			If you use the *Usage* parameter, you can't use any of the following parameters: • *Custom* • *Internal* • *Internet* • *Partner* For more information about Send connector usage types, permissions, and authentication methods, see Send connectors.
UseExternalDNSServersEnabled	Optional	System.Boolean	The *UseExternalDNSServersEnabled* parameter specifies whether this Send connector uses the external DNS list specified by the *ExternalDNSServers* parameter of the **Set-TransportService** cmdlet. The default value is `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-SendConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-SendConnector** cmdlet to delete a Send connector.

```
Remove-SendConnector -Identity <SendConnectorIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the Send connector named Contoso.com Send Connector.

```
Remove-SendConnector "Contoso.com Send Connector"
```

Detailed Description

The **Remove-SendConnector** cmdlet deletes the object and the configuration settings for the Send connector.

Caution:
Although a Send connector is configured locally in the Transport service on a Mailbox server or on an Edge server, deleting a Send connector may affect mail flow throughout the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Send connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.SendConnectorIdParameter	The *Identity* parameter specifies the name, or GUID of the Send connector. If the *Identity* name contains spaces, enclose the name in quotation marks ("). You can omit the *Identity* parameter label. You can also include the server name by using the format *ServerName**ConnectorName*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default

			when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SendConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-17*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-SendConnector** cmdlet to modify a Send connector.

```
Set-SendConnector -Identity <SendConnectorIdParameter> [-AddressSpaces
<MultiValuedProperty>] [-AuthenticationCredential <PSCredential>] [-
CloudServicesMailEnabled <$true | $false>] [-Comment <String>] [-Confirm
[<SwitchParameter>]] [-ConnectionInactivityTimeOut <EnhancedTimeSpan>] [-
DNSRoutingEnabled <$true | $false>] [-DomainController <Fqdn>] [-
DomainSecureEnabled <$true | $false>] [-Enabled <$true | $false>] [-
ErrorPolicies <Default | DowngradeDnsFailures | DowngradeCustomFailures |
UpgradeCustomFailures>] [-Force <SwitchParameter>] [-ForceHELO <$true |
$false>] [-Fqdn <Fqdn>] [-FrontendProxyEnabled <$true | $false>] [-
IgnoreSTARTTLS <$true | $false>] [-IsScopedConnector <$true | $false>] [-
MaxMessageSize <Unlimited>] [-Name <String>] [-Port <Int32>] [-
ProtocolLoggingLevel <None | Verbose>] [-RequireOorg <$true | $false>] [-
RequireTLS <$true | $false>] [-SmartHostAuthMechanism <None | BasicAuth |
BasicAuthRequireTLS | ExchangeServer | ExternalAuthoritative>] [-
SmartHosts <MultiValuedProperty>] [-SmtpMaxMessagesPerConnection <Int32>]
[-SourceIPAddress <IPAddress>] [-SourceTransportServers
<MultiValuedProperty>] [-TlsAuthLevel <EncryptionOnly |
CertificateValidation | DomainValidation>] [-TlsCertificateName
<SmtpX509Identifier>] [-TlsDomain <SmtpDomainWithSubdomains>] [-
UseExternalDNSServersEnabled <$true | $false>] [-WhatIf
```

```
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example makes the following configuration changes to the Send connector named Contoso.com Send Connector:

