdgeSync running on another Mailbox server from taking over the lease option.
3. The EdgeSync lease option lasts for one hour. During that hour, no other EdgeSync service can take over the option unless a manual synchronization is started before the end of the hour. If the preferred Mailbox server isn't available to provide EdgeSync service at the time manual synchronization is started, after a five-minute wait, the lock is released and another EdgeSync service can take over the lease option and perform synchronization.
4. Unless manual synchronization is started, synchronization occurs based on the EdgeSync synchronization schedule. If the preferred server isn't available when a scheduled synchronization occurs, after a five-minute wait, the lock is released and another EdgeSync service can take over the lease option and perform synchronization.

This method of locking and leasing prevents more than one instance of EdgeSync from pushing data to the same Edge Transport server at the same time.

Note:

If you also have Exchange 2010 or Exchange 2007 Mailbox servers in the subscribed Active Directory site, Exchange 2013 Mailbox servers will always take precedence and perform the replication.

Note:

When you subscribe an Edge Transport server to an Active Directory site, all Mailbox servers installed in that Active Directory site at that time can participate in the EdgeSync synchronization process. If one of those servers is removed, the EdgeSync service that's running on the remaining Mailbox servers will continue the data synchronization process. However, if you ;ater install new Mailbox servers in the Active Directory site, they won't automatically participate in EdgeSync synchronization. If you want to enable those new Mailbox servers to participate in EdgeSync synchronization, you will need to subscribe the Edge Transport server again.

The following table lists the EdgeSync properties related to locking and leasing. You can use the **Set-EdgeSyncServiceConfig** cmdlet to configure these properties.

EdgeSync lease properties

Parameter	Default value	Description
LockDuration	`00:05:00` (5 minutes)	This setting determines how long a particular EdgeSync service will acquire a lock. If the EdgeSync service on the Mailbox server that's holding

		this lock doesn't respond, after five minutes the EdgeSync service on another Mailbox server will take over the lease. Forcing immediate EdgeSync synchronization doesn't override this setting.
OptionDuration	`01:00:00` (1 hour)	This setting determines how long an EdgeSync service can declare a lease option on an Edge Transport server. If the EdgeSync service holding the lease is unavailable and doesn't restart during this option period, no other Exchange EdgeSync service will take over the lease option unless you force EdgeSync synchronization.
LockRenewalDuration	`00:01:00` (1 minute)	This setting determines how frequently the lock field is updated when an EdgeSync service has acquired a lock to an Edge Transport server.

Preparing to run the EdgeSync service

Before you can subscribe your Edge Transport server to your Exchange organization, you need to make sure your infrastructure and your Mailbox servers are prepared for the EdgeSync service. To prepare for EdgeSync synchronization, you need to:

- Verify that the perimeter network firewall separating the Edge Transport server from the Exchange organization is configured to enable communications through the correct ports. The Edge Transport server uses non-standard LDAP ports. If your environment requires specific ports, you can modify the ports used by AD LDS using the ConfigureAdam.ps1 script provided with

Exchange. For more information, see Modify AD LDS configuration. Modify the ports before you create the Edge Subscription. If you modify the ports after you create the Edge Subscription, you will need to remove the Edge Subscription and then create a new Edge subscription. By default, the following LDAP ports are used to access AD LDS:

  - **LDAP** Port 50389/TCP is used locally to bind to the AD LDS instance. This port doesn't have to be open on the perimeter network firewall.
  - **Secure LDAP** Port 50636/TCP is used for directory synchronization from Mailbox servers to AD LDS. This port must be open on the firewall for successful EdgeSync synchronization.
- Verify that DNS host name resolution is successful from the Edge Transport server to the Mailbox servers and from the Mailbox servers to the Edge Transport server.
- License the Edge Transport server. The licensing information for the Edge Transport server is captured when the Edge Subscription is created. Subscribed Edge Transport servers need to be subscribed to the Exchange organization after the license key has been applied on the Edge Transport server. If the license key is applied on the Edge Transport server after you perform the Edge Subscription process, licensing information will not be updated in the Exchange organization, and you will need to resubscribe the Edge Transport server.
- Configure the following transport settings for propagation to the Edge Transport server:
  - **Internal SMTP servers** Use the *InternalSMTPServers* parameter on the **Set-TransportConfig** cmdlet to specify a list of internal SMTP server IP addresses or IP address ranges to be ignored by the Sender ID and Connection Filtering agents on the Edge Transport server.
  - **Accepted domains** Configure all authoritative domains, internal relay domains, and external relay domains.
  - **Remote domains** Configure remote domain settings.

Managing Edge Subscriptions

For step-by-step instructions on Edge Subscription management tasks, see Manage Edge Subscriptions.

EdgeSync replication data

Exchange Server 2013 > Edge Transport servers > Edge Subscriptions >

Topic Last Modified: *2014-02-21*

When you deploy an Edge Transport server, it doesn't have access to Active Directory. To perform recipient lookup and safelist aggregation tasks, and to implement domain security by using Mutual Transport Layer Security (MTLS) authentication, the Edge Transport server needs data from Active Directory. This data is replicated to the Edge Transport server using EdgeSync; the Edge Transport

server stores all replicated information in Active Directory Lightweight Directory Services (AD LDS).

This topic focuses on data replicated from Active Directory to AD LDS on an Edge Transport server subscribed to an Active Directory site. To learn more about EdgeSync and Edge Subscriptions, see Edge Subscriptions.

Four types of data are replicated to AD LDS and used by the Edge Transport server:

Edge Subscription information

Configuration information

Recipient information

Topology information

Edge Subscription information

Exchange 2013 extends both the Active Directory and AD LDS schemas to provide attributes on the **ms-Exch-ExchangeServer** object to represent the data needed to control EdgeSync synchronization. These attributes provide three functions to EdgeSync:

- Automatic provisioning and maintenance of the credentials used to help secure the LDAP connection between a Mailbox server and a subscribed Edge Transport server.
- Arbitrating the synchronization lock and lease process, ensuring that only one server at a time will try to synchronize with an individual Edge Transport server. For more information about the lock and lease process, see Edge Subscriptions.
- Optimizing EdgeSync synchronization to maintain a record of current synchronization status. Easily viewing synchronization status helps avoid excessive manual synchronization.

The schema extensions in the following table are specific to Edge Subscriptions. The values assigned to these attributes are maintained by the Edge Subscription and EdgeSync; they are not intended to be manually edited.

Edge Subscription schema extensions

Attribute name	Description
ms-Exch-Server-EKPK-Public-Key	The current public key for the certificate being used by the server. This value is stored by both Edge Transport servers and Mailbox servers. The public key is used to encrypt credentials used to authenticate the server during LDAP and SMTP communication.
ms-Exch-EdgeSync-Credential	The list of credentials EdgeSync uses to establish an authenticated LDAP session with

	AD LDS. On Mailbox servers, this attribute contains only credentials the Mailbox server uses to authenticate the subscribed Edge Transport servers. On Edge Transport servers, this attribute contains the credentials of each Mailbox server in the subscribed Active Directory site that participates in EdgeSync synchronization. This attribute is only present on Mailbox servers running EdgeSync synchronization and on subscribed Edge Transport servers.
ms-Exch-Edge-Sync-Lease	Used to arbitrate between Mailbox servers when more than one Mailbox server tries to replicate to the same Edge Transport server.
ms-Exch-Edge-Sync-Status	Only present in AD LDS on the Edge Transport server object. This attribute tracks the status of replication to an AD LDS instance and includes information about replication.

Return to top

Configuration information

When you subscribe an Edge Transport server to an organization, you can manage the configuration objects common to the Edge Transport server and the Exchange organization from inside the organization. These changes are then replicated to the Edge Transport server using EdgeSync. This process helps maintain a consistent configuration across all servers involved in message processing.

A subset of the configuration data for the Exchange organization must also be maintained on the Edge Transport server. During EdgeSync synchronization, the configuration data the Edge Transport server needs is written to the configuration partition of AD LDS. The configuration data written to AD LDS includes:

- **Mailbox servers** The fully qualified domain name (FQDN) of each Mailbox server in the subscribed Active Directory site is made available to the local AD LDS store on the Edge Transport server. This information is used to derive a list of smart host servers for the inbound Send connector.

- **Accepted domains** All authoritative, internal relay, and external relay domains configured for the Exchange organization are written to AD LDS. Having the accepted domains available to the Edge Transport server enables the Exchange organization to perform domain filtering and reject invalid SMTP traffic into their organization as early as possible. For more information about accepted domains, see Accepted domains.
- **Message classifications** If message classifications are available on the Edge Transport server, transport agents and content conversion can act on message classifications in the perimeter network. For example, the Attachment Filter agent can apply the Attachment Removed classification when it removes an attachment, sending informational text to a Microsoft Outlook user or an Outlook Web App user to tell the recipient what happened. Agents developed for use by third-party applications can use message classifications in a similar manner.
- **Remote domains** All remote domain entries configured for the Exchange organization are written to AD LDS. Remote domain entries control out-of-office message settings and message format settings for a remote domain. For more information about remote domains, see Remote domains.
- **Send connectors** By default, creating an Edge Subscription automatically creates the Send connectors required to enable end-to-end mail flow between the Exchange organization and the Internet at the time the Edge Transport Server is subscribed. Any existing Send connectors on the Edge Transport server are deleted. If you want to configure additional Send connectors, configure the Send connector inside the Exchange organization and then select the Edge Subscription as the source server for the connector. For more information, see Edge Subscriptions.
- **Internal SMTP servers** The value for the *InternalSMTPServers* attribute is stored on the **TransportConfig** object for both the Exchange organization and the local Edge Transport server. During EdgeSync synchronization, the value stored on the local Edge Transport server object is overwritten with the value stored on this object for the Exchange organization. This attribute specifies a list of internal SMTP server IP addresses or IP address ranges that should be ignored by Sender ID and connection filtering.
- **Domain Secure lists** The *TLSReceiveDomainSecureList* and the *TLSSendDomainSecureList* attributes are stored on the **TransportConfig** object for both the Exchange organization and the local Edge Transport server. During EdgeSync synchronization, the value stored on the local Edge Transport server object is overwritten with the value stored on this object for the Exchange organization. These attributes specify the list of remote domains configured for mutual TLS authentication.

Return to top

Recipient information

Recipient information replicated to AD LDS includes only a subset of recipient attributes. Only data required by the Edge Transport to perform certain antispam tasks is replicated. Recipient information replicated to AD LDS includes:

- **Recipients** The list of recipients in the Exchange organization is replicated to AD LDS. Each recipient is identified by assigned Active Directory GUID. If you configure a recipient's account to

deny receipt of mail from outside the organization, that recipient isn't replicated to AD LDS. If you disable or delete a recipient's mailbox, that mailbox is no longer replicated to AD LDS.

- **Proxy addresses** All proxy addresses assigned to each recipient are replicated to AD LDS as hashed data. This is a one-way hash using Secure Hash Algorithm (SHA)-256. SHA-256 generates a 256-bit message digest of the original data. Storing proxy addresses as hashed data helps secure this information in case the Edge Transport server or AD LDS is compromised. Proxy addresses are referenced when the Edge Transport server performs the recipient lookup antispam task.
- **Safe Senders List, Blocked Senders List, and Safe Recipients List** Safe Senders Lists, Blocked Senders Lists and Safe Recipients Lists defined in each recipient's Outlook instance are aggregated and replicated to AD LDS. These settings are stored in the mailbox database where the recipient's mailbox resides. An Outlook user's safelist collection is the combined data from the user's Safe Senders List, Safe Recipients List, Blocked Senders List, and external contacts. Having safelist collection data available in AD LDS enables the Edge Transport server to screen senders appropriately, reducing operational overhead for filtering mail. This information is sent as hashed data.

Important:
Although the safe recipient data is stored in Outlook and can be aggregated into the safelist collection on the AD LDS instance on the Edge Transport server, the content filtering functionality doesn't act on safe recipient data.

- **Per recipient anti spam settings** You can use the **Set-Mailbox** cmdlet to assign anti spam threshold settings per recipient that differ from the organization-wide anti spam settings. If you configure per recipient anti spam settings, these settings override organization-wide settings. By replicating these settings to AD LDS, the per recipient settings can be considered before the message is relayed to the Exchange organization. This information is sent as hashed data.

Edge Subscription credentials

Topic Last Modified: *2014-02-21*

This topic explains how the Edge Subscription process provisions credentials used to help secure the EdgeSync synchronization process and how EdgeSync uses those credentials to establish a secure LDAP connection between an Exchange 2013 Mailbox server and an Edge Transport server. To learn more about the Edge Subscription process, see Edge Subscriptions.

Contents

Edge Subscription process

The Edge Transport server is subscribed to an Active Directory site to establish a synchronization relationship between the Mailbox servers in an Active Directory site and the subscribed Edge Transport server. The credentials provisioned during the Edge Subscription process are used to help secure the LDAP connection between a Mailbox server and an Edge Transport server in the perimeter network.

When you run the **New-EdgeSubscription** cmdlet on an Edge Transport server, EdgeSync bootstrap replication account (ESBRA) credentials are created in the Active Directory Lightweight Directory Services (AD LDS) directory on the local server and then written to the Edge Subscription file. These credentials are used only to establish initial synchronization and will expire 24 hours after the Edge Subscription file is created. If the Edge Subscription process isn't completed within 24 hours, you will need to run the **New-EdgeSubscription** cmdlet again to create a new Edge Subscription file. The Edge Subscription XML file stores configuration data for the Edge Subscription.

The Edge Subscription XML file contains the data shown in the following table.

Edge Subscription file contents

Subscription data	Description
EdgeServerName	The NetBIOS name of the Edge Transport server. The Active Directory name of the Edge Subscription will match this name.
EdgeServerFQDN	The fully qualified domain name (FQDN) of the Edge Transport server. Mailbox servers in the subscribed Active Directory site must be able to locate the Edge Transport server by using DNS

	to resolve the FQDN.
EdgeCertificateBlob	The public key of the Edge Transport server's self-signed certificate.
ESRAUsername	The name assigned to the ESBRA. The ESBRA account has the following format: ESRA.*Edge Transport server name*. ESRA means EdgeSync replication account; note the difference between ESBRA (initial bootstrap replication account) and ESRA.
ESRAPassword	The password assigned to the ESBRA. The password is generated using a random number generator and is stored in the Edge Subscription file in clear text.
EffectiveDate	The creation date of the Edge Subscription file.
Duration	The length of time these credentials will be valid before they expire. The ESBRA account is valid for only 24 hours.
AdamSslPort	The secure LDAP port EdgeSync binds to when synchronizing data from Active Directory to AD LDS. By default, this is TCP port 50636.
ProductID	The licensing information for the Edge Transport server. You need to license the Edge Transport server before creating the Edge Subscription.
VersionNumber	The version number of the Edge Subscription file.
SerialNumber	The Exchange version of the Edge Transport server.

Important:
ESBRA credentials are written to the Edge Subscription file in clear text. You need to protect this file throughout the subscription process. After the Edge Subscription file is imported to your Exchange organization, you should immediately delete the Edge Subscription file from the Edge Transport server, from the network share you used to import the file to your Exchange organization, and from any removable media.

Return to top

EdgeSync replication accounts

EdgeSync replication accounts (ESRA) are an important part of EdgeSync security. Authentication and authorization of the ESRA is the mechanism used to help secure the connection between an Edge Transport server and a Mailbox server.

The ESBRA contained in the Edge Subscription file is used to establish a secure LDAP connection during initial synchronization. After the Edge Subscription file is imported to a Mailbox server in the Active Directory site where the Edge Transport server is being subscribed, additional ESRA accounts are created in Active Directory for each Edge Transport-Mailbox server pair. During initial synchronization, the newly created ESRA credentials are replicated to AD LDS. These ESRA credentials are used to help secure later synchronization sessions.

Each EdgeSync replication account is assigned the properties shown in the following table.

Ms-Exch-EdgeSyncCredential properties

Property name	Type	Description
TargetServerFQDN	String	The Edge Transport server accepting these credentials.
SourceServerFQDN	String	The Mailbox server presenting these credentials. This value is empty if the credential is the bootstrap credential.
EffectiveTime	DateTime (UTC)	When to start using this credential.
ExpirationTime	DateTime (UTC)	When to stop using this credential.
UserName	String	The user name used to authenticate.

Password	Byte	The password used to authenticate. The password is encrypted using **ms-Exch-EdgeSync-Certificate**.

The following sections describe how the ESRA credentials are provisioned and used during the EdgeSync synchronization process.

Provision the EdgeSync bootstrap replication account

When the **New-EdgeSubscription** cmdlet is run on the Edge Transport server, the ESBRA is provisioned as follows:

- A self-signed certificate (Edge-Cert) is created on the Edge Transport server. The private key is stored in the local computer store and the public key is written to the Edge Subscription file.
- The ESBRA account is created in AD LDS, and its credentials are written to the Edge Subscription file.
- The Edge Subscription file is exported by copying it to removable media (because the Edge Server is not in your Active Directory, you cannot use a shared folder for exporting the file). The file is now ready to import to a Mailbox server.

Provision EdgeSync replication accounts in Active Directory

When the Edge Subscription file is imported on a Mailbox server, the following steps occur to establish a record of the Edge Subscription in Active Directory and to provision additional ESRA credentials:

1. An Edge Transport server configuration object is created in Active Directory. The Edge-Cert certificate is written to this object as an attribute.
2. Every Mailbox server in the subscribed Active Directory site receives an Active Directory notification that a new Edge Subscription has been registered. As soon as the notification is received, each Mailbox server retrieves the ESRA.edge account and encrypts the account by using the Edge-Cert public key. The encrypted ESRA.edge account is written to the Edge Transport server configuration object.
3. Each Mailbox server creates a self-signed certificate (TransportService-Cert). The private key is stored in the local computer store and the public key is stored in the Mailbox server configuration object in Active Directory.
4. Each Mailbox server encrypts the ESRA.edge account by using the public key of its own TransportService certificate and then stores it in its own configuration object.
5. Each Mailbox server generates an ESRA for each existing Edge Transport server configuration object in Active Directory (ESRA.edge. *Mailboxname.*#).

Example: ESRA.edge.Example.0

The password for ESRA.edge is generated by a random number generator and is encrypted by using the public key of the TransportService-Cert certificate. The generated password has the maximum length allowed for Windows Server.

6. Each ESRA.edge. *Mailboxname.#* account is encrypted by using the public key of the Edge-Cert certificate and is stored on the Edge Transport server configuration object in Active Directory.

The following sections explain how these accounts are used during EdgeSync synchronization.

Return to top

Authenticate initial replication

The initial ESBRA account is used only when establishing initial synchronization. During the first EdgeSync synchronization, the additional ESRA accounts, ESRA.edge.*Mailboxname.#*, are replicated to AD LDS. These accounts are used to authenticate later EdgeSync synchronization sessions.

The Mailbox server that performs the initial replication is determined randomly. The first Mailbox server in the Active Directory site to perform a topology scan and discover the new Edge Subscription performs the initial replication. Because this discovery is based on the timing of the topology scan, any Mailbox server in the site may perform the initial replication.

EdgeSync initiates a secure LDAP session from the Mailbox server to the Edge Transport server. The Edge Transport server presents its self-signed certificate and the Mailbox server verifies that the certificate matches the certificate stored on the Edge Transport server configuration object in Active Directory. After the Edge Transport server's identity is verified, the Mailbox server provides the credentials of the ESRA.edge.*Mailboxname.#* account to the Edge Transport server. The Edge Transport server verifies the credentials against the account stored in AD LDS.

The EdgeSync service on the Mailbox server then pushes the topology, configuration, and recipient data from Active Directory to AD LDS. The change to the Edge Transport server configuration object in Active Directory is replicated to AD LDS. AD LDS receives the newly added ESRA.edge.*Mailboxname.#* entries and the Microsoft Exchange Credential Service creates the corresponding AD LDS account. These accounts are now available to authenticate later scheduled EdgeSync synchronization sessions.

Microsoft Exchange Credential Service

The Microsoft Exchange Credential Service is part of the Edge Subscription process. The Credential Service runs only on the Edge Transport server. This service creates the reciprocal ESRA accounts in AD LDS so a Mailbox server can authenticate to an Edge Transport server to perform EdgeSync synchronization. EdgeSync doesn't communicate directly with the Microsoft Exchange Credential Service. The Microsoft Exchange Credential Service communicates with AD LDS and installs the ESRA credentials whenever the Mailbox server updates them.

Return to top

Authenticate scheduled synchronization sessions

After initial EdgeSync synchronization finishes, the EdgeSync synchronization schedule is established and any Active Directory data that has changed is regularly updated in AD LDS. A Mailbox server initiates a secure LDAP session with the AD LDS instance on the Edge Transport server. AD LDS proves its identity to that Mailbox server by presenting its self-signed certificate. The Mailbox server presents its ESRA.edge credentials to AD LDS. The ESRA.edge password is encrypted using the Mailbox server's self-signed certificate's public key. Only that particular Mailbox server can use those credentials to authenticate to AD LDS.

Return to top

Renew EdgeSync replication accounts

The password for the ESRA account must comply with the local server's password policy. To prevent the password renewal process from causing temporary authentication failure, a second ESRA.edge account is created seven days before the first ESRA.edge account expires, with an effective time three days before the first ESRA expiration time. As soon as the second ESRA.edge account becomes effective, EdgeSync stops using the first account and starts to use the second account. When the expiration time for the first account is reached, those ESRA credentials are deleted. This renewal process will continue until the Edge Subscription is removed.

Return to top

Manage Edge Subscriptions

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-21*

This topic gives detailed information on a variety of Edge Subscription management tasks.

Contents

Verify EdgeSync results

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "EdgeSync" entry and the "Edge Transport servers" section in the Mail flow permissions topic.
- You need to have an Edge server subscribed to your Internet-facing Active Directory site. For more information, see Configure Internet mail flow through a subscribed Edge Transport server.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Subscribe an Edge Transport server

You can subscribe one or more Edge Transport servers to a single Active Directory site. If you deploy additional Edge Transport servers in your perimeter network and subscribe them to the same Active Directory site where an Edge Subscription already exists, the following actions occur:

- A new Edge Subscription object is created in Active Directory.
- Additional ESRA accounts are created for each Mailbox server in the Active Directory site. These accounts are replicated to Active Directory Lightweight Directory Services (AD LDS) and used by the EdgeSync synchronization process during synchronization with the new server.
- The new Edge Subscription is added to the source server list of the automatic Send connector to the Internet. Messages submitted to that connector for processing will be load balanced between the subscribed Edge Transport servers.
- An inbound Send connector is automatically created from the Edge Transport server to the Exchange organization.
- EdgeSync synchronization to the Edge Transport server starts.

Remove an Edge Subscription

You may occasionally want to remove an Edge Subscription from the Exchange organization or from both the Exchange organization and the Edge Transport server. If you plan to later resubscribe the Edge Transport server to the Exchange organization, don't remove the Edge Subscription from the Edge Transport server. When you remove the Edge Subscription from an Edge Transport server, all replicated data is deleted from AD LDS. This can take a long time if you have lots of recipient data.

To completely remove an Edge Subscription, you need to run this procedure on the Edge Transport

server you wish to remove and on an Exchange 2013 Mailbox server in the Active Directory site where the Edge Transport server is subscribed.

After you remove the Edge Subscription, synchronization of information from AD LDS stops. All accounts stored in AD LDS are removed, and the Edge Transport server is removed from the source server list of any Send connector. You will no longer be able to use Edge Transport server features that rely on Active Directory data.

1. To remove the Edge Subscription from the Edge Transport server, use the following syntax.

```
Remove-EdgeSubscription <EdgeTransportServerIdentity>
```

For example, to remove the Edge Subscription on the Edge Transport server named Edge01, run the following command.

```
Remove-EdgeSubscription Edge01
```

2. To remove the Edge Subscription from the Mailbox server, use the following syntax.

```
Remove-EdgeSubscription <MailboxServerIdentity>
```

For example, to remove the Edge Subscription on the Mailbox server named Mailbox01, run the following command.

```
Remove-EdgeSubscription Mailbox01
```

You will need to remove the Edge Subscription if:

- You no longer want the Edge Transport server to participate in EdgeSync synchronization. You will need to remove the Edge Subscription from both the Edge Transport server and from the Exchange organization.
- An Edge Transport server is being decommissioned. In this scenario, you only need to remove the Edge Subscription from the Exchange organization. If you uninstall the Edge Transport server role from the computer, the AD LDS instance and all Active Directory data stored in AD LDS will also be removed.
- You want to change the Active Directory site association for the Edge Subscription. You will only need to remove the Edge Subscription from the Exchange organization. After the Edge Subscription is removed from the Exchange organization, you can resubscribe the Edge Transport server to a different Active Directory site.

When you remove an Edge Subscription from the Exchange organization:

- Synchronization of information from Active Directory to AD LDS stops.
- The ESRA accounts are removed from both Active Directory and AD LDS.
- The Edge Transport server is removed from the *SourceTransportServers* property of any Send connector.
- The automatic inbound Send connector from the Edge Transport server to the Exchange organization is removed from AD LDS.

When you remove the Edge Subscription from an Edge Transport server:

- You can no longer use Edge Transport server features that rely on Active Directory data.
- Replicated data is removed from AD LDS.
- Tasks that were disabled when the Edge Subscription was created are re-enabled to allow for local configuration.

Resubscribe an Edge Transport server

Occasionally you may have to resubscribe an Edge Transport server to an Active Directory site. When the Edge Subscription is re-created, new credentials are generated and you need to follow the complete Edge Subscription process. You will need to resubscribe an Edge Transport server if:

- You add new Mailbox servers in the subscribed Active Directory site, and you want the new Mailbox server to participate in EdgeSync synchronization.
- You applied the license key for the Edge Transport server after creating the Edge Subscription. Licensing information for the Edge Transport server is captured when the Edge Subscription is created. Subscribed Edge Transport servers only appear as licensed if they are subscribed to the Exchange organization after the license key has already been applied on the Edge Transport server. If the license key is applied on the Edge Transport server after you perform the Edge Subscription process, the licensing information won't be updated in the Exchange organization, and you will need to resubscribe the Edge Transport server.
- The ESRA credentials are compromised.

Important:
To resubscribe an Edge Transport server, export a new Edge Subscription file on the Edge Transport server and then import the XML file on a Mailbox server. You will need to resubscribe the Edge Transport server to the same Active Directory site where it was originally subscribed. You don't need to first remove the original Edge Subscription; the resubscription process will overwrite the existing Edge Subscription.

Add or Remove a Mailbox server

If you add a Mailbox server to an Active Directory site that already has an Edge Transport server subscribed, the new Mailbox server doesn't automatically participate in EdgeSync synchronization. To enable a newly deployed Mailbox server to participate in EdgeSync synchronization, you need to resubscribe each Edge Transport server to the Active Directory site.

Removing a Mailbox server from an Active Directory site where an Edge Transport server is subscribed won't affect EdgeSync synchronization unless that Mailbox server is the only Mailbox server in that site. If you remove all Mailbox servers from the Active Directory site where an Edge Transport server is subscribed, that site's subscribed Edge Transport servers are orphaned.

Run EdgeSync manually

You may want to manually run EdgeSync if you've made significant changes to the configuration or recipients in Active Directory and want your changes synchronized immediately. You can run a full

synchronization, or only synchronize changes made since the last replication.

A manual EdgeSync resets the EdgeSync synchronization schedule. The next automatic synchronization is based on when you ran the manual synchronization.

To manually run EdgeSync, use the following syntax.

```
Start-EdgeSynchronization [-Server <MailboxServerIdentity>]
[-TargetServer <EdgeTransportServerIdentity> [-
ForceFullSync]
```

The following example starts EdgeSync with the following options:

- The synchronization is initiated from the Exchange 2013 Mailbox server named Mailbox01.
- All Edge Transport servers are synchronized.
- Only the changes since the last replication are synchronized.

```
Start-EdgeSynchronization -Server Mailbox01
```

This example starts EdgeSync with the following options:

- The synchronization is initiated from the local Mailbox server.
- Only the Edge Transport server named Edge03 is synchronized.
- All recipient and configuration data are fully synchronized.

```
Start-EdgeSynchronization -TargetServer Edge03 -
ForceFullSync
```

Verify EdgeSync results

You can use the **Test-EdgeSynchronization** cmdlet to verify that the Edge synchronization is working. This cmdlet reports synchronization status of subscribed Edge Transport servers.

The output of this cmdlet lets you view objects that have not been synchronized to the Edge Transport server. The task compares data stored in Active Directory against data stored in AD LDS and reports any data inconsistencies.

You can use the *ExcludeRecipientTest* parameter on the **Test-EdgeSynchronization** cmdlet to exclude validation of recipient data synchronization. If you include this parameter, only the synchronization of configuration objects is validated. Validating recipient data will take longer than validating only configuration data.

Verify EdgeSync results for a single recipient

To verify EdgeSync results for a single recipient, use the following syntax on a Mailbox server in the subscribed Active Directory site.

```
Test-EdgeSynchronization -VerifyRecipient <emailaddress>
```

This example verifies EdgeSync results for the user kate@contoso.com.

```
Test-EdgeSynchronization -VerifyRecipient kate@contoso.com
```

Return to top

Modify AD LDS configuration

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-22*

You can use the **ConfigureAdam.ps1** script (located in $env:ExchangeInstallPath\Scripts) to modify the default Active Directory Lightweight Directory Services (AD LDS) configuration on Edge Transport servers before you subscribe the Edge Transport server to your Exchange organization.

Important:
The **ConfigureAdam.ps1** script invokes the **dsdbutil** command to change the registry settings for AD LDS. The **dsdbutil** command is an AD LDS management tool intended for use only by experienced administrators; using **ConfigureAdam.ps1** is the recommended way of changing the AD LDS configuration.

The parameters in the following table are available for the **ConfigureAdam.ps1** script. You can use one, all, or any combination of these parameters to modify AD LDS.

Parameters available for the ConfigureAdam.ps1 script

Parameter	Description
Ldapport	Modifies the port used for LDAP communication. By default, the Edge Transport server uses the nonstandard port 50389.
Sslport	Modifies the port used for secure LDAP communication. By default, the Edge Transport server uses the nonstandard port 50636.
LogPath	Modifies the log file location. By default, the Edge Transport server creates log files in the path %ExchangeInstallPath%Transport Roles

	\Data\adam
DataPath	Modifies the location of the directory database file. By default, the Edge Transport server stores the directory database in the path %ExchangeInstallPath%Transport Roles\Data\adam

What do you need to know before you begin?

- Estimated time to complete: five minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Edge Transport servers" section in Mail flow permissions.
- If you need to make any modifications to the Edge Transport server's AD LDS configuration, do so before subscribing the Edge Transport server to your Exchange organization. If you modify the AD LDS configuration of a subscribed Edge Transport server, you will then need to resubscribe the Edge Transport server to the Exchange organization.
- Always use the script to modify the registry settings. Making manual registry changes to the AD LDS configuration might make the AD LDS instance unavailable.
- If you need to modify the LDAP port or the SSL port used by AD LDS, first verify that the selected port isn't being used by another application. You can use the **netstat** command to view the ports being used on the Edge Transport server.
- You can only use the Shell to perform this procedure.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Modify the AD LDS configuration on an Edge Transport server

This example changes the LDAP port used by AD LDS to 5000. The ampersand (&) is part of the command syntax.

```
& $env:ExchangeInstallPath\Scripts\ConfigureAdam.ps1 -LdapPort:5000
```

This example makes the following changes to the AD LDS configuration. The ampersand (&) is part of the command syntax. Note the colon (:) used between each parameter and its value:

- Changes the LDAP port to 5000

- Changes the SSL port to 500
- Changes the log path to D:\Exchange Server\Data\ADLDS
- Changes the data path to D:\Exchange Server\Data\ADLDS

```
& $env:ExchangeInstallPath\Scripts\ConfigureAdam.ps1 -
LdapPort:5000 -SslPort:5001 -LogPath:"D:\Exchange Server
\Data\ADLDS" -DataPath:"D:\Exchange Server\Data\ADLDS"
```

Manually configure Edge Transport server mail flow

Exchange Server 2013 > Edge Transport servers > Edge Subscriptions >

Topic Last Modified: *2014-02-21*

This topic describes procedures for making manual configuration changes to how an Edge Transport Server manages mail flow. These procedures are intended to address specific scenarios; unless your organization has specific needs for making manual configuration changes, using the default configuration when subscribing Edge Transport servers is preferred.

Contents

Manually configure Send connectors

You can manually modify a Send connector's configuration. For example, if you need to route outbound email through a smart host, you can suppress automatic creation of a Send connector and manually configure a Send connector to the Internet.

Intra-Organization Send connectors

The Intra-Organization Send connector is an implicit and hidden Send connector that's

automatically computed by Exchange and enables the Transport service on Mailbox servers within the same organization to relay messages to each other without using explicit Send connectors. Because a configuration object with an Active Directory site association exists in Active Directory for an Edge Subscription, the intra-organization Send connector will also be used to relay messages to that Edge Transport server.

Only Mailbox servers located in the subscribed Active Directory site can transfer email directly to or from the subscribed Edge Transport server. If you have a multi-site Active Directory forest and Exchange is deployed in more than one site, the Mailbox servers in non-subscribed sites will route outbound email to the subscribed site. A Mailbox server in the subscribed site will route outbound email to the Edge Transport server.

Create additional Send connectors after Edge subscription

After an Edge Transport server is subscribed to an Active Directory site, cmdlets for creating and modifying Send connectors on the Edge Transport server are disabled. If you want to create a Send connector whose source server is the Edge Transport server, you can create the Send connector inside the Exchange organization. You can specify one or more Edge Subscriptions as the source server for a Send connector. You can't specify both Mailbox servers and Edge Subscriptions as source servers for the same Send connector. The Send connector will be replicated to the AD LDS instance on the Edge Transport server that's configured as a source server the next time configuration data is synchronized by EdgeSync. If you list more than one Edge Subscription as a source server, connections to that Send connector will be load balanced between the subscribed Edge Transport servers. Edge Transport servers need to be subscribed to the same Active Directory site for load balancing to occur. If Edge Subscriptions in different Active Directory sites are configured as source servers on the same Send connector, Edge Transport servers will route only to the closest source server.

You will need to manually create Send connectors if:

- You suppressed automatic creation of the Internet or inbound Send connectors.
- You have accepted domains in your organization that are configured as external relay domains.

Reasons to suppress automatic creation of Send connectors

Depending on the topology of your Exchange organization, you may decide to suppress automatic creation of Send connectors. The following examples describe scenarios that require you to suppress automatic creation of Send connectors.

Partition mail flow

If you decide to partition the inbound and outbound mail processing between two Edge Transport

servers, one Edge Transport server is responsible for processing outbound mail flow and a second Edge Transport server is responsible for processing inbound mail flow. To do this, configure the Edge Subscriptions as follows:

- For the outbound Edge Transport server, run the following command on the Mailbox server.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"C:\EdgeServerSubscription.xml" -Encoding Byte -ReadCount
0)) -Site "Site-A" -CreateInboundSendConnector $false -
CreateInternetSendConnector $true
```

- For the inbound Edge Transport server, run the following command on the Mailbox server.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"C:\EdgeServerSubscription.xml" -Encoding Byte -ReadCount
0)) -Site "Site-A" -CreateInboundSendConnector $true -
CreateInternetSendConnector $false
```

Route outbound email to a smart host

If your Exchange organization routes all outbound email through a smart host, the automatically created Send connector won't have the correct configuration.

Run the following command on the Mailbox server to suppress automatic creation of the Send connector to the Internet.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"C:\EdgeServerSubscription.xml" -Encoding Byte -ReadCount
0)) -Site "Site-A" -CreateInternetSendConnector $false
```

After the Edge Subscription process is complete, manually create a Send connector to the Internet. Create the Send connector inside the Exchange organization, and select the Edge Subscription as the source server for the connector. Select the `custom` usage type and configure one or more smart hosts. This new Send connector will be replicated to the AD LDS instance on the Edge Transport server the next time EdgeSync synchronizes configuration data. You can force immediate EdgeSync synchronization by running the **Start-EdgeSynchronization** cmdlet on a Mailbox server.

Example: Using the Shell to configure a Send connector for a subscribed Edge Transport server to route messages for all Internet address spaces through a smart host. Run this task on a Mailbox server inside the Exchange organization, not on the Edge Transport server.

```
New-SendConnector -Name "EdgeSync - Site-A to Internet" -
Usage Custom -AddressSpaces SMTP:*;100 -DNSRoutingEnabled
$false -SmartHosts 192.168.10.1 -SmartHostAuthMechanism
None -SourceTransportServers EdgeSubscriptionName
```

Important:
This example doesn't specify any smart host authentication mechanism. Make sure you configure the correct authentication mechanism and provide all necessary credentials when you create a smart host connector in your own Exchange organization.

Configure Send connectors for external relay domains

If you have accepted domains in your Exchange organization that are configured as external relay domains, you need to manually create a Send connector for those address spaces. Messages being delivered to external relay domains are relayed by the Edge Transport server. The Edge Subscription process doesn't automatically create and configure Send connectors for external relay domains. Therefore, you need to configure Send connectors for those domains and specify one or more Edge Subscriptions as the source server for those Send connectors.

The DNS MX resource record for an external relay domain resolves to your Edge Transport server. You can configure a Send connector that relays email to an external relay domain to use a smart host for routing. Configuring the Send connector for an external relay domain to use DNS routing will create a routing loop. For more information about external relay domains, see Accepted domains.

Return to Top

Configure Internet mail flow through a subscribed Edge Transport server

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-22*

To establish Internet mail through an Edge Transport server, subscribe the Edge Transport server to an Active Directory site. This automatically creates the two Send connectors required for Internet mail flow:

- A Send connector configured to send outbound email to all Internet domains.
- A Send connector configured to send inbound email from the Edge Transport server to an Exchange 2013 Mailbox server.

If you don't want to subscribe the Edge Transport server to an Active Directory site, it's possible to manually create the Send connectors required to establish mail flow between the Mailbox server and the Edge Transport server. For more information, see Configure Internet mail flow through an Edge Transport server without using EdgeSync. However, we recommend you subscribe the Edge Transport server to the Active Directory site whenever possible.

Before you begin

- Estimated time to complete: 20 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "EdgeSync" entry and the "Edge Transport servers" in the Mail flow permissions topic.
- Before you subscribe an Edge Transport server to your organization, you will first need to configure authoritative domains and email address policies for your Exchange organization.
- Enable the secure LDAP port 50636/TCP through the firewall separating your perimeter network from the Exchange organization. The Edge Transport server needs to be able to communicate with all Exchange 2013 Mailbox servers in the subscribed Active Directory site.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Configure Internet mail flow through a subscribed Edge Transport server

1. On the Edge Transport server, create the Edge Subscription file using the following syntax.

```
New-EdgeSubscription -FileName <FileName>.xml [-Force]
```

The following example creates an Edge Subscription file named EdgeSubscriptionInfo.xml in the folder C:\My Documents. The *Force* parameter suppresses prompts confirming commands that will be disabled and warnings that configuration data will be overwritten on the Edge Transport server.

```
New-EdgeSubscription -FileName "C:\My Documents
\EdgeSubscriptionInfo.xml" -Force
```

2. Copy the resulting Edge Subscription file to a Mailbox server in the Active Directory site you're subscribing the Edge Transport server to.
3. On the Mailbox server, to import the Edge Subscription file, use the following syntax.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"<FileName>.xml" -Encoding Byte -ReadCount 0)) -Site
<SiteName>
```

This example imports the Edge Subscription file named EdgeSubscriptionInfo.xml from the folder D:\Data, and subscribes the Edge Transport server to the Active Directory site named "Default-First-Site-Name".

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"D:\Data\EdgeSubscriptionInfo.xml" -Encoding Byte -
ReadCount 0)) -Site "Default-First-Site-Name"
```

Note:

You can use the *CreateInternetSendConnector* or *CreateInboundSendConnector* parameters to prevent one or both of the required Send connectors from being automatically created. For more information, see Edge Subscriptions.

4. On the Mailbox server, run the following command to start the first EdgeSync synchronization.

```
Start-EdgeSynchronization
```

5. When you're finished, we strongly recommend you delete the Edge Subscription file from both the Edge Transport server and from the Mailbox server. The Edge Subscription file contains information about credentials used during the LDAP communication process.

Configure Internet mail flow through an Edge Transport server without using EdgeSync

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-22*

We recommend you use the Edge Subscription process to establish mail flow between your Exchange organization and an Edge Transport server. However, certain situations may prevent you from subscribing the Edge Transport server to your Exchange organization using the Edge Subscription process. To manually establish mail flow between your Exchange organization and an Edge Transport server, you must create and configure the Send connectors and Receive connectors on the Edge Transport server and on the Mailbox servers in your Exchange organization.

Before you begin

- Estimated time to complete this task: 30 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Send connectors" entry, the "Send connectors - Edge Transport" entry and the "Receive connectors - Edge Transport" entry in the Mail flow permissions topic.

- This procedure uses Basic authentication over Transport Layer Security (TLS) to provide encryption and authentication. When you use Basic authentication over TLS, the receiving server must have an X.509 Secure Sockets Layer (SSL) server certificate installed. The fully qualified domain name (FQDN) value configured on the Receive connector must match the FQDN in the SSL server certificate. By default, the value of the FQDN on the Receive connector is the FQDN of the server that contains the Receive connector.
- You can also use the Externally Secured authentication method. However, if you do so, the communication between the Edge Transport server and Mailbox server isn't authenticated or encrypted by Exchange. We recommend you use the Externally Secured authentication method only when an additional encryption method is also used. The encryption method can be an Internet Protocol security (IPsec) association or a virtual private network (VPN).
- An Edge Transport server is typically *multihomed*. This means that the Edge Transport server has network adapters connected to multiple network segments. Each of these network adapters has a unique IP configuration. The network adapter that's connected to the external, or public, network segment should be configured to use a public Domain Name System (DNS) server for name resolution. This enables the server to resolve SMTP domain names to MX resource records and route mail to the Internet. The network adapter that's connected to the internal, or private, network segment should be configured to use a DNS server in the perimeter network or should have a Hosts file available.
- You need to create a user account in Active Directory and add the account to the universal security group on the Exchange Server computer. This account is used by the Send connector on the Edge Transport server to authenticate to the destination Mailbox server in the Exchange organization.

Important:

This account is granted the permissions associated with the computers running Exchange Server. Make sure you safeguard the account credentials to prevent misuse of the account. You can configure the account to allow logon to specific computers only.

Tip:

Edge Transport Server Procedures

The following connectors are required on the Edge Transport server:

- A Send connector configured to send messages to the Internet
- A Send connector configured to send messages to the Mailbox servers in the Exchange organization
- A Receive connector configured to receive messages only from Mailbox servers in the Exchange organization
- A Receive connector configured to accept messages only from the Internet

By default, a single Receive connector is created during the installation of the Edge Transport server role. This connector can be used for both incoming Internet messages and incoming messages from

the Mailbox servers. Typically, the Edge Subscription process automatically configures the correct permissions and authentication on the default Receive connector. When you don't use the Edge Subscription process, we recommend you modify the default Receive connector on the Edge Transport server to only accept messages from the Internet. You should then create a Receive connector on the Edge Transport server that's configured to only accept messages from internal Mailbox servers.

The following sections walk you through all the configuration steps required to prepare your Edge Transport server to communicate with your Exchange organization.

Note:
You can only use the Shell to perform these procedures on Edge Transport servers.

Step 1: Create a Send connector configured to send messages to the Internet

This Send connector requires the following configuration:

- **Name** To Internet (or any descriptive name)
- **Usage type** Internet
- **Address spaces** "*" (all domains)
- **Network settings** Use DNS MX records to route mail automatically. Depending on your network configuration, you can also route mail through a smart host. The smart host then routes mail to the Internet.

To create a Send connector that's configured to send messages to the Internet, run the following command.

```
New-SendConnector -Name "To Internet" -AddressSpaces * -
Usage Internet -DNSRoutingEnabled $true
```

For detailed syntax and parameter information, see New-SendConnector.

Step 2: Create a Send connector configured to send messages to the Exchange organization

Use the **New-SendConnector** cmdlet to create a Send connector.

Note:
Before you create the Send connector, you first need to run the **Get-Credential** command to save the user name and password you will use in a temporary variable. You need to do this because the **New-SendConnector** cmdlet will not accept user credentials in plain text.

This Send connector requires the following configuration:

- **Name** To Internal Org (or any descriptive name)
- **Usage type** Internal
- **Address spaces** All accepted domains for the Exchange organization. For example, *.contoso.com.
- DNS routing disabled (smart host routing enabled)
- **Smart hosts** FQDN of one or more Mailbox servers as smart hosts. For example, mbxserver01.contoso.com and mbxserver02.contoso.com.
- **Smart host authentication methods** Basic authentication and Basic authentication over TLS
- **Smart host authentication credentials** Credentials for the user account in the internal domain. You first need to save the user name and password in a temporary variable, because the **New-SendConnector** cmdlet will not accept user credentials in plain text.

To create a Send connector configured to send messages to the Exchange organization, run the following commands.

```
$MailboxCredentials = Get-Credential
New-SendConnector -Name "To Internal Org" -Usage Internal -
AddressSpaces *.contoso.com -DNSRoutingEnabled $false -
SmartHosts mbxserver01.contoso.com,mbxserver02.contoso.com
-SmartHostAuthMechanism BasicAuth,BasicAuthRequireTLS -
AuthenticationCredential $MailboxCredentials
```

For detailed syntax and parameter information, see New-SendConnector.

Step 3: Modify the default Receive connector to only accept messages from the Internet

You should make the following configuration changes to the default Receive connector:

- Modify the name to reflect that the connector will be used solely to receive email from the Internet. The name of the default Receive connector is "Default internal Receive connector <Edge Transport server name>".
- Change the network bindings to accept messages only from the network adapter that is accessible from the Internet. For example, 10.1.1.1 and the standard SMTP TCP port value of 25.

To modify the default Receive connector to only accept messages from the Internet, run the following command.

```
Set-ReceiveConnector "Default internal Receive connector
Edge01" -Name "From Internet" -Bindings 10.1.1.1:25
```

For detailed syntax and parameter information, see Set-ReceiveConnector.

Step 4: Create a Receive connector configured to only accept messages from the Exchange organization

This Receive connector requires the following configuration:

- **Name** From Internal Org (or any descriptive name)
- **Usage type** Internal
- **Local network bindings** Internal network-facing network adapter. For example, 10.1.1.2 and the standard SMTP TCP port value of 25.
- **Remote network settings** IP address of one or more Mailbox servers in the Exchange organization. For example, 192.168.5.10 and 192.168.5.20.
- **Authentication methods** TLS, Basic authentication, Basic authentication over TLS, and Exchange Server authentication.

To create a Receive connector configured to only accept messages from the Exchange organization, run the following command.

```
New-ReceiveConnector -Name "From Internal Org" -Usage
Internal -AuthMechanism
TLS,BasicAuth,BasicAuthRequireTLS,ExchangeServer -Bindings
10.1.1.2:25 -RemoteIPRanges 192.168.5.10,192.168.5.20
```

For detailed syntax and parameter information, see New-ReceiveConnector.

How do you know these steps worked?

To verify that you have successfully configured the required Send connectors and Receive connectors, run the following commands on the Edge Transport server and verify the values displayed are the values you configured.

```
Get-SendConnector | Format-List
Name,Usage,AddressSpaces,SourceTransportServers,DSNRoutingE
nabled,SmartHosts,SmartHostAuthMechanism
Get-ReceiveConnector | Format-List
Name,Usage,AuthMechanism,Bindings,RemoteIPRanges
```

Mailbox server procedures

Mailbox servers in your organization require a Send connector configured to send messages to the Edge Transport server for relay to the Internet.

By default, two Receive connectors are created during the installation of the Mailbox server role.

The connector named Client *ServerName* is configured to accept messages from all POP3 and IMAP messaging clients. The connector named Default *ServerName* is configured to accept messages from an Edge Transport server. No modifications to these connectors are required.

Step 5: Create a Send connector configured to send outgoing messages to the Edge Transport server

This Send connector requires the following configuration:

- **Name** To Edge (or any descriptive name)
- **Usage type** Internal
- **Address spaces** "*" (all domains)
- DNS routing disabled (smart host routing enabled)
- **Smart hosts** IP address or FQDN of the Edge Transport server. For example, edge01.contoso.net.
- **Source Mailbox servers** FQDN of one or more Mailbox servers. For example, mbxserver01.contoso.com and mbxserver02.contoso.com.
- **Smart host authentication methods** Basic authentication and basic authentication over TLS.
- **Smart host authentication credentials** Credentials for the user account on the Edge Transport server. You first need to save the user name and password in a temporary variable, because the **New-SendConnector** cmdlet will not accept user credentials in plain text.

To create a Send connector configured to send outgoing messages to the Edge Transport server, run the following commands.

```
$EdgeCredentials = Get-Credential
New-SendConnector -Name "To Edge" -Usage Internal -
AddressSpaces * -DNSRoutingEnabled $false -SmartHosts
edge01.contoso.com -SourceTransportServers
mbxserver01.contoso.com,mbxserver02.contoso.com -
SmartHostAuthMechanism BasicAuth,BasicAuthRequireTLS -
AuthenticationCredential $EdgeCredentials
```

For detailed syntax and parameter information, see New-SendConnector.

How do you know this step worked?

To verify that you have successfully created a Send connector configured to send outgoing messages to the Edge Transport server, run the following command on a Mailbox server and verify the values displayed are the values you configured.

```
Get-SendConnector | Format-List
Name,Usage,AddressSpaces,DSNRoutingEnabled,SmartHosts,Sourc
eTransportServers,SmartHostAuthMechanism
```

Edge Transport server planning

Topic Last Modified: *2014-04-28*

The Edge Transport server role has been re-introduced in Exchange Service Pack 1. Edge Transport provides improved anti-spam protection for the Exchange organization. The Edge Transport server also applies policies to messages in transport between organizations. This server role is deployed in the perimeter network and outside the Active Directory forest. Edge Transport servers don't have direct access to Active Directory for configuration and recipient information in the way Client Access or Mailbox servers do. The Edge Transport server uses the Active Directory Lightweight Directory Service (AD LDS) to store configuration and recipient information locally.

You can add an Edge Transport server to an existing Exchange 2013 organization. You don't have to perform any additional Active Directory preparation steps when you install the Edge Transport server.

Note:
If you are adding Edge Transport to an existing Exchange 2010 or Exchange 2007 organization, you will need to install specific rollup updates on your legacy servers before installing Exchange 2013 Edge Transport. For details, see Exchange 2013 system requirements.

When you're planning to deploy Edge Transport servers, you should consider the following issues:

- **Server Capacity** Planning for server capacity includes planning to conduct performance monitoring of the Edge Transport server. Performance monitoring will help you understand how hard the server is working. This information will determine the capacity of your current hardware configuration.
- **Transport Features** The Edge Transport server can provide anti-spam protection at the edge of the network. As part of your planning process, you should determine the anti-spam features that you will enable at the Edge Transport server and how they will be configured.
- **Security** The Edge Transport server role is designed to have a minimal attack surface. Therefore, it's important to correctly secure and manage both the physical access and network access to the server. Planning for security will help you make sure that IP connections are only enabled from authorized servers and from authorized users. For more information, see the Deployment security checklist.

The recommended practice is to put the Edge Transport server within a perimeter network. To make sure that the server can send and receive e-mail and receive recipient and configuration data updates from the Microsoft Exchange EdgeSync service, you must allow communication through the ports that are listed in the following table.

Communication port settings for Edge Transport servers

Network interface	Open port	Protocol	Note

Inbound from and outbound to the Internet	25/TCP	SMTP	This port is required for mail flow to and from the Internet.
Inbound from and outbound to the internal network	25/TCP	SMTP	This port is required for mail flow to and from the Exchange organization.
Local only	50389/TCP	LDAP	This port is used to make a local connection to AD LDS.
Inbound from the internal network	50636/TCP	Secure LDAP	This port is required for EdgeSync synchronization.
Inbound from the internal network	3389/TCP	RDP	Opening this port is optional. It provides more flexibility in managing the Edge Transport servers from inside the internal network by letting you use a remote desktop connection to manage the Edge Transport server.

Note:

The Edge Transport server role uses non-standard LDAP ports. The ports specified in this topic are the LDAP communication ports configured when the Edge Transport server role is installed.

- **EdgeSync** The recommended deployment process is to create an Edge Subscription to subscribe the Edge Transport server to the Exchange organization. When you create an Edge Subscription, recipient and configuration data is replicated from Active Directory to AD LDS. You subscribe an Edge Transport server to an Active Directory site. Then the Microsoft Exchange EdgeSync service that is running on the Mailbox servers in that site periodically updates AD LDS by synchronizing data from Active Directory. The Edge Subscription process automatically provisions the Send connectors that are required to enable mail flow from the Exchange organization to the Internet through an Edge Transport server. If you're using the recipient lookup

or safelist aggregation features on the Edge Transport server, you must subscribe the Edge Transport server to the organization.

Configure DNS settings for the Edge Transport server role

The Edge Transport server is deployed outside the Exchange organization as a stand-alone server in the perimeter network or as a member of a perimeter network Active Directory domain. You need to manually configure the correct DNS suffix for the Edge Transport server role before you install Exchange 2013. If a DNS suffix isn't configured, setup will fail.

Because the Edge Transport server is deployed in the perimeter network, it has network interfaces that are connected to multiple network segments. Each of these network segments has a unique IP configuration. The network interface that is connected to the external, or public, network segment should be configured to use a public DNS server for name resolution. This enables the server to resolve SMTP domain names to MX resource records and route mail to the Internet.

The network interface that is connected to the internal, or private, network segment should be configured to use a DNS server that can resolve the names of the Mailbox servers in your organization, or should have a Hosts file available. The Edge Transport servers and the Mailbox servers must be able to use DNS host resolution to locate each other.

To enable name resolution of Mailbox servers by Edge Transport servers, use one of the following methods:

- Manually create resource records for Mailbox servers in a forward lookup zone on the DNS server that's configured on the internal network adapter of the Edge Transport server.
- Edit the Hosts file on the Edge Transport server to include the Host records for the Mailbox servers. The Hosts file is a local text file in the same format as the 4.3 Berkeley Software Distribution (BSD) UNIX /etc/hosts file. This file maps host names to IP addresses, and the file is stored in the \%Systemroot%\System32\Drivers\Etc folder.

To enable name resolution of Edge Transport servers by Mailbox servers, use one of the following methods:

- Manually create resource records for Edge Transport servers in a forward lookup zone on the DNS server that's configured on the Mailbox server.
- To include the Host records for the Edge Transport servers, edit the Hosts file on the Mailbox servers that are located in the subscribed Active Directory site.

Follow these steps to configure DNS settings for the Edge Transport server:

1. Verify that the DNS server settings for each network interface are correct for the network segment.
2. Configure the DNS suffix for the Edge Transport server name using the following steps:
   a. Open Control Panel, and then choose **System Properties**.
   b. Choose the **Computer Name** tab.
   c. Choose **Change**.
   d. On the **Computer Name Changes** page, click **More**.
   e. In the **Primary DNS suffix of this computer** field, type a DNS domain name and suffix for the

Edge Transport server.

This name can't be changed after the Edge Transport server role is installed.

Override DNS settings

You might need to override the default DNS settings on the Exchange server so mail can be routed and delivered correctly. To do this, modify the **Internal DNS Lookups** and **External DNS Lookups** settings of the transport server's properties. These settings override the settings on the network adapter to route e-mail messages.

Edge Transport server cloned configuration

Exchange Server 2013 > Edge Transport servers >

Topic Last Modified: *2014-02-22*

Edge Transport servers store their configuration information in Active Directory Lightweight Directory Services (AD LDS). You can install more than one Edge Transport server in the perimeter network and use a DNS round robin to help balance network traffic among the Edge Transport servers. Round robin is a simple mechanism used by DNS servers to share and distribute loads for network resources.

To ensure all Edge Transport servers use the same configuration information, use the provided cloned configuration scripts to duplicate your source server's configuration on a target server.

Cloned configuration is used to deploy new Edge Transport servers based on a configured source server. Source server configuration information is duplicated and then exported to an XML file. The XML file is then imported to the target server.

This topic provides an overview of the cloned configuration process. For detailed steps about configuring your Edge Transport servers using cloned configuration, see Configure Edge Transport server using cloned configuration.

Contents

Cloned configuration and EdgeSync

Run the EdgeSync process after you import the cloned configuration. To perform recipient lookup and message security tasks, the Edge Transport server requires data that resides in Active Directory. *EdgeSync* is a collection of processes run on an Exchange 2013 Mailbox server to establish one-way replication of recipient and configuration information from Active Directory to the AD LDS instance on an Edge Transport server. EdgeSync copies only information required for the Edge Transport server to perform anti-spam tasks and information about connector configuration required to enable end-to-end mail flow. EdgeSync performs scheduled updates so the information in AD LDS remains current.

Cloned configuration doesn't duplicate a server's Edge Subscription settings. The certificates used by EdgeSync aren't cloned. You must run the EdgeSync process separately for each Edge Transport server. EdgeSync overwrites any settings included in both the cloned configuration information and in EdgeSync replication information. These settings include Send connectors, Receive connectors, accepted domains, and remote domains.

Cloned configuration process

The cloned configuration process consists of three steps:

1. Export the configuration from the source server.

Run the ExportEdgeConfig.ps1 script (located in %ExchangeInstallPath%Scripts) to export the source server's configuration information to an intermediate XML file.

2. Validate the configuration on the target server.

Run the ImportEdgeConfig.ps1 script (located in %ExchangeInstallPath%Scripts). This script checks the existing information in the intermediate XML file to see whether the exported settings are valid for the target server and then creates an answer file. The answer file specifies the server-specific information used when you import the configuration onto the target server. The answer file contains entries for each source server setting that isn't valid for the target server. You can modify these settings so that they're valid for the target server. If all settings are valid, the answer file contains no entries.

3. Import the configuration on the target server.

The ImportEdgeConfig.ps1 script uses the intermediate XML file and the answer file to clone an existing configuration or to restore the server to a specific configuration.

Step 1: Export the configuration from the source server

After you install and configure the Edge Transport server role, run the ExportEdgeConfig.ps1 script (located in %ExchangeInsallPath%Scripts). This script retrieves the source server's configuration information and stores the information in an intermediate XML file.

The following information is exported from the source server and stored in the intermediate XML file:

- Transport service-related information and log file path information:
  - *ReceiveProtocolLogPath*

    - *SendProtocolLogPath*
    - *MessageTrackingLogPath*
    - *PickupDirectoryPath*
    - *RoutingTableLogPath*
- Transport agent-related information, including status and priority settings of each transport agent.
- All Send connector-related information. If any Send connectors are configured to use credentials, the password is written to the intermediate XML file as an encrypted string. You can use the *-key* parameter with the ImportEdgeConfig.ps1 and ExportEdgeConfig.ps1 scripts to specify the 32-byte string to use for password encryption and decryption. If you don't use the *-key* parameter, a default encryption key is used.
- Receive connector-related information. To modify local network binding and port properties, you must modify the configuration information in the answer file that's created in the validate configuration step.
- Accepted domain configuration.
- Remote domain configuration.
- Anti-spam features configuration settings:
    - IP Allow list information. Only IP Allow list entries that were manually configured by the administrator are exported.
    - IP Block list information.
    - Content filter configuration.
    - Recipient filter configuration.
    - Address rewrite entries.
    - Attachment filter entries.

Return to top

Step 2: Validate the configuration on the target server

The target server is an Exchange 2013 server that has a clean installation of the Edge Transport server role. First, run the ImportEdgeConfig.ps1 script (located at %ExchangeInsallPath%Scripts) on the target server to validate the existing information in the intermediate XML file and to create the answer file. The answer file specifies the server-specific information used when you import the configuration onto the target server. The answer file contains entries for each source server setting that isn't valid for the target server. You will need to modify these settings so that they're valid for the target server. If all settings are valid, the answer file contains no entries. The intermediate XML file can be used for different target servers. The answer file is specific to a target server.

The ImportEdgeConfig.ps1 script (located at %ExchangeInsallPath%Scripts) performs the following tasks:

- Verifies that the data paths and log paths can be created on the target server. If the paths can't be created, a blank path is inserted into the answer file.
- For each Send connector in the XML file, the script adds a blank entry for the source IP address in

the answer file.

- For each Receive connector in the XML file, the script adds a blank entry for the local network bindings in the answer file.

You will need to manually modify the answer file to provide the following information about server-specific settings:

- Fill in the data paths and log paths. If these paths are left blank in the answer file, the paths configured in the intermediate XML file will be used in the next step when you import the configuration onto the target server.
- For each Send connector entry, fill in the source IP address. If this field is left blank, an error will occur in the import configuration step.
- For each Receive connector entry, fill in the local network bindings. If the local network bindings are left blank, an error will occur when you try to import the configuration onto the target server.

Return to top

Step 3: Import the configuration onto the target server

You can perform this step on any target server to clone the configuration of an existing Edge Transport server or to restore the server to a specific configuration. Run the ImportEdgeConfig.ps1 script (located at %ExchangeInsallPath%Scripts) to validate and import the new configuration. After you run this script, the target server's configuration will match the settings in the intermediate XML file and the answer file.

Important:
We recommend that you back up the existing server configuration before running the import configuration process, so that if the cloning operation fails, you can restore the server to its previous stable state.

This step uses the server-specific information provided in the answer file. If a setting isn't specified in the answer file, the data in the intermediate XML file will be used. Before the script modifies the configuration, the script validates the data in the intermediate XML file and the answer file.

Import configuration modifies the following target server configuration settings:

- The transport agent configuration is modified.
- The existing connectors on the target server are removed, and the connectors present in the intermediate XML file are added.
- The existing accepted domains are removed, and the accepted domain entries in the intermediate XML file are added.
- The existing remote domains are removed, and the remote domain entries in the intermediate XML file are added.
- The existing IP Allow list entries are removed, and the IP Allow list entries in the intermediate remote domains file are added.
- The existing IP Block list entries are removed, and the IP Block list entries in the intermediate remote domains file are added.

- The following anti-spam configuration is cloned to the target server:
  - Content filter configuration
  - Recipient filter configuration
  - Address rewrite entries
  - Attachment filter entries

Return to top

Transport configuration information

The settings of the transport configuration object define server-wide email transport settings for an Edge Transport server. When you import the intermediate XML file to the target server, all transport configuration object settings except the following are imported:

- General names and creation dates from the exported XML file
- Send connector information
- Receive connector information
- Attachment filter entries
- The **MaxDumpsterSizePerStorageGroup** attribute entry

After the import process is complete, you may also configure the settings by using the **Set-TransportConfig** cmdlet. For more information, see Set-TransportConfig.

The attributes in the following table are associated with the transport configuration object and the default values. You can configure this object on both Mailbox servers and Edge Transport servers. However, many attributes apply only to the Transport service on Exchange 2013 Mailbox servers. Configuring these attributes on an Edge Transport server will have no effect.

Transport configuration attributes and default values

Attribute	Description	Default value
ClearCategories	This attribute specifies whether to clear Microsoft Outlook categories during content conversion.	True
GenerateCopyOfDSNFor	This attribute specifies the delivery status notification (DSN) codes that cause the DSN message to be copied to the postmaster email address. DSN codes are entered as *x.y.z* and are separated by commas.	5.4.8, 5.4.6, 5.4.4, 5.2.4, 5.2.0, 5.1.4

InternalSMTPServers	This attribute specifies a list of internal SMTP server IP addresses or IP address ranges that should be ignored by Sender ID and connection filtering.	Null
JournalingReportNdrTo	This attribute specifies the email address to which journal reports are sent if the journaling mailbox is unavailable. This attribute doesn't apply to the configuration of an Edge Transport server.	Null
MaxDumpsterSizePerStorageGroup	This attribute specifies the maximum size of the transport dumpster on a Mailbox server. This attribute doesn't apply to the configuration of an Edge Transport server.	18 MB
MaxDumpsterTime	This attribute specifies how long an email message should remain in the transport dumpster on a Mailbox server. This attribute doesn't apply to the configuration of an Edge Transport server.	7.00:00:00
MaxReceiveSize	This attribute specifies the maximum message size that can be received by recipients in the organization. This attribute	10 MB

	doesn't apply to the configuration of an Edge Transport server.	
MaxRecipientEnvelopeLimit	This attribute specifies the maximum number of recipients that are allowed in a single email message. This attribute doesn't apply to the configuration of an Edge Transport server.	5,000
MaxSendSize	This attribute specifies the maximum message size that can be sent by senders in the organization. This attribute doesn't apply to the configuration of an Edge Transport server.	10 MB
TLSReceiveDomainSecureList	This attribute specifies the remote domains that will use mutual Transport Layer Security (TLS) authentication through Receive connectors configured to support Domain Security. Multiple domains may be separated by commas. The wildcard character (*) isn't supported in the domains that are listed in this attribute.	Null
TLSSendDomainSecureList	This attribute specifies the remote domains that will use mutual TLS authentication	Null

	when email is sent through a Send connector configured to support Domain Security and the address space of the target domain. Multiple domains may be separated by commas. The wildcard character (*) isn't supported in the domains that are listed in this attribute.	
VerifySecureSubmitEnabled	This attribute verifies that email clients that are submitting messages from mailboxes on Mailbox servers are using encrypted MAPI submission. This attribute doesn't apply to the configuration of an Edge Transport server. The valid values for this attribute are `$true` or `$false`.	False
VoicemailJournalingEnabled	This attribute specifies whether Unified Messaging voice mail is journaled by the Journaling agent. This attribute doesn't apply to the configuration of an Edge Transport server.	True

Note:

If the Edge Transport server is later subscribed to the Exchange organization, the value of the **InternalSMTPServers** attribute will be overwritten during the EdgeSync process. For more information, see Edge Subscriptions.

Return to top

Configure Edge Transport server using cloned configuration

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-22*

You can use the provided Exchange Management Shell scripts (located in %ExchangeInstallPath% Scripts) to duplicate the configuration of an Edge Transport server. This process is referred to as *cloned configuration*. *Cloned configuration* is the practice of deploying new Edge Transport servers based on configuration information from a previously configured source server. The configuration information from the previously configured source server is copied and exported to an XML file, which is then imported to the target server. For an overview of this process, see Edge Transport server cloned configuration.

Edge Transport server configuration information is stored in Active Directory Lightweight Directory Services (AD LDS) and isn't replicated among multiple Edge Transport servers. Using cloned configuration, you can ensure that every Edge Transport server deployed in your perimeter network is using the same configuration.

Two Shell scripts are used to perform cloned configuration tasks:

- **ExportEdgeConfig.ps1** Exports all user-configured settings and data from an Edge Transport server and stores that data in an XML file.
- **ImportEdgeConfig.ps1** During the validate configuration step, the ImportEdgeConfig.ps1 script checks the exported XML file to see whether the server-specific export settings are valid for the target server. If settings need to be modified, the script writes the invalid settings to an answer file you can modify to specify target server information, which is then used during the import configuration step. During the import configuration step, the script imports all user-configured settings and data stored in the intermediate XML file created by the ExportEdgeConfig.ps1 script.

Both these scripts are located in the %ExchangeInstallPath%Scripts folder.

Before you begin

- Estimated time to complete this task: 30 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Edge Transport servers" entry in the Mail flow permissions topic.
- Cloned configuration doesn't duplicate a server's Edge Subscription settings. EdgeSync certificates aren't cloned. You need to run the EdgeSync process separately for each Edge

Transport server. EdgeSync overwrites any settings included in both cloned configuration information and in EdgeSync replication information.

- If any Send connectors are configured to use credentials, the password is written to the intermediate XML file as an encrypted string. You can use the *-key* parameter with the ImportEdgeConfig.ps1 and ExportEdgeConfig.ps1 scripts to specify the 32-byte string to use for password encryption and decryption. If you don't use the *-key* parameter, a default encryption key is used.
- You can only use the Shell to perform this procedure. To learn how to open the Shell in your on-premises Exchange organization, see Open the Shell.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

How do you do this?

Step 1: Export the source server configuration data to a file on the source server

1. Copy the ExportEdgeConfig.ps1 script to the root folder of your user profile on the source server.
2. To export the source server configuration data to a file on the source server, use the following syntax.

```
./ExportEdgeConfig.ps1 -CloneConfigData:"<configuration file>"
```

For example, to export the source server configuration data to the file C:\CloneConfigData.xml, run the following command.

```
./ExportEdgeConfig.ps1 -CloneConfigData:"C:\CloneConfigData.xml"
```

How do you know this step worked?

You'll know you successfully exported the source configuration data to a file when the confirmation message, "Edge configuration data is exported successfully to: <output file path>" appears.

Step 2: Validate the configuration file and create an answer file on the target server

1. Copy the source server configuration file you exported in the previous step to the target Edge Transport server.
2. Copy the ImportEdgeConfig.ps1 script to the root folder of your user profile on the target server.
3. To validate the configuration file and use the results to create an answer file on the target server, use the following syntax.

```
./ImportEdgeConfig.ps1 -CloneConfigData:"<configuration
file>" -IsImport $false -CloneConfigAnswer:"<answer file>"
```

For example, to validate the configuration file C:\CloneConfigData.xml, and create the answer file C:\CloneConfigAnswer.xml, run the following command.

```
./ImportEdgeConfig.ps1 -CloneConfigData:"C:
\CloneConfigData.xml" -IsImport $false -
CloneConfigAnswer:"C:\CloneConfigAnswer.xml"
```

4. Open the answer file and modify any settings that are invalid for the target server. If no modifications are required, the answer file will have no entries. Save your changes.

How do you know this step worked?

You'll know you successfully validated the configuration file and created an answer file when the confirmation message, "Answer file is successfully created" appears.

Step 3 Import the configuration file on the target server

To import the configuration file on the target server, use the following syntax.

```
./ImportEdgeConfig.ps1 -CloneConfigData:"<Configuration
file>" -IsImport $true -CloneConfigAnswer:"<answer file>"
```

For example, to import the configuration file C:\CloneConfigData.xml by using the answer file C:\CloneConfigAnswer.xml, run the following command.

```
./ImportEdgeConfig.ps1 -CloneConfigData:"C:
\CloneConfigData.xml" -IsImport $true -
CloneConfigAnswer:"C:\CloneConfigAnswer.xml"
```

How do you know this step worked?

You'll know you successfully imported the configuration file on the target server when the confirmation message, "Importing Edge configuration information succeeded" appears.

Use an Exchange 2010 or 2007 Edge Transport server in Exchange 2013

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-22*

The Edge Transport server is available in Microsoft Exchange Server 2013 Service Pack 1 (SP1). However, you can continue to use existing Exchange Server 2007 or Exchange Server 2010 Edge Transport servers that you have deployed in your perimeter network. Or, you can install a new Exchange 2007 or Exchange 2010 Edge Transport server in your perimeter network for a new or upgraded Exchange 2013 organization.

Here are the things you need to know:

- An Exchange 2007 or Exchange 2010 Edge Transport server expects a connection to a Hub Transport server. In Exchange 2013, the Transport service exists on the Mailbox server. Therefore, Internet mail flow occurs between the Transport service on the Mailbox server and the Edge Transport server, which effectively bypasses the Exchange 2013 Client Access server.
- You can subscribe an Exchange 2007 or Exchange 2010 Edge Transport server to an Active Directory site that contains only Exchange 2013 servers. You can import the Edge Subscription file and run EdgeSync on a standalone Exchange 2013 Mailbox server, or on a server where the Mailbox server and the Client Access server are installed on the same computer. You can't import the Edge Subscription file or run EdgeSync on a standalone Exchange 2013 Client Access server.
- The procedures to deploy a new Exchange 2007 or Exchange 2010 Edge Transport server in your Exchange 2013 organization are basically the same as in previous versions of Exchange. However, any procedures that are performed on the Hub Transport server are performed on the Mailbox server in Exchange 2013. The procedures are:
  - Configure Internet Mail Flow Through a Subscribed Edge Transport Server
  - Configure Mail Flow Between an Edge Transport Server and Hub Transport Servers Without Using EdgeSync

Address rewriting on Edge Transport servers

Topic Last Modified: *2014-02-10*

Address rewriting modifies email addresses of senders and recipients in messages that enter or leave your organization through an Edge Transport server. Two transport agents on the Edge Transport server provide the rewriting functionality: the Address Rewriting Inbound Agent and the Address Rewriting Outbound Agent. The primary reason for address rewriting on outbound messages is to present a single, consistent email domain to external recipients. The primary reason for address rewriting on inbound messages is to deliver messages to the correct recipient.

The *address rewrite entry*, which you create, specifies the internal addresses (the email addresses you want to change) and the external addresses (the final email addresses you want). You can specify whether email addresses are rewritten in inbound and outbound messages, or in outbound messages only. You can create address writing entries for a single user (chris@contoso.com to support@contoso.com), all users in a single domain (contoso.com to fabrikam.com), or for users in multiple subdomains with exceptions (*.fabrikam.com to contoso.com, except legal.fabrikam.com).

Important:
Regardless of how you plan to use address rewriting, you need to verify that the resulting email addresses are unique in your organization so you don't end up with duplicates. This is because address rewriting doesn't verify the uniqueness of a rewritten email address.

Contents

Scenarios for address rewriting

The following scenarios are examples of how you can use address rewriting:

- **Group consolidation** Some organizations segment their internal businesses into separate domains that are based on business or technical requirements. This configuration can cause email messages to appear as if they come from separate groups or even separate organizations.

The following example shows how an organization, Contoso, Ltd., can hide its internal subdomains from external recipients:

  - Outbound messages from the northamerica.contoso.com, europe.contoso.com, and asia.contoso.com domains are rewritten so they appear to originate from a single contoso.com

domain. All messages are rewritten as they pass through Edge Transport servers that provide SMTP connectivity between the whole organization and the Internet.
    - Inbound messages to contoso.com recipients are relayed by the Edge Transport server to a Mailbox server. The message is delivered to the correct recipient based on the proxy address that's configured on the recipient's mailbox.
- **Mergers and acquisitions** An acquired company might continue to run as a separate business, but you can use address rewriting to make the two organizations appear as if they're one integrated organization.

The following example shows how Contoso, Ltd. can hide the email domain of the newly acquired company, Fourth Coffee:

- Contoso, Ltd. wants all outbound messages from Fourth Coffee's Exchange organization to appear as if they originate from contoso.com. All messages from both organizations are sent through the Edge Transport servers at Contoso, Ltd., where email messages are rewritten from *user*@fourthcoffee.com to *user*@contoso.com.
- Inbound messages to *user*@contoso.com are rewritten and routed to *user*@fourthcoffee.com mailboxes. Inbound messages that are sent to *user*@fourthcoffee.com are routed directly to Fourth Coffee's email servers.

- **Partners** Many organizations use external partners to provide services for their customers, other organizations, or their own organization. To avoid confusion, the organization might replace the email domain of the partner organization with its own email domain.

The following example shows how Contoso, Ltd. can hide a partner's email domain:

- Contoso, Ltd. provides support for the larger Wingtip Toys organization. Wingtip Toys wants a unified email experience for its customers, and it requires all messages from support personnel at Contoso, Ltd. to appear as if they were sent from Wingtip Toys. All outbound messages that relate to Wingtip Toys are sent through their Edge Transport servers, and all contoso.com email addresses are rewritten to wingtiptoys.com email addresses.
- Inbound messages for support@wingtiptoys.com are accepted by Wingtip Toy's Edge Transport servers, rewritten, and then routed to the support@contoso.com email address.

Return to top

Message properties modified by address rewriting

A standard SMTP email message consists of a *message envelope* and message content. The message envelope contains information required for transmitting and delivering the message between SMTP mail servers. The message content contains message header fields (collectively called the *message header*) and the message body. The message envelope is described in RFC 2821, and the message header is described in RFC 2822.

When a sender composes an email message and submits it for delivery, the message contains the basic information required to comply with SMTP standards, such as a sender, a recipient, the date and time that the message was composed, an optional subject line, and an optional message body. This information is contained in the message itself and, by definition, in the message header.

The sender's mail server generates a message envelope for the message by using the sender's and recipient's information found in the message header. It then transmits the message to the Internet for delivery to the recipient's mail server. Recipients never see the message envelope because it's generated by the message transmission process, and it isn't actually part of the message.

Address rewriting changes an email address by rewriting specific fields in the message header or message envelope. Address rewriting changes several fields in outbound messages but only one field in inbound email messages. The following table shows which SMTP header fields are rewritten in outbound and inbound messages.

Message fields rewritten on outbound and inbound messages

Field name	Location	Outbound messages	Inbound messages
MAIL FROM	Message envelope	Rewritten	Not rewritten
RCPT TO	Message envelope	Not rewritten	Rewritten
To	Message header	Rewritten	Not rewritten
Cc	Message header	Rewritten	Not rewritten
From	Message header	Rewritten	Not rewritten
Sender	Message header	Rewritten	Not rewritten
Reply-To	Message header	Rewritten	Not rewritten
Return-Receipt-To	Message header	Rewritten	Not rewritten
Disposition-Notification-To	Message header	Rewritten	Not rewritten
Resent-From	Message header	Rewritten	Not rewritten
Resent-Sender	Message header	Rewritten	Not rewritten

Return to top

What address rewriting doesn't change

Address rewriting doesn't modify any message header fields that would break SMTP functionality. For example, modifying certain header fields can affect routing loop detection, invalidate the signature, or make a rights-protected message unreadable. Therefore, the following header fields

aren't modified by address rewriting.

- **Return-Path**
- **Received**
- **Message-ID**
- **X-MS-TNEF-Correlator**
- **Content-Type Boundary=string**
- Header fields located inside MIME body parts

Address rewriting ignores domains that aren't controlled by the Exchange organization. In other words, address rewriting doesn't rewrite header fields that contain domains for which the Exchange organization isn't authoritative. Rewriting such domains would cause an uncontrollable form of message relay.

Address rewriting also doesn't modify the header fields of messages that are embedded in another message. Senders and recipients expect embedded messages to remain intact and be delivered without modification, as long as the messages don't trigger transport rules that are implemented between the sender and recipient.

Return to top

Considerations for outbound-only address rewriting

Outbound-only address rewriting on an Edge Transport server modifies the sender's email address as the message leaves the Exchange organization. You can configure outbound-only address rewriting for a single user (chris@contoso.com to support@contoso.com) or for all users in a single domain (contoso.com to fabrikam.com). You are required to configure outbound-only address rewriting for users in multiple subdomains (*.fabrikam.com to .contoso.com).

The rewritten email address must be configured as a proxy address on the affected recipients. For example, if laura@sales.contoso.com is rewritten to laura@contoso.com, the proxy address laura@contoso.com must be configured on Laura's mailbox. This allows replies and inbound messages to be delivered correctly.

Return to top

Considerations for inbound and outbound address rewriting

Inbound and outbound, or *bidirectional* address rewriting on an Edge Transport server modifies the sender's email address in messages that leave the Exchange organization, and it modifies the recipient's email address in messages that enter the Exchange organization.

You can configure outbound-only address rewriting for a single user (chris@contoso.com to support@contoso.com) and all users in a single domain (contoso.com to fabrikam.com). You can’t

configure bidirectional address rewriting for users in multiple subdomains (*.fabrikam.com to contoso.com).

Return to top

Considerations for rewriting email addresses in multiple domains

When you flatten multiple internal domains or subdomains into a single external domain, you need to consider the following factors:

- **Verify unique aliases** All email aliases (the part to the left of the @ sign) must be unique across all subdomains. For example, if there is a joe@sales.contoso.com, there can't be a joe@marketing.contoso.com because the rewritten email address for both users would be joe@contoso.com.
- **Add proxy addresses** The rewritten email address must be configured as a proxy address for all affected senders in the affected domains. For example, if joe@sales.contoso.com is rewritten to joe@contoso.com, you need to add the proxy address joe@contoso.com to Joe's mailbox. This allows replies and inbound messages to be delivered correctly.
- **Mail contacts for non-Exchange organizations** If you're rewriting email addresses from a non-Exchange email system, you need to create email contacts in Exchange to represent the users in the non-Exchange email system. These email contacts must contain the original email addresses and the rewritten email addresses. For example, if joe@unix.contoso.com is rewritten to joe@contoso.com, you need to create a mail contact with joe@unix.contoso.com as the external email address and joe@contoso.com as a proxy address.

Verify unique aliases

When you rewrite email addresses in multiple subdomains, you need to make sure that all email aliases are unique across all your subdomains. For example, consider the following configuration:

The following users are in the subdomains sales.contoso.com, marketing.contoso.com, and research.contoso.com:

- maria@sales.contoso.com
- chris@sales.contoso.com
- david@marketing.contoso.com
- brian@marketing.contoso.com
- chris@research.contoso.com
- adam@research.contoso.com

Suppose you want to rewrite the subdomains sales.contoso.com, marketing.contoso.com, and research.contoso.com into the single domain contoso.com.

When the email addresses in each subdomain are rewritten, a conflict occurs between

chris@sales.contoso.com and chris@research.contoso.com because both email addresses are rewritten to chris@contoso.com. To resolve this situation, you need to change the email address of one of the affected recipients. For example, you can change chris@research.contoso.com to christopher@research.contoso.com so the email address is rewritten to christopher@contoso.com.

Return to top

Priority of address rewrite entries

If a user's email address matches multiple address rewrite entries, the email address is only rewritten once based on the closest match. The following list describes the order of precedence of address rewrite entries from highest priority to lowest priority:

1. **Individual email addresses** An address rewrite entry is configured to rewrite the email address of john@contoso.com to support@contoso.com.
2. **Domain or subdomain mapping** An address rewrite entry is configured to rewrite all contoso.com email addresses to northwindtraders.com or all sales.contoso.com email addresses to contoso.com.
3. **Domain flattening** An address rewrite entry is configured to rewrite *.contoso.com email addresses to contoso.com.

For example, consider an Edge Transport server where the following outbound address rewrite entries are configured:

- *.contoso.com email addresses are rewritten to contoso.com
- japan.sales.contoso.com email addresses are rewritten to contoso.jp

If masato@japan.sales.contoso.com sends an email message, the address is rewritten to masato@contoso.jp, because that entry most closely matches the sender's email address.

Return to top

Digitally signed, encrypted, and rights-protected messages

Address rewriting shouldn't affect most signed, encrypted, or rights-protected messages. If address rewriting were to invalidate or otherwise change the security status of these types of messages in any way, address rewriting isn't applied.

The following values can be rewritten because the information isn't part of message signing, encryption, or rights protection:

- Fields in the message envelope
- Top-level message body headers

The following values aren't rewritten because the information is part of message signing, encryption, or rights protection:

- Header fields located inside MIME body parts that may be signed
- The boundary string parameter of the MIME content type

Return to top

Manage address rewriting on Edge Transport servers

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-10*

You use the Exchange Management Shell on an Edge Transport server for all management tasks related to address rewriting and the address rewriting agents. For more information about address rewriting, see Address rewriting on Edge Transport servers.

You can create address rewrite entries that apply to a single recipient, to all recipients in a specific domain or subdomain, or all recipients in multiple subdomains. Address rewriting can be outbound only, or inbound and outbound (bidirectional). When you create address rewrite entries, remember the following:

- Verify that the resulting email addresses are unique in your organization.
- Only literal strings are supported in the email address values.
- The wildcard character (*) is supported only in the internal address (the addresses you want to change). Valid syntax for using the wildcard character is ***.contoso.com**. The values ***contoso.com** or **sales.*.com** are not allowed.
- When you use the wildcard character, you need to configure the address rewriting as outbound only (you need to set the *OutboundOnly* parameter to the value `$true`).
- When you configure outbound-only address rewriting (by setting the *OutboundOnly* parameter to the value `$true`), you need to configure proxy addresses on the affected recipients. This allows mail that is sent to the rewritten address to be delivered correctly.
- By default, address rewriting is bidirectional for single recipients or all recipients in a specific domain or subdomain (the default value for the *OutboundOnly* parameter is `$false`).

What do you need to know before you begin?

- Estimated time to complete each procedure: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Edge Transport servers" section in the Mail flow permissions topic.
- You can only use the Shell to perform this procedure.
- Be careful when you configure address rewriting. Any changes that you make are immediately

applied when you run the command. Consider running the command with the *WhatIf* parameter. For more information about the *WhatIf* parameter, see WhatIf, Confirm, and ValidateOnly switches.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Use the Shell to enable or disable address rewriting

To completely enable or disable address rewriting, you enable or disable the address rewriting agents. By default, the address rewriting agents on an Edge Transport server are enabled.

To disable address rewriting, run the following commands:

```
Disable-TransportAgent "Address Rewriting Inbound Agent"
Disable-TransportAgent "Address Rewriting Outbound Agent"
```

To enable address rewriting, run the following commands:

```
Enable-TransportAgent "Address Rewriting Inbound Agent"
Enable-TransportAgent "Address Rewriting Outbound Agent"
```

How do you know this worked?

To verify that you have successfully enabled or disabled address rewriting, do the following:

1. Run the following command:

```
Get-TransportAgent
```

2. Verify the values of the **Enabled** property for the Address Rewriting Inbound Agent and the Address Rewriting Outbound Agent are the values you configured.

Use the Shell to view address rewrite entries

To view a summary list of all address rewrite entries, run the following command.

```
Get-AddressRewriteEntry
```

To view details of an address rewrite entry, use the following syntax.

```
Get-AddressRewriteEntry <AddressRewriteEntryIdentity> |
```

```
Format-List
```

The following example displays the details of the address rewrite entry named Rewrite Contoso.com to Northwindtraders.com:

```
Get-AddressRewriteEntry "Rewrite Contoso.com to
Northwindtraders.com" | Format-List
```

Use the Shell to create address rewrite entries

Rewrite the email addresses of single recipients

To rewrite the email address for a single recipient, use the following syntax:

```
New-AddressRewriteEntry -Name "<Descriptive Name>" -
InternalAddress <internal email address> -ExternalAddress
<external email address> [-OutboundOnly <$true | $false>]
```

The following example rewrites the email address of all messages entering and leaving the Exchange organization for the recipient joe@contoso.com. Outbound messages are rewritten so they appear to come from support@nortwindtraders.com. Inbound messages sent to support@northwindtraders.com are rewritten to joe@contoso.com for delivery to the recipient (the *OutboundOnly* parameter is `$false` by default).

```
New-AddressRewriteEntry -Name "joe@contoso.com to
support@northwindtraders.com" -InternalAddress
joe@contoso.com -ExternalAddress
support@northwindtraders.com
```

Rewrite email addresses for recipients in a single domain or subdomain

To rewrite the email addresses for recipients in a single domain or subdomain, use the following syntax:

```
New-AddressRewriteEntry -Name "<Descriptive Name>" -
InternalAddress <domain or subdomain> -ExternalAddress
<domain> [-OutboundOnly <$true | $false>]
```

The following example rewrites the email addresses of all messages entering and leaving the Exchange organization for recipients in the contoso.com domain. Outbound messages are rewritten so they appear to come from the fabrikam.com domain. Inbound messages sent to fabrikam.com email addresses are rewritten to contoso.com for delivery to the recipients (the *OutboundOnly* parameter is `$false` by default).

```
New-AddressRewriteEntry -Name "Contoso to Fabrikam" -
InternalAddress contoso.com -ExternalAddress fabrikam.com
```

The following example rewrites the email addresses of all messages leaving the Exchange organization that are sent by recipients in the sales.contoso.com subdomain. Outbound messages are rewritten so they appear to come from the contoso.com domain. Inbound messages sent to contoso.com email addresses aren't rewritten.

```
New-AddressRewriteEntry -Name "sales.contoso.com to
contoso.com" -InternalAddress sales.contoso.com -
ExternalAddress contoso.com -OutboundOnly $true
```

Rewrite email addresses for recipients in multiple subdomains

To rewrite the email addresses for recipients in a domain and all subdomains, use the following syntax.

```
New-AddressRewriteEntry -Name "<Descriptive Name>" -
InternalAddress *.<domain> -ExternalAddress <domain> -
OutboundOnly $true [-ExceptionList <domain1,domain2...>]
```

The following example rewrites the email addresses of all messages leaving the Exchange organization that are sent by recipients in the contoso.com domain and all subdomains. Outbound messages are rewritten so they appear to come from the contoso.com domain. Inbound messages sent to contoso.com recipients can't be rewritten because a wildcard is used in the *InternalAddress* parameter.

```
New-AddressRewriteEntry -Name "Rewrite all contoso.com
subdomains" -InternalAddress *.contoso.com -ExternalAddress
contoso.com -OutboundOnly $true
```

The following example is just like the previous example, except now messages sent by recipients in the legal.contoso.com and corp.contoso.com subdomains are never rewritten:

```
New-AddressRewriteEntry -Name "Rewrite all contoso.com
subdomains except legal.contoso.com and corp.contoso.com" -
InternalAddress *.contoso.com -ExternalAddress contoso.com
-OutboundOnly $true -ExceptionList
legal.contoso.com,corp.contoso.com
```

How do you know this worked?

To verify that you have successfully created address rewrite entries, do the following:
1. Run the command `Get-AddressRewriteEntry <AddressRewriteEntryIdentity> | Format-List` and

verify the settings displayed are the settings you configured.
2. From a mailbox that's affected by an address rewrite entry, send a test message to an external mailbox. Verify the test message appears to originate from the rewritten email address.
3. Reply to the test message from the external mailbox. Verify the original mailbox receives the reply.

Use the Shell to modify address rewrite entries

The configuration options that are available when you modify an existing address rewrite entry are identical to the configuration options when you create a new address rewrite entry.

Modify address rewrite entries for single recipients

To modify an address rewrite entry that rewrites the email address of a single recipient, use the following syntax:

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -Name
"<Descriptive Name>" -InternalAddress <internal email
address> -ExternalAddress <external email address> -
OutboundOnly <$true | $false>
```

The following example modifies the following properties of the single recipient address rewrite entry named "joe@contoso.com to support@nortwindtraders.com":

- Changes the external address to support@northwindtraders.net.
- Changes the name of the address rewrite entry to "joe@contoso.com to support@northwindtraders.net".
- Changes the value of *OutboundOnly* to `$true`. Note that this change requires you to configure support@northwindtraders.net as a proxy address on Joe's mailbox.

```
Set-AddressRewriteEntry "joe@contoso.com to
support@nortwindtraders.com" -Name "joe@contoso.com to
support@northwindtraders.net" -ExternalAddress
support@northwindtraders.net -OutboundOnly $true
```

Modify address rewrite entries for recipients in single domains or subdomains

To modify an address rewrite entry that rewrites the email addresses of recipients from a single domain or subdomain, use the following syntax.

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -Name
"<Descriptive Name>" -InternalAddress <domain or subdomain>
-ExternalAddress <domain> -OutboundOnly <$true | $false>
```

The following example changes the internal address value of the single domain address rewrite entry named "Northwind Traders to Contoso".

```
Set-AddressRewriteEntry "Northwindtraders to Contoso" -
InternalAddress northwindtraders.net
```

Modify address rewrite entries for recipients in multiple subdomains

To modify an address rewrite entry that rewrites the email address of recipients in a domain and all subdomains, use the following syntax.

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -Name
"<Descriptive Name>" -InternalAddress *.<domain> -
ExternalAddress <domain> -ExceptionList <list of domains>
```

To replace the existing exception list values of a multiple subdomain address rewrite entry, use the following syntax:

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -
ExceptionList <domain1,domain2,...>
```

The following example replaces the existing exception list for the multiple subdomain address rewrite entry named Contoso to Northwind Traders with the values marketing.contoso.com and legal.contoso.com:

```
Set-AddressRewriteEntry "Contoso to Northwind Traders" -
ExceptionList sales.contoso.com,legal.contoso.com
```

To selectively add or remove exception list values from a multiple subdomain address rewrite entry without modifying any existing exception list values, use the following syntax:

```
Set-AddressRewriteEntry <AddressRewriteEntryIdentity> -
ExceptionList @{Add="<domain1>","<domain2>"...;
Remove="<domain1>","<domain2>"...}
```

The following example adds finanace.contoso.com and removes marketing.contoso.com from the exception list of the multiple subdomain address rewrite entry named Contoso to Northwind Traders:

```
Set-AddressRewriteEntry "Contoso to Northwind Traders" -
ExceptionList @{Add="finanace.contoso.com";
Remove="marketing.contoso.com"}
```

How do you know this worked?

To verify that you have successfully modified an address rewrite entry, do the following:
1. Run the command `Get-AddressRewriteEntry <AddressRewriteEntryIdentity> | Format-List` and

verify the settings displayed are the settings you configured.
2. From a mailbox that's affected by an address rewrite entry, send a test message to an external mailbox. Verify the test message appears to originate from the rewritten email address.
3. From the external mailbox, reply to the test message. Verify the original mailbox receives the reply.

Use the Shell to remove address rewrite entries

To remove a single address rewrite entry, use the following syntax:

```
Remove-AddressRewriteEntry <AddressRewriteEntryIdentity>
```

The following example removes the address rewrite entry named "Contoso.com to Northwindtraders.com":

```
Remove-AddressRewriteEntry "Contoso.com to
Northwindtraders.com"
```

To remove multiple address rewrite entries, use the following syntax:

```
Get-AddressRewriteEntry [<search criteria>] | Remove-
AddressRewriteEntry [-WhatIf]
```

The following example removes all address rewrite entries:

```
Get-AddressRewriteEntry | Remove-AddressRewriteEntry
```

The following example simulates the removal of address rewrite entries that contain the text "to contoso.com" in the name. The *WhatIf* switch allows you to preview the result without committing any changes.

```
Get-AddressRewriteEntry "*to contoso.com" | Remove-
AddressRewriteEntry -WhatIf
```

If you are satisfied with the result, run the command again without the *WhatIf* switch to remove the address rewrite entries.

```
Get-AddressRewriteEntry "*to contoso.com" | Remove-
AddressRewriteEntry
```

How do you know this worked?

To verify that you have successfully removed an address rewrite entry, do the following:

1. Run the command `Get-AddressRewriteEntry`, and verify that the address rewrite entries you removed aren't listed.

2. From a mailbox that's affected by an address rewrite entry, send a test message to an external mailbox. Verify the test message is no longer affected by the removed address rewrite entry.
3. From the external mailbox, reply to the test message. Verify the original mailbox receives the reply and that the message is unaffected by the removed address rewrite entry.

Import address rewrite entries on Edge Transport servers

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-10*

You can bulk-create or import address rewriting information into an Edge Transport server by using a comma-separated value (CSV) file. The following list describes common scenarios that require you to do this:

- You are replacing an address rewriting solution with an Edge Transport server.
- You enter into an agreement with a third-party solution provider that requires you to rewrite their email addresses.
- You acquire another organization, and you need to temporarily rewrite the email addresses in the acquired organization.

You can use any text editor, like Notepad, or an application like Microsoft Excel, to create the CSV file. Format the file as described in this topic and save it as a .csv file.

The first row, or *header row*, of the CSV file lists the names of the parameters. Each parameter is separated by a comma. The required and optional parameters are described in the following table.

Parameter	Required or optional	Description
Name	Required	A unique, descriptive name for the address rewrites entry.
InternalAddress	Required	The address you want to change. You can use the following values: • A single email address (chris@contoso.com) • A single domain or subdomain (contoso.com or sales.contoso.com)

		• A domain and all subdomains (*.contoso.com)
ExternalAddress	Required	The final email address you want. You can use the following values: • A single email address if you specified a single email address for *InternalAddress* • A single domain or subdomain for all other values of *InternalAddress*
ExceptionList	Optional	Available only when you are rewriting email addresses in a domain and all subdomains (*.contoso.com). Specifies one or more subdomains you want to exclude from address rewriting. Enclose the value in double quotation marks, and separate multiple values by commas. For example, `"marketing.contoso.com"` or `"marketing.contoso.com,legal.contoso.com"`.
OutboundOnly	Optional	`False` means that addresses are written on inbound and outbound mail. `True` means that addresses are rewritten on outbound mail only, and you need to manually configure the rewritten email address as a proxy address on the affected recipients. The default value is `False`, but you must set it to `True` if *InternalAddress* contains the

		wildcard character (*.contoso.com). The *OutboundOnly* parameter value in the CSV file is `True` or `False`, not `$True` or `$False`.

Each row under the header row represents an individual address rewrite entry. The values in each row must be in the same order as the parameter names in the header row. Each value is separated by a comma.

What do you need to know before you begin?

- Estimated time to complete this task: 30 minutes
- Make sure you understand the ramifications of address rewriting. For example, the rewritten email address must be unique in your Exchange organization, and you might need to configure proxy addresses on the affected recipients. For more information, see Address rewriting on Edge Transport servers and Manage address rewriting on Edge Transport servers.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Address Rewriting agent" entry in the Mail flow permissions topic.
- If you have more than one Edge Transport server, we recommend that you use the procedures in this topic to import the address rewrite entries into a single Edge Transport server and then clone the configuration of that Edge Transport server to the other Edge Transport servers in your organization. For more information about how to clone an Edge Transport server, see Edge Transport server cloned configuration.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

How do you do this?

Step 1: Create the CSV file

When you create the CSV file, consider the following items:

- If you specify values for optional parameters in the CSV file, every row must include a value in that column. If you want to create multiple address rewrite entries where some entries have optional parameters and some entries do not, you need to separate those address rewrite entries into two separate CSV files and then import each CSV file separately.

- If the CSV file contains non-ASCII characters, be sure to save the CSV file with UTF-8 encoding or other Unicode encoding. Depending on the application, saving the CSV file with UTF-8 encoding or other Unicode encoding might be easier when the system locale of the computer matches the language used in the CSV file.

The following example shows how a CSV file can be populated with the optional *ExceptionList* and *OutboundOnly* parameters included:

```
Name,InternalAddress,ExternalAddress,ExceptionList,Outbound
Only
"Wingtip
UK",*.wingtiptoys.co.uk,tailspintoys.com,"legal.wingtiptoys
.co.uk,finance.wingtiptoys.co.uk,support.wingtiptoys.co.uk"
,True
"Wingtip
USA",*.wingtiptoys.com,tailspintoys.com,"legal.wingtiptoys.
com,finance.wingtiptoys.com,support.wingtiptoys.com,corp.wi
ngtiptoys.com",True
"Wingtip
Canada",*.wingtiptoys.ca,tailspintoys.com,"legal.wingtiptoy
s.ca,finance.wingtiptoys.ca,support.wingtiptoys.ca",True
```

Step 2: Import the CSV file

To import the CSV file, use the following syntax:

```
Import-Csv <FileNameAndPath> | ForEach {New-
AddressRewriteEntry -Name $_.Name -InternalAddress
$_.InternalAddress -ExternalAddress $_.ExternalAddress -
OutboundOnly ([Bool]::Parse($_.OutboundOnly)) -
ExceptionList $_.ExceptionList}
```

This example imports the address rewrite entries from C:\My Documents \ImportAddressRewriteEntries.csv.

```
Import-Csv "C:\My Documents
\ImportAddressRewriteEntries.csv" | ForEach {New-
AddressRewriteEntry -Name $_.Name -InternalAddress
$_.InternalAddress -ExternalAddress $_.ExternalAddress -
OutboundOnly ([Bool]::Parse($_.OutboundOnly)) -
ExceptionList $_.ExceptionList}
```

How do you know this step worked?

To verify that you have successfully imported address rewrite entries from a CSV file, do the following:

1. To see all address rewrite entries, run the command `Get-AddressRewriteEntry`.
2. To see details about a specific address rewrite entry, run the command `Get-AddressRewriteEntry <AddressRewriteIdentity> | Format-List`

High availability and site resilience

Exchange Server 2013 >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-01*

You can protect your Exchange Server 2013 mailbox databases and the data they contain by configuring your Mailbox servers and databases for high availability and site resilience. Exchange 2013 minimizes the cost and complexity of deploying a highly available and resilient messaging solution while providing high levels of service and data availability and support for very large mailboxes.

Exchange 2013 enables customers of all sizes and in all segments to economically deploy a messaging continuity service in their organization by building on the native replication capabilities and high availability architecture introduced in Exchange 2010. For a list of changes over Exchange 2010 and Exchange 2007, see Changes to high availability and site resilience over previous versions.

Contents

Key terminology

The following key terms are important to understand high availability or site resilience:

Active Manager

An internal Exchange component which runs inside the Microsoft Exchange Replication service

that's responsible for failure monitoring and corrective action through failover within a database availability group (DAG).

AutoDatabaseMountDial

A property setting of a Mailbox server that determines whether a passive database copy will automatically mount as the new active copy, based on the number of log files missing by the copy being mounted.

Continuous replication - block mode

In block mode, as each update is written to the active database copy's active log buffer, it's also shipped to a log buffer on each of the passive mailbox copies in block mode. When the log buffer is full, each database copy builds, inspects, and creates the next log file in the generation sequence.

Continuous replication - file mode

In file mode, closed transaction log files are pushed from the active database copy to one or more passive database copies.

Database availability group

A group of up to 16 Exchange 2013 Mailbox servers that hosts a set of replicated databases.

Database mobility

The ability of an Exchange 2013 mailbox database to be replicated to and mounted on other Exchange 2013 Mailbox servers.

Datacenter

Typically this refers to an Active Directory site; however, it can also refer to a physical site. In the context of this documentation, datacenter equals Active Directory site.

Datacenter Activation Coordination mode

A property of the DAG setting that, when enabled, forces the Microsoft Exchange Replication service to acquire permission to mount databases at startup.

Disaster recovery

Any process used to manually recover from a failure. This can be a failure that affects a single item, or it can be a failure that affects an entire physical location.

Exchange third-party replication API

An Exchange-provided API that enables use of third-party synchronous replication for a DAG instead of continuous replication.

High availability

A solution that provides service availability, data availability, and automatic recovery from failures that affect the service or data (such as a network, storage, or server failure).

Incremental deployment

The ability to deploy high availability and site resilience after Exchange 2013 is installed.

Lagged mailbox database copy

A passive mailbox database copy that has a log replay lag time greater than zero.

Mailbox database copy

A mailbox database (.edb file and logs), which is either active or passive.

Mailbox resiliency

The name of a unified high availability and site resilience solution in Exchange 2013.

Managed availability

A set of internal processes made up of probes, monitors, and responders that incorporate monitoring and high availability across all server roles and all protocols.

**over* (pronounced "star over")

Short for *switchovers* and *failovers*. A switchover is a manual activation of one or more database copies. A failover is an automatic activation of one or more database copies after a failure.

Safety Net

Formerly known as transport dumpster, this is a feature of the transport service that stores a copy of all messages for *X* days. The default setting is 2 days.

Shadow redundancy

A transport server feature that provides redundancy for messages for the entire time they're in transit.

Site resilience

A configuration that extends the messaging infrastructure to multiple Active Directory sites to provide operational continuity for the messaging system in the event of a failure affecting one of the sites.

Return to top

Database availability groups

A DAG is the base component of the high availability and site resilience framework built into Exchange 2013. A DAG is a group of up to 16 Mailbox servers that host a set of databases and provides automatic, database-level recovery from failures that affect individual databases, networks, or servers. Any server in a DAG can host a copy of a mailbox database from any other server in the DAG. When a server is added to a DAG, it works with the other servers in the DAG to provide automatic recovery from failures that affect mailbox databases, such as a disk failure or server failure. For more information about DAGs, see Database availability groups.

Return to top

Mailbox database copies

The high availability and site resilience features used first introduced in Exchange 2010 are used in Exchange 2013 to create and maintain database copies. Exchange 2013 also leverages the concept of database mobility, which is Exchange-managed database-level failovers.

Database mobility disconnects databases from servers and adds support for up to 16 copies of a single database. It also provides a native experience for creating copies of a database.

Setting a database copy as the active mailbox database is known as a *switchover*. When a failure affecting a database or access to a database occurs and a new database becomes the active copy,

this process is known as a *failover*. This process also refers to a server failure in which one or more servers bring online the databases previously online on the failed server. When either a switchover or failover occurs, other Exchange 2013 servers become aware of the switchover almost immediately and redirect client and messaging traffic to the new active database.

For example, if an active database in a DAG fails because of an underlying storage failure, Active Manager will automatically recover by failing over to a database copy on another Mailbox server in the DAG. In Exchange 2013, managed availability adds new behaviors to recover from loss of protocol access to a database, including recycling application worker pools, restarting services and servers, and initiating database failovers.

For more information about mailbox database copies, see Mailbox database copies.

Return to top

Active Manager

Exchange 2013 leverages the Active Manager component introduced in Exchange 2010 to manage the database and database copy health, status, continuous replication, and other aspects of Mailbox server high availability. For more information about Active Manager, see Active Manager.

Return to top

Site resilience

Although Exchange 2013 continues to use DAGs and Windows Failover Clustering for Mailbox server role high availability and site resilience, site resilience isn't the same in Exchange 2013. Site resilience is much better in Exchange 2013 because it has been simplified. The underlying architectural changes that were made in Exchange 2013 have significant impact on the recovery aspects of a site resilience configuration.

In Exchange 2010, mailbox (DAG) and client access (Client Access server array) recovery were tied together. If you lost all of your Client Access servers, the VIP for the array, or a significant portion of your DAG, you were in a situation where you needed to do a datacenter switchover. This is a well-documented and generally well-understood process, although it takes time to perform, and requires human intervention to begin the process.

In Exchange 2013, if you lose your Client Access server array for whatever reason (for example, the load balancer fails), you don't need to perform a datacenter switchover. With the proper configuration, failover happens at the client level and clients are automatically redirected to a second datacenter that has operating Client Access servers, and those operating Client Access servers proxy the communication back to the user's Mailbox server, which remains unaffected by the outage (because you don't do a switchover). Instead of working to recover service, the service recovers itself and you can focus on fixing the core issue (for example, replacing the failed load balancer).

Furthermore, with the namespace simplification, consolidation of server roles, de-coupling of Active Directory site server role requirements, separation of Client Access server array and DAG recovery, and load balancing changes, there are changes in Exchange 2013 that now enable both Client Access server and DAG recovery to be separate and automatic across sites, thereby providing datacenter failover scenarios, if you have three locations.

In Exchange 2010, you could deploy a DAG across two datacenters and host the witness in a third datacenter and enable failover for the Mailbox server role for either datacenter. But you didn't get failover for the solution itself, because the namespace still needed to be manually changed for the non-Mailbox server roles.

In Exchange 2013, the namespace doesn't need to move with the DAG. Exchange leverages fault tolerance built into the namespace through multiple IP addresses, load balancing (and if need be, the ability to take servers in and out of service). Modern HTTP clients work with this redundancy automatically. The HTTP stack can accept multiple IP addresses for a fully qualified domain name (FQDN), and if the first IP address it tries fails hard (that is, it can't connect), it will try the next IP address in the list. In a soft failure (connection is lost after the session is established, perhaps due to an intermittent failure in the service where, for example, a device is dropping packets and needs to be taken out of service), the user might need to refresh their browser.

This means the namespace is no longer a single point of failure as it was in Exchange 2010. In Exchange 2010, perhaps the biggest single point of failure in the messaging system is the FQDN that you give to users because it tells the user where to go. In the Exchange 2010 paradigm, changing where that FQDN goes isn't easy because you have to change DNS, and then handle DNS latency, which in some parts of the world is challenging. And you have name caches in browsers that are typically about 30 minutes or more that also have to be handled.

One of the changes in Exchange 2013 is to enable clients to have more than one place to go. Assuming the client has the ability to use more than one place to go (almost all the client access protocols in Exchange 2013 are HTTP based (examples include Outlook, Outlook Anywhere, EAS, EWS, OWA, and EAC), and all supported HTTP clients have the ability to use multiple IP addresses), thereby providing failover on the client side. You can configure DNS to hand multiple IP addresses to a client during name resolution. The client asks for mail.contoso.com and gets back two IP addresses, or four IP addresses, for example. However many IP addresses the client gets back will be used reliably by the client. This makes the client a lot better off because if one of the IP addresses fails, the client has one or more other IP addresses to try to connect to. If a client tries one and it fails, it waits about 20 seconds and then tries the next one in the list. Thus, if you lose the VIP for the Client Access server array, recovery for the clients happens automatically, and in about 21 seconds.

The benefits include the following:

- In Exchange 2010, if you lose the load balancer in your primary datacenter and you don't have another one in that site, you had to do a datacenter switchover. In Exchange 2013, if you lose the load balancer in your primary site, you simply turn it off (or maybe turn off the VIP) and repair or replace it. Clients that aren't already using the VIP in the secondary datacenter will automatically

fail over to the secondary VIP without any change of namespace, and without any change in DNS. Not only does that mean you no longer have to perform a switchover, but it also means that all of the time normally associated with a datacenter switchover recovery isn't spent. In Exchange 2010, you had to handle DNS latency (hence, the recommendation to set the Time to Live (TTL) to 5 minutes, and the introduction of the failback URL). In Exchange 2013, you don't need to do that because you get fast failover (20 seconds) of the namespace between VIPs (datacenters).

- Because you can fail over the namespace between datacenters, all that's needed to achieve a datacenter failover is a mechanism for failover of the Mailbox server role across datacenters. To get automatic failover for the DAG, you simply architect a solution where the DAG is evenly split between two datacenters, and then place the witness server in a third location so that it can be arbitrated by DAG members in either datacenter, regardless of the state of the network between the datacenters that contain the DAG members.
- In this scenario, the administrator's efforts are geared toward simply fixing the problem, and not spent restoring service. You simply fix the thing that failed; while service has been running and data integrity has been maintained. The urgency and stress level you feel when fixing a broken device is nothing like the urgency and stress you feel when you're working to restore service. It's better for the end user, and less stressful for the administrator.

You can allow failover to occur without having to perform switchbacks (sometimes mistakenly referred to as failbacks). If you lose Client Access servers in your primary datacenter and that results in a 20 second interruption for clients, you might not even care about failing back. At this point, your primary concern would be fixing the core issue (for example, replacing the failed load balancer). After it's back online and functioning, some clients will start using it, and other clients might remain operational through the second datacenter.

Exchange 2013 also provides functionality that enables administrators to deal with intermittent failures. An intermittent failure is where, for example, the initial TCP connection can be made, but nothing happens afterward. An intermittent failure requires some sort of extra administrative action to be taken because it might be the result of a replacement device being put into service. While this repair process is occurring, the device might be powered on and accepting some requests, but not really ready to service clients until the necessary configuration steps are performed. In this scenario, the administrator can perform a namespace switchover by simply removing the VIP for the device being replaced from DNS. Then during that service period, no clients will be trying to connect to it. After the replacement process has completed, the administrator can add the VIP back to DNS, and clients will eventually start using it.

For details about planning and deploying site resilience, see Planning for high availability and site resilience and Deploying high availability and site resilience.

Return to top

Third-party replication API

Exchange 2013 also includes a third-party replication API that enables organizations to use third-party synchronous replication solutions instead of the built-in continuous replication feature.

Microsoft supports third-party solutions that use this API, provided that the solution provides the necessary functionality to replace all native continuous replication functionality that's disabled as a result of using the API. Solutions are supported only when the API is used within a DAG to manage and activate mailbox database copies. Use of the API outside of these boundaries isn't supported. In addition, the solution must meet the applicable Windows hardware support requirements. (Test validation isn't required for support.)

When deploying a solution that uses the built-in third-party replication API, be aware that the solution vendor is responsible for primary support of the solution. Microsoft supports Exchange data for both replicated and non-replicated solutions. Solutions that use data replication must adhere to the Microsoft support policy for data replication, as described in Microsoft Knowledge Base article 895847, Multi-site data replication support for Exchange Server. In addition, solutions that utilize the Windows Failover Cluster resource model must meet Windows cluster supportability requirements as described in Microsoft Knowledge Base article 943984, The Microsoft Support Policy for Windows Server 2008 or Windows Server 2008 R2 Failover Clusters or The Microsoft Support Policy for Windows Server 2012 Failover Clusters.

Microsoft's backup and restore support policy for deployments that use third-party replication API-based solutions is the same as for native continuous replication deployments.

If you're a partner seeking information about the third-party API, contact your Microsoft representative.

Changes to high availability and site resilience over previous versions

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013*

Topic Last Modified: *2014-07-24*

Exchange 2013 uses DAGs and mailbox database copies, along with other features such as single item recovery, retention policies, and lagged database copies, to provide high availability, site resilience, and Exchange native data protection. The high availability platform, Exchange Information Store and Extensible Storage Engine (ESE) have all been enhanced to provide greater availability and easier management, and to reduce costs. These enhancements include:

- **Reduction in IOPS over Exchange 2010** This enables you to leverage larger disks in terms of capacity and IOPS as efficiently as possible.
- **Managed availability** With managed availability, internal monitoring and recovery-oriented features are tightly integrated to help prevent failures, proactively restore services, and initiate server failovers automatically or alert administrators to take action. The focus is on monitoring and managing the end-user experience rather than just server and component uptime to help keep the service continuously available.
- **Managed Store** The Managed Store is the name of the newly rewritten Information Store processes in Exchange 2013. The new Managed Store is written in C# and tightly integrated with the Microsoft Exchange Replication service (MSExchangeRepl.exe) to provide higher availability through improved resiliency.
- **Support for multiple databases per disk** Exchange 2013 includes enhancements that enable you to support multiple databases (mixtures of active and passive copies) on the same disk,

thereby leveraging larger disks in terms of capacity and IOPS as efficiently as possible.

- **AutoReseed** Automatic reseeding capability enables you to quickly restore database redundancy after disk failure. If a disk fails, the database copy stored on that disk is copied from the active database copy to a spare disk on the same server. If multiple database copies were stored on the failed disk, they can all be automatically reseeded on a spare disk. This enables faster reseeds, as the active databases are likely to be on multiple servers and the data is copied in parallel.
- **Automatic recovery from storage failures** This feature continues the innovation introduced in Exchange 2010 to allow the system to recover from failures that affect resiliency or redundancy. In addition to the Exchange 2010 bugcheck behaviors, Exchange 2013 includes additional recovery behaviors for long I/O times, excessive memory consumption by MSExchangeRepl.exe, and severe cases where the system is in such a bad state that threads can't be scheduled.
- **Lagged copy enhancements** Lagged copies can now care for themselves to a certain extent using automatic log play down. Lagged copies will automatically play down log files in a variety of situations, such as page patching and low disk space scenarios. If the system detects that page patching is required for a lagged copy, the logs will be automatically replayed into the lagged copy to perform page patching. Lagged copies will also invoke this auto replay feature when a low disk space threshold has been reached, and when the lagged copy has been detected as the only available copy for a specific period of time. In addition, lagged copies can leverage Safety Net, making recovery or activation much easier.
- **Single copy alert enhancements** The single copy alert introduced in Exchange 2010 is no longer a separate scheduled script. It's now integrated into the managed availability components within the system and is a native function within Exchange.
- **DAG network auto-configuration** DAG networks can be automatically configured by the system based on configuration settings. In addition to manual configuration options, DAGs can also distinguish between MAPI and replication networks and configure DAG networks automatically.

Reduction in IOPS over Exchange 2010

In Exchange 2010, passive database copies have a very low checkpoint depth, which is required for fast failover. In addition, the passive copy performs aggressive pre-reading of data to keep up with a 5-megabyte (MB) checkpoint depth. As a result of using a low checkpoint depth and performing these aggressive pre-read operations, IOPS for a passive database copy was equal to IOPS for an active copy in Exchange 2010.

In Exchange 2013, the system is able to provide fast failover while using a high checkpoint depth on the passive copy (100 MB). Because passive copies have 100-MB checkpoint depth, they've been de-tuned to no longer be so aggressive. As a result of increasing the checkpoint depth and de-tuning the aggressive pre-reads, IOPS for a passive copy is about 50 percent of the active copy IOPS in Exchange 2013.

Having a higher checkpoint depth on the passive copy also results in other changes. On failover in Exchange 2010, the database cache is flushed as the database is converted from a passive copy to

an active copy. In Exchange 2013, ESE logging was rewritten so that the cache is persisted through the transition from passive to active. Because ESE doesn't need to flush the cache, you get fast failover.

One other change was made to the background database maintenance (BDM) process. BDM now processes around 1-2 MB per second per copy.

As a result of these changes, Exchange 2013 provides a significant reduction in IOPS over Exchange 2010.

Managed Availability

Managed Availability is the integration of built-in, active monitoring and the Exchange 2013 high availability platform. With Managed Availability, the system can make a determination on when to fail over a database based on service health. Managed Availability is an internal infrastructure that's deployed on the Client Access and Mailbox server roles in Exchange 2013. Managed Availability includes three main asynchronous components that are constantly doing work. The first component is the probe engine, which is responsible for taking measurements on the server and collecting data. The results of those measurements flow into the second component, the monitor. The monitor contains all of the business logic used by the system based on what is considered healthy on the data collected. Similar to a pattern recognition engine, the monitor looks for the various different patterns on all the collected measurements, and then it decides whether something is considered healthy. Finally, there is the responder engine, which is responsible for recovery actions. When something is unhealthy, the first action is to attempt to recover that component. This could include multi-stage recovery actions; for example, the first attempt may be to restart the application pool, the second may be to restart the service, the third attempt may be to restart the server, and the subsequent attempt may be to take the server offline so that it no longer accepts traffic. If the recovery actions are unsuccessful, the system escalates the issue to a human through event log notifications.

Managed availability is implemented in the form of two services:

- **Exchange Health Manager Service (MSExchangeHMHost.exe)** This is a controller process that's used to manage worker processes. It's used to build, execute, and start and stop the worker process as needed. It's also used to recover the worker process in case that process crashes, to prevent the worker process from being a single point of failure.
- **Exchange Health Manager Worker process (MSExchangeHMWorker.exe)** This is the worker process that's responsible for performing the runtime tasks.

Managed availability uses persistent storage to perform its functions:

- XML configuration files are used to initialize the work item definitions during startup of the worker process.
- The registry is used to store runtime data, such as bookmarks.
- The crimson channel event log infrastructure is used to store the work item results.

For more information about managed availability, see Managed Availability.

Managed Store

All previous versions of Exchange Server, from Exchange Server 4.0 to Exchange Server 2010, have supported running a single instance of the Information Store process (Store.exe) on the Mailbox server role. This single Store instance hosts all databases on the server: active, passive, lagged, and recovery. In the previous Exchange architectures, there is little, if any, isolation between the different databases hosted on a Mailbox server. An issue with a single mailbox database has the potential to negatively affect all other databases, and crashes resulting from a mailbox corruption can affect service for all users whose databases are hosted on that server.

Another challenge with a single Store instance in previous versions of Exchange is that the Extensible Storage Engine (ESE) scales well to 8-12 processor cores, but beyond that, cross-processor communication and cache synchronization issues lead to negative scale. Given today's much larger servers, with 16+ core systems available, this would mean impose the administrative challenge of managing the affinity of 8-12 cores for ESE and using the other cores for non-Store processes (for example, Assistants, Search Foundation, Managed Availability, etc.). Moreover, the previous architecture restricted scale-up for the Store process.

The Store.exe process has evolved considerably throughout the years as Exchange Server itself evolved, but as a single process, ultimately its scalability is limited, and it represents a single point of failure. Because of these limits, Store.exe is gone in Exchange 2013 and replaced by the Managed Store.

For more information, see Managed Store.

Multiple databases per volume

Although the storage improvements in Exchange 2013 are designed primarily for just a bunch of disks (JBOD) configurations, they're available for use by all supported storage configurations. One such feature is the ability to host multiple databases on the same volume. This feature is about Exchange optimizing for large disks. These optimizations result in a much more efficient use of large disks in terms of capacity, IOPS, and reseed times, and they're meant to address the challenges associated with running in a JBOD storage configuration:

- Database sizes must be manageable.
- Reseed operations must be fast and reliable.
- Although storage capacity is increasing, IOPS aren't.
- Disks hosting passive database copies are underutilized in terms of IOPS.
- Lagged copies have asymmetric storage requirements.
- Limited agility exists to recover from low disk space conditions.

The trend of increasing storage capacity is continuing, with 8-terabyte drives expected to be available soon. When using 8-terabyte drives in conjunction with the Exchange maximum database size best practices guidelines (2 terabytes), you would waste more than 5 terabytes of disk space. One solution would be to simply grow the databases larger, but that inhibits manageability

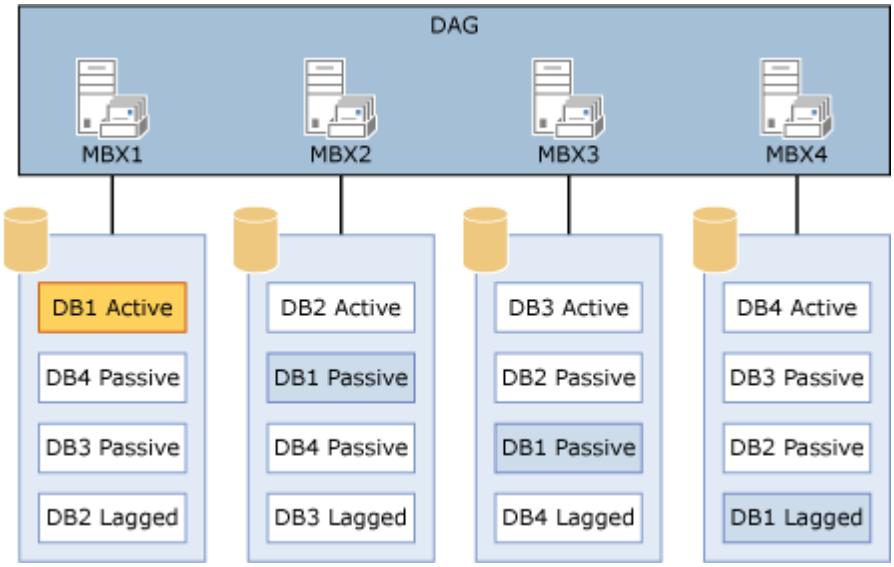
because it introduces long reseed times, including in some cases, operationally unmanageable reseed times, and the reliability of copying that amount of data over the network is compromised.

In addition, in the Exchange 2010 model, the disk storing a passive copy is underutilized in terms of IOPS. In the case of a lagged passive copy, not only is the disk underutilized in terms of IOPS, but it's also asymmetric in terms of its size, relative to the disks used to store the active and non-lagged passive copies.

Continuing a long-standing practice, Exchange 2013 is optimized so that it can use large disks (8 terabytes) in a JBOD configuration more efficiently. In Exchange 2013, with multiple databases per disk, you can have the same size disks storing multiple database copies, including lagged copies. The goal is to drive the distribution of users across the number of volumes that exist, providing you with a symmetric design where during normal operations each DAG member hosts a combination of active, passive, and optional lagged copies on the same volumes.

An example of a configuration that uses multiple databases per volume is illustrated below.

Configuration that uses multiple databases per volume



The above configuration provides a symmetrical design. All four servers have the same four databases all hosted on a single disk per server. The key is that the number of copies of each database that you have should be equal to the number of database copies per disk. In the above example, there are four copies of each database: one active copy, two passive copies, and one lagged copy. Because there are four copies of each database, the proper configuration is one that has four copies per volume. In addition, activation preference is configured so that it's balanced across the DAG and across each server. For example, the active copy will have an activation preference value of 1, the first passive copy will have an activation preference value of 2, the second passive copy will have an activation preference value of 3, and the lagged copy will have an activation preference value of 4.

In addition to having a better distribution of users across the existing volumes, another benefit of using multiple databases per disk is that it reduces the amount of time to restore data protection in the event of a failure that necessitates a reseed (for example, disk failure).

As a database gets bigger, reseeding the database takes longer. For example, a 2-terabyte

database could take 23 hours to reseed, whereas an 8-terabyte database could take as long as 93 hours (almost 4 days). Both seeds would occur at about 20 MB per second. This generally means that a very large database can't be seeded within an operationally reasonable amount of time.

In the case of a single database copy per disk scenario, the seeding operation is effectively source-bound, because it's always seeding the disk from a single source. By dividing the volume into multiple database copies, and by having the active copy of the passive databases on a specified volume stored on separate DAG members, the system is no longer source bound in the context of reseeding the disk. When a failed disk is replaced, it can be reseeded from multiple sources. This allows the system to reseed and restore data protection for these databases in a much shorter amount of time.

When using multiple databases per volume, we recommend adhering to the following best practices and requirements:

- A single logical disk partition per physical disk must be used. Don't create multiple partitions on the disk. Each database copy and its companion files (such as transaction logs and content index) should be hosted in a unique directory on the single partition.
- The number of database copies configured per volume should be equal to the number of copies of each database. For example, if you have four copies of your databases, you should use four database copies per volume.
- Database copies should have the same neighbors. (For example, they should all share the same disk on each server.)
- Activation preference across the DAG should be balanced, such that each database copy on a specified disk has a unique activation preference value.

AutoReseed

Automatic reseed, or AutoReseed, is a feature that's the replacement for what is normally administrator-driven action in response to a disk failure, database corruption event, or other issue that necessitates a reseed of a database copy. AutoReseed is designed to automatically restore database redundancy after a disk failure by using spare disks that have been provisioned on the system.

For more information, see AutoReseed. For detailed steps to configure AutoReseed, see Configure AutoReseed for a database availability group.

Automatic recovery from storage failures

Automatic recovery from storage failures continues the innovation introduced in Exchange 2010 to allow the system to recover from failures that affect resiliency or redundancy. In addition to the Exchange 2010 bugcheck behaviors, Exchange 2013 includes additional recovery behaviors for long I/O times, excessive memory consumption by the Microsoft Exchange Replication service (MSExchangeRepl.exe), and severe cases where threads can't be scheduled.

Even in JBOD environments, storage array controllers can have issues, such as crashing or hanging. Exchange 2010 included hung I/O detection and recovery features that provided enhanced resilience. These features are listed in the following table.

Name	Check	Action	Threshold
ESE Database Hung IO Detection	ESE checks for outstanding I/Os	Generates a failure item in the crimson channel to restart the server	240 seconds
Failure Item Channel Heartbeat	Ensures failure items can be written to and read from crimson channel	Replication service heartbeats crimson channel and restart server on failures	30 seconds
System Disk Heartbeat	Verifies server's system disk state	Periodically sends unbuffered I/O to system disk; restarts server on heartbeat time out	120 seconds

Exchange 2013 enhances server and storage resilience by including new behaviors for other serious conditions. These conditions and behaviors are described in the following table.

Name	Check	Action	Threshold
System bad state	No threads, including non-managed threads, can be scheduled	Restart the server	302 seconds
Long I/O times	I/O operation latency measurements	Restart the server	41 seconds
Replication service memory use	Measure the working set of MSExchangeRepl.exe	1. Log event 4395 in the crimson channel with a service termination request 2. Initiate termination of MSExchangeRepl.exe	4 gigabyte (GB)

		3. If service termination fails, restart the server	
System Event 129 (Bus reset)	Check for Event 129 in System event log	Restart the server	When event occurs
Cluster database hang	Global Update Manager updates are blocked	Restart the server	When event occurs

Lagged copy enhancements

Lagged copy enhancements include integration with Safety Net and automatic play down of log files in certain scenarios. Safety Net is a feature of transport that replaces the Exchange 2010 feature known as transport dumpster. Safety Net is similar to transport dumpster, in that it's a delivery queue that's associated with the Transport service on a Mailbox server. This queue stores copies of messages that were successfully delivered to the active mailbox database on the Mailbox server. Each active mailbox database on the Mailbox server has its own queue that stores copies of the delivered messages. You can specify how long Safety Net stores copies of the successfully delivered messages before they expire and are automatically deleted.

Safety Net takes some responsibility from shadow redundancy in DAG environments. In DAG environments, shadow redundancy doesn't need to keep another copy of the delivered message in a shadow queue while it waits for the delivered message to replicate to the passive copies of mailbox databases on the other Mailbox servers in the DAG. The copy of the delivered message is already stored in Safety Net, so shadow redundancy can redeliver the message from Safety Net if necessary.

With the introduction of Safety Net, activating a lagged database copy becomes significantly easier. For example, consider a lagged copy that has a 2-day replay lag. In that case, you would configure Safety Net for a period of 2 days. If you encounter a situation in which you need to use your lagged copy, you can suspend replication to it, and copy it twice (to preserve the lagged nature of the database and to create an extra copy in case you need it). Then, take a copy and discard all the log files, except for those in the required range. Mount the copy, which triggers an automatic request to Safety Net to redeliver the last two days of mail. With Safety Net, you don't need to hunt for where the point of corruption was introduced. You get the last two days mail, minus the data ordinarily lost on a lossy failover.

Lagged copies can now care for themselves by invoking automatic log replay to play down the log files in certain scenarios:

- When a low disk space threshold is reached
- When the lagged copy has physical corruption and needs to be page patched
- When there are fewer than three available healthy copies (active or passive only; lagged database

copies are not counted) for more than 24 hours

In Exchange 2010, page patching wasn't available for lagged copies. In Exchange 2013, page patching is available for lagged copies through this automatic play down feature. If the system detects that page patching is required for a lagged copy, the logs are automatically replayed into the lagged copy to perform page patching. Lagged copies also invoke this auto replay feature when a low disk space threshold has been reached, and when the lagged copy has been detected as the only available copy for a specific period of time.

Lagged copy play down behavior is disabled by default, and can be enabled by running the following command.

```
Set-DatabaseAvailabilityGroup <DAGName> -
ReplayLagManagerEnabled $true
```

After being enabled, play down occurs when there are fewer than three copies. You can change the default value of 3, by modifying the following DWORD registry value.

HKLM\Software\Microsoft\ExchangeServer\v15\Replay\Parameters\ReplayLagManagerNumAvailableCopies

To enable play down for low disk space thresholds, you must configure the following registry entry.

HKLM\Software\Microsoft\ExchangeServer\v15\Replay\Parameters\ReplayLagPlayDownPercentDiskFreeSpace

After configuring either of these registry settings, restart the Microsoft Exchange DAG Management service for the changes to take effect.

As an example, consider an environment where a given database has 4 copies (3 highly available copies and 1 lagged copy), and the default setting is used for *ReplayLagManagerNumAvailableCopies*. If a non-lagged copy is out-of-service for any reason (for example, it is suspended, etc.) then the lagged copy will automatically play down its log files in 24 hours.

Single copy alert enhancements

Ensuring that your servers are operating reliably and that your mailbox database copies are healthy are primary objectives of daily Exchange 2013 messaging operations. You must actively monitor the hardware, the Windows operating system, and the Exchange services. But when running in an Exchange 2013 mailbox resiliency environment, it's important that you monitor the health and status of the DAG and your mailbox database copies. It's especially vital to perform data redundancy risk management and monitor for periods in which a replicated database is down to just a single copy. This is particularly critical in environments that don't use Redundant Array of Independent Disks (RAID) and instead deploy JBOD configurations. In a RAID environment, a single disk failure doesn't affect an active mailbox database copy. However, in a JBOD environment, a single disk failure will trigger a database failover.

In Exchange 2010, the script CheckDatabaseRedundancy.ps1 was introduced. As its name implies, the purpose of the script was to monitor the redundancy of replicated mailbox databases by validating that there is at least two configured, healthy, and current copies, and to alert an administrator through event log generation when only a single healthy copy of a replicated database exists. In this case, both active and passive copies are counted when determining redundancy.

Single copy conditions include, but aren't limited to:

- Failure of an active copy to replicate to any passive copy.
- Failure of all passive copies, which includes FailedAndSuspended and Failed states in addition to healthy states where the copy is behind in log copying or replay. Note that lagged copies aren't considered behind if they're within ten minutes in replaying their logs to their lag period.
- Failure of the system to accurately know the current log generation of the active copy.

Because it's a top priority for administrators to know when they're down to a single healthy copy of a database, the CheckDatabaseRedundancy.ps1 script has been replaced with integrated, native functionality that's part of managed availability's DataProtection Health Set.

The native functionality still alerts administrators through event log notifications, and to distinguish Exchange 2013 alerts from Exchange 2010, Exchange 2013 uses the following Event IDs:

- Event 4138 (Red Alert)
- Event 4139 (Green Alert)

In Exchange 2013, the native functionality has been enhanced to reduce the level of alert noise that can occur when multiple databases on the same server enter into a single copy condition. In Exchange 2010, single copy alerts were generated on a per-database level. As a result, when there was a server-wide issue that affected multiple databases and multiple database copies, alert storms could occur. Because several failures, such as controller or memory problems, are server-wide, there was a moderately high probability that such an alert storm would occur for each server incident. In Exchange 2013, alerts are now generated on a per-server basis. When an outage affects an entire server and data redundancy becomes at risk for multiple database copies, a single alert per server is now generated.

DAG network auto-configuration

A DAG network is a collection of one or more subnets used for either replication traffic or MAPI traffic. Each DAG contains a maximum of one MAPI network and zero or more replication networks. In Exchange 2010, the initial DAG networks (for example, DAGNetwork01 and DAGNetwork02) were created by the system based on the subnets enumerated by the Cluster service. In environments where multiple networks are used and the interfaces for a specified network (for example, the MAPI network) were on the same subnet, there was little additional configuration that an administrator needed to perform. However, in environments where the interfaces for a specified network were on multiple subnets, the administrator had to perform a task referred to as collapsing DAG networks.

In Exchange 2013, collapsing DAG networks is no longer necessary. Exchange 2013 still uses the

same detection mechanisms to distinguish between the MAPI and replication networks, but it now automatically collapses DAG networks as appropriate.

In addition, by default, DAG networks are now automatically managed by the system. To view DAG network properties using the Exchange Administration Center (EAC), you must configure the DAG for manual network control by modifying the properties of the DAG using EAC, or by using the **Set-DatabaseAvailabilityGroup** cmdlet to set the *ManualDagNetworkConfiguration* parameter to `True`.

Changes to best copy selection

Best copy selection (BCS) is an internal algorithm process for finding the best copy of an individual database to activate, given a list of potential copies for activation and their health and status. Active Manager selects the best available (and unblocked) copy to become the new active database copy when the existing active database copy fails or when an administrator performs a targetless switchover. In Exchange 2010, the BCS process evaluated several aspects of each database copy to determine the best copy to activate. These included:

- Copy queue length
- Replay queue length
- Database status
- Content index status

In Exchange 2013, Active Manager performs the same BCS checks and phases to determine replication health, but it now also includes the use of a constraint of the decreasing order of health states. As a result of these changes, BCS is now called best copy and server selection (BCSS).

BCSS includes several new health checks that are part of the built in managed availability monitoring components in Exchange 2013. There are four new additional checks performed by Active Manager (listed in the order in which they're performed):

1. **All Healthy** Checks for a server hosting a copy of the affected database that has all monitoring components in a healthy state.
2. **Up to Normal Healthy** Checks for a server hosting a copy of the affected database that has all monitoring components with Normal priority in a healthy state.
3. **All Better than Source** Checks for a server hosting a copy of the affected database that has monitoring components in a state that's better than the current server hosting the affected copy.
4. **Same as Source** Checks for a server hosting a copy of the affected database that has monitoring components in a state that's the same as the current server hosting the affected copy.

If BCSS is invoked as a result of a failover that's triggered by a managed availability monitoring component (for example, via a Failover responder), an additional mandatory constraint is enforced where the target server's component health must be better than the server on which the failover occurred. For example, if a failure of Microsoft Office Outlook Web App triggers a managed availability failover via a Failover responder, BCSS must select a server hosting a copy of the affected database on which Outlook Web App is healthy.

DAG Management Service

Cumulative Update 2 (CU2) for the Release to Manufacturing (RTM) version of Exchange 2013 contains a new service on Mailbox servers that are members of a DAG. This service is called the Microsoft Exchange DAG Management Service (MSExchangeDAGMgmt). This new service contains internal DAG monitoring functionality that previously executed inside the Microsoft Exchange Replication service (MSExchangeRepl).

DAGs without a cluster administrative access point

All DAGs running Windows Server 2008 R2 or Windows Server 2012 require at least one IP address on every subnet included in the MAPI network. The IP address(es) assigned to the DAG are used by the DAG's cluster with the cluster's administrative access point (also known as the cluster network name) to enable name resolution and connectivity to the cluster (or more precisely, connectivity to the cluster member that currently owns the cluster core resource group) using the cluster name. Windows Server 2012 R2 enables you to create a failover cluster without an administrative access point. Windows failover clusters without administrative access points have the following characteristics:

- There is no IP address assigned to the cluster, and therefore no IP Address Resource in the cluster core resource group.
- There is no network name assigned to the cluster, and therefore no Network Name Resource in the cluster core resource group
- The name of the cluster is not registered in DNS, and it is not resolvable on the network.
- A cluster name object (CNO) is not created in Active Directory.
- The Windows failover cluster cannot be managed using the Failover Cluster Management tool. It must be managed using Windows PowerShell, and the PowerShell cmdlets must be run against individual cluster members.

When running on Windows Server 2012 R2 or later, Service Pack 1 (SP1) for Exchange 2013 and later enable you to create a DAG without a cluster administrative access point. You can create a DAG without an administrative access point using the Exchange Admin Center or by using the Shell. For more information, see Creating DAGs and Create a database availability group.

Database availability groups

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-18*

A database availability group (DAG) is the base component of the Mailbox server high availability and site resilience framework built into Microsoft Exchange Server 2013. A DAG is a group of up to 16 Mailbox servers that hosts a set of databases and provides automatic database-level recovery from failures that affect individual servers or databases.

A DAG is a boundary for mailbox database replication, database and server switchovers and failovers, and an internal component called *Active Manager*. Active Manager, which runs on every Mailbox server, manages switchovers and failovers within DAGs. For more information about Active Manager, see Active Manager.

Any server in a DAG can host a copy of a mailbox database from any other server in the DAG. When a server is added to a DAG, it works with the other servers in the DAG to provide automatic recovery from failures that affect mailbox databases, such as a disk, server, or network failure.

Contents

Database availability group lifecycle

DAGs leverage the concept of *incremental deployment*, which is the ability to deploy service and data availability for all Mailbox servers and databases after Exchange is installed. After you deploy Exchange 2013 Mailbox servers, you can create a DAG, add Mailbox servers to the DAG, and then replicate mailbox databases between the DAG members.

Note:

It's supported to create a DAG that contains a combination of physical Mailbox servers and virtualized Mailbox servers, provided that the servers and solution comply with the Exchange 2013 system requirements and the requirements set forth in Exchange 2013 virtualization. As with all Exchange high availability configurations, you must ensure that all Mailbox servers in the DAG are sized appropriately to handle the necessary workload during scheduled and unscheduled outages.

A DAG is created by using the New-DatabaseAvailabilityGroup cmdlet. A DAG is initially created as an empty object in Active Directory. This directory object is used to store relevant information about the DAG, such as server membership information and some DAG configuration settings. When you add the first server to a DAG, a failover cluster is automatically created for the DAG. This failover cluster is used exclusively by the DAG, and the cluster must be dedicated to the DAG. Use of the cluster for any other purpose isn't supported.

In addition to a failover cluster being created, the infrastructure that monitors the servers for network or server failures is initiated. The failover cluster heartbeat mechanism and cluster database are then used to track and manage information about the DAG that can change quickly, such as database mount status, replication status, and last mounted location.

During creation, the DAG is given a unique name, and either assigned one or more static IP addresses or configured to use Dynamic Host Configuration Protocol (DHCP), or created without a cluster administrative access point. DAGs without an administrative access point can be created only on servers running Exchange 2013 Service Pack 1 or later on Windows Server 2012 R2 Standard or Datacenter edition. DAGs without cluster administrative access points have the following characteristics:

- There is no IP address assigned to the cluster/DAG, and therefore no IP Address Resource in the cluster core resource group.
- There is no network name assigned to the cluster, and therefore no Network Name Resource in the cluster core resource group
- The name of the cluster/DAG is not registered in DNS, and it is not resolvable on the network.
- A cluster name object (CNO) is not created in Active Directory.
- The cluster cannot be managed using the Failover Cluster Management tool. It must be managed using Windows PowerShell, and the PowerShell cmdlets must be run against individual cluster members.

This example shows how to use the Shell to create a DAG with a cluster administrative access point that will have three servers. Two servers (EX1 and EX2) are on the same subnet (10.0.0.0), and the third server (EX3) is on a different subnet (192.168.0.0).

```
New-DatabaseAvailabilityGroup -Name DAG1 -WitnessServer EX4
-DatabaseAvailabilityGroupIPAddresses 10.0.0.5,192.168.0.5
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer EX1
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer EX2
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer EX3
```

The commands to create a DAG without a cluster administrative access point are very similar:

```
New-DatabaseAvailabilityGroup -Name DAG1 -WitnessServer EX4
-DatabaseAvailabilityGroupIPAddresses
([System.Net.IPAddress])::None
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer EX1
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer EX2
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer EX3
```

The cluster for DAG1 is created when EX1 is added to the DAG. During cluster creation, the **Add-**

DatabaseAvailabilityGroupServer cmdlet retrieves the IP addresses configured for the DAG and ignores the ones that don't match any of the subnets found on EX1. In the first example above, the cluster for DAG1 is created with an IP address of 10.0.0.5, and 192.168.0.5 is ignored. In the second example above, the value of the *DatabaseAvailabilityGroupIPAddresses* parameter instructs the task to create a failover cluster for the DAG that does not have an administrative access point. Thus, the cluster is created with an IP address or network name resource in the core cluster resource group.

Then, EX2 is added, and the **Add-DatabaseAvailabilityGroupServer** cmdlet again retrieves the IP addresses configured for the DAG. There are no changes to the cluster's IP addresses because in EX2 is on the same subnet as EX1.

Then, EX3 is added, and the **Add-DatabaseAvailabilityGroupServer** cmdlet again retrieves the IP addresses configured for the DAG. Because a subnet matching 192.168.0.5 is present on EX3, the 192.168.0.5 address is added as an IP address resource in the cluster group. In addition, an **OR** dependency for the Network Name resource for each IP address resource is automatically configured. The 192.168.0.5 address will be used by the cluster when the cluster core resource group moves to EX3.

For DAGs with cluster administrative access points, Windows failover clustering registers the IP addresses for the cluster in the Domain Name System (DNS) when the Network Name resource is brought online. In addition, when EX1 is added to the cluster, a cluster name object (CNO) is created in Active Directory. The network name, IP address(es), and CNO for the cluster are not used for DAG functions. Administrators and end users don't need to interface with or connect to the cluster/DAG name or IP address for any reason. Some third party applications connect to the cluster administrative access point to perform management tasks, such as backup or monitoring. If you do not use any third party applications that require a cluster administrative access point, and your DAG is running Exchange 2013 SP1 or later on Windows Server 2012 R2, then we recommend creating a DAG without an administrative access point. This simplifies DAG configuration, eliminates the need for one or more IP addresses, and reduces the attack surface of a DAG.

DAGs are also configured to use a witness server and a witness directory. The witness server and witness directory are either automatically configured by the system, or they can be manually configured by the administrator. In the examples above, EX4 (a server that is not and will not be a member of the DAG) is being manually configured as the DAG’s witness server.

By default, a DAG is designed to use the built-in continuous replication feature to replicate mailbox databases among servers in the DAG. If you're using third-party data replication that supports the Third Party Replication API in Exchange 2013, you must create the DAG in third-party replication mode by using the New-DatabaseAvailabilityGroup cmdlet with the *ThirdPartyReplication* parameter. After this mode is enabled, it can't be disabled.

After the DAG is created, Mailbox servers can be added to the DAG. When the first server is added to the DAG, a cluster is formed for use by the DAG. DAGs make use of Windows failover clustering technology, such as the cluster heartbeat, cluster networks, and the cluster database (for storing data that changes, such as database state changes from active to passive or vice versa, or from mounted to dismounted and vice versa). As each subsequent server is added to the DAG, it's joined

to the underlying cluster, the cluster's quorum model is automatically adjusted by Exchange, and the server is added to the DAG object in Active Directory.

After Mailbox servers are added to a DAG, you can configure a variety of DAG properties, such as whether to use network encryption or network compression for database replication within the DAG. You can also configure DAG networks and create additional DAG networks.

After you add members to a DAG and configure the DAG, the active mailbox databases on each server can be replicated to the other DAG members. After you create mailbox database copies, you can monitor the health and status of the copies using a variety of built-in monitoring tools. In addition, you can perform database and server switchovers.

For more information about creating DAGs, managing DAG membership, configuring DAG properties, creating and monitoring mailbox database copies, and performing switchovers, see Managing high availability and site resilience.

Database availability group quorum models

Underneath every DAG is a Windows failover cluster. Failover clusters use the concept of quorum, which uses a consensus of voters to ensure that only one subset of the cluster members (which could mean all members or a majority of members) is functioning at one time. Quorum isn't a new concept for Exchange 2013. Highly available Mailbox servers in previous versions of Exchange also use failover clustering and its concept of quorum. Quorum represents a shared view of members and resources, and the term quorum is also used to describe the physical data that represents the configuration within the cluster that's shared between all cluster members. As a result, all DAGs require their underlying failover cluster to have quorum. If the cluster loses quorum, all DAG operations terminate and all mounted databases hosted in the DAG dismount. In this event, administrator intervention is required to correct the quorum problem and restore DAG operations.

Quorum is important to ensure consistency, to act as a tie-breaker to avoid partitioning, and to ensure cluster responsiveness:

- **Ensuring consistency** A primary requirement for a Windows failover cluster is that each of the members always has a view of the cluster that's consistent with the other members. The cluster hive acts as the definitive repository for all configuration information relating to the cluster. If the cluster hive can't be loaded locally on a DAG member, the Cluster service doesn't start, because it isn't able to guarantee that the member meets the requirement of having a view of the cluster that's consistent with the other members.
- **Acting as a tie-breaker** A quorum witness resource is used in DAGs with an even number of members to avoid split brain syndrome scenarios and to make sure that only one collection of the members in the DAG is considered official. When the witness server is needed for quorum, any member of the DAG that can communicate with the witness server can place a Server Message Block (SMB) lock on the witness server's witness.log file. The DAG member that locks the witness server (referred to as the *locking node*) retains an additional vote for quorum purposes. The DAG members in contact with the locking node are in the majority and maintain quorum. Any

DAG members that can't contact the locking node are in the minority and therefore lose quorum.

- **Ensuring responsiveness** To ensure responsiveness, the quorum model makes sure that, whenever the cluster is running, enough members of the distributed system are operational and communicative, and at least one replica of the cluster's current state can be guaranteed. No additional time is required to bring members into communication or to determine whether a specific replica is guaranteed.

DAGs with an even number of members use the failover cluster's Node and File Share Majority quorum mode, which employs an external witness server that acts as a tie-breaker. In this quorum mode, each DAG member gets a vote. In addition, the witness server is used to provide one DAG member with a weighted vote (for example, it gets two votes instead of one). The cluster quorum data is stored by default on the system disk of each member of the DAG, and is kept consistent across those disks. However, a copy of the quorum data isn't stored on the witness server. A file on the witness server is used to keep track of which member has the most updated copy of the data, but the witness server doesn't have a copy of the cluster quorum data. In this mode, a majority of the voters (the DAG members plus the witness server) must be operational and able to communicate with each other to maintain quorum. If a majority of the voters can't communicate with each other, the DAG's underlying cluster loses quorum, and the DAG will require administrator intervention to become operational again.

DAGs with an odd number of members use the failover cluster's Node Majority quorum mode. In this mode, each member gets a vote, and each member's local system disk is used to store the cluster quorum data. If the configuration of the DAG changes, that change is reflected across the different disks. The change is only considered to have been committed and made persistent if that change is made to the disks on half the members (rounding down) plus one. For example, in a five-member DAG, the change must be made on two plus one members, or three members total.

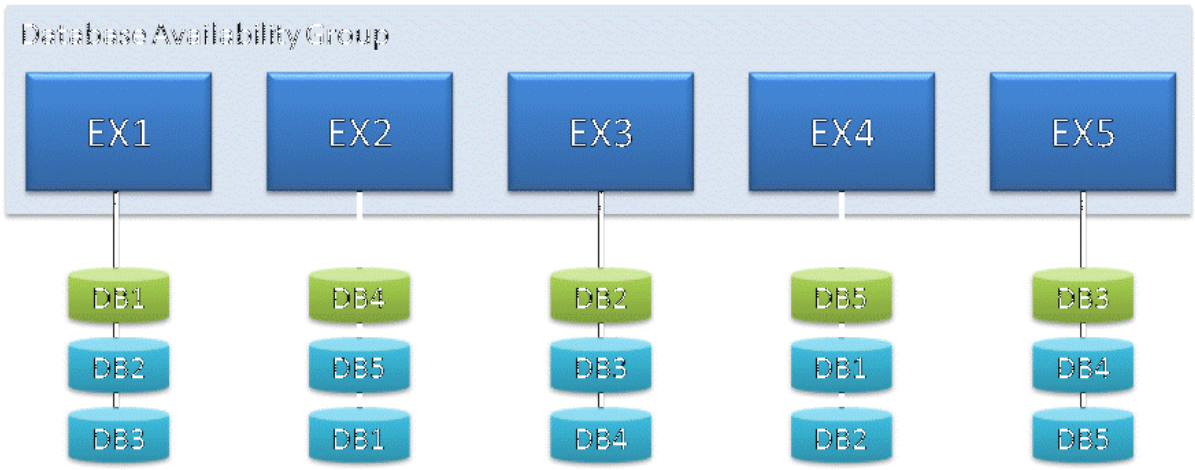
Quorum requires a majority of voters to be able to communicate with each other. Consider a DAG that has four members. Because this DAG has an even number of members, an external witness server is used to provide one of the cluster members with a fifth, tie-breaking vote. To maintain a majority of voters (and therefore quorum), at least three voters must be able to communicate with each other. At any time, a maximum of two voters can be offline without disrupting service and data access. If three or more voters are offline, the DAG loses quorum, and service and data access will be disrupted until you resolve the problem.

Return to top

Using a database availability group for high availability

To illustrate how a DAG can provide high availability for your mailbox databases, consider the following example, which uses a DAG with five members. This DAG is illustrated in the following figure.

DAG with five members

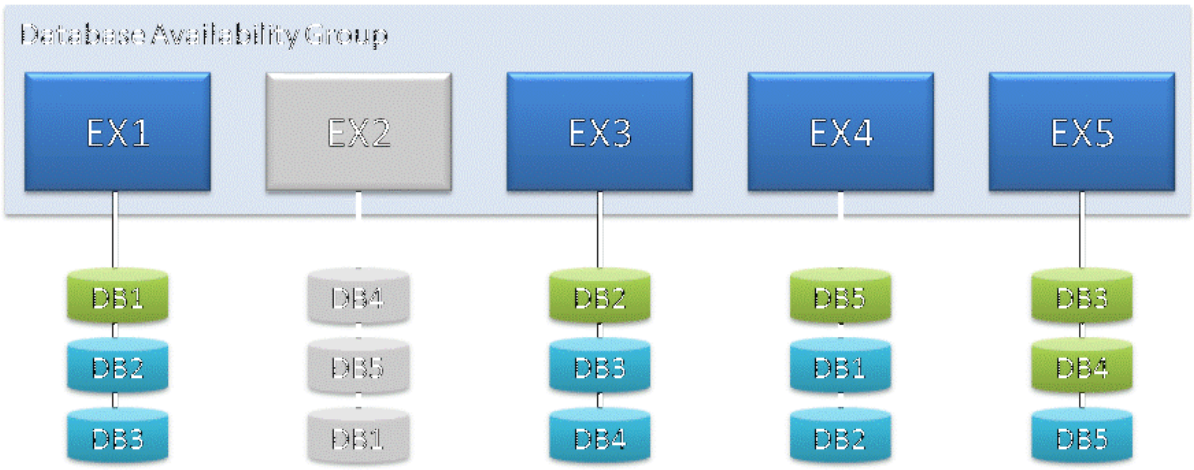


In the preceding figure, the green databases are active mailbox database copies and the blue databases are passive mailbox database copies. In this example, the database copies aren't mirrored across each server, but rather spread across multiple servers. This ensures that no two servers in the DAG have the same set of database copies, providing the DAG with greater resilience to failures, including failures that occur while other components are unavailable as a result of regular maintenance.

Consider the following scenario, using the preceding example DAG, which illustrates resilience to multiple database and server failures.

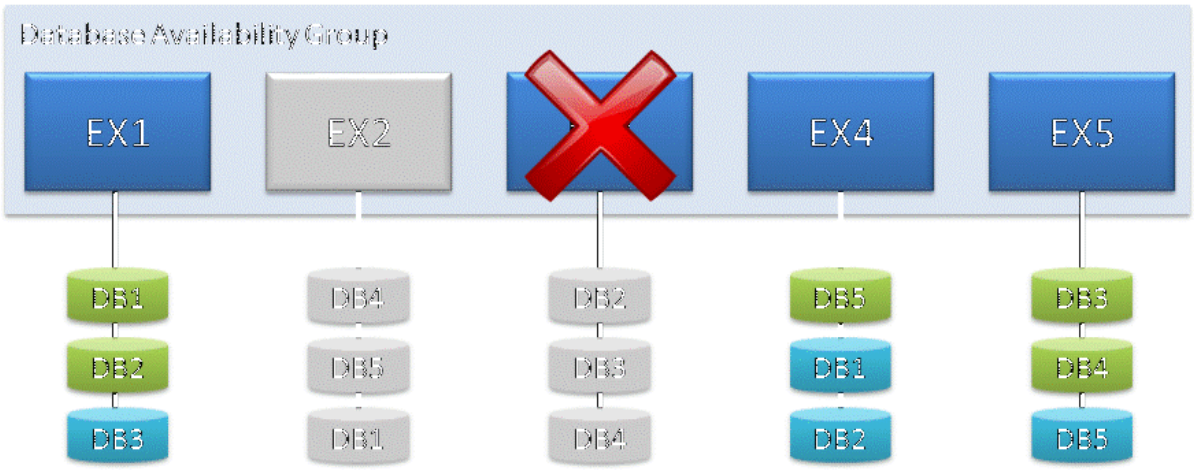
Initially, all databases and servers are healthy. You need to install some operating system updates on EX2, so you put the server into maintenance mode. This causes a server switchover, which activates the copy of DB4 on another Mailbox server. A server switchover moves all active mailbox database copies from their current server to one or more other Mailbox servers in the DAG in preparation for a scheduled outage for the current server. In this example, there's only one active mailbox database on EX2 (DB4), so only one active mailbox database copy is moved.

DAG with a server offline for maintenance



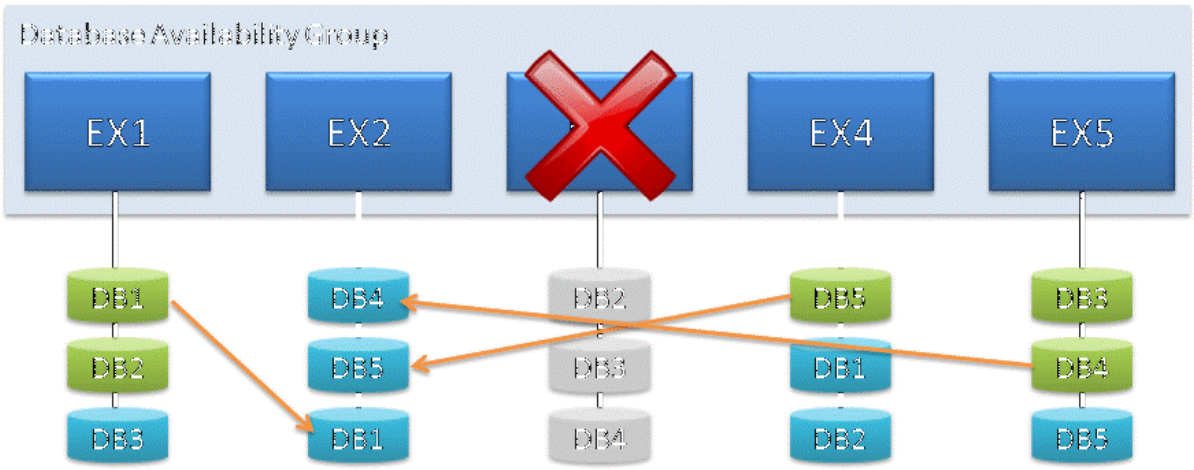
While you perform maintenance on EX2, EX3 experiences a catastrophic hardware failure and goes offline. Prior to going offline, EX3 hosted the active copy of DB2. To recover from the failure, the system automatically activates the copy of DB2 that's hosted on EX1 within 30 seconds. This is illustrated in the following figure.

DAG with a server offline for maintenance and a failed server



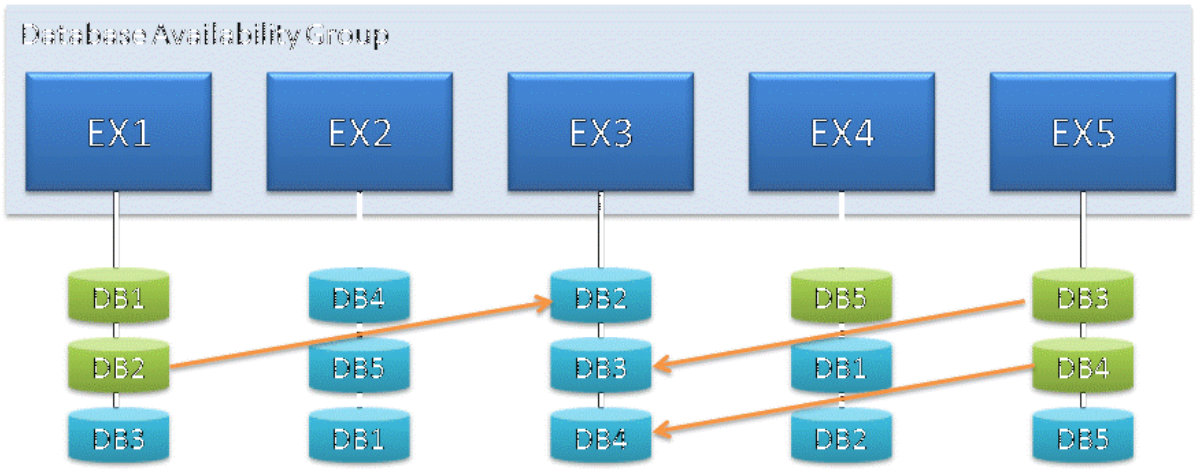
After the scheduled maintenance is completed for EX2, you bring the server online and take it out of maintenance mode. As soon as EX2 is available, the other members of the DAG are notified, and the copies of DB1, DB4, and DB5 hosted on EX2 are automatically synchronized with the active copy of each database. This is illustrated in the following figure.

DAG with a restored server synchronizing its database copies



After the failed hardware component in EX3 is replaced with a new component, EX3 is brought online. After EX3 is available, the other members of the DAG are notified, and the copies of DB2, DB3, and DB4 hosted on EX3 are automatically synchronized with the active copy of each database. This is illustrated in the following figure.

DAG with a repaired server synchronizing its database copies

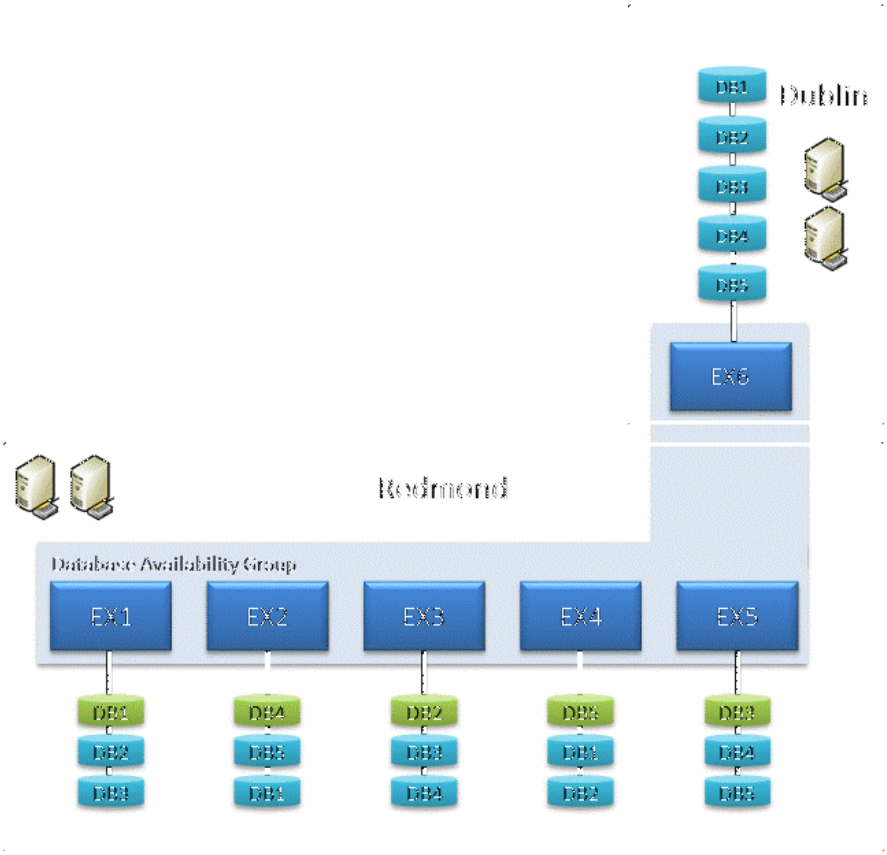


Return to top

Using a database availability group for site resilience

In addition to providing high availability within a datacenter, a DAG can also be extended to one or more datacenters in a configuration that provides site resilience for one or multiple datacenters. In the preceding example figures, the DAG is located in a single datacenter and single Active Directory site. Incremental deployment can be used to extend this DAG to a second datacenter (and a second Active Directory site) by deploying a Mailbox server and the necessary supporting resources (one or more Active Directory servers, and DNS services). The Mailbox server is then added to the DAG, as illustrated in the following figure.

DAG extended across two Active Directory sites



In this example, a passive copy of each active database in the Redmond datacenter is configured on EX6 in the Dublin datacenter. However, there are many other examples of DAG configurations that provide site resilience. For example:

- Instead of hosting only passive database copies, EX6 could host all active copies, or it could host a mixture of active and passive copies.
- In addition to EX6, multiple DAG members could be deployed in the Dublin datacenter, providing protection against additional failures. This configuration also provides additional capacity, so that if the Redmond datacenter fails, the Dublin datacenter can support a much larger user population.

Using multiple database availability groups for site resilience

In the preceding example, a single DAG extends across multiple datacenters, providing site resilience for either or both datacenters. When using a single DAG to provide site resilience in an environment where each datacenter to which you extend the DAG has an active user population, there is a single point of failure in the wide area network (WAN) connection. This is because quorum requires a majority of the voters to be active and able to communicate with each other.

In the preceding example, the majority of voters are located in the Redmond datacenter. If the Dublin datacenter hosts active mailbox databases, and it has a local user population, a WAN

outage would result in a messaging service outage for the Dublin users. When WAN connectivity breaks, only the DAG members in the Redmond datacenter retain quorum and continue providing messaging service.

To eliminate the WAN as a single point of failure when you need to provide site resilience for multiple datacenters that each have an active user population, you should deploy multiple DAGs, where each DAG has a majority of voters in a separate datacenter. When a WAN outage occurs, replication will be blocked until connectivity is restored. Users will have messaging service, because each DAG continues to service its local user population.

Return to top

Active Manager

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-21*

Microsoft Exchange Server 2013 includes a component called *Active Manager* that manages the high availability platform that includes the database availability group (DAG) and mailbox database copies. Active Manager runs inside the Microsoft Exchange Replication service (MSExchangeRepl.exe) on all Mailbox servers. On Mailbox servers that aren't members of a DAG, there is a single Active Manager role: *Standalone Active Manager*. On servers that are members of a DAG, there are two Active Manager roles: *Primary Active Manager* (PAM) and *Standby Active Manager* (SAM). PAM is the Active Manager role in a DAG that decides which copies will be active and passive. PAM is responsible for getting topology change notifications and reacting to server failures. The DAG member that holds the PAM role is always the member that currently owns the cluster quorum resource (default cluster group). If the server that owns the cluster quorum resource fails, the PAM role automatically moves to a surviving server that takes ownership of the cluster quorum resource. In addition, if you need to take the server that hosts the cluster quorum resource offline for maintenance or an upgrade, you must first move the PAM to another server in the DAG. The PAM controls all movement of the active designations between a database's copies. (Only one copy can be active at any specified time, and that copy may be mounted or dismounted.) The PAM also performs the functions of the SAM role on the local system (detecting local database and local Information Store failures).

The SAM provides information on which server hosts the active copy of a mailbox database to other components of Exchange that are running an Active Manager client component (for example, Client Access or Transport services). The SAM detects failures of local databases and the local Information Store. It reacts to failures by asking the PAM to initiate a failover (if the database is replicated). A SAM doesn't determine the target of failover, nor does it update a database's

location state in the PAM. It will access the active database copy location state to answer queries for the active copy of the database that it receives.

Note:
Exchange 2013 isn't a clustered application. Instead, it uses the cluster library functions implemented in clusapi.dll for cluster, group, cluster network (heartbeating), node management, cluster registry, and a few control code functions. In addition, Active Manager stores current mailbox database information (for example, active and passive data, and mounted data) in the cluster database (also known as the cluster registry). Although the information is stored directly in the cluster database, it isn't accessed directly by any other components.

In Exchange 2013, the Microsoft Exchange Replication service periodically monitors the health of all mounted databases. In addition, it also monitors the Extensible Storage Engine (ESE) for any I/O errors or failures. When the service detects a failure, it notifies Active Manager. Active Manager then determines which database copy should be mounted and what it requires to mount that database. In addition, it tracks the active copy of a mailbox database (based on the last mounted copy of the database) and provides the tracking results information to the Client Access server to which the client is connected.

Best Copy Selection

When a failure occurs that prevents access to the active copy of a replicated mailbox database, Active Manager takes several steps to recover from the failure by selecting the best possible passive copy of the affected database to activate. This process was known as best copy selection (BCS) in Exchange 2010, and it's now known as best copy and server selection (BCSS) in Exchange 2013. The general process occurs in the following order:

1. Managed availability or Active Manager detects a failure, or an administrator initiates a targetless switchover.
2. The PAM runs the BCSS internal algorithm.
3. A process called *attempt copy last logs* (ACLL) occurs, which tries to copy any missing log files from the server that hosted the active database copy prior to the failure or switchover.
4. After the ACLL process has completed, the value of the *AutoDatabaseMountDial* for the Mailbox servers hosting copies of the database is compared with the copy queue length of the database being activated. At this point, either:
   - The number of missing log files is equal to or less than the value of *AutoDatabaseMountDial*, in which case Step 5 occurs.
   - The number of missing log files is greater than the value of *AutoDatabaseMountDial*, in which case Active Manager will try to activate next best available copy, if there is one.
5. The PAM issues a mount request to the Microsoft Exchange Information Store via remote procedure call (RPC). At this point, either:
   - The database mounts and is made available to clients.
   - The database doesn't mount, and PAM performs steps 3 and 4 on the next best copy (if one is available).

In Exchange 2010, the BCS process evaluated several aspects of each database copy to determine the best copy to activate. These included:

- Copy queue length
- Replay queue length
- Database status
- Content index status

In Exchange 2013, Active Manager runs through all of the same BCS checks and phases, but it now also includes the use of a constraint of the decreasing order of health states. Specifically, BCSS includes several new health checks that are part of the built in managed availability monitoring components in Exchange 2013. There are four new additional checks performed by Active Manager (listed in the order in which they are performed):

1. **All Healthy** Checks for a server hosting a copy of the affected database that has all monitoring components in a healthy state.
2. **Up to Normal Healthy** Checks for a server hosting a copy of the affected database that has all monitoring components with Normal priority in a healthy state.
3. **All Better than Source** Checks for a server hosting a copy of the affected database that has monitoring components in a state that's better than the current server hosting the affected copy.
4. **Same as Source** Checks for a server hosting a copy of the affected database that has monitoring components in a state that's the same as the current server hosting the affected copy.

If BCSS is invoked as a result of a failover that's triggered by a monitoring component (for example, via a Failover responder), an additional mandatory constraint is enforced where the target server's component health must be better than the server on which the failover occurred. For example, if a failure of Microsoft Office Outlook Web App triggers a failover via a Failover responder, BCSS must select a server hosting a copy of the affected database on which Outlook Web App is healthy.

Best copy selection process

With respect to database failures (not protocol failures), Active Manager in Exchange 2013 performs the same checks as it did in Exchange 2010. Active Manager begins the best copy selection process by creating a list of database copies that are potential candidates for activation. Any database copies that are unreachable or are administratively blocked from activation are ignored and not used during the selection process. The order of the list depends on the value of the *AutoDatabaseMountDial*:

- If the *AutoDatabaseMountDial* is configured with any value other than `Lossless` on all servers that host a copy of the database, Active Manager sorts the resulting list using the copy queue length as the primary key. The calculation is based on LastLogInspected (from the copy's point of view), so the list of potential copies is sorted by the highest value for LastLogInspected (which will be the copy with the lowest copy queue length). If necessary, Active Manager sorts the list a second time, using the value for activation preference as a secondary key to break any tie conditions where two or more passive copies have the same copy queue length. The copy with the lowest activation preference value has the higher priority on the list.

- If the *AutoDatabaseMountDial* is configured with a value of `Lossless` on any server that hosts a copy of the database, Active Manager sorts the resulting list in ascending order by using the value for activation preference as the primary key. In addition, when an administrator performs a lossless server or database switchover without specifying a target, Active Manager also sorts the resulting list in ascending order by using the value for activation preference as the primary key.

Next, Active Manager attempts to locate a mailbox database copy on the list that has a status of Healthy, DisconnectedAndHealthy, DisconnectedAndResynchronizing, or SeedingSource, and then evaluates the activation potential of each of the copies on the list by using an order set of ten criteria. Active Manager determines if any of the candidates for activation meet the first set of criteria:

- It has a content index with a status of Healthy.
- It has a copy queue length less than 10 log files.
- It has a replay queue length less than 50 log files.

If none of the database copies meet the first set of criteria, Active Manager tries to locate a database copy that meets the second set of criteria:

- It has a content index with a status of Crawling.
- It has a copy queue length less than 10 log files.
- It has a replay queue length less than 50 log files.

If none of the database copies meet the second set of criteria, Active Manager tries to locate a database copy that meets the third set of criteria:

- It has a content index with a status of Healthy.
- It has a replay queue length less than 50 log files.

If none of the database copies meet the third set of criteria, Active Manager tries to locate a database copy that meets the fourth set of criteria:

- It has a content index with a status of Crawling.
- It has a replay queue length less than 50 log files.

If none of the database copies meet the fourth set of criteria, Active Manager tries to locate a database copy that meets the fifth set of criteria:

- It has a replay queue length less than 50 log files.

If none of the database copies meet the fifth set of criteria, Active Manager tries to locate a database copy that meets the sixth set of criteria:

- It has a content index with a status of Healthy.
- It has a copy queue length less than 10 log files.

If none of the database copies meet the sixth criteria, Active Manager tries to locate a database copy that meets the seventh set of criteria:

- It has a content index with a status of Crawling.
- It has a copy queue length less than 10 log files.

If none of the database copies meet the seventh set of criteria, Active Manager tries to locate a database copy that meets the eighth set of criteria:

- It has a content index with a status of Healthy.

If none of the database copies meet all of the eighth set of criteria, Active Manager tries to locate a database copy that meets the ninth set of criteria:

- It has a content index with a status of Crawling.

If none of the database copies meet the ninth set of criteria, Active Manager tries to activate any database copy with a status of Healthy, DisconnectedAndHealthy, DisconnectedAndResynchronizing, or SeedingSource (the tenth set of criteria). If it can't find any database copies that meet the tenth set of criteria, it isn't able to automatically activate a database copy.

After one or more copies are located that meet one or more sets of criteria, the ACLL process runs to copy any log files from the original source to the potential new active copy. After the ACLL process has completed, the PAM issues a mount request and either the database mounts and is made available to clients or the database doesn't mount and the PAM searches for the next best copy (if one is available).

Datacenter Activation Coordination mode

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

Datacenter Activation Coordination (DAC) mode is a property of a database availability group (DAG). DAC mode is disabled by default but should be enabled for all DAGs with two or more members that use continuous replication. DAC mode shouldn't be enabled for DAGs that use third-party replication mode unless specified by the third-party vendor.

DAC mode is used to control the database mount on startup behavior of a DAG. This control is designed to prevent split brain from occurring at the database level during a datacenter switchback. Split brain, also known as split brain syndrome, is a condition that results in a database copying being mounted as an active copy on two members of the same DAG that are unable to communicate. Split brain is prevented using DAC mode because DAC mode requires DAG members to obtain permission to mount databases before they can be mounted.

For example, consider a scenario where a primary datacenter contains two DAG members and the witness server, and a second datacenter contains two other DAG members. In this scenario, the DAG is not in DAC mode. The primary datacenter loses power, so you activate the DAG in the second datacenter. Eventually power to the primary datacenter is restored, and the DAG members in the primary datacenter, which had quorum before the power failure, will start up and mount their databases. Because the primary datacenter was restored without network connectivity to the

second datacenter, and because the DAG was not in DAC mode, the active databases within the DAG entered a split brain condition.

How DAC mode works

DAC mode is designed to prevent split brain from occurring by including a protocol called Datacenter Activation Coordination Protocol (DACP). When DAC mode is enabled, DAG members won't automatically mount databases even if they have quorum. Instead DACP is used to determine the current state of the DAG and whether Active Manager should attempt to mount the databases.

You might think of DAC mode as an application level of quorum for mounting databases. To understand the purpose of DACP and how it works, it's important to understand the primary scenario it's intended to handle. Consider the two-datacenter scenario. Suppose there is a complete power failure in the primary datacenter. In this event, all of the servers and the WAN are down, so the organization makes the decision to activate the standby datacenter. In almost all such recovery scenarios, when power is restored to the primary datacenter, WAN connectivity is typically not immediately restored. This means that the DAG members in the primary datacenter will power up, but they won't be able to communicate with the DAG members in the activated standby datacenter. The primary datacenter should always contain the majority of the DAG quorum voters, which means that when power is restored, even in the absence of WAN connectivity to the DAG members in the standby datacenter, the DAG members in the primary datacenter have a majority and therefore have quorum. This is a problem because with quorum, these servers may be able to mount their databases, which in turn would cause divergence from the actual active databases that are now mounted in the activated standby datacenter.

DACP was created to address this issue. Active Manager stores a bit in memory (either a 0 or a 1) that tells the DAG whether it's allowed to mount local databases that are assigned as active on the server. When a DAG is running in DAC mode, each time Active Manager starts up the bit is set to 0, meaning it isn't allowed to mount databases. Because it's in DAC mode, the server must try to communicate with all other members of the DAG that it knows to get another DAG member to give it an answer as to whether it can mount local databases that are assigned as active to it. The answer comes in the form of the bit setting for other Active Managers in the DAG. If another server responds that its bit is set to 1, it means servers are allowed to mount databases, so the server starting up sets its bit to 1 and mounts its databases.

But when you recover from a primary datacenter power outage where the servers are recovered but WAN connectivity has not been restored, all of the DAG members in the primary datacenter will have a DACP bit value of 0; and therefore none of the servers starting back up in the recovered primary datacenter will mount databases, because none of them can communicate with a DAG member that has a DACP bit value of 1.

DAC mode for DAGs with two members

DAGs with two members have inherent limitations that prevent the DACP bit alone from fully

protecting against application-level split brain syndrome. For DAGs with only two members, DAC mode also uses the boot time of the DAG's witness server to determine whether it can mount databases on startup. The boot time of the witness server is compared to the time when the DACP bit was set to 1.

- If the time the DACP bit was set is earlier than the boot time of the witness server, the system assumes that the DAG member and witness server were rebooted at the same time (perhaps because of power loss in the primary datacenter), and the DAG member isn't permitted to mount databases.
- If the time that the DACP bit was set is more recent than the boot time of the witness server, the system assumes that the DAG member was rebooted for some other reason (perhaps a scheduled outage in which maintenance was performed or perhaps a system crash or power loss isolated to the DAG member), and the DAG member is permitted to mount databases.

Important:
Because the witness server's boot time is used to determine whether a DAG member can mount its active databases on startup, you should never restart the witness server and the sole DAG member at the same time. Doing so may leave the DAG member in a state where it can't mount databases on startup. If this happens, you must run the Restore-DatabaseAvailabilityGroup cmdlet on the DAG. This resets the DACP bit and permits the DAG member to mount databases.

Other benefits of DAC mode

In addition to preventing split brain syndrome at the application level, DAC mode also enables the use of the built-in site resilience cmdlets used to perform datacenter switchovers. These include the following:

- Stop-DatabaseAvailabilityGroup
- Restore-DatabaseAvailabilityGroup
- Start-DatabaseAvailabilityGroup

Performing a datacenter switchover for DAGs that aren't in DAC mode involves using a combination of Exchange tools and cluster management tools. For more information, see Datacenter Switchovers.

Enabling DAC mode

DAC mode can be enabled only by using the Exchange Management Shell. Specifically, you can use the Set-DatabaseAvailabilityGroup cmdlet to enable DAC mode, as illustrated in the following example.