- Sets the maximum message size limit to 10 MB.
- Changes the connection inactivity time-out to 15 minutes.

```
Set-SendConnector "Contoso.com Send Connector" -
MaxMessageSize 10MB -ConnectionInactivityTimeOut 00:15:00
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Send connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.SendConnectorIdParameter	The GUID or connector name that represents the Send connector you want to modify.
AddressSpaces	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AddressSpaces* parameter specifies the domain names to which the Send connector routes mail. The complete syntax for entering each address space is as follows: *<AddressSpaceType>:<AddressSpace>;<AddressSpaceCost>*

			• **AddressSpaceType:** On an Edge server, the address space type must be SMTP. In the Transport service on a Mailbox server, the address space type may be SMTP, X400, or any other text string. If you omit the address space type, SMTP is assumed. • **AddressSpace:** For SMTP address space types, the address space that you enter must be RFC 1035-compliant. For example, *, *.com, and *.contoso.com are permitted, but *contoso.com is not. For X.400 address space types, the address space that you enter must be RFC 1685-compliant, such as **o=MySite;p=MyOrg;a=adatum;c=us**. For all other values of address space type, you can enter any text for the address space. • **AddressSpaceCost:** The valid input range for the cost is from 1

			through 100. A lower cost indicates a better route. This parameter is optional. If you omit the address space cost, a cost of 1 is assumed. If you enter a non-SMTP address space that contains the semicolon character (;), you must specify the address space cost. If you specify the address space type or the address space cost, you must enclose the address space in quotation marks ("). For example, the following address space entries are equivalent: • `"SMTP:contoso.com;1"` • `"contoso.com;1"` • `"SMTP:contoso.com"` • `contoso.com` You may specify multiple address spaces by separating the address spaces with commas, for example: `contoso.com,fabrikam.com`. If you specify the address space type or the address space cost, enclose the address space in quotation marks ("), for

			example: `"contoso.com;2","fabrikam.com;3"`. If you specify a non-SMTP address space type on a Send connector configured in the Transport service on a Mailbox server, you must configure the following parameters: • The *SmartHosts* parameter must be set to a value that specifies a smart host. • The *DNSRoutingEnabled* parameter must be set to `$false`. **Note:** Although you can configure non-SMTP address spaces on a Send connector in the Transport service on a Mailbox server, the Send connector uses SMTP as the transport mechanism to send messages to other messaging servers. Foreign connectors in the Transport service on a Mailbox server are used to send messages to local messaging servers, such as third-party fax gateway servers, which don't use SMTP as their primary transport mechanism. For more information, see

			Foreign connectors.
AuthenticationCredential	Optional	System.Management.Automation.PSCredential	The *AuthenticationCredential* parameter specifies a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information about the **Get-Credential** cmdlet, enter **Get-Help Get-Credential** in the Exchange Management Shell.
CloudServicesMailEnabled	Optional	System.Boolean	Set to `$true` to enable this connector to send messages to the cloud service.
Comment	Optional	System.String	The*Comment* parameter specifies an optional comment. You must enclose the *Comment* parameter in quotation marks ("), for example: `"this is an admin note"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectionInactivityTimeOut	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectionInactivityTimeOut* parameter specifies the maximum time an idle connection can remain open. The default value is ten minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify fifteen minutes, set it to `00:15:00`. The valid input range for this parameter is `00:00:01` to `1.00:00:00`.
DNSRoutingEnabled	Optional	System.Boolean	The *DNSRoutingEnabled* parameter specifies whether the Send connector uses Domain Name System (DNS) to route mail. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. If

			you specify a *SmartHosts* parameter, the *DNSRoutingEnabled* parameter must be `$false`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainSecureEnabled	Optional	System.Boolean	The *DomainSecureEnabled* parameter is part of the process to enable mutual Transport Layer Security (TLS) authentication for the domains serviced by this Send connector. Mutual TLS authentication

			functions correctly only when the following conditions are met: • The value of the *DomainSecureEnabled* parameter must be `$true`. • The value of the *DNSRoutingEnabled* parameter must be `$true`. • The value of the *IgnoreStartTLS* parameter must be `$false`. The wildcard character (*) is not supported in domains that are configured for mutual TLS authentication. The same domain must also be defined on the corresponding Receive connector and in the *TLSReceiveDomainSecureList* attribute of the transport configuration. The default value for the *DomainSecureEnabled* parameter is `$false` for the following types of Send connectors: • All Send connectors

			defined in the Transport service on a Mailbox server. • User-created Send connectors defined on an Edge server. The default value for the *DomainSecureEnabled* parameter is `$true` for default Send connectors defined on an Edge server.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the Send connector to process email messages. Valid values are `$true` or `$false`. The default value is `$true`.
ErrorPolicies	Optional	Microsoft.Exchange.Data.ErrorPolicies	The *ErrorPolicies* parameter specifies how communication errors are treated. Possible values are the following: • `Default` A non-delivery report (NDR) is generated for communication errors. • `DowngradeDnsFailures` All DNS errors are treated as transient. • `DowngradeCustomFailures` Particular SMTP errors are treated as transient.

			• `UpgradeCustomFailures` Custom transient failures are upgraded and treated as permanent failures. Multiple values can be specified for this parameter, separated by commas. Specify a value other than `Default` for this parameter only if this Send connector is used to send messages over a reliable and well-defined communication channel where communication errors aren't expected. For example, consider specifying a value other than `Default` if this Send connector is used to send messages to a partner.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in

			the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
ForceHELO	Optional	System.Boolean	The *ForceHELO* parameter specifies whether HELO is sent instead of the default EHLO. Valid values are `$true` or `$false`. The default value is `$false`.
Fqdn	Optional	Microsoft.Exchange.Data.Fqdn	The *Fqdn* parameter specifies the FQDN used as the source server for connected messaging servers that use the Send connector to receive outgoing messages. The value of this parameter is displayed to connected messaging servers whenever a source server name is required, as in the following examples: • In the EHLO/HELO command when the Send connector communicates with the next hop messaging server • In the most recent `Received` header field

			added to the message by the next hop messaging server after the message leaves the Transport service on a Mailbox server or an Edge server • During TLS authentication The default value of the *Fqdn* parameter is `$null`. This means the default FQDN value is the FQDN of the Mailbox server or Edge server that contains the Send connector.
FrontendProxyEnabled	Optional	System.Boolean	The *FrontendProxyEnabled* parameter routes outbound messages through the CAS server, where destination specific routing, such as DNS or IP address, is set, when the parameter is set to `$true`.
IgnoreSTARTTLS	Optional	System.Boolean	The *IgnoreSTARTTLS* parameter specifies whether to ignore the StartTLS option offered by a remote sending server. This parameter is used with remote domains. This

			parameter must be set to `$false` if the *RequireTLS* parameter is set to `$true`. Valid values for this parameter are `$true` or `$false`.
IsScopedConnector	Optional	System.Boolean	The *IsScopedConnector* parameter specifies the availability of the connector to other Mailbox servers with the Transport service. When the value of this parameter is `$false`, the connector can be used by all Mailbox servers in the Exchange organization. When the value of this parameter is `$true`, the connector can only be used by Transport service on Mailbox servers in the same Active Directory site. The default value is `$false`.
MaxMessageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxMessageSize* parameter specifies the maximum size of a message that can pass through a connector. The default value is 25 MB. When you enter a value,

			qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is 0 to 2147483647 bytes. To remove the message size limit on a Send connector, enter a value of `unlimited`.
Name	Optional	System.String	The *Name* parameter specifies the administrator-supplied name of the connector. You must enclose the *Name* parameter in quotation marks (") if the name contains spaces. For example, `"New Send Connector"`.
Port	Optional	System.Int32	The *Port* parameter specifies the port number for smart host forwarding, if you specify a value in the *SmartHosts* parameter. The valid input range is an integer from 0

			through 65535. The default value is 25. In most organizations, the port number is set to 25.
ProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *ProtocolLoggingLevel* parameter specifies whether to enable protocol logging. `verbose` enables protocol logging. `None` disables protocol logging. The location of the Send connector protocol logs for all Send connectors configured in the Transport service on a Mailbox server or on an Edge server is specified with the *SendProtocolLogPath* parameter of the **Set-TransportService** cmdlet.
RequireOorg	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RequireTLS	Optional	System.Boolean	The *RequireTLS* parameter specifies whether all messages sent through this connector must be transmitted using TLS. The default value is `$false`.
SmartHostAuthMechanism	Optional	Microsoft.Exchange.Data.Directory.SystemCo	The *SmartHostAuthMechanis*

		nfiguration.SmtpSendConnectorConfig+AuthMechanisms	*m* parameter specifies the smart host authentication mechanism to use for authentication with a remote server. Use this parameter only when a smart host is configured and the *DNSRoutingEnabled* parameter is set to `$false`. Valid values are `None`, `BasicAuth`, `BasicAuthRequireTLS`, `ExchangeServer`, and `ExternalAuthoritative`. All values are mutually exclusive. If you select `BasicAuth` or `BasicAuthRequireTLS`, you must use the *AuthenticationCredential* parameter to specify the authentication credential.
SmartHosts	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SmartHosts* parameter specifies the smart hosts the Send connector uses to route mail. This parameteris required if you set the *DNSRoutingEnabled* parameter to `$false` and it must be specified on the same command line. The

			SmartHosts parameter takes one or more FQDNs, such as `server.contoso.com`, or one or more IP addresses, or a combination of both FQDNs and IP addresses. If you enter an IP address, you must enter the IP address as a literal. For example, `10.10.1.1`. The smart host identity can be the FQDN of a smart-host server, a mail exchanger (MX) record, or an address (A) record. If you configure an FQDN as the smart host identity, the source server for the Send connector must be able to use DNS name resolution to locate the smart-host server. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax:

			"<value1>","<value2>"... To add or remove one or more values without affecting any existing entries, use the following syntax: @{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}.
SmtpMaxMessagesPerConnection	Optional	System.Int32	The *SmtpMaxMessagesPerConnection* parameter specifies the maximum number of messages the server can send per connection.
SourceIPAddress	Optional	System.Net.IPAddress	The *SourceIPAddress* parameter specifies the local IP address to use as the endpoint for an SMTP connection to a remote messaging server. The default IP address is 0.0.0.0. This value means that the server can use any available local IP address. This parameter is valid only for Send connectors configured on an Edge server.
SourceTransportServe	Optional	Microsoft.Exchange.Da	The

rs		ta.MultiValuedProperty	*SourceTransportServers* parameter specifies the names of the Mailbox servers that can use this Send connector. This parameter isn't valid for Send connectors configured on an Edge server. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
TlsAuthLevel	Optional	Microsoft.Exchange.Data.TlsAuthLevel	The *TlsAuthLevel* parameter specifies the TLS authentication level that is used for outbound

			TLS connections established by this Send connector. Valid values are: • `EncryptionOnly`: TLS is used only to encrypt the communication channel. No certificate authentication is performed. • `CertificateValidation`: TLS is used to encrypt the channel and certificate chain validation and revocation lists checks are performed. • `DomainValidation`: In addition to channel encryption and certificate validation, the Send connector also verifies that the FQDN of the target certificate matches the domain specified in the *TlsDomain* parameter. If no domain is specified in the *TlsDomain* parameter, the FQDN on the certificate is compared with the recipient's domain. You can't specify a value for this parameter if the *IgnoreSTARTTLS* parameter is set to `$true`, or if the *RequireTLS* parameter is set to `$false`.

TlsCertificateName	Optional	Microsoft.Exchange.Data.SmtpX509Identifier	The *TlsCertificateName* parameter specifies the X.509 certificate to use with TLS sessions and secure mail. Valid input for this parameter is `[I]`*Issuer*`[S]`*Subject*. The *Issuer* value is found in the certificate's `Issuer` field, and the *Subject* value is found in the certificate's `Subject` field. You can find these values by running the **Get-ExchangeCertificate** cmdlet.
TlsDomain	Optional	Microsoft.Exchange.Data.SmtpDomainWithSubdomains	The *TlsDomain* parameter specifies the domain name that the Send connector uses to verify the FQDN of the target certificate when establishing a TLS secured connection. This parameter is used only if the *TlsAuthLevel* parameter is set to `DomainValidation`. A value for this parameter is required if: • The *TLSAuthLevel* parameter is set to

			`DomainValidation`. • The *DNSRoutingEnabled* parameter is set to `$false` (smart host Send connector).
UseExternalDNSServersEnabled	Optional	System.Boolean	The *UseExternalDNSServersEnabled* parameter specifies whether this Send connector uses the external DNS list specified by the *ExternalDNSServers* parameter of the **Set-TransportService** cmdlet. The default value is `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-SmtpConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-09*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-SmtpConnectivity** cmdlet to diagnose whether an SMTP connection can successfully be established to the Receive connectors on a specific server. Although you can run this cmdlet manually to verify SMTP connectivity for a specified server, it's primarily used by Microsoft System Center Operations Manager 2007 to test your transport servers' ability to receive SMTP connections to each of the bindings on all the Receive connectors on those servers.

```
Test-SmtpConnectivity [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Identity <ServerIdParameter>] [-MonitoringContext <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example verifies SMTP connectivity for all Receive connectors on the Mailbox server named Mailbox01.

```
Test-SmtpConnectivity Mailbox01
```

EXAMPLE 2

This example verifies SMTP connectivity for all Receive connectors on all Mailbox servers in the organization.

```
Get-TransportService | Test-SmtpConnectivity
```

Detailed Description

When you run the **Test-SmtpConnectivity** cmdlet against a Mailbox server, the cmdlet attempts to establish an SMTP connection to all bindings of all Receive connectors hosted on that server. For each attempt, the cmdlet returns the following information:

- **Server:** The name of the server that hosts the Receive connector.
- **ReceiveConnector:** The name of the Receive connector to which the SMTP connection was attempted.
- **Binding:** The binding that was configured on the Receive connector.
- **EndPoint:** The actual IP address and port to which the SMTP connection was attempted.
- **StatusCode:** The result of the connection attempt. This can be one of the following values: Success, Unable to connect, Transient error, Permanent error, External error.
- **Details:** The actual response received from the server being tested. If the connection attempt isn't successful, this field contains an error string.

The **Test-SmtpConnectivity** results are displayed on-screen. You can write the results to a file by piping the output to **ConvertTo-Html** or **ConvertTo-Csv** and adding "> <filename>" to the command. For example:

```
Test-SmtpConnectivity Mailbox01 | ConvertTo-Csv > "C:\My Documents\SMTP Test.csv"
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Testing mail flow" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the transport server for which the cmdlet verifies SMTP connectivity. The cmdlet verifies SMTP connectivity for all Receive connectors hosted on the specified server. If no server is specified, the cmdlet attempts to perform the SMTP connectivity

			test against all Receive connectors on the local server.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SystemMessage

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-SystemMessage** cmdlet to view the delivery status notification (DSN) or quota messages on Mailbox servers or Edge Transport servers.

```
Get-SystemMessage [-Original <SwitchParameter>] <COMMON PARAMETERS>

Get-SystemMessage [-Identity <SystemMessageIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays a list of all customized DSN and quota messages configured in your organization.

```
Get-SystemMessage
```

EXAMPLE 2

This example displays detailed configuration information of the specific customized DSN message for DSN code 5.3.2.

```
Get-SystemMessage En\Internal\5.3.2 | Format-List
```

EXAMPLE 3

This example displays detailed configuration information of the specific customized quota message for mailbox size warning.

```
Get-SystemMessage En\WarningMailbox | Format-List
```

EXAMPLE 4

This example displays a list of all built-in DSN and quota messages.

```
Get-SystemMessage -Original
```

Detailed Description

The **Get-SystemMessage** cmdlet displays default and customized DSN and quota messages. You can retrieve a customized DSN or quota message by specifying the identity of the message by using the *Identity* parameter. You can retrieve a list of built-in DSN or quota messages by using the *Original* parameter.