```
Set-DatabaseAvailabilityGroup -Identity DAG2 -
DatacenterActivationMode DagOnly
```

In the preceding example, DAG2 is enabled for DAC mode.

For more information about enabling DAC mode, see Configure database availability group properties and Set-DatabaseAvailabilityGroup.

Mailbox database copies

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-04-05*

Microsoft Exchange Server 2013 leverages the concept of database mobility, which is Exchange-managed database-level failovers. Database mobility disconnects databases from servers, adds support for up to 16 copies of a single database, and provides a native experience for adding database copies to a database.

Key characteristics

The key characteristics of mailbox database copies are:

- Up to 16 copies of an Exchange 2013 mailbox database can be created on multiple Mailbox servers, provided the servers are grouped into a database availability group (DAG), which is a boundary for continuous replication. Exchange 2013 mailbox databases can be replicated only to other Exchange 2013 Mailbox servers within a DAG. You can't replicate a database outside of a DAG, nor can you replicate an Exchange 2013 mailbox database to a server running Exchange 2010 or earlier. For detailed information about DAGs, see Database availability groups.
- All Mailbox servers in a DAG must be in the same Active Directory domain.
- Mailbox database copies support the concepts of replay lag time and truncation lag time. Appropriate planning must be performed before enabling these features.
- All database copies can be backed up using an Exchange-aware, Volume Shadow Copy Service (VSS)-based backup application.
- Database copies can be created only on Mailbox servers that don't host the active copy of a database. You can't create two copies of the same database on the same server.
- All copies of a database use the same path on each server containing a copy. The database and log file paths for a database copy on each Mailbox server must not conflict with any other database paths.
- Database copies can be created in the same or different Active Directory sites, and on the same or different network subnets.
- Database copies aren't supported between Mailbox servers with round trip network latency greater than 500 milliseconds (ms).

Mailbox database copies

You can create a mailbox database copy at any time. Mailbox database copies can be distributed across Mailbox servers in a flexible and granular way.

You can create a mailbox database copy using the **Add mailbox database copy** wizard in the Exchange Administration Center or by using the **Add-MailboxDatabaseCopy** cmdlet in the Exchange Management Shell.

When creating a mailbox database copy, specify the following parameters:

- *Identity* This parameter specifies the name of the database being copied. Database names must be unique within the Exchange organization.
- *MailboxServer* This parameter specifies the name of the Mailbox server that will host the database copy. This server must be a member of the same DAG and must not already host a copy of the database.

Optionally, you can also specify:

- *ActivationPreference* This parameter specifies the activation preference number, which is used as part of Active Manager's best copy selection process. It's also used to redistribute active mailbox databases throughout the DAG when using the RedistributeActiveDatabases.ps1 script. The value for the activation preference is a number equal to or greater than one, where one is at the top of the preference order. The position number cannot be larger than the number of mailbox database copies.
- *ReplayLagTime* This parameter specifies the amount of time that the Microsoft Exchange Replication service should wait before replaying log files that are copied to the database copy. The format for this parameter is (Days.Hours:Minutes:Seconds). The default setting for this value is 0 seconds. The maximum allowable setting for this value is 14 days. The minimum allowable setting is 0 seconds. Setting the value for replay lag time to 0 turns off log replay delay.
- *TruncationLagTime* This parameter specifies the amount of time that the Microsoft Exchange Replication service should wait before truncating log files that have replayed into a copy of the database. The time period begins after the log has been successfully replayed into the copy of the database. The format for this parameter is (Days.Hours:Minutes:Seconds). The default setting for this value is 0 seconds. The maximum allowable setting for this value is 14 days. The minimum allowable setting is 0 seconds. Setting the value for truncation lag time to 0 turns off log truncation delay.
- *SeedingPostponed* This parameter specifies that the task shouldn't automatically seed the database copy on the specified Mailbox server. This option is typically used when you intend to seed a new mailbox database copy by using an existing passive copy of the database (for example, adding a second copy of a specific database to a remote location). When you use this parameter, you must manually seed the database copy using the Update-MailboxDatabaseCopy cmdlet.

For more information about creating, using, and managing mailbox database copies, see Managing mailbox database copies.

AutoReseed

Exchange Server 2013 > High availability and site resilience > Database availability groups >

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013*

Topic Last Modified: *2014-08-07*

Automatic Reseed, or AutoReseed, is a feature that's the replacement for what is normally administrator-driven action in response to a disk failure, database corruption event, or other issue that necessitates a reseed of a database copy. AutoReseed is designed to automatically restore database redundancy after a disk failure by using spare disks that have been provisioned on the system.

Overview of Autoreseed

In an AutoReseed configuration, a standardized storage presentation structure is used, and the administrator picks the starting point. AutoReseed is about restoring redundancy as soon as possible after a drive fails. This involves pre-mapping a set of volumes (including spare volumes) and databases using mount points. In the event of a disk failure where the disk is no longer available to the operating system, or is no longer writable, a spare volume is allocated by the system, and the affected database copies are reseeded automatically.

1. The Microsoft Exchange Replication service periodically scans for copies that have a status of FailedAndSuspended. If all database copies on a volume configured for AutoReseed are in a FailedandSuspended state for 15 consecutive minutes, the AutoReseed workflow is initiated.
2. AutoReseed will try to resume the failed and suspended copies up to three times, with a 5-minute sleep in between each attempt. Sometimes, after a FailedandSuspended database copy is resumed, the copy remains in a Failed state. This can happen for a variety of reasons, so this step is designed to handle those cases; AutoReseed will automatically suspend a database copy that has been Failed for 10 consecutive minutes to keep the workflow running. If the suspend and resume actions don’t result in a healthy database copy, the workflow continues.
3. When it finds a copy with that status, it performs some prerequisite checks. For example, it will verify that a spare disk is available, that the database and its log files are configured on the same volume, and in the appropriate locations that match the required naming conventions.
4. If the prerequisite checks pass successfully, the Disk Reclaimer function within the Microsoft Exchange Replication service allocates, remaps and formats a spare disk according to the timelines in the table below. AutoReseed will attempt to assign a spare volume up to 5 times, with 1-hour sleeps in between each try.
5. Once a spare has been assigned, AutoReseed will perform an InPlaceSeed operation using the SafeDeleteExistingFiles seeding switch. All databases that were on the affected disk are re-seeded using the active copy of the database as the seeding source.
6. After the seeding operation has been completed, the Microsoft Exchange Replication service

verifies that the newly seeded copy is healthy.

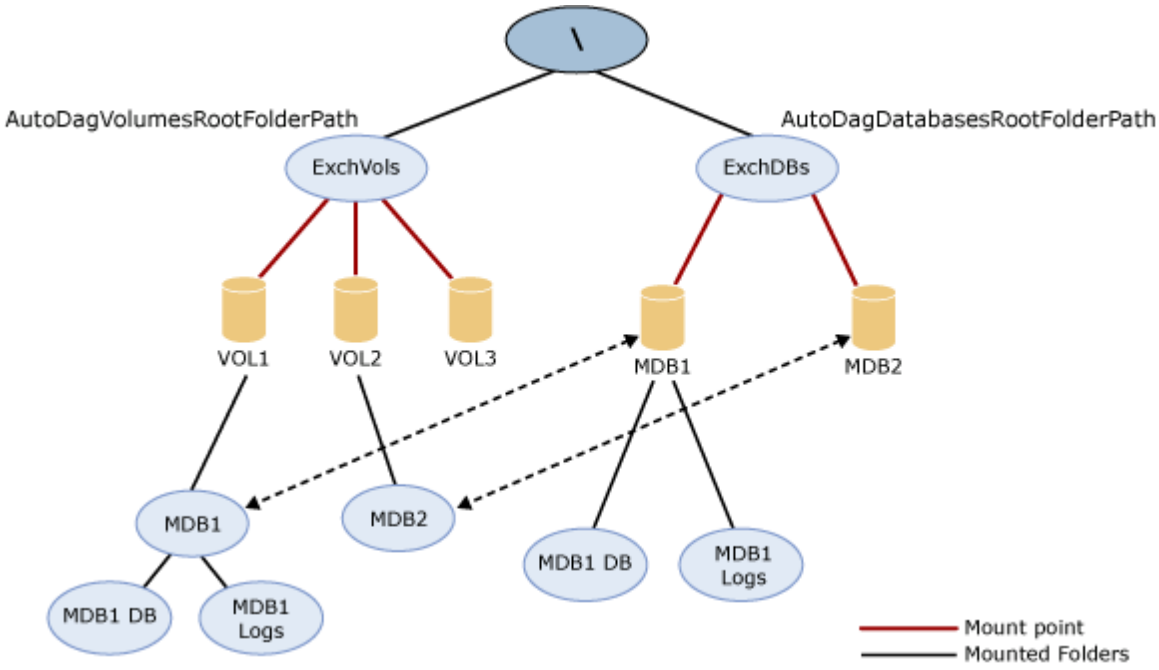
Once all retries are exhausted, the workflow stops. If, after 3 days, the database copy is still FailedandSuspended, the workflow state is reset and it starts again from Step 1. This reset/resume behavior is useful (and intentional) since it can take a few days to replace a failed disk, controller, etc.

At this point, if the failure was a disk failure, it would require manual intervention by an operator or administrator to remove and replace the failed disk and reconfigure the replacement disk as a spare.

AutoReseed is configured using three properties of the DAG. Two of the properties refer to the two mount points that are in use. Exchange 2013 leverages the fact that Windows Server allows multiple mount points per volume. The *AutoDagVolumesRootFolderPath* property refers to the mount point that contains all of the available volumes. This includes volumes that host databases and spare volumes. The *AutoDagDatabasesRootFolderPath* property refers to the mount point that contains the databases. A third DAG property, *AutoDagDatabaseCopiesPerVolume*, is used to configure the number of database copies per volume.

An example AutoReseed configuration is illustrated below.

Example AutoReseed configuration



In this example, there are three volumes, two of which will contain databases (VOL1 and VOL2), and one of which is a blank, formatted spare (VOL3).

To configure AutoReseed:

1. All three volumes are mounted under a single mount point. In this example, a mount point of C:\ExchVols is used. This represents the directory used to get storage for Exchange databases.
2. The root directory of the mailbox databases is mounted as another mount point. In this example, a mount point of C:\ExchDBs is used. Next, a directory structure is created so that a parent directory is created for the database, and under the parent directory, two subdirectories are created: one database file and one for the log files.

3. Databases are created. The above example illustrates a simple design using a single database per volume. Thus, on VOL1, there are three directories: the parent directory and two subdirectories (one for MDB1's database file, and one for its logs). Although not depicted in the example image, on VOL2, there would also be three directories: the parent directory, and under that, a directory for MDB2's database file, and one for its log files.

In this configuration, if MDB1 or MDB2 were to experience a failure, a copy of the failed database will be automatically reseeded to VOL3.

Disk Reclaimer

The AutoReseed component that allocates and formats spare disks is called the *Disk Reclaimer*. The Disk Reclaimer component automatically formats spare disks in preparation for automatic reseeding at different intervals, depending on the state of the disk. In order for the Disk Reclaimer to format a disk, certain conditions must met:

- The Disk Reclaimer must be enabled. It is enabled by default, but it can be disabled using Set-DatabaseAvailabilityGroup.
- The volume must have a mount point in the root volumes path (by default, C:\ExchangeVolumes).
- The volume must not have any mount points in the database volumes path (by default, C:\ExchangeDatabases).
- If the volume contains any files, none of the files must have been touched for 24 hours.

In addition to the above conditions, the Disk Reclaimer will only attempt to format a given volume once a day. The following table describes the formatting behavior of the Disk Reclaimer.

State of Disk and Database Copies	Formatting Interval
Disk is unformatted, or formatted but empty, or formatted but contains files that have not been touched for 24 hours, and there are healthy active database copies in the local Active Directory site that can be used as a seeding source.	1 day
Disk is unformatted, or formatted but empty, or formatted but contains files that have not been touched for 24 hours, but there are no healthy active database copies in the local Active Directory site that can be used as a seeding source.	2 days
Disk is unformatted, or formatted but empty,	2 weeks

or formatted but contains files that have not been touched for 24 hours, and there are healthy active database copies in the local Active Directory site that can be used as a seeding source, but there are unknown files outside of the database file (EDB file) and log files.	
Disk is unformatted, or formatted but empty, or formatted but contains files that have not been touched for 24 hours, and there are healthy active database copies in the local Active Directory site that can be used as a seeding source, but there are one or more database files (EDB files) for databases that are not present in Active Directory.	2 weeks

Planning for high availability and site resilience

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-05*

During the planning phase, the system architects, administrators, and other key stakeholders should identify the business requirements and the architectural requirements for the deployment; in particular, the requirements about high availability and site resilience.

There are general requirements that must be met for deploying these features, as well as hardware, software, and networking requirements that must also be met.

Contents

General requirements

Before deploying a database availability group (DAG) and creating mailbox database copies, make sure that the following system-wide recommendations are met:

- Domain Name System (DNS) must be running. Ideally, the DNS server should accept dynamic updates. If the DNS server doesn't accept dynamic updates, you must create a DNS host (A) record for each Exchange server. Otherwise, Exchange won't function properly.
- Each Mailbox server in a DAG must be a member server in the same domain.
- Adding an Exchange 2013 Mailbox server that's also a directory server to a DAG isn't supported.
- The name you assign to the DAG must be a valid, available, and unique computer name of 15 characters or less.

Return to top

Hardware requirements

Generally, there are no special hardware requirements specific to DAGs or mailbox database copies. The servers used must meet all of the requirements set forth in the topics for Exchange 2013 prerequisites and Exchange 2013 system requirements.

Return to top

Storage requirements

Generally, there are no special storage requirements specific to DAGs or mailbox database copies. DAGs don't require or use cluster-managed shared storage. Cluster-managed shared storage is supported for use in a DAG only when the DAG is configured to use a solution that leverages the Third Party Replication API built into Exchange 2013.

Return to top

Software requirements

DAGs are available in both Exchange 2013 Standard and Exchange 2013 Enterprise. In addition, a DAG can contain a mix of servers running Exchange 2013 Standard and Exchange 2013 Enterprise.

Each member of the DAG must also be running the same operating system. Exchange 2013 is

supported on the Windows Server 2008 R2, Windows Server 2012, and Windows Server 2012 R2 operating systems. All members of a specific DAG must run the same operating system. Windows Server 2012 R2 is supported only for DAG members that are running Exchange 2013 Service Pack 1 or later.

In addition to meeting the prerequisites for installing Exchange 2013, there are operating system requirements that must be met. DAGs use Windows Failover Clustering technology, and as a result, they require the Enterprise or Datacenter version of Windows Server 2008 R2, or the Standard or Datacenter version of the Windows Server 2012 or Windows Server 2012 R2 operating systems.

Return to top

Network requirements

There are specific networking requirements that must be met for each DAG and for each DAG member. Each DAG must have a single *MAPI network*, which is used by a DAG member to communicate with other servers (for example, other Exchange 2013 servers or directory servers), and zero or more *Replication networks*, which are networks dedicated to log shipping and seeding.

In previous versions of Exchange, we recommended at least two networks (one MAPI network and one Replication network) for DAGs. In Exchange 2013, multiple networks are supported, but our recommendation depends on your physical network topology. If you have multiple physical networks between DAG members that are physically separate from one another, then using a separate MAPI and Replication network provides additional redundancy. If you have multiple networks that are partially physically separate but converge into a single physical network (for example, a single WAN link), then using a single network (preferably 10 gigabit Ethernet) for both MAPI and Replication traffic is recommended. This provides simplicity for the network and the network path.

Consider the following when designing the network infrastructure for your DAG:

- Each member of the DAG must have at least one network adapter that's able to communicate with all other DAG members. If you're using a single network path, we recommend that you use a minimum of 1 gigabit Ethernet, but preferably 10 gigabit Ethernet. In addition, when using a single network adapter in each DAG member, we recommend that you design the overall solution with the single network adapter and path in mind.
- Using two network adapters in each DAG member provides you with one MAPI network and one Replication network, with redundancy for the Replication network and the following recovery behaviors:
  - In the event of a failure affecting the MAPI network, a server failover will occur (assuming there are healthy mailbox database copies that can be activated).
  - In the event of a failure affecting the Replication network, if the MAPI network is unaffected by the failure, log shipping and seeding operations will revert to use the MAPI network, even if the MAPI network has it's *ReplicationEnabled* property set to False. When the failed Replication network is restored to health and ready to resume log shipping and seeding operations, you

must manually switch over to the Replication network. To change replication from the MAPI network to a restored Replication network, you can either suspend and resume continuous replication by using the **Suspend-MailboxDatabaseCopy** and **Resume-MailboxDatabaseCopy** cmdlets, or restart the Microsoft Exchange Replication service. We recommend using suspend and resume operations to avoid the brief outage caused by restarting the Microsoft Exchange Replication service.

- Each DAG member must have the same number of networks. For example, if you plan on using a single network adapter in one DAG member, all members of the DAG must also use a single network adapter.
- Each DAG must have no more than one MAPI network. The MAPI network must provide connectivity to other Exchange servers and other services, such as Active Directory and DNS.
- Additional Replication networks can be added, as needed. You can also prevent an individual network adapter from being a single point of failure by using network adapter teaming or similar technology. However, even when using teaming, this doesn't prevent the network itself from being a single point of failure. Moreover, teaming adds unnecessary complexity to the DAG.
- Each network in each DAG member server must be on its own network subnet. Each server in the DAG can be on a different subnet, but the MAPI and Replication networks must be routable and provide connectivity, such that:
  - Each network in each DAG member server is on its own network subnet that's separate from the subnet used by each other network in the server.
  - Each DAG member server's MAPI network can communicate with each other DAG member's MAPI network.
  - Each DAG member server's Replication network can communicate with each other DAG member's Replication network.
  - There is no direct routing that allows heartbeat traffic from the Replication network on one DAG member server to the MAPI network on another DAG member server, or vice versa, or between multiple Replication networks in the DAG.
- Regardless of their geographic location relative to other DAG members, each member of the DAG must have round trip network latency no greater than 500 milliseconds between each other member. As the round trip latency between two Mailbox servers hosting copies of a database increases, the potential for replication not being up to date also increases. Regardless of the latency of the solution, customers should validate that the networks between all DAG members is capable of satisfying the data protection and availability goals of the deployment. Configurations with higher latency values may require special tuning of DAG, replication, and network parameters, such as increasing the number of databases or decreasing the number of mailboxes per database, to achieve the desired goals.
- Round trip latency requirements may not be the most stringent network bandwidth and latency requirement for a multi-datacenter configuration. You must evaluate the total network load, which includes client access, Active Directory, transport, continuous replication, and other application traffic, to determine the necessary network requirements for your environment.
- DAG networks support Internet Protocol version 4 (IPv4) and IPv6. IPv6 is supported only when IPv4 is also used; a pure IPv6 environment isn't supported. Using IPv6 addresses and IP address

ranges is supported only when both IPv6 and IPv4 are enabled on that computer, and the network supports both IP address versions. If Exchange 2013 is deployed in this configuration, all server roles can send data to and receive data from devices, servers, and clients that use IPv6 addresses.

- Automatic Private IP Addressing (APIPA) is a feature of Windows that automatically assigns IP addresses when no Dynamic Host Configuration Protocol (DHCP) server is available on the network. APIPA addresses (including manually assigned addresses from the APIPA address range) aren't supported for use by DAGs or by Exchange 2013.

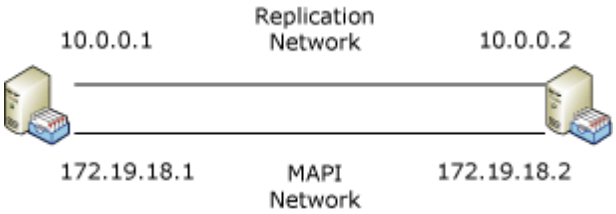
DAG name and IP address requirements

During creation, each DAG is given a unique name, and either assigned one or more static IP addresses, or configured to use DHCP. Regardless of whether you use static or dynamically assigned addresses, any IP address assigned to the DAG must be on the MAPI network.

Each DAG running on Windows Server 2008 R2 or Windows Server 2012 requires a minimum of one IP address on the MAPI network. A DAG requires additional IP addresses when the MAPI network is extended across multiple subnets. DAGs running on Windows Server 2012 R2 that are created without a cluster administrative access point do not require an IP address.

The following figure illustrates a DAG where all nodes in the DAG have the MAPI network on the same subnet.

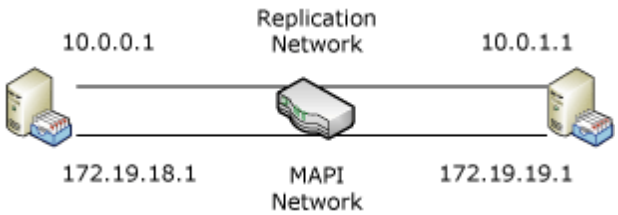
DAG with MAPI network on same subnet



In this example, the MAPI network in each DAG member is on the 172.19.18.*x* subnet. As a result, the DAG requires a single IP address on that subnet.

The next figure illustrates a DAG that has a MAPI network that extends across two subnets: 172.19.18.*x* and 172.19.19.*x*.

DAG with MAPI network on multiple subnets



In this example, the MAPI network in each DAG member is on a separate subnet. As a result, the DAG requires two IP addresses, one for each subnet on the MAPI network.

Each time the DAG's MAPI network is extended across an additional subnet, an additional IP address for that subnet must be configured for the DAG. Each IP address that's configured for the DAG is assigned to and used by the DAG's underlying failover cluster. The name of the DAG is also

used as the name for the underlying failover cluster.

At any specific time, the cluster for the DAG will use only one of the assigned IP addresses. Windows Failover Clustering registers this IP address in DNS when the cluster IP address and Network Name resources are brought online. In addition to using an IP address and network name, a cluster name object (CNO) is created in Active Directory. The name, IP address, and CNO for the cluster are used internally by the system to secure the DAG and for internal communication purposes. Administrators and end users don't need to interface with or connect to the DAG name or IP address.

Note:
Although the cluster's IP address and network name are used internally by the system, there is no hard dependency in Exchange 2013 that these resources be available. Even if the underlying cluster's administrative access point (e.g., it's IP address and Network Name resources) is offline, internal communication still occurs within the DAG by using the DAG member server names. However, we recommend that you periodically monitor the availability of these resources to ensure that they aren't offline for more than 30 days. If the underlying cluster is offline for more than 30 days, the cluster CNO account may be invalidated by the garbage collection mechanism in Active Directory.

Network adapter configuration for DAGs

Each network adapter must be configured properly based on its intended use. A network adapter that's used for a MAPI network is configured differently from a network adapter that's used for a Replication network. In addition to configuring each network adapter correctly, you must also configure the network connection order in Windows so that the MAPI network is at the top of the connection order. For detailed steps about how to modify the network connection order, see Modify the protocol bindings and network provider order.

MAPI network adapter configuration

A network adapter intended for use by a MAPI network should be configured as described in the following table.

Networking features	Settings
Client for Microsoft Networks	Enabled
QoS Packet Scheduler	Optionally enabled
File and Printer Sharing for Microsoft Networks	Enabled
Internet Protocol version 6 (TCP/IP v6)	Enabled
Internet Protocol version 4 (TCP/IP v4)	Enabled

Link-Layer Topology Discovery Mapper I/O Driver	Enabled
Link-Layer Topology Discovery Responder	Enabled

The TCP/IP v4 properties for a MAPI network adapter are configured as follows:

- The IP address for a DAG member's MAPI network can be manually assigned or configured to use DHCP. If DHCP is used, we recommend using persistent reservations for the server's IP address.
- The MAPI network typically uses a default gateway, although one isn't required.
- At least one DNS server address must be configured. Using multiple DNS servers is recommended for redundancy.
- The **Register this connection's addresses in DNS** check box should be selected.

Replication network adapter configuration

A network adapter intended for use by a Replication network should be configured as described in the following table.

Networking features	Settings
Client for Microsoft Networks	Disabled
QoS Packet Scheduler	Optionally enabled
File and Printer Sharing for Microsoft Networks	Disabled
Internet Protocol version 6 (TCP/IP v6)	Enabled
Internet Protocol version 4 (TCP/IP v4)	Enabled
Link-Layer Topology Discovery Mapper I/O Driver	Enabled
Link-Layer Topology Discovery Responder	Enabled

The TCP/IP v4 properties for a Replication network adapter are configured as follows:

- The IP address for a DAG member's Replication network can be manually assigned or configured to use DHCP. If DHCP is used, we recommend using persistent reservations for the server's IP address.
- Replication networks typically don't have default gateways, and if the MAPI network has a default gateway, no other networks should have default gateways. Routing of network traffic on a Replication network can be configured by using persistent, static routes to the corresponding network on other DAG members using gateway addresses that have the ability to route between

the Replication networks. All other traffic not matching this route will be handled by the default gateway that's configured on the adapter for the MAPI network.
- DNS server addresses shouldn't be configured.
- The **Register this connection's addresses in DNS** check box shouldn't be selected.

Witness server requirements

A *witness server* is a server outside a DAG that's used to achieve and maintain quorum when the DAG has an even number of members. DAGs with an odd number of members don't use a witness server. All DAGs with an even number of members must use a witness server. The witness server can be any computer running Windows Server. There is no requirement that the version of the Windows Server operating system of the witness server matches the operating system used by the DAG members.

Quorum is maintained at the cluster level, underneath the DAG. A DAG has quorum when the majority of its members are online and can communicate with the other online members of the DAG. This notion of quorum is one aspect of the concept of quorum in Windows failover clustering. A related and necessary aspect to quorum in failover clusters is the *quorum resource*. The quorum resource is a resource inside a failover cluster that provides a means for arbitration leading to cluster state and membership decisions. The quorum resource also provides persistent storage for storing configuration information. A companion to the quorum resource is the *quorum log*, which is a configuration database for the cluster. The quorum log contains information such as which servers are members of the cluster, what resources are installed in the cluster, and the state of those resources (for example, online or offline).

It's critical that each DAG member have a consistent view of how the DAG's underlying cluster is configured. The quorum acts as the definitive repository for all configuration information relating to the cluster. The quorum is also used as a tie-breaker to avoid *split-brain* syndrome. Split brain syndrome is a condition that occurs when DAG members can't communicate with each other but are running. Split brain syndrome is prevented by always requiring a majority of the DAG members (and in the case of DAGs with an even number of member, the DAG witness server) to be available and interacting for the DAG to be operational.

Planning for site resilience

Every day, more businesses recognize that access to a reliable and available messaging system is fundamental to their success. For many organizations, the messaging system is part of the business continuity plans, and their messaging service deployment is designed with site resilience in mind. Fundamentally, many site resilient solutions involve the deployment of hardware in a second datacenter.

Ultimately, the overall design of a DAG, including the number of DAG members and the number of mailbox database copies, will depend on each organization's recovery service level agreements (SLAs) that cover various failure scenarios. During the planning stage, the solution's architects and administrators identify the requirements for the deployment, including in particular the requirements for site resilience. They identify the locations to be used and the required recovery SLA targets. The SLA will identify two specific elements that should be the basis for the design of a solution that provides high availability and site resilience: the recovery time objective and the recovery point objective. Both of these values are measured in minutes. The recovery time objective is how long it takes to restore service. The recovery point objective refers to how current the data is after the recovery operation has completed. An SLA may also be defined for restoring the primary datacenter to full service after its problems are corrected.

The solution's architects and administrators will also identify which set of users require site resilience protection, and determine if the multiple site solution will be an active/passive or active/active configuration. In an active/passive configuration, no users are normally hosted in the standby datacenter. In an active/active configuration, users are hosted in both locations, and some percentage of the total number of databases within the solution has a preferred active location in a second datacenter. When service for the users of one datacenter fails, those users are activated in the other datacenter.

Constructing the appropriate SLAs often requires answering the following basic questions:

- What level of service is required after the primary datacenter fails?
- Do users need their data or just messaging services?
- How rapidly is data required?
- How many users must be supported?
- How will users access their data?
- What is the standby datacenter activation SLA?
- How is service moved back to the primary datacenter?
- Are the resources dedicated to the site resilience solution?

By answering these questions, you begin to shape a site resilient design for your messaging solution. A core requirement of recovery from site failure is to create a solution that gets the necessary data to the backup datacenter that hosts the backup messaging service.

Certificate planning

There are no unique or special design considerations for certificates when deploying a DAG in a single datacenter. However, when extending a DAG across multiple datacenters in a site resilient configuration, there are some specific considerations with respect to certificates. Generally, your certificate design will depend on the clients in use, as well as the certificate requirements by other applications that use certificates. But there are some specific recommendations and best practices you should follow with respect to the type and number of certificates.

As a best practice, you should minimize the number of certificates you use for your Exchange servers and reverse proxy servers. We recommend using a single certificate for all of these service

endpoints in each datacenter. This approach minimizes the number of certificates that are needed, which reduces both cost and complexity for the solution.

For Outlook Anywhere clients, we recommend that you use a single subject alternative name (SAN) certificate for each datacenter, and include multiple host names in the certificate. To ensure Outlook Anywhere connectivity after a database, server, or datacenter switchover, you must use the same Certificate Principal Name on each certificate, and configure the Outlook Provider Configuration object in Active Directory with the same Principal Name in Microsoft-Standard Form (msstd). For example, if you use a Certificate Principal Name of mail.contoso.com, you would configure the attribute as follows.

```
Set-OutlookProvider EXPR -CertPrincipalName
"msstd:mail.contoso.com"
```

Some applications that integrate with Exchange have specific certificate requirements that may require using additional certificates. Exchange 2013 can co-exist with Office Communications Server (OCS). OCS requires certificates with 1024-bit or greater certificates that use the OCS server name for the Certificate Principal Name. Because using an OCS server name for the Certificate Principal Name would prevent Outlook Anywhere from working properly, you would need to use an additional and separate certificate for the OCS environment.

Network planning

In addition to the specific networking requirements that must be met for each DAG, as well as for each server that's a member of a DAG, there are some requirements and recommendations that are specific to site resilience configurations. As with all DAGs, whether the DAG members are deployed in a single site or in multiple sites, the round-trip return network latency between DAG members must be no greater than 500 milliseconds. In addition, there are specific configuration settings that are recommended for DAGs that are extended across multiple sites:

- **MAPI networks should be isolated from Replication networks** Windows network policies, Windows firewall policies, or router access control lists (ACLs) should be used to block traffic between the MAPI network and the Replication networks. This configuration is necessary to prevent network heartbeat cross talk.
- **Client-facing DNS records should have a Time to Live (TTL) value of 5 minutes** The amount of downtime that clients experience is dependent not just on how quickly a switchover can occur, but also on how quickly DNS replication occurs and the clients query for updated DNS information. DNS records for all Exchange client services, including Microsoft Office Outlook Web App, Microsoft Exchange ActiveSync, Exchange Web services, Outlook Anywhere, SMTP, POP3, and IMAP4 in both the internal and external DNS servers should be set with a TTL of 5 minutes.
- **Use static routes to configure connectivity across Replication networks** To provide network connectivity between each of the Replication network adapters, use persistent static routes. This is a quick and one-time configuration that's performed on each DAG member when using static IP addresses. If you're using DHCP to obtain IP addresses for your Replication networks, you can also

use it to assign static routes for the replication, thereby simplifying the configuration process.

General site resilience planning

In addition to the requirements listed above for high availability, there are other recommendations for deploying Exchange 2013 in a site resilient configuration (for example, extending a DAG across multiple datacenters). What you do during the planning phase will directly affect the success of your site resilience solution. For example, poor namespace design can cause difficulties with certificates, and an incorrect certificate configuration can prevent users from accessing services.

To minimize the time it takes to activate a second datacenter, and allow the second datacenter to host the service endpoints of a failed datacenter, the appropriate planning must be completed. The following are examples:

- The SLA goals for the site resilience solution must be well understood and documented.
- The servers in the second datacenter must have sufficient capacity to host the combined user population of both datacenters.
- The second datacenter must have all services enabled that are provided in the primary datacenter (unless the service isn't included as part of the site resilience SLA). This includes Active Directory, networking infrastructure (for example, DNS or TCP/IP), telephony services (if Unified Messaging is in use), and site infrastructure (such as power or cooling).
- For some services to be able to service users from the failed datacenter, they must have the proper server certificates configured. Some services don't allow instancing (for example, POP3 and IMAP4) and only allow the use of a single certificate. In these cases, either the certificate must be a SAN certificate that includes multiple names, or the multiple names must be similar enough so that a wildcard certificate can be used (assuming the security policies of the organization allows the use of wildcard certificates).
- The necessary services must be defined in the second datacenter. For example, if the first datacenter has three different SMTP URLs on different transport servers, the appropriate configuration must be defined in the second datacenter to enable at least one (if not all three) transport server to host the workload.
- The necessary network configuration must be in place to support the datacenter switchover. This might mean making sure that the load balancing configurations are in place, that global DNS is configured, and that the Internet connection is enabled with the appropriate routing configured.
- The strategy for enabling the DNS changes necessary for a datacenter switchover must be understood. The specific DNS changes, including their TTL settings, must be defined and documented to support the SLA in effect.
- A strategy for testing the solution must also be established and factored into the SLA. Periodic validation of the deployment is the only way to guarantee that the quality and viability of the deployment doesn't degrade over time. After the deployment is validated, we recommend that the part of the configuration that directly affects the success of the solution be explicitly documented. In addition, we recommend that you enhance your change management processes around those segments of the deployment.

Deploying high availability and site resilience

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-21*

Microsoft Exchange Server 2013 uses the concept known as *incremental deployment* for both high availability and site resilience. You simply install two or more Exchange 2013 Mailbox servers as stand-alone servers, and then incrementally configure them and mailbox databases for high availability and site resilience, as needed.

Overview of the deployment process

While the actual steps used by each organization may vary slightly, the overall process for deploying Exchange 2013 in a highly available or site resilient configuration is generally the same. After performing the necessary planning and design tasks for building and deploying a database availability group (DAG) and creating mailbox database copies, you would:

1. Create a DAG. For detailed steps, see Create a database availability group.
2. If necessary, pre-stage the cluster name object (CNO). Pre-staging the CNO is required when deploying a DAG with Mailbox servers running Windows Server 2012. If you are deploying a DAG without an administrative access point using Mailbox servers running Windows Server 2012 R2, then you do not need to pre-stage a CNO. Pre-staging is also required in environments where computer account creation is restricted or where computer accounts are created in a container other than the default computers container. For detailed steps, see Pre-stage the cluster name object for a database availability group.
3. Add two or more Mailbox servers to the DAG. For detailed steps, see Manage database availability group membership.
4. Configure the DAG properties as needed:
   a. Optionally configure DAG encryption and compression, replication port, DAG IP addresses, and other DAG properties. For detailed steps, see Configure database availability group properties.
   b. Enable Datacenter Activation Coordination (DAC) mode for the DAG. This protects the DAG from database-level split brain conditions during switchback to the primary datacenter after a datacenter switchover has been performed, and it enables the use of the built-in DAG recovery cmdlets. For more information, see Datacenter Activation Coordination mode.

5. Add mailbox database copies across Mailbox servers in the DAG. For detailed steps, see Add a mailbox database copy.

Example deployment: four-member DAG in two datacenters

This example details how an organization, Contoso, Ltd., is configuring and deploying a four-member DAG that will be extended across two physical locations: Redmond, Washington and Portland, Oregon.

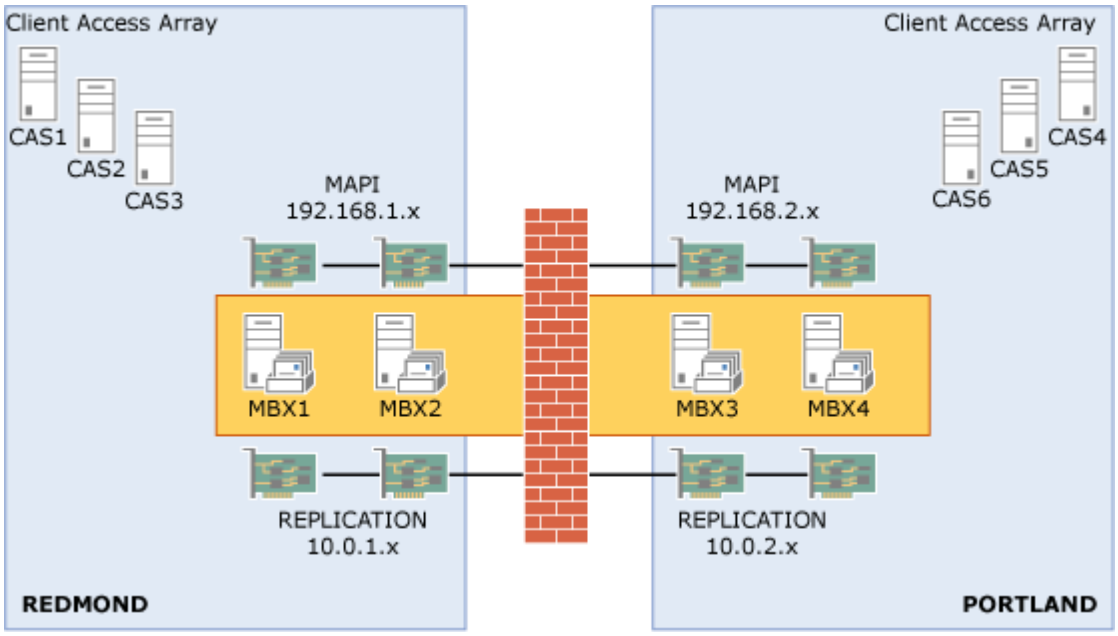
Base infrastructure

Each location contains the infrastructure elements that are necessary to operate a messaging infrastructure based on Exchange 2013, namely:

- Directory services (either Active Directory or Active Directory Domain Services (AD DS))
- Domain Name System (DNS) name resolution
- Multiple Exchange 2013 Client Access servers
- Multiple Exchange 2013 Mailbox servers

The following figure illustrates the Contoso configuration.

Database availability group extended across two sites



Network configuration

As illustrated in the previous figure, the solution involves the use of multiple subnets and multiple networks. Each Mailbox server in the DAG has two network adapters on separate subnets. In each Mailbox server, one network adapter will be used for the MAPI network (192.168.*x.x*) and one network adapter will be used for the Replication network (10.0.*x.x*). Only the MAPI network provides

connectivity to Active Directory, DNS services, other Exchange servers and clients. The adapter used for the Replication network in each member provides connectivity only to the Replication network adapters in the other members of the DAG.

The settings for each network adapter in each node are detailed in the following table.

Name	IPv4 address	Subnet mask	Default gateway
MBX1 (MAPI)	192.168.1.4	255.255.255.0	192.168.1.1
MBX2 (MAPI)	192.168.1.5	255.255.255.0	192.168.1.1
MBX3 (MAPI)	192.168.2.4	255.255.255.0	192.168.2.1
MBX4 (MAPI)	192.168.2.5	255.255.255.0	192.168.2.1
MBX1 (Replication)	10.0.1.4	255.255.0.0	None
MBX2 (Replication)	10.0.1.5	255.255.0.0	None
MBX3 (Replication)	10.0.2.4	255.255.0.0	None
MBX4 (Replication)	10.0.2.5	255.255.0.0	None

As shown in the preceding table, adapters used for Replication networks don't use default gateways. To provide network connectivity between each of the Replication network adapters, Contoso uses persistent static routes, which they configure by using the Netsh.exe tool.

To configure routing for the Replication network adapters on MBX1 and MBX2, the following command was run on each server.

```
netsh interface ipv4 add route 10.0.2.0/24 <NetworkName>
10.0.1.254
```

To configure routing for the Replication network adapters on MBX3 and MBX4, the following command was run on each server.

```
netsh interface ipv4 add route 10.0.1.0/24 <NetworkName>
10.0.2.254
```

The following additional network settings have also been configured:

- The **Register this connection's addresses in DNS** check box is selected for each DAG member's MAPI network adapter, and cleared for each Replication network adapter.
- At least one DNS server address is configured for each DAG member's MAPI network adapter, and none are configured for the Replication network adapters. For redundancy, Contoso is using multiple DNS server addresses for their MAPI network adapters.

- Contoso doesn't use the Windows Firewall and have turned it off on their servers.

After the network adapters have been configured, Contoso is ready to create a DAG and add the Mailbox servers to the DAG.

Database availability group creation and configuration

The administrator has decided to create a Windows PowerShell command-line interface script that performs several tasks:

- It uses the New-DatabaseAvailabilityGroup cmdlet to create the DAG. Because REDMOND is considered to be the primary datacenter, Contoso has chosen to use a witness server in the same datacenter, namely, CAS1.
- It uses the Set-DatabaseAvailabilityGroup cmdlet to preconfigure an alternate witness server and alternate witness directory in case a datacenter switchover is ever necessary.
- It uses the Add-DatabaseAvailabilityGroupServer cmdlet to add each of the four Mailbox servers to the DAG.
- It uses the Set-DatabaseAvailabilityGroup cmdlet to configure the DAG for DAC mode. For more information about DAC mode, see Datacenter Activation Coordination mode.

The following are the commands used in the script:

```
New-DatabaseAvailabilityGroup -Name DAG1 -WitnessServer
CAS1 -WitnessDirectory C:\DAGWitness\DAG1.contoso.com -
DatabaseAvailabilityGroupIPAddresses
192.168.1.8,192.168.2.8
```

The preceding command creates the DAG DAG1, configures CAS1 to act as the witness server, configures a specific witness directory (C:\DAGWitness\DAG1.contoso.com), and configures two IP addresses for the DAG (one for each subnet on the MAPI network).

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
AlternateWitnessDirectory C:\DAGWitness\DAG1.contoso.com -
AlternateWitnessServer CAS4
```

The preceding command configures DAG1 to use an alternate witness server of CAS4 and an alternate witness directory on CAS4 that uses the same path that was configured on CAS1.

Note:

Using the same path isn't required; Contoso has chosen to do this to standardize their configuration.

```
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX1
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
```

```
MailboxServer MBX3
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX2
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX4
```

The preceding commands add each of the Mailbox servers, one at a time, to the DAG. The commands also install the Windows Failover Clustering component on each Mailbox server (if it isn't already installed), create a failover cluster, and join each Mailbox server to the newly created cluster.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatacenterActivationMode DagOnly
```

The preceding command enables DAC mode for the DAG.

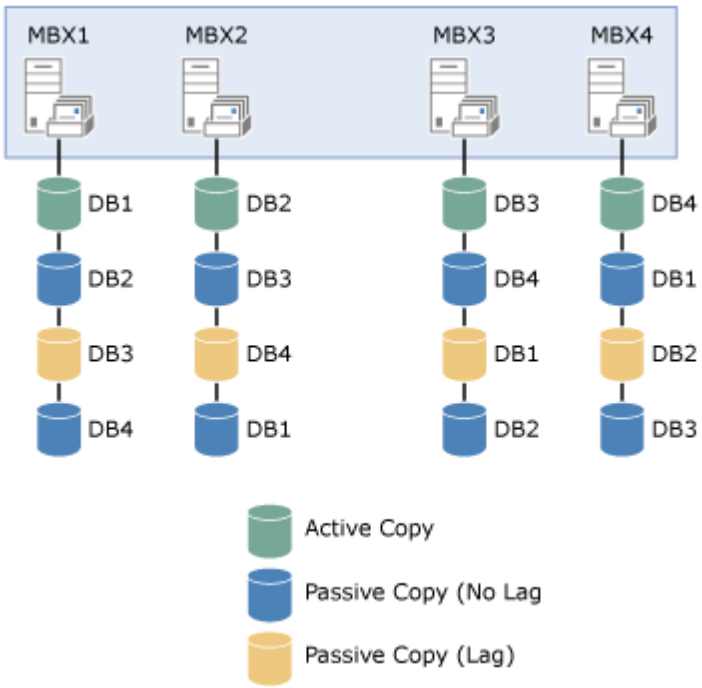
Mailbox databases and mailbox database copies

After creating the DAG and adding the Mailbox servers to the DAG, Contoso prepares to create mailbox databases and mailbox database copies. To meet their criteria for failure resistance, Contoso is planning to configure each mailbox database with three non-lagged database copies, and one lagged database copy. The lagged copy will have a configured log replay delay of three days.

This configuration provides a total of four copies for each database (one active, two non-lagged passives, and a lagged passive). Contoso plans on having four active databases per server. With four active databases per server, and three passive copies of each database, the Contoso solution contains 16 total database copies.

As shown in the following figure, Contoso is taking a balanced approach to their database layout.

Database copy layout for Contoso, Ltd



Each Mailbox server hosts an active mailbox database copy, two non-lagged passive database copies, and one lagged passive database copy. The lagged copy of each active mailbox database is hosted on a Mailbox server in the other site.

To create this configuration, the administrator runs several commands.

On MBX1, run the following commands.

```
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX2
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX4
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX3 -
ReplayLagTime 3.00:00:00 -SeedingPostponed
Suspend-MailboxDatabaseCopy -Identity DB1\MBX3 -
SuspendComment "Seed from MBX4" -Confirm:$False
Update-MailboxDatabaseCopy -Identity DB1\MBX3 -SourceServer
MBX4
Suspend-MailboxDatabaseCopy -Identity DB1\MBX3 -
ActivationOnly
```

On MBX2, run the following commands.

```
Add-MailboxDatabaseCopy -Identity DB2 -MailboxServer MBX1
Add-MailboxDatabaseCopy -Identity DB2 -MailboxServer MBX3
Add-MailboxDatabaseCopy -Identity DB2 -MailboxServer MBX4 -
ReplayLagTime 3.00:00:00 -SeedingPostponed
Suspend-MailboxDatabaseCopy -Identity DB2\MBX4 -
SuspendComment "Seed from MBX3" -Confirm:$False
Update-MailboxDatabaseCopy -Identity DB2\MBX4 -SourceServer
```

```
MBX3
Suspend-MailboxDatabaseCopy -Identity DB2\MBX4 -
ActivationOnly
```

On MBX3, run the following commands.

```
Add-MailboxDatabaseCopy -Identity DB3 -MailboxServer MBX4
Add-MailboxDatabaseCopy -Identity DB3 -MailboxServer MBX2
Add-MailboxDatabaseCopy -Identity DB3 -MailboxServer MBX1 -
ReplayLagTime 3.00:00:00 -SeedingPostponed
Suspend-MailboxDatabaseCopy -Identity DB3\MBX1 -
SuspendComment "Seed from MBX2" -Confirm:$False
Update-MailboxDatabaseCopy -Identity DB3\MBX1 -SourceServer
MBX2
Suspend-MailboxDatabaseCopy -Identity DB3\MBX1 -
ActivationOnly
```

On MBX4, run the following commands.

```
Add-MailboxDatabaseCopy -Identity DB4 -MailboxServer MBX3
Add-MailboxDatabaseCopy -Identity DB4 -MailboxServer MBX1
Add-MailboxDatabaseCopy -Identity DB4 -MailboxServer MBX2 -
ReplayLagTime 3.00:00:00 -SeedingPostponed
Suspend-MailboxDatabaseCopy -Identity DB4\MBX2 -
SuspendComment "Seed from MBX1" -Confirm:$False
Update-MailboxDatabaseCopy -Identity DB4\MBX2 -SourceServer
MBX1
Suspend-MailboxDatabaseCopy -Identity DB4\MBX2 -
ActivationOnly
```

In the preceding examples for the **Add-MailboxDatabaseCopy** cmdlet, the *ActivationPreference* parameter wasn't specified. The task automatically increments the activation preference number with each copy that's added. The original database always has a preference number of 1. The first copy added with the **Add-MailboxDatabaseCopy** cmdlet is automatically assigned a preference number of 2. Assuming no copies are removed, the next copy added is automatically assigned a preference number of 3, and so forth. Thus, in the preceding examples, the passive copy in the same datacenter as the active copy has an activation preference number of 2; the non-lagged passive copy in the remote datacenter has an activation preference number of 3, and the lagged passive copy in the remote datacenter has an activation preference number of 4.

Although there are two copies of each active database across the WAN in the other location, seeding over the WAN was only performed once. This is because Contoso is leveraging the

Exchange 2013 ability to use a passive copy of a database as the source for seeding. Using the Add-MailboxDatabaseCopy cmdlet with the *SeedingPostponed* parameter prevents the task from automatically seeding the new database copy being created. Then, the administrator can suspend the un-seeded copy, and by using the Update-MailboxDatabaseCopy cmdlet with the *SourceServer* parameter, the administrator can specify the local copy of the database as the source of the seeding operation. As a result, seeding of the second database copy added to each location happens locally and not over the WAN.

Note:
In the preceding example, the non-lagged database copy is seeded over the WAN, and that copy is then used to seed the lagged copy of the database that's in the same datacenter as the non-lagged copy.

Contoso has configured one of the passive copies of each mailbox database as a lagged database copy to provide protection against the extremely rare but catastrophic case of database logical corruption. As a result, the administrator is configuring the lagged copies as blocked for activation by using the Suspend-MailboxDatabaseCopy cmdlet with the *ActivationOnly* parameter. This ensures that the lagged database copies won't be activated if a database or server failover occurs.

Validating the solution

After the solution has been deployed and configured, the administrator performs several tasks that validate the solution's readiness prior to moving production mailboxes to the databases in the DAG. The solution should be tested and inspected using several methods, including failure simulations. To validate the solution, the administrator performs several tasks.

To verify the overall health of the DAG, the administrator runs the Test-ReplicationHealth cmdlet. This cmdlet checks several aspects of the replication and replay status to provide information about each Mailbox server and database copy in the DAG.

To verify replication and replay activity, the administrator runs the Get-MailboxDatabaseCopyStatus cmdlet. This cmdlet can provide real-time status information about a specific mailbox database copy or for all mailbox database copies on a specific server. For more information about monitoring the health and status of replicated databases in a DAG, see Monitoring database availability groups.

To verify that switchovers work as expected, the administrator uses the Move-ActiveMailboxDatabase cmdlet to perform a series of database switchovers and server switchovers. When these tasks have completed successfully, the administrator uses the same cmdlet to move the active database copies back to their original locations.

To verify the expected behaviors in various failure scenarios, the administrator performs several tasks that either simulate failures or actually cause failures to occur. For example, the administrator might:

- Unplug the power cord on MBX1, thereby triggering a server failover. The administrator then verifies that DB1 becomes active on another server (preferably MBX2, based on the activation

preference values).

- Unplug the network cable for the MAPI network adapter on MBX2, thereby triggering a server failover. The administrator then verifies that DB2 becomes active on another server (preferably MBX1, based on the activation preference values).
- Take the disk used by the active copy of DB3 offline, thereby triggering a database failover. The administrator then verifies that DB3 becomes active on another server (preferably MBX4, based on activation preference values).

There may be other failure scenarios that are tested by an organization, based on the business needs. After simulating a single failure (such as pulling the power plug), and verifying the solution's recovery behavior, the administrator may revert the solution back to its original configuration. In some cases, the solution may be tested for multiple concurrent failures. Ultimately, your solution test plan will dictate whether the solution is reverted back to its original configuration after each failure simulation has been completed.

In addition, an administrator may decide to disconnect the network connection between the two datacenters, thereby simulating a site failure. Performing a datacenter switchover is a much more involved and coordinated process; however, we recommend the process if the solution being deployed is intended to provide site resilience for the messaging services and data.

Transitioning to operations

After the solution has been deployed, it can be extended further using incremental deployment. At this point, management of the solution would also transition to operation processes, in which the following tasks would be performed:

- Monitor the health and status of DAGs and mailbox database copies. For more information, see Monitoring database availability groups.
- Perform database switchovers as needed. For detailed steps about how to perform a database switchover, see Activate a mailbox database copy.

For more information about managing the solution, see Managing high availability and site resilience.

Managing high availability and site resilience

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-05*

After you build, validate, and deploy a Microsoft Exchange Server 2013 high availability or site resilience solution, the solution transitions from the deployment phase to the operational phase of the overall solution lifecycle. The operational phase consists of several tasks, and all tasks are related to one of the following areas: database availability groups (DAGs), mailbox database copies, performing proactive monitoring, and managing switchovers and failovers.

Contents

Database availability group management

The operational management tasks associated with DAGs include:

- **Creating one or more DAGs** Creating a DAG is typically a one-time procedure performed during the deployment phase of the solution lifecycle. However, there may be reasons for creating DAGs that occur during the operational phase, for example:
  - The DAG is configured for third-party replication mode, and you want to revert to using continuous replication. You can't convert a DAG back to continuous replication; you need to create a DAG.
  - You have servers in multiple domains. All members of the same DAG must also be members of the same domain.
- **Managing DAG membership** Managing DAG members is an infrequent task typically performed during the deployment phase of the solution lifecycle. However, because of the flexibility provided by incremental deployment, managing DAG membership may also be performed throughout the solution lifecycle.
- **Configuring DAG properties** Each DAG has various properties that can be configured as needed. These properties include:
  - **Witness server and witness directory** The witness server is a server outside the DAG that acts as a quorum voter when the DAG contains an even number of members. The witness directory is a directory created and shared on the witness server for use by the system in maintaining a quorum.
  - **IP addresses** Each DAG will have one or more IPv4 addresses, and optionally, one or more IPv6 addresses. The IP addresses assigned to the DAG are used by the DAG's underlying cluster. The number of IPv4 addresses assigned to the DAG equals the number of subnets that comprise the MAPI network used by the DAG. You can configure the DAG to use static IP addresses or to obtain addresses automatically by using Dynamic Host Configuration Protocol (DHCP).
  - **Datacenter Activation Coordination mode** Datacenter Activation Coordination mode is a property setting on a DAG that's designed to prevent split-brain conditions at the database level, in a scenario in which you're restoring service to a primary datacenter after a datacenter

switchover has been performed. For more information about Datacenter Activation Coordination mode, see Datacenter Activation Coordination mode.

  - **Alternate witness server and alternate witness directory** The alternate witness server and alternate witness directory are values that you can preconfigure as part of the planning process for a datacenter switchover. These refer to the witness server and witness directory that will be used when a datacenter switchover has been performed.
  - **Replication port** By default, all DAGs use TCP port 64327 for continuous replication. You can modify the DAG to use a different TCP port for replication by using the *ReplicationPort* parameter of the Set-DatabaseAvailabilityGroup cmdlet.
  - **Network discovery** You can force the DAG to rediscover networks and network interfaces. This operation is used when you add or remove networks or introduce new subnets. Rediscovery of all DAG networks can be forced by using the *DiscoverNetworks* parameter of the Set-DatabaseAvailabilityGroup cmdlet.
  - **Network compression** By default, DAGs use compression only between DAG networks on different subnets. You can enable compression for all DAG networks or for seeding operations only, or you can disable compression for all DAG networks.
  - **Network encryption** By default, DAGs use encryption only between DAG networks on different subnets. You can enable encryption for all DAG networks or for seeding operations only, or you can disable encryption for all DAG networks.
- **Shutting down DAG members** The Exchange 2013 high availability solution is integrated with the Windows shutdown process. If an administrator or application initiates a shutdown of a Windows server in a DAG that has a mounted database that's replicated to one or more DAG members, the system will try to activate another copy of the mounted databases prior to allowing the shutdown process to complete. However, this new behavior doesn't guarantee that all of the databases on the server being shut down will experience a lossless activation. As a result, it's a best practice to perform a server switchover prior to shutting down a server that's a member of a DAG.

For detailed steps about how to create a DAG, see Create a database availability group. For detailed steps about how to configure DAGs and DAG properties, see Configure database availability group properties. For more information about each of the preceding management tasks, and about managing DAGs in general, see Managing database availability groups.

Return to top

Mailbox database copy management

The operational management tasks associated with mailbox database copies include:

- **Adding mailbox database copies** When you add a copy of a mailbox database, continuous replication is automatically enabled between the existing database and the database copy.
- **Configuring mailbox database copy properties** You can configure a variety of properties, such as the database activation policy, the amount of time, if any, for replay lag and truncation lag, and the activation preference for the database copy.

- **Suspending or resuming a mailbox database copy** You can suspend a mailbox database copy in preparation for seeding, or for other forms of maintenance. You can also suspend a mailbox database copy for activation only. This configuration prevents the system from automatically activating the copy as a result of a failure, but it still allows the system to keep the database copy up to date with log shipping and replay.
- **Updating a mailbox database copy** Updating, also known as *seeding*, is the process in which a copy of a mailbox database is added to another Mailbox server. This becomes the baseline database for the copy. After the initial first seed of the baseline database copy, only in rare circumstances will the database need to be seeded again.
- **Activating a mailbox database copy** Activating is the process of designating a specific passive copy as the new active copy of a mailbox database. This process is referred to as a *switchover*. For more information, see "Switchovers and Failovers" later in this topic.
- **Removing a mailbox database copy** You can remove a mailbox database copy at any time. Occasionally, it may be necessary to remove a mailbox database copy. For example, you can't remove a Mailbox server from a DAG until all mailbox database copies are removed from the server. In addition, you must remove all copies of a mailbox database before you can change the path for a mailbox database.

For detailed steps about how to add a mailbox database copy, see Add a mailbox database copy. For detailed steps about how to configure mailbox database copies, see Configure mailbox database copy properties. For more information about each of the preceding management tasks, and about managing mailbox database copies in general, see Managing mailbox database copies. For detailed steps about how to remove a mailbox database copy, see Remove a mailbox database copy.

Return to top

Proactive monitoring

Making sure that your servers are operating reliably and that your database copies are healthy are key objectives for daily messaging operations. Exchange 2013 includes a number of features that can be used to perform a variety of health monitoring tasks for DAGs and mailbox database copies, including:

- Get-MailboxDatabaseCopyStatus
- Test-ReplicationHealth
- Crimson channel event logging

In addition to monitoring the health and status, it's also critical to monitor for situations that can compromise availability. For example, we recommend that you monitor the redundancy of your replicated databases. It's critical to avoid situations where you're down to a single copy of a database. This scenario should be treated with the highest priority and resolved as soon as possible.

For more detailed information about monitoring the health and status of DAGs and mailbox database copies, see Monitoring database availability groups.

Return to top

Switchovers and failovers

A *switchover* is a manual process in which an administrator manually activates one or more mailbox database copies. Switchovers, which can occur at the database or server level, are typically performed as part of preparation for maintenance activities. Switchover management involves performing database or server switchovers as needed. For example, if you need to perform maintenance on a Mailbox server in a DAG, you would first perform a server switchover so that the server didn't host any active mailbox database copies. For detailed steps about how to perform a database switchover, see Activate a mailbox database copy. Switchovers can also be performed at the datacenter level.

A *failover* is the automatic activation by the system of one or more database copies in reaction to a failure. For example, the loss of a disk drive in a RAID-less environment will trigger a database failover. The loss of the MAPI network or a power failure will trigger a server failover.

Return to top

Managing database availability groups

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-21*

A database availability group (DAG) is a set of up to 16 Microsoft Exchange Server 2013 Mailbox servers that provides automatic, database-level recovery from a database, server, or network failure. DAGs use continuous replication and a subset of Windows failover clustering technologies to provide high availability and site resilience. Mailbox servers in a DAG monitor each other for failures. When a Mailbox server is added to a DAG, it works with the other servers in the DAG to provide automatic, database-level recovery from database failures.

When you create a DAG, it's initially empty. When you add the first server to a DAG, a failover cluster is automatically created for the DAG. In addition, the infrastructure that monitors the servers for network or server failures is initiated. The failover cluster heartbeat mechanism and cluster database are then used to track and manage information about the DAG that can change quickly, such as database mount status, replication status, and last mounted location.

Shutting down DAG members

Installing updates on DAG members

Creating DAGs

A DAG can be created using the New Database Availability Group wizard in the Exchange Admin Center (EAC), or by running the **New-DatabaseAvailabilityGroup** cmdlet in the Exchange Management Shell. When creating a DAG, you provide a name for the DAG, and optional witness server and witness directory settings. In addition, you can assign one or more IP addresses to the DAG, either by using static IP addresses or by allowing the DAG to be automatically assigned the necessary IP addresses using Dynamic Host Configuration Protocol (DHCP). You can manually assign IP addresses to the DAG by using the *DatabaseAvailabilityGroupIpAddresses* parameter. If you omit this parameter, the DAG attempts to obtain an IP address by using a DHCP server on your network.

If you are creating a DAG that will contain Mailbox servers that are running Windows Server 2012 R2, you also have the option of creating a DAG without a cluster administrative access point. In that case, the cluster will not have a cluster name object (CNO) in Active Directory, and the cluster core resource group will not contain a network name resource or an IP address resource.

For detailed steps about how to create a DAG, see Create a database availability group.

When you create a DAG, an empty object representing the DAG with the name you specified and an object class of **msExchMDBAvailabilityGroup** is created in Active Directory.

DAGs use a subset of Windows failover clustering technologies, such as the cluster heartbeat, cluster networks, and cluster database (for storing data that changes or can change quickly, such as database state changes from active to passive or the reverse, or from mounted to dismounted or the reverse). Because DAGs rely on Windows failover clustering, they can only be created on Exchange 2013 Mailbox servers running the Windows Server 2008 R2 Enterprise or Datacenter operating system, Windows Server 2012 Standard or Datacenter operating system, or Windows Server 2012 R2 Standard or Datacenter operating system.

Note:

The failover cluster created and used by the DAG must be dedicated to the DAG. The cluster can't be used for any other high availability solution or for any other purpose. For example, the failover cluster can't be used to cluster other applications or services. Using a DAG's underlying failover cluster for purposes other than the DAG isn't supported.

DAG witness server and witness directory

When creating a DAG, you need to specify a name for the DAG no longer than 15 characters that's unique within the Active Directory forest. In addition, each DAG is configured with a witness server and witness directory. The witness server and its directory are used only when there's an even number of members in the DAG and then only for quorum purposes. You don't need to create the witness directory in advance. Exchange automatically creates and secures the directory for you on the witness server. The directory shouldn't be used for any purpose other than for the DAG witness server.

The requirements for the witness server are as follows:

- The witness server can't be a member of the DAG.
- The witness server must be in the same Active Directory forest as the DAG.
- The witness server must be running Windows Server 2012, Windows Server 2008 R2, Windows Server 2008, Windows Server 2003 R2, or Windows Server 2003.
- A single server can serve as a witness for multiple DAGs. However, each DAG requires its own witness directory.

Regardless of what server is used as the witness server, if the Windows Firewall is enabled on the intended witness server, you must enable the Windows Firewall exception for File and Printer Sharing.

Important:

If the witness server you specify isn't an Exchange 2013 or Exchange 2010 server, you must add the Exchange Trusted Subsystem universal security group (USG) to the local Administrators group on the witness server prior to creating the DAG. These security permissions are necessary to ensure that Exchange can create a directory and share on the witness server as needed.

Neither the witness server nor the witness directory needs to be fault tolerant or use any form of redundancy or high availability. There's no need to use a clustered file server for the witness server or employ any other form of resiliency for the witness server. There are several reasons for this. With larger DAGs (for example, six members or more), several failures are required before the witness server is needed. Because a six-member DAG can tolerate as many as two voter failures without losing quorum, it would take as many as three voters failing before the witness server would be needed to maintain a quorum. Also, if there's a failure that affects your current witness server (for example, you lose the witness server because of a hardware failure), you can use the Set-DatabaseAvailabilityGroup cmdlet to configure a new witness server and witness directory (provided you have a quorum).

Note:

You can also use the **Set-DatabaseAvailabilityGroup** cmdlet to configure the witness server and witness directory in the original location if the witness server lost its storage or if someone changed the witness directory or share permissions.

Witness server placement considerations

The placement of a DAG's witness server will depend on your business requirements and the options available to your organization. Exchange 2013 includes support for new DAG configuration options that are not recommended or not possible in previous versions of Exchange. These options include using a third location, such as a third datacenter or a branch office.

The following table lists general witness server placement recommendations for different deployment scenarios.

Deployment Scenario	Recommendations
Single DAG deployed in a single datacenter	Locate witness server in the same datacenter as DAG members
Single DAG deployed across two datacenters; no additional locations available	Locate witness server in primary datacenter
Multiple DAGs deployed in a single datacenter	Locate witness server in the same datacenter as DAG members. Additional options include: • Using the same witness server for multiple DAGs • Using a DAG member to act as a witness server for a different DAG
Multiple DAGs deployed across two datacenters	Locate witness server in the datacenter that is considered primary for each DAG. Additional options include: • Using the same witness server for multiple DAGs • Using a DAG member to act as a witness server for a different DAG
Single or Multiple DAGs deployed across more than two datacenters	In this configuration, the witness server should be located in the datacenter where you want the majority of quorum votes to exist.

When a DAG has been deployed across two datacenters, a new configuration option in Exchange 2013 is to use a third location for hosting the witness server. If your organization has a third location with a network infrastructure that is isolated from network failures that affect the two datacenters in which your DAG is deployed, then you can deploy the DAG's witness server in that

third location, thereby configuring your DAG with the ability automatically failover databases to the other datacenter in response to a datacenter-level failure event.

Specifying a witness server and witness directory during DAG creation

When creating a DAG, you must provide a name for the DAG. You can optionally also specify a witness server and witness directory.

When creating a DAG, the following combinations of options and behaviors are available:

- You can specify only a name for the DAG, and leave the **Witness server** and **Witness directory** fields blank. In this scenario, the wizard searches the local Active Directory site for a Client Access server that doesn't have the Mailbox server installed, and it automatically creates the default directory (%SystemDrive%:\DAGFileShareWitnesses\<*DAGFQDN*>) and default share (<*DAGFQDN*>) on that server and uses that Client Access server as the witness server. For example, consider the witness server CAS3 on which the operating system has been installed onto drive C. A DAG named DAG1 in the contoso.com domain would use a default witness directory of C:\DAGFileShareWitnesses\DAG1.contoso.com, which would be shared as \\CAS3\DAG1.contoso.com.
- You can specify a name for the DAG, the witness server that you want to use, and the directory you want created and shared on the witness server.
- You can specify a name for the DAG and the witness server that you want to use, and leave the **Witness directory** field blank. In this scenario, the wizard creates the default directory on the specified witness server.
- You can specify a name for the DAG, leave the **Witness server** field blank, and specify the directory you want created and shared on the witness server. In this scenario, the wizard searches for a Client Access server that doesn't have the Mailbox server installed, and it automatically creates the specified DAG on that server, shares the directory, and uses that Client Access server as the witness server.

When a DAG is formed, it initially uses the Node Majority quorum model. When the second Mailbox server is added to the DAG, the quorum is automatically changed to a Node and File Share Majority quorum model. When this change occurs, the DAG's cluster begins using the witness server for maintaining quorum. If the witness directory doesn't exist, Exchange automatically creates it, shares it, and provisions the share with full control permissions for the CNO computer account for the DAG.

Note:
Using a file share that's part of a Distributed File System (DFS) namespace isn't supported.

If Windows Firewall is enabled on the witness server before the DAG is created, it may block the creation of the DAG. Exchange uses Windows Management Instrumentation (WMI) to create the directory and file share on the witness server. If Windows Firewall is enabled on the witness server and there are no firewall exceptions configured for WMI, the **New-DatabaseAvailabilityGroup** cmdlet fails with an error. If you specify a witness server, but not a witness directory, you receive the following error message.

The task was unable to create the default witness directory on server <*Server Name*>. Please manually specify a witness directory.

If you specify a witness server and witness directory, you receive the following warning message.

Unable to access file shares on witness server '*ServerName*'. Until this problem is corrected, the database availability group may be more vulnerable to failures. You can use the Set-DatabaseAvailabilityGroup cmdlet to try the operation again. Error: The network path was not found.

If Windows Firewall is enabled on the witness server after the DAG is created but before servers are added, it may block the addition or removal of DAG members. If Windows Firewall is enabled on the witness server and there are no firewall exceptions configured for WMI, the **Add-DatabaseAvailabilityGroupServer** cmdlet displays the following warning message.

Failed to create file share witness directory 'C:\DAGFileShareWitnesses\DAG_FQDN' on witness server '*ServerName*'. Until this problem is corrected, the database availability group may be more vulnerable to failures. You can use the Set-DatabaseAvailabilityGroup cmdlet to try the operation again. Error: WMI exception occurred on server '*ServerName*': The RPC server is unavailable. (Exception from HRESULT: 0x800706BA)

To resolve the preceding error and warnings, do one of the following:

- Manually create the witness directory and share on the witness server, and assign the CNO for the DAG full control for the directory and share.
- Enable the WMI exception in Windows Firewall.
- Disable Windows Firewall.

Return to top

DAG membership

After a DAG has been created, you can add servers to or remove servers from the DAG using the Manage Database Availability Group wizard in the EAC, or using the **Add-DatabaseAvailabilityGroupServer** or **Remove-DatabaseAvailabilityGroupServer** cmdlets in the Shell. For detailed steps about how to manage DAG membership, see Manage database availability group membership.

Note:
Each Mailbox server that's a member of a DAG is also a node in the underlying cluster used by the DAG. As a result, at any one time, a Mailbox server can be a member of only one DAG.

If the Mailbox server being added to a DAG doesn't have the failover clustering component

installed, the method used to add the server (for example, the **Add-DatabaseAvailabilityGroupServer** cmdlet or the Manage Database Availability Group wizard) installs the failover clustering feature.

When the first Mailbox server is added to a DAG, the following occurs:

- The Windows failover clustering component is installed, if it isn't already installed.
- A failover cluster is created using the name of the DAG. This failover cluster is used exclusively by the DAG, and the cluster must be dedicated to the DAG. Use of the cluster for any other purpose isn't supported.
- A CNO is created in the default computers container.
- The name and IP address of the DAG is registered as a Host (A) record in Domain Name System (DNS).
- The server is added to the DAG object in Active Directory.
- The cluster database is updated with information on the databases mounted on the added server.

In a large or multiple site environment, especially those in which the DAG is extended to multiple Active Directory sites, you must wait for Active Directory replication of the DAG object containing the first DAG member to complete. If this Active Directory object isn't replicated throughout your environment, adding the second server may cause a new cluster (and new CNO) to be created for the DAG. This is because the DAG object appears empty from the perspective of the second member being added, thereby causing the **Add-DatabaseAvailabilityGroupServer** cmdlet to create a cluster and CNO for the DAG, even though these objects already exist. To verify that the DAG object containing the first DAG server has been replicated, use the **Get-DatabaseAvailabilityGroup** cmdlet on the second server being added to verify that the first server you added is listed as a member of the DAG.

When the second and subsequent servers are added to the DAG, the following occurs:

- The server is joined to the Windows failover cluster for the DAG.
- The quorum model is automatically adjusted:
  - A Node Majority quorum model is used for DAGs with an odd number of members.
  - A Node and File Share Majority quorum model is used for DAGs with an even number of members.
- The witness directory and share are automatically created by Exchange when needed.
- The server is added to the DAG object in Active Directory.
- The cluster database is updated with information about mounted databases.

Note:

The quorum model change should happen automatically. However, if the quorum model doesn't automatically change to the proper model, you can run the **Set-DatabaseAvailabilityGroup** cmdlet with only the *Identity* parameter to correct the quorum settings for the DAG.

Pre-staging the cluster name object for a DAG

The CNO is a computer account created in Active Directory and associated with the cluster's Name

resource. The cluster's Name resource is tied to the CNO, which is a Kerberos-enabled object that acts as the cluster's identity and provides the cluster's security context. The formation of the DAG's underlying cluster and the CNO for that cluster is performed when the first member is added to the DAG. When the first server is added to the DAG, remote PowerShell contacts the Microsoft Exchange Replication service on the Mailbox server being added. The Microsoft Exchange Replication service installs the failover clustering feature (if it isn't already installed) and begins the cluster creation process. The Microsoft Exchange Replication service runs under the LOCAL SYSTEM security context, and it's under this context in which cluster creation is performed.

⚠Warning:

If your DAG members are running Windows Server 2012, you must pre-stage the CNO prior to adding the first server to the DAG. If your DAG members are running Windows Server 2012 R2, and you create a DAG without a cluster administrative access point, then a CNO will not be created, and you do not need to create a CNO for the DAG.

In environments where computer account creation is restricted, or where computer accounts are created in a container other than the default computers container, you can pre-stage and provision the CNO. You create and disable a computer account for the CNO, and then either:

- Assign full control of the computer account to the computer account of the first Mailbox server you're adding to the DAG.
- Assign full control of the computer account to the Exchange Trusted Subsystem USG.

Assigning full control of the computer account to the computer account of the first Mailbox server you're adding to the DAG ensures that the LOCAL SYSTEM security context will be able to manage the pre-staged computer account. Assigning full control of the computer account to the Exchange Trusted Subsystem USG can be used instead because the Exchange Trusted Subsystem USG contains the machine accounts of all Exchange servers in the domain.

For detailed steps about how to pre-stage and provision the CNO for a DAG, see Pre-stage the cluster name object for a database availability group.

Removing servers from a DAG

Mailbox servers can be removed from a DAG by using the Manage Database Availability Group wizard in the EAC or the **Remove-DatabaseAvailabilityGroupServer** cmdlet in the Shell. Before a Mailbox server can be removed from a DAG, all replicated mailbox databases must first be removed from the server. If you attempt to remove a Mailbox server with replicated mailbox databases from a DAG, the task fails.

There are scenarios in which you must remove a Mailbox server from a DAG before performing certain operations. These scenarios include:

- **Performing a server recovery operation** If a Mailbox server that's a member of a DAG is lost, or otherwise fails and is unrecoverable and needs replacement, you can perform a server recovery operation using the **Setup /m:RecoverServer** switch. However, before you can perform the recovery operation, you must first remove the server from the DAG using the Remove-

DatabaseAvailabilityGroupServer cmdlet with the *ConfigurationOnly* parameter.

- **Removing the database availability group** There may be situations in which you need to remove a DAG (for example, when disabling third-party replication mode). If you need to remove a DAG, you must first remove all servers from the DAG. If you attempt to remove a DAG that contains any members, the task fails.

Return to top

Configuring DAG properties

After servers have been added to the DAG, you can use the EAC or the Shell to configure the properties of a DAG, including the witness server and witness directory used by the DAG, and the IP addresses assigned to the DAG.

Configurable properties include:

- **Witness server** The name of the server that you want to host the file share for the file share witness. We recommend that you specify a Client Access server as the witness server. This enables the system to automatically configure, secure, and use the share, as needed, and enables the messaging administrator to be aware of the availability of the witness server.
- **Witness directory** The name of a directory that will be used to store file share witness data. This directory will automatically be created by the system on the specified witness server.
- **Database availability group IP addresses** One or more IP addresses must be assigned to the DAG, unless the DAG members are running Windows Server 2012 R2 and you are creating a DAG without an IP address. Otherwise, the DAG's IP addresses can be configured using manually assigned static IP addresses, or they can be automatically assigned to the DAG using a DHCP server in your organization.

The Shell enables you to configure DAG properties that aren't available in the EAC, such as DAG IP addresses, network encryption and compression settings, network discovery, the TCP port used for replication, and alternate witness server and witness directory settings, and to enable Datacenter Activation Coordination mode.

For detailed steps about how to configure DAG properties, see Configure database availability group properties.

DAG network encryption

DAGs support the use of encryption by leveraging the encryption capabilities of the Windows Server operating system. DAGs use Kerberos authentication between Exchange servers. Microsoft Kerberos security support provider (SSP) EncryptMessage and DecryptMessage APIs handle encryption of DAG network traffic. Microsoft Kerberos SSP supports multiple encryption algorithms. (For the complete list, see section 3.1.5.2, "Encryption Types" of Kerberos Protocol Extensions). The Kerberos authentication handshake selects the strongest encryption protocol supported in the list: typically Advanced Encryption Standard (AES) 256-bit, potentially with a SHA Hash-based Message Authentication Code (HMAC) to maintain integrity of the data. For details, see HMAC.

Network encryption is a property of the DAG and not a DAG network. You can configure DAG network encryption using the **Set-DatabaseAvailabilityGroup** cmdlet in the Shell. The possible encryption settings for DAG network communications are shown in the following table.

DAG network communication encryption settings

Setting	Description
Disabled	Network encryption isn't used.
Enabled	Network encryption is used on all DAG networks for replication and seeding.
InterSubnetOnly	Network encryption is used on DAG networks when replicating across different subnets. This is the default setting.
SeedOnly	Network encryption is used on all DAG networks for seeding only.

DAG network compression

DAGs support built-in compression. When compression is enabled, DAG network communication uses XPRESS, which is the Microsoft implementation of the LZ77 algorithm. For details, see An Explanation of the Deflate Algorithm and section 3.1.4.11.1.2.1 "LZ77 Compression Algorithm" of Wire Format Protocol Specification. This is the same type of compression used in many Microsoft protocols, in particular, MAPI RPC compression between Microsoft Outlook and Exchange.

As with network encryption, network compression is also a property of the DAG and not a DAG network. You configure DAG network compression by using the Set-DatabaseAvailabilityGroup cmdlet in the Shell. The possible compression settings for DAG network communications are shown in the following table.

DAG network communication compression settings

Setting	Description
Disabled	Network compression isn't used.
Enabled	Network compression is used on all DAG networks for replication and seeding.
InterSubnetOnly	Network compression is used on DAG networks when replicating across different

	subnets. This is the default setting.
SeedOnly	Network compression is used on all DAG networks for seeding only.

Return to top

DAG networks

A DAG network is a collection of one or more subnets used for either replication traffic or MAPI traffic. Each DAG contains a maximum of one MAPI network and zero or more replication networks. In a single network adapter configuration, the network is used for both MAPI and replication traffic. Although a single network adapter and path is supported, we recommend that each DAG have a minimum of two DAG networks. In a two-network configuration, one network is typically dedicated for replication traffic, and the other network is used primarily for MAPI traffic. You can also add network adapters to each DAG member and configure additional DAG networks as replication networks.

Note:

When using multiple replication networks, there's no way to specify an order of precedence for network use. Exchange randomly selects a replication network from the group of replication networks to use for log shipping.

In Exchange 2010, manual configuration of DAG networks was necessary in many scenarios. By default in Exchange 2013, DAG networks are automatically configured by the system. Before you can create or modify DAG networks, you must first enable manual DAG network control by running the following command:

```
Set-DatabaseAvailabilityGroup <DAGName> -
ManualDagNetworkConfiguration $true
```

After you've enabled manual DAG network configuration, you can use the **New-DatabaseAvailabilityGroupNetwork** cmdlet in the Shell to create a DAG network. For detailed steps about how to create a DAG network, see Create a database availability group network.

You can use the **Set-DatabaseAvailabilityGroupNetwork** cmdlet in the Shell to configure DAG network properties. For detailed steps about how to configure DAG network properties, see Configure database availability group network properties. Each DAG network has required and optional parameters to configure:

- **Network name** A unique name for the DAG network of up to 128 characters.
- **Network description** An optional description for the DAG network of up to 256 characters.
- **Network subnets** One or more subnets entered using a format of *IPAddress/Bitmask* (for example, 192.168.1.0/24 for Internet Protocol version 4 (IPv4) subnets; 2001:DB8:0:C000::/64 for Internet Protocol version 6 (IPv6) subnets).

- **Enable replication** In the EAC, select the check box to dedicate the DAG network to replication traffic and block MAPI traffic. Clear the check box to prevent replication from using the DAG network and to enable MAPI traffic. In the Shell, use the *ReplicationEnabled* parameter in the Set-DatabaseAvailabilityGroupNetwork cmdlet to enable and disable replication.

Note:
Disabling replication for the MAPI network doesn't guarantee that the system won't use the MAPI network for replication. When all configured replication networks are offline, failed, or otherwise unavailable, and only the MAPI network remains (which is configured as disabled for replication), the system uses the MAPI network for replication.

The initial DAG networks (for example, MapiDagNetwork and ReplicationDagNetwork01) created by the system are based on the subnets enumerated by the Cluster service. Each DAG member must have the same number of network adapters, and each network adapter must have an IPv4 address (and optionally, an IPv6 address as well) on a unique subnet. Multiple DAG members can have IPv4 addresses on the same subnet, but each network adapter and IP address pair in a specific DAG member must be on a unique subnet. In addition, only the adapter used for the MAPI network should be configured with a default gateway. Replication networks shouldn't be configured with a default gateway.

For example, consider DAG1, a two-member DAG where each member has two network adapters (one dedicated for the MAPI network and the other for a replication network). Example IP address configuration settings are shown in the following table.

Example network adapter settings

Server-network adapter	IP address/subnet mask	Default gateway
EX1-MAPI	192.168.1.15/24	192.168.1.1
EX1-Replication	10.0.0.15/24	Not applicable
EX2-MAPI	192.168.1.16	192.168.1.1
EX2-Replication	10.0.0.16	Not applicable

In the following configuration, there are two subnets configured in the DAG: 192.168.1.0 and 10.0.0.0. When EX1 and EX2 are added to the DAG, two subnets will be enumerated and two DAG networks will be created: MapiDagNetwork (192.168.1.0) and ReplicationDagNetwork01 (10.0.0.0). These networks will be configured as shown in the following table.

Enumerated DAG network settings for a single-subnet DAG

Name	Subnets	Interfaces	MAPI access enabled	Replication enabled
MapiDagNetwork	192.168.1.0/24	EX1 (192.168.1.15)	True	True

		EX2 (192.168.1.16)		
ReplicationDagNetwork01	10.0.0.0/24	EX1 (10.0.0.15) EX2 (10.0.0.16)	False	True

To complete the configuration of ReplicationDagNetwork01 as the dedicated replication network, disable replication for MapiDagNetwork by running the following command.

```
Set-DatabaseAvailabilityGroupNetwork -Identity DAG1
\MapiDagNetwork -ReplicationEnabled:$false
```

After replication is disabled for MapiDagNetwork, the Microsoft Exchange Replication service uses ReplicationDagNetwork01 for continuous replication. If ReplicationDagNetwork01 experiences a failure, the Microsoft Exchange Replication service reverts to using MapiDagNetwork for continuous replication. This is done intentionally by the system to maintain high availability.

DAG networks and multiple subnet deployments

In the preceding example, even though there are two different subnets in use by the DAG (192.168.1.0 and 10.0.0.0), the DAG is considered a single-subnet DAG because each member uses the same subnet to form the MAPI network. When DAG members use different subnets for the MAPI network, the DAG is referred to as a *multi-subnet DAG*. In a multi-subnet DAG, the proper subnets are automatically associated with each DAG network.

For example, consider DAG2, a two-member DAG where each member has two network adapters (one dedicated for the MAPI network and the other for a replication network), and each DAG member is located in a separate Active Directory site, with its MAPI network on a different subnet. Example IP address configuration settings are shown in the following table.

Example network adapter settings for a multi-subnet DAG

Server-network adapter	IP address/subnet mask	Default gateway
EX1-MAPI	192.168.0.15/24	192.168.0.1
EX1-Replication	10.0.0.15/24	Not applicable
EX2-MAPI	192.168.1.15	192.168.1.1
EX2-Replication	10.0.1.15	Not applicable

In the following configuration, there are four subnets configured in the DAG: 192.168.0.0, 192.168.1.0, 10.0.0.0, and 10.0.1.0. When EX1 and EX2 are added to the DAG, four subnets will be enumerated, but only two DAG networks will be created: MapiDagNetwork (192.168.0.0, 192.168.1.0) and ReplicationDagNetwork01 (10.0.0.0, 10.0.1.0). These networks will be configured as

shown in the following table.

Enumerated DAG network settings for a multi-subnet DAG

Name	Subnets	Interfaces	MAPI access enabled	Replication enabled
MapiDagNetwork	192.168.0.0/24 192.168.1.0/24	EX1 (192.168.0.15) EX2 (192.168.1.15)	True	True
ReplicationDagNetwork01	10.0.0.0/24 10.0.1.0/24	EX1 (10.0.0.15) EX2 (10.0.1.15)	False	True

DAG networks and iSCSI networks

By default, DAGs perform discovery of all networks detected and configured for use by the underlying cluster. This includes any Internet SCSI (iSCSI) networks in use as a result of using iSCSI storage for one or more DAG members. As a best practice, iSCSI storage should use dedicated networks and network adapters. These networks shouldn't be managed by the DAG or its cluster, or used as DAG networks (MAPI or replication). Instead, these networks should be manually disabled from use by the DAG, so they can be dedicated to iSCSI storage traffic. To disable iSCSI networks from being detected and used as DAG networks, configure the DAG to ignore any currently detected iSCSI networks using the Set-DatabaseAvailabilityGroupNetwork cmdlet, as shown in this example:

```
Set-DatabaseAvailabilityGroupNetwork -Identity DAG2
\DAGNetwork02 -ReplicationEnabled:$false -
IgnoreNetwork:$true
```

This command will also disable the network for use by the cluster. Although the iSCSI networks will continue to appear as DAG networks, they won't be used for MAPI or replication traffic after running the above command.

Return to top

Configuring DAG members

Mailbox servers that are members of a DAG have some properties specific to high availability that should be configured as described in the following sections:

- Automatic database mount dial
- Database copy automatic activation policy
- Maximum active databases

Automatic database mount dial

The *AutoDatabaseMountDial* parameter specifies the automatic database mount behavior after a database failover. You can use the Set-MailboxServer cmdlet to configure the *AutoDatabaseMountDial* parameter with any of the following values:

- `BestAvailability` If you specify this value, the database automatically mounts immediately after a failover if the copy queue length is less than or equal to 12. The copy queue length is the number of logs recognized by the passive copy that needs to be replicated. If the copy queue length is more than 12, the database doesn't automatically mount. When the copy queue length is less than or equal to 12, Exchange attempts to replicate the remaining logs to the passive copy and mounts the database.
- `GoodAvailability` If you specify this value, the database automatically mounts immediately after a failover if the copy queue length is less than or equal to six. The copy queue length is the number of logs recognized by the passive copy that needs to be replicated. If the copy queue length is more than six, the database doesn't automatically mount. When the copy queue length is less than or equal to six, Exchange attempts to replicate the remaining logs to the passive copy and mounts the database.
- `Lossless` If you specify this value, the database doesn't automatically mount until all logs generated on the active copy have been copied to the passive copy. This setting also causes the Active Manager best copy selection algorithm to sort potential candidates for activation based on the database copy's activation preference value and not its copy queue length.

The default value is `GoodAvailability`. If you specify either `BestAvailability` or `GoodAvailability`, and all the logs from the active copy can't be copied to the passive copy being activated, you may lose some mailbox data. However, the Safety Net feature (which is enabled by default) helps protect against most data loss by resubmitting messages that are in the Safety Net queue.

Example: configuring automatic database mount dial

The following example configures a Mailbox server with an *AutoDatabaseMountDial* setting of `GoodAvailability`.

```
Set-MailboxServer -Identity EX1 -AutoDatabaseMountDial
GoodAvailability
```

Database copy automatic activation policy

The *DatabaseCopyAutoActivationPolicy* parameter specifies the type of automatic activation available for mailbox database copies on the selected Mailbox servers. You can use the Set-MailboxServer cmdlet to configure the *DatabaseCopyAutoActivationPolicy* parameter with any of the following values:

- `Blocked` If you specify this value, databases can't be automatically activated on the selected Mailbox servers.
- `IntrasiteOnly` If you specify this value, the database copy is allowed to be activated on servers in the same Active Directory site. This prevents cross-site failover or activation. This property is for incoming mailbox database copies (for example, a passive copy being made an active copy). Databases can't be activated on this Mailbox server for database copies that are active in another Active Directory site.
- `Unrestricted` If you specify this value, there are no special restrictions on activating mailbox database copies on the selected Mailbox servers.

Example: configuring database copy automatic activation policy

The following example configures a Mailbox server with a *DatabaseCopyAutoActivationPolicy* setting of `Blocked`.

```
Set-MailboxServer -Identity EX1 -
DatabaseCopyAutoActivationPolicy Blocked
```

Maximum active databases

The *MaximumActiveDatabases* parameter (also used with the Set-MailboxServer cmdlet) specifies the number of databases that can be mounted on a Mailbox server. You can configure Mailbox servers to meet your deployment requirements by ensuring that an individual Mailbox server doesn't become overloaded.

The *MaximumActiveDatabases* parameter is configured with a whole number numeric value. When the maximum number is reached, the database copies on the server won't be activated if a failover or switchover occurs. If the copies are already active on a server, the server won't allow databases to be mounted.

Example: configuring maximum active databases

The following example configures a Mailbox server to support a maximum of 20 active databases.

```
Set-MailboxServer -Identity EX1 -MaximumActiveDatabases 20
```

Return to top

Performing maintenance on DAG members

Before performing any type of software or hardware maintenance on a DAG member, you should first place the DAG member into maintenance mode. This involves moving all active databases off the server and blocking active databases from moving to the server. It also ensures that all critical DAG support functionality that may be on the server (for example, the Primary Active Manager (PAM) role) is moved to another server and blocked from moving back to the server. Specifically, you should perform the following tasks:

1. To begin the process of draining the transport queues, run `Set-ServerComponentState <ServerName> -Component HubTransport -State Draining -Requester Maintenance`
2. To initiate the draining of the transport queues, run `Restart-Service MSExchangeTransport`
3. To begin the process of draining all Unified Messaging calls, run `Set-ServerComponentState <ServerName> -Component UMCallRouter -State Draining -Requester Maintenance`
4. To redirect messages pending delivery in the local queues to the Mailbox server specified by the Target parameter, run `Redirect-Message -Server <ServerName> -Target <MailboxServerFQDN>`
5. To pause the cluster node, which prevents the node from being and becoming the PAM, run `Suspend-ClusterNode <ServerName>`
6. To move all active databases currently hosted on the DAG member to other DAG members, run `Set-MailboxServer <ServerName> -DatabaseCopyActivationDisabledAndMoveNow $True`
7. To prevent the server from hosting active database copies, run `Set-MailboxServer <ServerName> -DatabaseCopyAutoActivationPolicy Blocked`
8. To place the server into maintenance mode, run `Set-ServerComponentState <ServerName> -Component ServerWideOffline -State Inactive -Requester Maintenance`

To verify that a server is ready for maintenance, perform the following tasks:

1. To verify the server has been placed into maintenance mode, run `Get-ServerComponentState <ServerName> | ft Component,State -Autosize`
2. To verify the server is not hosting any active database copies, run `Get-MailboxServer <ServerName> | ft DatabaseCopy* -Autosize`
3. To verify that the node is paused, run `Get-ClusterNode <ServerName> | fl`
4. To verify that all transport queues have been drained, run `Get-Queue`

After the maintenance is complete and the DAG member is ready to return to service, you can take the DAG member out of maintenance mode and put it back into production by performing the following tasks:

- To designate that the server is out of maintenance mode, run `Set-ServerComponentState <ServerName> -Component ServerWideOffline -State Active -Requester Maintenance`
- To allow the server to accept Unified Messaging calls, run `Set-ServerComponentState <ServerName> -Component UMCallRouter -State Active -Requester Maintenance`
- To resume the node in the cluster and enable full cluster functionality for the server, run `Resume-ClusterNode <ServerName>`
- To allow databases to become active on the server, run `Set-MailboxServer <ServerName> -DatabaseCopyActivationDisabledAndMoveNow $False`
- To remove the automatic activation blocks, run `Set-MailboxServer <ServerName> -DatabaseCopyAutoActivationPolicy Unrestricted`
- To enable the transport queues and allow the server to accept and process messages, run `Set-ServerComponentState <ServerName> -Component HubTransport -State Active -Requester Maintenance`
- To resume transport activity, run `Restart-Service MSExchangeTransport`

To verify that a server is ready for production use, perform the following tasks:

1. To verify the server is not maintenance mode, run `Get-ServerComponentState <ServerName> | ft Component,State -Autosize`

If you are installing an Exchange update, and the update process fails, it can leave some server components in an inactive state, which will be displayed in the output of the above Get-ServerComponentState cmdlet. To resolve this, run the following commands:

- `Set-ServerComponentState <ServerName> -Component ServerWideOffline -State Active -Requester Functional`
- `Set-ServerComponentState <ServerName> -Component Monitoring -State Active -Requester Functional`
- `Set-ServerComponentState <ServerName> -Component RecoveryActionsEnabled -State Active -Requester Functional`

Return to top

Shutting down DAG members

The Exchange 2013 high availability solution is integrated with the Windows shutdown process. If an administrator or application initiates a shutdown of a Windows server in a DAG that has a mounted database that's replicated to one or more DAG members, the system attempts to activate another copy of the mounted database prior to allowing the shutdown process to complete.

However, this new behavior doesn't guarantee that all of the databases on the server being shut down will experience a `lossless` activation. As a result, it's a best practice to perform a server switchover prior to shutting down a server that's a member of a DAG.

Return to top

Installing updates on DAG members

Installing Microsoft Exchange Server 2013 updates on a server that's a member of a DAG is a relatively straightforward process. When you install an update on a server that's a member of a DAG, several services are stopped during the installation, including all Exchange services and the Cluster service. The general process for applying updates to a DAG member is as follows:

1. Use the steps described above to put the DAG member in maintenance mode.
2. Install the update.
3. Use the steps described above to take the DAG member out of maintenance mode and put it back into production.
4. Optionally, use the RedistributeActiveDatabases.ps1 script to rebalance the active database copies across the DAG.

You can download the latest update for Exchange 2013 from the Microsoft Download Center.

Return to top

Create a database availability group

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-21*

A database availability group (DAG) is a set of up to 16 Microsoft Exchange Server 2013 Mailbox servers that provide automatic database-level recovery from a database, server, or network failure. When a Mailbox server is added to a DAG, it works with the other servers in the DAG to provide automatic, database-level recovery from database, server, and network failures.

Looking for other management tasks related to DAGs? Check out Managing database availability groups.

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- When creating a DAG with Mailbox servers running Windows Server 2012, you must pre-stage the cluster name object (CNO) before adding members to the DAG. If you are creating a DAG without an administrative access point with Mailbox servers running Windows Server 2012 R2, then you do not need to pre-stage a CNO for the DAG. For detailed steps, see Pre-stage the cluster name object for a database availability group.
- When creating a DAG, you provide a unique name for the DAG of up to 15 characters. In addition to providing a name for the DAG, you must also assign one or more IP addresses (either IPv4 or both IPv4 and IPv6) to the DAG, unless you are creating a Windows Server 2012 R2 DAG without an administrative access point and you are not assigning any IP addresses to the DAG. Otherwise, the IP addresses you assign must be on each subnet intended for the MAPI network and must be available for use. If you specify one or more IPv4 addresses and your system is configured to use IPv6, the task will also attempt to automatically assign the DAG one or more IPv6 addresses.
- When creating a DAG, you can optionally specify a witness server and witness directory. If you specify a witness server, we recommend that you use a Client Access server that doesn't have the Mailbox server role installed. This allows an Exchange administrator to be aware of the availability of the witness, and it ensures that all of the necessary security permissions needed for using the witness server are in place.

The following combinations of options and behaviors are available:

  - You can specify only a name for the DAG and leave the **Witness server** and **Witness directory** fields empty. In this scenario, the task will search for a Client Access server that doesn't have the

Mailbox server role installed. It will automatically create the default witness directory and share on that Client Access server and configure the DAG to use that server as its witness server.

- You can specify a name for the DAG, the witness server that you want to use, and the directory you want created and shared on the witness server.
- You can specify a name for the DAG and the witness server that you want to use, and leave the **Witness directory** field empty. In this scenario, the task will create the default witness directory on the specified witness server.
- You can specify a name for the DAG, leave the **Witness server** field empty, and specify the directory you want created and shared on the witness server. In this scenario, the wizard will search for a Client Access server that doesn't have the Mailbox server role installed, and it will automatically create the specified witness directory on that server, share the directory, and configure the DAG to use that Client Access server as its witness server.

Important:

If the witness server you specify isn't an Exchange 2013 or Exchange 2010 server, you must add the Exchange Trusted Subsystem universal security group to the local Administrators group on the witness server. These security permissions are necessary to ensure that Exchange can create a directory and share on the witness server as needed. If the proper permissions aren't configured, the following error is returned:

```
Error: An error occurred during discovery of the database availability group
topology. Error: An error occurred while attempting a cluster operation. Error:
Cluster API "AddClusterNode() (MaxPercentage=12) failed with 0x80070005. Error:
Access is denied."
```

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

What do you want to do?

Use the EAC to create a database availability group

1. In the EAC, go to **Servers** > **Database Availability Groups**.
2. Click **+** to create a DAG.
3. On the **new database availability group** page, provide the following information for the DAG:
   - **Database availability group name** Use this field to type a valid and unique name for the DAG of up to 15 characters. The name is equivalent to a computer name, and a corresponding CNO will be created in Active Directory with that name. This name will be both the name of the DAG and the name of the underlying cluster.
   - **Witness server** Use this field to specify a witness server for the DAG. If you leave this field blank, the system will attempt to automatically select a Client Access server in the local Active Directory site that isn't installed on a computer with the Mailbox server to be used as the witness server.

Note:

If you specify a witness server, you must use either a host name or a fully qualified domain name (FQDN). Using an IP address or a wildcard name isn't supported. In addition, the witness server can't be a member of the DAG.

- **Witness directory** Use this field to type the path to a directory on the witness server that will be used to store witness data. If the directory doesn't exist, the system will create it for you on the witness server. If you leave this field blank, the default directory (%SystemDrive%\DAGFileShareWitnesses\<DAG FQDN>) will be created on the witness server.
- **Database availability group IP addresses** Use this field to assign one or more static IPv4 addresses to the DAG. Enter an IPv4 address and click **+** to add it. Leave this field blank if you want the DAG to use Dynamic Host Configuration Protocol (DHCP) to obtain the necessary IPv4 addresses. Optionally, enter 255.255.255.255 to create a DAG without an IP address or cluster administrative access point, which applies only to DAGs that will contain Mailbox servers running Windows Server 2012 R2.

4. Click **Save** to create the DAG.

Use the Shell to create a database availability group

This example creates the DAG DAG1 that's configured to use the witness server FILESRV1 and the local directory C:\DAG1. DAG1 is also configured to use DHCP for the DAG's IP addresses.

```
New-DatabaseAvailabilityGroup -Name DAG1 -WitnessServer
FILESRV1 -WitnessDirectory C:\DAG1
```

This example creates the DAG DAG2. The system automatically selects a Client Access server in the local Active Directory site that does not contain the Mailbox server role as the DAG's witness server. DAG2 is assigned a single static IP address because in this example all DAG members have the MAPI network on the same subnet.

```
New-DatabaseAvailabilityGroup -Name DAG2 -
DatabaseAvailabilityGroupIPAddresses 10.0.0.8
```

This example creates the DAG DAG3. DAG3 is configured to use the witness server MBX2 and the local directory C:\DAG3. DAG3 is assigned multiple static IP addresses because its DAG members are on different subnets on the MAPI network.

```
New-DatabaseAvailabilityGroup -Name DAG3 -WitnessServer
MBX2 -WitnessDirectory C:\DAG3 -
DatabaseAvailabilityGroupIPAddresses 10.0.0.8,192.168.0.8
```

This example creates the DAG DAG4 that's configured to use DHCP. In addition, the witness server will be automatically selected by the system, and the default witness directory will be created.

```
New-DatabaseAvailabilityGroup -Name DAG4
```

This example creates the DAG DAG5 that will not have an administrative access point (valid for Windows Server 2012 R2 DAGs only). In addition, MBX4 will be used as the witness server for the DAG, and the default witness directory will be created.

```
New-DatabaseAvailabilityGroup -Name DAG5 -
DatabaseAvailabilityGroupIPAddresses
([System.Net.IPAddress]::None) -WitnessServer MBX4
```

How do you know this worked?

To verify that you've successfully created a DAG, do one of the following:

- In the EAC, navigate to **Servers** > **Database Availability Groups**. The newly created DAG is displayed.
- In the Shell, run the following command to verify the DAG was created and to display DAG property information.

```
Get-DatabaseAvailabilityGroup <DAGName> | Format-List
```

Pre-stage the cluster name object for a database availability group

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-14*

In environments where computer account creation is restricted or where computer accounts are created in a container other than the default computers container, you can pre-stage the cluster name object (CNO) and then provision the CNO by assigning permissions to it. Pre-staging the CNO is also required for Windows Server 2012 and Windows Server 2012 R2 DAG members due to permissions changes in Windows for computer objects. When deploying a database availability group (DAG) using Mailbox servers that are running Windows Server 2012 or Windows Server 2012 R2, you must pre-stage and provision the CNO, unless you are deploying a DAG without a cluster administrative access point. DAGs without cluster administrative access points do not use CNOs; therefore pre-staging is not required for those DAGs.

You create and disable a computer account for the CNO, and then either:

- Assign full control of the computer account to the computer account of the first Mailbox server you're adding to the DAG.
- Assign full control of the computer account to the Exchange Trusted Subsystem universal security group (USG).

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You must use an account that has permissions to create computer objects in Active Directory.
- After completing the following steps, allow time for Active Directory replication to occur. After the object is replicated, you can add the first member to the DAG.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Pre-stage the CNO

1. Open Active Directory Users and Computers.
2. Expand the forest node.
3. Right-click the organizational unit (OU) in which you want to create the new account, select **New**, and then select **Computer**.
4. In **New Object - Computer**, type the computer account name for the CNO in the **Computer name** box. This is the name that you'll use for the DAG. Click **OK** to create the account.
5. Right-click the new computer account, and then click **Disable Account**. Click **Yes** to confirm the disable action, and then click **OK**.

Assign permissions to the CNO

1. Open Active Directory Users and Computers.
2. If Advanced Features aren't enabled, turn them on by clicking **View**, and then clicking **Advanced**

Features.

3. Right-click the new computer account, and then click **Properties**.
4. In **<Computer Name> Properties**, on the **Security** tab, click **Add** to add either the computer account for the first node to be added to the DAG or to add the Exchange Trusted Subsystem USG:
   - To add the Exchange Trusted Subsystem, type **Exchange Trusted Subsystem** in the **Enter the object names to select** field. Click **OK** to add the USG. Select the Exchange Trusted Subsystem USG and in the **Permissions for Exchange Trusted Subsystem** field, select **Full Control** in the **Allow** column. Click **OK** to save the permission settings.
   - To add the computer account for the first node to be added to the DAG, click **Object Types**. In the **Object Types** dialog box, clear the **Built-in security principals**, **Groups**, and **Users** check boxes. Select the **Computers** check box and click **OK**. In the **Enter the object names to select** field, type the name of the first Mailbox server to be added to the DAG, and then click **OK**. Select the first node's computer account, and in the **Permissions for <NodeName>** field, select **Full Control** in the **Allow** column. Click **OK** to save the permission settings.

How do you know this worked?

To verify that you've successfully created the CNO, do the following:

1. Open Active Directory Users and Computers.
2. Expand the forest node.
3. Open the OU in which you created the account, and then verify that the account is listed.

Configure database availability group properties

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-24*

You can use the EAC or the Shell to configure the properties of a database availability group (DAG), including DAG IP address configuration and the witness server and witness directory used by the DAG. The Shell enables you to configure DAG properties that aren't available in the EAC, such as alternate witness server and alternate witness directory information, the TCP port used for replication, and datacenter activation coordination (DAC) mode.

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- DAG property values are stored in both Active Directory and the cluster database. However, some properties are stored only in the cluster database. As a result, the underlying cluster for the DAG must be running and have quorum to set the properties for:
  - ReplicationPort
  - NetworkCompression
  - NetworkEncryption
  - DiscoverNetworks
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure database availability group properties

1. In the EAC, go to **Servers** > **Database Availability Groups**.
2. Select the DAG you want to configure and click ✎.
3. Use the **General** page to view DAG membership and operational status, and to configure the DAG's witness server, witness directory, and automatic network configuration:
   - **Witness server** The host name or fully qualified domain name (FQDN) of the witness server for the DAG. Although this is a required property for all DAGs, the witness server is used when there is an even number of DAG members and the quorum model in use by the cluster is Node and File Share Majority.
   - **Witness directory** The full path of the directory used to store the witness.log file on the witness server. Although this is a required property for all DAGs, the witness directory is used only when the DAG's witness server is in use.
   - **Operational servers** A read-only field that displays a list of DAG members and their current operational status.
   - **Configure the database group network manually** A check box that you select when you want to configure all DAG networks manually. When you leave the check box clear, the system configures DAG networks automatically based on network interface configuration. If the check box is clear, the **Set-DatabaseAvailabilityGroupNetwork** and **New-DatabaseAvailabilityGroupNetwork** cmdlets are disabled for administrative use against the DAG.

4. Use the **IP Addresses** page to view and modify the IP addresses assigned to the DAG:
   - Select an existing IP address and click ✎ to modify it.
   - Select an existing IP address and click the minus icon (delete) to remove it.
   - Enter an IP address and click **+** to add it to the DAG.
5. Click **Save** to save any changes that were made.

Use the Shell to configure database availability group properties

This example sets the witness directory to C:\DAG1DIR for the DAG DAG1.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
WitnessDirectory C:\DAG1DIR
```

This example preconfigures an alternate witness server of CAS3 and an alternate witness directory of C:\DAGFileShareWitnesses\DAG1.contoso.com for the DAG DAG1.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
AlternateWitnessDirectory C:\DAGFileShareWitnesses
\DAG1.contoso.com -AlternateWitnessServer CAS3
```

This example configures the DAG DAG1 to use Dynamic Host Configuration Protocol (DHCP) to obtain an IP address.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatabaseAvailabilityGroupIPAddresses 0.0.0.0
```

This example configures the DAG DAG1 to use a static IP address of 10.0.0.8.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatabaseAvailabilityGroupIPAddresses 10.0.0.8
```

This example configures the multi-subnet DAG DAG1 with multiple static IP addresses.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatabaseAvailabilityGroupIPAddresses 10.0.0.8,10.0.1.8
```

This example configures the DAG DAG1 for DAC mode.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatacenterActivationMode DagOnly
```

This example configures the replication port for the DAG DAG1 to be 63132.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
ReplicationPort 63132
```

Note:
After changing the default replication port for a DAG, you must manually modify the Windows Firewall exceptions on each member of the DAG to allow communication to occur over the specified port.

How do you know this worked?

To verify that you've successfully configured the DAG, do the following:

- In the Shell, run the following command to display DAG configuration settings and verify the DAG was configured successfully.

```
Get-DatabaseAvailabilityGroup <DAGName> | Format-List
```

For more information

Create a database availability group

Remove a database availability group

Create a database availability group network

Manage database availability group membership

Get-DatabaseAvailabilityGroup

Set-DatabaseAvailabilityGroup

Manage database availability group membership

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-13*

When you add a server to a database availability group (DAG), it works with the other servers in the DAG to provide automatic database-level recovery from database, server, or network failures. When you remove a server from a DAG, it's no longer automatically protected from failures.

Looking for other management tasks related to DAGs? Check out Managing database availability

groups.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes per server
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- DAGs use Windows Failover Clustering (WFC) technologies. Each Mailbox server that's a member of a DAG is also a node in the underlying cluster used by the DAG. As a result, at any specific time, a Mailbox server can be a member of only one DAG. Because DAGs use WFC technology, all servers added to a DAG must be running the same operating system: either Windows Server 2008 R2 Enterprise or Datacenter Edition, or the Standard or Datacenter Edition of Windows Server 2012 or Windows Server 2012 R2.
- If you're adding Mailbox servers running Windows Server 2012, you must pre-stage the cluster name object (CNO) for the DAG. If you're adding Mailbox servers running Windows Server 2012 R2, and your DAG does not have an administrative access point, then you do not need to pre-stage a CNO, as DAGs without administrative access points do not have a CNO. For detailed steps, see Pre-stage the cluster name object for a database availability group.
- Before you can add members to a DAG, you must first create a DAG. For detailed steps, see Create a database availability group.
- You must remove all replicated database copies from the server before you can remove it from a DAG.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to manage database availability group membership

1. In the EAC, go to **Servers** > **Database Availability Groups**.
2. Select the DAG you want to configure, and then click .
   - To add one or more Mailbox servers to the DAG, click **+**, select the servers from the list, click **Add**, and then click **OK**.
   - To remove one or more Mailbox servers from the DAG, select the servers, and then click the minus (-) icon.
3. Click **Save** to save the changes.

4. When the task has completed successfully, click **Close**.

Use the Shell to manage database availability group membership

This example adds the Mailbox server MBX1 to the DAG DAG1.

```
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX1
```

This example removes the Mailbox server MBX1 from the DAG DAG1. Before running this command, make sure that no replicated databases exist on the Mailbox server.

```
Remove-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX1
```

This example removes the configuration settings for the Mailbox server MBX4 from the DAG DAG2. MBX4 is expected to be offline for an extended period, so its configuration is being removed from the DAG while it's offline to establish quorum with the remaining online DAG members.

```
Remove-DatabaseAvailabilityGroupServer -Identity DAG2 -
MailboxServer MBX4 -ConfigurationOnly
```

How do you know this worked?

To verify that you've successfully managed DAG membership, do one of the following:

- In the EAC, navigate to **Servers** > **Database Availability Groups**. The current DAG membership is displayed in the **Member Servers** column.
- In the Shell, run the following command to display DAG membership information.

```
Get-DatabaseAvailabilityGroup <DAGName> | Format-List
Servers
```

For more information

Add-DatabaseAvailabilityGroupServer

Remove-DatabaseAvailabilityGroupServer

Create a database availability group

network

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-02*

If needed, you can create additional networks for use in a database availability group (DAG). You can use the EAC or the Shell to create a DAG network.

Looking for other management tasks related to DAGs? Check out Managing database availability groups.

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- You can create a DAG network only when automatic network configuration has been disabled for a DAG. For detailed steps about how to disable automatic network configuration for a DAG, see Configure database availability group properties.
- When creating a DAG network, you must assign unique subnets that aren't in use by another DAG network. If you use subnets that are assigned to an existing DAG network, they will be removed from that DAG network and added to the newly created DAG network.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to create a database availability group network

1. In the EAC, go to **Servers** > **Database Availability Groups**.
2. Select the DAG you want to configure, and then click .
3. On the **new database availability group network** page, provide the following information:
   - **Database availability group network name** Use this field to type a name for the network

that's unique in the DAG.

- **Description** Use this field to provide a text description of the DAG network.
- **Subnets** Use this field to associate one or more subnets with the DAG network. Click **+** to add a subnet, click ✎ to edit a subnet, and click minus (-) to remove a subnet.

4. Click **Save** to create the DAG network.

Use the Shell to create a database availability group network

This example creates the network ReplicationDagNetwork02 with a subnet of 10.0.0.0 and a bitmask of 8 in the DAG DAG1. Replication is enabled for the network, and an optional description of the network is also being added.

```
New-DatabaseAvailabilityGroupNetwork -
DatabaseAvailabilityGroup DAG1 -Name
ReplicationDagNetwork02 -Description "Replication network
2" -Subnets 10.0.0.0/8 -ReplicationEnabled:$True
```

How do you know this worked?

To verify that you've successfully created a DAG network, do one of the following:

- In the EAC, navigate to **Servers** > **Database Availability Groups**. Select the appropriate DAG, and the newly created DAG network is displayed in the details pane.
- In the Shell, run the following command to verify the DAG network was created and to display DAG network configuration information.

```
Get-DatabaseAvailabilityGroupNetwork <DAGNetworkName> |
Format-List
```

For more information

Set-DatabaseAvailabilityGroupNetwork

Get-DatabaseAvailabilityGroupNetwork

New-DatabaseAvailabilityGroupNetwork

Remove-DatabaseAvailabilityGroupNetwork

Configure database availability group

network properties

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-31*

Each database availability group (DAG) network has several properties that you can configure, including the name of the DAG network, a description field for the DAG network, a list of subnets that are used by the DAG network, and whether the DAG network is enabled for replication.

Looking for other management tasks related to DAGs? Check out Managing database availability groups.

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- You can configure a DAG network only when automatic network configuration has been disabled for a DAG. For detailed steps about how to disable automatic network configuration for a DAG, see Configure database availability group properties.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure database availability group network properties

1. In the EAC, go to **Servers** > **Database Availability Groups**.
2. Select the DAG you want to configure, and in the Details pane, under the DAG network you want to configure, choose:
   - **Disable Replication** or **Enable Replication** Configures the replication settings for the DAG network.
   - **Remove** Removes a DAG network. Before you can remove a DAG network, you must first

remove all associated subnets from the DAG network.

- **View details** Configures DAG network properties, such as the name, description, and associated subnets for the DAG network. You can also view the network interfaces associated with those subnets, and enable or disable replication for the DAG network.

Use the Shell to configure database availability group network properties

This example adds a subnet of 10.0.0.0 and subnet mask of 255.0.0.0 to the DAG network MapiDagNetwork in the DAG DAG1.

```
Set-DatabaseAvailabilityGroupNetwork -Subnets 10.0.0.0/8 -
Identity DAG1\MapiDagNetwork
```

How do you know this worked?

To verify that you've successfully configured the DAG network, do the following:

- In the Shell, run the following command to display DAG network configuration settings and verify the DAG network was configured successfully.

```
Get-DatabaseAvailabilityGroupNetwork <DAGNetworkName> |
Format-List
```

For more information

Set-DatabaseAvailabilityGroupNetwork

Get-DatabaseAvailabilityGroupNetwork

New-DatabaseAvailabilityGroupNetwork

Remove-DatabaseAvailabilityGroupNetwork

Configure AutoReseed for a database availability group

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-04-15*

AutoReseed is a feature for quickly restoring database redundancy after a disk failure. If a disk fails, the database copies stored on that disk are automatically reseeded to a preconfigured spare disk on the Mailbox server. You can use the steps in this topic to configure AutoReseed for a database availability group (DAG).

Caution:

The AutoReseed feature doesn't perform any prerequisite configuration tasks for you. Installing disks correctly, adding spare disks to the system, replacing bad disks, and formatting new disks must be done manually by an administrator.

For additional management tasks related to DAGs, see Managing database availability groups.

What do you need to know before you begin?

- Estimated time to complete this task: 10 minutes.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- A single logical disk/partition per physical disk must be created.
- The specific database and log folder structure described in the steps below must be used.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

How do you do this?

Step 1: Configure the root paths for databases and volumes

The first step involves configuring the root directories for the databases (*AutoDagDatabasesRootFolderPath*) and volumes (*AutoDagVolumesRootFolderPath*) used by the DAG. The defaults are C:\ExchangeDatabases, and C:\ExchangeVolumes, respectively. You can omit this step if you're using the default paths.

This example illustrates how to configure the root path for the databases.

```
Set-DatabaseAvailabilityGroup DAG1 -
AutoDagDatabasesRootFolderPath "C:\ExchDbs"
```

This example illustrates how to configure the root path for the storage volumes.

```
Set-DatabaseAvailabilityGroup DAG1 -
AutoDagVolumesRootFolderPath "C:\ExchVols"
```

How do you know this step worked?

To verify that you've successfully configured the root paths for databases and volumes, run the following command.

```
Get-DatabaseAvailabilityGroup DAG1 | Format-List *auto*
```

The output for *AutoDagDatabasesRootFolderPath* and *AutoDagVolumesRootFolderPath* should reflect the configured paths.

Step 2: Configure the number of databases per volume

Next, configure the number of databases per volume (*AutoDagDatabaseCopiesPerVolume*) for the DAG.

This example illustrates how to configure this AutoReseed setting for a DAG configured with 4 databases per volume.

```
Set-DatabaseAvailabilityGroup DAG1 -
AutoDagDatabaseCopiesPerVolume 4
```

How do you know this step worked?

To verify that you've successfully configured the number of databases per volume, run the following command.

```
Get-DatabaseAvailabilityGroup DAG1 | Format-List *auto*
```

The output for *AutoDagDatabaseCopiesPerVolume* should reflect the configured value.

Step 3: Create the root directories for databases and volumes

Next, create the directories that correspond to the root directories you configured in Step 1. This example shows how to create the default directories using the command prompt.

```
md C:\ExchangeDatabases
md C:\ExchangeVolumes
```

How do you know this step worked?

To verify that you've successfully configured the root directories for databases and volumes, run the following command.

```
Dir C:\
```

The created directories should appear in the output list.

Step 4: Mount the volume folders

For every volume that will be used for databases (including spare volumes), use the Windows Disk Management application (diskmgmt.msc) to mount each volume in a mounted folder under C:\ExchangeVolumes\. For example, if there are 2 volumes with databases and 1 spare volume, mount the volumes to the following mounted folders:

- C:\ExchangeVolumes\Volume1
- C:\ExchangeVolumes\Volume2
- C:\ExchangeVolumes\Volume3

The names of the mounted folders can be any folder name, as long as the folders are mounted under the root volume's path.

How do you know this step worked?

To verify that you've successfully mounted the volume folders, run the following command.

```
Dir C:\
```

The mounted volumes should appear in the output list.

Step 5: Create the database folders

Next, create the database directories under the root path C:\ExchangeDatabases. This example illustrates how to create directories for a storage configuration with 4 databases on each volume.

```
md c:\ExchangeDatabases\db001

md c:\ExchangeDatabases\db002

md c:\ExchangeDatabases\db003

md c:\ExchangeDatabases\db004
```

How do you know this step worked?

To verify that you've successfully mounted the database folders, run the following command.

```
Dir C:\ExchangeDatabases
```

The created directories should appear in the output list.

Step 6: Create the mount points for the databases

Create the mount points for each database and link the mount point to the correct volume. For example, the mounted folder for db001 should be at C:\ExchangeDatabases\db001. You can use diskmgmt.msc or mountvol.exe to do this. This example illustrates how to mount db001 to C:\ExchangeDatabases\db001 using mountvol.exe.

```
Mountvol.exe c:\ExchangeDatabases\db001 \\?\Volume (GUID)
```

How do you know this step worked?

To verify that you've successfully created the mount points for the database, run the following command.

```
Mountvol.exe C:\ExchangeDatabases\db001 /L
```

The mounted volume should appear in the mount point list.

Step 7: Create the database directory structure

Next, create two directories underneath the folders you created in Step 5, one for each database and one for each of the database's log stream that will be stored on the same volume. You must use the following format for your directory structure:

C:\< *DatabaseFolderName*>*DatabaseName*\<*DatabaseName*>.db

C:\< *DatabaseFolderName*>*DatabaseName*\<*DatabaseName*>.log

This example illustrates how to create directories for 4 databases that will be stored on Volume 1:

```
md c:\ExchangeDatabases\db001\db001.db

md c:\ExchangeDatabases\db001\db001.log

md c:\ExchangeDatabases\db002\db002.db

md c:\ExchangeDatabases\db002\db002.log

md c:\ExchangeDatabases\db003\db003.db
```

```
md c:\ExchangeDatabases\db003\db003.log

md c:\ExchangeDatabases\db004\db004.db

md c:\ExchangeDatabases\db004\db004.log
```

Repeat the preceding commands for databases on every volume.

How do you know this step worked?

To verify that you've successfully created the database directory structure, run the following command.

```
Dir C:\ExchangeDatabases /s
```

The created directories should appear in the output list.

Step 8: Create databases

Create databases with log and database paths configured with the appropriate folders. This example illustrates how to create a database that's stored in the newly created directory and mount point structure.

```
New-MailboxDatabase -Name db001 -Server MBX1 -LogFolderPath
C:\ExchangeDatabases\db001\db001.log -EdbFilePath C:
\ExchangeDatabases\db001\db001.db\db001.edb
```

How do you know this step worked?

To verify that you've successfully created databases in the appropriate folder, run the following command.

```
Get-MailboxDatabase db001 | Format List *path*
```

Database properties that are returned should indicate that the database file and log files are being stored in the above folders.

How do you know this task worked?

To verify that you've configured AutoReseed for a DAG, do the following:
1. Run the following command to verify the DAG is configured correctly.

```
Get-DatabaseAvailabilityGroup DAG1 | Format-List *auto*
```

2. Run the following command to verify the directory structure is configured correctly (below are

the default paths; if necessary, substitute the paths for the paths you're using).

```
Dir c:\ExchangeDatabases /s

Dir c:\ExchangeVolumes /s
```

Remove a database availability group

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-16*

Removing a database availability group (DAG) is a quick and easy task. You can use the EAC or the Shell to remove a DAG.

Looking for other management tasks related to DAGs? Check out Managing database availability groups.

What do you need to know before you begin?

- Estimated time to complete: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.
- Before you can remove a DAG, the DAG must be empty. If the DAG you want to remove contains any Mailbox servers, you must first remove the servers from the DAG. For detailed steps about how to remove a Mailbox server from a DAG, see Manage database availability group membership.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to remove a database availability group

1. Navigate to **Servers** > **Database availability groups**.

2. Select the DAG you want to remove and click **Delete** 🗑.
3. Click **Yes** to confirm the warning and remove the DAG.

Use the Shell to remove a database availability group

This example removes the DAG DAG1.

```
Remove-DatabaseAvailabilityGroup -Identity DAG1
```

How do you know this worked?

To verify that you've successfully removed the DAG, do one of the following:

- In the EAC, go to **Servers** > **Database Availability Groups**, and see if the DAG is still displayed.
- In the Shell, run the following command to see if the DAG still exists:

```
Get-DatabaseAvailabilityGroup <DAGName>
```

If the DAG was successfully deleted, the preceding command will produce an error message indicating the object could not be found.

Managing mailbox database copies

Exchange Server 2013 > High availability and site resilience > Managing high availability and site resilience >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

After a database availability group (DAG) has been created, configured, and populated with Mailbox server members, you can use the Exchange Admin Center (EAC) or the Exchange Management Shell to add mailbox database copies in a flexible and granular way.

Managing database copies

After multiple copies of a database are created, you can use the EAC or the Shell to monitor the health and status of each copy and to perform other management tasks associated with database copies. Some of the management tasks you may need to perform include suspending or resuming a database copy, seeding a database copy, monitoring database copies, configuring database copy settings, and removing a database copy.

Suspending and resuming database copies

For a variety of reasons, such as performing planned maintenance, it may be necessary to suspend and resume continuous replication activity for a database copy. In addition, some administrative tasks, such as seeding, require you to first suspend a database copy. We recommend that all replication activity be suspended when the path for the database or its log files is being changed. You can suspend and resume database copy activity by using the EAC, or by running the **Suspend-MailboxDatabaseCopy** and **Resume-MailboxDatabaseCopy** cmdlets in the Shell. For detailed steps about how to suspend or resume continuous replication activity for a database copy, see Suspend or resume a mailbox database copy.

Seeding a database copy

Seeding, also known as *updating*, is the process in which a database, either a blank database or a copy of the production database, is added to the target copy location on another Mailbox server in the same DAG as the active database. This becomes the baseline database for the copy maintained by that server.

Depending on the situation, seeding can be an automatic process or a manual process that you initiate. When a database copy is added, the copy will be automatically seeded, provided that the target server and its storage are properly configured. If you want to manually seed a database copy and don't want automatic seeding to occur when creating the copy, you can use the *SeedingPostponed* parameter when running the Add-MailboxDatabaseCopy cmdlet.

Database copies rarely need to be reseeded after the initial seeding has occurred. But if reseeding is necessary, or if you want to manually seed a database copy instead of having the system automatically seed the copy, these tasks can be performed by using the Update Mailbox Database Copy wizard in the EAC or by using the Update-MailboxDatabaseCopy cmdlet in the Shell. Before seeding a database copy, you must first suspend the mailbox database copy. For detailed steps about how to seed a database copy, see Update a mailbox database copy.

After a manual seed operation has completed, replication for the seeded mailbox database copy is automatically resumed. If you don't want replication to automatically resume, you can use the *ManualResume* parameter when running the Update-MailboxDatabaseCopy cmdlet.

Choosing what to seed

When performing a seed operation, you can choose to seed the mailbox database copy, the content index catalog for the mailbox database copy, or both the database copy and the content index catalog copy. The default behavior of the Update Mailbox Database Copy wizard and the Update-MailboxDatabaseCopy cmdlet is to seed both the mailbox database copy and the content index catalog copy. To seed just the mailbox database copy without seeding the content index catalog, use the *DatabaseOnly* parameter when running the Update-MailboxDatabaseCopy cmdlet. To seed just the content index catalog copy, use the *CatalogOnly* parameter when running the Update-MailboxDatabaseCopy cmdlet.

Selecting the seeding source

Any healthy database copy can be used as the seeding source for an additional copy of that database. This is particularly useful when you have a DAG that has been extended across multiple physical locations. For example, consider a four-member DAG deployment, where two members (MBX1 and MBX2) are located in Portland, Oregon and two members (MBX3 and MBX4) are located in New York, New York. A mailbox database named DB1 is active on MBX1 and there are passive copies of DB1 on MBX2 and MBX3. When adding a copy of DB1 to MBX4, you have the option of using the copy on MBX3 as the source for seeding. In doing so, you avoid seeding over the wide area network (WAN) link between Portland and New York.

To use a specific copy as a source for seeding when adding a new database copy, you would do the following:

- Use the *SeedingPostponed* parameter when running the Add-MailboxDatabaseCopy cmdlet to add the database copy. If the *SeedingPostponed* parameter isn't used, the database copy will be explicitly seeded using the active copy of the database as the source.
- You can specify the source server you want to use as part of the Update Mailbox Database Copy wizard in the EAC, or you can use the *SourceServer* parameter when running the Update-MailboxDatabaseCopy cmdlet to specify the desired source server for seeding. In the preceding example, you would specify MBX3 as the source server. If the *SourceServer* parameter isn't used, the database copy will be explicitly seeded from the active copy of the database.

Seeding and networks

In addition to selecting a specific source server for seeding a mailbox database copy, you can also use the Shell to specify which DAG networks to use, and optionally override the DAG network's compression and encryption settings during the seed operation.

To specify the networks you want to use for seeding, use the *Network* parameter when running the Update-MailboxDatabaseCopy cmdlet and specify the DAG networks that you want to use. If you don't use the *Network* parameter, the system uses the following default behavior for selecting a network to use for the seeding operation:

- If the source server and target server are on the same subnet and a replication network has been configured that includes the subnet, the replication network will be used.
- If the source server and target server are on different subnets, even if a replication network that contains those subnets has been configured, the client (MAPI) network will be used for seeding.
- If the source server and target server are in different datacenters, the client (MAPI) network will be used for seeding.

At the DAG level, DAG networks are configured for encryption and compression. The default settings are to use encryption and compression only for communications on different subnets. If the source and target are on different subnets and the DAG is configured with the default values for *NetworkCompression* and *NetworkEncryption*, you can override these values by using the *NetworkCompressionOverride* and *NetworkEncryptionOverride* parameters, respectively, when running the Update-MailboxDatabaseCopy cmdlet.

Seeding process

When you initiate a seeding process by using the Add-MailboxDatabaseCopy or Update-MailboxDatabaseCopy cmdlets, the following tasks are performed:

1. Database properties from Active Directory are read to validate the specified database and servers, and to verify that the source and target servers are running Exchange 2013, they are both members of the same DAG, and that the specified database isn't a recovery database. The database file paths are also read.
2. Preparations occur for reseed checks from the Microsoft Exchange Replication service on the target server.
3. The Microsoft Exchange Replication service on the target server checks for the presence of database and transaction log files in the file directories read by the Active Directory checks in step 1.
4. The Microsoft Exchange Replication service returns the status information from the target server to the administrative interface from where the cmdlet was run.
5. If all preliminary checks have passed, you're prompted to confirm the operation before continuing. If you confirm the operation, the process continues. If an error is encountered during the preliminary checks, the error is reported and the operation fails.
6. The seed operation is started from the Microsoft Exchange Replication service on the target server.
7. The Microsoft Exchange Replication service suspends database replication for the active database copy.
8. The state information for the database is updated by the Microsoft Exchange Replication service to reflect a status of Seeding.
9. If the target server doesn't already have the directories for the target database and log files, they are created.
10. A request to seed the database is passed from the Microsoft Exchange Replication service on the target server to the Microsoft Exchange Replication service on the source server using TCP. This request and the subsequent communications for seeding the database occur on a DAG network that has been configured as a replication network.
11. The Microsoft Exchange Replication service on the source server initiates an Extensible Storage Engine (ESE) streaming backup via the Microsoft Exchange Information Store service interface.
12. The Microsoft Exchange Information Store service streams the database data to the Microsoft Exchange Replication service.
13. The database data is moved from the source server's Microsoft Exchange Replication service to the target server's Microsoft Exchange Replication service.
14. The Microsoft Exchange Replication service on the target server writes the database copy to a temporary directory located in the main database directory called *temp-seeding*.
15. The streaming backup operation on the source server ends when the end of the database is reached.
16. The write operation on the target server completes, and the database is moved from the temp-seeding directory to the final location. The temp-seeding directory is deleted.
17. On the target server, the Microsoft Exchange Replication service proxies a request to the Microsoft Exchange Search service to mount the content index catalog for the database copy, if

it exists. If there are existing out-of-date catalog files from a previous instance of the database copy, the mount operation fails, which triggers the need to replicate the catalog from the source server. Likewise, if the catalog doesn't exist on a new instance of the database copy on the target server, a copy of the catalog is required. The Microsoft Exchange Replication service directs the Microsoft Exchange Search service to suspend indexing for the database copy while a new catalog is copied from the source.

18. The Microsoft Exchange Replication service on the target server sends a seed catalog request to the Microsoft Exchange Replication service on the source server.
19. On the source server, the Microsoft Exchange Replication service requests the directory information from the Microsoft Exchange Search service and requests that indexing be suspended.
20. The Microsoft Exchange Search service on the source server returns the search catalog directory information to the Microsoft Exchange Replication service.
21. The Microsoft Exchange Replication service on the source server reads the catalog files from the directory.
22. The Microsoft Exchange Replication service on the source server moves the catalog data to the Microsoft Exchange Replication service on the target server using a connection across the replication network. After the read is complete, the Microsoft Exchange Replication service sends a request to the Microsoft Exchange Search service to resume indexing of the source database.
23. If there are any existing catalog files on the target server in the directory, the Microsoft Exchange Replication service on the target server deletes them.
24. The Microsoft Exchange Replication service on the target server writes the catalog data to a temporary directory called *CiSeed.Temp* until the data is completely transferred.
25. The Microsoft Exchange Replication service moves the complete catalog data to the final location.
26. The Microsoft Exchange Replication service on the target server resumes search indexing on the target database.
27. The Microsoft Exchange Replication service on the target server returns a completion status.
28. The final result of the operation is passed to the administrative interface from which the cmdlet was called.

Configuring database copies

After a database copy is created, you can view and modify its configuration settings when needed. You can view some configuration information by examining the **Properties** page for a database copy in the EAC. You can also use the Get-MailboxDatabase and Set-MailboxDatabaseCopy cmdlets in the Shell to view and configure database copy settings, such as replay lag time, truncation lag time, and activation preference order. For detailed steps about how to view and configure database copy settings, see Configure mailbox database copy properties.

Using replay lag and truncation lag options

Mailbox database copies support the use of a *replay lag time* and a *truncation lag time*, both of which are configured in minutes. Setting a replay lag time enables you to take a database copy back to a specific point in time. Setting a truncation lag time enables you to use the logs on a passive database copy to recover from the loss of log files on the active database copy. Because both of these features result in the temporary buildup of log files, using either of them will affect your storage design.

Replay lag time

Replay lag time is a property of a mailbox database copy that specifies the amount of time, in minutes, to delay log replay for the database copy. The replay lag timer starts when a log file has been replicated to the passive copy and has successfully passed inspection. By delaying the replay of logs to the database copy, you have the capability to recover the database to a specific point in time in the past. A mailbox database copy configured with a replay lag time greater than 0 is referred to as a *lagged mailbox database copy*, or simply, a *lagged copy*.

A strategy that uses database copies and the litigation hold features in Exchange 2013 can provide protection against a range of failures that would ordinarily cause data loss. However, these features can't provide protection against data loss in the event of logical corruption, which although rare, can cause data loss. Lagged copies are designed to prevent loss of data in the case of logical corruption. Generally, there are two types of logical corruption:

- **Database logical corruption** The database pages checksum matches, but the data on the pages is wrong logically. This can occur when ESE attempts to write a database page and even though the operating system returns a success message, the data is either never written to the disk or it's written to the wrong place. This is referred to as a *lost flush*. To prevent lost flushes from losing data, ESE includes a lost flush detection mechanism in the database along with a page patching feature (single page restore).
- **Store logical corruption** Data is added, deleted, or manipulated in a way that the user doesn't expect. These cases are generally caused by third-party applications. It's generally only corruption in the sense that the user views it as corruption. The Exchange store considers the transaction that produced the logical corruption to be a series of valid MAPI operations. The litigation hold feature in Exchange 2013 provides protection from store logical corruption (because it prevents content from being permanently deleted by a user or application). However, there may be scenarios where a user mailbox becomes so corrupted that it would be easier to restore the database to a point in time prior to the corruption, and then export the user mailbox to retrieve uncorrupted data.

The combination of database copies, hold policy, and ESE single page restore leaves only the rare but catastrophic store logical corruption case. Your decision on whether to use a database copy with a replay lag (a lagged copy) will depend on which third-party applications you use and your organization's history with store logical corruption.

If you choose to use lagged copies, be aware of the following implications for their use:

- The replay lag time is an administrator-configured value, and by default, it's disabled.
- The replay lag time setting has a default setting of 0 days, and a maximum setting of 14 days.

- Lagged copies aren't considered highly available copies. Instead, they are designed for disaster recovery purposes, to protect against store logical corruption.
- The greater the replay lag time set, the longer the database recovery process. Depending on the number of log files that need to replayed during recovery, and the speed at which your hardware can replay them, it may take several hours or more to recover a database.
- We recommend that you determine whether lagged copies are critical for your overall disaster recovery strategy. If using them is critical to your strategy, we recommend using multiple lagged copies, or using a redundant array of independent disks (RAID) to protect a single lagged copy, if you don't have multiple lagged copies. If you lose a disk or if corruption occurs, you don't lose your lagged point in time.
- Lagged copies aren't patchable with the ESE single page restore feature. If a lagged copy encounters database page corruption (for example, a -1018 error), it will have to be reseeded (which will lose the lagged aspect of the copy).

Activating and recovering a lagged mailbox database copy is an easy process if you want the database to replay all log files and make the database copy current. If you want to replay log files up to a specific point in time, it's a more difficult operation because you manually manipulate log files and run Exchange Server Database Utilities (Eseutil.exe).

For detailed steps about how to activate a lagged mailbox database copy, see Activate a lagged mailbox database copy.

Truncation lag time

Truncation lag time is a property of a mailbox database copy that specifies the amount of time, in minutes, to delay log deletion for the database copy after the log file has been replayed into the database copy. The truncation lag timer starts when a log file has been replicated to the passive copy, successfully passed inspection, and has been successfully replayed into the copy of the database. By delaying the truncation of log files from the database copy, you have the capability to recover from failures that affect the log files for the active copy of the database.

Database copies and log truncation

Log truncation works the same in Exchange 2013 as it did in Exchange 2010. Truncation behavior is determined by the replay lag time and truncation lag time settings for the copy.

The following criteria must be met for a database copy's log file to be truncated when lag settings are left at their default values of 0 (disabled):

- The log file must have been successfully backed up, or circular logging must be enabled.
- The log file must be below the checkpoint (the minimum log file required for recovery) for the database.
- All other lagged copies must have inspected the log file.
- All other copies (not lagged copies) must have replayed the log file.

The following criteria must be met for truncation to occur for a lagged database copy:

- The log file must be below the checkpoint for the database.

- The log file must be older than ReplayLagTime + TruncationLagTime.
- The log file must have been truncated on the active copy.

In Exchange 2013 log truncation doesn't occur on an active mailbox database copy when one or more passive copies are suspended. If planned maintenance activities are going to take an extended period of time (for example, several days), you may have considerable log file buildup. To prevent the log drive from filling up with transaction logs, you can remove the affected passive database copy instead of suspending it. When the planned maintenance is completed, you can re-add the passive database copy.

Exchange 2013 Service Pack 1 (SP1) introduces a new feature called *loose truncation*, which is disabled by default. During normal operations, each database copy keeps logs that need to be shipped to other database copies until all copies of a database confirm they have replayed (passive copies) or received (lagged copies) the log files. This is default log truncation behavior. If a database copy goes offline for some reason, the log files begin accumulating on the disks used by the other copies of the database. If the affected database copy remains offline for an extended period, this can cause the other database copies to run out of disk space.

When loose truncation is enabled, the truncation behavior is different. Each database copy tracks its own free disk space and applies loose truncation behavior if free space gets low. For the active copy, the oldest straggler (the passive database copy that is farthest behind in log replay) is ignored and truncation respects the oldest remaining passive copies. The active database copy is where global truncation is calculated. The passive copies will attempt to respect the truncation decision made on the active copy. Despite the implication of the name MinCopiesToProtect, Exchange will only ignore the oldest known straggler at the time truncation is run. For a passive copy, if space gets low, it will independently truncate its log files using the configured parameters described below.

When the offline database is brought back online, it will be missing log files that have been deleted from the other healthy copies, and its database copy status will be FailedAndSuspended. In this event, if Autoreseed is configured, the affected copy will be automatically reseeded. If Autoreseed is not configured, the database copy will need to be manually seeded by an administrator.

The required number of healthy copies, the free disk space threshold, and the number of logs to keep are all configurable parameters. By default, the free disk space threshold is 204800 MB (200 GB), and the number of logs to keep is 100,000 (100 GB) for passive copies, and 10,000 (10 GB) for active copies.

Enabling loose truncation and configuring loose truncation parameters is performed by editing the Windows registry on each DAG member. There are three registry values that can be configured, that are all stored under HKLM\Software\Microsoft\ExchangeServer\v15\BackupInformation. The BackupInformation key the following DWORD values do not exist by default and must be manually created. The DWORD registry values under BackupInformation are described in the following table:

Registry Value	Description	Default Value
LooseTruncation_MinCopiesTo	This key is used to enable loose	0

Protect	truncation. It represents the number of passive copies to protect from loose truncation on the active copy of a database. Setting the value of this key to 0 disables loose truncation.	
LooseTruncation_MinDiskFreeSpaceThresholdInMB	Available disk space (in MB) threshold for triggering loose truncation. If free disk space falls below this value, loose truncation is triggered.	If this registry value is not configured, the default value used by loose truncation is 200 GB.
LooseTruncation_MinLogsToProtect	The minimum number of log files to retain on healthy copies whose logs are being truncated. If this registry value is configured, then the configured value applies to both active and passive copies.	If this registry value is not configured, then default values of 100,000 for passive database copies and 10,000 for active database copies is used.

When using the LooseTruncation_MinLogsToProtect registry value, note that the behavior is different for active and passive database copies. On the active database copy, this is the number of extra logs that are retained preceding those that are required by the protected passive copies and the required range of the active copy.On a passive database copy, this is the number of logs maintained from the latest available log. One tenth of this number is also used to maintain logs prior to the required range of this passive copy. The two limits are in place to ensure that lagged database copies don't take up too much space, since their required range is typically very large.

Database activation policy

There are scenarios in which you may want to create a mailbox database copy and prevent the system from automatically activating that copy in the event of a failure, for example:

- If you deploy one or more mailbox database copies to an alternate or standby datacenter.
- If you configure a lagged database copy for recovery purposes.
- If you are performing maintenance or an upgrade of a server.

In each of the preceding scenarios, you have database copies that you don't want the system to activate automatically. To prevent the system from automatically activating a mailbox database copy, you can configure the copy to be blocked (suspended) for activation. This allows the system to maintain the currency of the database through log shipping and replay, but prevents the system from automatically activating and using the copy. Copies blocked for activation must be manually activated by an administrator. You can configure the database activation policy for an entire server by using the Set-MailboxServer cmdlet or an individual database copy by using the Set-MailboxDatabaseCopy cmdlet to set the *DatabaseCopyAutoActivationPolicy* parameter to Blocked.

For more information about configuring database activation policy, see Configure activation policy for a mailbox database copy.

Effect of mailbox moves on continuous replication

On a very busy mailbox database with a high log generation rate, there is a greater chance for data loss if replication to the passive database copies can't keep up with log generation. One scenario that can introduce a high log generation rate is mailbox moves. Exchange 2013 includes a Data Guarantee API that's used by services such as the Microsoft Exchange Mailbox Replication service (MRS) to check the health of the database copy architecture based on the value of the *DataMoveReplicationConstraint* parameter that was set by the system or an administrator. Specifically, the Data Guarantee API can be used to:

- **Check replication health** Confirms that the prerequisite number of database copies is available.
- **Check replication flush** Confirms that the required log files have been replayed against the prerequisite number of database copies.

When executed, the API returns the following status information to the calling application:

- **Retry** Signifies that there are transient errors that prevent a condition from being checked against the database.
- **Satisfied** Signifies that the database meets the required conditions or the database isn't replicated.
- **NotSatisfied** Signifies that the database doesn't meet the required conditions. In addition, information is provided to the calling application as to why the **NotSatisfied** response was returned.

The value of the *DataMoveReplicationConstraint* parameter for the mailbox database determines how many database copies should be evaluated as part of the request. The *DataMoveReplicationConstraint* parameter has the following possible values:

- `None` When you create a mailbox database, this value is set by default. When this value is set, the Data Guarantee API conditions are ignored. This setting should be used only for mailbox databases that aren't replicated.
- `SecondCopy` This is the default value when you add the second copy of a mailbox database. When this value is set, at least one passive database copy must meet the Data Guarantee API conditions.

- `SecondDatacenter` When this value is set, at least one passive database copy in another Active Directory site must meet the Data Guarantee API conditions.
- `AllDatacenters` When this value is set, at least one passive database copy in each Active Directory site must meet the Data Guarantee API conditions.
- `AllCopies` When this value is set, all copies of the mailbox database must meet the Data Guarantee API conditions.

Check Replication Health

When the Data Guarantee API is executed to evaluate the health of the database copy infrastructure, several items are evaluated.

If the *DataMoveReplicationConstraint* parameter is set to...	Then, for a given database...	Conditions
`SecondCopy`	At least one passive database copy for a replicated database must meet the conditions in the next column.	The passive database copy must: • Be healthy. • Have a replay queue within 10 minutes of the replay lag time. • Have a copy queue length less than 10 logs. • Have an average copy queue length less than 10 logs. The average copy queue length is computed based on the number of times the application has queried the database status.
`SecondDatacenter`	At least one passive database copy in another Active Directory site must meet the conditions in the next column.	
`AllDatacenters`	The active copy must be mounted, and a passive copy in each Active Directory site must meet the conditions in the next column.	
`AllCopies`	The active copy must be mounted, and all passive database copies must meet the conditions in the next column.	

Check Replication Flush

The Data Guarantee API can also be used to validate that a prerequisite number of database copies have replayed the required transaction logs. This is verified by comparing the last log replayed timestamp with that of the calling service's commit timestamp (in most cases, this is the timestamp of the last log file that contains required data) plus an additional five seconds (to deal with system time clock skews or drift). If the replay timestamp is greater than the commit timestamp, the *DataMoveReplicationConstraint* parameter is satisfied. If the replay timestamp is less than the commit timestamp, the *DataMoveReplicationConstraint* isn't satisfied.

Before moving large numbers of mailboxes to or from replication databases within a DAG, we recommend that you configure the *DataMoveReplicationConstraint* parameter on each mailbox database according to the following:

If you're deploying...	Set DataMoveReplicationConstraint to...
Mailbox databases that don't have any database copies	`None`
A DAG within a single Active Directory site	`SecondCopy`
A DAG in multiple datacenters using a stretched Active Directory site	`SecondCopy`
A DAG that spans two Active Directory sites, and you will have highly available database copies in each site	`SecondDatacenter`
A DAG that spans two Active Directory sites, and you will have only lagged database copies in the second site	`SecondCopy` This is because the Data Guarantee API won't guarantee data being committed until the log file is replayed into the database copy, and due to the nature of the database copy being lagged, this constraint will fail the move request, unless the lagged database copy ReplayLagTime value is less than 30 minutes.
A DAG that spans three or more Active Directory sites, and each site will contain highly available database copies	`AllDatacenters`

Balancing database copies

Due to the inherent nature of DAGs, as the result of database switchovers and failovers, active mailbox database copies will change hosts several times throughout a DAG's lifetime. As a result, DAGs can become unbalanced in terms of active mailbox database copy distribution. The following table shows an example of a DAG that has four databases with four copies of each database (for a total of 16 databases on each server) with an uneven distribution of active database copies.

DAG with unbalanced active copy distribution

Server	Number of active databases	Number of passive databases	Number of mounted databases	Number of dismounted databases	Preference count list
EX1	5	11	5	0	4, 4, 3, 5
EX2	1	15	1	0	1, 8, 6, 1
EX3	12	4	12	0	13, 2, 1, 0
EX4	1	15	1	0	1, 1, 5, 9

In the preceding example, there are four copies of each database, and therefore, only four possible values for activation preference (1, 2, 3, or 4). The **Preference count list** column shows the count of the number of databases with each of these values. For example, on EX3, there are 13 database copies with an activation preference of 1, two copies with an activation preference of 2, one copy with an activation preference of 3, and no copies with an activation preference of 4.

As you can see, this DAG isn't balanced in terms of the number of active databases hosted by each DAG member, the number of passive databases hosted by each DAG member, or the activation preference count of the hosted databases.

You can use the RedistributeActiveDatabases.ps1 script to balance the active mailbox databases copies across a DAG. This script moves databases between their copies in an attempt to have an equal number of mounted databases on each server in DAG. If required, the script also attempts to balance active databases across sites.

The script provides two options for balancing active database copies within a DAG:

- **BalanceDbsByActivationPreference** When this option is specified, the script attempts to move databases to their most preferred copy (based on activation preference) without regard to the Active Directory site.
- **BalanceDbsBySiteAndActivationPreference** When this option is specified, the script attempts to move active databases to their most preferred copy, while also trying to balance active databases within each Active Directory site.

After running the script with the first option, the preceding unbalanced DAG becomes balanced, as shown in the following table.

DAG with balanced active copy distribution

Server	Number of active databases	Number of passive databases	Number of mounted databases	Number of dismounted databases	Preference count list
EX1	4	12	4	0	4, 4, 4, 4
EX2	4	12	4	0	4, 4, 4, 4
EX3	4	12	4	0	4, 4, 4, 4
EX4	4	12	4	0	4, 4, 4, 4

As shown in the preceding table, this DAG is now balanced in terms of number of active and passive databases on each server and activation preference across the servers.

The following table lists the available parameters for the RedistributeActiveDatabases.ps1 script.