DSN messages are issued to the sender of e-mail messages that haven't reached their intended recipients. Quota messages are issued to users whose mailboxes or public folders have reached the specific warning, prohibit send, or prohibit receive quotas. Customized DSN and quota messages replace the built-in DSN or quota messages included with Exchange.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "DSNs" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.SystemMessageIdParameter	The *Identity* parameter specifies the DSN or quota message you want to view. You can also retrieve a customized DSN message by using the following format: *language**internal | external**system code*. For more information about the syntax of the DSN message identity,

			see DSN message identity. You can also retrieve a customized quota message by using the following format: *language**QuotaMessageType*. *Language* is expressed as the two-character locale code. *QuotaMessageType* accepts the following values: Quota message types related to mailbox size: • `ProhibitSendReceiveMailBox` Issued when a mailbox exceeds its **ProhibitSendReceiveQuota** limit. • `ProhibitSendMailbox` Issued when a mailbox exceeds its **ProhibitSendQuota** limit. • `WarningMailbox` Issued when a mailbox that has a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningMailboxUnlimitedSize` Issued when a mailbox that doesn't have a **ProhibitSendQuota** limit or a

			ProhibitSendReceiveQuota limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to public folder size: • `ProhibitPostPublicFolder` Issued when a public folder exceeds its **ProhibitPostQuota** limit. • `WarningPublicFolder` Issued when a public folder that has a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningPublicFolderUnlimitedSize` Issued when a public folder that doesn't have a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to the number of messages allowed in a mailbox folder: • `ProhibitReceiveMailboxMessagesPerFolderCount` Issued when a mailbox exceeds its **MailboxMessagesPerFolderCountReceiveQuota** limit. • `WarningMailboxMessage`

			sPerFolderCount Issued when a mailbox that has a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. • WarningMailboxMessagesPerFolderUnlimitedCount Issued when a mailbox that doesn't have a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. Quota message types related to the number of subfolders that can be created in a mailbox folder: • ProhibitReceiveFolderHierarchyChildrenCountCount Issued when a mailbox exceeds its **FolderHierarchyChildrenCountReceiveQuota** limit. • WarningFolderHierarchyChildrenCount Issued when a mailbox that has a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildr**

			enCountWarningQuota limit. • `WarningFolderHierarchyChildrenUnlimitedCount` Issued when a mailbox that doesn't have a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuota** limit. • `WarningFoldersCount` Issued when the number of folders in the hierarchy exceeds the **FoldersCountWarningQuota** limit. • `ProhibitReceiveFolderscount` Issued when new public folder creation fails because the public folder hierarchy is too big and has reached the **FoldersCountReceiveQuota** limit. • `WarningFoldersCountUnlimited` Issued when the public folder hierarchy is getting too big and does not have the **FoldersCountReceiveQuota** limit configured. Quota message types related to the number of levels allowed in the folder hierarchy of a mailbox folder: • `ProhibitReceiveFolder`

			`HierarchyDepth` Issued when a mailbox exceeds its **FolderHierarchyDepth WarningQuota** limit. • `WarningFolderHierarchyDepth` Issued when a mailbox that has a **FolderHierarchyDepth ReceiveQuota** limit configured exceeds its **FolderHierarchyDepth WarningQuota** limit. • `WarningFolderHierarchyDepthUnlimited` Issued when a mailbox that doesn't have a **FolderHierarchyDepth ReceiveQuota** limit configured exceeds its **FolderHierarchyDepth WarningQuota** limit.
Original	Optional	System.Management.Automation.SwitchParameter	The *Original* parameter specifies whether to retrieve the list of default DSN or quota messages that were included with Exchange when you installed Exchange.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-SystemMessage

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-SystemMessage** cmdlet to create customized delivery status notification (DSN) or quota messages, in the specified language, on Mailbox servers or Edge Transport servers.

```
New-SystemMessage -DsnCode <EnhancedStatusCode> -Internal <$true | $false>
-Language <CultureInfo> -Text <String> <COMMON PARAMETERS>

New-SystemMessage -Language <CultureInfo> -QuotaMessageType
<WarningMailboxUnlimitedSize | WarningPublicFolderUnlimitedSize |
WarningMailbox | WarningPublicFolder | ProhibitSendMailbox |
ProhibitPostPublicFolder | ProhibitSendReceiveMailBox |
WarningMailboxMessagesPerFolderCount |
ProhibitReceiveMailboxMessagesPerFolderCount |
WarningFolderHierarchyChildrenCount |
ProhibitReceiveFolderHierarchyChildrenCountCount |
WarningMailboxMessagesPerFolderUnlimitedCount |
WarningFolderHierarchyChildrenUnlimitedCount | WarningFolderHierarchyDepth
| ProhibitReceiveFolderHierarchyDepth |
WarningFolderHierarchyDepthUnlimited | WarningFoldersCount |
ProhibitReceiveFoldersCount | WarningFoldersCountUnlimited> -Text <String>
<COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a customized DSN message for the DSN code 5.3.5 with the following settings:

- This DSN message is only displayed to external users.
- The text for the DSN message is provided for the English locale.

```
New-SystemMessage -DsnCode 5.3.5 -Language en -Internal
$false -Text "The recipient e-mail system can't process
this e-mail message. Please contact your system
administrator for more information."
```

EXAMPLE 2

This example creates a customized `WarningMailbox` quota message. This message is displayed to users who meet the following criteria:

- The mailbox has exceeded the warning mailbox limit configured on the mailbox.
- The mailbox is located on a server that uses the English locale.