RedistributeActiveDatabases.ps1 script parameters

Parameter	Description
DagName	Specifies the name of the DAG you want to rebalance. If this parameter is omitted, the DAG of which the local server is a member is used.
BalanceDbsByActivationPreference	Specifies that the script should move databases to their most preferred copy without regard to the Active Directory site.
BalanceDbsBySiteAndActivationPreference	Specifies that the script should attempt to move active databases to their most preferred copy, while also trying to balance active databases within each Active Directory site.
ShowFinalDatabaseDistribution	Specifies that a report of current database distribution be displayed after redistribution is complete.
AllowedDeviationFromMeanPercentage	Specifies the allowed variation of active databases across sites, expressed as a percentage. The default is 20%. For example, if there were 99 databases distributed between

	three sites, the ideal distribution would be 33 databases in each site. If the allowed deviation is 20%, the script attempts to balance the databases so that each site has no more than 10% more or less than this number. 10% of 33 is 3.3, which is rounded up to 4. Therefore, the script attempts to have between 29 and 37 databases in each site.
ShowDatabaseCurrentActives	Specifies that the script produce a report for each database detailing how the database was moved and whether it's now active on its most-preferred copy.
ShowDatabaseDistributionByServer	Specifies that the script produce a report for each server showing its database distribution.
RunOnlyOnPAM	Specifies that the script run only on the DAG member that currently has the PAM role. The script verifies it's being run from the PAM. If it isn't being run from the PAM, the script exits.
LogEvents	Specifies that the script logs an event (MsExchangeRepl event 4115) containing a summary of the actions.
IncludeNonReplicatedDatabases	Specifies that the script should include non-replicated databases (databases without copies) when determining how to redistribute the active databases. Although non-replicated databases can't be moved, they may affect the distribution of the replicated databases.
Confirm	The Confirm switch can be used to suppress the confirmation prompt that appears by default when this script is run. To suppress the

	confirmation prompt, use the syntax -Confirm:$False. You must include a colon (:) in the syntax.

RedistributeActiveDatabases.ps1 examples

This example shows the current database distribution for a DAG, including preference count list.

```
RedistributeActiveDatabases.ps1 -DagName DAG1 -
ShowDatabaseDistributionByServer | Format-Table
```

This example redistributes and balances the active mailbox database copies in a DAG using activation preference without prompting for input.

```
RedistributeActiveDatabases.ps1 -DagName DAG1 -
BalanceDbsByActivationPreference -Confirm:$False
```

This example redistributes and balances the active mailbox database copies in a DAG using activation preference, and produces a summary of the distribution.

```
RedistributeActiveDatabases.ps1 -DagName DAG1 -
BalanceDbsByActivationPreference -
ShowFinalDatabaseDistribution
```

Monitoring database copies

A database copy is your first defense if a failure occurs that affects the active copy of a database. It's therefore critical to monitor the health and status of database copies to ensure that they will be available when needed. You can view a variety of information, including copy queue length, replay queue length, status, and content index state information, by examining the details of a database copy in the EAC. You can also use the **Get-MailboxDatabaseCopyStatus** cmdlet in the Shell to view a variety of status information for a database copy.

For more information about monitoring database copies, see Monitoring database availability groups.

Removing a database copy

A database copy can be removed at any time by using the EAC or by using the **Remove-MailboxDatabaseCopy** cmdlet in the Shell. After removing a database copy, you must manually delete any database and transaction log files from the server from which the database copy is being removed. For detailed steps about how to remove a database copy, see Remove a mailbox

database copy.

Database switchovers

The Mailbox server that hosts the active copy of a database is referred to as the mailbox database master. The process of activating a passive database copy changes the mailbox database master for the database and turns the passive copy into the new active copy. This process is called a database switchover. In a database switchover, the active copy of a database is dismounted on one Mailbox server and a passive copy of that database is mounted as the new active mailbox database on another Mailbox server. When performing a switchover, you can optionally override the database mount dial setting on the new mailbox database master.

You can quickly identify which Mailbox server is the current mailbox database master by reviewing the right-hand column under the **Database Copies** tab in the EAC. You can perform a switchover by using the **Activate** link in the EAC, or by using the **Move-ActiveMailboxDatabase** cmdlet in the Shell.

There are several internal checks that will be performed before activating a passive copy:

- The status of the database copy is checked. If the database copy is in a failed state, the switchover is blocked. You can override this behavior and bypass the health check by using the *SkipHealthChecks* parameter of the **Move-ActiveMailboxDatabase** cmdlet. This parameter allows you to move the active copy to a database copy in a failed state.
- The active database copy is checked to see if it's currently a seeding source for any passive copies of the database. If the active copy is currently being used as a source for seeding, the switchover is blocked. You can override this behavior and bypass the seeding source check by using the *SkipActiveCopyChecks* parameter of the **Move-ActiveMailboxDatabase** cmdlet. This parameter allows you to move an active copy that's being used as a seeding source. Using this parameter will cause the seeding operation to be cancelled and considered failed.
- The copy queue and replay queue lengths for the database copy are checked to ensure their values are within the configured criteria. Also, the database copy is verified to ensure that it isn't currently in use as a source for seeding. If the values for the queue lengths are outside the configured criteria, or if the database is currently used as a source for seeding, the switchover is blocked. You can override this behavior and bypass these checks by using the *SkipLagChecks* parameter of the **Move-ActiveMailboxDatabase** cmdlet. This parameter allows a copy to be activated that has replay and copy queues outside of the configured criteria.
- The state of the search catalog (content index) for the database copy is checked. If the search catalog isn't up to date, is in an unhealthy state, or is corrupt, the switchover is blocked. You can override this behavior and bypass the search catalog check by using the *SkipClientExperienceChecks* parameter of the **Move-ActiveMailboxDatabase** cmdlet. This parameter causes this search to skip the catalog health check. If the search catalog for the database copy you're activating is in an unhealthy or unusable state and you use this parameter to skip the catalog health check and activate the database copy, you will need to either crawl or seed the search catalog again.

When performing a database switchover, you also have the option of overriding the mount dial settings configured for the server that hosts the passive database copy being activated. Using the *MountDialOverride* parameter of the **Move-ActiveMailboxDatabase** cmdlet instructs the target server to override its own mount dial settings and use those specified by the *MountDialOverride* parameter.

For detailed steps about how to perform a switchover of a database copy, see Activate a mailbox database copy.

Add a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-30*

When you add a copy of a mailbox database, continuous replication is automatically enabled between the existing database and the database copy. Database copies are automatically assigned an identity in the format of *<DatabaseName>**<HostMailboxServerName>*. For example, a copy of the database DB1 that's hosted on the server MBX3 would be DB1\MBX3.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 2 minutes, plus the time to seed the database copy, which depends on a variety of factors, such as the size of the database, the speed, available bandwidth and latency of the network, and storage speeds.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- The active copy of the database must be mounted.
- The specified Mailbox server must not already host a copy of the database.
- The path for the database copy and its log files must be available on the selected Mailbox server.
- The server hosting the active copy and the server that will host the passive copy must be in the same database availability group (DAG). The DAG must also have quorum and be healthy.
- If you're adding the second copy of a database (for example, creating the first passive copy of the database), circular logging must not be enabled for the specified mailbox database. If circular logging is enabled, you must first disable it. After the mailbox database copy has been added, circular logging can be enabled. After circular logging is enabled for a replicated mailbox

database, continuous replication circular logging (CRCL) is used instead of JET circular logging. If you're adding the third or subsequent copy of a database, CRCL can remain enabled.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to add a mailbox database copy

1. In the EAC, go to **Servers** > **Databases**.
2. Select the database that you want to copy, and then click .
3. On the **add mailbox database copy** page, click **browse...**, select the Mailbox server that will host the database copy, and then click **OK**.
4. Optionally, configure the **Activation preference number** for the database copy.
5. Click **More options...** to designate the database copy as a lagged database copy by configuring a replay lag time, or to postpone automatic seeding of the database copy.
6. Click **Save** to save the configuration changes and add the mailbox database copy.
7. Click **OK** to acknowledge any messages that appear.

Use the Shell to add a mailbox database copy

This example adds a copy of mailbox database DB1 to the Mailbox server MBX3. Replay lag time and truncation lag time are left at the default values of zero, and the activation preference is configured with a value of 2.

```
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX3 -ActivationPreference 2
```

This example adds a copy of mailbox database DB2 to the Mailbox server MBX4. Replay lag time and truncation lag time are left at the default values of zero, and the activation preference is configured with a value of 5. In addition, seeding is being postponed for this copy so that it can be seeded using a local source server instead of the current active database copy, which is geographically distant from MBX4.

```
Add-MailboxDatabaseCopy -Identity DB2 -MailboxServer MBX4 -ActivationPreference 5 -SeedingPostponed
```

This example adds a copy of mailbox database DB3 to the Mailbox server MBX5. Replay lag time is set to 3 days, truncation lag time is left at the default value of zero, and the activation preference is configured with a value of 4.

```
Add-MailboxDatabaseCopy -Identity DB3 -MailboxServer MBX5 -
ReplayLagTime 3.00:00:00 -ActivationPreference 4
```

How do you know this worked?

To verify that you have successfully created a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the database that was copied. In the Details pane, the status of the database copy and its content index are displayed, along with the current copy queue length.
- In the Shell, run the following command to verify the mailbox database copy was created and is healthy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName>
```

The Status and Content Index State should both be Healthy.

For more information

Mailbox database copies

Managing mailbox database copies

Configure mailbox database copy properties

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-01*

Each mailbox database copy has its own properties that you can configure. These include the amount of time, if any, for replay lag and truncation lag, and the activation preference number. For more information about replay lag, truncation lag and the activation preference number, see Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To

see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure mailbox database copy properties

1. In the EAC, go to **Servers** > **Databases**.
2. Select the database you want to configure.
3. In the Details pane, under **Database Copies**, click **View details** for the desired database copy, and then view or configure the following:
   - **Database** Displays the name of the selected database.
   - **Mailbox server** Displays the name of the Mailbox server that hosts the selected database copy.
   - **Content index state** Displays the current state of the content index for the selected database copy.
   - **Status** Displays the current status of the selected database copy.
   - **Copy queue length** Indicates the number of log files waiting to be copied to the selected database copy. This field is relevant only for passive database copies.
   - **Replay queue length** Indicates the number of log files waiting to be replayed into the selected database copy. This field is relevant only for passive database copies.
   - **Error messages** Displays any error messages for database copies that have a status of `Failed` or `Failed and Suspended`.
   - **Latest available log time** Displays the date and time stamp of the most recently generated log file on the active copy of the database. This field is relevant only for passive database copies. On active database copies (replicated and stand-alone), this field will display **never**.
   - **Last inspected log time** Displays the date and time stamp of the last log file that was inspected by the LogInspector on the selected database copy. This field is relevant only for passive database copies. On active database copies (replicated and stand-alone), this field will display **never**.
   - **Last copied log time** Displays the date and time stamp of the last log file that was copied by the LogCopier on the selected database copy. This field is relevant only for passive database copies. On active database copies (replicated and stand-alone), this field will display **never**.
   - **Last replayed log time** Displays the date and time stamp of the last log file that was replayed by the LogReplayer into the selected database copy. This field is relevant only for

passive database copies. On active database copies (replicated and stand-alone), this field will display **never**.

- **Activation preference number** Displays the activation preference number. This is used as part of Active Manager's best copy selection process and to balance the DAG by redistributing active mailbox databases throughout the DAG using the RedistributeActiveDatabases.ps1 script. The value for activation preference is a number equal to or greater than 1, where 1 is at the top of the preference order. The number can't be larger than the number of copies of the mailbox database.
- **Replay lag time (days)** Displays the amount of time that the Microsoft Exchange Information Store service should wait before replaying log files that have been copied by the Microsoft Exchange Replication service to the passive database copy. Setting this parameter to a value greater than 0 creates a lagged database copy. The default setting for this value is 0 days. The maximum allowable value for this setting is 14 days. The minimum allowable value is 0 days, and setting this value to 0 disables replay lag.

Use the Shell to configure mailbox database copy properties

This example configures a mailbox database copy with an activation preference number of 3.

```
Set-MailboxDatabaseCopy -Identity DB3\EX3 -
ActivationPreference 3
```

This example configures a copy of the database DB1 that's hosted on Server1 with a replay lag time and truncation lag time of 1 day, and an activation preference number of 2.

```
Set-MailboxDatabaseCopy -Identity DB1\Server1 -
ReplayLagTime 1.0:0:0 -TruncationLagTime 1.0:0:0 -
ActivationPreference 2
```

How do you know this worked?

To verify that you've successfully configured a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the appropriate database, and in the Details pane, click **View details** to view the database copy properties.
- In the Shell, run the following command to display configuration information for a database copy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName> | Format-
List
```

For more information

Set-MailboxDatabaseCopy

Get-MailboxDatabaseCopyStatus

Get-MailboxDatabase

Move the mailbox database path for a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-07*

After a mailbox database is created, you can move it to another volume, folder, location, or path by using either the EAC or the Shell. For step-by-step instructions about how to move the database path for a non-replicated mailbox database, see Move a mailbox database path.

If the mailbox database being moved is replicated to one or more mailbox database copies, you must follow the procedure in this topic to move the mailbox database path. All copies of a mailbox database must be located in the same path on each server that hosts a copy. For example, if database DB1 is located at C:\mountpoints\DB1 on server EX1, copies of DB1 on servers EX2, EX3, and so on, must also be located at C:\mountpoints\DB1.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 2 minutes, plus the time to move the data, which depends on a variety of factors, such as the size of the database, the speed, available bandwidth and latency of the network, and storage speeds.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- To perform the move operation, the database must be temporarily dismounted, making it inaccessible to all users. If the database is currently dismounted, it isn't remounted upon completion.
- To perform the move operation, replication for the database must be disabled for all copies. It's

not enough to suspend replication; you must disable it by using the Remove-MailboxDatabaseCopy cmdlet to remove the database copies.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to move a replicated mailbox database to a new path

Note:

You can't use the EAC to move a replicated mailbox database to a new path.

1. Note any replay lag or truncation lag settings for all copies of the mailbox database being moved. You can obtain this information by using the Get-MailboxDatabase cmdlet, as shown in this example.

```
Get-MailboxDatabase DB1 | Format-List *lag*
```

2. If circular logging is enabled for the database, it must be disabled before proceeding. You can disable circular logging for a mailbox database by using the Set-MailboxDatabase cmdlet, as shown in this example.

```
Set-MailboxDatabase DB1 -CircularLoggingEnabled $false
```

3. Remove all mailbox database copies for the database being moved. For detailed steps, see Remove a mailbox database copy. After all copies are removed, preserve the database and transaction log files from each server from which the database copy is being removed by moving them to another location. These files are being preserved so the database copies don't require re-seeding after they have been re-added.
4. Move the mailbox database path to the new location. For detailed steps, see Move a mailbox database path.

Important:

During the move operation, the database being moved must be dismounted. Until the move is complete, this process will cause an interruption in service and an outage for all users with mailboxes on the database being moved. After the move operation completes, the database is automatically mounted.

5. Create the necessary folder structure on each Mailbox server that previously contained a passive copy of the moved mailbox database. For example, if you moved the database to C:\mountpoints\DB1, you must create this same path on each Mailbox server that will host a mailbox database copy.
6. After creating the folder structure, move the passive copy of the mailbox database and its log

stream to the new location. These are the files that were left from and preserved after Step 3. Repeat this process for each database copy that was removed in Step 3.

7. Add all of the database copies that were removed in Step 3. For detailed steps, see Add a mailbox database copy.
8. On each server that contains a copy of the mailbox database being moved, run the following commands to stop and restart the content index services.

```
Net stop MSExchangeFastSearch
Net start MSExchangeFastSearch
```

9. Optionally, enable circular logging by using the Set-MailboxDatabase cmdlet, as shown in this example.

```
Set-MailboxDatabase DB1 -CircularLoggingEnabled $true
```

10. Reconfigure any previously set values for replay lag time and truncation lag time by using the Set-MailboxDatabaseCopy cmdlet, as shown in this example.

```
Set-MailboxDatabaseCopy DB1\MBX2 -ReplayLagTime 00:15:00
```

11. As each copy is added, we recommend that you verify the health and status of the copy prior to adding the next copy. You can verify the health and status by:
    a. Examining the event log for any error or warning events related to the database or the database copy.
    b. Using the Get-MailboxDatabaseCopyStatus cmdlet to check the health and status of continuous replication for the database copy.
    c. Using the Test-ReplicationHealth cmdlet to verify the health and status of the database availability group and continuous replication.

For detailed syntax and parameter information, see the following topics:

- Get-MailboxDatabase
- Set-MailboxDatabase
- Set-MailboxDatabaseCopy
- Get-MailboxDatabaseCopyStatus
- Test-ReplicationHealth

How do you know this worked?

To verify that you've successfully moved the path for a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the database that was copied. In the Details pane, the status of the database copy and its content index are displayed, along with the current copy queue length. Verify that the status is Healthy.
- In the Shell, run the following command to verify the mailbox database copy was created and is healthy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName>
```

The Status and Content Index State should both be Healthy.

Configure activation policy for a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-02*

Activation is the process of changing a mailbox database copy from a passive copy to an active copy. Activation occurs automatically by the system as part of a database or server failover operation, and it can be performed manually by an administrator as part of a database or server switchover operation. Blocking a database for activation prevents it from becoming the active copy during a database or server failover.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to configure the activation policy for a mailbox database copy

1. In the EAC, go to **Servers** > **Databases**.
2. Select the database that you want to configure.
3. In the Details pane, under **Database Copies**, locate the database copy you want to configure and click **Suspend**.
4. Optionally, add a comment, and select the check box that says **This copy can only be activated by manual intervention**.
5. Click **Save** to save the configuration changes for the mailbox database copy.

Use the Shell to suspend or resume a database copy for activation

This example blocks the copy of the database DB1 on the server MBX2 for activation.

```
Suspend-MailboxDatabaseCopy -Identity DB1\MBX2 -
ActivationOnly
```

This example resumes the copy of the database DB1 on the server MBX2 for activation.

```
Resume-MailboxDatabaseCopy -Identity DB1\MBX2
```

For detailed syntax and parameter information, see Suspend-MailboxDatabaseCopy or Resume-MailboxDatabaseCopy.

Use the Shell to configure the activation policy for a server

This example configures the database copies on server MBX2 as blocked for activation.

```
Set-MailboxServer -Identity MBX2 -
DatabaseCopyAutoActivationPolicy Blocked
```

This example configures the database copies on server MBX3 as blocked for out-of-site activation.

```
Set-MailboxServer -Identity MBX3 -
DatabaseCopyAutoActivationPolicy IntrasiteOnly
```

This example configures the database copies on server MBX4 as unblocked for activation.

```
Set-MailboxServer -Identity MBX4 -
DatabaseCopyAutoActivationPolicy Unrestricted
```

For detailed syntax and parameter information, see Suspend-MailboxDatabaseCopy, Resume-MailboxDatabaseCopy, or Set-MailboxServer.

How do you know this worked?

To verify that you've successfully configured the activation policy, do one of the following:

- In the Shell, run the following command to verify activation settings for a database copy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName> | Format-List ActivationSuspended
```

- In the Shell, run the following command to verify activation settings for a DAG member.

```
Get-MailboxServer <ServerName> | Format-List DatabaseCopyAutoActivationPolicy
```

Update a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-02*

Updating, also known as *seeding*, is the process in which a copy of a mailbox database is added to another Mailbox server in a database availability group (DAG). The newly added copy becomes the baseline database for the passive copy into which log files copied from the active copy are replayed. Seeding is required under the following conditions:

- When a new passive copy of a database is created. Seeding can be postponed for a new mailbox database copy, but eventually, each passive database copy must be seeded to function as a redundant database copy.
- After a failover occurs in which data is lost as a result of the passive database copy having become diverged and unrecoverable.
- When the system has detected a corrupted log file that can't be replayed into the passive copy of the database.
- After an offline defragmentation of any copy of the database occurs.
- After the log generation sequence for the database has been reset back to 1.

You can perform seeding by using the following methods:

- **Automatic seeding** An automatic seed produces a passive copy of the active database on the target Mailbox server. Automatic seeding occurs during the creation of a database.
- **Seeding using the Update-MailboxDatabaseCopy cmdlet** You can use the Update-MailboxDatabaseCopy cmdlet in the Shell to seed a database copy at any time.
- **Seeding using the Update Mailbox Database Copy wizard** You can use the Update Mailbox

Database Copy wizard in the EAC to seed a database copy at any time.

- **Manually copying the offline database** You can dismount the active copy of the database and copy the database file to the same location on another Mailbox server in the same DAG. If you use this method, there will be an interruption in service because the process requires you to dismount the database.

Updating a database copy can take a long time, especially if the database being copied is large, or if there is high network latency or low network bandwidth. After the seeding process has started, don't close the EAC or the Shell until the process has completed. If you do, the seeding operation will be terminated.

A database copy can be seeded using either the active copy or an up-to-date passive copy as the source for the seed. When seeding from a passive copy, be aware that the seed operation will terminate with a network communication error under the following circumstances:

- If the status of the seeding source copy changes to Failed or FailedAndSuspended.
- If the database fails over to another copy.

Multiple database copies can be seeded simultaneously. However, when seeding multiple copies simultaneously, you must seed only the database file, and omit the content index catalog. You can do this by using the *DatabaseOnly* parameter with the Update-MailboxDatabaseCopy cmdlet.

Note:

If you don't use the *DatabaseOnly* parameter when seeding multiple targets from the same source, the task will fail with SeedInProgressException error FE1C6491.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 2 minutes, plus the time to seed the database copy, which depends on a variety of factors, such as the size of the database, the speed, available bandwidth and latency of the network, and storage speeds.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- The mailbox database copy must be suspended. For detailed steps, see Suspend or resume a mailbox database copy.
- The Remote Registry service must be running on the server hosting the passive database copy you're updating.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to update a mailbox database copy

1. In the EAC, go to **Servers** > **Databases**.
2. Select the mailbox database whose passive copy you want to update.
3. In the Details pane, under **Database Copies**, click **Suspend** under the passive database copy you want to seed. Provide any optional comments, and click **save**.
4. In the Details pane, under **Database Copies**, click **Update** under the passive database copy you want to seed.
5. By default, the active copy of the database is used as the source database for seeding. If you prefer to use a passive copy of the database for seeding, click **browse...** to select the server containing the passive database copy you want to use for the source.
6. Click **save** to update the passive database copy.

Use the Shell to update a mailbox database copy

This example shows how to seed a copy of the database DB1 on MBX1.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1
```

This example shows how to seed a copy of the database DB1 on MBX1 using MBX2 as the source Mailbox server for the seed.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -SourceServer
MBX2
```

This example shows how to seed a copy of the database DB1 on MBX1 without seeding the content index catalog.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -DatabaseOnly
```

This example shows how to seed the content index catalog for the copy of the database DB1 on MBX1 without seeding the database file.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -CatalogOnly
```

Manually copy an offline database

1. If circular logging is enabled for the database, it must be disabled before proceeding. You can disable circular logging for a mailbox database by using the Set-MailboxDatabase cmdlet, as shown in this example.

```
Set-MailboxDatabase DB1 -CircularLoggingEnabled $false
```

2. Dismount the database. You can use the Dismount-Database cmdlet, as shown in this example.

```
Dismount-Database DB1 -Confirm $false
```

3. Manually copy the database files (the database file and all log files) to a second location, such as an external disk drive or a network share.
4. Mount the database. You can use the Mount-Database cmdlet, as shown in this example.

```
Mount-Database DB1
```

5. On the server that will host the copy, copy the database files from the external drive or network share to the same path as the active database copy. For example, if the active copy database path is D:\DB1\DB1.edb and log file path is D:\DB1, you would copy the database files to D:\DB1 on the server that will host the copy.
6. Add the mailbox database copy by using the Add-MailboxDatabaseCopy cmdlet with the *SeedingPostponed* parameter, as shown in this example.

```
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX3 -
SeedingPostponed
```

7. If circular logging is enabled for the database, enable it again by using the Set-MailboxDatabase cmdlet, as shown in this example.

```
Set-MailboxDatabase DB1 -CircularLoggingEnabled $true
```

How do you know this worked?

To verify that you've successfully seeded a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the database that was seeded. In the Details pane, the status of the database copy and its content index are displayed, along with the current copy queue length.
- In the Shell, run the following command to verify the mailbox database copy was seeded successfully and is healthy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName>
```

The Status and Content Index State should both be Healthy.

Suspend or resume a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-02*

You may need to suspend or resume a database copy for a variety of reasons, such as maintenance on the disk that contains a database copy, or suspend an individual database copy from activation for disaster recovery purposes.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to suspend a mailbox database copy

1. In the EAC, go to **Servers** > **Databases**.
2. Select the database whose copy you want to suspend.
3. In the Details pane, under **Database Copies**, click **Suspend** under the database copy you want to suspend.
4. In the **Comments** field, add an optional comment of up to 512 characters specifying the reason for the suspension.
5. To suspend the database copy from automatic activation, select the **This copy can only be activated by manual intervention** check box.
6. Click **save** to suspend the database copy.

Use the EAC to resume a mailbox database copy

1. In the EAC, go to **Servers** > **Databases**.
2. Select the database whose copy you want to resume.

3. In the Details pane, under **Database Copies**, click **Resume** under the database copy you want to resume.
4. Click **yes** to resume the database copy.

Use the Shell to suspend a mailbox database copy

This example suspends continuous replication for a copy of the database DB1 hosted on the server MBX1. An optional comment has also been specified.

```
Suspend-MailboxDatabaseCopy -Identity DB1\MBX1 -
SuspendComment "Maintenance on MBX1" -Confirm:$False
```

This example suspends activation for a copy of the database DB2 hosted on the server MBX2.

```
Suspend-MailboxDatabaseCopy -Identity DB2\MBX2 -
ActivationOnly -Confirm:$False
```

Use the Shell to resume a mailbox database copy

This example resumes a copy of the database DB1 on the server MBX1.

```
Resume-MailboxDatabaseCopy -Identity DB1\MBX1
```

This example resumes a copy of the database DB2 on the server MBX2 for replication only.

```
Resume-MailboxDatabaseCopy -Identity DB2\MBX2 -
ReplicationOnly
```

How do you know this worked?

To verify that you have successfully suspended or resumed a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the appropriate database, and in the Details pane, click **View details** to view the database copy properties.
- In the Shell, run the following command to display status information for a database copy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName> | Format-
List
```

Activate a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-01*

Activating a mailbox database copy is the process of designating a specific passive copy as the new active copy of a mailbox database. This process is referred to as a *database switchover*. A database switchover involves dismounting the current active database and mounting the database copy on the specified server as the new active mailbox database copy. The database copy that will become the active mailbox database must be healthy and current.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to move the active mailbox database

1. In the EAC, go to **Servers** > **Databases**.
2. Select the database whose copy you want to activate.
3. In the Details pane, under **Database Copies**, click **Activate** under the database copy you want to activate.
4. Click **yes** to activate the database copy.

Use the Shell to move the active mailbox database

This example activates and mounts a copy of the database DB4 hosted on MBX3 as the new active mailbox database. This command makes DB4 the new active mailbox database, and it doesn't override the database mount dial settings on MBX3.

```
Move-ActiveMailboxDatabase DB4 -ActivateOnServer MBX3 -
```

```
MountDialOverride:None
```

This example performs a switchover of the database DB2 to the Mailbox server MBX1. When the command completes, MBX1 hosts the active copy of DB2. Because the *MountDialOverride* parameter is set to `None`, MBX1 mounts the database using its own defined database auto mount dial settings.

```
Move-ActiveMailboxDatabase DB2 -ActivateOnServer MBX1 -
MountDialOverride:None
```

This example performs a switchover of the database DB1 to the Mailbox server MBX3. When the command completes, MBX3 hosts the active copy of DB1. Because the *MountDialOverride* parameter is specified with a value of `Good Availability`, MBX3 mounts the database using a database auto mount dial setting of *GoodAvailability*.

```
Move-ActiveMailboxDatabase DB1 -ActivateOnServer MBX3 -
MountDialOverride:GoodAvailability
```

This example performs a switchover of the database DB3 to the Mailbox server MBX4. When the command completes, MBX4 hosts the active copy of DB3. Because the *MountDialOverride* parameter isn't specified, MBX4 mounts the database using a database auto mount dial setting of *Lossless*.

```
Move-ActiveMailboxDatabase DB3 -ActivateOnServer MBX4
```

This example performs a server switchover for the Mailbox server MBX1. All active mailbox database copies on MBX1 will be activated on one or more other Mailbox servers with healthy copies of the active databases on MBX1.

```
Move-ActiveMailboxDatabase -Server MBX1
```

This example performs a switchover of the database DB4 to the Mailbox server MBX5. In this example, the database copy on MBX5 has a replay queue greater than 6. As a result, the *SkipLagChecks* parameter must be specified to activate the database copy on MBX5.

```
Move-ActiveMailboxDatabase DB4 MBX5 -SkipLagChecks
```

This example performs a switchover of the database DB5 to the Mailbox server MBX6. In this example, the database copy on MBX6 has a *ContentIndexState* of Failed. As a result, the *SkipClientExperienceChecks* parameter must be specified to activate the database copy on MBX6.

```
Move-ActiveMailboxDatabase DB5 MBX6 -
SkipClientExperienceChecks
```

How do you know this worked?

To verify that you've successfully activated a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the appropriate database, and in the Details pane, click **View details** to view the database copy properties.
- In the Shell, run the following command to display status information for a database copy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName> | Format-List
```

For more information

Mailbox database copies

Configure mailbox database copy properties

Activate a lagged mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-28*

A lagged mailbox database copy is a mailbox database copy configured with a replay lag time value greater than 0. Activating and recovering a lagged mailbox database copy is a simple process if you want the database to replay all log files and make the database copy current. If you want to replay log files up to a specific point in time, it's a more difficult operation because you have to manually manipulate log files and run Eseutil.

Looking for other information related to lagged mailbox database copies? Check out Managing mailbox database copies.

Note:

The amount of time it takes to activate a lagged mailbox database copy directly depends on how many log files need to be replayed and how fast the hardware can replay them. At a minimum, you should experience a log replay rate of at least two logs per second per database.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute, plus the time it takes to duplicate the lagged copy, replay the necessary log files, and extract the data or mount the database for client activity.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- The mailbox database copy being activated must be configured with a replay lag time greater than 0.
- The mailbox database copy being activated must have all log files to the point in time to which you want to recover it. Keep in mind that database transactions can span multiple log files when determining the point in time to which you want to recover.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the Shell to activate a lagged mailbox database copy to a specific point in time

Note:

You can't use the EAC to activate a lagged mailbox database copy to a specific point in time. Instead, you perform a series of steps using the Shell and the command line.

1. This example suspends replication for the lagged copy being activated by using the Suspend-MailboxDatabaseCopy cmdlet.

```
Suspend-MailboxDatabaseCopy DB1\EX3 -SuspendComment
"Activate lagged copy of DB1 on Server EX3" -Confirm:$false
```

2. Optionally (to preserve a lagged copy), make a copy of the database copy and its log files.

Note:

At this point, continuing to perform this procedure on the existing volume would incur a copy on write performance penalty. If this isn't desirable, you can copy the database and log files to another volume to perform the recovery.

3. Determine which log files are required to replay into the database to meet your point-in-time requirement for this recovery (based on log file date and time, as shown in Windows Explorer). All logs created after this point should be moved to a different directory, until the recovery process is completed, and the logs are no longer needed.
4. Delete the checkpoint (.chk) file for the database.
5. This example uses Eseutil to perform the recovery operation.

```
Eseutil.exe /r eXX /a
```

Note:
In the preceding example, e*XX* is the log generation prefix for the database (for example, E00, E01, E02, and so on).

Important:
This step may take a considerable amount of time, depending on several factors, such as the length of the replay lag time, the number of log files generated during that period, and the speed at which your hardware can replay those logs into the database being recovered.

6. After log replay is finished, the database is in a clean shutdown state and can be copied and used for recovery purposes.
7. After the recovery process is complete, this example resumes replication for the database that was used as part of the recovery process.

```
Resume-MailboxDatabaseCopy DB1\EX3
```

For detailed syntax and parameter information, see Suspend-MailboxDatabaseCopy or Resume-MailboxDatabaseCopy.

Use the Shell to activate a lagged mailbox database copy by replaying all uncommitted log files

1. Optionally (to preserve a lagged copy), make a copy of the database copy and its log files.
   a. This example suspends replication for the lagged copy being activated by using the Suspend-MailboxDatabaseCopy cmdlet.

```
Suspend-MailboxDatabaseCopy DB1\EX3 -SuspendComment
"Activate lagged copy of DB1 on Server EX3" -Confirm:$false
```

   b. Optionally (to preserve a lagged copy), make a copy of the database copy and its log files.

Note:
At this point, continuing to perform this procedure on the existing volume would incur a copy on write performance penalty. If this isn't desirable, you can copy the database and log files to another volume to perform the recovery.

2. This example activates the lagged mailbox database copy using the Move-ActiveMailboxDatabase cmdlet with the *SkipLagChecks* parameter.

```
Move-ActiveMailboxDatabase DB1 -ActivateOnServer EX3 -
SkipLagChecks
```

Use the Shell to activate a lagged mailbox database copy

by using SafetyNet recovery

1. Optionally (to preserve a lagged copy), take a file system-based (non-Exchange aware) Volume Shadow Copy Service (VSS) snapshot of the volumes containing the database copy and its log files.
   a. This example suspends replication for the lagged copy being activated by using the Suspend-MailboxDatabaseCopy cmdlet.

```
Suspend-MailboxDatabaseCopy DB1\EX3 -SuspendComment
"Activate lagged copy of DB1 on Server EX3" -Confirm:$false
```

   b. Optionally (to preserve a lagged copy), make a copy of the database copy and its log files.

Note:
At this point, continuing to perform this procedure on the existing volume would incur a copy-on-write performance penalty. If this isn't desirable, you can copy the database and log files to another volume to perform the recovery.

2. Determine the required logs for the lagged database copy by looking for the "Log Required:" value in ESEUTIL database header output

```
Eseutil /mh <DBPath> | findstr /c:"Log Required"
```

Take note of the hexadecimal numbers in parentheses. The first number is the lowest generation required (referred to as LowGeneration), and the second number is the highest generation required (referred to as HighGeneration). Move all log generation files that have a generation sequence greater than HighGeneration to a different location so that they are not replayed into the database.

3. On the server hosting the active copy of database, either delete the log files for the lagged copy being activated from the active copy, or stop the Microsoft Exchange Replication service.
4. Perform a database switchover and activate the lagged copy. This example activates the database by using the Move-ActiveMailboxDatabase cmdlet with several parameters.

```
Move-ActiveMailboxDatabase DB1 -ActivateOnServer EX3 -
MountDialOverride BestEffort -SkipActiveCopyChecks -
SkipClientExperienceChecks -SkipHealthChecks -SkipLagChecks
```

5. At this point, the database will automatically mount and request redelivery of missing messages from SafetyNet.

How do you know this worked?

To verify that you've successfully activated a lagged mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the appropriate database, and in the Details pane, click **View details** to view the database copy properties.
- In the Shell, run the following command to display status information for a database copy.

```
Get-MailboxDatabaseCopyStatus <DatabaseCopyName> | Format-
List
```

Remove a mailbox database copy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-06*

These procedures show you how to remove a copy of a mailbox database. You can't use these procedures to remove the last copy of a mailbox database. For detailed steps about how to remove the last copy of a mailbox database, see Remove a mailbox database or Remove-MailboxDatabase.

Looking for other management tasks related to mailbox database copies? Check out Managing mailbox database copies.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- Mailbox database copies can only be removed from a healthy database availability group (DAG). If the DAG isn't healthy (for example, the DAG's underlying cluster is down because quorum was lost), you won't be able to remove any mailbox database copies.
- If you're removing the last passive copy of the database, continuous replication circular logging (CRCL) must not be enabled for the specified mailbox database. If CRCL is enabled, you must first disable it. After the mailbox database copy has been removed, circular logging can be enabled. Once enabled for a non-replicated mailbox database, JET circular logging is used instead of CRCL. If you aren't removing the last passive copy of a database, CRCL can remain enabled.
- After removing a database copy, you must manually delete any database and transaction log files from the server from which the database copy is being removed.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

What do you want to do?

Use the EAC to remove a mailbox database copy

1. In the EAC, go to **Servers** > **Databases**.
2. Select the mailbox database whose copy you want to remove.
3. In the Details pane, locate the passive copy you want to remove and click **Remove**.
4. Confirm the removal on the warning dialog box by clicking **yes**.
5. Click **ok** to confirm the removal after reviewing any messages.
6. Manually delete any database and transaction log files from the server from which the database copy is being removed.

Use the Shell to remove a mailbox database copy

This example removes a copy of the mailbox database DB1 from the Mailbox server MBX1.

```
Remove-MailboxDatabaseCopy -Identity DB1\MBX1 -
Confirm:$False
```

How do you know this worked?

To verify that you've successfully removed a mailbox database copy, do one of the following:

- In the EAC, navigate to **Servers** > **Databases**. Select the appropriate database, and in the Details pane, the removed passive copy is no longer listed.
- In the Shell, run the following command to verify removal of the copy.

```
Get-MailboxDatabase <DatabaseName> | Format-List
DatabaseCopies
```

The removed passive copy is no longer listed.

Monitoring database availability groups

Exchange Server 2013 > High availability and site resilience > Managing high availability and site resilience >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-08-01*

You can use the details in this topic for monitoring the health and status of mailbox database

copies for database availability groups (DAGs), for gathering diagnostic information, and for configuring the low disk space monitoring threshold.

Get-MailboxDatabaseCopyStatus cmdlet

You can use the Get-MailboxDatabaseCopyStatus cmdlet to view status information about mailbox database copies. This cmdlet enables you to view information about all copies of a particular database, information about a specific copy of a database on a specific server, or information about all database copies on a server. The following table describes possible values for the copy status of a mailbox database copy.

Database copy status

Database copy status	Description
Failed	The mailbox database copy is in a Failed state because it isn't suspended, and it isn't able to copy or replay log files. While in a Failed state and not suspended, the system will periodically check whether the problem that caused the copy status to change to Failed has been resolved. After the system has detected that the problem is resolved, and barring no other issues, the copy status will automatically change to Healthy.
Seeding	The mailbox database copy is being seeded, the content index for the mailbox database copy is being seeded, or both are being seeded. Upon successful completion of seeding, the copy status should change to Initializing.
SeedingSource	The mailbox database copy is being used as a source for a database copy seeding operation.
Suspended	The mailbox database copy is in a Suspended state as a result of an administrator manually suspending the database copy by running the **Suspend-MailboxDatabaseCopy** cmdlet.

Healthy	The mailbox database copy is successfully copying and replaying log files, or it has successfully copied and replayed all available log files.
ServiceDown	The Microsoft Exchange Replication service isn't available or running on the server that hosts the mailbox database copy.
Initializing	The mailbox database copy is in an Initializing state when a database copy has been created, when the Microsoft Exchange Replication service is starting or has just been started, and during transitions from Suspended, ServiceDown, Failed, Seeding, or SinglePageRestore to another state. While in this state, the system is verifying that the database and log stream are in a consistent state. In most cases, the copy status will remain in the Initializing state for about 15 seconds, but in all cases, it should generally not be in this state for longer than 30 seconds.
Resynchronizing	The mailbox database copy and its log files are being compared with the active copy of the database to check for any divergence between the two copies. The copy status will remain in this state until any divergence is detected and resolved.
Mounted	The active copy is online and accepting client connections. Only the active copy of the mailbox database copy can have a copy status of Mounted.

Dismounted	The active copy is offline and not accepting client connections. Only the active copy of the mailbox database copy can have a copy status of Dismounted.
Mounting	The active copy is coming online and not yet accepting client connections. Only the active copy of the mailbox database copy can have a copy status of Mounting.
Dismounting	The active copy is going offline and terminating client connections. Only the active copy of the mailbox database copy can have a copy status of Dismounting.
DisconnectedAndHealthy	The mailbox database copy is no longer connected to the active database copy, and it was in the Healthy state when the loss of connection occurred. This state represents the database copy with respect to connectivity to its source database copy. It may be reported during DAG network failures between the source copy and the target database copy.
DisconnectedAndResynchronizing	The mailbox database copy is no longer connected to the active database copy, and it was in the Resynchronizing state when the loss of connection occurred. This state represents the database copy with respect to connectivity to its source database copy. It may be reported during DAG network failures between the source copy and the target database copy.
FailedAndSuspended	The Failed and Suspended states have been set simultaneously by the system because a failure

	was detected, and because resolution of the failure explicitly requires administrator intervention. An example is if the system detects unrecoverable divergence between the active mailbox database and a database copy. Unlike the Failed state, the system won't periodically check whether the problem has been resolved, and automatically recover. Instead, an administrator must intervene to resolve the underlying cause of the failure before the database copy can be transitioned to a healthy state.
SinglePageRestore	This state indicates that a single page restore operation is occurring on the mailbox database copy.

The **Get-MailboxDatabaseCopyStatus** cmdlet also returns details about the in-use replication networks, including *IncomingLogCopyingNetwork*, which is returned for passive database copies, and *OutgoingConnections*, which is returned for active databases that have more than one copy, as well as any database copy being used as a source for a database seeding operation. Outgoing connection information is provided for database copies that are in file mode replication. Outgoing connection information is not provided for database copies that are in block mode replication.

Get-MailboxDatabaseCopyStatus examples

The following examples use the **Get-MailboxDatabaseCopyStatus** cmdlet. Each example pipes the results to the **Format-List** cmdlet to display the output in list format.

This example returns status information for all copies of the database DB2.

```
Get-MailboxDatabaseCopyStatus -Identity DB2 | Format-List
```

This example returns the status for all database copies on the Mailbox server MBX2.

```
Get-MailboxDatabaseCopyStatus -Server MBX2 | Format-List
```

This example returns the status for all database copies on the local Mailbox server.

```
Get-MailboxDatabaseCopyStatus -Local | Format-List
```

For more information about using the **Get-MailboxDatabaseCopyStatus** cmdlet, see Get-MailboxDatabaseCopyStatus.

Test-ReplicationHealth cmdlet

You can use the Test-ReplicationHealth cmdlet to view continuous replication status information about mailbox database copies. This cmdlet can be used to check all aspects of the replication and replay status to provide a complete overview of a specific Mailbox server in a DAG.

The **Test-ReplicationHealth** cmdlet is designed for the proactive monitoring of continuous replication and the continuous replication pipeline, the availability of Active Manager, and the health and status of the underlying cluster service, quorum, and network components. It can be run locally on or remotely against any Mailbox server in a DAG. The **Test-ReplicationHealth** cmdlet performs the tests listed in the following table.

Test-ReplicationHealth cmdlet tests

Test name	Description
ClusterService	Verifies that the Cluster service is running and reachable on the specified DAG member, or if no DAG member is specified, on the local server.
ReplayService	Verifies that the Microsoft Exchange Replication service is running and reachable on the specified DAG member, or if no DAG member is specified, on the local server.
ActiveManager	Verifies that the instance of Active Manager running on the specified DAG member, or if no DAG member is specified, the local server, is in a valid role (primary, secondary, or stand-alone).
TasksRpcListener	Verifies that the tasks remote procedure call (RPC) server is running and reachable on the specified DAG member, or if no DAG member is specified, on the local server.
TcpListener	Verifies that the TCP log copy listener is

	running and reachable on the specified DAG member, or if no DAG member is specified, on the local server.
ServerLocatorService	Verifies the Active Manager client/server processes on DAG members and on the Client Access Server that perform lookups in Active Directory and Active Manager to determine where a user's mailbox database is active.
DagMembersUp	Verifies that all DAG members are available, running, and reachable.
ClusterNetwork	Verifies that all cluster-managed networks on the specified DAG member, or if no DAG member is specified, the local server, are available.
QuorumGroup	Verifies that the default cluster group (quorum group) is in a healthy and online state.
FileShareQuorum	Verifies that the witness server and witness directory and share configured for the DAG are reachable.
DatabaseRedundancy	Verifies that there is at least one healthy copy available of the databases on the specified DAG member, or if no DAG member is specified, on the local server.
DatabaseAvailability	Verifies that the databases have sufficient availability on the specified DAG member, or if no DAG member is specified, on the local server.
DBCopySuspended	Checks whether any mailbox database copies are in a state of Suspended on the specified

	DAG member, or if no DAG member is specified, on the local server.
DBCopyFailed	Checks whether any mailbox database copies are in a state of Failed on the specified DAG member, or if no DAG member is specified, on the local server.
DBInitializing	Checks whether any mailbox database copies are in a state of Initializing on the specified DAG member, or if no DAG member is specified, on the local server.
DBDisconnected	Checks whether any mailbox database copies are in a state of Disconnected on the specified DAG member, or if no DAG member is specified, on the local server.
DBLogCopyKeepingUp	Verifies that log copying and inspection by the passive copies of databases on the specified DAG member, or if no DAG member is specified, on the local server, are able to keep up with log generation activity on the active copy.
DBLogReplayKeepingUp	Verifies that replay activity for the passive copies of databases on the specified DAG member, or if no DAG member is specified, on the local server, is able to keep up with log copying and inspection activity.

Test-ReplicationHealth example

This example uses the **Test-ReplicationHealth** cmdlet to test the health of replication for the Mailbox server MBX1.

```
Test-ReplicationHealth -Identity MBX1
```

Crimson channel event logging

Windows includes two categories of event logs: Windows logs, and Applications and Services logs. The Windows logs category includes the event logs available in previous versions of Windows: Application, Security, and System event logs. It also includes two new logs: the Setup log and the ForwardedEvents log. Windows logs are intended to store events from legacy applications and events that apply to the entire system.

Applications and Services logs are a new category of event logs. These logs store events from a single application or component rather than events that might have system-wide impact. This new category of event logs is referred to as an application's crimson channel.

The Applications and Services logs category includes four subtypes: Admin, Operational, Analytic, and Debug logs. Events in Admin logs are of particular interest if you use event log records to troubleshoot problems. Events in the Admin log should provide you with guidance about how to respond to the events. Events in the Operational log are also useful, but may require more interpretation. Admin and Debug logs aren't as user friendly. Analytic logs (which by default are hidden and disabled) store events that trace an issue, and often a high volume of events are logged. Debug logs are used by developers when debugging applications.

Exchange 2013 logs events to crimson channels in the Applications and Services logs area. You can view these channels by performing these steps:

1. Open Event Viewer.
2. In the console tree, navigate to **Applications and Services Logs** > **Microsoft** > **Exchange**.
3. Under **Exchange**, select a crimson channel, such as **HighAvailability** or **MailboxDatabaseFailureItems** to see DAG and database copy-related events, or **ActiveMontoring** or **ManagedAvailability** to see events related to Managed Availability.

The HighAvailability channel contains events related to startup and shutdown of the Microsoft Exchange Replication service, and the various components that run within the Microsoft Exchange Replication service, such as Active Manager, the third-party synchronous replication API, the tasks RPC server, TCP listener, and Volume Shadow Copy Service (VSS) writer. The HighAvailability channel is also used by Active Manager to log events related to Active Manager role monitoring and database action events, such as a database mount operation and log truncation, and to record events related to the DAG's underlying cluster.

The MailboxDatabaseFailureItems channel is used to log events associated with any failures that affect a replicated mailbox database.

The ActiveMonitoring channel contains definition and result events for Managed Availability probes, monitors and responders.

The ManagedAvailability channel contains recovery action logs and results and related events.

Low Disk Space Monitor

Exchange 2013 Managed Availability monitors hundreds of system metrics and components every minute, including the amount of free disk space on volumes used by the Mailbox server role. Prior to Exchange 2013 Service Pack 1 (SP1), Exchange monitors available space on all local volumes, including volumes that don't contain any databases or log files. In SP1 and later, only volumes that contain Exchange databases and log files are monitored. In SP1, the default threshold for the low volume space monitor is 200 GB. In Exchange 2013 Cumulative Update 6 and later, the default threshold is 180 GB. In SP1 and later, you can configure the threshold by adding the following DWORD registry value (in MB) on each Mailbox server that you want to customize:

Path: **HKEY_LOCAL_MACHINE\Software\Microsoft\ExchangeServer\v15\Replay\Parameters**

Value: *SpaceMonitorLowSpaceThresholdInMB*

For example to configure the threshold to 100 GB, you would configure the following registry value:

REG_DWORD 186a0 (100000)

After configuring or modifying the above registry value, you must restart the Microsoft Exchange DAG Management service for the change to take effect.

CollectOverMetrics.ps1 script

Exchange 2013 includes a script called CollectOverMetrics.ps1, which can be found in the Scripts folder. CollectOverMetrics.ps1 reads DAG member event logs to gather information about database operations (such as database mounts, moves, and failovers) over a specific time period. For each operation, the script records the following information:

- Identity of the database
- Time at which the operation began and ended
- Servers on which the database was mounted at the start and finish of the operation
- Reason for the operation
- Whether the operation was successful, and if the operation failed, the error details

The script writes this information to .csv files with one operation per row. It writes a separate .csv file for each DAG.

The script supports parameters that allow you to customize the script's behavior and output. For example, the results can be restricted to a specified subset by using the *Database* or *ReportFilter* parameters. Only the operations that match these filters will be included in the summary HTML report. The available parameters are listed in the following table.

CollectOverMetrics.ps1 script parameters

Parameter	Description
DatabaseAvailabilityGroup	Specifies the name of the DAG from which you want to collect metrics. If this parameter is omitted, the DAG of which the local server is a

	member will be used. Wildcard characters can be used to collect information from and report on multiple DAGs.
Database	Provides a list of databases for which the report needs to be generated. Wildcard characters are supported, for example, `-Database:"DB1","DB2"` or `-Database:"DB*"`.
StartTime	Specifies the duration of the time period to report on. The script gathers only the events logged during this period. As a result, the script may capture partial operation records (for example, only the end of an operation at the start of the period or vice-versa). If neither *StartTime* nor *EndTime* is specified, the script defaults to the past 24 hours. If only one parameter is specified, the period will be 24 hours, either beginning or ending at the specified time.
EndTime	Specifies the duration of the time period to report on. The script gathers only the events logged during this period. As a result, the script may capture partial operation records (for example, only the end of an operation at the start of the period or vice-versa). If neither *StartTime* nor *EndTime* is specified, the script defaults to the past 24 hours If only one parameter is specified, the period will be 24 hours, either beginning or ending at the specified time.
ReportPath	Specifies the folder used to store the results of event processing. If this parameter is omitted,

	the Scripts folder will be used. When specified, the script takes a list of .csv files generated by the script and uses them as the source data to generate a summary HTML report. The report is the same one that's generated with the -GenerateHtmlReport option. The files can be generated across multiple DAGs at many different times, or even with overlapping times, and the script will merge all of their data together.
GenerateHtmlReport	Specifies that the script gather all the information it has recorded, group the data by the operation type, and then generate an HTML file that includes statistics for each of these groups. The report includes the total number of operations in each group, the number of operations that failed, and statistics for the time taken within each group. The report also contains a breakdown of the types of errors that resulted in failed operations.
ShowHtmlReport	Specifies that the HTML-generated report should be displayed in a Web browser after it's generated.
SummariseCsvFiles	Specifies that the script read the data from existing .csv files that were previously generated by the script. This data is then used to generate a summary report similar to the report generated by the *GenerateHtmlReport* parameter.
ActionType	Specifies the type of operational actions the script should collect. The values for this

	parameter are `Move`, `Mount`, `Dismount`, and `Remount`. The `Move` value refers to any time that the database changes its active server, whether by controlled moves or by failovers. The `Mount`, `Dismount`, and `Remount` values refer to times that the database changes its mounted status without moving to another computer.
ActionTrigger	Specifies which administrative operations should be collected by the script. The values for this parameter are `Admin` or `Automatic`. Automatic actions are those performed automatically by the system (for example, a failover when a server goes offline). Admin actions are any actions that were performed by an administrator using either the Exchange Management Shell or the Exchange Administration Center.
RawOutput	Specifies that the script writes the results that would have been written to .csv files directly to the output stream, as would happen with write-output. This information can then be piped to other commands.
IncludedExtendedEvents	Specifies that the script collects the events that provide diagnostic details of times spent mounting databases. This can be a time-consuming stage if the Application event log on the servers is large.
MergeCSVFiles	Specifies that the script takes all the .csv files containing data about each operation and merges them into a single .csv file.

ReportFilter	Specifies that a filter should be applied to the operations using the fields as they appear in the .csv files. This parameter uses the same format as a `where` operation, with each element set to `$_` and returning a Boolean value. For example: `{$_DatabaseName -notlike "Mailbox Database*"}` can be used to exclude the default databases from the report.

CollectOverMetrics.ps1 examples

The following example collects metrics for all databases that match DB* (which includes a wildcard character) in the DAG DAG1. After the metrics are collected, an HTML report is generated and displayed.

```
CollectOverMetrics.ps1 -DatabaseAvailabilityGroup DAG1 -
Database:"DB*" -GenerateHTMLReport -ShowHTMLReport
```

The following examples demonstrate ways that the summary HTML report may be filtered. The first uses the *Database* parameter, which takes a list of database names. The summary report then contains data only about those databases. The next two examples use the *ReportFilter* option. The last example filters out all the default databases.

```
CollectOverMetrics.ps1 -SummariseCsvFiles (dir *.csv) -
Database MailboxDatabase123,MailboxDatabase456
CollectOverMetrics.ps1 -SummariseCsvFiles (dir *.csv) -
ReportFilter { $_.DatabaseName -notlike "Mailbox Database*"
}
CollectOverMetrics.ps1 -SummariseCsvFiles (dir *.csv) -
ReportFilter { ($_.ActiveOnStart -like "ServerXYZ*") -and
($_.ActiveOnEnd -notlike "ServerXYZ*") }
```

CollectReplicationMetrics.ps1 script

CollectReplicationMetrics.ps1 is another health metric script included in Exchange 2013. This script provides an active form of monitoring because it collects metrics in real time, while the script is running. CollectReplicationMetrics.ps1 collects data from performance counters related to database replication. The script gathers counter data from multiple Mailbox servers, writes each server's data to a .csv file, and then reports various statistics across all of this data (for example, the

amount of time each copy was failed or suspended, the average copy or replay queue length, or the amount of time that copies were outside of their failover criteria).

You can either specify the servers individually, or you can specify entire DAGs. You can either run the script to first collect the data and then generate the report, or you can run it to just gather the data or to only report on data that's already been collected. You can specify the frequency at which data should be sampled and the total duration to gather data.

The data collected from each server is written to a file named **CounterData.<ServerName>.<TimeStamp>.csv**. The summary report will be written to a file named **HaReplPerfReport.<DAGName>.<TimeStamp>.csv**, or **HaReplPerfReport.<TimeStamp>.csv** if you didn't run the script with the *DagName* parameter.

The script starts Windows PowerShell jobs to collect the data from each server. These jobs run for the full period in which data is being collected. If you specify a large number of servers, this process can use a considerable amount of memory. The final stage of the process, when data is processed into a summary report, can also be quite time consuming for large amounts of data. It's possible to run the collection stage on one computer, and then copy the data elsewhere for processing.

The CollectReplicationMetrics.ps1 script supports parameters that allow you to customize the script's behavior and output. The available parameters are listed in the following table.

CollectReplicationMetrics.ps1 script parameters

Parameter	Description
DagName	Specifies the name of the DAG from which you want to collect metrics. If this parameter is omitted, the DAG of which the local server is a member will be used.
DatabaseNames	Provides a list of databases for which the report needs to be generated. Wildcard characters are supported for use, for example, `-DatabaseNames:"DB1","DB2"` or `-DatabaseNames:"DB*"`.
ReportPath	Specifies the folder used to store the results of event processing. If this parameter is omitted, the Scripts folder will be used.
Duration	Specifies the amount of time the collection process should run. Typical values would be one

	to three hours. Longer durations should be used only with long intervals between each sample or as a series of shorter jobs run by scheduled tasks.
Frequency	Specifies the frequency at which data metrics are collected. Typical values would be 30 seconds, one minute, or five minutes. Under normal circumstances, intervals that are shorter than these won't show significant changes between each sample.
Servers	Specifies the identity of the servers from which to collect statistics. You can specify any value, including wildcard characters or GUIDs.
SummariseFiles	Specifies a list of .csv files to generate a summary report. These files are the files named **CounterData.<CounterData>*** and are generated by the CollectReplicationMetrics.ps1 script.
Mode	Specifies the processing stages that the script executes. You can use the following values: • `CollectAndReport` This is the default value. This value signifies that the script should both collect the data from the servers and then process them to produce the summary report. • `CollectOnly` This value signifies that the script should just collect the data and not produce the report. • `ProcessOnly` This value signifies that the script should import data from a set of .csv files and process them to produce the summary report. The *SummariseFiles* parameter is used to provide the script with the list of files to process.
MoveFilestoArchive	Specifies that the script should move the files to a compressed folder after processing.

LoadExchangeSnapin	Specifies that the script should load the Shell commands. This parameter is useful when the script needs to run from outside the Shell, such as in a scheduled task.

CollectReplicationMetrics.ps1 example

The following example gathers one hour's worth of data from all the servers in the DAG DAG1, sampled at one minute intervals, and then generates a summary report. In addition, the *ReportPath* parameter is used, which causes the script to place all the files in the current directory.

```
CollectReplicationMetrics.ps1 -DagName DAG1 -Duration
"01:00:00" -Frequency "00:01:00" -ReportPath
```

The following example reads the data from all the files matching CounterData* and then generates a summary report.

```
CollectReplicationMetrics.ps1 -SummariseFiles (dir
CounterData*) -Mode ProcessOnly -ReportPath
```

Switchovers and Failovers

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013*

Topic Last Modified: *2014-06-23*

Switchovers and failovers are the two forms of outages in Microsoft Exchange Server 2013:

- A *switchover* is a scheduled outage of a database or server that's explicitly initiated by an administrator, typically in preparation for performing a maintenance operation. Switchovers involve an administrator moving the active mailbox database copy to another server in the database availability group (DAG).
- A *failover* refers to unexpected events that result in the unavailability of services, data, or both. A failover involves the system automatically recovering from the failure by activating a passive mailbox database copy to make it the active mailbox database copy.

Exchange 2013 is specifically designed to handle both switchovers and failovers.

Looking for management tasks related to high availability and site resilience? See Managing high availability and site resilience.

Switchovers

There are three types of switchovers in Exchange 2013:

- Database switchovers
- Server switchovers
- Datacenter switchovers

Database Switchovers

A *database switchover* is the process by which an individual active database is switched over to another database copy (a passive copy), and that database copy is made the new active database copy. Database switchovers can happen both within and across datacenters. A database switchover can be performed by using the Exchange Admin Center (EAC) or the Shell. Regardless of which interface is used, the switchover process is as follows:

1. The administrator initiates a database switchover to move the current active mailbox database copy to another server.
2. The client used for the task makes an RPC call to the Microsoft Exchange Replication service on a DAG member.
3. If the DAG member doesn't hold the Primary Active Manager (PAM) role, the DAG member refers the task to the server that holds the PAM role.
4. The task makes an RPC call to the Microsoft Exchange Replication service on the server that holds the PAM role.
5. The PAM reads and updates the database location information that's stored in the cluster database for the DAG.
6. The PAM contacts the Microsoft Exchange Replication service on the DAG member whose passive copy is being activated as the new active mailbox database copy.
7. The Microsoft Exchange Replication service on the target server queries the Microsoft Exchange Replication services on all other DAG members to determine the best log source for the database copy.
8. The database is dismounted from the current server and the Microsoft Exchange Replication service on the target server copies the remaining logs to the target server.
9. The Microsoft Exchange Replication service on the target server requests a database mount.
10. The Microsoft Exchange Information Store service on the target server replays the log files and mounts the database.
11. Any error codes are returned to the Microsoft Exchange Replication service on the target server.
12. The PAM updates the database copy state information in the cluster database for the DAG.
13. Any error codes are returned by the Microsoft Exchange Replication service on the target server to the Microsoft Exchange Replication service on the PAM.
14. The Microsoft Exchange Replication service on the PAM returns any errors to the administrative interface where the task was called.
15. Remote PowerShell returns the results of the operation to the calling administrative interface.

For detailed steps about how to perform a database switchover, see Activate a mailbox database copy.

Server Switchovers

A server switchover is the process by which all active databases on a DAG member are activated on one or more other DAG members. Like database switchovers, a server switchover can occur both within a datacenter and across datacenters, and it can be initiated by using both the EAC and the Shell. Regardless of which interface is used, the server switchover process is as follows:

1. The administrator initiates a server switchover to move all current active mailbox database copies to one or more other servers.
2. The task performs the same steps described earlier in this topic for database switchovers (Steps 2 through 4) for each of the active databases on the current server.
3. The PAM reads and updates the database location information that's stored in the cluster database for the DAG.
4. The PAM contacts the Microsoft Exchange Replication service on each DAG member that has a passive copy being activated.
5. The Microsoft Exchange Replication service on the target servers query the Microsoft Exchange Replication services on all other DAG members to determine the best log source for the database copy.
6. The database is dismounted from the current server and the Microsoft Exchange Replication service on each target server copies the remaining logs.
7. The Microsoft Exchange Replication service on each target server requests a database mount.
8. The Microsoft Exchange Information Store service on each target server replays the log files and mounts the database.
9. Any error codes are returned to the Microsoft Exchange Replication service on the target server.
10. The PAM updates the database copy state information in the cluster database for the DAG.
11. Any error codes are returned by the Microsoft Exchange Replication service on the target server to the Microsoft Exchange Replication service on the PAM.
12. The Microsoft Exchange Replication service on the PAM returns any errors to the administrative interface where the task was called.
13. Remote PowerShell returns the results of the operation to the calling administrative interface.

For detailed steps about how to perform a server switchover, see Perform a Server Switchover.

Datacenter Switchovers

In a site resilient configuration, automatic recovery in response to a site-level failure can occur within a DAG, allowing the messaging system to remain in a functional state. This configuration requires at least three locations, as it requires deploying DAG members in two locations and the DAG's witness server in a third location.

If you don't have three locations, or even if you do have three locations, but you want to control

datacenter-level recovery actions, you can configure a DAG for manual recovery in the event of a site-level failure. In that event, you would perform a process called a *datacenter switchover*. As with many disaster recovery scenarios, prior planning and preparation for a datacenter switchover can simplify your recovery process and reduce the duration of your outage.

Because of the numerous architectural changes in Exchange 2013, including the consolidation of server roles, performing a datacenter switchover in Exchange 2013 is significantly easier than it was in Exchange 2010. For detailed steps to performing a datacenter switchover, see Datacenter Switchovers.

Failovers

A failover is an automatic activation process that can occur at the database, server, or datacenter level. Failovers occur in response to a failure that affects an individual database (for example, an isolated storage loss) an entire server (for example, a motherboard failure or a loss of power), or an entire site (for example, the loss of all DAG members in a site).

DAGs and mailbox database copies provide full redundancy and rapid recovery of both the data and the services that provide access to the data. The following table lists the expected recovery actions for a variety of failures. Some failures require the administrator to initiate the recovery, and other failures are automatically handled by the system.

Description	Automatic activation	Automatic repair action	State during repair: Active	State during repair: Passive	Repair actions	Comments
Extensible Storage Engine (ESE) soft database failure: The drives storing the database are returning errors on some reads (for example, a -1018 error).	Possible short outage. Possible automatic failover.	Automatic patching of bad page.	Manual switchover, automatic failover, or online repair.	Failed	RAID rebuild, database and database copy repair, restore and run recovery then page patching, or page patching from copy.	There may be other soft database failure codes. Doesn't include NTFS file system block failures. If failover or switchover is performed,

						host server is updated.
ESE "*semi-soft*" database failure: The drives storing the database are returning errors on some writes.	Short outage during automatic failover.	Automatic volume/disk rebuilt after possible drive replacement.	Dismounted if can't be recovered.	Failed	RAID rebuild may solve the problem. Copy and repair, restore and run recovery, or volume/disk rebuilt after possible replacement.	An ESE semi-soft write error means some writes are successful. Doesn't include an NTFS block failure.
ESE "semi-soft" log failure: The drives storing the log data are returning non-recovered errors on some reads or writes.	Short outage during automatic failover.	Automatic volume/disk rebuilt after possible drive replacement.	Dismounted if can't be recovered.	Failed	RAID rebuild may solve the problem. Copy and repair, restore and run recovery, or volume/disk rebuilt after possible replacement.	An ESE semi-soft read/write error means some reads/ writes are successful. If the database fails, automated recovery will occur before log data recovery processing starts.

ESE software error or resource exhaustion: An error where ESE terminates instance (for example, Event ID 1022, checkpoint depth too deep).	Short outage during automatic failover.	None.	Dismounted if can't be recovered.	Failed	Fix underlying resource issue.	This failure could be the surfaced error of other cases.
NTFS block failures: The drives storing the database or logs experiences a read or write error to an NTFS control structure.	Short outage during automatic failover.	Volume completely rebuilt after possible drive replacement.	Dismounted if can't be recovered.	Failed	RAID rebuild may solve the problem. NTFS utilities may solve the NTFS problems. Exchange recovery may be required.	This is more likely to occur when RAID isn't in use. If this impacts the active log volume, some recent log files will be lost. Doesn't include errors automatically corrected by NTFS or its underlying software or hardware

						stack.
Database or log drive failure: A drive storing the database or logs has completely failed and is inaccessible.	Short outage during automatic failover.	Drive reformatted or replaced, followed by complete volume rebuild.	Dismounted if can't be recovered.	Failed	Drive replacement followed by possible RAID rebuild. Drive replacement followed by complete volume rebuild. Complete volume rebuild.	Not applicable.
Database or log volume failure: The volume fails due to NTFS or lower level volume issues.	Short outage during automatic failover.	Drive reformatted or replaced.	Dismounted if can't be recovered.	Failed	Drive replacement followed by possible RAID rebuild. Drive replacement followed by complete volume rebuild. Complete volume rebuild.	Not applicable.

Database or log volume out of space: The NTFS file system with the database or log files is out of space.	Automatic failover if other copy isn't in similar state.	None.	Dismounted.	Failed	Run full or incremental backups, manually delete logs, let time pass, resume database copy, or repair failed database copy.	Not applicable.
Administrator dismounts the wrong database.	If automatic failover isn't blocked by the administrator, there will be a short outage. If automatic failover is prevented, there will be an outage until the database is mounted.	None.	Dismounted.	Not applicable	Administrator corrects the error.	Not applicable.
Administrator suspends the wrong database	Depending on configuratio	None.	Not applicable.	Suspended	Administrator corrects the error.	Not applicable.

copy.	n and impacted copy, auto recovery may be prevented.					
Administrator dismounts a database for storage, NTFS, or volume maintenance.	If automatic failover isn't blocked by the administrator, there will be a short outage. If automatic failover is blocked, there will be an outage until the administrator completes the task.	None.	Dismounted.	Not applicable	Administrator completes the task.	Not applicable.
Administrator suspends a database copy for storage, NTFS, or volume maintenance.	Depending on configuration and impacted copy, auto recovery may be prevented.	None.	Not applicable.	Suspended	Administrator completes the actions.	Not applicable.

Administrator dismounts a database for offline database maintenance.	Outage until repaired.	None.	Dismounted.	Suspended	Administrator completes the actions.	Active and passive database copies are diverged. Administrator must suspend copies.
Storage area network (SAN), disk, or storage controller failure.	Short outage during automatic failover.	None.	Dismounted.	Any	Repair hardware.	A passive database copy will be in the state that existed at the time when the system failed.
Server hardware maintenance.	Short outage during automatic failover (unless blocked by an administrator).	None.	Dismounted.	Any	Complete actions.	A passive database copy will be in the state that existed at the time when the system was shut down.
Server software maintenance.	Short outage during	None.	Dismounted.	Any	Complete actions.	A passive database copy will be

	automatic failover (unless blocked by an administrator).					in the state that existed at the time when the system was shut down.
Microsoft Exchange Information Store service is stopped or paused by an administrator.	None.	None.	Dismounted.	Any	Restart the Microsoft Exchange Information Store service.	A passive database copy will be in the state that existed at the time when the service was stopped.
Microsoft Exchange Information Store service fails; operating system is still running.	Short outage during automatic failover.	Service Control Manager restarts the Microsoft Exchange Information Store service.	Dismounted.	Any	Manually or automatically restart the Microsoft Exchange Information Store service.	A passive database copy will be in the state that existed when the Microsoft Exchange Information Store service failed.
Partial Microsoft Exchange Information Store service	Possible short outage during automatic	None.	Mounted and partially functional.	Any, but may be only partially functional	Restart server, operating system, or	Not applicable.

failure; some part of the Exchange store stops functioning, but it's not identified as completely failed.	failover.				Microsoft Exchange Information Store service.	
Server failure: The server fails for one of the following reasons: • Complete power failure • Unrecovered failure of the processor chip, motherboard, or backplane • Operating system stop error • Operating system stops responding • Complete communicatio n failure	Short outage during automatic failover.	Restart computer.	Dismounted.	Any	Restore power, change operating system settings, change hardware settings, replace hardware, restart operating system, service operating system, service hardware, or repair communicat ion problems.	Not applicable.

DAG experiences a quorum failure.	Outage until repaired.	None.	Dismounted.	Any	Repair failed quorum, assign new quorum, or restore the network that's causing quorum failure.	A passive database copy will be in the state that existed at the time when the system failed.
MAPI network communication failure: The server is no longer available on the MAPI network.	Short outage during automatic failover; must be lossless.	None. Communication continues to be attempted.	Dismounted.	Any	Fix communication problem by correcting hardware or software issues.	Not applicable.
Replication network communication failure: The server can't receive heartbeats, log copies, or seed through the failed replication network.	Possible short copying or seeding outage while the workload is switched to other network.	None. Communication continues to be attempted.	None.	Any	Fix communication problem by correcting hardware or software issues.	Resiliency impacted by failure.
Multiple network	Short outage	None. Communicat	Dismounted.	Any	Fix communicat	At least one network is

Partial failure of one or more networks: Networks experience high error rates.	Failure not detected; no action.	None.	Mounted, but possible performance issues.	Any	Fix communicat ion problem by correcting hardware or software issues.	Network experiences higher than normal error rates.
Undetected operating system hang: Operating system stops responding but it's not detected by monitoring or clustering.	None.	None.	Any.	Any	Restart or terminate the resources that aren't responding.	Hang isn't detected so no action is taken. Some functionality may be operational.
Operating system drive experiences a failure.	Short outage during automatic failover.	None.	Dismounted.	Any	Replace drive and rebuild server or rebuild	Not applicable.

					volume by using RAID.	
Operating system drive out of space.	Short outage during automatic failover.	None.	Dismounted.	Any	Manually free space on the volume.	Not applicable.
Drive containing Exchange binaries experiences a volume or drive failure.	Short outage during automatic failover.	None.	Dismounted.	Any	Replace drive and reinstall application or rebuild volume by using RAID.	Not applicable.
Drive containing the Exchange binaries is out of space.	Short outage during automatic failover.	None.	Dismounted.	Any	Manually free space on the volume.	Not applicable.
Invalid new log detected: The log sequence is disrupted by an existing file.	Short outage during automatic failover; assume other copies don't have the same problem.	None.	Dismounted.	Failed	Remove disruptive logs after determining source.	The disruptive logs shouldn't replicate.
Continuous	Not	Discard log.	Not	Failed	Discard	Not

replication detects invalid log: Replay detects an inappropriate log during copy or replay.	applicable.		applicable.		invalid log; move impacting log stream.	applicable.

Database Failovers

A database failover occurs when a database copy that was active is no longer able to remain active. The following occurs as part of a database failover:

1. The database failure is detected by the Microsoft Exchange Information Store service.
2. The Microsoft Exchange Information Store service writes failure events to the crimson channel event log.
3. The Active Manager on the server that contains the failed database detects the failure events.
4. The Active Manager requests the database copy status from the other servers that hold a copy of the database.
5. The other servers return the requested database copy status to the requesting Active Manager.
6. The PAM initiates a move of the active database to another server in the DAG using a best copy selection algorithm.
7. The PAM updates the database mount location in the cluster database to refer to the selected server.
8. The PAM sends a request to the Active Manager on the selected server to become the database master.
9. The Active Manager on the selected server requests that the Microsoft Exchange Replication service attempt to copy the last logs from the previous server and set the mountable flag for the database.
10. The Microsoft Exchange Replication service copies the logs from the server that previously had the active copy of the database.
11. The Active Manager reads the maximum log generation number from the cluster database.
12. The Microsoft Exchange Information Store service mounts the new active database copy.

Server Failovers

A server failover occurs when the DAG member is no longer able to service the MAPI network, or when the Cluster service on a DAG member is no longer able to contact the remaining DAG members. The following occurs as part of a server failover:

1. The Cluster service on the PAM sends a notification to the PAM for one of two conditions:
   a. **Node Down** The server is reachable but is unable to participate in DAG operations.

   b. **MAPI Network Down** The server can't be contacted over the MAPI network and therefore can't participate in DAG operations.
2. If the server is reachable, the PAM contacts the Active Manager on the affected server and requests that all databases be immediately dismounted.
3. For each affected database copy:
   a. The PAM requests the database copy status from all servers in the DAG.
   b. The PAM receives a response from all reachable and active DAG members.
   c. The PAM tries to determine the best log source among all responding servers by querying the most recent log generation number from each of the responders.
   d. Each of the servers responds with the log generation number.
4. The PAM retrieves the current search index catalog status from the cluster database.
5. Based on the log generation number and catalog health of each database copy, the PAM selects the best copies to activate.
6. The PAM updates the mounted location of the database in the cluster database.
7. The PAM initiates database failover by communicating with the Active Manager on one or more other servers.
8. The Active Manager on the selected servers requests that the Microsoft Exchange Replication service attempt to copy the last logs from the previous server and set the mountable flag.
9. When the database is mountable, the Active Manager on the servers mounts the databases.

For more information about Active Manager's best copy selection process, see Active Manager.

Datacenter Failovers

Significant changes have been made in Exchange 2013 that address the challenges with an Exchange 2010 site resilience configuration. With the namespace simplification, consolidation of server roles, separation of Client Access server and DAG recovery (in Exchange 2013, the namespace does not need to move with the DAG), and the changes around load balancing, Exchange 2013 provides new site resilience options, such as the ability to use a single global namespace. In addition, if you have more than two locations in which to deploy messaging service components, Exchange 2013 also provides the ability to configure the messaging service for automatic failover in response to failures that required manual intervention in Exchange 2010.

Site resilience has been operationally simplified in Exchange 2013. Exchange leverages fault tolerance built into the namespace through multiple IP addresses, load balancing (and if need be, the ability to take servers in and out of service). One of the most significant changes we made in Exchange 2013 was to leverage the clients' ability to cache multiple IP addresses returned from a DNS server in response to a name resolution request. Assuming the client has the ability to cache multiple IP addresses (which almost all HTTP clients do, and since almost all of the client access protocols in Exchange 2013 are HTTP based (Outlook, Outlook Anywhere, EAS, EWS, OWA, EAC, RPS, etc.), all supported HTTP clients have the ability to use multiple IP addresses), thereby providing failover on the client side. You can configure DNS to hand multiple IP addresses to a client during name resolution. The client asks for mail.contoso.com and gets back two IP addresses,

or four IP addresses, for example. However many IP addresses the client gets back will be used reliably by the client. This makes the client a lot better off because if one of the IP addresses fails, the client has one or more others to try to connect to. If a client tries one and it fails, it waits around 20 seconds and then tries the next one in the list. Thus, if you lose connectivity to your primary CAS array, and you have a second published IP address for a second CAS array, recovery for the clients happens automatically (and in about 21 seconds).

Modern HTTP clients (operating systems and Web browsers that are ten years old or less) simply work with this redundancy automatically. The HTTP stack can accept multiple IP addresses for an FQDN, and if the first IP it tries fails hard (e.g., cannot connect), it will try the next IP in the list. In a soft failure (connect lost after session established, perhaps due to an intermittent failure in the service where, for example, a device is dropping packets and needs to be taken out of service), the user might need to refresh their browser.

With the proper configuration, failover can happen at the client level and clients will be automatically redirected to a second datacenter that has operating Client Access servers, and those operating Client Access servers will proxy the communication back to the user's Mailbox server, which remains unaffected by the outage (because you don't do a switchover). Instead of working to recover service, the service recovers itself and you can focus on fixing the core issue (e.g., replacing a failed load balancer).

Since you can failover the namespace between datacenters, all that is needed to achieve a datacenter failover is a mechanism for failover of the Mailbox role across datacenters. To get automatic failover for the DAG, you simply architect a solution where the DAG is evenly split between two datacenters, and then place the witness server in a third location so that it can be arbitrated by DAG members in either datacenter, regardless of the state of the network between the datacenters that contain the DAG members. The key is that third location is isolated from network failures that affect the locations containing the DAG members.

Datacenter Switchovers

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013*

Topic Last Modified: *2014-08-26*

In a site resilient configuration, automatic recovery in response to a site-level failure can occur within a DAG, allowing the messaging system to remain in a functional state. This configuration requires at least three locations, as it requires deploying DAG members in two locations and the DAG's witness server in a third location.

If you don't have three locations, or even if you do have three locations, but you want to control

datacenter-level recovery actions, you can configure a DAG for manual recovery in the event of a site-level failure. In that event, you would perform a process called a *datacenter switchover*. As with many disaster recovery scenarios, prior planning and preparation for a datacenter switchover can simplify your recovery process and reduce the duration of your outage.

There are four basic steps that you complete to perform a datacenter switchover, after making the initial decision to activate the second datacenter:

1. **Terminate a partially running datacenter** This step involves terminating Exchange services in the primary datacenter, if any services are still running. This is particularly important for the Mailbox server role because it uses an active/passive high availability model. If services in a partially failed datacenter aren't stopped, it's possible for problems from the partially failed datacenter to negatively affect the services during a switchover back to the primary datacenter.

Important:
If network or Active Directory infrastructure reliability has been compromised as a result of the primary datacenter failure, we recommend that all messaging services be off until these dependencies are restored to healthy service.

2. **Validate and confirm the prerequisites for the second datacenter** This step can be performed in parallel with step 1 because validation of the health of the infrastructure dependences in the second datacenter is largely independent of the first datacenter services. Each organization typically requires its own method for performing this step. For example, you may decide to complete this step by reviewing health information collected and filtered by an infrastructure monitoring application, or by using a tool that's unique to your organization's infrastructure. This is a critical step, because activating the second datacenter when its infrastructure is unhealthy and unstable is likely to yield poor results.
3. **Activate the Mailbox servers** This step begins the process of activating the second datacenter. This step can be performed in parallel with step 4 because the Microsoft Exchange services can handle database outages and recover. Activating the Mailbox servers involves a process of marking the failed servers from the primary datacenter as unavailable followed by activation of the servers in the second datacenter. The activation process for Mailbox servers depends on whether the DAG is in database activation coordination (DAC) mode. For more information about database activation coordination mode, see Datacenter Activation Coordination mode.

If the DAG is in DAC mode, you can use the Exchange site resilience cmdlets to terminate a partially failed datacenter (if necessary) and activate the Mailbox servers. For example, in DAC mode, this step is performed by using the Stop-DatabaseAvailabilityGroup cmdlet. In some cases, the servers must be marked as unavailable twice (once in each datacenter). Next, the Restore-DatabaseAvailabilityGroup cmdlet is run to restore the remaining members of the database availability group (DAG) in the second datacenter by reducing the DAG members to those that are still operational, thereby reestablishing quorum. If the DAG isn't in DAC mode, you must use the Windows Failover Cluster tools to activate the Mailbox servers. After either process is complete, the database copies that were previously passive in the second datacenter can become active and be mounted. At this point, Mailbox server recovery is complete.

4. **Activate the Client Access servers** This involves using the URL mapping information and the

Domain Name System (DNS) change methodology to perform all required DNS updates. The mapping information describes what DNS changes to perform. The amount of time required to complete the update depends on the methodology used and the Time to Live (TTL) settings on the DNS record (and whether the deployment's infrastructure honors the TTL).

Users should start to have access to messaging services sometime after steps 3 and 4 are completed. Steps 3 and 4 are described in greater detail later in this topic.

Contents

Terminating a Partially Failed Datacenter

If any DAG members in the failed datacenter are still running, they should be terminated.

When the DAG is in DAC mode, the specific actions to terminate any surviving DAG members in the primary datacenter are as follows:

1. The DAG members in the primary datacenter must be marked as stopped in the primary datacenter. *Stopped* is a state of Active Manager that prevents databases from mounting, and Active Manager on each server in the failed datacenter is put into this state by using the Stop-DatabaseAvailabilityGroup cmdlet. The *ActiveDirectorySite* parameter of this cmdlet can be used to mark all of the servers in the primary datacenter as stopped with a single command. This step may not be possible depending on the failure. This step should be taken if the state of the datacenter permits it. The **Stop-DatabaseAvailabilityGroup** cmdlet should be run against all servers in the primary datacenter. If the Mailbox server is unavailable but Active Directory is operating in the primary datacenter, the **Stop-DatabaseAvailabilityGroup** command with the *ConfigurationOnly* parameter must be run against all servers in this state in the primary datacenter, or the Mailbox server must be turned off. Failure to either turn off the Mailbox servers in the failed datacenter or to successfully perform the **Stop-DatabaseAvailabilityGroup** command against the servers will create the potential for split-brain syndrome to occur across the two datacenters. You may need to individually turn off computers through power management devices to satisfy this requirement.
2. The second datacenter must now be updated to represent which primary datacenter servers are stopped. This is done by running the same **Stop-DatabaseAvailabilityGroup** command with the *ConfigurationOnly* parameter using the same *ActiveDirectorySite* parameter and specifying the name of the Active Directory site in the failed primary datacenter. The purpose of this step is to inform the servers in the second datacenter about which mailbox servers are available to use when restoring service.

When the DAG isn't in DAC mode, the specific actions to terminate any surviving DAG members in the primary datacenter are as follows:

1. The DAG members in the primary datacenter must be forcibly evicted from the DAG's underlying cluster by running the following commands on each member:

```
net stop clussvc
cluster <DAGName> node <DAGMemberName> /forcecleanup
```

2. The DAG members in the second datacenter must now be restarted and then used to complete the eviction process from the second datacenter. Stop the Cluster service on each DAG member in the second datacenter by running the following command on each member:

```
net stop clussvc
```

3. On a DAG member in the second datacenter, force a quorum start of the Cluster service by running the following command:

```
net start clussvc /forcequorum
```

4. Open the Failover Cluster Management tool and connect to the DAG's underlying cluster. Expand the cluster, and then expand **Nodes**. Right-click each node in the primary datacenter, select **More Actions**, and then select **Evict**. When you're done evicting the DAG members in the primary datacenter, close the Failover Cluster Management tool.

If any Unified Messaging services are in use in the failed datacenter, they must be disabled to prevent call routing to the failed datacenter. You can disable Unified Messaging services by using the Disable-UMService cmdlet (for example, `Disable-UMService EX1`). Alternatively, if you are using a Voice over IP (VoIP) gateway, you can also remove the server entries from the VoIP gateway, or change the DNS records for the failed servers to point to the IP address of the servers in the second datacenter if your VoIP gateway is configured to route calls using DNS.

Return to top

Activating Mailbox Servers

The steps needed to activate Mailbox servers during a datacenter switchover also depend on whether the DAG is in DAC mode. Before activating the DAG members in the second datacenter, we recommend that you validate that the infrastructure services in the second datacenter are ready for messaging service activation.

When the DAG is in DAC mode, the steps to complete activation of the mailbox servers in the second datacenter are as follows:

1. The Cluster service must be stopped on each DAG member in the second datacenter. You can use the **Stop-Service** cmdlet to stop the service (for example, `Stop-Service ClusSvc`), or use `net stop clussvc` from an elevated command prompt.
2. The Mailbox servers in the standby datacenter are then activated by using the Restore-

DatabaseAvailabilityGroup cmdlet. The Active Directory site of the standby datacenter is passed to the **Restore-DatabaseAvailabilityGroup** cmdlet to identify which servers to use to restore service and to configure the DAG to use an alternate witness server. If the alternate witness server wasn't previously configured, you can configure it by using the *AlternateWitnessServer* and *AlternateWitnessDirectory* parameters of the Restore-DatabaseAvailabilityGroup cmdlet. If this command succeeds, the quorum criteria are shrunk to the servers in the standby datacenter. If the number of servers in that datacenter is an even number, the DAG will switch to using the alternate witness server as identified by the setting on the DAG object.

3. The databases can now be activated. Depending on the specific configuration used by the organization, this may not be automatic. If the servers in the standby datacenter have an activation blocked setting, the system won't do an automatic failover from the primary datacenter to the standby datacenter of any database. If no failover restrictions are present for any of the database copies in the standby datacenter, the system will activate copies in the second datacenter assuming they are healthy. If databases are configured with an activation blocked setting that requires explicit manual action, there are two choices for action:
   a. Clear the setting that blocks activation. This will make the system return to its default behavior, which is to activate any available copy.
   b. Leave the setting unchanged and use the Move-ActiveMailboxDatabase cmdlet to complete the database activation in the second datacenter. To complete this step using the **Move-ActiveMailboxDatabase** cmdlet when activation blocked is set, you must explicitly identify the target of the move.
4. The last step is to review all error and warning messages from the tasks. Any indicated warnings should be followed up and corrected. The task design model for these commands is to only fail if they can't achieve the fundamental goal of their design. For example, the **Restore-DatabaseAvailabilityGroup** cmdlet will fail if it can't shrink the quorum of the DAG to allow a server in the second datacenter to be restarted for servicing without causing a quorum outage. However, each task's output is also used to identify the issues that require administrator follow-up. You're strongly encouraged to save all task output and review it for follow-up actions.

When the DAG isn't in DAC mode, the steps to complete activation of the mailbox servers in the second datacenter are as follows:

1. The quorum must be modified based on the number of DAG members in the second datacenter.
   a. If there's an odd number of DAG members, change the DAG quorum model from a Node a File Share Majority to a Node Majority quorum by running the following command:

```
cluster <DAGName> /quorum /nodemajority
```

   b. If there's an even number of DAG members, reconfigure the witness server and directory by running the following command in the Exchange Management Shell:

```
Set-DatabaseAvailabilityGroup <DAGName> -WitnessServer
<ServerName>
```

2. Start the Cluster service on any remaining DAG members in the second datacenter by running the following command:

```
net start clussvc
```

3. Perform server switchovers to activate the mailbox databases in the DAG by running the following command for each DAG member:

```
Move-ActiveMailboxDatabase -Server <DAGMemberinPrimarySite>
-ActivateOnServer <DAGMemberinSecondSite>
```

4. Mount the mailbox databases on each DAG member in the second site by running the following command:

```
Get-MailboxDatabase <DAGMemberinSecondSite> | Mount-
Database
```

Return to top

Activating Client Access Servers

Clients connect to service endpoints (for example Outlook Web App, Autodiscover, Exchange ActiveSync, Outlook Anywhere, POP3, IMAP4, and the RPC Client Access array) to access Exchange services and data. Therefore, activating Client Access servers involves changing the mapping of the DNS records for these service endpoints from IP addresses in the primary datacenter to the IP addresses in the second datacenter that are configured as the new service endpoints. Depending on your DNS configuration, the DNS records that need to be modified may or may not be in the same DNS zone.

Activating Client Access Servers

Clients will then automatically connect to the new service endpoints in one of two ways:

- Clients will continue to try to connect, and should automatically connect after the TTL has expired for the original DNS entry, and after the entry is expired from the client's DNS cache. Users can also run the `ipconfig /flushdns` command from a command prompt to manually clear their DNS cache.
- Clients starting or restarting will perform a DNS lookup on startup and will get the new IP address for the service endpoint, which will be a Client Access server or array in the second datacenter.

Assuming that all appropriate configuration changes have been completed to define and configure the services in the second datacenter to function as they were in the primary datacenter, and assuming that the established DNS configuration is correct, no further changes should be needed to activate Client Access servers.

Activating Transport Services

Clients and other servers that submit messages typically identify those servers using DNS. Activating

transport services in the second datacenter involves changing DNS records to point to the IP addresses of the Mailbox servers in the second datacenter. Clients and sending servers will then automatically connect to the servers in the second datacenter in one of two ways:

- Clients will continue to try to connect, and should automatically connect after the TTL has expired for the original DNS entry, and after the entry is expired from the client's DNS cache. Users can also run the `ipconfig /flushdns` command from a command prompt to manually clear their DNS cache.
- Clients starting or restarting will perform a DNS lookup on startup and will get the new IP address for the SMTP endpoint, which will be a Mailbox server in the second datacenter.

Assuming that all appropriate configuration changes have been completed to define and configure the services in the second datacenter to function as they were in the primary datacenter, and assuming that the established DNS configuration is correct, no further changes should be needed to activate transport services.

Activating Unified Messaging Services

Unified Messaging (UM) services connect to an organization's PBX system and phone lines. The logical connection between the PBX system and the Unified Messaging service is provided by an IP gateway. IP gateways include high availability functionality and are able to switch between multiple Unified Messaging services when a failure is detected.

If there are Unified Messaging services in the second datacenter that were in a disabled state because they are dedicated to the site resilience solution, they can be enabled by using the Enable-UMService cmdlet (for example, `Enable-UMService EX4`).

Assuming the IP gateways are associated with Unified Messaging services by using DNS servers, activating Unified Messaging services therefore involves changing DNS records to point to the new IP addresses that will be configured for the Unified Messaging service in the second datacenter. Assuming that all appropriate configuration changes have been completed to define and configure the services in the second datacenter to function as they were in the primary datacenter, and assuming that the established DNS configuration is correct, no further changes should be needed to activate Unified Messaging services.

If the IP gateway in use doesn't support the use of DNS names to resolve the Unified Messaging services, additional configuration steps will be necessary to manually point the IP gateway to the IP addresses of the Unified Messaging services in the second datacenter.

Activating Edge Transport Servers

The steps to activate the Edge Transport server role will vary, depending on the specific configuration. Edge Transport servers in two datacenters can be configured in either an active/passive or an active/active configuration. In an active/passive configuration, the Edge Transport server in the second datacenter is idle until the second datacenter is activated. In an active/active

configuration, Edge Transport servers in both datacenters are delivering mail at all times.

In an active/active configuration, no steps are necessary to activate the second datacenter's Edge Transport servers because they are already running. In an active/passive configuration, the DNS MX resource record for each SMTP domain needs to be updated as part of the switchover from the primary datacenter to the standby datacenter. Although the active/active configuration provides a simple datacenter switchover solution, it has the drawback of requiring careful load monitoring to make sure that after the datacenter switchover, the Edge Transport servers in the second datacenter can provide sufficient capacity to support the increased load now flowing through it, as a result of the Edge Transport servers in the primary datacenter being unavailable.

Even with an active/active configuration, it may be appropriate to update the MX resource records for your Edge Transport servers during a datacenter switchover. Allowing the MX resource record for the failed datacenter to continue to point at the failed datacenter means that when the datacenter starts recovering, it could start experiencing connection attempts to its Edge Transport servers. This could happen while the Edge Transport services are in an unstable state (for example, because dependent services in the datacenter are being restored).

Assuming the DNS records are under the control of the organization, activating Edge Transport servers involves updating the MX resource record for each SMTP domain hosted by the server.

Note:

If the MX resource record used by your organization isn't hosted by a DNS server under your organization's control, you might consider referencing a CNAME record in the MX resource record and using a CNAME record under the organization's control that can then be updated.

DNS updates enable incoming traffic, and outgoing traffic is handled by the activation of the mailbox databases in a site that has functioning Edge Transport servers:

- When incoming SMTP connections are initiated using the updated name resolution information, SMTP clients will connect to the Edge Transport servers in the second datacenter. Traffic will be appropriately routed by the Edge Transport server, and no further changes are required.
- When outgoing SMTP connections are initiated, they will try the locally available Edge Transport server, and those messages will be queued or immediately sent based on the status of the receiving server.

Return to top

Restoring Service to the Primary Datacenter

Generally, datacenter failures are either temporary or permanent. With a permanent failure, such as an event that has caused the permanent destruction of a primary datacenter, there's no expectation that the primary datacenter will be activated. However, with a temporary failure (for example, an extended power loss or extensive but repairable damage), there's an expectation that the primary datacenter will eventually be restored to full service.

The process of restoring service to a previously failed datacenter is referred to as a *switchback*. The

steps used to perform a datacenter switchback are similar to the steps used to perform a datacenter switchover. A significant distinction is that datacenter switchbacks are scheduled, and the duration of the outage is often much shorter.

It's important that switchback not be performed until the infrastructure dependencies for Exchange have been reactivated, are functioning and stable, and have been validated. If these dependencies aren't available or healthy, it's likely that the switchback process will cause a longer than necessary outage, and the process could fail altogether.

Mailbox Server Role Switchback

The Mailbox server role should be the first role that's switched back to the primary datacenter. The following steps detail the Mailbox server role switchback process:

1. As part of the datacenter switchover process, the Mailbox servers in the primary datacenter were put into a stopped state. When the environment (such as primary datacenter, Exchange dependencies, and wide area network (WAN) connectivity) is ready, the first step is to put the Mailbox servers in the restored primary datacenter into a started state and incorporate them into the DAG. The way in which this is done depends on whether the DAG is in DAC mode.
   a. If the DAG is in DAC mode, you can reincorporate the DAG members in the primary site by using the Start-DatabaseAvailabilityGroup cmdlet. Then, to make sure that the proper quorum model is being used by the DAG, run the Set-DatabaseAvailabilityGroup cmdlet against the DAG without specifying any parameters.
   b. If the DAG isn't in DAC mode, you can reincorporate the DAG members by using the Add-DatabaseAvailabilityGroupServer cmdlet.
2. After the Mailbox servers in the primary datacenter have been incorporated into the DAG, they will need some time to synchronize their database copies. Depending on the nature of the failure, the length of the outage, and actions taken by an administrator during the outage, this may require reseeding the database copies. For example, if during the outage, you remove the database copies from the failed primary datacenter to allow log file truncation to occur for the surviving active copies in the second datacenter, reseeding will be required. Each database can individually proceed from this point forward. After a replicated database copy in the primary datacenter is healthy, it can proceed to the next step.

Note:

This process doesn't require that all databases be moved at the same time. You are encouraged to move the majority of your organization's databases at one time, but some databases many linger in the second datacenter if there are issues associated with the database copies in the primary datacenter.

3. After a majority of the databases are in a healthy state in the primary datacenter, the switchback outage can be scheduled. When the scheduled time arrives, the following steps must be taken:
   a. During the datacenter switchover process, the DAG was configured to use an alternate witness server. The DAG must be reconfigured to use a witness server in the primary datacenter. If you are using the same witness server and witness directory that was used prior to the primary datacenter outage, you can run the `Set-DatabaseAvailabilityGroup -Identity DAGName`

command. If you plan on using a witness server or witness directory that is different from the original witness server and directory, use the Set-DatabaseAvailabilityGroup command to configure the witness server and witness directory parameters with the appropriate values.

b. The databases being reactivated in the primary datacenter should be dismounted in the second datacenter. You can use the Dismount-Database cmdlet to dismount the databases.

c. After the databases have been dismounted, the Client Access server URLs should be moved from the second datacenter to the primary datacenter. This is accomplished by changing the DNS record for the URLs to point to the Client Access server or array in the primary datacenter. This will result in the system acting as though a database failover has occurred for each database being moved.

Important:
Don't proceed to the next step until the Client Access server URLs have been moved and the DNS TTL and cache entries have expired. Activating the databases in the primary datacenter prior to moving the Client Access server URLs to the primary datacenter will result in an invalid configuration (for example, a mounted database that has no Client Access servers in its Active Directory site).

d. Because each database in the primary datacenter is in a healthy state, it can be activated in the primary datacenter by performing database switchovers. This is accomplished by using the Move-ActiveMailboxDatabase cmdlet for each database that will be activated.

e. After each database is moved to the primary datacenter, it can be mounted by using the Mount-Database cmdlet.

After one or more databases are active and mounted in the primary datacenter, switchback procedures for the other server roles can be performed.

Client Access Server Switchback

As part of the switchover process, the internal and external DNS records used by clients, other servers, and IP gateways to resolve the service endpoints for Client Access servers, Transport and Unified Messaging services, and Edge Transport servers were modified to point to the corresponding endpoints in the second datacenter. The switchback process for the other server roles involves modifying those records to point to the restored service endpoints in the primary datacenter.

As with the DNS changes that were made during the switchover to the second datacenter, clients, servers, and IP gateways will continue to try to connect, and should automatically connect after the TTL has expired for the original DNS entry, and after the entry is expired from their DNS cache.

Return to top

Reestablishing Site Resilience

After switchback to the primary datacenter is completed successfully, you can reestablish site resilience for the primary datacenter by verifying the health and status of each mailbox database

copy in the second datacenter. In addition, if any database copies in the second datacenter were originally blocked for activation, you can reconfigure those settings at this time.

Return to top

Perform a Server Switchover

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013*

Topic Last Modified: *2014-06-23*

A server switchover is a task that you perform to move all active mailbox database copies from their current Mailbox server to one or more other Mailbox servers in a database availability group (DAG). This task is performed as part of preparation for a scheduled outage for the current Mailbox server.

What do you need to know before you begin?

- Estimated time to complete: 30 seconds per database
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the EAC to perform a server switchover

You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the"Mailbox database copies" entry in the High availability and site resilience permissions topic.

1. In the EAC, go to **Servers** > **servers**.
2. Select the Mailbox server you want to switchover.
3. In the details pane, select **Server Switchover**.
4. On the **Server Switchover** page, do one of the following:
   a. Accept the default setting of **Automatically choose a target server** (in which case, the system automatically selects the best Mailbox server for each database being switched over), and then click **save**.
   b. Click **Use the specified server as the target for switchover**, click **Browse** to select a Mailbox

server, and then click **save**.

5. When the switchover has completed, click **close** to exit the **Server Switchover** page.

Use the Shell to perform a server switchover

This example performs a server switchover for the server MBX1. The system automatically selects the best Mailbox server for each active database on MBX1.

```
Move-ActiveMailboxDatabase -Server MBX1
```

This example performs a server switchover of the Mailbox server MBX4. When the command completes, MBX5 hosts the active copy of the databases that were previously active on MBX4.

```
Move-ActiveMailboxDatabase -Server MBX4 -ActivateOnServer
MBX5
```

For detailed syntax and parameter information, see Move-ActiveMailboxDatabase.

Backup, restore, and disaster recovery

Exchange Server 2013 > High availability and site resilience >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-20*

As part of your data protection planning, it's important that you understand the ways in which data can be protected, and to determine which method best suits your organization's needs. Data protection planning is a complex process that relies on many decisions that you make during the planning phase of your deployment.

Traditionally, backups have been used for the following scenarios:

- **Disaster recovery** In the event of a hardware or software failure, multiple database copies in a DAG enable high availability with fast failover and little or no data loss. This eliminates downtime and the resulting lost productivity that's a significant cost of recovering from a past point-in-time backup to disk or tape. DAGs can be extended to multiple sites and can provide resilience against disk, server, network, and datacenter failures.
- **Recovery of accidentally deleted items** Historically, in a situation where a user deleted items that later needed to be recovered, it involved finding the backup media on which the data that needed to be recovered was stored, and then somehow obtaining the desired items and providing them to the user. With the new Recoverable Items folder in Exchange 2013 and the Hold Policy that can be applied to it, it's possible to retain all deleted and modified data for a specified period of time, so recovery of these items is easier and faster. This reduces the burden

on Exchange administrators and the IT help desk by enabling end users to recover accidentally deleted items themselves, thereby reducing the complexity and administrative costs associated with single item recovery. For more information, see Messaging policy and compliance and Data loss prevention.

- **Long-term data storage** Backups have also been used as an archive, and typically tape is used to preserve point-in-time snapshots of data for extended periods of time as governed by compliance requirements. The new archiving, multiple-mailbox search, and message retention features in Exchange 2013 provide a mechanism to efficiently preserve data in an end-user accessible manner for extended periods of time. This eliminates expensive restores from tape, and increases productivity. For more information, see In-Place Archiving, In-Place eDiscovery, and In-Place Hold.
- **Point-in-time database snapshot** If a past point-in-time copy of mailbox data is a requirement for your organization, Exchange provides the ability to create a lagged database copy in a DAG environment. This can be useful in the rare event that store logical corruption replicates to multiple database copies in the DAG, resulting in a need to return to a previous point in time. It may also be useful if an administrator accidentally deletes mailboxes or user data. Recovery from a lagged copy can be faster than restoring from a backup because lagged copies don't require a time-consuming copy process from the backup server to the Exchange server. This can significantly lower total cost of ownership by reducing downtime.

Because there are native Exchange 2013 features that meet each of these scenarios in an efficient and cost effective manner, you may be able to reduce or eliminate the use of traditional backups in your environment.

Exchange Native Data Protection

Microsoft's preferred architecture for Exchange Server 2013 leverages a concept known as Exchange Native Data Protection. Exchange Native Data Protection relies on built-in Exchange features to protect your mailbox data, without the use of backups (although you can still use those features and make backups). Exchange 2013 includes several new features and core changes that, when deployed and configured correctly, can provide native data protection that eliminates the need to make traditional backups of your data. Using the high availability features built into

Exchange 2013 to minimize downtime and data loss in the event of a disaster can also reduce the total cost of ownership of the messaging system. By combining these features with other built-in features, such as Legal Hold, you can reduce or eliminate your use of traditional point-in-time backups and reduce the associated costs.

In addition to determining whether Exchange 2013 enables you to move away from traditional point-in-time backups, we recommend that you evaluate the cost of your current backup infrastructure. Consider the cost of end-user downtime and data loss when attempting to recover from a disaster using your existing backup infrastructure. Also, include hardware, installation, and license costs, as well as the management cost associated with recovering data and maintaining the backups. Depending on the requirements of your organization, it's quite likely that a pure Exchange 2013 environment with at least three mailbox database copies will provide lower total cost of ownership than one with backups.

There are several issues that you should consider before using the features built into Exchange 2013 as a replacement for traditional backups. There may also be considerations unique to your organization. Consider the following issues, and note that this isn't an exhaustive list:

- You should determine how many copies of the database need to be deployed. We strongly recommend deploying a minimum of three (non-lagged) copies of a mailbox database before eliminating traditional forms of protection for the database, such as Redundant Array of Independent Disks (RAID) or traditional VSS-based backups.
- You should clearly define the recovery time objective and recovery point objective goals, and you should establish that using a combined set of built-in features in lieu of traditional backups to enable you to meet these goals.
- You should determine how many copies of each database are needed to cover the various failure scenarios against which your system is designed to protect.
- You should determine whether eliminating the use of a DAG or some of its members captures sufficient costs to support a traditional backup solution. If so, you should determine whether that solution improves your recovery time objective or recovery point objective service level agreements (SLAs).
- You should determine whether you can afford to lose a point-in-time copy if the DAG member hosting the copy experiences a failure that affects the copy or the integrity of the copy.
- Exchange 2013 allows you to deploy much larger mailboxes, with a recommended maximum mailbox database size of 2 terabytes (when two or more highly available mailbox database copies are being used). Based on the larger mailboxes that most organizations are likely to deploy, you should determine your recovery point objective if you have to replay a large number of log files when activating a database copy or a lagged database copy.
- You should determine how you'll detect and prevent logical corruption in an active database copy from replicating to the passive copies of the database. This includes determining the recovery plan for this situation and how frequently this scenario has occurred in the past. If logical corruption occurs frequently in your organization, we recommend that you factor that scenario into your design by using one or more lagged copies, with a sufficient replay lag window to allow you to detect and act on logical corruption when it occurs, but before that corruption is

replicated to other database copies.

One of the functions performed at the end of a successful full or incremental backup is the truncation of transaction log files that are no longer needed for database recovery. If backups aren't being taken, log truncation won't occur. To prevent a buildup of log files, you enable circular logging for your replicated databases. When you combine circular logging with continuous replication, you have a new type of circular logging called continuous replication circular logging (CRCL), which is different from Extensible Storage Engine (ESE) circular logging. Whereas ESE circular logging is performed and managed by the Microsoft Exchange Information Store service, CRCL is performed and managed by the Microsoft Exchange Replication service. When enabled, ESE circular logging doesn't generate additional log files and instead overwrites the current log file when needed. However, in a continuous replication environment, log files are needed for log shipping and replay. As a result, when you enable CRCL, the current log file isn't overwritten and closed log files are generated for the log shipping and replay process.

Specifically, the Microsoft Exchange Replication service manages CRCL so that log continuity is maintained and logs aren't deleted if they're still needed for replication. The Microsoft Exchange Replication service and the Microsoft Exchange Information Store service communicate by using remote procedure calls (RPCs) regarding which log files can be deleted.

For truncation to occur on highly available (non-lagged) mailbox database copies, the following must be true:

- The log file has been backed up, or CRCL is enabled.
- The log file is below the checkpoint.
- The other non-lagged copies of the database agree with deletion.
- The log file has been inspected by all lagged copies of the database.

For truncation to occur on lagged database copies, the following must be true:

- The log file is below the checkpoint.
- The log file is older than ReplayLagTime + TruncationLagTime.
- The log file is deleted on the active copy of the database.

Return to top

Supported Backup Technologies

Exchange 2013 supports only Exchange-aware, VSS-based backups. Exchange 2013 includes a plug-in for Windows Server Backup that enables you to make and restore VSS-based backups of Exchange data. To back up and restore Exchange 2013, you must use an Exchange-aware application that supports the VSS writer for Exchange 2013, such as Windows Server Backup (with the VSS plug-in), Microsoft System Center 2012 - Data Protection Manager, or a third-party Exchange-aware VSS-based application.

For detailed steps about how to back up and restore Exchange data using Windows Server Backup, see Using Windows Server Backup to back up and restore Exchange data.

Return to top

Exchange 2013 VSS Writer

Exchange 2013 introduces a significant change from the VSS writer architecture used in Exchange 2010 and Exchange 2007. These earlier versions of Exchange included two VSS writers: one inside the Microsoft Exchange Information Store service (store.exe) and one inside the Microsoft Exchange Replication service (msexchangerepl.exe). In Exchange, the VSS writer functionality previously found in the Microsoft Exchange Information Store service has been moved to the Microsoft Exchange Replication service. The new writer, which is named Microsoft Exchange Writer, is now used by Exchange-aware VSS-based applications to back up active and passive database copies, and to restore backed up database copies. Although the new writer runs in the Microsoft Exchange Replication service, it requires the Microsoft Exchange Information Store service to be running for the writer to be advertised. As a result, both services are required to back up or restore Exchange databases.

Return to top

Exchange Server Recovery

Almost all of the configuration settings for Mailbox and Client Access servers are stored in Active Directory. As with previous versions of Exchange, Exchange 2013 includes a Setup parameter for recovering lost servers. This parameter, */m:RecoverServer*, is used to rebuild and re-create a lost server by using the settings and configuration information stored in Active Directory. However, be aware that there are several settings which are not restored, such as changes to local web.config and other configuration files. In addition, custom registry entries are not restored. We recommend that you use a reliable change management process to track and recreate these changes.

For detailed steps about how to perform a server recovery of a lost Exchange 2013 server, see Recover an Exchange Server. For detailed steps about how to recover a lost server that's a member of a database availability group (DAG), see Recover a database availability group member server.

Return to top

Unified Contact Store Recovery

When Microsoft Lync Server 2013 is used in an Exchange 2013 environment, the user's Lync contact information is stored in a special contact folder in the user's mailbox. This is referred to as the unified contact store (UCS). If you restore a UCS-migrated mailbox, the instant messaging contact list for the target user may be affected. If the user was migrated after the last backup, restoring the mailbox will result in a complete loss of the user's contact list. In less severe cases, modifications to the contact list made by the user since the last backup will be lost. To mitigate this potential data loss, ensure the user is migrated back to the instant messaging server prior to restoring the mailbox.

Return to top

Recovery Database

A recovery database is a special kind of mailbox database that allows you to mount a restored mailbox database and extract data from the restored database as part of a recovery operation. You can use the New-MailboxRestoreRequest cmdlet to extract data from a recovery database. After extraction, the data can be exported to a folder or merged into an existing mailbox. Recovery databases enable you to recover data from a backup or copy of a database without disturbing user access to current data.

Using a recovery database for a Mailbox database from any previous version of Exchange isn't supported. In addition, the target mailbox used for data merges and extraction must be in the same Active Directory forest as the database mounted in the recovery database.

For more information, see Recovery databases. For detailed steps about how to create a recovery database, see Create a recovery database. For detailed steps about how to use a recovery database, see Restore data using a recovery database.

Return to top

Database Portability

Database portability is a feature that enables an Exchange 2013 mailbox database to be moved to and mounted on any other Exchange 2013 Mailbox server in the same organization. By using database portability, reliability is improved by removing several error-prone, manual steps from the recovery processes. In addition, database portability reduces the overall recovery times for various failure scenarios.

For more information, see Database portability. For detailed steps to use database portability, see Move a mailbox database using database portability.

Return to top

Dial Tone Portability

Dial tone portability is a feature that provides a limited business continuity solution for failures that affect a mailbox database, a server, or an entire site. Dial tone portability enables a user to have a temporary mailbox for sending and receiving e-mail while the original mailbox is being restored or repaired. The temporary mailbox can be on the same Exchange 2013 Mailbox server or on any other Exchange 2013 Mailbox server in your organization. This allows an alternative server to host the mailboxes of users who were previously on a server that's no longer available. Clients that support Autodiscover, such as Microsoft Outlook, are automatically redirected to the new server without having to manually update the user's desktop profile. After the user's original mailbox data

has been restored, an administrator can merge a user's recovered mailbox and the user's dial tone mailbox into a single, up-to-date mailbox.

The process for using dial tone portability is called a *dial tone recovery*. A dial tone recovery involves creating an empty database on a Mailbox server to replace a failed database. This empty database, referred to as a *dial tone database*, allows users to send and receive e-mail while the failed database is recovered. After the failed database is recovered, the dial done database and the recovered database are swapped, and then the data from the dial tone database is merged into the recovered database.

For more information, see Dial tone portability. For detailed steps to perform a dial tone recovery, see Perform a dial tone recovery.

Return to top

Using Windows Server Backup to back up and restore Exchange data

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-23*

Microsoft's preferred architecture for Exchange Server 2013 leverages a concept known as Exchange Native Data Protection. Exchange Native Data Protection relies on native Exchange features to protect your mailbox data, without the use of traditional backups. But if you want to create backups, Exchange includes a plug-in for Windows Server Backup (WSB) that enables you to create Exchange-aware Volume Shadow Copy Service (VSS)-based backups of Exchange data. To take Exchange-aware backups, you must have the WSB feature installed.

The plug-in, WSBExchange.exe, runs as a service named Microsoft Exchange Server Extension for Windows Server Backup (the short name for this service is WSBExchange). This service is automatically installed and configured for manual startup on all Mailbox servers. The plug-in enables WSB to create Exchange-aware VSS backups.

Before using WSB to back up Exchange data, we recommend that you familiarize yourself with the following features and options for the plug-in:

- Backups taken with WSB occur at the volume level, and the only way to perform an application-level backup or restore is to select an entire volume. To back up a database and its log stream, you must back up the entire volume containing the database and logs, not just the individual folders. You can't back up any data without backing up the entire volume containing the data.
- The backup must be run locally on the server being backed up, and you can't use the plug-in to

take remote VSS backups. There is no remote administration of WSB or the plug-in. You can, however, use Remote Desktop Services or Terminal Services to remotely manage backups.
- The backup can be created on a local drive or on a remote network share.
- Only full backups should be taken. Log truncation will occur only after a successful completion of a VSS full backup of a volume or folders containing an Exchange database.
- When restoring data, it's possible to restore only Exchange data. This data can be restored to its original location or to an alternate location. If you restore the data to its original location, WSB and the plug-in automatically handle the recovery process, including dismounting any existing database and replaying logs into the restored database.
- The restore process doesn't support the Exchange recovery database (RDB). If you want to use an RDB, you must restore the data to an alternate location and then manually copy or move the restored data from that location into the RDB folder structure.
- When restoring Exchange data, all backed up databases must be restored together. You can't restore a single database.
- Bare metal restores are supported when using WSB; however, the recommended recovery approach for Exchange servers is to recover the Exchange server and then restore the data. If you are using a third-party backup application (e.g., non-Microsoft), then support for bare metal restores of Exchange may be available from your backup application vendor.

The following table describes the supportability of the backup and recovery options available for Exchange 2013 with WSB.

If you…	Then…
Back up the full server…	A VSS copy backup will be performed, and the transaction logs for the databases on the server will not be truncated.
Perform a custom backup and select one or more volumes to back up…	A VSS full backup can be selected, allowing the transaction logs for the databases on the selected volumes to be truncated at the completion of a successful backup.
Perform a custom backup and select one or more folders to back up…	A VSS full backup can be selected and the log files will be truncated; however, restoration of the backup will be limited to file restore, as an Application level restore will not be available as an option.

For detailed steps to back up Exchange using WSB, see Use Windows Server Backup to back up Exchange.

For detailed steps to restore data from a backup taken with WSB, see Use Windows Server Backup

to restore a backup of Exchange.

Use Windows Server Backup to back up Exchange

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-18*

You can use Windows Server Backup to back up and restore Exchange databases. Exchange includes a plug-in for Windows Server Backup that allows you to make Volume Shadow Copy Service (VSS)-based backups of Exchange data.

What do you need to know before you begin?

- Estimated time to complete: 1 minute, plus the time it takes to back up the data
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox recovery" entry in the Recipients Permissions topic.
- The Windows Server Backup feature must be installed on the local computer.
- During the backup operation, a consistency check of the Exchange data files is run to make sure that the files are in a good state and can be used for recovery. If the consistency check succeeds, Exchange data is available for recovery from that backup. If the consistency check fails, the Exchange data isn't available for recovery. Windows Server Backup runs the consistency check on the snapshot taken for the backup. As a result, before copying files from the snapshot to backup media, the consistency of the backup is known, and the user is notified of the consistency check results.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use Windows Server Backup to back up Exchange

1. Start Windows Server Backup.
2. Select **Local Backup**.
3. In the Actions pane, click **Backup Once...** to start the Backup Once Wizard.
4. On the **Backup Options** page, select **Different options**, and then click **Next**.
5. On the **Select Backup Configuration** page, select **Custom**, and then click **Next**.

6. On the **Select Items for Backup** page, click **Add Items** to select the volume(s) to be backed up, and then click **OK**.

Note:
Choose volumes and not individual folders. The only way to perform an application-level backup or restore is to select an entire volume.

7. Click **Advanced Settings**. On the **Exclusions** tab, click **Add Exclusion** to add any files or file types you want to exclude from the backup.

Note:
By default, volumes that contain operating system components or applications are included in the backup and can't be excluded.

8. On the **VSS Settings tab**, select **VSS full Backup**, and then click **OK**, and then click **Next**.
9. On the **Specify Destination Type** page, select the location where you want to store the backup, and then click **Next**.
    - If you choose **Local drives**, the **Select Backup Destination** page appears. Select an option from the **Backup destination** dropdown, and then click **Next**.
    - If you choose **Remote shared folder**, the **Specify remote folder** page appears. Specify a UNC path for the backup files, configure access control settings. Choose **Do not inherit** if you want the backup to be accessible only through a specific account. Provide a user name and password for an account that has write permissions on the computer hosting the remote folder, and then click **OK**. Alternatively, choose **Inherit** if you want the backup to be accessible by everyone who has access to the remote folder. Click **Next**.
10. On the **Confirmation** page, review the backup settings, and then click **Backup**.
11. On the **Backup Progress** page, you can view the status and progress of the backup operation.
12. Click **Close** to exit the **Backup Progress** page at any time. Any backup in progress will continue to run in the background.

How do you know this worked?

To verify that you've successfully backed up the data, do any of the following:

- On the server on which Windows Server Backup was run, the last backup status will be displayed, which should say Successful. You can also verify that the backup completed successfully by viewing the Windows Server Backup logs.
- Open Event Viewer and verify that a backup completion event was logged in the Application event log.
- Run the following command in the Exchange Management Shell to verify that each database on the selected volume(s) was backed up successfully:

```
Get-MailboxDatabase -Server <ServerName> -Status | fl
Name,*FullBackup
```

The *SnapshotLastFullBackup* and *LastFullBackup* properties of the database indicate when the last successful backup was taken, and if it was a VSS full backup.

Use Windows Server Backup to restore a backup of Exchange

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-18*

You can use Windows Server Backup to back up and restore Exchange databases. Exchange includes a plug-in for Windows Server Backup that allows you to make and restore Volume Shadow Copy Service (VSS)-based backups of Exchange data. For additional information, see Using Windows Server Backup to back up and restore Exchange data.

What do you need to know before you begin?

- Estimated time to complete: 1 minute, plus the time it takes to restore the data
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox recovery" entry in the Recipients Permissions topic.
- The Windows Server Backup feature must be installed on the local computer.
- When restoring a database to its original location, the database can remain in a dirty shutdown state and be mountable by the system. When restoring to an alternate location (for example, in preparation to use a recovery database), the database must be manually brought into a clean shutdown state by using Exchange Server Database Utilities (Eseutil.exe).

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use Windows Server Backup to restore a backup of Exchange

1. Start Windows Server Backup.
2. Select **Local Backup**.
3. In the Actions pane, click **Recover...** to start the Recovery Wizard.
4. On the **Getting Started** page, do either of the following:
   - If the data being recovered was backed up on the local server, select **This server (ServerName)**, and then click **Next**.
   - If the data being recovered is from another server, or if the backup being recovered is located

on another computer, select **Another server**, and then click **Next**. On the **Specify location type** page, select **Local drives** or **Remote shared folder**, and then click **Next**. If you select **Local drives**, select the drive containing the backup on the **Select backup location** page, and then click **Next**. If you select **Remote shared folder**, enter the UNC path for the backup data on the **Specify remote folder** page, and then click **Next**.

5. On the **Select Backup Date** page, select the date and time of the backup that you want to recover, and then click **Next**.
6. On the **Select Recovery Type** page, select **Applications**, and then click **Next**.

Note:

If **Applications** is not available as a selection, it indicates that the backup selected for restore was a folder-level backup, and not a volume level backup. You must perform backups at the volume level when backing up Exchange data with Windows Server Backup.

7. On the **Select Application** page, verify that Exchange is selected in the **Applications** field. Click **View Details** to view the application components of the backups. If the backup that you're recovering is the most recent, the **Do not perform a roll-forward recovery of the application database** check box is displayed. Select this check box if you want to prevent Windows Server Backup from rolling forward the database being recovered by committing all uncommitted transaction logs. Click **Next**.
8. On the **Specify Recovery Options** page, specify where you want to recover the data, and then click **Next**:
   - Choose **Recover to original location** if you want to restore the Exchange data directly to its original location. If you use this option, you can't choose which databases are restored; all backed up databases on the volume will be restored to their original locations.
   - Choose **Recover to another location** if you want to restore individual databases and their files to a specified location. Click **Browse** to specify the alternate location. If you use this option, you can choose which databases are restored. After being restored, the data files can then be moved into a recovery database, manually moved back to their original location, or mounted somewhere else in the Exchange organization using Database portability. When you restore a database to an alternate location, the restored database will be in a dirty shutdown state. After the restore process has completed, you will need to manually put the database into a clean shutdown state using Eseutil.exe.
9. On the **Confirmation** page, review the recovery settings, and then click **Recover**.
10. On the **Recovery Progress** page, you can view the status and progress of the recovery operation.
11. Click **Close** when the recovery operation has completed.

How do you know this worked?

The **Recovery Progress** page will indicate whether or not the recovery process completed successfully. To further verify that you've successfully restored the data, do any of the following:

- Examine the target directory of the backup and verify that the restored data exists.
- On the server on which Windows Server Backup was run, verify that the job completed successfully by viewing the backup logs.

- Open Event Viewer and verify that a restore completion event was logged in the Application event log.

Recover an Exchange Server

Exchange Server 2013 > High availability and site resilience > Backup, restore, and disaster recovery >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-12*

You can recover a lost server by using the **Setup /m:RecoverServer** switch in Microsoft Exchange Server 2013. Most of the settings for a computer running Exchange 2013 are stored in Active Directory. The */m:RecoverServer* switch rebuilds an Exchange server with the same name by using the settings and other information stored in Active Directory.

Recovering a lost Exchange server is often accomplished by using new hardware. However, you can also use an existing server.

This topic shows you how to recover a lost Exchange 2013 server that isn't a member of a database availability group (DAG). For detailed steps about how to recover a server that was a member of a DAG, see Recover a database availability group member server.

Note:

If Exchange is installed in a location other than the default location, you must use the */TargetDir* switch to specify the location of the Exchange binary files. If you don't use the */TargetDir* switch, the Exchange files are installed in the default location (%programfiles%\Microsoft\Exchange Server\V15).
To determine the install location, follow these steps:

1. Open ADSIEDIT.MSC or LDP.EXE.
2. Navigate to the following location: **CN=ExServerName,CN=Servers,CN=First Administrative Group,CN=Administrative Groups,CN=ExOrg Name,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=DomainName,CN=Com**
3. Right-click the Exchange server object, and then click **Properties**.
4. Locate the **msExchInstallPath** attribute. This attribute stores the current installation path.

Looking for other management tasks related to backing up and restoring data? Check out Backup, restore, and disaster recovery.

What do you need to know before you begin?

- Estimated time to complete: 20 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Exchange infrastructure permissions" section in the

Exchange and Shell infrastructure permissions topic.

- The server on which recovery is being performed must be running the same operating system as the lost server. For example, you can't recover a server that was running Exchange 2013 and Windows Server 2008 R2 on a server running Windows Server 2012, or vice versa. Likewise, you can’t recover a server that was running Exchange 2013 and Windows Server 2012 on a server running Windows Server 2012 R2, or vice versa.
- The same disk drive letters on the failed server for mounted databases must exist on the server on which you're running recovery.
- The server on which recovery is being performed should have the same performance characteristics and hardware configuration as the lost server.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Recover a Lost Exchange Server

1. Reset the computer account for the lost server. For detailed steps, see Reset a Computer Account.
2. Install the proper operating system and name the new server with the same name as the lost server. Recovery won't succeed if the server on which recovery is being performed doesn't have the same name as the lost server.
3. Join the server to the same domain as the lost server.
4. Install the necessary prerequisites and operating system components. For details, see Exchange 2013 system requirements and Exchange 2013 prerequisites.
5. Log on to the server being recovered and open a command prompt.
6. Navigate to the Exchange 2013 installation files, and run the following command.

```
Setup /m:RecoverServer /IAcceptExchangeServerLicenseTerms
```

7. After Setup has completed, but before the recovered server is put into production, reconfigure any custom settings that were previously present on the server, and then restart the server.

How do you know this worked?

The successful completion of Setup will be the primary indicator that the recovery was successful. To further verify that you've successfully recovered a lost server, do the following:

- Open the Windows Services tool (services.msc) and verify that the Microsoft Exchange services have been installed and are running.

Recover a database availability group

member server

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-16*

If a Mailbox server that's a member of a database availability group (DAG) is lost or otherwise fails and is unrecoverable and needs replacement, you can perform a server recovery operation. Microsoft Exchange Server 2013 Setup includes the switch */m:RecoverServer* that can be used to perform the server recovery operation. Running Setup with the */m:RecoverServer* switch causes Setup to read the server's configuration information from Active Directory for a server with the same name as the server from which you're running Setup. After the server's configuration information is gathered from Active Directory, the original Exchange files and services are then installed on the server, and the roles and settings that were stored in Active Directory are then applied to the server.

Looking for other management tasks related to DAGs? Check out Managing database availability groups.

What do you need to know before you begin?

- Estimated time to complete: 30 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox database copies" entry in the High availability and site resilience permissions topic.
- If Exchange is installed in a location other than the default location, you must use the */TargetDir* Setup switch to specify the location of the Exchange program files. If you don't use the */TargetDir* switch, the Exchange program files will be installed in the default location (%programfiles%\Microsoft\Exchange Server\V15).

To determine the install location, follow these steps:

1. Open ADSIEDIT.MSC or LDP.EXE.
2. Navigate to the following location: **CN=ExServerName,CN=Servers,CN=First Administrative Group,CN=Administrative Groups,CN=ExOrg Name,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=DomainName,CN=Com**
3. Right-click the Exchange server object, and then click **Properties**.
4. Locate the **msExchInstallPath** attribute. This attribute stores the current installation path.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use Setup /m:RecoverServer to recover a server

1. Retrieve any replay lag or truncation lag settings for any mailbox database copies that exist on the server being recovered by using the Get-MailboxDatabase cmdlet:

```
Get-MailboxDatabase DB1 | Format-List *lag*
```

2. Remove any mailbox database copies that exist on the server being recovered by using the Remove-MailboxDatabaseCopy cmdlet:

```
Remove-MailboxDatabaseCopy DB1\MBX1
```

3. Remove the failed server's configuration from the DAG by using the Remove-DatabaseAvailabilityGroupServer cmdlet:

```
Remove-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX1
```

Note:

If the DAG member being removed is offline and can't be brought online, you must add the *ConfigurationOnly* parameter to the preceding command. If you use the *ConfigurationOnly* switch, you must also manually evict the node from the cluster.

4. Reset the server's computer account in Active Directory. For detailed steps, see Reset a Computer Account.
5. Open a Command Prompt window. Using the original Setup media, run the following command:

```
Setup /m:RecoverServer
```

6. When the Setup recovery process is complete, add the recovered server to the DAG by using the Add-DatabaseAvailabilityGroupServer cmdlet:

```
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX1
```

7. After the server has been added back to the DAG, you can reconfigure mailbox database copies by using the Add-MailboxDatabaseCopy cmdlet. If any of the database copies being added previously had replay lag or truncation lag times greater than 0, you can use the *ReplayLagTime* and *TruncationLagTime* parameters of the Add-MailboxDatabaseCopy cmdlet to reconfigure those settings:

```
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX1
Add-MailboxDatabaseCopy -Identity DB2 -MailboxServer MBX1 -
ReplayLagTime 3.00:00:00
Add-MailboxDatabaseCopy -Identity DB3 -MailboxServer MBX1 -
ReplayLagTime 3.00:00:00 -TruncationLagTime 3.00:00:00
```

How do you know this worked?

To verify that you've successfully recovered the DAG member, do the following:

- In the Shell, run the following command to verify the health and status of the recovered DAG member.

```
Test-ReplicationHealth <ServerName>
```

```
Get-MailboxDatabaseCopyStatus -Server <ServerName>
```

All of the replication health tests should pass successfully, and the status of databases and their content indexes should be healthy.

Recovery databases

Exchange Server 2013 > High availability and site resilience > Backup, restore, and disaster recovery >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-02*

A recovery database (RDB) is a special kind of mailbox database that allows you to mount a restored mailbox database and extract data from the restored database as part of a recovery operation. You can use the New-MailboxRestoreRequest cmdlet to extract data from an RDB. After extraction, the data can be exported to a folder or merged into an existing mailbox. RDBs enable you to recover data from a backup or copy of a database without disturbing user access to current data.

Microsoft Exchange Server 2013 supports the ability to restore data directly to a recovery database. Mounting the recovered data as a recovery database allows the administrator to restore individual mailboxes or individual items in a mailbox. Restoring to a recovery database can be accomplished in two ways:

- If a recovery database already exists, the application can dismount the database, restore the data onto the recovery database and log files, and then remount the database.
- The database and log files can be restored to any disk location. Exchange analyzes the restored data and replays the transaction logs to bring the databases up to date, and then a recovery database can be configured to point to already recovered database files.

Difference between a mailbox database and a recovery database

RDBs are different from standard mailbox databases in several respects:

- An RDB is created by using the Exchange Management Shell.
- Mail can't be sent to or from an RDB. All client protocol access to an RDB (including SMTP, POP3, and IMAP4) is blocked. This design prevents using an RDB to insert mail into or remove mail from the messaging system.
- Client MAPI access using Microsoft Office Outlook or Outlook Web App is blocked. MAPI access is supported for an RDB, but only by recovery tools and applications. Both the mailbox GUID and the database GUID must be specified when using MAPI to log into a mailbox in an RDB.
- Mailboxes in an RDB can't be connected to user accounts. To allow a user to access the data in a mailbox in an RDB, the mailbox must be merged into an existing mailbox, or exported to a folder.
- System and mailbox management policies aren't applied. This design prevents items in an RDB from being deleted by the system during the recovery process.
- Online maintenance isn't performed for RDBs.
- Circular logging can't be enabled for RDBs.
- Only one RDB can be mounted at any time on a Mailbox server. The use of an RDB doesn't count against the database limit per Mailbox server.
- You can't create mailbox database copies of an RDB.
- An RDB can be used as a target for restore operations, but not backup operations.
- A recovered database mounted as an RDB isn't tied to the original mailbox in any way.

Using a recovery database

Before you can use an RDB, there are certain requirements that must be met. An RDB can be used for Exchange 2013 mailbox databases only. Mailbox databases from previous versions of Exchange aren't supported. In addition, the target mailbox used for data merges and extraction must be in the same Active Directory forest as the database mounted in the RDB.

An RDB can be used to recover data in several situations, such as:

- **Same server dial tone recovery** You can perform a recovery from an RDB after the original database has been restored from backup, as part of a dial tone recovery operation.
- **Alternate server dial tone recovery** You can use an alternate server to host the dial tone database, and then later recover data from an RDB after the original database has been restored from backup.
- **Mailbox recovery** You can recover an individual mailbox from backup when the deleted mailbox retention period has elapsed. You then extract data from the restored mailbox and copy it to a target folder or merge it with another mailbox.
- **Specific item recovery** You can restore from backup data that has been deleted or purged from a mailbox.

Note:

Folder access control lists (ACLs) aren't preserved when recovering content into an active mailbox. Because the recovery process typically involves recovering mailbox data and merging

the content back into the original database, there should be no need to recover or copy ACLs.

An RDB is designed for mailbox database recovery under the following conditions and scenarios:

- The logical information about the original database and the mailboxes in that database remains intact and unchanged in Active Directory.
- You need to recover a single mailbox or a single database. Recovery scenarios include:
  - Recovering or repairing a database while a dial tone database is in use, with the goal of merging the two databases.
  - Recovering a database on a server other than the original server for that database. If needed, you can then merge the recovered data back to the original server.
  - Recovering deleted items that users previously deleted from their mailbox, after the deleted item retention period has expired.

RDBs are generally not designed for scenarios in which you have to restore entire servers, when you have to restore multiple databases, or when you're in an emergency situation that requires changing or rebuilding your Active Directory topology.

For detailed steps about how to create an RDB, see Create a recovery database. For detailed steps about how to use an RDB, see Restore data using a recovery database.

Create a recovery database

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-01-21*

You can use the Shell to create a recovery database, a special kind of mailbox database that's used to mount and extract data from the restored database as part of a recovery operation. After you create a recovery database, you can move a recovered or restored mailbox database into the recovery database, and then use the New-MailboxRestoreRequest cmdlet to extract data from the recovered database. After extraction, the data can then be exported to a folder or merged into an existing mailbox. Using recovery databases, you can recover data from a backup or copy of a database without disrupting user access to current data.

Looking for other management tasks related to recovery databases? Check out Recovery databases.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox recovery" entry in the Recipients Permissions

topic.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to create a recovery database

This example creates the recovery database RDB1 on the Mailbox server MBX2.

```
New-MailboxDatabase -Recovery -Name RDB1 -Server MBX2
```

This example creates the recovery database RDB2 on the Mailbox server MBX1 using a custom path for the database file and log folder.

```
New-MailboxDatabase -Recovery -Name RDB2 -Server MBX1 -
EdbFilePath "C:\Recovery\RDB2\RDB2.EDB" -LogFolderPath "C:
\Recovery\RDB2"
```

For detailed syntax and parameter information, see New-MailboxDatabase.

How do you know this worked?

To verify that you've successfully created a recovery database, do the following:

- In the Shell, run the following command to display configuration information for the recovery database.

```
Get-MailboxDatabase <RecoveryDatabaseName> | Format-List
```

Other Tasks

After you create a recovery database, you may also want to restore data using a recovery database. For detailed steps, see Restore data using a recovery database.

Restore data using a recovery database

High availability and site resilience > Backup, restore, and disaster recovery > Recovery databases >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-30*

A recovery database (RDB) is a special kind of mailbox database that allows you to mount and extract data from a restored mailbox database as part of a recovery operation. RDBs allow you to recover data from a backup or copy of a database without disrupting user access to current data.

After you create an RDB, you can restore a mailbox database into the RDB by using a backup application or by copying a database and its log files into the RDB folder structure. Then you can use the New-MailboxRestoreRequest cmdlet to extract data from the recovered database. Once extracted, the data can then be exported to a folder or merged into an existing mailbox.

For additional management tasks related to RDBs, see Recovery databases.

What do you need to know before you begin?

- Estimated time to complete this task: 1 minute, plus the time it takes to put the database into a clean shutdown state and to extract the data.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox recovery" entry in the Recipients Permissions topic.
- Some backup applications have the ability to restore Exchange data directly to a recovery database. Windows Server Backup can restore only file-level backups to a recovery database. It cannot be used to restore application-level backups to a recovery database.
- The database and log files containing the recovered data must be restored or copied into the RDB folder structure.
- The database must be in a clean shutdown state. Because an RDB is an alternate restore location for all databases, all restored databases will be in a dirty shutdown state. You must use **Eseutil /R** to put restored databases into a clean shutdown state.

Use the Shell to recover data using a recovery database

1. Copy a recovered database and its log files, or restore a database and it log files, to the location you will use for your recovery database.
2. Use Eseutil to bring that database into a clean shutdown state. In the following example, EXX is the log generation prefix for the database (for example, E00, E01, E02, and so on).

```
Eseutil /R EXX /l <RDBLogFilePath> /d <RDBEdbFolder>
```

The following example illustrates a log generation prefix of E01 and a recovery database and log file path of E:\Databases\RDB1:

```
Eseutil /R E01 /l E:\Databases\RDB1 /d E:\Databases\RDB1
```

3. Create a recovery database. Give the recovery database a unique name, but use the name and path of the database file for the EdbFilePath parameter, and the location of the recovered log

files for the LogFolderPath parameter.

```
New-MailboxDatabase -Recovery -Name <RDBName> -Server
<ServerName> -EdbFilePath <RDBPathandFileName> -
LogFolderPath <LogFilePath>
```

The following example illustrates creating a recovery database that will be used to recover DB1.edb and its log files, which are located at E:\Databases\RDB1.

```
New-MailboxDatabase -Recovery -Name <RDBName> -Server
<ServerName> -EdbFilePath "E:\Databases\RDB1\DB1.EDB" -
LogFolderPath "E:\Databases\RDB1"
```

4. Restart the Microsoft Exchange Information Store service:

```
Restart-Service MSExchangeIS
```

5. Mount the recovery database:

```
Mount-database <RDBName>
```

6. Verify that the mounted database contains the mailbox(es) you want to restore:

```
Get-MailboxStatistics -Database <RDBName> | ft -auto
```

7. Use the New-MailboxRestoreRequest cmdlet to restore a mailbox or items from the recovery database to a production mailbox.

The following example restores the source mailbox that has the MailboxGUID 1d20855f-fd54-4681-98e6-e249f7326ddd on mailbox database DB1 to the target mailbox with the alias Scott.

```
New-MailboxRestoreRequest -SourceDatabase DB1 -
SourceStoreMailbox 1d20855f-fd54-4681-98e6-e249f7326ddd -
TargetMailbox Scott
```

The following example restores the content of the source mailbox that has the display name Scott Schnoll on mailbox database DB1 to the archive mailbox for scott@contoso.com.

```
New-MaiboxRestoreRequest -SourceDatabase DB1 -
SourceStoreMailbox "Scott Schnoll" -TargetMailbox
scott@contoso.com -TargetIsArchive
```

8. Periodically check the status of the Mailbox restore request using Get-MailboxRestoreRequest. Once the restore has a status of Completed, remove the restore request using Remove-MailboxRestoreRequest. For example:

```
Get-MailboxRestoreRequest -Status Completed | Remove-
MailboxRestoreRequest
```

How do you know this worked?

To verify that you have successfully recovered the mailbox data, open the target mailbox using Outlook or Outlook Web App and verify that the recovered data is present.

Tip:

Database portability

Exchange Server 2013 > High availability and site resilience > Backup, restore, and disaster recovery >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-01-21*

Database portability is a feature that enables a Microsoft Exchange Server 2013 mailbox database to be moved to or mounted on any other Mailbox server in the same organization running Exchange 2013 that has databases with the same database schema version. Mailbox databases from previous versions of Exchange can't be moved to a Mailbox server running Exchange 2013. By using database portability, reliability is improved by removing several error-prone, manual steps from the recovery processes. In addition, database portability reduces the overall recovery times for various failure scenarios.

For information about how to perform a database recovery using the database portability feature, see Move a mailbox database using database portability.

Move a mailbox database using database portability

High availability and site resilience > Backup, restore, and disaster recovery > Database portability >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-16*

You can use database portability to move a Microsoft Exchange Server 2013 mailbox database between Exchange 2013 Mailbox servers in the same organization. This can help reduce overall

recovery times for some failure scenarios. To learn more, see Database portability.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes, plus the time it takes to restore the data, move the database files, and wait for Active Directory replication to complete.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox recovery" entry in the Recipients Permissions topic.
- You can't use the EAC to move user mailboxes to a recovered or dial tone database using database portability.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to move user mailboxes to a recovered or dial tone database using database portability

1. Verify that the database to be moved is in a clean shutdown state. If the database isn't in a clean shutdown state, perform a soft recovery.

Note:

When you perform a soft recovery, any uncommitted log files are committed to the database. If you don't have all of the required log files, you can't complete the soft recovery process. Proceed to step 2.

To commit all uncommitted log files to the database, from a command prompt, run the following command.

```
ESEUTIL /R <Enn>
```

Note:

<E*nn*> specifies the log file prefix for the database into which you intend to replay the log files. The log file prefix specified by <E*nn*> is a required parameter for Eseutil /r.

2. Create a database on a server using the following syntax:

```
New-MailboxDatabase -Name <DatabaseName> -Server
<ServerName> -EdbFilePath <DatabaseFileNameandPath> -
LogFolderPath <LogFilesPath>
```

3. Set the *This database can be over written by restore* attribute using the following syntax:

```
Set-MailboxDatabase <DatabaseName> -AllowFileRestore $true
```

4. Move the original database files (.edb file, log files, and Exchange Search catalog) to the

database folder you specified when you created the new database above.

5. Mount the database using the following syntax:

```
Mount-Database <DatabaseName>
```

6. After the database is mounted, modify the user account settings with the Set-Mailbox cmdlet so that the account points to the mailbox on the new mailbox server. To move all of the users from the old database to the new database, use the following syntax.

```
Get-Mailbox -Database <SourceDatabase> |where
{$_.ObjectClass -NotMatch '(SystemAttendantMailbox|
ExOleDbSystemMailbox)'}| Set-Mailbox -Database
<TargetDatabase>
```

7. Trigger delivery of any messages remaining in queues using the following syntax.

```
Get-Queue <QueueName> | Retry-Queue -Resubmit $true
```

After Active Directory replication is complete, all users can access their mailboxes on the new Exchange server. Most clients are redirected via Autodiscover. Microsoft Office Outlook Web App users are also automatically redirected.

How do you know this worked?

To verify that you've successfully moved a mailbox, do the following:

- Open the mailbox using Outlook Web App.
- Open the mailbox using Microsoft Outlook.

Dial tone portability

Exchange Server 2013 > High availability and site resilience > Backup, restore, and disaster recovery >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2013-01-28*

Dial tone portability is a feature of Microsoft Exchange Server 2013 that provides a limited business continuity solution for failures that affect a mailbox database, a server, or an entire site. Dial tone portability enables users to have a temporary mailbox for sending and receiving email while their original mailbox is being restored or repaired. The temporary mailbox can be on the same Exchange 2013 Mailbox server or on any other Exchange 2013 Mailbox server in your organization that has databases with the same database schema version. This allows an alternative server to host the mailboxes of users who were previously on a server that is no longer available. Clients that

support Autodiscover are automatically redirected to the new server without having to manually update the user's desktop profile. After the user's original mailbox data has been restored, an administrator can merge a user's recovered mailbox and the user's dial tone mailbox into a single, up-to-date mailbox.

The process for using dial tone portability is called a *dial tone recovery*. A dial tone recovery involves creating an empty database on a Mailbox server to replace a failed database. This empty database, referred to as a *dial tone database*, allows users to send and receive email messages while the failed database is recovered.

There are three options for performing a dial tone recovery:

- **Dial tone recovery on the server with the failed database** If the server hosting the failed database is still functional, we recommend that you perform a dial tone recovery on that server. This means less downtime because you don't need to move database files between servers. In addition, you won't need to reconfigure messaging profiles for clients that don't support Autodiscover.
- **Dial tone recovery using an alternate server for the dial tone database** If a server fails and needs to be rebuilt, the most efficient way to give users basic mail functionality is to create a dial tone database on another server, and use database portability to move the users' mailbox configuration to that new server. Because this process involves moving the dial tone database back to the original (recovered) server, this option adds more time to the overall recovery process. In addition, this process is more complex than performing a dial tone recovery on the original server. When performing this process, the server hosting the dial tone database must have sufficient resources to support the added load of the additional users. In addition, if the users' client doesn't support Autodiscover, their messaging profile will need to be reconfigured to point to the dial tone server.
- **Dial tone recovery using and staying on an alternate server for the dial tone database** This is similar to the preceding option, except that you don't revert back to the original server. We recommend this option for situations in which it isn't possible or feasible to recover the failed server. In this scenario, users typically remain on an alternate server after the recovery operation has completed. When performing this process, the server hosting the dial tone database must have sufficient resources to support the added load of the additional users. In addition, if the users' client doesn't support Autodiscover, their messaging profile will need to be reconfigured to point to the dial tone server.

All three options follow the same basic steps:

1. Create an empty dial tone database to replace the failed database.

This new database will allow users who had mailboxes on the failed database to send and receive new messages. Dial tone portability allows you to point a user to a different database without moving the mailbox. If you created the dial tone database on a different server than the server that housed the failed database, you need to move the mailbox configuration to that new server.

2. Restore the old database.

Use the backup and recovery software you typically use to restore the failed database. If there is no backup of the failed database, recover the failed database using other means if possible. If you're

using the same server for dial tone recovery, you need to restore the database to a recovery database (RDB).

3. Swap the dial tone database with the restored database.

After the failed database is restored, swap it with the dial tone database. This gives the users the ability to send and receive email and access all the data in the restored database. If users were moved to a dial tone database on another server, you need to move the mailbox configuration back to the original server.

4. Merge the databases.

To get the data from the dial tone database into the restored database, you merge the data using the New-MailboxRestoreRequest cmdlet.

For detailed steps about how to perform a dial tone recovery, see Perform a dial tone recovery.

Perform a dial tone recovery

High availability and site resilience > Backup, restore, and disaster recovery > Dial tone portability >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-27*

Using dial tone portability, users can have a temporary mailbox for sending and receiving email while their original mailbox is being restored or repaired. The temporary mailbox can be on the same Exchange 2013 Mailbox server or on any other Exchange 2013 Mailbox server in your organization. The process for using dial tone portability is called a dial tone recovery, which involves creating an empty database on a Mailbox server to replace a failed database. To learn more, see Dial tone portability.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes, plus the time it takes to restore and move the data.
- You must have fewer than the maximum number of databases deployed to create a dial tone database. Exchange 2013 Standard Edition supports a maximum of five databases per server. Exchange 2013 Enterprise Edition supports a maximum of 50 databases per server in RTM and CU1, and 100 databases per server in CU2 and later.
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Mailbox recovery" entry in the Recipients Permissions topic.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection..

Use the Shell to perform a dial tone recovery on a single server

Note:

You can't use the EAC to perform a dial tone recovery on a single server.

1. Make sure that any existing files for the database being recovered are preserved in case they're needed later for further recovery operations.
2. Use the New-MailboxDatabase cmdlet to create a dial tone database, as shown in this example.

```
New-MailboxDatabase -Name DTDB1 -EdbFilePath D:\DialTone
\DTDB1.EDB
```

3. Use the Set-Mailbox cmdlet to rehome the user mailboxes hosted on the database being recovered, as shown in this example.

```
Get-Mailbox -Database DB1 | Set-Mailbox -Database DTDB1
```

4. Use the Mount-Database cmdlet to mount the database so client computers can access the database and send and receive messages, as shown in this example.

```
Mount-Database -Identity DTDB1
```

5. Create a recovery database (RDB) and restore or copy the database and log files containing the data you want to recover into the RDB. For detailed steps, see Create a recovery database.
6. After the data is copied to the RDB, but before mounting the restored database, copy any log files from the failed database to the recovery database log folder so they can be played against the restored database.
7. Mount the RDB, and then use the Dismount-Database cmdlet to dismount it, as shown in this example.

```
Mount-Database -Identity RDB1
Dismount-Database -Identity RDB1
```

8. After the RDB is dismounted, move the current database and log files within the RDB folder to a safe location. This is done in preparation for swapping the recovered database with the dial tone database.
9. Dismount the dial tone database, as shown in this example. Note that your end users will experience an interruption in service when you dismount this database.

```
Dismount-Database -Identity DTDB1
```

10. Move the database and log files from the dial tone database folder into the RDB folder.

11.Move the database and log files from the safe location containing the recovered database into the dial tone database folder, and then mount the database, as shown in this example.

```
Mount-Database -Identity DTDB1
```

This ends the service interruption for your end users. They will be able to access their original production database and send and receive messages.

12.Mount the RDB, as shown in this example.

```
Mount-Database -Identity RDB1
```

13.Use the Get-Mailbox and New-MailboxRestoreRequest cmdlets to export the data from the RDB and import it into the recovered database, as shown in this example. This will import all the messages sent and received using the dial tone database into the production database.

```
$mailboxes = Get-Mailbox -Database DTDB1

$mailboxes | %{ New-MailboxRestoreRequest -
SourceStoreMailbox $_.ExchangeGuid -SourceDatabase RDB1 -
TargetMailbox $_ }
```

14.After the restore operation is complete, you can dismount and remove the RDB, as shown in this example.

```
Dismount-Database -Identity RDB1
Remove-MailboxDatabase -Identity RDB1
```

For detailed syntax and parameter information, see the following topics:

- New-MailboxDatabase
- Get-Mailbox
- Set-Mailbox
- Mount-Database
- Dismount-Database
- Remove-MailboxDatabase

How do you know this worked?

To verify that you've successfully moved a mailbox, do the following:

- Open the mailbox using Microsoft Office Outlook Web App.
- Open the mailbox using Microsoft Outlook.

Managed Availability

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-08-07*

Ensuring that users have a good email experience has always been the primary objective for messaging system administrators. To help ensure the availability and reliability of your Microsoft Exchange Server 2013 organization, all aspects of the system must be actively monitored, and any detected issues must be resolved quickly. In previous versions of Exchange, monitoring critical system components typically involved using an external application such as Microsoft System Center 2012 Operations Manager to collect data, and to provide recovery action for problems detected as a result of analyzing the collected data. Exchange 2010 and previous versions included health manifests and correlation engines in the form of management packs. These components enabled Operations Manager to make a determination as to whether a particular component was healthy or unhealthy. In addition, Operations Manager also used the diagnostic cmdlet infrastructure built into Exchange 2010 to run synthetic transactions against various aspects of the system.

Exchange 2013 takes a new approach to monitoring and preserving the end user experience natively using a feature called *Managed Availability* that provides built-in monitoring and recovery actions.

Managed Availability

Managed availability, also known as *Active Monitoring* or *Local Active Monitoring*, is the integration of built-in monitoring and recovery actions with the Exchange high availability platform. It's designed to detect and recover from problems as soon as they occur and are discovered by the system. Unlike previous external monitoring solutions and techniques for Exchange, managed availability doesn't try to identify or communicate the root cause of an issue. It's instead focused on recovery aspects that address three key areas of the user experience:

- **Availability** Can users access the service?
- **Latency** How is the experience for users?
- **Errors** Are users able to accomplish what they want?

The server role consolidation and other architectural changes in Exchange 2013 require a new approach to the monitoring methodologies and health model used in previous versions of Exchange. Managed availability is designed to address these changes by providing a native health monitoring and recovery solution. It moves away from monitoring individual separate slices of the system to monitoring the end-to-end user experience, and protecting the end user's experience through recovery-oriented actions.

Managed availability is an internal process that runs on every Exchange 2013 server. It polls and analyzes hundreds of health metrics every second. If something is found to be wrong, most of the time it will be fixed automatically. But there will always be issues that managed availability won't

be able to fix on its own. In those cases, managed availability will escalate the issue to an administrator by means of event logging.

Managed availability implemented in the form of two services:

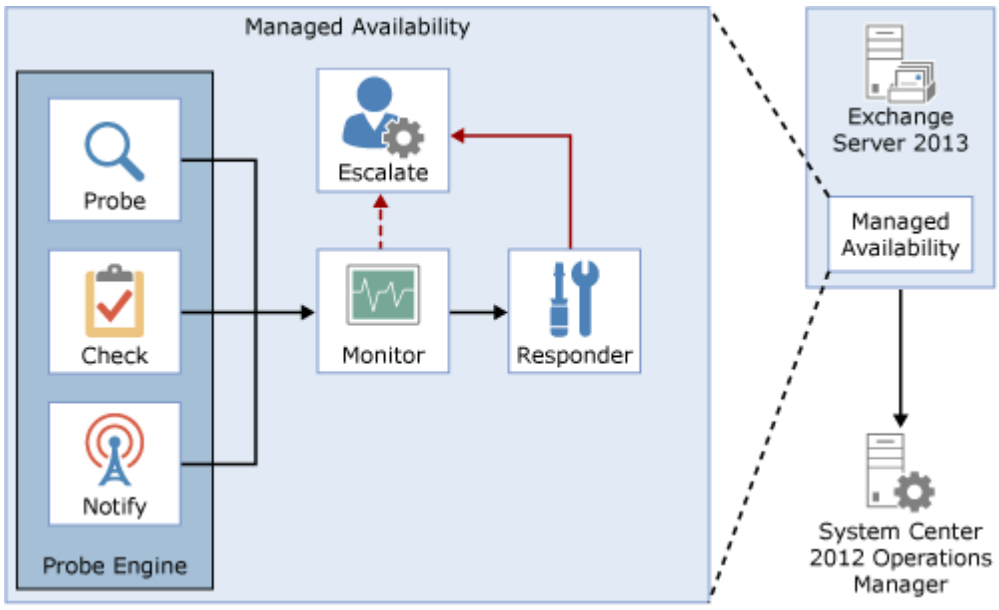
- **Exchange Health Manager Service (MSExchangeHMHost.exe)** This is a controller process used to manage worker processes. It's used to build, execute, and start and stop the worker process, as needed. It's also used to recover the worker process in case that process fails, to prevent the worker process from being a single point of failure.
- **Exchange Health Manager Worker process (MSExchangeHMWorker.exe)** This is the worker process responsible for performing run-time tasks within the managed availability framework.

Managed availability uses persistent storage to perform its functions:

- XML files in the \bin\Monitoring\config folder are used to store configuration settings for some of the probe and monitor work items.
- Active Directory is used to store global overrides.
- The Windows registry is used to store run-time data, such as bookmarks, and local (server-specific) overrides.
- The Windows crimson channel event log infrastructure is used to store the work item results.
- Health mailboxes are used for probe activity. Multiple health mailboxes will be created on each mailbox database that exists on the server.

As illustrated in the following drawing, managed availability includes three main asynchronous components that are constantly doing work.

Managed Availability Components



The first component is called a *Probe*. Probes are responsible for taking measurements on the server and collecting data. The results of those measurements flow into the second component, the *Monitor*. The monitor contains all of the business logic used by the system based on what is considered healthy on the data collected. Similar to a pattern recognition engine, the monitor looks for the various different patterns on all the collected measurements, and then it decides whether something is considered healthy. Finally, there are *Responders*, which are responsible for recovery

and escalation actions. When something is unhealthy, the first action is to attempt to recover that component. This could include multi-stage recovery actions; for example, the first attempt may be to restart the application pool, the second may be to restart the service, the third attempt may be to restart the server, and the subsequent attempt may be to take the server offline so that it no longer accepts traffic. If the recovery actions are unsuccessful, the system escalates the issue to a human through event log notifications.

There are three primary categories of probes: recurrent probes, notifications, and checks. Recurrent probes are synthetic transactions performed by the system to test the end-to-end user experience. Checks are the infrastructure that perform the collection of performance data, including user traffic, and measure the collected data against thresholds that are set to determine spikes in user failures. This enables the checks infrastructure to become aware when users are experiencing issues. Finally, the notification logic enables the system to take action immediately based on a critical event, without having to wait for the results of the data collected by a probe. These are typically exceptions or conditions that can be detected and recognized without a large sample set.

Recurrent probes run every few minutes and check some aspect of service health. These probes might transmit an email via Exchange ActiveSync to a monitoring mailbox, they might connect to an RPC endpoint, or they might verify Client Access-to-Mailbox connectivity.

All probes are defined on Health Manager service startup in the Microsoft.Exchange.ActiveMonitoring\ProbeDefinition crimson channel. Each probe definitions has many properties, but the most relevant properties are:

- **Name** The name of the probe, which begins with a *SampleMask* of the probe's monitor.
- **TypeName** The code object type of the probe that contains the probe's logic.
- **ServiceName** The name of the health set that contains this probe.
- **TargetResource** The object the probe is validating. This is appended to the name of the probe when it is executed to become a probe result *ResultName*
- **RecurrenceIntervalSeconds** How often the probe executes.
- **TimeoutSeconds** How long the probe will wait before failing.

There are hundreds of recurrent probes. Many of these probes are per-database, so as the number of databases increases, so does the number of probes. Most probes are defined in code and are therefore not directly discoverable.

The basics of a recurrent probe are as follows: start every *RecurrenceIntervalSeconds* and check (or probe) some aspect of health. If the component is healthy, the probe passes and writes an informational event to the Microsoft.Exchange.ActiveMonitoring\ProbeResult channel with a *ResultType* of 3. If the check fails or times out, the probe fails and writes an error event to the same channel. A *ResultType* of 4 means the check failed and a *ResultType* of 1 means that it timed out. Many probes will re-run if they timeout, up to the value of the *MaxRetryAttempts* property.

Note:

Note The ProbeResult crimson channel can get very busy with hundreds of probes running every few minutes and logging an event, so there can be a real impact on the performance of your Exchange server if you try expensive queries against the event logs in a production

environment.

Notifications are probes that are not run by the health manager framework, but by some other service on the server. These services perform their own monitoring, and then feed their data into the Managed Availability framework by directly writing probe results. You won't see these probes in the ProbeDefinition channel, as this channel only describes probes that will be run by the Managed Availability framework. For example, the ServerOneCopyMonitor Monitor is triggered by probe results written by the MSExchangeDAGMgmt service. This service performs its own monitoring, determines whether there is a problem, and logs a probe result. Most notification probes have the capability to log both a red event that turns the monitor unhealthy and a green event that makes the monitor healthy again.

Checks are probes that only log events when a performance counter passes above or below a defined threshold. They are really a special case of notification probes, as there is a service monitoring the performance counters on the server and logging events to the ProbeResult channel when the configured threshold is met.

To find the counter and threshold that is considered unhealthy, you can look at the monitor for this check. Monitors of the type *Microsoft.Office.Datacenter.ActiveMonitoring.OverallConsecutiveSampleValueAboveThresholdMonitor* or *Microsoft.Office.Datacenter.ActiveMonitoring.OverallConsecutiveSampleValueBelowThresholdMonitor* mean that the probe they watch is a check probe

Monitors query the data collected by probes to determine if action needs to be taken based on a predefined rule set. Depending on the rule or the nature of the issue, a monitor can either initiate a responder or escalate the issue to a human via an event log entry. In addition, monitors define how much time after a failure that a responder is executed, as well as the workflow of the recovery action. Monitors have various states. From a system state perspective, monitors have two states:

- **Healthy** The monitor is operating properly and all collected metrics are within normal operating parameters
- **Unhealthy** The monitor isn't healthy and has either initiated recovery through a responder or notified an administrator through escalation.

From an administrative perspective, monitors have additional states that appear in the Shell:

- **Degraded** When a monitor is in an unhealthy state from 0 through 60 seconds, it's considered Degraded. If a monitor is unhealthy for more than 60 seconds, it is considered Unhealthy.
- **Disabled** The monitor has been explicitly disabled by an administrator.
- **Unavailable** The Microsoft Exchange Health service periodically queries each monitor for its state. If it doesn't get a response to the query, the monitor state becomes Unavailable.
- **Repairing** An administrator sets the Repairing state to indicate to the system that corrective action is in process by a human, which allows the system and humans to differentiate between other failures that may occur at the same time corrective action is being taken (such as a database copy reseed operation).

Every monitor has a *SampleMask* property in its definition. As the monitor executes, it looks for

events in the ProbeResult channel that have a *ResultName* that matches the monitor's *SampleMask*. These events could be from recurrent probes, notifications, or checks. If the monitor's thresholds are achieved, it becomes Unhealthy. From the monitor's perspective, all three probe types are the same as they each log to the ProbeResult channel.

It is worth noting that a single probe failure does not necessarily indicate that something is wrong with the server. It is the design of monitors to correctly identify when there is a real problem that needs fixing. This is why many monitors have thresholds of multiple probe failures before becoming Unhealthy. Even then, many of these problems can be fixed automatically by responders, so the best place to look for problems that require manual intervention is in the Microsoft.Exchange.ManagedAvailability\Monitoring crimson channel. This will include the most recent probe error.

As their name implies, responders execute some sort of response to an alert that was generated by a monitor. Responders take a variety of recovery actions, such as resetting an application worker pool to restarting a server. There are several types of responders:

- **Restart Responder** Terminates and restarts a service
- **Reset AppPool Responder** Stops and restarts an application pool in Internet Information Services (IIS)
- **Failover Responder** Initiates a database or server failover
- **Bugcheck Responder** Initiates a bugcheck of the server, thereby causing a server reboot
- **Offline Responder** Takes a protocol on a server out of service (rejects client requests)
- **Online Responder** Places a protocol on a server back into production (accepts client requests)
- **Escalate Responder** Escalates the issue to an administrator via event logging

In addition to the above listed responders, some components also have specialized responders that are unique to their component.

All responders include throttling behavior, which provide a built-in sequencing mechanism for controlling responder actions. The throttling behavior is designed to ensure that the system isn't compromised or made worse as a result of responder recovery actions. All responders are throttled in some fashion. When throttling occurs, the responder recovery action may be skipped or delayed, depending on the responder action. For example, when the Bugcheck Responder is throttled, its action is skipped, and not delayed.

Health Sets

From a reporting perspective, managed availability has two views of health, one internal and one external. The internal view uses *health sets*. Each component in Exchange 2013 (for example, Outlook Web App, Exchange ActiveSync, the Information Store service, content indexing, transport services, etc.) is monitored by managed availability using probes, monitors, and responders. A group of probes, monitors and responders for a given component is called a *health set*. A health set is a group of probes, monitors, and responders that determine if that component is healthy. The current state of a health set (e.g., whether it is healthy or unhealthy) is determined by using the state

of the health set's monitors. If all of a health set's monitors are healthy, then the health set is in a healthy state. If any monitor is not in a healthy state, then the health set state will be determined by its least healthy monitor.

For detailed steps to view server health or health sets state, see Manage health sets and server health.

Health Groups

The external view of managed availability is composed of *health groups*. Health groups are exposed to System Center Operations Manager 2007 R2 and System Center Operations Manager 2012.

There are four primary health groups:

- **Customer Touch Points** Components that affect real-time user interactions, such as protocols, or the Information Store
- **Service Components** Components without direct, real-time user interactions, such as the Microsoft Exchange Mailbox Replication service, or the offline address book generation process (OABGen)
- **Server Components** The physical resources of the server, such as disk space, memory and networking
- **Dependency Availability** The server's ability to access necessary dependencies, such as Active Directory, DNS, etc.

When the Exchange 2013 Management Pack is installed, System Center Operations Manager (SCOM) acts as a health portal for viewing information related to the Exchange environment. The SCOM dashboard includes three views of Exchange server health:

- **Active Alerts** Escalation Responders write events to the Windows event log that are consumed by the monitor within SCOM. These appear as alerts in the Active Alerts view.
- **Organization Health** A rollup summary of the overall health of the Exchange organization health is displayed in this view. These rollups include displaying health for individual database availability groups, and health within specific Active Directory sites.
- **Server Health** Related health sets are combined into health groups and summarized in this view.

Overrides

Overrides provide an administrator with the ability to configure some aspects of the managed availability probes, monitors, and responders. Overrides can be used to fine tune some of the thresholds used by managed availability. They can also be used to enable emergency actions for unexpected events that may require configuration settings that are different from the out-of-box defaults.

Overrides can be created and applied to a single server (this is known as a *server override*), or they can be applied to a group of servers (this is known as a *global override*). Server override

configuration data is stored in the Windows registry on the server on which the override is applied. Global override configuration data is stored in Active Directory.

Overrides can be configured to last indefinitely, or they can be configured for a specific duration. In addition, global overrides can be configured to apply to all servers, or only servers running a specific version of Exchange.

When you configure an override, it will not take effect immediately. The Microsoft Exchange Health Manager service checks for updated configuration data every 10 minutes. In addition, global overrides will be dependent on Active Directory replication latency.

For detailed steps to view or configure server or global overrides, see Configure managed availability overrides.

Management Tasks and Cmdlets

There are three primary operational tasks that administrators will typically perform with respect to managed availability:

- Extracting or viewing system health
- Viewing health sets, and details about probes, monitors and responders
- Managing overrides

The two primary management tools for managed availability are the Windows Event Log and the Shell. Managed availability logs a large amount of information in the Exchange ActiveMonitoring and ManagedAvailability crimson channel event logs, such as:

- Probe, monitor, and responder definitions, which are logged in the respective *Definition event logs.
- Probe, monitor, and responder results, which are logged in the respective *Results event logs.
- Details about responder recovery actions, including when the recovery action is started, and it is considered complete (whether successful or not), which are logged in the RecoveryActionResults event log.

There are 12 cmdlets used for managed availability, which are described in the following table.

Cmdlet	Description
Get-ServerHealth	Used to get raw server health information, such as health sets and their current state (healthy or unhealthy), health set monitors, server components, target resources for probes, and timestamps related to probe or monitor start or stop times, and state transition times.
Get-HealthReport	Used to get a summary health view that

	includes health sets and their current state.
Get-MonitoringItemIdentity	Used to view the probes, monitors, and responders associated with a specific health set.
Get-MonitoringItemHelp	Used to view descriptions about some of the properties of probes, monitors, and responders.
Add-ServerMonitoringOverride	Used to create a local, server-specific override of a probe, monitor, or responder.
Get-ServerMonitoringOverride	Used to view a list of local overrides on the specified server.
Remove-ServerMonitoringOverride	Used to remove a local override from a specific server.
Add-GlobalMonitoringOverride	Used to create a global override for a group of servers.
Get-GlobalMonitoringOverride	Used to view a list of global overrides configured in the organization.
Remove-GlobalMonitoringOverride	Used to remove a global override.
Set-ServerComponentState	Used to configure the state of one or more server components.
Get-ServerComponentState	Used to view the state of one or more server components.

Manage health sets and server health

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-12-02*

You can use the built-in health reporting cmdlets to perform a variety of tasks related to managed availability, such as:

- Viewing the health of a server or group of servers
- Viewing a list of health sets
- Viewing a list of probes, monitors, and responders associated with a particular health set
- View a list of monitors and their current health

What do you need to know before you begin?

- Estimated time to complete each procedure: 2 minutes
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

View Server Health

You can use the Shell to get a summary of the health of a server running Exchange 2013.

Use the Shell to View Server Health

Run either of the following commands to view the health sets and health information on a server running Exchange 2013.