```
New-SystemMessage -QuotaMessageType WarningMailbox -
Language en -Text "Your mailbox has exceeded the warning
limit specified by your e-mail administrator. Please reduce
the size of your mailbox."
```

Detailed Description

DSN messages are issued to the sender of e-mail messages that haven't reached their intended recipients. Quota messages are issued to users whose mailboxes or public folders have reached the specific warning, prohibit send, or prohibit receive quotas. Customized DSN and quota messages replace the built-in DSN or quota messages included with Exchange.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "DSNs" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DsnCode	Required	Microsoft.Exchange.Data.EnhancedStatusCode	The *DsnCode* parameter specifies which DSN code the DSN message applies to. This parameter can be a built-in code, or it can be a customized administrator-defined code. **Note:** This parameter can't be used when the *QuotaMessageType* parameter is specified.
Internal	Required	System.Boolean	The *Internal* parameter specifies whether the message is displayed to

			users inside the Exchange organization. For messages that are only displayed internally, set this parameter to `$true`. For messages that are only displayed to external users, set this parameter to `$false`. **Note:** This parameter can't be used when the *QuotaMessageType* parameter is specified.
Language	Required	System.Globalization.CultureInfo	The *Language* parameter specifies the language of the message. The message can be created in any Exchange-supported language. Languages are specified by using their locale name. For example, the locale name for English is en and the locale name for Japanese is ja. For a complete list of locales, see Supported languages for system messages.
QuotaMessageType	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.QuotaMessageType	The *QuotaMessageType* parameter selects the type of quota message to create.

			The *QuotaMessageType* parameter accepts the following values: Quota message types related to mailbox size: • `ProhibitSendReceiveMailBox` Issued when a mailbox exceeds its **ProhibitSendReceiveQuota** limit. • `ProhibitSendMailbox` Issued when a mailbox exceeds its **ProhibitSendQuota** limit. • `WarningMailbox` Issued when a mailbox that has a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningMailboxUnlimitedSize` Issued when a mailbox that doesn't have a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to public folder size: • `ProhibitPostPublicFolder` Issued when a public folder exceeds its

			ProhibitPostQuota limit. • `WarningPublicFolder` Issued when a public folder that has a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningPublicFolderUnlimitedSize` Issued when a public folder that doesn't have a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to the number of messages allowed in a mailbox folder: • `ProhibitReceiveMailboxMessagesPerFolderCount` Issued when a mailbox exceeds its **MailboxMessagesPerFolderCountReceiveQuota** limit. • `WarningMailboxMessagesPerFolderCount` Issued when a mailbox that has a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. • `WarningMailboxMessagesPerFolderUnlimitedCount` Issued when a

			mailbox that doesn't have a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. Quota message types related to the number of subfolders that can be created in a mailbox folder: • `ProhibitReceiveFolderHierarchyChildrenCountCount` Issued when a mailbox exceeds its **FolderHierarchyChildrenCountReceiveQuota** limit. • `WarningFolderHierarchyChildrenCount` Issued when a mailbox that has a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuota** limit. • `WarningFolderHierarchyChildrenUnlimitedCount` Issued when a mailbox that doesn't have a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuot**

			a limit. • `WarningFoldersCount` Issued when the number of folders in the hierarchy exceeds the **FoldersCountWarningQuota** limit. • `ProhibitReceiveFoldersCount` Issued when new public folder creation fails because the public folder hierarchy is too big and has reached the **FoldersCountReceiveQuota** limit. • `WarningFoldersCountUnlimited` Issued when the public folder hierarchy is getting too big and does not have the **FoldersCountReceiveQuota** limit configured. Quota message types related to the number of levels allowed in the folder hierarchy of a mailbox folder: • `ProhibitReceiveFolderHierarchyDepth` Issued when a mailbox exceeds its **FolderHierarchyDepthWarningQuota** limit. • `WarningFolderHierarchyDepth` Issued when a mailbox that has a **FolderHierarchyDepthReceiveQuota** limit configured exceeds its **FolderHierarchyDepth**

			WarningQuota limit. • `WarningFolderHierarchyDepthUnlimited` Issued when a mailbox that doesn't have a **FolderHierarchyDepthReceiveQuota** limit configured exceeds its **FolderHierarchyDepthWarningQuota** limit. **Note:** This parameter can't be used when the *DsnCode* parameter is specified.
Text	Required	System.String	The *Text* parameter specifies the text of the message displayed to senders or mailbox owners. The text should explain why the message was created and what actions the sender or mailbox owner should take, if any.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	The *DomainController*

		ta.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-SystemMessage

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-SystemMessage** cmdlet to delete customized delivery status notification (DSN) or quota messages on Mailbox servers or Edge Transport servers.

```
Remove-SystemMessage -Identity <SystemMessageIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a customized DSN message for the DSN code 5.7.9.

```
Remove-SystemMessage En\Internal\5.7.9
```

EXAMPLE 2

This example removes a customized quota message for a mailbox size warning.

```
Remove-SystemMessage En\WarningMailbox
```

Detailed Description

DSN messages are issued to the sender of email messages that haven't reached their intended recipients. Quota messages are issued to users whose mailboxes or public folders have reached the specific warning, prohibit send, or prohibit receive quotas. Customized DSN and quota messages replace the built-in DSN or quota messages included with Exchange.

Note:

Only customized DSN and quota messages can be removed from the server. Built-in DSN and quota messages can't be removed. When a customized DSN or quota message is removed, the message text reverts to the built-in text included with Exchange.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "DSNs" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.SystemMessageIdParameter	The *Identity* parameter specifies the DSN or quota message you want to remove. You can also identify a customized DSN message by using the following format: *language**internal | external**system code*. For more information about the syntax of the DSN message identity, see DSN message identity. You can identify a customized quota message by using the following format: *Language**QuotaMessageType*. *Language* is expressed as the two-character locale code. *QuotaMessageType* accepts the following

			values: Quota message types related to mailbox size: • `ProhibitSendReceiveMailBox` Issued when a mailbox exceeds its **ProhibitSendReceiveQuota** limit. • `ProhibitSendMailbox` Issued when a mailbox exceeds its **ProhibitSendQuota** limit. • `WarningMailbox` Issued when a mailbox that has a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningMailboxUnlimitedSize` Issued when a mailbox that doesn't have a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to public folder size: • `ProhibitPostPublicFolder` Issued when a public folder exceeds its **ProhibitPostQuota** limit.

			• `WarningPublicFolder` Issued when a public folder that has a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningPublicFolderUnlimitedSize` Issued when a public folder that doesn't have a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to the number of messages allowed in a mailbox folder: • `ProhibitReceiveMailboxMessagesPerFolderCount` Issued when a mailbox exceeds its **MailboxMessagesPerFolderCountReceiveQuota** limit. • `WarningMailboxMessagesPerFolderCount` Issued when a mailbox that has a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. • `WarningMailboxMessagesPerFolderUnlimitedCount` Issued when a mailbox that doesn't have a

			MailboxMessagesPerFolderCountReceiveQuota limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. Quota message types related to the number of subfolders that can be created in a mailbox folder: • `ProhibitReceiveFolderHierarchyChildrenCountCount` Issued when a mailbox exceeds its **FolderHierarchyChildrenCountReceiveQuota** limit. • `WarningFolderHierarchyChildrenCount` Issued when a mailbox that has a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuota** limit. • `WarningFolderHierarchyChildrenUnlimitedCount` Issued when a mailbox that doesn't have a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuota** limit. • `WarningFoldersCount`

			Issued when the number of folders in the hierarchy exceeds the **FoldersCountWarningQuota** limit. • `ProhibitReceiveFoldersCount` Issued when new public folder creation fails because the public folder hierarchy is too big and has reached the **FoldersCountReceiveQuota** limit. • `WarningFoldersCountUnlimited` Issued when the public folder hierarchy is getting too big and does not have the **FoldersCountReceiveQuota** limit configured. Quota message types related to the number of levels allowed in the folder hierarchy of a mailbox folder: • `ProhibitReceiveFolderHierarchyDepth` Issued when a mailbox exceeds its **FolderHierarchyDepthWarningQuota** limit. • `WarningFolderHierarchyDepth` Issued when a mailbox that has a **FolderHierarchyDepthReceiveQuota** limit configured exceeds its **FolderHierarchyDepthWarningQuota** limit. • `WarningFolderHierarchyDepthUnlimited`

			Issued when a mailbox that doesn't have a **FolderHierarchyDepthReceiveQuota** limit configured exceeds its **FolderHierarchyDepthWarningQuota** limit.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write

			data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SystemMessage

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-SystemMessage** cmdlet to modify existing customized delivery status notification (DSN) or quota messages.

```
Set-SystemMessage -Identity <SystemMessageIdParameter> [-Confirm
```

```
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Name <String>] [-
Original <SwitchParameter>] [-Text <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the English text of an existing customized DSN message that has the DSN code 5.3.5.