```
Get-HealthReport -Identity <ServerName>
```

```
Get-ServerHealth -Identity <ServerName> | Format-Table
Server,CurrentHealthSetState,Name,HealthSetName,AlertValue,
HealthGroupName -Auto
```

Run any of the following commands to view the health sets on a server or database availability group running Exchange 2013.

```
Get-ExchangeServer | Get-HealthReport -RollupGroup
```

```
Get-ExchangeServer | Get-HealthReport -RollupGroup -
HealthSetName <HealthSet>
```

```
(Get-DatabaseAvailabiltyGroup <DAGName>).Servers | Get-HealthReport -RollupGroup
```

View a List of Health Sets

A health set is a group of monitors, probes and responders for a component that determine whether the component is healthy or unhealthy. You can use the Shell to view the list of health sets on a server running Exchange 2013.

Use the Shell to View a List of Health Sets

Run the following command to view the health sets on a server running Exchange 2013.

```
Get-HealthReport -Server <ServerName>
```

View the Probes, Monitors and Responders for a Health Set

A health set is a group of monitors, probes and responders for a component that determine whether the component is healthy or unhealthy. You can use the Shell to view the list of probes, monitors, and responders associated with a health set on a server running Exchange 2013.

Use the Shell to View the Probes, Monitors and Responders for a Health Set

Run the following command to view the probes, monitors and responders associated with a health set on a server running Exchange 2013.

```
Get-MonitoringItemIdentity -Server <ServerName> -Identity <HealthSetName> | Format-Table Identity,ItemType,Name -Auto
```

View a List of Monitors and Their Current Health

The health of a monitor is reported by using the "worst of" monitors in the health set. You can view the details of a health set to see which monitors are healthy and which ones are unhealthy.

Use the Shell to View a List of Monitors and Their Current Health

Run the following command to view a list of the monitors and their current health on a server running Exchange 2013.

```
Get-ServerHealth -HealthSet <HealthSetName> -Server <ServerName> | Format-Table Name, AlertValue -Auto
```

Configure managed availability overrides

Applies to: *Exchange Server 2013 SP1, Exchange Server 2013, Exchange Online*

Topic Last Modified: *2013-11-15*

Managed availability performs continuous probing to detect possible problems with Exchange components or their dependencies, and it performs recovery actions to make sure the end user experience is not impacted due to a problem with any of these components. However, there may be scenarios where the out-of-box settings may not be suitable for your environment. Managed availability probes, monitors and responders can be customized by creating an override.

There are two types of overrides: local and global. As their names imply, a local override is available only on the server on which it is created, and a global override is used to apply an override to multiple servers. Either type of override can be created for a specific duration or for a specific version of servers.

Note:

When you create an override, it does not take effect immediately. The Microsoft Exchange Health Management service checks for configuration changes every 10 minutes and loads any detected configuration changes. Alternatively, you can restart the service to make the override changes effective immediately.

For additional management tasks related to managed availability, see Manage health sets and server health.

What do you need to know before you begin?

- Estimated time to complete each procedure: 1 minute
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Create a Local Override

The following example shows how to create server-specific local overrides using the Shell.

Use the Shell to Create a Local Override

Use the Add-ServerMonitoringOverride cmdlet to create a server-specific local override.

```
Add-ServerMonitoringOverride -Server ServerName -Identity
<ItemtoOverride> -ItemType <ItemType> -PropertyName
<PropertyName> -PropertyValue <Value> -Duration
<DurationofOverride>
```

When using the ServerMonitoringOverride cmdlets, the Identity is in the form of HealthSetName \MonitoringItemName\TargetResource (for example, FrontEndTransport\OnPremisesInboundProxy or DataProtection\ServiceHealthMSExchangeReplEndpointEscalate\<ServerName>).

How do you know this worked?

To verify that you have successfully created a server override, use the Get-ServerMonitoringOverride cmdlet to view the list of server overrides:

```
Get-ServerMonitoringOverride -Server | Format-List
```

The override should appear in the list.

Remove a Local Override

The following example shows how to remove a server-specific local override using the Shell.

Use the Shell to Remove a Local Override

Use the Remove-ServerMonitoringOverride cmdlet to delete a server-specific local override.

```
Remove-ServerMonitoringOverride -Server <ServerName> -
Identity <ItemtoOverride> -ItemType <ItemType> -
PropertyName <PropertytoRemove>
```

How do you know this worked?

To verify that you have successfully removed a server override, use the Get-ServerMonitoringOverride cmdlet to view the list of server overrides:

```
Get-ServerMonitoringOverride -Server | Format-List
```

The removed override should not appear in the list.

Create a Global Override

The following example shows how to create a global override using the Shell.

Use the Shell to Create a Global Override

Use the Add-GlobalMonitoringOverride cmdlet to create a global override.

```
Add-GlobalMonitoringOverride -Identity <ItemtoOverride> -
ItemType <ItemType> -PropertyName <PropertytoOverride> -
PropertyValue <NewPropertyValue>
```

You can also create a global override that applies to a specific version of Exchange and/or for a specific time duration.

```
Add-GlobalMonitoringOverride -Identity <ItemtoOverride> -
ItemType <ItemType> -PropertyName <PropertytoOverride> -
PropertyValue <NewPropertyValue> -ApplyVersion
<ExchangeVersion> -Duration 45.00:00:00
```

How do you know this worked?

To verify that you have successfully created a global override, use the Get-GlobalMonitoringOverride cmdlet to view the list of global overrides:

```
Get-GlobalMonitoringOverride
```

The override should appear in the list.

Remove a Global Override

The following example shows how to remove a global override using the Shell.

Use the Shell to Remove a Global Override

Use the Remove-GlobalMonitoringOverride cmdlet to delete a global override.

```
Remove-GlobalMonitoringOverride -Identity <ItemtoOverride>
-ItemType <ItemType> -PropertyName <OverriddenProperty>
```

How do you know this worked?

To verify that you have successfully removed a global override, use the Get-GlobalMonitoringOverride cmdlet to view the list of global overrides:

```
Get-GlobalMonitoringOverride
```

The removed override should not appear in the list.

Exchange Management Shell

Exchange Server 2013 >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2012-11-06*

The Exchange Management Shell, built on Windows PowerShell technology, provides a powerful command-line interface for Microsoft Exchange Server 2013 that enables automation of administrative tasks. With the Shell, you can manage every aspect of Exchange. You can enable new email accounts, create Send and Receive connectors, configure database properties, manage distribution groups, and more. The Shell can perform every task that can be performed by the Exchange Administration Center (EAC) plus things that can't be done in the EAC. In fact, when you do something in the EAC, it's the Shell that's doing the work behind the scenes.

The Shell also provides a robust and flexible scripting platform that can reduce the complexity of current Microsoft Visual Basic scripts. Tasks that previously required many lines in Visual Basic scripts can now be done by using as little as one line of code in the Shell. The Shell provides this flexibility because it doesn't use text as the basis for interaction with the system, but uses an object model based on the Microsoft .NET platform. This object model enables the Shell cmdlets to apply the output from one command to subsequent commands when they are run.

If you want to start using the Shell immediately, see the “Exchange Management Shell basics” section later in this topic. For a list of cmdlets included with Exchange 2013, see Exchange 2013 cmdlets. Otherwise, continuing reading here for more information about the Shell in Exchange 2013.

Looking for a list of Shell topics? See Shell documentation.

Accessing the Exchange Management Shell

With Exchange 2013, you can connect to a remote session on a remote Exchange 2013 computer to perform commands on that remote computer. Whether you use the Shell to administer a local server or administer a server across the country, remote Shell is used to perform the operation in Exchange 2013. If the Exchange management tools are installed and you want to use the Shell, follow the procedure in Open the Shell.

In Exchange 2013, when you click the Shell shortcut, Windows PowerShell opens. Unlike in Microsoft Exchange Server 2007, which uses local Windows PowerShell, a Windows PowerShell snap-in for Exchange isn't loaded. Instead, Windows PowerShell connects to the closest Exchange 2013 server using a required component called Windows Remote Management 3.0, performs authentication checks, and then creates a remote session for you to use. When the remote session is created, you're given access only to the cmdlets and the parameters associated with the management role groups

and management roles you're assigned. For more information about how Exchange uses role groups and roles to manage who can do what tasks, see Permissions.

A benefit of remote Shell is that you don't need to install Exchange-specific tools on your computer. With Windows PowerShell, .NET Framework 4.5 and Windows Remote Management 3.0 installed on any computer running Windows 7, Windows 8, Windows Server 2008 R2 Service Pack 1 (SP1), or Windows Server 2012, you can connect to a remote Exchange 2013 computer to administer it. However, while it's possible to manage an Exchange 2013 server with just Windows PowerShell, .NET Framework 4.5, and Windows Remote Management 3.0, we recommend that you install the Exchange management tools on any computer that you use to manage Exchange 2013. Without the Exchange management tools installed, you need to connect to the remote Exchange 2013 server manually, and you don't have access to the additional capabilities that the Exchange management tools provide.

For more information about connecting to Exchange 2013 servers without the Exchange management tools installed, see Connect to Exchange using remote Shell.

Exchange Management Shell quick reference for Exchange 2013

Open the Shell

Exchange Server 2013 > Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-03*

When you open the Exchange Management Shell, you can perform administrative tasks against servers that run Microsoft Exchange Server 2013.

What do you need to know before you begin?

- Estimated time to complete this procedure: less than 1 minute
- The Exchange management tools have been installed on the computer you want to use to administer Exchange servers.
- The user must be enabled to connect to the Shell remotely.
- The user must be assigned at least one management role. For detailed steps, see Permissions.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:
Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Open the Shell

1. Click **Start** > **All Programs** > **Microsoft Exchange Server 2013**.
2. Click **Exchange Management Shell**.

Manage Exchange Management Shell access

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-19*

Remote Shell in Microsoft Exchange Server 2013 enables you to manage your server running Exchange Server 2013 from a remote computer, either on your network or from the Internet. You can enable or disable a user's ability to connect to an Exchange server using remote Shell. For more information about remote Shell, see Exchange Management Shell.

For additional management tasks related to remote Shell, see Connect to Exchange using remote Shell.

What do you need to know before you begin?

- Estimated time to complete each procedure: less than 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Remote Shell" entry in the Exchange and Shell infrastructure permissions topic.
- To use remote Shell, users must be a member of a management role group or be directly assigned a management role that enables the user to run Exchange cmdlets. For more information about role groups and management roles, see Permissions.
- You must use the Shell to perform these procedures.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Enable remote Shell for a user

To enable remote Shell for a user, set the *RemotePowerShellEnabled* parameter to `$True` on the **Set-User** cmdlet. This example enables remote Shell for the user David.

```
Set-User David -RemotePowerShellEnabled $True
```

For detailed syntax and parameter information, see Set-User.

After you enable remote Shell for a user, you may also want to:

- Manage role group members
- Open the Shell

Disable remote Shell for a user

To disable remote Shell for a user, set the *RemotePowerShellEnabled* parameter to `$False` on the **Set-User** cmdlet. This example disables remote Shell for the user David.

```
Set-User David -RemotePowerShellEnabled $False
```

For detailed syntax and parameter information, see Set-User.

Connect to Exchange using remote Shell

Exchange Server 2013 > Exchange Management Shell > Manage Exchange Management Shell access >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-02-11*

If you don't have the Exchange management tools installed, you can use Windows PowerShell on your local computer to create a remote Shell session to an Exchange server. It's a simple three-step process where you enter your Exchange credentials, provide the required connection settings, and then import the Exchange cmdlets into your local Windows PowerShell session so that you can use them.

Note:
For ease of management and to receive the benefits that come with them, we recommend that you install the Exchange management tools on any computer that's used to administer an Exchange 2013 server. For more information, see Install the Exchange 2013 management tools and Open the Shell.

For more information about the Exchange Management Shell, see Exchange Management Shell.

What do you need to know before you begin?

- Estimated time to complete: 5 minutes
- You can use the following versions of Windows:
  - Windows 8 or Windows 8.1

- Windows Server 2012 or Windows Server 2012 R2
- Windows 7 Service Pack 1 (SP1)*
- Windows Server 2008 R2 SP1*

* You need to install the Microsoft .NET Framework 4.5 and then either the Windows Management Framework 3.0 or the Windows Management Framework 4.0. For more information, see Installing the .NET Framework 4.5, 4.5.1 and Windows Management Framework 3.0 or Windows Management Framework 4.0.

- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

Connect to a remote Exchange server

1. On your local computer, open Windows PowerShell and run the following command.

```
$UserCredential = Get-Credential
```

In the **Windows PowerShell Credential Request** dialog box, type your Exchange user name and password, and then click **OK**.

2. Run the following command. You need to specify the FQDN of an Exchange 2013 Client Access server.

```
$Session = New-PSSession -ConfigurationName
Microsoft.Exchange -ConnectionUri http://<FQDN of Exchange
2013 Client Access server>/PowerShell/ -Authentication
Kerberos -Credential $UserCredential
```

3. Run the following command.

```
Import-PSSession $Session
```

Note:

Be sure to disconnect the remote PowerShell session when you're finished. If you close the Windows PowerShell window without disconnecting the session, you could use up all the remote PowerShell sessions available to you, and you'll need to wait for the sessions to expire. To disconnect the remote PowerShell session, run the following command.

```
Remove-PSSession $Session
```

How do you know this worked?

After Step 3, the Exchange cmdlets are imported into your local Windows PowerShell session as

tracked by a progress bar. If you don't receive any errors, you connected successfully. A quick test is to run an Exchange cmdlet—for example, **Get-Mailbox**—and see the results.

If you receive errors, check the following requirements:

- A common problem is an incorrect password. Run the three steps again and pay close attention to the user name and password you enter in Step 1.
- Windows PowerShell needs to be configured to run scripts. You only need to configure this setting once on your computer, not every time you connect. To enable Windows PowerShell to run signed scripts, run the following command in an elevated Windows PowerShell window (a Windows PowerShell window you opened by selecting **Run as administrator**).

```
Set-ExecutionPolicy RemoteSigned
```

- The account you use to connect to the Exchange server must be enabled for remote Shell. For more information, see Manage Exchange Management Shell access.
- TCP port 80 traffic needs to be open between your local computer and the Exchange server. It's probably open, but it's something to consider if your organization has a restrictive Internet access policy.

See also

The cmdlets that you use in this topic are Windows PowerShell cmdlets. For more information about these cmdlets, see the following topics.

- Get-Credential
- New-PSSession
- Import-PSSession
- Remove-PSSession
- Set-ExecutionPolicy

Topic Last Modified: *2012-10-01*

You can assign an Exchange Management Shell cmdlet or Cmd.exe command to an administrator-

defined and easy-to-remember alias in Microsoft Exchange Server 2013. Such aliases can be handy when you frequently use certain cmdlets and want to reduce the typing that you must do.

When an alias is called from the command line, the rules that apply to the cmdlet that is represented by the alias are enforced exactly as when the cmdlet is called. You must supply any required parameters and their values exactly as if you had called the cmdlet name.

Contents

Built-in aliases

Many cmdlets that are used regularly have default, or built-in, aliases assigned to them. These built-in aliases help reduce the typing that you have to do when you administer Exchange 2013 by using the Shell.

For example, the **Get-ChildItem** cmdlet resembles the MS-DOS `Dir` command. Because you are familiar with the `Dir` command, you might want to use the `Dir` alias when you use the Shell instead of typing **Get-ChildItem** every time that you want to view the contents of a directory. The output from the **Get-ChildItem** cmdlet and the `Dir` alias is the same and can be used interchangeably.

You can view a list of built-in aliases by running the **Get-Alias** cmdlet in the Shell.

For more information about aliases, run the following command in the Shell.

```
Get-Help About_Alias
```

Return to top

Creating custom aliases

In addition to the default, or built-in, aliases, you can define and use custom aliases instead of the names of cmdlets that you frequently use. You can use the **Set-Alias** cmdlet to associate cmdlets to familiar command names that have the equivalent functionality in Cmd.exe. You can assign multiple aliases to a single command. However, each alias can only be assigned to a single command. For example, you can have three aliases `Alias1`, `Alias2`, and `Alias3` that are assigned to the **New-Mailbox** cmdlet. You could then use any of the three aliases to run the **New-Mailbox** cmdlet. However, each alias that you create can only be assigned to the **New-Mailbox** cmdlet. You can't,

for example, assign `Alias1` to both the **New-Mailbox** cmdlet and the **Get-Mailbox** cmdlet.

To create a new alias-cmdlet pairing, run the **Set-Alias** cmdlet and supply the name of the alias, together with the name of the cmdlet that you want to call when the alias is entered.

The following table shows several examples of how to create a new alias.

Examples of custom aliases

Alias description	Alias command
Retrieve the contents of a file	`Set-Alias Type Get-Content`
Retrieve the listing of a directory	`Set-Alias Dir Get-ChildItem`
Remove a file	`Set-Alias Erase Remove-Item`
Set **pad** as an alias for Microsoft WordPad	`Set-Alias Pad "${env:programfiles`
Display the list of all defined aliases	`Set-Alias Aliases Get-Alias`

Return to top

Removing an alias

To remove an alias, delete the alias from the alias drive. For example, an administrator creates the `Ls` alias by using the following command.

```
Set-Alias Ls Get-ChildItem
```

Later the administrator decides that the `Ls` alias is no longer needed and uses the following command to remove the `Ls` alias.

```
Remove-Item Alias Ls
```

Importing and exporting aliases

The **Export-Alias** cmdlet writes the current alias list to a file in comma-separated values (CSV) format. You can include the name of the file and its path in the command line. If the path doesn't exist, the cmdlet will create the path for you.

The **Import-Alias** cmdlet reads a text file that has CSV values and brings the list into the Shell as an object. By using the **Export-Alias** cmdlet and **Import-Alias** cmdlet, you can export a list of aliases from the Shell on one computer and import them to the Shell on another computer. Because existing predefined aliases exist on both computers, all alias name conflicts will be ignored and not

imported.

Alias persistence

Aliases that are created from the command line by using the **Set-Alias** cmdlet during a Shell session can be used when the session is active. After the session is closed, the alias definition is lost. To make a user-defined alias persistent and available every time that a new Shell session is opened, you must add the alias definition to your Shell profile. You can modify your Shell profile by running the command `Notepad $Profile`. If the profile directory doesn't exist, you might have to create it first. To find out the path of your profile, run the command `$Profile`.

Alias limitations

Although aliases can be defined for cmdlets and used instead of cmdlet names, you can't include parameters in the definition of the aliases that you define. You must provide parameters as needed when the alias is called, exactly as you would if you called the cmdlet.

Return to top

Arrays

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

An array provides a data structure that can be used to store a collection of data elements of the same type. The Exchange Management Shell supports all kinds of data elements. See the following sections for information about:

Creating arrays

Reading arrays

Manipulating arrays

Associative arrays

For detailed information about how to use arrays, run the following command in the Shell.

```
Get-Help About_Array
```

Creating arrays

You can create and initialize arrays by assigning multiple values to a variable. The values that are stored in the array are delimited by using a comma and are separated from the variable name by the = assignment operator. For example, suppose you want to create an array that is named `$Example` that contains the following seven integer values: `22, 5, 10, 8, 12, 9, 80`. To create the array, enter the following command.

```
$Example = 22,5,10,8,12,9,80
```

In the array, the first data element is at index position `0`, the second is at position `1`, and so on.

Reading arrays

You can reference an array by its variable name, such as `$Example`. You can reference a specific value within the array by using the index number of the position in the array where the value is stored. For example, to reference the first data element in the `$Example` array, enter the following command.

```
Write-Host $Example[0]
```

The Shell will return the value `22` because that is stored in the first array element.

Manipulating arrays

To change the value of a single item in an array, specify the array name, the index you want to modify, the = assignment operator, and the new value that you want to use instead of the existing value. For example, to change the value of the second item in the `$Example` array, index position `1`, to `10`, enter the following command.

```
$Example[1] = 10
```

You can also use the **SetValue** method to change a value. The following example changes the second value, index position `1`, of an array named `$Example` to `500`:

```
$Example.SetValue(500,1)
```

You can append a value to the end of an existing array. For example, to add an additional integer, such as `200`, to the `$Example` array, enter the following command.

```
$Example += 200
```

Associative arrays

Associative arrays are the same as regular arrays. However, they enable the assignment of key-value pairs to a variable. For example, you may want to assign values to keys in an array to be called on when a command is being processed. The following example creates an associative array:

```
$Example = @{blue = 1; red = 2,3}
```

When you enter `$Example` on the command line, you see the following output:

```
Key                            Value
---                            -----
red                            {2, 3}
blue                           1
```

You can retrieve the information that is stored in the array by calling the array as follows:

```
$Example.blue
```

The previous example returns a value `1`.

Because multiple values were assigned to the `red` key, those values make up a nested array. You can reference the values in this nested array by using their index value. You can retrieve the information that is stored in the key's nested array by calling the associative array, `$Example`, with the `red` key and the index of the nested array location that you want to retrieve `1`, as follows:

```
$Example.red[1]
```

The previous example returns the value 3.

For more information about associative arrays, run the following command in the Shell.

```
Get-Help About_Associative_Array
```

Cmdlets

Exchange Server 2013 > Exchange Management Shell > Basic concepts in Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

A *cmdlet*, pronounced "command-let", is the smallest unit of functionality in the Exchange Management Shell. Cmdlets resemble built-in commands in other shells, for example, the `dir` command found in `cmd.exe`. Like these familiar commands, cmdlets can be called directly from the command line in the Shell and run under the context of the Shell, not as a separate process.

Note:

Since Microsoft Exchange Server 2007, there have been changes to how Exchange 2013 uses cmdlets internally due to the use of Windows PowerShell remoting functionality. These changes have little to no impact on how you need to use cmdlets, but they may offer additional flexibility in how you manage your Exchange servers.

Cmdlets are usually designed around repetitive administrative tasks, and, in the Shell, several hundred cmdlets are provided for Exchange-specific management tasks. These cmdlets are available in addition to the non-Exchange system cmdlets included in the basic Windows PowerShell shell design. For information about how to open the Exchange Management Shell, see Open the Shell.

All cmdlets in the Shell are presented in verb-noun pairs. The verb-noun pair is always separated by a hyphen (-) without spaces, and the cmdlet nouns are always singular. Verbs refer to the action that the cmdlet takes. Nouns refer to the object on which the cmdlet takes action. For example, in the **Get-SystemMessage** cmdlet, the verb is **Get**, and the noun is **SystemMessage**. All Shell cmdlets that manage a specific feature share the same noun. The following table provides examples of some verbs available in the Shell.

Note:

By default, if the verb is omitted, the Shell assumes the **Get** verb. For example, when you call **Mailbox**, you retrieve the same results as when you call **Get-Mailbox**.

Examples of verbs in the Exchange Management Shell

Verb	Description
Disable	**Disable** cmdlets set the `Enabled` status of the specified Exchange object to `$False`. This prevents the object from processing data even though the object exists.
Enable	**Enable** cmdlets set the Enabled status of the specified Exchange object to `$True`. This enables the object to process data.
Get	**Get** cmdlets retrieve information about a specific Exchange object. **Note:** Most **Get** cmdlets only return summary information when you run them. To tell the **Get** cmdlet to return verbose information when you run a command, pipe the command to the **Format-List** cmdlet. For more information about the **Format-List** command, see Working with command output. For more information about pipelining, see Pipelining.

Install	**Install** cmdlets install a new object or feature on an Exchange server.	
Move	**Move** cmdlets relocate the specified Exchange object from one container or server to another.	
New	**New** cmdlets create new Exchange object.	
Remove	**Remove** cmdlets delete the specified Exchange object.	
Set	**Set** cmdlets modify the properties of an existing Exchange object.	
Test	**Test** cmdlets test specific Exchange components and provide log files that you can examine.	
Uninstall	**Uninstall** cmdlets remove an object or feature from an Exchange server.	

The following list of cmdlets is an example of a complete cmdlet set. This cmdlet set is used to manage the delivery status notification (DSN) message and mailbox quota message features of Exchange 2013:

- **Get-SystemMessage**
- **New-SystemMessage**
- **Remove-SystemMessage**
- **Set-SystemMessage**

Comparison operators

Exchange Server 2013 > Exchange Management Shell > Basic concepts in Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-05*

The Exchange Management Shell has a rich set of operators that enables comparisons of one object with another object or one object with a set of objects. For more information about comparison operators, run the following command in the Shell:

```
Get-Help About_Comparison_Operators
```

The following table lists the comparison operators that are available in the Shell. Some comparison operators are case-sensitive. If a comparison operator is case-sensitive, the case that is used in the strings that are being compared must match. For example, the string "Test" does not match "test" when you use a comparison operator that is case-sensitive.

Comparison operators that are available in the Exchange Management Shell

Operator	Definition
-eq	Equals (not case-sensitive)
-ieq	Equals (not case-sensitive)
-ceq	Equals (case-sensitive)
-ne	Not equal (not case-sensitive)
-ine	Not equal (not case-sensitive)
-cne	Not equal (case-sensitive)
-lt	Less than (not case-sensitive)
-ilt	Less than (not case-sensitive)
-clt	Less than (case-sensitive)
-gt	Greater than (not case-sensitive)
-igt	Greater than (not case-sensitive)
-cgt	Greater than (case-sensitive)
-le	Less than or equal to (not case-sensitive)
-ile	Less than or equal to (not case-sensitive)
-cle	Less than or equal to (case-sensitive)
-ge	Greater than or equal to (not case-sensitive)
-ige	Greater than or equal to (not case-sensitive)

-cge	Greater than or equal to (case-sensitive)
-contains	The elements in the left operand that is equal to the right operand (not case-sensitive)
-icontains	The elements in the left operand that is equal to the right operand (not case-sensitive)
-ccontains	The elements in the left operand that is equal to the right operand (case-sensitive)
-notcontains	The elements in the left operand that is equal to the right operand (not case-sensitive)
-inotcontains	The elements in the left operand that is equal to the right operand (not case-sensitive)
-cnotcontains	The elements in the left operand that is equal to the right operand (case-sensitive)
-band	Bitwise And
-bor	Bitwise Or
-bnot	Bitwise NOT
-and	Logical and
-or	Logical or
-not	Logical not
-match	Compare strings by using regular expressions (not case-sensitive)
-notmatch	Compare strings by using regular expressions (not case-sensitive)
-imatch	Compare strings by using regular expressions (not case-sensitive)

-inotmatch	Compare strings by using regular expressions (not case-sensitive)
-cmatch	Compare strings by using regular expressions (case-sensitive)
-cnotmatch	Compare strings by using regular expressions (case-sensitive)
-like	Compare strings by using wildcard rules
-notlike	Compare strings by using wildcard rules
-ilike	Compare strings by using wildcard rules (not case-sensitive)
-inotlike	Compare strings by using wildcard rules (not case-sensitive)
-clike	Compare strings by using wildcard rules (case-sensitive)
-cnotlike	Compare strings by using wildcard rules (case-sensitive)

Getting help

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

In Microsoft Exchange Server 2013, the Exchange Management Shell provides many Help resources so that you can use it to its fullest potential. This topic provides the following sections, which describe Help resources and functionality:

- Exchange 2013 Help Exchange 2013 Help contains all the cmdlet Help topics in a role-based and task-based hierarchy. The cmdlet Help topics also link to procedural topics that tell you how to perform specific tasks.

- Help cmdlets The Shell has several Help cmdlets that enable you to find the appropriate information to accomplish your task.
- Help views Help in the Shell contains extensive information about the cmdlets available to you. Help views enable you to access the information that you need about a cmdlet.
- Tab completion You can use tab completion on cmdlet names and parameter names to reduce the amount of typing at a command prompt.

Exchange 2013 Help

Exchange 2013 Help contains the same cmdlet Help information available on each cmdlet in the Shell. However, in Exchange 2013 Help, the Help topics for all the cmdlets are organized by server role and administration task so that you can easily find specific cmdlets associated with the task that you want to perform. Also, cmdlet topics in Exchange 2013 Help are linked to topics that introduce you to the features that they manage, show you how to use the cmdlets to manage that feature, and provide specific details about the feature or common scenarios.

For more information about the cmdlet Help topics available in Exchange 2013 Help, see Exchange 2013 cmdlets.

Help cmdlets

The following tables provide examples of how to use the **Get-Help** and **Get-Command** cmdlets to access the Help information available for each cmdlet in the Shell.

Important:
To view a list of Exchange cmdlets that match a string that you specify, use the **Get-ExCommand** cmdlet. For more information, see the "Examples of how to use miscellaneous Help commands" table later in this section.

The following table provides examples of how the **Get-Help** cmdlet is used.

Examples of how to use the Get-Help cmdlet

Examples	Description
`Get-Help`	When you use the **Get-Help** cmdlet by itself, it gives you basic instructions on how to use the Shell Help system.
`Get-Help <cmdlet>`	When you give the **Get-Help** cmdlet a cmdlet as an argument, it displays the Help information for that cmdlet. For example, to retrieve the Help information for the **Get-SystemMessage** cmdlet, use the following

	command. `Get-Help Get-SystemMessage`
`Get-Help About_*`	The **Get-Help About_*** command provides a list of all general Shell Help topics to help you better understand and use the Shell. If you want to learn more about a topic in the list displayed, run the **Get-Help About_**<*feature*> command. For example, if you want to learn more about wildcards, use the following command. **Note:** You might need to run the **Update-Help** cmdlet to download the Windows PowerShell-provided About_* help files. `Get-Help About_wildcards`.
`Get-Help <cmdlet> -Detailed`	For a description, see the Help views section later in this topic.
`Get-Help <cmdlet> -Full`	For a description, see the Help views section later in this topic.
`Get-Help <cmdlet> -Examples`	For a description, see the Help views section later in this topic.
`Get-Help <cmdlet> -Parameter <parameter name>`	For a description, see the Parameters filter section later in this topic.
`Get-Help <cmdlet> -Online`	For a description, see the Online Help section later in this topic.

The following table provides examples of how the **Get-Command** cmdlet is used.

Examples of how to use the Get-Command cmdlet

Examples	Description
`Get-Command`	The **Get-Command** cmdlet provides a list of all the cmdlets available to the Shell. The **Get-Command** cmdlet allows for wildcard character expansion.

`Get-Command *<string>*`	When you enclose a string with wildcard characters (`*`), the **Get-Command** cmdlet returns a list of all cmdlets and functions that are available to you that contain that string. For example, to find all cmdlets or functions that contain the string "`mailbox`", use the command `Get-Command *mailbox*`. Exchange cmdlets are shown as functions in the output of the **Get-Command** cmdlet.
`Get-Command -Noun <CmdletNoun>`	The **Get-Command -Noun <***CmdletNoun***>** command lists all the cmdlets that exist with the specified noun. This command is useful when you want to view a list of all cmdlets associated with a particular feature. For example, the **Get-Command -Noun SystemMessage** command returns all the cmdlets available for the SystemMessage feature.
`Get-Command -Verb <CmdletVerb>`	The **Get-Command -Verb <***CmdletVerb***>** command lists all the cmdlets that exist with the specified verb. This command is useful when you want to view a list of all cmdlets associated with a particular action. For example, the **Get-Command -Verb Enable** command returns all cmdlets available that perform the enable action.

The following table provides examples of how to use miscellaneous Help commands.

Examples of how to use miscellaneous Help commands

Examples	Description
`Get-ExCommand`	The Get-ExCommand command returns a list of all Exchange cmdlets available to you.
`Get-ExCommand *<string>*`	When you enclose a string with wildcard

	characters (`*`), the **Get-ExCommand** command returns a list of all Exchange cmdlets that are available to you that contain that string. For example, to find all Exchange cmdlets that contain the string "`mailbox`", use the command `Get-ExCommand *mailbox*`. Exchange cmdlets are shown as functions in the output of the **Get-ExCommand** command.
`QuickRef`	The **QuickRef** command opens a link to a printable HTML chart that lists the most frequently used Shell cmdlets. This command works only if the Exchange management tools are installed. To open this chart directly, see Exchange Management Shell quick reference for Exchange 2013.
`<Cmdlet> -?`	Use the **<Cmdlet> -?** command together with any cmdlet to find the same Help information available when you use the **Get-Help** cmdlet. For example, type `Get-SystemMessage -?` to display detailed Help for the **Get-SystemMessage** cmdlet.
`Get-Tip`	The **Get-Tip** cmdlet generates a new Exchange Management Shell Tip of the Day. This cmdlet works only if the Exchange management tools are installed.
`Get-ExBlog`	The **Get-ExBlog** cmdlet opens your default browser to display the Exchange Team blog. This cmdlet works only if the Exchange management tools are installed.

Help views

When a cmdlet is specified as a parameter of the **Get-Help** cmdlet, the Help information for the specified cmdlet is displayed. In some cases, the information returned can be extensive, and you may only want to see specific information. Help views enable you to view specific information about a cmdlet without having to sort through information that you may not need.

The Shell has four views that present different types of information. You can also retrieve a specific parameter or set of similar parameters.

The following table shows the sections displayed in each view.

Help views in the Exchange Management Shell

Help view	Default	Detailed	Full	Examples
Synopsis	X	X	X	X
Syntax	X	X	X	
Description	X	X	X	
Parameters without metadata		X		
Parameters with metadata			X	
Inputs			X	
Outputs			X	
Errors			X	
Examples		X	X	X
Related links	X		X	
Remarks	X	X		

The following table describes each view and provides an example of a command that calls each view.

Examples of Exchange Management Shell Help views

Help view	Examples	Description

Default	`Get-Help Set-Mailbox`	The Default view is displayed when you use the command `Get-Help <cmdlet>`.
`Detailed`	`Get-Help Set-Mailbox -Detailed`	The `Detailed` view is displayed when you use the command `Get-Help <cmdlet> -Detailed`. The parameters returned in the `Parameters` section don't include parameter metadata. For more information, see Parameters.
`Full`	`Get-Help Set-Mailbox -Full`	The `Full` view is displayed when you use the command `Get-Help <cmdlet> -Full`. The parameters returned in the `Parameters` section include the following parameter metadata: • `Required?` • `Position?` • `Default value` • `Accept pipeline input?` • `Accept wildcard characters?` For more information, see Parameters.
`Examples`	`Get-Help Set-Mailbox -Examples`	The `Examples` view is displayed when you use the command `Get-Help <cmdlet> -Examples`.

Parameters filter

In addition to these four Help views, you can also access the description and metadata about a specific parameter or set of similar parameters. You can specify the parameter together with the `Get-Help <cmdlet>` command. The following example shows how you can display the description of the *ForwardingAddress* parameter on the **Set-Mailbox** cmdlet:

```
Get-Help Set-Mailbox -Parameter ForwardingAddress
```

You can also display a set of similar parameters that exist on a specific cmdlet if you specify the partial name of a parameter together with a wildcard character (*). The following example shows how you can display all the parameters on the **Set-Mailbox** cmdlet that contain the word Quota.

```
Get-Help Set-Mailbox -Parameter *Quota*
```

Note:

When you use the *Parameter* parameter with the **Get-Help** cmdlet to retrieve Help information for a cmdlet that has only one parameter, the **Get-Help** cmdlet doesn't return any results, even if you use the wildcard character (*). This is a known issue in Microsoft Windows PowerShell.

Online Help

If a cmdlet has many parameters, it may be difficult to read the Help information for that cmdlet in the Shell. With Exchange 2013, the *Online* switch has been made available. The *Online* switch tells the Shell to open your default Web browser and browse to the online Help topic for the cmdlet. The online Help topic is the same as the Help for the cmdlet in the Shell with the additional benefits of being able to view the topic in a larger window, to search the topic for terms, or to click related links embedded within the topic. For example, to view online Help for the **Set-Mailbox** cmdlet, use the following command:

```
Get-Help Set-Mailbox -Online
```

Using the *Online* switch requires that your computer has a connection to the Internet.

Tab completion

You can use tab completion to reduce typing when you use the Shell. After you type a partial cmdlet name, and then press the TAB key, the Shell completes the cmdlet name if a matching cmdlet is found. If multiple matching cmdlet names are found, each cmdlet name cycles through after you press the TAB key. When you use tab completion with cmdlet names, you must supply at least the verb and the hyphen (-). The following examples show how you can use tab completion when you enter a cmdlet name:

```
Get-Transport<Tab>
Enable-<Tab>
```

Each time you press the TAB key in the first example, the Shell cycles through all the cmdlet names that start with **Get-Transport**. In the second example, the Shell cycles through all cmdlets with the verb **Enable**.

As with cmdlet names, you can also use tab completion when you want the Shell to complete the

partial parameter name that you entered. When you use tab completion with parameter names, you must specify the full cmdlet name either by typing it or by using tab completion. The following examples show how you can use tab completion when you enter a parameter name:

```
Set-Mailbox -Email<Tab>
New-TransportRule -Cond<Tab>
```

Each time you press the TAB key in the first example, the Shell cycles through all the parameter names that start with *Email* on the **Set-Mailbox** cmdlet. In the second example, when you press the TAB key, the Shell completes the *Conditions* parameter on the **New-TransportRule** cmdlet.

Identity

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

The *Identity* parameter is a special parameter that you can use with most cmdlets. The *Identity* parameter gives you access to the unique identifiers that refer to a specific object in Microsoft Exchange Server 2013. This capability lets you perform actions on a specific Exchange 2013 object.

The following sections describe the Identity parameter and provide examples of how you can use it effectively:

Characteristics of the Identity parameter

Wildcard characters in Identity

Examples of the Identity parameter

Characteristics of the Identity parameter

The primary unique identifier of an object in Exchange 2013 is always a GUID. A GUID is a 128-bit identifier, such as `63d64005-42c5-4f8f-b310-14f6cb125bf3`. This GUID never repeats and is therefore always unique. However, you don't want to type such GUIDs regularly. Therefore the *Identity* parameter typically also consists of the values of other parameters, or combined set of values from multiple parameters on a single object. These values are also guaranteed to be unique across that set of objects. You can specify the values of these other parameters, such as *Name* and *DistriguishedName*, or they can be system-generated. The additional parameters that are used, if any, and how they are populated, depend on the object you refer to.

The *Identity* parameter is also considered a positional parameter. The first argument on a cmdlet is

assumed to be the *Identity* parameter when no parameter label is specified. This reduces the number of keystrokes when you type commands. For more information about positional parameters, see Parameters.

The following example shows the use of the *Identity* parameter by using the Receive connector's unique *Name* parameter value. This example also shows how you can omit the *Identity* parameter name because *Identity* is a positional parameter.

```
Get-ReceiveConnector -Identity "From the Internet"
Get-ReceiveConnector "From the Internet"
```

Like all objects in Exchange 2013, this Receive connector can also be referred to by its unique GUID. For example, if the Receive connector named `"From the Internet"` is also assigned the GUID `63d64005-42c5-4f8f-b310-14f6cb125bf3`, you can also retrieve the Receive connector by using the following command:

```
Get-ReceiveConnector 63d64005-42c5-4f8f-b310-14f6cb125bf3
```

Return to top

Wildcard characters in Identity

Some **Get** cmdlets can accept a wildcard character (*) as part of the value you submit to *Identity* when you run the cmdlet. By using a wildcard with the *Identity* parameter, you can specify a partial name and retrieve a list of objects that match that partial name. You can place a wildcard character at the beginning or the end of the *Identity* value, but you can't place the character in the middle of a string. For example, the commands `Get-Mailbox David*` and `Get-Mailbox *anders*` are valid, but `Get-Mailbox Reb*ca` isn't a valid command.

Some **Get** cmdlets retrieve objects in Exchange 2013 that are organized in a hierarchical or parent and children relationship. That is, there may be a collection of parent objects that also contain their own child objects. Objects that have a parent and child relationship may have an *Identity* with the syntax of `<parent>\<child>`.

When an *Identity* parameter has a syntax of `<parent>\<child>`, some cmdlets enable you to use a wildcard character (*) to replace all or some of the parent or child names. For example, if you want to find all of the child objects named "Contoso" in all parent objects, you could use the syntax `"*\Contoso"`. Likewise, if you want to find all of the child objects with a partial name of "Auth" that exist under the `"ServerA"` parent object, you could use the syntax `"ServerA\Auth*"`.

Some, but not all, cmdlets allow you to specify just the child portion of the Identity parameter when you run a command. When you do this, the cmdlets default to the current parent object being accessed. For example, two receive connectors named "Contoso Receive Connector" exist on both MBX1 and MBX2. If you run the command `Get-ReceiveConnector "Contoso Receive Connector"` on MBX2, only the receive connector on the server MBX2 is returned.

The specific behavior of the Identity parameter and wildcard characters is dependent on the cmdlet that's being run. For more information about the cmdlet you're running, see the feature-specific content for that cmdlet.

Return to top

Examples of the Identity parameter

The examples described in this topic illustrate how the *Identity* parameter can accept different unique values to refer to specific objects in the Exchange 2013 organization. These examples also illustrate how the *Identity* parameter label can be omitted to reduce the number of keystrokes when you type commands.

DSN messages

The examples in this section refer to the delivery status notification (DSN) messages that can be configured in an Exchange 2013 organization. The first example shows how to retrieve DSN 5.4.1 by using the **Get-SystemMessage** cmdlet. In the **Get-SystemMessage** cmdlet, the *Identity* parameter consists of several pieces of data that are configured on each DSN message object. These pieces of data include the language that the DSN is written in, whether the DSN is internal or external in scope, and the DSN message code as in the following example:

```
Get-SystemMessage en\internal\5.4.1
```

You can also retrieve this DSN message by using its GUID as in the following example, because all objects in Exchange 2013 have a GUID:

```
Get-SystemMessage 82ca7bde-1c2d-4aa1-97e1-f298a6f10222
```

For more information about the makeup of the *Identity* parameter when it's used with the **SystemMessage** cmdlets, see DSN message identity.

Management role entries

The examples in this section refer to management role entries that make up management roles in Exchange 2013. Management roles are used to control the permissions that are granted to administrators and end users. Management role entries are made up of two parts: the management role they're associated with and a cmdlet. The Identity parameter is likewise made up of both the management role name and the cmdlet name. For example, the following is the role entry for the **Set-Mailbox** cmdlet on the `Mail Recipients` role:

```
Mail Recipients\Set-Mailbox
```

The `Mail Recipients\Set-Mailbox` role entry is one of several entries on the `Mail Recipients` role. To

view all the role entries on the `Mail Recipients` role, you can use the following command:

```
Get-ManagementRoleEntry "Mail Recipients\*"
```

To view all the role entries on the `Mail Recipients` role that contain the string "`Mailbox`", use the following command:

```
Get-ManagementRoleEntry "Mail Recipients\*Mailbox*"
```

To view all the management roles where **Set-Mailbox** is one of the role entries, use the following command:

```
Get-ManagementRoleEntry *\Set-Mailbox
```

With role entries you can use the wildcard character in a variety of ways to query Exchange 2013 for the information you're interested in.

For more information about management roles, see Understanding management roles.

Import and export files in the Exchange Management Shell

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-10*

Microsoft Exchange Server 2013 uses Windows PowerShell command-line interface remoting to establish a connection between the server or workstation from which you're administering Exchange and the server running Exchange 2013 that you're administering. In Exchange 2013, this is called remote Exchange Management Shell, or remote Shell. Even if you're administering the local Exchange 2013 server, remote Shell is used to make the connection. For more information about local and remote Shell, see Exchange Management Shell.

How you import and export files to and from an Exchange server in Exchange 2013 is different than how you might have done it in Exchange Server 2007. This is due to the use of remote Shell in Exchange 2013. This topic discusses why this new process is required and how to import and export files between a local server or workstation and an Exchange 2013 server.

Windows PowerShell sessions

To understand why you need a special syntax to import and export files in remote Shell, you need to know how the Shell is implemented in Exchange 2013. The Shell uses Windows PowerShell sessions, which are the environments in which variables, cmdlets, and so on, can share information. Every time you open a new Shell window, you create a new session. The cmdlets that are run in each window can access variables and other information stored in that window, but can't access variables in other open Shell windows. This is because they're each contained within their own Windows PowerShell session. Windows PowerShell sessions can also be referred to as runspaces.

Remote Shell in Exchange 2013 has two sessions, the local session and the remote session. The local session is the Windows PowerShell session that's running on your local computer. This session contains all of the cmdlets that ship with Windows PowerShell. It also has access to your local file system.

The remote session is the Windows PowerShell session that's running on the remote Exchange server. This session is where all Exchange cmdlets are run. It has access to the Exchange server's file system.

When you connect to a remote Exchange server, a connection is made between your local session on your computer and the remote session on the Exchange server. This connection enables you to run Exchange cmdlets on the remote Exchange server in your local session even though your local computer doesn't have any Exchange cmdlets installed. Even though the Exchange cmdlets appear to be running on your local computer, they're actually running on the Exchange server.

Important:
Even if you open the Shell on an Exchange 2013 server, the same connection process takes place and two sessions are created. This means that you must use the same new syntax to import and export files whether you're opening the Shell on an Exchange 2013 server or from a remote client workstation.

The Exchange cmdlets that run in the remote session on the remote Exchange server don't have access to your local file system. This means that you can't use Exchange cmdlets, on their own, to import or export files from or to your local file system. Additional syntax needs to be used to transfer the files to and from your local file system so that the Exchange cmdlets running on the remote Exchange server can use the data. For more information about the required syntax, see "Importing and exporting files in remote Shell" later in this topic.

Importing and exporting files in remote Shell

Importing and exporting files requires a specific syntax because Mailbox and Client Access servers use remote Shell and don't have access to the local computer's file system.

Importing files in remote Shell

The syntax to import files in Exchange 2013 is used any time you want to send a file to a cmdlet running on an Exchange 2013 server from your local computer or server. Cmdlets that accept data from a file on your local computer will have a parameter called *FileData* (or something similar). To determine the correct parameter to use, see the Help information for the cmdlet you're using.

The Shell must know what file you want to send to the Exchange 2013 cmdlet, and what parameter will accept the data. To do so, use the following syntax.

```
<Cmdlet> -FileData ([Byte[]]$(Get-Content -Path <local path
to file> -Encoding Byte -ReadCount 0))
```

For example, the following command imports the file C:\MyData.dat into the *FileData* parameter on the **Import-SomeData** fictional cmdlet.

```
Import-SomeData -FileData (Byte[]]$(Get-Content -Path "C:
\MyData.dat" -Encoding Byte -ReadCount 0))
```

The following actions occur when the command is run:

1. The command is accepted by remote Shell.
2. Remote Shell evaluates the command and determines that there's an embedded command in the value being provided to the *FileData* parameter.
3. Remote Shell stops evaluating the **Import-SomeData** command and runs the **Get-Content** command. The **Get-Content** command reads the data from the MyData.dat file.
4. Remote Shell temporarily stores the data from the **Get-Content** command as a `Byte[]` object so that it can be passed to the **Import-SomeData** cmdlet.
5. Execution of the **Import-SomeData** command resumes. Remote Shell sends the request to run the **Import-SomeData** cmdlet to the remote Exchange 2013 server, along with the object created by the **Get-Content** cmdlet.
6. On the remote Exchange 2013 server, the **Import-SomeData** cmdlet is run, and the data stored in the temporary object created by the **Get-Content** cmdlet is passed to the *FileData* parameter. The **Import-SomeData** cmdlet processes the input and performs whatever actions are required.

Some cmdlets use the following alternate syntax that accomplishes the same thing as the preceding syntax.

```
[Byte[]]$Data = Get-Content -Path <local path to file> -
Encoding Byte -ReadCount 0
Import-SomeData -FileData $Data
```

The same process happens with this alternate syntax. The only difference is instead of performing the entire operation at once, the data retrieved from the local file is stored in a variable that can be referenced after it's created. The variable is then used in the import command to pass the contents of the local file to the **Import-SomeData** cmdlet. Using this two-step process is useful when you want to use the data from the local file in more than one command.

There are limitations that you must consider when importing files. For more information, see "Limitations on importing files" later in this topic.

For specific information about how to import data into Exchange 2013, see the Help topics for the feature you're managing.

Limitations on importing files

Limits must be set when importing data in remote Shell to preserve the integrity of the data that's being transferred. Transfers that are in progress can't be resumed if they're interrupted. Also, because data being transferred is stored in the remote server's memory, the server must be protected from memory exhaustion caused by excessively large amounts of data.

For these reasons, the amount of data that's transferred to a remote Exchange 2013 server from a local computer or server is limited to the following:

- 500 megabytes (MB) for each cmdlet that's run
- 75 MB for each object that's passed to a cmdlet

If you exceed either of the limits, the execution of the cmdlet and its associated pipeline will stop and you'll receive an error. Consider the examples in the following table to understand how these limits work.

Import data limit examples

Number of objects	Object size (MB)	Total size (MB)	Result of operation
10	40	400	The operation is successful because neither the size of the individual objects exceeds 75 MB nor the total amount of data passed to the cmdlet exceeds 500 MB.
5	80	400	The operation fails because, although the total amount of data passed to the cmdlet is only 400 MB, the size of each individual object exceeds the 75

			MB limit.
120	5	600	The operation fails because, although each individual object is only 5 MB, the total amount of data passed to the cmdlet exceeds the 500 MB limit.

Due to the size limits that have been placed on the amount of data that can be transferred between a remote Exchange 2013 server and a local computer, not all cmdlets that once supported importing support this method of data transfer. To determine whether a specific cmdlet supports this method, see the Help information for the specific cmdlet.

These limits should accommodate the majority of typical operations that can be performed on an Exchange 2013 server. If the limits are lowered, you may find that some normal operations fail because they exceed the new limits. If the limits are raised, the data being transferred could take longer to transfer and become more at risk to transient conditions that interrupt the data transfer. Also, you may exhaust the memory on the remote server if you haven't installed enough memory to allow the server to store the entire block of data during transfer. Each possibility could result in data loss and therefore we recommend you don't change the default limits.

Exporting files in remote Shell

The syntax to export files in Exchange 2013 is used any time you want to accept data from a cmdlet running on a remote Exchange 2013 server and store the data on your local computer or server. Cmdlets that provide data that you can save to a local file will output an object that will contain the **FileData** property (or something similar). Depending on the cmdlet, the **FileData** property is only populated on the object that's output in specific situations. To determine the correct property to use and when it can be used, see the Help information for the cmdlet you're using.

The Shell must know that you want to save the data stored in the **FileData** property to your local computer. To do so, use the following syntax.

```
<cmdlet> | ForEach { $_.FileData | Add-Content <local path
to file> -Encoding Byte }
```

For example, the following command exports the data stored in the **FileData** property on the object created by the **Export-SomeData** fictional cmdlet. The exported data is stored in a file you specify on the local computer, in this case MyData.dat.

Note:

This procedure uses the **ForEach** cmdlet, objects, and pipelining. For more information about each, see Pipelining and Structured data.

```
Export-SomeData | ForEach { $_.FileData | Add-Content C:
\MyData.dat -Encoding Byte }
```

The following actions occur when the command is run:

1. The command is accepted by remote Shell.
2. Remote Shell calls the **Export-SomeData** cmdlet on the remote Exchange 2013 server.
3. The output object created by the **Export-SomeData** cmdlet is passed back to the local Shell session via the pipeline.
4. The output object is then piped to the **ForEach** cmdlet, which has a script block.
5. Within the script block, the **FileData** property on the current object in the pipeline is accessed. The data contained within the **FileData** property is piped to the **Add-Content** cmdlet.
6. The **Add-Content** cmdlet saves the data piped from the **FileData** property to the file MyData.dat on the local file system.

For specific information about how to export data from Exchange 2013, see the Help topics for the feature you're managing.

Modifying multivalued properties

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

A multivalued property is a property that can contain more than one value. For example, the **BlockedRecipients** property on the **RecipientFilterConfig** object can accept multiple recipient addresses as in the following examples:

- john@contoso.com
- kim@northwindtraders.com
- david@adatum.com

Because the **BlockedRecipients** property can accept more than one value, it's called a multivalued property. This topic explains how to use the Exchange Management Shell to add values to and remove values from a multivalued property on an object.

For more information about objects, see Structured data. For more information about the Shell, see Exchange Management Shell.

Modifying a multivalued property vs. modifying a property that accepts only a single value

How you modify a multivalued property is slightly different from how you modify a property that accepts only one value. When you modify a property that accepts only a single value, you can assign a value directly to it, as in the following command.

```
Set-TransportConfig -MaxSendSize 12MB
```

When you use this command to provide a new value to the **MaxSendSize** property, the stored value is overwritten. This isn't a problem with properties that accept only one value. However, it becomes a problem with multivalued properties. For example, assume that the **BlockedRecipients** property on the **RecipientFilterConfig** object is configured to have the three values that are listed in the previous section. When you run the command `Get-RecipientFilterConfig | Format-List BlockedRecipients`, the following is displayed.

```
BlockedRecipients : {david@adatum.com,
kim@northwindtraders.com, john@contoso.com}
```

Now assume that you've received a request to add a new SMTP address to the blocked recipients list. You run the following command to add the new SMTP address.

```
Set-RecipientFilterConfig -BlockedRecipients
chris@contoso.com
```

When you run the `Get-RecipientFilterConfig | Format-List BlockedRecipients` command again, you will see the following.

```
BlockedRecipients : {chris@contoso.com}
```

This isn't what you expected. You wanted to add the new SMTP address to the existing list of blocked recipients, but instead the existing list of blocked recipients was overwritten by the new SMTP address. This unintended result exemplifies how modifying a multivalued property differs from modifying a property that accepts only a single value. When you modify a multivalued property, you must make sure that you append or remove values instead of overwriting the whole list of values. The following sections show you how to do exactly that.

Modifying multivalued properties

Modifying multivalued properties is similar to modifying single-valued properties. You just need to add some additional syntax to tell the Shell that you want to add or remove values to or from the multivalued property rather than replace everything that’s stored in the property. The syntax is

included, along with the value or values to add or remove to or from the property, as a value on a parameter when you run a cmdlet. The following table shows the syntax that you need to add to a parameter on a cmdlet to modify multivalued properties.

Multivalue property syntax

Action	Syntax
Add one or more values to a multivalued property	`@{Add="<value1>", "<value2>", "<value3>"}`
Remove one or more values from a multivalued property	`@{Remove="<value1>", "<value2>", "<value3>"}`

The syntax that you choose from the Multivalue property syntax table is specified as a parameter value on a cmdlet. For example, the following command adds multiple values to a multivalued property:

```
Set-ExampleCmdlet -Parameter @{Add="Red", "Blue", "Green"}
```

When you use this syntax, the values that you specify are added or removed from the list of values already present on the property. Taking the **BlockedRecipients** example earlier in this topic, we can now add chris@contoso.com without overwriting the rest of the values on this property by using the following command:

```
Set-RecipientFilterConfig -BlockedRecipients
@{Add="chris@contoso.com"}
```

If you wanted to remove david@adatum.com from the list of values, you would use this command:

```
Set-RecipientFilterConfig -BlockedRecipients
@{Remove="david@adatum.com"}
```

More complex combinations can be used, such as adding or removing values to and from a property at the same time. To do so, insert a semicolon (;) between `Add` and `Remove` actions. For example:

```
Set-RecipientFilterConfig -BlockedRecipients
```

```
@{Add="carter@contoso.com", "sam@northwindtraders.com",
"brian@adatum.com"; Remove="john@contoso.com"}
```

If we use the `Get-RecipientFilterConfig | Format-List BlockedRecipients` command again, we can see that the email addresses for Carter, Sam, and Brian have been added while the address for John has been removed.

```
BlockedRecipients : {brian@adatum.com,
sam@northwindtraders.com, carter@contoso.com,
chris@contoso.com, kim@northwindtraders.com}
```

Parameters

Exchange Server 2013 > Exchange Management Shell > Basic concepts in Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-04*

Most cmdlets rely on parameters. Parameters are elements that provide information to the cmdlet, either identifying an object and its attributes to act upon, or controlling how the cmdlet performs its task. The name of the parameter is preceded by a hyphen (-) and followed by the value of the parameter as follows:

```
Verb-Noun -ParameterName <ParameterValue>
```

In this simple example, the hyphen in front of the parameter name tells the Exchange Management Shell that the word that immediately follows the hyphen is a parameter that is passed to the cmdlet and that the next separate word after the parameter is the value of the parameter.

This topic discusses the following parameters and their behavior in the Shell:

Positional parameters

Boolean parameters

Switch parameters

Common Windows PowerShell parameters

Positional parameters

A positional parameter is a parameter that lets you specify the parameter's value without specifying the parameter's name. A parameter is a positional parameter if the `Parameter Position` attribute is an integer. This integer indicates the position on the command line where the cmdlet can find the

parameter's value. For more information about the various attributes that make up a parameter, see the Parameter Details section later in this topic.

Most cmdlets only have one positional parameter, *Identity*. *Identity* is always in position `1` if it is available on a cmdlet. Some cmdlets have multiple positional parameters. With these cmdlets, you can specify the values for each positional parameter in the order specified by the `Parameter Position` attribute on each parameter. The values for each parameter must be in the correct position on the command line to work correctly.

If a parameter isn't a positional parameter, it's considered to be a `named` parameter. You must specify the parameter name and parameter value for `named` parameters.

The following two commands perform the same task of returning configuration information for a Receive connector that is named `"Contoso"`.

```
Get-ReceiveConnector -Identity "Contoso"
Get-ReceiveConnector "Contoso"
```

The following two commands perform the same task. The positional parameter values in the first command are placed in the exact order as required by the Parameter Position attribute on each parameter.

```
Set-ExampleCmdlet "Seattle Users" $True "Contoso.com"
Set-ExampleCmdlet -Name "Seattle Users" -Enabled $True -
Domain "Contoso.com"
```

Parameter details

Attributes, also called metadata, on each parameter are included in the PARAMETERS section of the Shell Help that is retrieved by the **Get-Help** cmdlet. The following example is from the **Get-Service** cmdlet.

```
PARAMETERS
    -ServiceName System.String[]
        Parameter required?           false
        Parameter position?           1
        Default value                 *
        Accept pipeline input?       true
        Accept wildcard characters?  True
```

This example from the **Get-Service** cmdlet includes some specific details about the value types that can be passed for the *ServiceName* parameter. Not all cmdlets include such details. However, most cmdlets do include some settings for each parameter as described in the following table.

Parameter settings

Setting	Description
Required?	Indicates whether the cmdlet will run if you don't supply the parameter. When *Required?* is set to `True`, the Shell prompts you for the value if the parameter isn't supplied on the command line.
Position?	Indicates whether you must put the parameter name in front of the parameter value. When *Position?* is set to `Named`, the parameter name is required. When *Position?* is set to an integer, the name isn't required, only the value.
Default value	Indicates the default value for this parameter if no other value is provided.
Accept pipeline input?	Indicates whether the parameter can receive its value as an input through a pipeline from another cmdlet.
Accept wildcard characters?	Indicates whether the parameter's value can contain wildcard characters and can be matched to multiple objects.

Boolean parameters

Boolean parameters are used in the Shell to determine, among other things, whether a feature or option is enabled, `$True`, or disabled, `$False`. The value that you assign to a Boolean parameter is stored in the configuration of the object that you're modifying. When you supply a value to a Boolean parameter, you must use the values `$True` or `1`, or `$False` or `0`. The dollar sign (`$`) must be included with `$True` and `$False`. You may notice that some commands insert a colon (:) between the Boolean parameter name and Boolean value. On Boolean parameters, this colon is optional. The following example disables the Receive connector "Contoso.com":

```
Set-ReceiveConnector "Contoso.com" -Enabled $False
```

Switch parameters

Switch parameters are commonly used to indicate whether the current command should proceed with additional prompting or to enable an alternate option for the command being run. This state isn't saved between commands. Switch parameters resemble Boolean parameters, but they serve different purposes and require different syntax. Switch parameters don't require a value. When you specify a switch parameter on a command line without a value, the parameter evaluates to `$True`.

On some cmdlets, the cmdlet may run as though the switch parameter was included on the command line, even if you didn't include it yourself. This behavior commonly occurs with the *Confirm* switch parameter on cmdlets that can cause data loss if they're inadvertently run. In the case of the *Confirm* switch parameter on such a cmdlet, the cmdlet will always prompt for confirmation before running unless you explicitly tell the cmdlet not to by overriding the switch parameter. You can override the switch parameter by including the *Confirm* switch parameter on the command line with a value of `:$False`. Unlike any other parameters, the colon character (`:`) is required between switch parameters and the value `$False`.

The first of the following examples instructs the **Start-EdgeSynchronization** cmdlet to display a confirmation prompt before it lets EdgeSync synchronization start. The second example instructs the **Remove-ReceiveConnector** cmdlet not to display a confirmation prompt before deleting the Receive connector "Contoso.com":

```
Start-EdgeSynchronization -Confirm
Remove-ReceiveConnector "Contoso.com" -Confirm:$False
```

Common Windows PowerShell parameters

There are several Windows PowerShell parameters that are automatically added to all commands by the Shell. These parameters perform functions that can be used with, or used by, the commands that they're run against. The following table lists all the common parameters that are available in the Shell. Three additional parameters, *WhatIf*, *Confirm*, and *ValidateOnly*, may also be added to cmdlets. For more information about these additional parameters, see WhatIf, Confirm, and ValidateOnly switches.

Common Windows PowerShell parameters in the Exchange Management Shell

Parameter name	Required	Type	Description
Debug	Optional	System.Boolean	The *Debug* parameter instructs the command to provide programmer-level detail about the operation.

ErrorAction	Optional	System.Enum	The *ErrorAction* parameter controls the behavior of the command when an error occurs. Values are as follows: • `Continue`, which is the default value • `Stop` • `SilentlyContinue` • `Inquire`, which asks the user what to do
ErrorVariable	Optional	System.String	The *ErrorVariable* parameter specifies the name of the variable that the command uses to store errors that are encountered during processing. This variable is populated in addition to `$ERROR`.
OutVariable	Optional	System.String	The *OutVariable* parameter specifies the name of the variable that the command uses for objects that are output from this command. This is equivalent to piping the command to `Set-Variable <name> -Passthru:$true`
Verbose	Optional	System.Boolean	The *Verbose* parameter instructs the command to provide detailed information about the

			operation. **Note:** Most **Get** cmdlets only return summary information that contains the most commonly used properties when you run them. To tell the **Get** cmdlet to return all of the properties on an object, pipe the command to the **Format-List** cmdlet. For more information, see Pipelining and Working with command output.

Pipelining

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

Pipelining in the Exchange Management Shell is the act of one cmdlet using the output of another cmdlet when it performs an operation. Pipelining is accomplished by using the pipe "|" symbol. All verbs in the same noun-cmdlet set can use piped information from another command. Some noun-cmdlet sets also let you pass data through the pipeline to another noun cmdlet set.

See the following sections for information and examples of using pipelining in the Shell:

Using pipelining to perform multiple actions

Using pipelining to process data from another cmdlet

Using pipelining to pipe data between dissimilar nouns

Using pipelining to report errors

Using pipelining to perform multiple actions

The use of pipelining to string together the actions of two or more cmdlets gives the Shell the power of composition, which lets you take smaller components and convert them into something more powerful. For example, you can use one cmdlet to gather data, pass that data to a second

cmdlet to filter the data to a subset, and then pass that data to a third cmdlet to act on the subset only.

For example, the following command uses pipelining to move all the mailboxes on `Server1` to the `Executives` database on `Server2` by using the **New-MoveRequest** cmdlet, based on output that is piped from the **Get-Mailbox** cmdlet:

```
Get-Mailbox -Server Server1 | New-MoveRequest -
TargetDatabase Executives
```

Using pipelining to process data from another cmdlet

You can also use pipelining to process data that is output by a cmdlet. For example, for a list of all processes where the `HandleCount` property of the process is larger than `400`, you can run the following command:

```
Get-Process | Where { $_.HandleCount -gt 400 } | Format-
List
```

In this example, the **Get-Process** cmdlet passes objects to the **Where-Object** cmdlet. The **Where-Object** cmdlet picks out the objects that have a property called `HandleCount` with a value larger than `400`.

Note:

Where is an alias for the **Where-Object** cmdlet. For more information, see Aliases.

In this example, the `HandleCount` property is preceded by the `$_` variable. This variable is created automatically by the Shell to store the current pipeline object. The **Where-Object** cmdlet then sends these objects to the **Format-List** cmdlet to be displayed.

The use of structured objects, instead of text, is one of the most exciting capabilities of the Shell. The use of structured objects forms the basis of a powerful compositional model of administration. For more information about structured objects, see Structured data.

Using pipelining to pipe data between dissimilar nouns

Piping data between dissimilar nouns is useful in cases where you want to use the data from one cmdlet with another cmdlet, but the preceding cmdlet in the pipeline doesn't output an object that the next cmdlet can use to identify the object to act upon. This situation typically happens if you're trying to pipe an object from a cmdlet with a noun that's different than the cmdlet that's expecting the object. For more information about cmdlets, see Cmdlets.

To pass data between cmdlets that haven't been optimized to pass objects directly between each other, you need to pass the object through the **ForEach** cmdlet. When you use the **ForEach** cmdlet, you can access the object directly using the `$_` special variable and associate its properties with the

parameters on the second cmdlet.

In the following example, the **Get-Mailbox** cmdlet and the **New-InboxRule** cmdlet aren't optimized to send objects directly between each other. For the **New-InboxRule** cmdlet to take action on objects provided by the **Get-Mailbox** cmdlet, we need to manually associate the correct property on the mailbox object to the correct parameter on the **New-InboxRule** cmdlet. To do this, we use the following command:

```
Get-Mailbox | ForEach { New-InboxRule -Name "Mark as Read"
-Mailbox $_.Name -From john@contoso.com -MarkAsRead $True}
```

In this example, we know that the **New-InboxRule** cmdlet requires that you specify the mailbox on which to create the new inbox rule. We also know that the **Get-Mailbox** cmdlet outputs an object that contains the name of each mailbox being returned. By using the **ForEach** cmdlet, which contains the command to be run on each object it receives, we gain access to the `$_` special variable, which contains the current object in the pipeline. We can access the *Name* property of the current mailbox object using the syntax `$_.Name`. We provide `$_.Name` as an argument on the *Mailbox* parameter of the **New-InboxRule** cmdlet which provides the cmdlet with the information it needs to create the new inbox rule.

Note:

ForEach is an alias for the **ForEach-Object** cmdlet. For more information, see Aliases.

Using pipelining to report errors

To report errors, you can use the error pipeline. The error pipeline lets you report errors while a command runs. You don't have to wait until the command has finished running or to put the error information in the standard result pipeline. The **Write-Error** cmdlet writes its arguments to the error pipeline.

For more information about pipelining, run the following command in the Shell:

```
Get-Help About_Pipeline
```

Script security

Exchange Server 2013 > Exchange Management Shell > Basic concepts in Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

Script security in the Exchange Management Shell helps prevent harmful or otherwise unwanted

scripts from running in your organization. Options are available to modify script security to meet the requirements of your organization.

You typically encounter scripts from several sources: yourself, another person in your organization, and script writers from outside your organization, such as the Internet. If you write a script, you trust the script to do what it's designed to do. If you share the script with other administrators in your organization, they too may trust the script because they trust you.

When scripts come from other sources, such as the Internet, script security is a concern. The only way that you can trust scripts from sources unknown to your organization is to inspect the script code directly and test it in an isolated lab environment. Although this process can be time consuming and tedious, we recommend this practice to prevent unintentional execution of malicious or destructive code.

The Shell supports the recommended use of digital signatures to make sure a script isn't altered after the script is created. For more information about digital signatures, see "Code-signing basics" later in this topic.

Script execution modes

Four modes of script execution in the Shell control how scripts are used, depending on how they are signed and if they are from known or unknown sources. The following table describes each script execution mode.

Important:
The remote Shell requires that the script execution mode be set to `RemotedSigned` or `Unrestricted`. For more information about the remote Shell, see Exchange Management Shell.

Script execution modes

Mode	Description
`Restricted` mode	No scripts will run, even if they are signed by a trusted publisher. This is the default script execution mode.
`AllSigned` mode	All scripts must be digitally signed by a trusted publisher before they will run.
`RemoteSigned` mode	All scripts locally created will run. Scripts downloaded from remote locations, such as the Internet, that can't be trusted, won't run.
`Unrestricted` mode	All scripts, regardless of whether they are digitally signed or trusted, will run. We don't

	recommend the `Unrestricted` mode unless you're running the script in a controlled test environment and not in a production environment.

To change the script execution mode from the default `Restricted` script execution mode, use the **Set-ExecutionPolicy** cmdlet in the Shell. This example changes the execution policy to `RemotedSigned` mode.

```
Set-ExecutionPolicy RemotedSigned
```

The Shell recognizes the change to the policy immediately.

Note:
If you have user access control enabled, you must open the Shell with elevated permissions to set the execution policy. To open the Shell with elevated permissions, right-click the Shell icon and select **Run as administrator**.

Large organizations that want to set a consistent script execution mode for all computers running the Shell should apply the script execution mode setting by using an Active Directory Group Policy. You configure the Active Directory Group Policy to set the `ExecutionPolicy` value located under the **HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\PowerShell\1\ShellIds\Microsoft.PowerShell** registry key to the desired script execution mode.

Caution:
Incorrectly editing the registry can cause serious problems that may require you to reinstall your operating system. Problems resulting from editing the registry incorrectly may not be able to be resolved. Before editing the registry, back up any valuable data.

Code-signing basics

Digital signatures are created by using a public-key signature algorithm that uses two different cryptographic keys called a key pair: the public key and the private key. The private key is known only to its owner, and the public key is available to anyone. In digital signatures, the private key generates the signature, and the corresponding public key validates the signature.

A *certificate* is a digital document that's generally used for authentication and to help secure information on open networks. A certificate securely binds a public key to the entity that holds the corresponding private key. Certificates are digitally signed by the issuing certification authority (CA). By using a code-signing certificate, the author of the script adds a digital signature to the script file. During this process, a one-way hash of the script is created and encrypted by using the private key. The encrypted hash is a digital signature string that's added to the script file. This digital signature string is commented out so that it doesn't interfere with script functionality.

When this script is run in a Shell environment where code signing is required, a new one-way hash

of the script file is produced. The one-way hash is compared to the encrypted hash included with the script file after it's decrypted by using the public key. If the script wasn't altered in any way after it was signed, the hashes will match. The computer then tries to verify that the signature is from a trusted publisher by building a certificate chain to a trusted CA. If the trust is verified, the script runs.

Whether a script is from a trusted source depends on the origin of the code-signing certificate used to digitally sign the script. There are generally two types of certificates:

- **Certificates issued by a trusted CA** The CA verifies the identity of the requestor before it issues a code-signing certificate. The issuing authority can be an external, public third party that sells certificates or an internal CA hosted by your organization. If you sign a script by using this kind of certificate, you can share the script with users on other computers that recognize and trust the CA that issued the certificate.
- **Self-signed certificates** For this kind of certificate, your computer is the authority that creates the certificate. The benefit of a self-signed certificate is you can write, sign, and run scripts on your computer. But you can't share your script to run on other computers because your computer isn't recognized as a trusted CA. If your computer isn't trusted, your self-signed signature can't be validated, and the script won't run.

Cmdlets for managing code signing

The Shell includes two cmdlets for managing code signing. The **Set-AuthenticodeSignature** cmdlet is used to add digital signatures to script files. The **Set-AuthenticodeSignature** cmdlet takes the name of the file to be signed as its first positional parameter. If the file isn't in the current working directory, you must provide the path of the file. The second input parameter for this cmdlet is the certificate used for signing. This certificate is stored in the local certificate store. You must provide this parameter in the form of a string that references the certificate. The certificate can be accessed through the Cert: drive.

The other cmdlet for managing code signing is the **Get-AuthenticodeSignature** cmdlet. Use the **Get-AuthenticodeSignature** cmdlet to check and confirm the current code-signing status for the file provided as a parameter input. If a problem occurs when you use a code-signed script, the output from the **Get-AuthenticodeSignature** cmdlet will provide useful troubleshooting information.

If you want to run scripts from outside sources, such as Microsoft, you must adapt the scripts according to the script execution mode of your environment. You can receive scripts as basic .txt files, rename them as .ps1 script files, and then after you apply any required signing, run these scripts as if you had written the scripts yourself.

For more information about digital signing and script execution policies, in the Shell, run the following command: `Get-Help About_Signing`. This command returns information that includes detailed instructions for digitally signing scripts.

Scripting with the Exchange Management Shell

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-17*

For most general tasks, running cmdlets one at a time or together through pipelines is sufficient. However, sometimes you may want to automate tasks. The Exchange Management Shell supports a rich scripting language, based on the Microsoft .NET Framework, which resembles the scripting language in other shells. The Shell lets you create scripts, from simple to complex. Language constructs for looping, conditional, flow control, and variable assignment are all supported.

Every organization has tasks that are in some way unique to that organization. With a library of script files to perform these tasks, you can save time by running these scripts on any computer that has the Shell installed.

For more information about how to use scripts, see Scripting with Windows PowerShell. Because the Shell is built on Microsoft Windows PowerShell technology, the scripting guidance for Windows PowerShell applies to the Exchange Management Shell.

Contents

Running a script inside the Shell

Those familiar with the Cmd.exe environment know how to run command shell scripts. These scripts are simply text files that have the .bat file name extension. Like batch files, you can create the Shell script files by using a text editor, such as Notepad. You can also use the Windows PowerShell Integrated Scripting Environment (ISE) to write scripts. The Windows PowerShell ISE provides a rich editing experience with debugging support, syntax coloring, selective execution, and more. The Shell script files use the .ps1 file name extension.

The Shell uses a root directory for script files when they are called. By default, the root directory is the *<root drive>*:\Program Files\Microsoft\Exchange Server\V15\bin directory. You can also verify the current PSHome directory on any computer running the Shell by running `$PSHome` at a command

prompt. Both of these directories are in the PATH environment variable.

If a script file is saved to the root directory, you can call it by using the script name. If the script file is located somewhere other than the current location, the path and script name must be used. If the script file is located in the current location, the script name must be prefixed by the period backslash (.\) characters.

These examples show the command syntax requirements for calling three different scripts. These examples all use the **Get-Date** cmdlet, from three different locations.

```
[PS] C:\>Get-Date-Script-A.ps1
Friday, January 20, 2006 3:13:01 PM
```

The script file Get-Date-Script-A.ps1 is located in the directory specified by `$PSHhome` and requires only the script name to run.

```
[PS] C:\>c:\workingfolder\Get-Date-Script-B.ps1
Friday, January 20, 2006 3:13:25 PM
```

The script file Get-Date-Script-B.ps1 is located in the C:\workingfolder directory so the full path must be supplied to run.

```
[PS] C:\>.\Get-Date-Script-C.ps1
Friday, January 20, 2006 3:13:40 PM
```

The script file Get-Date-Script-C.ps1 is located in the current location, C:\. Therefore, it must be prefixed with .\ to run.

```
[PS] C:\>Get-Date-Script-C.ps1
The term 'Get-Date-Script-C.ps1' is not recognized as the
name of a cmdlet, function, script file, or operable
program. Check the spelling
of the name, or if a path was included, verify that the
path is correct and try again.
At line:1 char:22
+ Get-Date-Script-C.ps1 <<<<
    + CategoryInfo          : ObjectNotFound: (Get-Date-
Script-C.ps1:String) [], CommandNotFoundException
    + FullyQualifiedErrorId : CommandNotFoundException
```

In the last example, when this same script, Get-Date-Script-C.ps1, is called without the prefix .\, the expected results are shown.

As a best practice, always give script files a descriptive name and include comments in the script to describe its purpose and to identify each point of interest. Some information about the author

should also be included in case someone running the script has questions about its use. Use the number sign (#) to start comment lines inside the script body.

Running a script from Cmd.exe

If you want to run a script on a scheduled basis using the Windows Task Scheduler service, you can call the Shell and include the script that you want to run as a parameter. If you want to use Exchange cmdlets with your script, you must direct Windows PowerShell to connect to a server running Exchange and load the Exchange cmdlets you have access to. The shortcut you use to open the Shell does this automatically. To do this when you want to run a script that contains Exchange cmdlets, you must direct Windows PowerShell to run the scripts that make this connection. This syntax is required to open Windows PowerShell, connect to an Exchange server, and run your script from the Cmd.exe command.

```
PowerShell.exe -command ". 'D:\Program Files\Microsoft
\Exchange Server\V15\bin\RemoteExchange.ps1'; Connect-
ExchangeServer -auto; <path to your script>"
```

This example runs the script RetrieveMailboxes.ps1 from C:\My Scripts.

```
PowerShell.exe -command ". 'D:\Program Files\Microsoft
\Exchange Server\V15\bin\RemoteExchange.ps1'; Connect-
ExchangeServer -auto; C:\My Scripts\RetrieveMailboxes.ps1"
```

For additional options to use when you call the Shell from the Cmd.exe environment, type **PowerShell.exe /?**

Testing scripts

When you create scripts, you should always test them in a lab environment before you apply them in your production environment. As you test your scripts in your lab, and as you deploy them in your production environment, you can use the *WhatIf* parameter that's available on many cmdlets included in the Shell to verify that your script performs as expected. The *WhatIf* parameter instructs the command to which it is applied to run, but only to display which objects would be affected by running the command and what changes would be made to those objects, without actually changing any of those objects.

For more information about the *WhatIf* parameter, see WhatIf, Confirm, and ValidateOnly switches.

Troubleshooting scripts

Scripts may not work as expected for many reasons. It can be difficult to determine where the

problem is and what's wrong. The Shell can help you locate general syntax errors by reporting the line and character at the point of failure. When the syntax of a script is correct but its behavior is unexpected, it can be much more difficult to diagnose the problem. The Shell includes simple debugging functionality to troubleshoot script files by examining each step that the script makes as it executes. This functionality is called *tracing*.

To enable tracing and examine each command step in a script, use the **Set-PSDebug** cmdlet with the *Trace* parameter set to a value of 1. To examine each step and each variable assignment as they are made, set the *Trace* parameter to a value of 2. To turn tracing off, set the value of the *Trace* parameter to 0 (zero).

To examine each command in a script line by line, use the **Set-PSDebug** cmdlet with the *Step* parameter. At each step, you will be prompted to continue the operation. The following choices are available in step mode.

```
[Y] Yes (continue to the next step)
[A] Yes to All (continue to the end of the script)
[N] No (stop this step)
[L] No to All (stop all remaining steps)
[S] Suspend (suspend at this point and drop to a prompt)
```

Suspend lets you exit to a prompt where you can run any command, for example, to check or set values on an object before the script can access it. When you are ready to resume script execution, type **Exit**, and control immediately returns to the point at which the script was suspended.

Shell variables

Exchange Server 2013 > Exchange Management Shell > Basic concepts in Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-09-19*

Shell variables are a set of variables that are created and declared automatically by the Exchange Management Shell. The variables are maintained throughout your session as part of the system state and are available to all commands, scripts, and applications that run in that session.

The Shell supports two types of shell variables:

- Automatic variables provide a mechanism for passing information to and from commands, scripts, and applications.
- Policy variables store information about the state of the Shell.

You can use shell variables as you would use any other type of variable. For example, the `$PSHome` shell variable stores the name of the directory where the Shell is installed, and the `$_` shell variable stores the current pipeline object. You can use these variables in a command to specify the location of the file and to call a property of the `Get-ChildItem` object, as shown in the following example:

```
Get-ChildItem $PSHome | Sort {$_.Name}
```

This command retrieves all items from the Shell installation directory, and it uses the name property of the object that is stored in the `$_` variable to sort the data when it is displayed.

Common Shell Variables

The following table lists several common automatic variables that are available for your use in the Shell.

Common automatic variables

Automatic variable	Description
`$$`	Contains the last token of the last line that is received by the Shell.
`$?`	Contains the success or fail status of the last operation.
`$^`	Contains the first token of the last line that is received by the Shell.
`$_`	Contains the current pipeline object that is used in script blocks, filters, and the `Where` statement.
`$Error`	Contains objects for which an error occurred when they are processed in a cmdlet.
`$ExBin`	Displays the full path of the <*root drive*>:`\Program Files\Microsoft\Exchange Server\V15\bin\` directory. This variable is only available if the Exchange management tools are installed.
`$ExScripts`	Displays the full path of the Exchange scripts

	directory. This variable is only available if the Exchange management tools are installed.
`$ForEach`	Refers to the enumerator in a `ForEach` loop.
`$Home`	Specifies the user's root directory. It is the equivalent of `%HomeDrive%%HomePath%`.
`$MaximumHistoryCount`	Specifies the maximum number of entries that can be saved in the command history.
`$PSHome`	Specifies the directory where the Shell is installed.

Structured data

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

Each action that you take in the Exchange Management Shell must be done within the context of objects. The Shell uses structured collections of information called objects. These objects represent items in hierarchical data sources. When you call a cmdlet, one or more strongly typed structured objects are returned. Objects carry information about an item and about the object's structure. The object also acts as a proxy for the real item. For example, when you access a file from the Shell, you work with the object that represents that file, and not with the file itself.

Using objects gives the Shell an advantage over other traditional command shells. Traditional command shells have always supported the redirection of the output of one command to another in the form of a textual stream. This method has its disadvantages because parsing text has to be carefully controlled, usually by some kind of encoding to prevent unexpected behavior. By using objects, the Shell enables you to more easily choose the data you want to work with and use predefined methods to utilize and manipulate that data. You spend less time retrieving the data and more time using it.

The Exchange Management Shell uses this object model to pass information from one command to another by using pipelining. This avoids the problems caused by textual parsing in other command shells because the data that the Shell uses has a definite structure and is interpreted according to the object model.

For more information about pipelining, see Pipelining.

Structure of an object

An object consists of three types of data: the object's type, its properties, and its methods.

Object type

The data type of an object provides details about what kind of object it is. For example, an object that represents a mailbox is a **Mailbox** object. An object that represents a file is a **FileInfo** object. All objects have a distinct predefined type and namespace that the Shell can process.

To see what object types are accepted and returned by cmdlets, see Cmdlet Input and Output Types.

Object properties

A property is data associated with an object that specifies a particular state of that object. For example, a **Mailbox** object includes the property **EmailAddresses**. This object property represents the value of the actual attribute **ProxyAddresses** on mailbox-enabled Active Directory user accounts. This is the actual item represented by the **Mailbox** object.

The information about properties included with an object includes the current state and the definition of each property. This includes its name and the type of data that the property can take, such as Integer, Boolean, String, and so on.

Object methods

A method is a set of instructions that defines a particular action that you can take on an object. Methods are defined based on the object type. For example, an object that is of type System.String, or String, has several methods that enable you to manipulate the string. Using the **ToUpper()** method on a string enables you to raise all of the characters within the string to uppercase. Some methods don't take arguments and some require arguments. It depends on the particular method you're using.

To call the methods available to an object, specify the method you want to use after the variable that the object is stored in. The variable and the method are separated by a period. The following example stores a string in the *$Example* variable and then calls the **ToUpper()** method to raise the string to uppercase.

```
$Example = "This is a string"
$Example.ToUpper()
THIS IS A STRING.
```

Notice that if you run `$Example` again, the string itself hasn't been modified.

```
$Example
This is a string.
```

To update the variable with the output of the method, you need to assign the output to the variable as shown in the following example.

```
$Example = "This is a string"
$Example = $Example.ToUpper()
```

Now when you run `$Example`, the string has been changed to uppercase in the variable.

```
$Example
THIS IS A STRING.
```

If an object has properties, the properties can also have their own methods. As with objects, the type of the property defines what methods are available. The property type doesn't necessarily match the object type. To call a method on an object property, you use similar syntax to when you call an object method, but you include the property along with the object. For example, a Send connector object has a property called **MaxMessageSize**, which is of type ByteQuantifiedSize. One of the methods for the type ByteQuantifiedSize is **ToMB()**. The following command displays the value stored in **MaxMessageSize**.

```
$Connector = Get-ReceiveConnector "From Internet"
$Connector.MaxMessageSize
35 MB (36,700,160 bytes)
```

If you now call the **ToMB()** method, the value stored in **MaxMessageSize** is displayed in megabytes.

```
$Connector.MaxMessageSize.ToMB()
35
```

Syntax

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-01*

This topic explains how to read the Exchange Management Shell parameter sets and examples in the Exchange Help documentation and how to format a command so that the Shell can process the command. In the Shell and the Microsoft Exchange Server 2013 Help, parameter sets are displayed in the Syntax section of a cmdlet Help topic. For more information about cmdlet help, see Getting help.

Contents

Command conventions in the Exchange Management Shell

The Shell follows several command conventions that help you understand what information is required or optional when you run a command and how you must present the parameters and their values. See the "Parameter sets" section later in this topic for examples of how parameter sets are presented in the Shell Help and Exchange 2013 Help.

The following table lists these command conventions.

Exchange Management Shell command conventions

Symbol	Description
-	A hyphen indicates that the next word on the command line is a parameter. The most common parameter is *Identity*. For more information, see Parameters.
< >	Angle brackets are used to enclose parameter values. These values can be choices or names. For example, in `-Parameter1 <1 | 2 | 3>`, the numbers represent specific value choices. In `-Parameter2 <ServerName>`, `ServerName` represents the actual value.
[ ]	Square brackets are used to enclose an optional parameter and its value. A parameter

	and its value that are not enclosed in square brackets are required.
|	When the pipe symbol is used in a parameter value list, such as `-Parameter1 <1 | 2 | 3>`, it indicates a choice between available values. This convention applies to `System.Enum` parameters and `System.Boolean` parameters.

These command conventions help you understand how a command should be constructed. Don't type these conventions when you enter the command on the command line.

Parameter sets

In the Exchange Help documentation, all cmdlets display their associated parameters in parameter sets. Parameter sets are groupings of parameters that can be used with each other. Parameters that exist in one parameter set, but not in another parameter set, are mutually exclusive. They can't be used together.

Although all cmdlets have parameter sets, many only have one set of parameters. This means that all the parameters on that cmdlet can be used with each other. Other cmdlets may have several parameter sets. The following example displays the parameter sets that are available on the **New-SystemMessage** cmdlet:

```
New-SystemMessage -DsnCode <EnhancedStatusCode> -Internal
<$true | $false> -Language <CultureInfo> -Text <String>
<COMMON PARAMETERS>
New-SystemMessage -Language <CultureInfo> -QuotaMessageType
<WarningMailboxUnlimitedSize |
WarningPublicFolderUnlimitedSize | WarningMailbox |
WarningPublicFolder | ProhibitSendMailbox |
ProhibitPostPublicFolder | ProhibitSendReceiveMailBox> -
Text <String> <COMMON PARAMETERS>
COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

The **New-SystemMessage** cmdlet has two parameter sets (plus the COMMON PARAMETERS list; more on that later). The first parameter set contains the *DsnCode* parameter and *Internal* parameter, and the second parameter set contains the *QuotaMessageType* parameter. This means that the *DsnCode* parameter and *Internal* parameter can be used with each other. But, they can't be used with the *QuotaMessageType* parameter.

Parameter sets can indicate that a single cmdlet may have multiple uses. For example, you can use the **New-SystemMessage** cmdlet to configure customized delivery status notification (DSN) messages or configure customized mailbox quota limit messages. However, cmdlets typically have multiple parameter sets because one parameter may perform a function that is incompatible with another parameter. For example, the following example displays the parameter sets for the **Set-ManagementScope** cmdlet:

```
Set-ManagementScope [-RecipientRestrictionFilter <String>]
[-RecipientRoot <OrganizationalUnitIdParameter>] <COMMON
PARAMETERS>
Set-ManagementScope -ServerRestrictionFilter <String>
<COMMON PARAMETERS>
Set-ManagementScope -DatabaseRestrictionFilter <String>
<COMMON PARAMETERS>
Set-ManagementScope -
PartnerDelegatedTenantRestrictionFilter <String> <COMMON
PARAMETERS>
COMMON PARAMETERS: -Identity <ManagementScopeIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>]
[-Force <SwitchParameter>] [-Name <String>] [-WhatIf
[<SwitchParameter>]]
```

In the **Set-ManagementScope** cmdlet, the first parameter set lists the parameters that let you create a recipient filter-based management scope. The subsequent parameter sets let you create server and database scopes respectively (partner scopes are a Microsoft internal-only scope and are not publically available). Only the parameters that are listed in each parameter set can be used with each other. For example, you can't use the *RecipientRestrictionFilter* parameter with the *DatabaseRestrictionFilter* parameter in the same command because they're in different parameter sets.

However, you'll notice that each parameter set includes **<COMMON PARAMETERS>**. *Common parameters* can be used with parameters in any parameter set. The list of common parameters is included at the end of all the available parameter sets and begins with **COMMON PARAMETERS**:. You can, for example, use the *Identity* parameter in a command with the *RecipientRestrictionFilter* parameter and in another command with the *ServerRestrictionFilter* parameter, or any other parameter.

Use of quotation marks

Double quotation marks (") are most commonly used to enclose a value that has spaces when you pass that value to a parameter. For example, if you want to pass `Contoso Receive Connector` to the *Name* parameter of the **Set-ReceiveConnector** cmdlet, you must enclose `Contoso Receive`

`Connector` in quotation marks as in the following example:

```
Set-ReceiveConnector -Name "Contoso Receive Connector"
```

If you don't enclose the string in quotation marks, the Shell tries to interpret each word in the string as a new argument on the command line and displays an error.

In the Shell, double quotation marks and single quotation marks (') have different meanings. When you enclose a string in double quotation marks, the Shell replaces any variables with a matching value. For example, assume the value `serverName` is assigned to the variable `$server`. Then, assume the following command is entered on the command line:

```
"$Server Example"
```

The following output is displayed:

```
ServerName Example
```

The variable `$server` is replaced by the value `serverName` in the output.

When you enclose a string in single quotation marks, the Shell doesn't try to replace variables with a matching value. Assume the variable `$server` is still assigned the value `serverName`. Then assume the following command is entered on the command line:

```
'$Server-Example'
```

The following output is displayed:

```
$Server-Example
```

The variable `$server` has not been replaced with a value because the Shell doesn't interpret variables that are included in text that is enclosed in single quotation marks.

For more information about variables, see User-defined variables and Shell variables.

Escape character

You may also want to display some characters, such as the dollar sign (`$`), double or single quotation marks, or back quotation mark (` ). These characters have special meanings when you use them in the Shell. To instruct the Shell not to interpret these characters and to display them when they are included in a string that is enclosed with double quotation marks, you must use the back quotation mark escape character ( `). For example, type the following text on the command line:

```
"The price is `$23."
```

The following output is displayed:

```
The price is $23.
```

Because we used the back quotation escape character with the dollar sign (`$`), the Shell doesn't interpret the `$` as the beginning of a variable.

If you enclose a string in single quotation marks, you don't have to escape any character unless you want to display a single quotation mark in a string. If you want to display a single quotation mark in a string that is enclosed in single quotation marks, you must use two single quotation marks (`''`). For example, type the following on the command line:

```
'Don''t confuse two single quotation marks with a double quotation mark!'
```

The following output is displayed:

```
Don't confuse two single quotation marks with a double quotation mark!
```

Command operators in the Exchange Management Shell

Use the operators in the following table when you type commands in the Shell. Some of the operators may match some of the previously mentioned command conventions. However, they don't have the same meaning when they are typed on the command line. The following table shows the valid operators that you can use in a command.

Exchange Management Shell command operators

Operator	Description
=	The equal sign is used as an assignment character. The value on the right side of the equal sign is assigned to the variable on the left side of the equal sign. The following characters are also assignment characters: • **+=** Add the value on the right side of the equal sign to the current value that is contained in the variable on the left side of the equal sign. • **-=** Subtract the value on the right side of the equal sign from the current value that is contained in the variable on the left side of the equal sign. • ***=** Multiply the current value of the variable on the left side of the equal sign by the value that is specified on the right side

	of the equal sign. • **/=** Divide the current value of the variable on the left side of the equal sign by the value that is specified on the right side of the equal sign. • **%=** Modify the current value of the variable on the left side of the equal sign by the value that is specified on the right side of the equal sign.
:	A colon can be used to separate a parameter's name and the parameter's value, as in the following example: `-Enabled:$True`. The use of a colon is optional with all parameter types except switch parameters. For more information about switch parameters, see Parameters.
!	The exclamation point is a logical **NOT** operator. When it is used with the equal (**=**) sign, the combined pair means "not equal to."
[ ]	Brackets are used to specify the index value of an array position. For example, `$Red[9]` refers to the tenth index position in the array, `$Red`. It refers to the tenth index position because array indexes start at zero (`0`). Brackets can also be used to assign a type to a variable, as in the following example: `$A=[XML] "<Test><A>value</A></Test>"`. The following types are valid: `Array`, `Bool`, `Byte`, `Char`, `Char[]`, `Decimal`, `Double`, `Float`, `Int`, `Int[]`, `Long`, `Long[]`, `RegEx`, `Single`, `ScriptBlock`, `String`, `Type`, and `XML`.
{ }	Braces are used to include an expression in a command, as in the following example: `Get-Process | Where { $_.HandleCount -gt 400 }`
|	The pipe symbol is used when one cmdlet pipes a result to another cmdlet. For example, the following command pipes the results from the Get-Mailbox cmdlet to the Set-Mailbox cmdlet: `Get-Mailbox -Server SRV1 | Set-Mailbox -ProhibitSendQuota 2GB`

>	The right-angle bracket is used to send the output of a command to a file, as in the following example: `Get-TransportRulePredicate > c:\out.txt`. The destination file is overwritten.
>>	Double right-angle brackets are used to append the output of a command to a file, if the file exists. If the file doesn't exist, a new file is created. The following is an example of how to use double right-angle brackets: `Get-TransportRulePredicate >>c:\out.txt`
" "	Quotation marks are used to enclose a string that contains spaces.
$	A dollar sign indicates a variable. For example, `$Blue = 10` assigns the value `10` to the variable `$Blue`.
@	The @ symbol references an associative array. For more information, see Arrays.
$( )	A dollar sign (`$`) with parentheses indicates command substitution. You can use command substitution when you want to use the output of one command as an argument in another command, as in the following example: `Get-ChildItem $(Read-Host -Prompt "Enter FileName: ")`
..	Double-periods indicate a value range. For example, if an array contains several indexes, you can specify the following command to return the values of all indexes between the second and fifth indexes, as in the following example: `$Blue[2..5]`
+	The **+** operator adds two values together. For example, `6 + 6` equals `12`.
-	The **-** operator subtracts one value from another value. For example, `12 - 6` equals `6`. The **-** operator can also be used to represent a negative number,

	such as `-6`. For example, `-6 * 6` equals `-36`.	
*****	A wildcard character has several meanings. You can use wildcard characters to match strings, to multiply numeric values, or, if strings and numeric values are used together, to repeat the string value the number of times that is specified by the numeric value, as in the following example: `"Test" * 3` equals `TestTestTest`.	
/	The **/** operator divides one value by another. For example, `6 / 6` equals `1`.	
%	When used in a numerical evaluation, the **%** operator returns the remainder from a division operator. For example, `6 % 4` equals `2`. When used in a pipeline, the percent character (`%`) is shorthand for the `ForEach` cmdlet. For example, instead of the command `Import-Csv c:\MyFile.csv | ForEach { Set-Mailbox $_.Identity -Name $_.Name }`, you can use `Import-Csv c:\MyFile.csv | % { Set-Mailbox $_.Identity -Name $_.Name }`. For more information, see Pipelining.	
?	The question mark character (`?`) is shorthand for the **Where** cmdlet. For example, instead of `Get-Alias | Where {$_.Definition -eq "Clear-Host"}`, you can use `Get-Alias \| ? {$_.Definition -eq "Clear-Host"}`.	

User-defined variables

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-05*

A variable is a location to store information. Unlike in many programming environments, in the Exchange Management Shell, you don't have to declare a variable before you use it.

You designate a variable by prepending a string with a dollar sign (`$`). You must enclose the string in braces (`{ }`) if the string contains spaces or other special characters. By using the array reference notation (`[ ]`), you can address the elements of an array or hash table variable. For more information, see Arrays.

See the following sections for more information about user-defined variables in the Shell:

Using variables to store values

Storing the output of a command in a variable

Storing the output of the Dir command in a variable

Using variables to store values

Variables are very useful if you want to store a value. You can assign values to variables by using an assignment operator. For more information about operators, see Syntax.

For example, to assign a value of `8` to the variable `$Example`, use the following command:

```
$Example = 8
```

This command assigns the integer `8` to the variable `$Example`. You can then call the `$Example` variable later in another command to recall the value. The values that are specified in a variable are treated exactly as if the value that it contains was typed in the location that the variable is specified. For example, the following two commands are equivalent if `$Example2` is assigned the value `"Hello"`:

```
Write-Host $Example2
Write-Host "Hello"
```

Storing the output of a command in a variable

You can also store the output of commands in a variable for later use. When you assign a command to a variable, the command is evaluated at the time that command is run. The output of that command is assigned to the variable. For example, if you run `$CurrentDate = Get-Date` on the command line and then call `$CurrentDate` repeatedly over several seconds, the value that is reported is the same every time that the variable is called.

When you assign the output of a command to a variable, you can also access the properties and methods of the underlying object. For example, to view the properties and methods that are available when you assign `Get-Date` to `$CurrentDate`, you can use the `$CurrentDate | Get-Member`

command. When you use the `$CurrentDate | Get-Member -MemberType Property` command, the following properties are returned in a list:

```
Name         MemberType Definition
----         ---------- ----------
Date         Property   System.DateTime Date {get;}
Day          Property   System.Int32 Day {get;}
DayOfWeek    Property   System.DayOfWeek DayOfWeek {get;}
DayOfYear    Property   System.Int32 DayOfYear {get;}
Hour         Property   System.Int32 Hour {get;}
Kind         Property   System.DateTimeKind Kind {get;}
Millisecond  Property   System.Int32 Millisecond {get;}
Minute       Property   System.Int32 Minute {get;}
Month        Property   System.Int32 Month {get;}
Second       Property   System.Int32 Second {get;}
Ticks        Property   System.Int64 Ticks {get;}
TimeOfDay    Property   System.TimeSpan TimeOfDay {get;}
Year         Property   System.Int32 Year {get;}
```

You can then call any of these properties by typing the variable, a period (`.`), and then the property that you want to view. For example, to view the year that is stored on a variable, use the following command:

```
$CurrentDate.Year
```

By accessing the properties of a variable, you can easily manipulate and use each piece of information that is stored in the variable without the use of text parsing.

Storing the output of the Dir command in a variable

You can also store the output of the `Dir` command in a variable. Because the `Dir` command returns multiple rows when it runs, each row that is returned is stored in a variable as a new array element. You can then access each file object that is stored in the newly created array. For more information about arrays, see Arrays.

The following command assigns the output of the `Dir` command to the `$DirOutput` variable:

```
$DirOutput = Dir
```

You can then select a specific file object by specifying the array index that you want to view as follows:

```
$DirOutput[1].Name
```

Or you can create a simple loop that cycles through the whole array and displays the name and file size of each file that is stored in the array as follows:

```
0..$DirOutput.Length | ForEach { $DirOutput[$_].Name + " is
" + $DirOutput[$_].Length + " bytes long." }
```

The following list examines this example:

- The `0..$DirOutput.Length` command instructs the Shell to output an integer from `0` to the maximum length of the array that is stored in the `$DirOutput` variable.
- The output of the `0..$DirOutput.Length` command is piped to the `ForEach` command that loops through each element of the array until it reaches the end of the array. The `ForEach` command runs the commands that are enclosed in the braces " `{ }` ".
- The `$_` variable stores the current object that is in the pipeline. In this case, the object in the pipeline is an integer that is produced by the `0..$DirOutput.Length` command as it counts from `0` to the maximum length of the array. This variable is used in the `$DirOutput[$_].Name` command and `$DirOutput[$_].Length` command to select the array element to access.
- For more information about the `$_` variable, see Shell variables.
- The plus " `+` " signs concatenate the output of the `$DirOutput[$_].Name` command and `$DirOutput[$_].Length` command, together with the strings supplied, to create output similar to the following:

```
abv_dg.dll is 416144 bytes long.
addxa.dll is 285056 bytes long.
ASDat.MSI is 5626880 bytes long.
ASEntDat.MSI is 5626880 bytes long.
ASEntIRS.MSI is 910336 bytes long.
ASEntSig.MSI is 45056 bytes long.
BPA.Common.dll is 211848 bytes long.
BPA.ConfigCollector.dll is 101272 bytes long.
BPA.NetworkCollector.dll is 52128 bytes long.
```

These examples show that you can use the `Length` property more than one time to display different information about the same variable. You can do this because more than one type of data is stored in the `$DirOutput` variable. The first type of data is the directory object itself, and the second type of data is the file objects. When you run the `$DirObject.Length` command, without specifying an array index, you're accessing the directory parent object types that are stored in the array. When you specify an array index, such as `$DirObject[5].Length`, you're accessing the file child objects that are stored in the directory object.

This behavior exists on many objects. You can typically access many levels of object data that are contained in a single variable. The ability to access this data makes the Shell quite flexible.

WhatIf, Confirm, and ValidateOnly switches

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-04*

Both experienced administrators and script writers, and administrators who are new to Exchange and scripting, can benefit from using the *WhatIf*, *Confirm*, and *ValidateOnly* switches. These switches let you control how your commands run and indicate exactly what a command will do before it affects data. This functionality is quite valuable as you transition from your test environment into your production environment and as you roll out new scripts or commands.

The *WhatIf*, *Confirm*, and *ValidateOnly* switches are especially useful when you use them with commands that modify objects that are returned by using a filter or by using a **Get** command in a pipeline. This topic describes each switch and also provides an example command for each switch.

Important:

If you want to use the *WhatIf*, *Confirm*, and *ValidateOnly* switches with commands in a script, you must add the appropriate switch to each command in the script, and not on the command line that calls the script.

Note:

WhatIf, *Confirm*, and *ValidateOnly* are called switch parameters. For more information about switch parameters, see Parameters.

WhatIf switch

The *WhatIf* switch instructs the command to which it is applied to run but only to display the objects that would be affected by running the command and what changes would be made to those objects. The switch does not actually change any of those objects. When you use the *WhatIf* switch, you can see whether the changes that would be made to those objects match your expectations, without the worry of modifying those objects.

When you run a command together with the *WhatIf* switch, you put the *WhatIf* switch at the end of the command, as in the following example:

```
New-AcceptedDomain -Name "Contoso Domain" -DomainName "contoso.com" -WhatIf
```

When you run this example command, the following text is returned by the Shell:

```
What if: Creating Accepted Domain "Contoso Domain" with
domain name "contoso.com".
```

Confirm switch

The *Confirm* switch instructs the command to which it is applied to stop processing before any changes are made. The command then prompts you to acknowledge each action before it continues. When you use the *Confirm* switch, you can step through changes to objects to make sure that changes are made only to the specific objects that you want to change. This functionality is useful when you apply changes to many objects and want precise control over the operation of the Shell. A confirmation prompt is displayed for each object before the Shell modifies the object.

By default, the Shell automatically applies the *Confirm* switch to cmdlets that have the following verbs:

- **Clear**
- **Disable**
- **Dismount**
- **Move**
- **Remove**
- **Stop**
- **Suspend**
- **Uninstall**

When a cmdlet runs that has any of these verbs, the Shell automatically stops the command and waits for your acknowledgement before it continues to process.

If you want to manually apply the *Confirm* switch to a command, include the *Confirm* switch at the end of the command, as in the following example:

```
Get-JournalRule | Enable-JournalRule -Confirm
```

When you run this example command, the following confirmation prompt is returned by the Shell:

```
Confirm
Are you sure you want to perform this action?
Enabling journal rule "Litigation Journal Rule".
[Y] Yes  [A] Yes to All  [N] No  [L] No to All  [S] Suspend
 [?] Help
(default is "Y"):
```

The confirmation prompt gives you the following choices:

- **[Y] Yes** Type **Y** to instruct the command to continue the operation. The next operation will present another confirmation prompt. `[Y] Yes` is the default choice.
- **[A] Yes to All** Type **A** to instruct the command to continue the operation and all subsequent

operations. You will not receive additional confirmation prompts for the duration of this command.

- **[N] No** Type **N** to instruct the command to skip this operation and continue with the next operation. The next operation will present another confirmation prompt.
- **[L] No to All** Type **L** to instruct the command to skip this operation and all subsequent operations.
- **[S] Suspend** Type **S** to pause the current pipeline and return to the command line. Type **Exit** to resume the pipeline.
- **[?] Help** Type **?** to display confirmation prompt Help on the command line.

If you want to override the default behavior of the Shell and suppress the confirmation prompt for cmdlets on which it is automatically applied, you can include the *Confirm* switch with a value of `$False`, as in the following example:

```
Get-JournalRule | Disable-JournalRule -Confirm:$False
```

In this case, no confirmation prompt is displayed.

Caution:

The default value of the *Confirm* switch is `$True`. The default behavior of the Shell is to automatically display a confirmation prompt. If you suppress this default behavior, you instruct the command to suppress all confirmation prompts for the duration of that command. The command will process all objects that meet the criteria for the command without confirmation.

ValidateOnly switch

The *ValidateOnly* switch instructs the command to which it is applied to evaluate all the conditions and requirements that are needed to perform the operation before you apply any changes. The *ValidateOnly* switch is available on cmdlets that may take a long time to run, have several dependencies on multiple systems, or affect critical data, such as mailboxes.

When you apply the *ValidateOnly* switch to a command, the command runs through the whole process. The command performs each action as it would without the *ValidateOnly* switch. But the command doesn't change any objects. When the command completes its process, it displays a summary with the results of the validation. If the validation indicates that the command was successful, you can run the command again without the *ValidateOnly* switch.

When you run a command together with the *ValidateOnly* switch, you put the *ValidateOnly* switch at the end of the command.

Working with command output

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-09*

The Exchange Management Shell offers several methods that you can use to format command output. This topic discusses the following subjects:

- How to format data Control how the data that you see is formatted by using the **Format-List**, **Format-Table**, and **Format-Wide** cmdlets.
- How to output data Determine whether data is output to the Shell console window or to a file by using the **Out-Host** and **Out-File** cmdlets. Included in this topic is a sample script to output data to Microsoft Internet Explorer.
- How to filter data Filter data by using either of the following filtering methods:
  - Server-side filtering, available on certain cmdlets.
  - Client-side filtering, available on all cmdlets by piping the results of a command to the **Where-Object** cmdlet.

To use the functionality that is described in this topic, you must be familiar with the following concepts:

- Pipelining
- Shell variables
- Comparison operators

How to format data

If you call formatting cmdlets at the end of the pipeline, you can override the default formatting to control what data is displayed and how that data appears. The formatting cmdlets are **Format-List**, **Format-Table**, and **Format-Wide**. Each has its own distinct output style that differs from the other formatting cmdlets.

Format-List

The **Format-List** cmdlet takes input from the pipeline and outputs a vertical columned list of all the specified properties of each object. You can specify which properties you want to display by using the *Property* parameter. If the **Format-List** cmdlet is called without any parameters specified, all properties are output. The **Format-List** cmdlet wraps lines instead of truncating them. One of the best uses for the **Format-List** cmdlet is to override the default output of a cmdlet so that you can retrieve additional or more focused information.

For example, when you call the **Get-Mailbox** cmdlet, you only see a limited amount of information in table format. If you pipe the output of the **Get-Mailbox** cmdlet to the **Format-List** cmdlet and add parameters for the additional or more focused information that you want to view, you can retrieve the output that you want.

You can also specify a wildcard character "*" with a partial property name. If you include a wildcard

character, you can match multiple properties without having to type each property name individually. For example, `Get-Mailbox | Format-List -Property Email*` returns all properties that begin with `Email`.

The following examples show the different ways that you can view the same data returned by the **Get-Mailbox** cmdlet.

```
Get-Mailbox TestUser1
Name                      Alias                ServerName
     ProhibitSendQuo

    ta
----                      -----                ----------
     ---------------
TestUser1                 TestUser1            mbx
     unlimited
```

In the first example, the **Get-Mailbox** cmdlet is called without specific formatting so the default output is in table format and contains a predetermined set of properties.

```
Get-Mailbox TestUser1 | Format-List -Property
Name,Alias,EmailAddresses
Name           : TestUser1
Alias          : TestUser1
EmailAddresses : {SMTP:TestUser1@contoso.com}
```

In the second example, the output of the **Get-Mailbox** cmdlet is piped to the **Format-List** cmdlet, together with specific properties. As you can see, the format and content of the output is significantly different.

```
Get-Mailbox TestUser1 | Format-List -Property Name, Alias,
Email*
Name                      : Test User
Alias                     : TestUser1
EmailAddresses            : {SMTP:TestUser1@contoso.com}
EmailAddressPolicyEnabled : True
```

In the last example, the output of the **Get-Mailbox** cmdlet is piped to the **Format-List** cmdlet as in the second example. However, in the last example, a wildcard character is used to match all properties that start with `Email`.

If more than one object is passed to the **Format-List** cmdlet, all specified properties for an object are displayed and grouped by object. The display order depends on the default parameter for the

cmdlet. The default parameter is most frequently the *Name* parameter or the *Identity* parameter. For example, when the **Get-Childitem** cmdlet is called, the default display order is file names in alphabetical order. To change this behavior, you must call the **Format-List** cmdlet, together with the *GroupBy* parameter, and the name of a property value by which you want to group the output. For example, the following command lists all files in a directory and then groups these files by extension.

```
Get-Childitem | Format-List Name,Length -GroupBy Extension
    Extension: .xml
Name   : Config_01.xml
Length : 5627
Name   : Config_02.xml
Length : 3901
    Extension: .bmp
Name   : Image_01.bmp
Length : 746550
Name   : Image_02.bmp
Length : 746550
    Extension: .txt
Name   : Text_01.txt
Length : 16822
Name   : Text_02.txt
Length : 9835
```

In this example, the **Format-List** cmdlet has grouped the items by the *Extension* property that is specified by the *GroupBy* parameter. You can use the *GroupBy* parameter with any valid property for the objects in the pipeline stream.

Format-Table

The **Format-Table** cmdlet lets you display items in a table format with label headers and columns of property data. By default, many cmdlets, such as the **Get-Process** and **Get-Service** cmdlets, use the table format for output. Parameters for the **Format-Table** cmdlet include the *Properties* and *GroupBy* parameters. These parameters work exactly as they do with the **Format-List** cmdlet.

The **Format-Table** cmdlet also uses the *Wrap* parameter. This parameter enables long lines of property information to display completely instead of truncating at the end of a line. To see how the *Wrap* parameter is used to display returned information, compare the output of the **Get-Command** command in the following two examples.

In the first example, when the **Get-Command** cmdlet is used to display command information about the **Get-Process** cmdlet, the information for the *Definition* property is truncated.

```
Get-Command Get-Process | Format-Table Name,Definition
Name                                               Definition
----                                               ----------
get-process                                        get-process [[-
ProcessName] String[]...
```

In the second example, the *Wrap* parameter is added to the command to force the complete contents of the *Definition* property to display.

```
Get-Command Get-Process | Format-Table Name,Definition -
Wrap
Get-Process                                        Get-Process [[-
Name] <String[]>] [-Comp
                                                   uterName <String[]
>] [-Module] [-FileVe
                                                   rsionInfo] [-
Verbose] [-Debug] [-ErrorA
                                                   ction
<ActionPreference>] [-WarningActi
                                                   on
<ActionPreference>] [-ErrorVariable
                                                   <String>] [-
WarningVariable <String>] [
                                                   -OutVariable
<String>] [-OutBuffer <Int
                                                   32>]
                                                   Get-Process -Id
<Int32[]> [-ComputerNam
                                                   e <String[]>] [-
Module] [-FileVersionIn
                                                   fo] [-Verbose] [-
Debug] [-ErrorAction <
                                                   ActionPreference>]
[-WarningAction <Act
                                                   ionPreference>] [-
ErrorVariable <String
                                                   >] [-
WarningVariable <String>] [-OutVar
                                                   iable <String>] [-
```

```
OutBuffer <Int32>]
                                                    Get-Process [-
ComputerName <String[]>]
                                                    [-Module] [-
FileVersionInfo] -InputObje
                                                    ct <Process[]> [-
Verbose] [-Debug] [-Er
                                                    rorAction
<ActionPreference>] [-Warning
                                                    Action
<ActionPreference>] [-ErrorVaria
                                                    ble <String>] [-
WarningVariable <String
                                                    >] [-OutVariable
<String>] [-OutBuffer
                                                    <Int32>]
```

As with the **Format-List** cmdlet, you can also specify a wildcard character "*" with a partial property name. By including a wildcard character, you can match multiple properties without typing each property name individually.

Format-Wide

The **Format-Wide** cmdlet provides a much simpler output control than the other format cmdlets. By default, the **Format-Wide** cmdlet tries to display as many columns of property values as possible on a line of output. By adding parameters, you can control the number of columns and how the output space is used.

In the most basic usage, calling the **Format-Wide** cmdlet without any parameters arranges the output in as many columns as will fit the page. For example, if you run the **Get-Childitem** cmdlet and pipe its output to the **Format-Wide** cmdlet, you will see the following display of information:

```
Get-ChildItem | Format-Wide
    Directory: FileSystem::C:\WorkingFolder
Config_01.xml                               Config_02.xml
Config_03.xml                               Config_04.xml
Config_05.xml                               Config_06.xml
Config_07.xml                               Config_08.xml
Config_09.xml                               Image_01.bmp
Image_02.bmp                                Image_03.bmp
Image_04.bmp                                Image_05.bmp
```

```
Image_06.bmp                    Text_01.txt
Text_02.txt                     Text_03.txt
Text_04.txt                     Text_05.txt
Text_06.txt                     Text_07.txt
Text_08.txt                     Text_09.txt
Text_10.txt                     Text_11.txt
Text_12.txt
```

Generally, calling the **Get-Childitem** cmdlet without any parameters displays the names of all files in the directory in a table of properties. In this example, by piping the output of the **Get-Childitem** cmdlet to the **Format-Wide** cmdlet, the output was displayed in two columns of names. Notice that only one property type can be displayed at a time, specified by a property name that follows the **Format-Wide** cmdlet. If you add the *Autosize* parameter, the output is changed from two columns to as many columns as can fit the screen width.

```
Get-ChildItem | Format-Wide -AutoSize
    Directory: FileSystem::C:\WorkingFolder
Config_01.xml   Config_02.xml   Config_03.xml
Config_04.xml   Config_05.xml
Config_06.xml   Config_07.xml   Config_08.xml
Config_09.xml   Image_01.bmp
Image_02.bmp    Image_03.bmp    Image_04.bmp
Image_05.bmp    Image_06.bmp
Text_01.txt     Text_02.txt     Text_03.txt     Text_04.txt
    Text_05.txt
Text_06.txt     Text_07.txt     Text_08.txt     Text_09.txt
    Text_10.txt
Text_11.txt     Text_12.txt
```

In this example, the table is arranged in five columns, instead of two columns. The *Column* parameter offers more control by letting you specify the maximum number of columns to display information as follows:

```
Get-ChildItem | Format-Wide -Column 4
    Directory: FileSystem::C:\WorkingFolder
Config_01.xml       Config_02.xml       Config_03.xml
 Config_04.xml
Config_05.xml       Config_06.xml       Config_07.xml
 Config_08.xml
Config_09.xml       Image_01.bmp        Image_02.bmp
 Image_03.bmp
```

```
Image_04.bmp          Image_05.bmp          Image_06.bmp
 Text_01.txt
Text_02.txt           Text_03.txt           Text_04.txt
 Text_05.txt
Text_06.txt           Text_07.txt           Text_08.txt
 Text_09.txt
Text_10.txt           Text_11.txt           Text_12.txt
```

In this example, the number of columns is forced to four by using the *Column* parameter.

How to output data

Out-Host and Out-File cmdlets

The **Out-Host** cmdlet is an unseen default cmdlet at the end of the pipeline. After all formatting is applied, the **Out-Host** cmdlet sends the final output to the console window for display. You don't have to explicitly call the **Out-Host** cmdlet, because it's the default output. You can override sending the output to the console window by calling the **Out-File** cmdlet as the last cmdlet in the command. The **Out-File** cmdlet then writes the output to the file that you specify in the command as in the following example:

```
Get-ChildItem | Format-Wide -Column 4 | Out-File c:
\OutputFile.txt
```

In this example, the **Out-File** cmdlet writes the information that is displayed in the **Get-ChildItem | Format-Wide -Column 4** command to a file that is named `OutputFile.txt`. You can also redirect pipeline output to a file by using the redirection operator, which is the right-angle bracket (>). To append pipeline output of a command to an existing file without replacing the original file, use the double right-angle brackets (>>), as in the following example:

```
Get-ChildItem | Format-Wide -Column 4 >> C:\OutputFile.txt
```

In this example, the output from the **Get-Childitem** cmdlet is piped to the **Format-Wide** cmdlet for formatting and then is written to the end of the `OutputFile.txt` file. Notice that if the `OutputFile.txt` file didn't exist, use of the double right-angle brackets (>>) would create the file.

For more information about pipelines, see Pipelining.

For more information about the syntax used in the previous examples, see Syntax.

Viewing data in Internet Explorer

Because of the flexibility and ease of scripting in the Exchange Management Shell, you can take the

data that is returned by commands and format and output them in almost limitless ways.

The following example shows how you can use a simple script to output the data that is returned by a command and display it in Internet Explorer. This script takes the objects that are passed through the pipeline, opens an Internet Explorer window, and then displays the data in Internet Explorer:

```
$Ie = New-Object -Com InternetExplorer.Application
$Ie.Navigate("about:blank")
while ($Ie.Busy) { Sleep 1 }
$Ie.Visible = $True
$Ie.Document.Write("$Input")
# If the previous line doesn't work on your system,
uncomment the line below.
# $Ie.Document.IHtmlDocument2_Write("$Input")
$Ie
```

To use this script, save it to the `C:\Program Files\Microsoft\Exchange Server\V15\Scripts` directory on the computer where the script will be run. Name the file `Out-Ie.ps1`. After you save the file, you can then use the script as a regular cmdlet.

Note:

To run scripts in Exchange 2013, scripts must be added to an unscoped management role and you must be assigned the management role either directly or through a management role group. For more information, see Understanding management roles.

The `Out-Ie` script assumes that the data it receives is valid HTML. To convert the data that you want to view into HTML, you must pipe the results of your command to the **ConvertTo-Html** cmdlet. You can then pipe the results of that command to the `Out-Ie` script. The following example shows how to view a directory listing in an Internet Explorer window:

```
Get-ChildItem | Select Name,Length | ConvertTo-Html | Out-
Ie
```

How to filter data

The Shell gives you access to a large quantity of information about your servers, mailboxes, Active Directory, and other objects in your organization. Although access to this information helps you better understand your environment, this much information can be overwhelming. The Shell lets you control this information and return only the data that you want to see by using filtering. The following types of filtering are available:

- **Server-side filtering** Server-side filtering takes the filter that you specify on the command line and submits it to the Exchange server that you query. That server processes the query and returns only the data that matches the filter that you specified.

Server-side filtering is performed only on objects where tens or hundreds of thousands of results could be returned. Therefore, only the recipient management cmdlets, such as the **Get-Mailbox** cmdlet, and queue management cmdlets, such as the **Get-Queue** cmdlet, support server-side filtering. These cmdlets support the *Filter* parameter. This parameter takes the filter expression that you specify and submits it to the server for processing.

- **Client-side filtering** Client-side filtering is performed on the objects in the local console window in which you are currently working. When you use client-side filtering, the cmdlet retrieves all the objects that match the task that you are performing to the local console window. The Shell then takes all the returned results, applies the client-side filter to those results, and returns to you only the results that match your filter. All cmdlets support client-side filtering. This is invoked by piping the results of a command to the **Where-Object** cmdlet.

Server-side filtering

The implementation of server-side filtering is specific to the cmdlet on which it is supported. Server-side filtering is enabled only on specific properties on the objects that are returned. For more information, see the Help for the following cmdlets:

Get-ActiveSyncDevice	Get-ActiveSyncDeviceClass	Get-CASMailbox	Get-Contact	Get-DistributionGroup
Get-DynamicDistributionGroup	Get-Group	Get-Mailbox	Get-MailboxStatistics	Get-MailContact
Get-MailPublicFolder	Get-MailUser	Get-Message	Get-MobileDevice	Get-Queue
Get-QueueDigest	Get-Recipient	Get-RemoteMailbox	Get-RoleGroup	Get-SecurityPrincipal
Get-StoreUsageStatistics	Get-UMMailbox	Get-User	Get-UserPhoto	Remove-Message
Resume-Message	Resume-Queue	Retry-Queue	Suspend-Message	Suspend-Queue

Client-side filtering

Client-side filtering can be used with any cmdlet. This capability includes those cmdlets that also support server-side filtering. As described earlier in this topic, client-side filtering accepts all the data that is returned by a previous command in the pipeline, and in turn, returns only the results that match the filter that you specify. The **Where-Object** cmdlet performs this filtering. It can be shortened to **Where**.

As data passes through the pipeline, the **Where** cmdlet receives the data from the previous object and then filters the data before passing it on to the next object. The filtering is based on a script block that is defined in the **Where** command. The script block filters data based on the object's properties and values.

The **Clear-Host** cmdlet is used to clear the console window. In this example, you can find all the defined aliases for the **Clear-Host** cmdlet if you run the following command:

```
Get-Alias | Where {$_.Definition -eq "Clear-Host"}
CommandType     Name                                Definition
-----------     ----                                ----------
Alias           clear                               clear-host
Alias           cls                                 clear-host
```

The **Get-Alias** cmdlet and the **Where** command work together to return the list of aliases that are defined for the **Clear-Host** cmdlet and no other cmdlets. The following table outlines each element of the **Where** command that is used in the example.

Elements of the Where command

Element	Description
`{ }`	Braces enclose the script block that defines the filter.
`$_`	This special variable automatically initiates and binds to the objects in the pipeline.
`Definition`	The `Definition` property is the property of the current pipeline objects that stores the name of the alias definition. When `Definition` is used with the `$_` variable, a period comes before the property name.
`-eq`	This comparison operator for "equal to" is used to specify that the results must exactly match the property value that is supplied in the

	expression.
"**Clear-Host**"	In this example, "**Clear-Host**" is the value for which the command is parsing.

In the example, the objects that are returned by the **Get-Alias** cmdlet represent all the defined aliases on the system. Even though you don't see them from the command line, the aliases are collected and passed to the **Where** cmdlet through the pipeline. The **Where** cmdlet uses the information in the script block to apply a filter to the alias objects.

The special variable `$_`represents the objects that are being passed. The `$_`variable is automatically initiated by the Shell and is bound to the current pipeline object. For more information about this special variable, see Shell variables.

Using standard "dot" notation (object.property), the `Definition` property is added to define the exact property of the object to evaluate. The `-eq` comparison operator then compares the value of this property to `"Clear-Host"`. Only the objects that have the `Definition` property that match this criterion are passed to the console window for output. For more information about comparison operators, see Comparison operators.

After the **Where** command has filtered the objects returned by the **Get-Alias** cmdlet, you can pipe the filtered objects to another command. The next command processes only the filtered objects returned by the Where command.

Cmdlet extension agents

Exchange Server 2013 > Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-12-05*

Cmdlet extension agents are components in Microsoft Exchange Server 2013 invoked by Exchange 2013 cmdlets when the cmdlets run. As the name implies, cmdlet extension agents extend the capabilities of the cmdlets that invoke them by assisting in processing data or performing additional actions based on the requirements of the cmdlet. Cmdlet extension agents are available on any server role.

Agents can modify, replace, or extend functionality of Exchange Management Shell cmdlets. An agent can provide a value for a required parameter that isn't provided on a command, override a value provided by a user, perform other actions outside of the cmdlet workflow while a cmdlet runs, and more.

For example, the **New-Mailbox** cmdlet accepts the *Database* parameter that specifies the mailbox

database in which to create a new mailbox. In Microsoft Exchange Server 2007, if you don't specify the *Database* parameter when you run the **New-Mailbox** cmdlet, the command fails. However, in Exchange 2013, the **New-Mailbox** cmdlet invokes the `Mailbox Resources Management` agent when the cmdlet runs. If the *Database* parameter isn't specified, the `Mailbox Resources Management` agent automatically determines a suitable mailbox database on which to create the new mailbox and inserts that value into the *Database* parameter.

Cmdlet extension agents can only be invoked by Exchange 2013 and Microsoft Exchange Server 2010 cmdlets. Exchange 2007 cmdlets and cmdlets provided by other Microsoft and third-party products can't invoke cmdlet extension agents. Scripts also can't invoke cmdlet extension agents directly. However, if scripts contain Exchange 2013 cmdlets, those cmdlets continue to call the cmdlet extension agents.

Looking for management tasks related to cmdlet extension agents? See Manage cmdlet extension agents.

Agent priority

The priority of an agent determines the order in which the agent is invoked while a cmdlet runs. An agent that has a higher priority, closer to zero, is invoked first. The priority of an agent becomes important when two or more agents attempt to set the value of the same property. The highest priority agent that attempts to set a property value succeeds, and all subsequent attempts to set the same property by lower priority agents are ignored. For example, if the **Name** property on an object is modified by an agent with a priority of 3 and another agent with a priority of 6 modifies the same object, the modification made by the agent with a priority of 6 is ignored.

If you want to use the `Scripting agent` to set the value of properties that might be set by other, higher priority agents, you have the following options:

- Disable the agent that currently sets the property.
- Set the `Scripting agent` to a priority higher than the existing agent you want to replace.
- Keep the priorities of the agents the same and make sure that the script that runs under the `Scripting agent` respects the value provided by the other agents.

Caution:

Changing the priority or replacing the functionality of a built-in agent is an advanced operation. Be sure that you completely understand the changes you're making.

For more information about changing the priority of an agent, see Manage cmdlet extension agents.

Built-in agents

Exchange 2013 includes several agents that can be invoked when a cmdlet runs. The following table lists the agents, their order, and whether the agents are enabled by default. You can't add or remove agents to or from a server running Exchange 2013. However, you can use the `Scripting`

agent to run Windows PowerShell scripts to extend the functionality of the cmdlets that use it. For more information about the Scripting agent, see the "Scripting agent" section later in this topic.

You can enable or disable most agents or change the priority of the agents if you want to replace the functionality of a specific agent with functionality you provide in a custom script that you call using the Scripting agent. However, some agents can't be disabled. Agents that can't be disabled are called *system agents* and have their *IsSystem* property set to $True. The following table provides information about Exchange 2013 cmdlet extension agents, including system agents.

The configuration for agents is stored at the organization level. When you enable or disable an agent, or set its priority, you set that agent configuration across every server in the organization. The exception is adding scripts to the Scripting agent. You must update the scripts on each server individually. For more information about configuring scripts for use with the Scripting agent, see the "Scripting agent" section later in this topic.

Caution:

Changing the priority of agents, or enabling or disabling agents, can cause unintended effects if you don't completely understand what each agent does and how they interact with Exchange cmdlets. Before you change the configuration of any agent, be sure you fully understand the changes and results you want and that you verify that your custom script will work as intended.

Exchange 2013 cmdlet extension agents

Agent name	Priority	Enabled by default	System agent
Admin Audit Log agent	255	True	Yes
Scripting agent	6	False	No
Mailbox Resources Management agent	5	True	No
OAB Resources Management agent	4	True	No
Query Base DN agent	3	True	No
Provisioning Policy agent	2	True	No
Rus agent	1	True	No
Mailbox Creation Time agent	0	True	No

Scripting agent

You can use the Scripting agent cmdlet extension agent in Exchange 2013 to insert your own scripting logic into the execution of Exchange cmdlets. Using the Scripting agent, you can add

conditions, override values, and set up reporting.

Caution:

When you enable the `Scripting agent` cmdlet extension agent, the agent is invoked every time a cmdlet is run on a server running Exchange 2013. This includes not only cmdlets run directly by you in the Exchange Management Shell, but also cmdlets run by Exchange services, and the Exchange Administration Center (EAC). We strongly recommend that you test your scripts and any changes you make to the configuration file before you copy your updated configuration file to your Exchange 2013 servers and enable the `Scripting agent` cmdlet extension agent.

Every time an Exchange cmdlet is run, the cmdlet invokes the `Scripting agent` cmdlet extension agent. When this agent is invoked, the cmdlet checks whether any scripts are configured to be invoked by the cmdlet. If a script should be run for a cmdlet, the cmdlet tries to invoke any APIs defined in the script. The following APIs are available and are invoked in the following order:

1. **ProvisionDefaultProperties** This API can be used to set values of properties on objects when they're created. When you set a value, that value is returned to the cmdlet and the cmdlet sets the value on the property. You can fill in values on properties if the user didn't specify a value, or you can override the value specified by the user. This API respects the values set by higher priority agents. The `Scripting agent` cmdlet extension agent won't overwrite the values set by higher priority agents.
2. **UpdateAffectedIConfigurable** This API can be used to set values of properties on objects after all other processing has been completed, but the `Validate` API hasn't yet been invoked. This API respects the values set by higher priority agents. The `Scripting agent` cmdlet extension agent won't overwrite the values set by higher priority agents.
3. **Validate** This API can be used to validate the values on an object's properties that are about to be set by the cmdlet. This API is called just before a cmdlet writes any data. You can configure validation checks that allow a cmdlet to either succeed or fail. If a cmdlet passes the validation checks in this API, the cmdlet is allowed to write the data. If the cmdlet fails the validation checks, it returns any errors defined in this API.
4. **OnComplete** This API is used after all cmdlet processing is complete. It can be used to perform post-processing tasks, such as writing data to an external database.

Note:

The `Scripting agent` cmdlet extension agent isn't invoked when cmdlets with the `Get` verb are run.

Scripting agent configuration file

The `Scripting agent` configuration file contains all the scripts that you want the `Scripting agent` to run. Scripts in the configuration file are contained within XML tags that define the beginning and end of the script and various input parameters required to pass data to the script. Scripts are written using Windows PowerShell syntax. The configuration file is an XML file that uses the elements or attributes in the following table.

Attributes of Scripting agent configuration file

Element	Attribute	Description
`Configuration`	Not applicable	This element contains all the scripts that the `Scripting agent` cmdlet extension agent can run. The `Feature` tag is a child of this tag. There is only one `Configuration` tag in the configuration file.
`Feature`	Not applicable	This element contains a set of scripts that relate to a feature. Each script, defined in the `ApiCall` child tag, extends a specific part of the cmdlet execution pipeline. This tag contains the `Name` and `Cmdlets` attributes. There can be multiple `Feature` tags under the `Configuration` tag.
	`Name`	This attribute contains the name of the feature. Use this attribute to help identify which feature is extended by the scripts contained within the tag.
	`Cmdlets`	This attribute contains a list of the Exchange cmdlets used by the set of scripts in this feature extension. You can specify multiple cmdlets by separating each cmdlet with a comma.

`ApiCall`	Not applicable	This element contains scripts that can extend a part of the cmdlet execution pipeline. Each script is defined by the API call name in the cmdlet execution pipeline it's extending. The following are the API names that can be extended: • `ProvisionDefaultProperties` • `UpdateAffectedIConfigurable` • `Validate` • `OnComplete`
	`Name`	This attribute includes the name of the API call that's extending the cmdlet execution pipeline.
`Common`	Not applicable	This element contains functions that can be used by any script in the configuration file.

Every Exchange 2013 server includes the file ScriptingAgentConfig.xml.sample in the *<installation path>*\V15\Bin\CmdletExtensionAgents folder. This file must be renamed to ScriptingAgentConfig.xml on every Exchange 2013 server if you enable the Scripting Agent cmdlet extension agent. The sample configuration file contains sample scripts that you can use to help you understand how to add scripts to the configuration file.

After you add a script to the configuration file, or if you make a change to the configuration file, you must update the file on every Exchange 2013 server in your organization. This must be done to make sure that each server contains an up-to-date version of the scripts that the `Scripting Agent` cmdlet extension agent runs.

Some characters typically used in scripts also have a special meaning in XML. To use these characters in your script, use escape sequences. For example, the following characters use an escape sequence:

- Instead of a greater than sign (>), use `>`
- Instead of a less than sign (<), use `$lt;`
- Instead of an ampersand (&), use `&`

Enable the Scripting agent

The `Scripting agent` cmdlet extension agent is disabled by default. When you enable the `Scripting agent`, the agent is enabled for the entire Exchange 2013 organization. Before you enable the

`scripting agent`, verify that the `scripting agent` configuration file has been correctly renamed and updated with your scripts on every Exchange 2013 server. You will receive an error message each time a cmdlet runs if you don't rename the configuration file correctly or copy a configuration file to this computer from another Exchange 2013 server.

To enable the `scripting agent`, you must do the following:

1. Rename the ScriptingAgentConfig.xml.sample file in **<installation path>\V15\Bin\CmdletExtensionAgents** to ScriptingAgentConfig.xml on every Exchange 2013 server in your organization.

Note:

You can copy the configuration file from one Exchange 2013 server to other Exchange 2013 servers. Be sure you update the configuration file you want to copy before you copy it.

2. Add your script to the renamed configuration file on every Exchange 2013 server in your organization.
3. Enable the `scripting agent` cmdlet extension agent. For more information about enabling cmdlet extension agents, see Manage cmdlet extension agents.

Scripting Agent priority

By default, the `scripting agent` cmdlet extension agent runs after every other agent, with the exception of the `scripting agent` agent. If you want a script you created to replace an existing agent, you must either disable the other agent or change the priority of either agent so that the `scripting agent` cmdlet extension agent runs first. For more information about how to disable or change the priority of agents, see Manage cmdlet extension agents.

Manage cmdlet extension agents

Exchange Server 2013 > Exchange Management Shell > Cmdlet extension agents >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-11-19*

This topic shows you how to enable, disable, view, and change the priority of cmdlet extension agents in Microsoft Exchange Server 2013. For more information about cmdlet extension agents in Exchange 2013, see Cmdlet extension agents.

What do you need to know before you begin?

- Estimated time to complete each procedure: less than 5 minutes
- You need to be assigned permissions before you can perform this procedure or procedures. To see what permissions you need, see the "Cmdlet extension agents" entry in the Exchange and

Shell infrastructure permissions topic.

- Before you enable the `Scripting Agent`, you must verify that it's configured correctly. For more information about the `Scripting Agent`, see Cmdlet extension agents.
- You must use the Shell to perform these procedures.
- For information about keyboard shortcuts that may apply to the procedures in this topic, see Keyboard shortcuts in the Exchange admin center.

Tip:

Having problems? Ask for help in the Exchange forums. Visit the forums at: Exchange Server, Exchange Online, or Exchange Online Protection.

What do you want to do?

Enable a cmdlet extension agent

When you enable a cmdlet extension agent in Exchange 2013, the agent is run on every server running Exchange 2013 in the organization. When an agent is enabled, it's made available to cmdlets, which can then use the agent to perform additional operations.

Caution:

Before you enable an agent, be sure that you're aware of how the agent works and what impact the agent will have on your organization.

This example enables a cmdlet extension agent by using the **Enable-CmdletExtensionAgent** cmdlet. You must specify the name of the agent you want to enable when you run the cmdlet. Before you enable the `Scripting Agent`, you need to make sure that you've deployed the `ScriptingAgentConfig.xml` configuration file to all the servers in your organization. If you don't deploy the configuration file first and you enable the `Scripting Agent`, all non-**Get** cmdlets fail when they're run. This example enables the `Scripting Agent`.

```
Enable-CmdletExtensionAgent "Scripting Agent"
```

For detailed syntax and parameter information, see Enable-CmdletExtensionAgent.

Disable a cmdlet extension agent

When you disable a cmdlet extension agent in Exchange 2013, the agent is disabled on every server running Exchange 2013 in the organization. When an agent is disabled, it's not made available to cmdlets. Cmdlets can no longer use the agent to perform additional operations.

Caution:

Before you disable an agent, be sure that you're aware of how the agent works and what impact disabling the agent will have on your organization.

To disable a cmdlet extension agent, use the **Disable-CmdletExtensionAgent** cmdlet. Specify the

name of the agent you want to disable when you run the cmdlet. This example disables the `Scripting Agent`.

```
Disable-CmdletExtensionAgent "Scripting Agent"
```

For detailed syntax and parameter information, see Disable-CmdletExtensionAgent.

View existing cmdlet extension agents

Viewing cmdlet extension agents enables you to see which agents are run first and which agents are enabled in an Exchange 2013 organization. For more information about pipelining and the **Format-Table** cmdlet, see the following topics:

- Pipelining
- Working with command output

This example gets the details of a specific cmdlet extension agent by using the **Get-CmdletExtensionAgent** cmdlet. In this example, the details of the `Mailbox Permissions Agent` are returned.

```
Get-CmdletExtensionAgent "Mailbox Permissions Agent"
```

This example gets multiple cmdlet extension agents by using the **Get-CmdletExtensionAgent** cmdlet, and then pipes the output to the **Format-Table** cmdlet. This example displays a list of all of the cmdlet extension agents in the organization, and by using the **Format-Table** cmdlet, the **Name**, **Enabled**, and **Priority** properties of each agent are displayed in a table.

```
Get-CmdletExtensionAgent | Format-Table Name, Enabled,
Priority
```

For detailed syntax and parameter information, see Get-CmdletExtensionAgent.

Change the priority of a cmdlet extension agent

The ability to change the priority of a cmdlet extension agent in Exchange 2013 is useful when you want a certain agent to be called by a cmdlet before another agent. This is especially useful if you create a custom script that's run in the `Scripting Agent`, and you want that script to take precedence over a built-in agent. For more information about the `Scripting Agent`, see Cmdlet extension agents.

Caution:
Changing the priority or replacing the functionality of a built-in agent is an advanced operation. Be sure that you completely understand the changes you're making.

Agents are ordered from zero to the maximum number of agents. The closer to zero the agent is, the higher the priority of the agent. Agents with a higher priority are called first. For more

information about agent priorities, see Cmdlet extension agents.

This example changes the priority of a cmdlet extension agent by using the **Set-CmdletExtensionAgent** cmdlet. In this example, the priority of the `Scripting Agent` is changed to 3.

```
Set-CmdletExtensionAgent "Scripting Agent" -Priority 3
```

For detailed syntax and parameter information, see Set-CmdletExtensionAgent.

Exchange Management Shell quick reference for Exchange 2013

Exchange Server 2013 > Exchange Management Shell >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2012-10-03*

This topic describes the most frequently used cmdlets available in the release to manufacturing (RTM) and later versions of Microsoft Exchange Server 2013 and provides examples of their use.

Note:
More content will be added about other areas of Exchange 2013 soon.

For more information about the Exchange Management Shell in Exchange 2013 and all the available cmdlets, see the following topics:

- Exchange Management Shell
- Exchange 2013 cmdlets

What would you like to learn about?

Common cmdlet actions

The following verbs are supported by most cmdlets and are associated with a specific action.

New	The New verb creates an instance of something, such as a new configuration setting, a new database, or a new SMTP connector.
Remove	The Remove verb removes an instance of something, such as a mailbox or transport rule.

	All Remove cmdlets support the *WhatIf* and *Confirm* parameters. For more information about these parameters, see Important Parameters.	
Enable	The Enable verb enables a setting or mail-enables a recipient.	
Disable	The Disable verb disables an enabled setting or mail-disables a recipient. All Disable tasks also support the *WhatIf* and *Confirm* parameters. For more information about these parameters, see Important Parameters.	
Set	The Set verb modifies specific settings of an object, such as the alias of a contact or the deleted item retention of a mailbox database.	
Get	The Get verb queries a specific object or a subset of a type of object, such as a specific mailbox, all mailbox users, or mailbox users in a domain.	

Important parameters

The following parameters help you control how your commands run and indicate exactly what a command will do before it affects data.

Identity	The *Identity* parameter identifies the unique object for the task. It's typically used with Enable, Disable, Remove, Set, and Get cmdlets. *Identity* is also a positional parameter, which means that you don't have to specify *Identity* when you specify the parameter's value on the command line. For example, *Get-Mailbox -Identity user1* queries for the mailbox of *user1*. *Get-Mailbox*

	user1 is equivalent to *Get-Mailbox -Identity user1*.
WhatIf	The *WhatIf* parameter instructs the cmdlet to simulate the actions that it would take on the object. By using the *WhatIf* parameter, you can view what changes would occur without actually applying any of the changes. The default value is *$true*.
Confirm	The *Confirm* parameter causes the cmdlet to pause processing and requires the administrator to acknowledge what the cmdlet will do before processing continues. The default value is *$true*.
Validate	The *Validate* parameter causes the cmdlet to check that all prerequisites for running the operation are satisfied and that the operation will complete successfully.

Tips and tricks

The following commands are associated with various tasks that you can use when administering Exchange 2013.

Get-Command	This cmdlet retrieves all tasks that can be executed in Exchange 2013.
Get-Command **keyword**	This cmdlet retrieves tasks that have *keyword* in the cmdlet.
Get-*task* | Get-Member	This cmdlet retrieves all properties and methods of *task*.
Get-*task* | Format-List	This cmdlet displays the output of the query in a formatted list. You can pipe the output of any

	Get cmdlet to Format-List to view the whole set of properties that exist on the object returned by that command, or you can specify individual properties that you want to view, separated by commas, as in the following example: *Get-Mailbox *john* | Format-List alias,*quota*
Help *task*	This cmdlet retrieves Exchange Management Shell help information for any task in Exchange 2013, as in the following example: *Help Get-Mailbox*
Get-*task* | Format-List > *file.txt*	This cmdlet exports the output of *task* to a text file: *file.txt*

Permissions

Get-RoleGroupMember "*Organization Management*"	This command retrieves the members of the *Organization Management* management role group.
Get-ManagementRoleAssignment -Role "*Mail Recipient Creation*" -GetEffectiveUsers	This command retrieves a list of all the users who are granted permissions provided by the *Mail Recipient Creation* management role. This includes users who are members of role groups or universal security groups (USGs) that are assigned the Mail Recipient Creation role. This doesn't include users who are members of linked role groups in another forest.
Get-ManagementRoleAssignment -RoleAssignee *Administrator* | Get-ManagementRole | Get-ManagementRoleEntry	This command retrieves a list of cmdlets that the user *Administrator* can run.
ForEach ($RoleEntry in Get-ManagementRoleEntry *	This command retrieves a list of all the users who can run the *Remove-Mailbox* cmdlet.

Remove-Mailbox -parameters Identity) {Get-ManagementRoleAssignment -Role $RoleEntry.Role -GetEffectiveUsers -Delegating $False \| Where-Object {$_.EffectiveUserName -Ne "All Group Members"} | FL Role, EffectiveUserName, AssignmentChain}	
Get-ManagementRoleAssignment -WritableRecipient *kima* -GetEffectiveUsers | FT RoleAssigneeName, EffectiveUserName, Role, AssignmentChain	This command retrieves a list of all users who can modify the mailbox of *kima*.
New-ManagementScope "*Seattle Users*" -RecipientRestrictionFilter { *City* -Eq "*Seattle*" } New-RoleGroup "*Seattle Admins*" -Roles "*Mail Recipients*", "*Mail Recipient Creation*", "*Mailbox Import Export*", -CustomRecipientWriteScope "*Seattle Users*"	This command creates a new management scope and management role group to enable members of the role group to manage recipients in Seattle. First, the *Seattle Users* management scope is created, which matches only recipients who have *Seattle* in the *City* attribute on their user object. Then, a new role group called *Seattle Admins* is created and the *Mail Recipients*, *Mail Recipient Creation*, and *Mailbox Import Export* roles are assigned. The role group is scoped so that its members can manage only users who match the *Seattle Users* recipient filter scope.
New-ManagementScope "*Vancouver Servers*" -ServerRestrictionFilter	This command creates a new management scope and copies an existing role group to enable members of the new role group to manage only servers in the Vancouver Active

{ *ServerSite* -Eq "*Vancouver*" } $RoleGroup = Get-RoleGroup "*Server Management*" New-RoleGroup "*Vancouver Server Management*" -Roles $RoleGroup.Roles -CustomConfigWriteScope "*Vancouver Servers*"	Directory site. First, the *Vancouver Servers* management scope is created, which matches only servers that are located in the *Vancouver* Active Directory site. The Active Directory site is stored in the *ServerSite* attribute on the server objects. Then, a new role group called *Vancouver Server Management* is created that's a copy of the *Server Management* role group. This new role group, however, is scoped to allow its members to manage only servers that match the *Vancouver Servers* configuration filter scope.	
Add-RoleGroupMember "*Organization Management*" -Member *davids*	This command adds the user *davids* to the *Organization Management* role group.	
Get-ManagementRoleAssignment -Role "*Mail Recipient Creation*" -RoleAssignee "*Seattle Admins*" | Remove-ManagementRoleAssignment	This command removes the *Mail Recipient Creation* role from the *Seattle Admins* role group. This command is useful because you don't need to know the name of the management role assignment that assigns the role to the role group.	

Remote Shell

$Session = New-PSSession -ConfigurationName Microsoft.Exchange -ConnectionUri http://*ExServer.contoso.com*/PowerShell/ -Authentication Kerberos Import-PSSession $Session	These commands open a new remote Shell session between a local domain-joined computer and a remote Exchange 2013 server with the FQDN *ExServer.contoso.com*. Use this command if you want to administer a remote Exchange 2013 server and only have the Windows Management Framework, which

	includes the Windows PowerShell command-line interface, installed on your local computer. This command uses your current logon credentials to authenticate against the remote Exchange 2013 server.
$UserCredential = Get-Credential $Session = New-PSSession -ConfigurationName Microsoft.Exchange -ConnectionUri http://*ExServer.contoso.com*/PowerShell/ -Authentication Kerberos -Credential $UserCredential Import-PSSession $Session	These commands open a new remote Shell session between a local domain-joined computer and a remote Exchange 2013 server with the FQDN *ExServer.contoso.com*. Use this command if you want to administer a remote Exchange 2013 server and only have the Windows Management Framework, which includes Windows PowerShell, installed on your local computer. This command uses credentials you specify explicitly to authenticate against the remote Exchange 2013 server.
Remove-PSSession $Session	This command closes the remote Shell session between a local computer and the remote Exchange 2013 server.
Import-RecipientDataProperty -Identity "Tony Smith" -SpokenName -FileData *([Byte[]]$(Get-Content -Path "M:\AudioFiles\TonySmith.wma" -Encoding Byte -ReadCount 0))*	This command shows an example of the syntax, shown in italics, required to import a file into a remote Exchange 2013 server using the FileData parameter on a cmdlet. The syntax encapsulates the data contained in the *M:\AudioFiles\TonySmith.wma* file and streams the data to the FileData property on the Import-RecipientDataProperty cmdlet. The FileData parameter accepts data from a file on your local computer using this syntax on most cmdlets.
Export-RecipientDataProperty -Identity	This command shows an example of the syntax,

tony@contoso.com -SpokenName | *ForEach { $_.FileData | Add-Content C:\tonysmith.wma -Encoding Byte}*	shown in italics, required to export a file from a remote Exchange 2013 server. The syntax encapsulates the data stored in the FileData property on the object returned by the cmdlet and then streams the data to your local computer. The data is then stored in the *C:\tonysmith.wma* file. Most cmdlets that output objects with a FileData property use this syntax to export data to a file on your local computer.

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AdServerSettings** cmdlet to view the Active Directory Domain Services (AD DS)

environment settings in the current Windows PowerShell session. The **Get-AdServerSettings** cmdlet replaces the `AdminsessionADSettings` session variable that was used in Microsoft Exchange Server 2007.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AdServerSettings
```

Examples

EXAMPLE 1

This example displays the session settings for the current session.

```
Get-AdServerSettings | Format-List
```

For more information about pipelining and the **Format-List** cmdlet, see Pipelining and Working with command output.

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Active Directory Domain Services server settings" entry in the Exchange and Shell infrastructure permissions topic.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AdServerSettings

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-08*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AdServerSettings** cmdlet to manage the Active Directory Domain Services (AD DS) environment in the current Exchange Management Shell session. The **Set-AdServerSettings** cmdlet replaces the *AdminSessionADSettings* session variable that was used in Microsoft Exchange Server 2007.

For information about the parameter sets in the Syntax section below, see Syntax.

```

```

Examples

EXAMPLE 1

This example sets the recipient scope to the Marketing Users OU in the contoso.com domain for the current session.

```
Set-AdServerSettings -RecipientViewRoot "contoso.com/
Marketing Users"
```

EXAMPLE 2

This example sets the scope of the current session to the entire forest and designates gc1.contoso.com as the preferred global catalog server.

```
Set-AdServerSettings -ViewEntireForest $true -
PreferredGlobalCatalog gc1.contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Active Directory Domain Services server settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DisableGls	Required	System.Boolean	This parameter is reserved for internal Microsoft use.
ForceADInTemplateScope	Required	System.Boolean	This parameter is reserved for internal Microsoft use.
ResetSettings	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
RunspaceServerSettings	Required	Microsoft.Exchange.Data.Directory.Management.RunspaceServerSettingsPresentationObject	The *RunspaceServerSettings* parameter specifies whether to pass an entire configuration object to the command to be processed. This parameter is useful in scripts where an entire object must be passed to the command.
ConfigurationDomainC	Optional	Microsoft.Exchange.Dat	The

ontroller		a.Fqdn	*ConfigurationDomainController* parameter specifies the fully qualified domain name (FQDN) of the configuration domain controller to be used for reading Exchange configuration information in this session.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
PreferredGlobalCatalog	Optional	Microsoft.Exchange.Data.Fqdn	The *PreferredGlobalCatalog* parameter specifies the FQDN of the global catalog server to be used for reading recipient information in this session.
PreferredServer	Optional	Microsoft.Exchange.Dat	The *PreferredServer*

		a.Fqdn	parameter specifies the FQDN of the domain controller to be used for this session.
RecipientViewRoot	Optional	System.String	The *RecipientViewRoot* parameter specifies the organizational unit (OU) to include in the recipient scope for this session. When you specify a recipient scope with this parameter, only the recipients included in the scope are returned. To specify an OU, use the syntax *<FQDN of domain>/<OU tree>*.
SetPreferredDomainControllers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SetPreferredDomainControllers* parameter specifies the list of domain controllers used to read information from Active Directory in this session. You must specify the FQDN of the domain controllers. Separate multiple domain controllers using commas.

ViewEntireForest	Optional	System.Boolean	The *ViewEntireForest* parameter specifies whether all the objects in the forest are viewed and managed in this session. Valid values are `$true` and `$false`. When you specify a value of `$true`, the value stored in the *RecipientViewRoot* parameter is removed and all of the recipients in the forest can be viewed and managed.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WriteOriginatingChangeTimestamp	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

WriteShadowProperties	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AdSite

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AdSite** cmdlet to display configuration information about one or more Active Directory sites.

```
Get-AdSite [-Identity <AdSiteIdParameter>] [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays the configuration details for the Active Directory site named Default-First-Site-Name.

```
Get-AdSite Default-First-Site-Name
```

Detailed Description

Exchange uses Active Directory sites and the costs assigned to the Active Directory site links to

make message routing decisions.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *Identity* parameter specifies the identity of the Active Directory site for which you want to view configuration details. The identity can be expressed as a GUID or the Active Directory

			site name. If the Active Directory site name includes spaces, enclose the name in quotation marks (").

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AdSite

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AdSite** cmdlet to configure the Exchange settings of Active Directory sites.

```
Set-AdSite -Identity <AdSiteIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-HubSiteEnabled <$true | $false>] [-
InboundMailEnabled <$true | $false>] [-MinorPartnerId <Int32>] [-PartnerId
<Int32>] [-ResponsibleForSites <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the Active Directory site named `Default-First-Site-Name` as a hub site.

```
Set-AdSite Default-First-Site-Name -HubSiteEnabled $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *Identity* parameter specifies the identity of the Active Directory site you want to modify. You can use any value that uniquely identifies the site. For example, you can use the name, GUID or distinguished name (DN) of the Active Directory site.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Dat	The *DomainController*

		a.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
HubSiteEnabled	Optional	System.Boolean	The *HubSiteEnabled* parameter specifies whether this site acts as a hub site. The default value is `$false`.
InboundMailEnabled	Optional	System.Boolean	The *InboundMailEnabled* parameter enables or disables receiving incoming messages for all the Exchange located in the Active Directory site. Typically, this parameter is used after Active Directory site failover or maintenance. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If you set the value to `$false`, none of the Exchange servers in the Active Directory site will be

			able to receive incoming messages.
MinorPartnerId	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
PartnerId	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
ResponsibleForSites	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AdSiteLink

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AdSiteLink** cmdlet to view configuration information about an Active Directory IP site link.

```
Get-AdSiteLink [-Identity <AdSiteLinkIdParameter>] [-DomainController
<Fqdn>]
```

Examples

EXAMPLE 1

This example returns a list of all IP site links in your organization.

```
Get-ADSiteLink
```

EXAMPLE 2

This example returns a list of all IP site links in your organization that have a specific Exchange cost assigned.

```
Get-AdSiteLink | Where {$_.ExchangeCost -ne $null}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteLinkIdParameter	The *Identity* parameter specifies the name or GUID of the IP site link for which you want to view configuration information.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AdSiteLink

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AdSiteLink** cmdlet to assign an Exchange-specific cost to an Active Directory IP site link. You can also use this cmdlet to configure the maximum message size that can pass across an Active Directory IP site link.

```
Set-AdSiteLink -Identity <AdSiteLinkIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExchangeCost <Int32>] [-
MaxMessageSize <Unlimited>] [-Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example assigns an Exchange-specific cost of 25 to the IP site link DEFAULT_IP_SITE_LINK and configures a maximum message size limit of 10 MB on the IP site link.

```
Set-AdSiteLink DEFAULT_IP_SITE_LINK -ExchangeCost 25 -
MaxMessageSize 10MB
```

Detailed Description

By default, Microsoft Exchange determines the least cost routing path by using the cost assigned to the Active Directory IP site link. You can use the **Set-AdSiteLink** cmdlet to assign an Exchange-specific cost to the Active Directory IP site link. The Exchange-specific cost is a separate attribute used instead of the Active Directory-assigned cost to determine the least cost routing path.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.AdSiteLinkIdParameter	specifies the name or GUID of the IP site link you want to modify.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

ExchangeCost	Optional	System.Int32	The *ExchangeCost* parameter specifies an Exchange-specific cost for the IP site link. This cost is used instead of the Active Directory-assigned cost. To clear the value of the *ExchangeCost* parameter and revert to using the cost of the IP site link specified in Active Directory, set the value of the *ExchangeCost* parameter to `$null`.
MaxMessageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxMessageSize* parameter specifies the maximum size of a message that can pass across the Active Directory IP site link. The default value is `unlimited`. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from `64`

			KB through Int64. To remove the message size limit on an Active Directory IP site link, enter a value of unlimited.
Name	Optional	System.String	The *Name* parameter specifies a unique name for the IP site link. The name that you assign overwrites the current identity of the IP site link.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DomainController

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-DomainController** cmdlet to view a list of domain controllers that exist in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DomainController [-Forest <Fqdn>] [-GlobalCatalog <SwitchParameter>]
<COMMON PARAMETERS>

Get-DomainController [-DomainName <Fqdn>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Credential <NetworkCredential>]
```

Examples

EXAMPLE 1

This example retrieves a list of global catalog servers in the corp.contoso.com domain.

Because a different set of credentials are required to access this domain, the **Get-Credential** cmdlet is used to obtain the user name and password from the user. The **Get-Credential** cmdlet displays a prompt to the user that accepts the user name and password. The credentials are then stored in the `$UserCredentials` variable.

```
$UserCredentials = Get-Credential
```

The `$UserCredentials` variable is then passed to the *Credential* parameter in the **Get-DomainController** command. To make the list more readable, the output is piped to the **Format-Table** cmdlet and only the `Name` and `ADSite` properties are displayed.

```
Get-DomainController -DomainName corp.contoso.com -
Credential $UserCredentials | Format-Table -AutoSize Name,
ADSite
```

For more information about pipelining and the **Format-Table** cmdlet, see Pipelining and Working with command output.

Detailed Description

The **Get-DomainController** cmdlet is used by the Exchange Administration Center in Microsoft Exchange Server 2013 to populate fields that display domain controller information.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Active Directory Domain Services server settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Credential	Optional	System.Net.NetworkCredential	The *Credential* parameter specifies the credentials to use to access the domain specified if the *DomainName* parameter is used. If the *Forest* parameter is used, the credentials are used to access the forest. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.

DomainName	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainName* parameter specifies the fully qualified domain name (FQDN) of the domain for which you want to return a list of domain controllers.
Forest	Optional	Microsoft.Exchange.Data.Fqdn	The *Forest* parameter specifies the FQDN of the root domain of the forest for which you want to return a list of domain controllers.
GlobalCatalog	Optional	System.Management.Automation.SwitchParameter	The *GlobalCatalog* switch specifies whether the command should return a list of global catalog servers.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OrganizationalUnit

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-OrganizationalUnit** cmdlet to view a list of organizational units (OUs) that exist in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OrganizationalUnit [-Identity <ExtendedOrganizationalUnitIdParameter>]
[-SingleNodeOnly <SwitchParameter>] <COMMON PARAMETERS>

Get-OrganizationalUnit [-SearchText <String>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-IncludeContainers
<SwitchParameter>] [-Organization <OrganizationIdParameter>] [-ResultSize
<Unlimited>]
```

Examples

EXAMPLE 1

This example retrieves a list of the first level child OUs beneath the North America OU and formats the output so that only the **Name** and **DistinguishedName** properties are displayed.

```
Get-OrganizationalUnit "North America" -SingleNodeOnly |
Format-Table Name, DistinguishedName
```

For more information about pipelining and the **Format-Table** cmdlet, see Pipelining and Working with command output.

EXAMPLE 2

This example retrieves a list of OUs that match the text string "Executives" and formats the output so that only the **Name** and **DistinguishedName** properties are displayed.

```
Get-OrganizationalUnit -SearchText "Executives" | Format-
Table Name, DistinguishedName
```

For more information about pipelining and the **Format-Table** cmdlet, see Pipelining and Working with command output.

Detailed Description

The **Get-OrganizationalUnit** cmdlet is used by the Exchange Administration Center in Microsoft Exchange Server 2013 to populate fields that display OU information.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Active Directory Domain Services server settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExtendedOrganizationalUnitIdParameter	The *Identity* parameter specifies the OU to retrieve. If the OU name contains spaces, enclose the value in quotation marks ("). This parameter can't be used with the *SearchText* parameter.
IncludeContainers	Optional	System.Management.Automation.SwitchParameter	The *IncludeContainers* switch instructs the command to return containers while

			returning a list of OUs.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
SearchText	Optional	System.String	The *SearchText* parameter enables you to search the names of all OUs in your organization for the specified string. Only the OUs that match the string you specify are returned. If the string you specify contains spaces, enclose it in quotation marks ("). This parameter can't be used with the *Identity* parameter.
SingleNodeOnly	Optional	System.Management.A	The *SingleNodeOnly*

		utomation.SwitchParameter	switch instructs the command to return only the first level child OUs beneath the OU specified in the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Dump-ProvisioningCache

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Dump-ProvisioningCache** cmdlet to return a list of the cached keys and values for the specified server and Windows PowerShell application.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Dump-ProvisioningCache -Application <String> -GlobalCache
<SwitchParameter> -Server <Fqdn> <COMMON PARAMETERS>

Dump-ProvisioningCache -Application <String> -Server <Fqdn> [-
CurrentOrganization <SwitchParameter>] [-Organizations
<MultiValuedProperty>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-CacheKeys <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example displays all cache keys for the specified server and Windows PowerShell application.

```
Dump-ProvisioningCache -Server EXSRV1.contoso.com -
Application Powershell-Proxy -GlobalCache
```

Detailed Description

The **Dump-ProvisioningCache** cmdlet is for diagnostic purposes only and is rarely used. Exchange administrators or Microsoft support personnel may need to run this cmdlet to troubleshoot problems resulting from incorrect links or properties stamped on newly provisioned recipients, which can be caused by stale data in the provisioning cache.

The **Dump-ProvisioningCache** cmdlet displays a list of the Windows PowerShell provisioning cache keys. Use the value of these cache keys with the **Reset-ProvisioningCache** cmdlet to reset provisioning cache data.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange server configuration settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Application	Required	System.String	The *Application* parameter specifies the specific administrative application to reset the provisioning cache for. You can use the following values: • `Powershell` • `Powershell-LiveId` • `Powershell-Proxy` • `PowershellLiveId-Proxy` • `Ecp` • `Psws`
GlobalCache	Required	System.Management.Automation.SwitchPar	The *GlobalCache* switch specifies that all cache

		ameter	keys are cleared.
Server	Required	Microsoft.Exchange.Data.Fqdn	The *Server* parameter specifies the fully qualified domain name (FQDN) of the server that the application you want to reset is running on.
CacheKeys	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *CacheKeys* parameter specifies the value for the cache key that you want to clear. The format for the values should contain 32 digits separated by four dashes: `xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx` Use the **Dump-ProvisioningCache** cmdlet to return a list of cache keys.