```
Set-SystemMessage En\Internal\5.3.5 -Text "The recipient e-
mail system can't process this e-mail message. Please
contact your system administrator for more information."
```

EXAMPLE 2

This example modifies the English text of an existing customized `WarningMailbox` quota message.

```
Set-SystemMessage En\WarningMailbox -Text "Your mailbox has
exceeded the warning limit specified by your e-mail
administrator. Please reduce the size of your mailbox."
```

Detailed Description

DSN messages are issued to the sender of e-mail messages that haven't reached their intended recipients. Quota messages are issued to users whose mailboxes or public folders have reached the specific warning, prohibit send, or prohibit receive quotas. Customized DSN and quota messages replace the built-in DSN or quota messages included with Exchange.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "DSNs" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.SystemMessageIdParameter	The*Identity* parameter specifies the identity of the DSN or quota message to modify. To modify a DSN

			message, use the following format: *language*\internal | external*system code*. For more information about the syntax of the DSN message identity, see DSN message identity. To modify a customized quota message, use the following format: *language* *QuotaMessageType*. *Language* is expressed as the two-character locale code. The *QuotaMessageType* parameter accepts the following values: Quota message types related to mailbox size: • `ProhibitSendReceiveMailBox` Issued when a mailbox exceeds its **ProhibitSendReceiveQuota** limit. • `ProhibitSendMailbox` Issued when a mailbox exceeds its **ProhibitSendQuota** limit. • `WarningMailbox` Issued when a mailbox that has a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured

			exceeds its **IssueWarningQuota** limit. • `WarningMailboxUnlimitedSize` Issued when a mailbox that doesn't have a **ProhibitSendQuota** limit or a **ProhibitSendReceiveQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to public folder size: • `ProhibitPostPublicFolder` Issued when a public folder exceeds its **ProhibitPostQuota** limit. • `WarningPublicFolder` Issued when a public folder that has a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. • `WarningPublicFolderUnlimitedSize` Issued when a public folder that doesn't have a **ProhibitPostQuota** limit configured exceeds its **IssueWarningQuota** limit. Quota message types related to the number of messages allowed in a

			mailbox folder: • `ProhibitReceiveMailboxMessagesPerFolderCount` Issued when a mailbox exceeds its **MailboxMessagesPerFolderCountReceiveQuota** limit. • `WarningMailboxMessagesPerFolderCount` Issued when a mailbox that has a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. • `WarningMailboxMessagesPerFolderUnlimitedCount` Issued when a mailbox that doesn't have a **MailboxMessagesPerFolderCountReceiveQuota** limit configured exceeds its **MailboxMessagesPerFolderCountWarningQuota** limit. Quota message types related to the number of subfolders that can be created in a mailbox folder: • `ProhibitReceiveFolderHierarchyChildrenCountCount` Issued when a mailbox exceeds its **FolderHierarchyChildrenCountReceiveQuota** limit.

			• `WarningFolderHierarchyChildrenCount` Issued when a mailbox that has a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuota** limit. • `WarningFolderHierarchyChildrenUnlimitedCount` Issued when a mailbox that doesn't have a **FolderHierarchyChildrenCountReceiveQuota** limit configured exceeds its **FolderHierarchyChildrenCountWarningQuota** limit. • `WarningFoldersCount` Issued when the number of folders in the hierarchy exceeds the **FoldersCountWarningQuota** limit. • `ProhibitReceiveFoldersCount` Issued when new public folder creation fails because the public folder hierarchy is too big and has reached the **FoldersCountReceiveQuota** limit. • `WarningFoldersCountUnlimited` Issued when the public folder hierarchy is getting too big and does not have the **FoldersCountReceive**

			Quota limit configured. Quota message types related to the number of levels allowed in the folder hierarchy of a mailbox folder: • `ProhibitReceiveFolderHierarchyDepth` Issued when a mailbox exceeds its **FolderHierarchyDepthWarningQuota** limit. • `WarningFolderHierarchyDepth` Issued when a mailbox that has a **FolderHierarchyDepthReceiveQuota** limit configured exceeds its **FolderHierarchyDepthWarningQuota** limit. • `WarningFolderHierarchyDepthUnlimited` Issued when a mailbox that doesn't have a **FolderHierarchyDepthReceiveQuota** limit configured exceeds its **FolderHierarchyDepthWarningQuota** limit.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Name	Optional	System.String	The *Name* parameter specifies a name that you can use to describe the DSN or quota message.
Original	Optional	System.Management.Automation.SwitchParameter	The *Original* parameter reverts the DSN or quota message text back to the original shipped text. This parameter is useful when you don't want to remove the customized DSN or quota entry but want to revert to the original text.

Text	Optional	System.String	The *Text* parameter specifies the text of the message displayed to senders or mailbox owners. The text should explain why the message was created and what actions the sender or mailbox owner should take, if any.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-TransportAgent

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-TransportAgent** cmdlet to disable a transport agent.

```
Disable-TransportAgent -Identity <TransportAgentObjectId> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-TransportService <Hub |
Edge | FrontEnd | MailboxSubmission | MailboxDelivery>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example shows how a fictitious application named Test App is disabled in the Transport service on a Mailbox server.

```
Disable-TransportAgent "Test App" -TransportService Hub
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.AgentTasks.TransportAgentObjectId	The *Identity* parameter specifies the display name of the transport agent to be disabled. The length of the name can't exceed 64 characters.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the transport service that you want to view or modify.

			Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers. • `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport servers.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-TransportAgent

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-TransportAgent** cmdlet to enable a transport agent.

```
Enable-TransportAgent -Identity <TransportAgentObjectId> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-TransportService <Hub |
Edge | FrontEnd | MailboxSubmission | MailboxDelivery>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables a fictitious application named Test App in the Transport service on a Mailbox server.

```
Enable-TransportAgent "Test App" -TransportService Hub
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.AgentTasks.TransportAgentObje	The *Identity* parameter specifies the display name of the transport agent to

		ctId	be enabled. The length of the name can't exceed 64 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the transport service that you want to view or modify. Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers. • `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport servers.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportAgent

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-TransportAgent** cmdlet to view the configuration of a transport agent.

```
Get-TransportAgent [-Identity <TransportAgentObjectId>] [-DomainController
<Fqdn>] [-TransportService <Hub | Edge | FrontEnd | MailboxSubmission |
MailboxDelivery>]
```

Examples

EXAMPLE 1

This example displays a summary list of all transport agents installed on all Exchange servers in your organization.

```
Get-TransportAgent
```

EXAMPLE 2

This example displays detailed information about the Transport Rule agent that's installed in the Transport service on a Mailbox server. The output of the **Get-TransportAgent** command is piped to the **Format-List** command to display the detailed configuration of the transport agent.

```
Get-TransportAgent "Transport Rule Agent" -TransportService
Hub | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Management.AgentTasks.TransportAgentObjectId	The *Identity* parameter specifies the display name of the transport agent to be displayed. The length of the name can't exceed 64 characters.
TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the

			transport service that you want to view or modify. Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers. • `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport servers.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Install-TransportAgent

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Install-TransportAgent** cmdlet to register a transport agent in the Transport service on a Mailbox server, in the Front End Transport service on a Client Access server, or on an Edge Transport server.

```
Install-TransportAgent -AssemblyPath <String> -Name <String> -
TransportAgentFactory <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-TransportService <Hub | Edge | FrontEnd |
MailboxSubmission | MailboxDelivery>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example shows how a fictitious application named Test App is installed in the Transport service on a Mailbox server.

```
Install-TransportAgent -Name "Test App" -
TransportAgentFactory
"vendor.exchange.avTransportAgentfactory" -AssemblyPath "c:
\Program Files\Vendor\TransportAgent
\AvTransportAgentFactory.dll" -TransportService Hub
```

Detailed Description

Caution:
Transport agents have full access to all email messages that they encounter. Exchange puts no restrictions on a transport agent's behavior. Transport agents that are unstable or contain security flaws may affect the stability and security of Exchange. Therefore, you must only install transport agents that you fully trust and that have been fully tested in a test environment.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AssemblyPath	Required	System.String	The *AssemblyPath* parameter specifies the location of the transport agent Microsoft .NET

			assembly. Universal Naming Convention (UNC) file paths can't be used.
Name	Required	System.String	The *Name* parameter specifies the display name of the transport agent to be installed. The length of the name can't exceed 64 characters.
TransportAgentFactory	Required	System.String	The *TransportAgentFactory* parameter specifies the Microsoft .NET class type of the transport agent factory. The developer of the transport agent being installed provides the transport agent factory and related information. For more information, see the documentation provided by the developer of the transport agent.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You

			don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the transport service that you want to view or modify. Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers.

			• `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport servers.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-TransportAgent

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-TransportAgent** cmdlet to modify a transport agent.

```
Set-TransportAgent -Identity <TransportAgentObjectId> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Priority <Int32>] [-
TransportService <Hub | Edge | FrontEnd | MailboxSubmission |
MailboxDelivery>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the priority of a fictitious agent named Test App in the Front End Transport service on a Client Access server.

```
Set-TransportAgent "Test App" -Priority 3 -TransportService
-FrontEnd
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.AgentTasks.TransportAgentObjectId	The *Identity* parameter specifies the display name of the transport agent to be modified. The length of the name can't exceed 64 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Priority	Optional	System.Int32	The *Priority* parameter specifies the priority of the transport agent. The priority of the transport agent controls the order in which the transport agents process email messages. The priority

			must be a value between 0 and the maximum number of transport agents. The default behavior is to append a new transport agent to the end of the priority list. Transport agents with a priority closest to 0 process email messages first.
TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the transport service that you want to view or modify. Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers. • `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport servers.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it

			would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Uninstall-TransportAgent

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Uninstall-TransportAgent** cmdlet to unregister a transport agent from the Transport service on a Mailbox server, the Front End Transport service on a Client Access server, or from an Edge Transport server.

```
Uninstall-TransportAgent -Identity <TransportAgentObjectId> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-TransportService <Hub |
Edge | FrontEnd | MailboxSubmission | MailboxDelivery>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example uninstalls a fictitious application named Test App from the Transport service on a Mailbox server.

```
Uninstall-TransportAgent "Test App" -TransportService Hub
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.AgentTasks.TransportAgentObjectId	The *Identity* parameter specifies the display name of the transport agent to be uninstalled. The length of the name can't exceed 64 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the transport service that you want to view or modify. Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers. • `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport

			servers.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportConfig

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-TransportConfig** cmdlet to view organization-wide transport configuration settings.

```
Get-TransportConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example lists the organization-wide transport settings on Mailbox server, or the local transport settings on an Edge Transport server.

```
Get-TransportConfig
```

EXAMPLE 2

This example lists all delivery status notification-related (DSN) configuration settings for your organization when run on a Mailbox server. When run on an Edge Transport server, it displays the DSN-related settings configured on that Edge Transport server.

```
Get-TransportConfig | Format-List *DSN*
```

Detailed Description

The **Get-TransportConfig** cmdlet displays configuration information for global transport settings applied across the organization when the cmdlet is run on a Mailbox server. When this cmdlet is run on an Edge Transport server, only the transportation configuration settings for the local computer are shown.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-TransportConfig

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Set-TransportConfig** cmdlet to modify the transport configuration settings for the whole Exchange organization.

```
Set-TransportConfig [-Identity <OrganizationIdParameter>] [-
AddressBookPolicyRoutingEnabled <$true | $false>] [-
AgentGeneratedMessageLoopDetectionInSmtpEnabled <$true | $false>] [-
AgentGeneratedMessageLoopDetectionInSubmissionEnabled <$true | $false>] [-
AnonymousSenderToRecipientRatePerHour <Int32>] [-ClearCategories <$true |
$false>] [-Confirm [<SwitchParameter>]] [-ConvertDisclaimerWrapperToEml
<$true | $false>] [-DiagnosticsAggregationServicePort <Int32>] [-
DomainController <Fqdn>] [-DSNConversionMode <UseExchangeDSNs |
PreserveDSNBody | DoNotConvert>] [-ExternalDelayDsnEnabled <$true |
$false>] [-ExternalDsnDefaultLanguage <CultureInfo>] [-
ExternalDsnLanguageDetectionEnabled <$true | $false>] [-
ExternalDsnMaxMessageAttachSize <ByteQuantifiedSize>] [-
ExternalDsnReportingAuthority <SmtpDomain>] [-ExternalDsnSendHtml <$true |
$false>] [-ExternalPostmasterAddress <SmtpAddress>] [-GenerateCopyOfDSNFor
<MultiValuedProperty>] [-HeaderPromotionModeSetting <NoCreate | MayCreate
| MustCreate>] [-HygieneSuite <Standard | Premium>] [-
InternalDelayDsnEnabled <$true | $false>] [-InternalDsnDefaultLanguage
<CultureInfo>] [-InternalDsnLanguageDetectionEnabled <$true | $false>] [-
InternalDsnMaxMessageAttachSize <ByteQuantifiedSize>] [-
InternalDsnReportingAuthority <SmtpDomain>] [-InternalDsnSendHtml <$true |
$false>] [-InternalSMTPServers <MultiValuedProperty>] [-
JournalArchivingEnabled <$true | $false>] [-JournalingReportNdrTo
<SmtpAddress>] [-JournalReportDLMemberSubstitutionEnabled <$true |
$false>] [-LegacyArchiveJournalingEnabled <$true | $false>] [-
LegacyArchiveLiveJournalingEnabled <$true | $false>] [-
LegacyJournalingMigrationEnabled <$true | $false>] [-

[<SwitchParameter>]] [-Xexch50Enabled <$true | $false>]
```

Examples

EXAMPLE 1

This example configures the Exchange organization to forward all DSN messages that have the DSN codes 5.7.1, 5.7.2, and 5.7.3 to the postmaster email account.

```
Set-TransportConfig -GenerateCopyOfDSNFor 5.7.1,5.7.2,5.7.3
```

EXAMPLE 2

This example configures the Exchange organization to redirect all journaling reports that can't be delivered to the journaling mailbox to the email account `journalingndr@contoso.com`.

```
Set-TransportConfig -JournalingReportNdrTo
journalingndr@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AddressBookPolicyRoutingEnabled	Optional	System.Boolean	The *AddressBookPolicyRoutingEnabled* parameter controls how recipients are resolved in an organization that uses address book policies to create separate virtual organizations within the same Exchange organization. Specifically, the global address list (GAL) that's specified in the user's address book policy controls how recipients are resolved. When the value of this parameter is `$true`, users

			that are assigned different GALs appear as external recipients. When the value of this parameter is `$false`, users that are assigned different GALs appear as internal recipients. The default value is `$false`. Note that this parameter has no effect if your organization doesn't use address book policies, or if the address book policy routing agent isn't installed and enabled. Also note that changing the value of this parameter may take up to 30 minutes to take effect. For more information about address book policies, see Address book policies.
AgentGeneratedMessageLoopDetectionInSmtpEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *AgentGeneratedMessageLoopDetectionInSmtpEnabled* parameter controls the behavior of messages

			loop detection in for loops caused by transport agents in the Transport service. An agent-generated loop occurs when an agent creates a new copy of a message or adds recipients to a message, and the agent continues to process these resulting messages by creating copies or adding recipients. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When Exchange detects an agent-generated message loop, the loop is stopped. When this parameter is set to `$false`, the loop is logged in the message tracking log. When this parameter is set to `$true`, the message is rejected with an NDR when the loop generates the number of messages specified by the *MaxAllowedAgentGenerat*

			edMessageDepth and *MaxAllowedAgentGeneratedMessageDepthPerAgent* parameters.
AgentGeneratedMessageLoopDetectionInSubmissionEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *AgentGeneratedMessageLoopDetectionInSubmissionEnabled* parameter controls the behavior of messages loop detection in for loops caused by transport agents in the Mailbox Transport Submission service. An agent-generated loop occurs when an agent creates a new copy of a message or adds recipients to a message, and the agent continues to process these resulting messages by creating copies or adding recipients. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When Exchange detects

			an agent-generated message loop, the loop is stopped. When this parameter is set to `$true`, the loop is logged in the message tracking log. When this parameter is set to `$false`, the message is rejected with an NDR when the loop generates the number of messages specified by the *MaxAllowedAgentGeneratedMessageDepthPerAgent* and *MaxAllowedAgentGeneratedMessageDepth* parameters.
AnonymousSenderToRecipientRatePerHour	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
ClearCategories	Optional	System.Boolean	The *ClearCategories* parameter keeps or removes Microsoft Outlook message categories during content conversion. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This means that by default, Outlook message categories are

			removed during content conversion.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConvertDisclaimerWrapperToEml	Optional	System.Boolean	The *ConvertDisclaimerWrapperToEml* parameter specifies whether the original message will be added as a TNEF attachment or a regular EML attachment to a disclaimer when all of the following are true: • Message is sent to an external user. • The sender has signed the message. • The message is processed by a Transport rule that adds a disclaimer. When a Transport rule that adds disclaimers to

			outbound messages encounters a message signed by the sender, the Transport rule can't add the disclaimer directly to the message. As a result, the disclaimer is sent to the intended recipient with the original message as an attachment. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you set this parameter to `$true`, the original message is sent as an EML attachment. Otherwise, it is sent as a TNEF attachment.
DiagnosticsAggregationServicePort	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *DiagnosticsAggregationServicePort* parameter specifies the TCP port that's used to collect message queue diagnostic information. The default value is 9710.
DomainController	Optional	Microsoft.Exchange.Da	This parameter is available only in on-

		ta.Fqdn	premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DSNConversionMode	Optional	Microsoft.Exchange.Data.DSNConversionOption	The *DSNConversionMode* parameter controls how Exchange handles delivery status notifications (DSNs) that are generated by earlier versions of Exchange or non-Exchange messaging systems. You can specify one of the following values for this parameter: • `UseExchangeDSNs` • `PreserveDSNBody` • `DoNotConvert`

			By default, this parameter is set to `UseExchangeDSNs` and Exchange converts the DSNs to the Exchange 2013 DSN format, which is the same as the Exchange 2010 DSN format. Any customized text or attachments that were associated with the original DSN are overwritten. If you set this parameter to `PreserveDSNBody`, Exchange converts the DSNs to Exchange 2013 DSN format. However, the text in the body of the DSN message is retained. If you set this parameter to `DoNotConvert`, Exchange does not modify the DSN message. Instead, Exchange delivers the message as a standard message.
ExternalDelayDsnEnabled	Optional	System.Boolean	The *ExternalDelayDsnEnabled* parameter specifies whether a delay delivery status notification (DSN) message should be

			created for external messages that couldn't be immediately delivered. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ExternalDsnDefaultLanguage	Optional	System.Globalization.CultureInfo	The *ExternalDsnDefaultLanguage* parameter specifies which Exchange server language should be used by default when you create external DSN messages. The default value is the default Windows server language.
ExternalDsnLanguageDetectionEnabled	Optional	System.Boolean	The *ExternalDsnLanguageDetectionEnabled* parameter specifies whether the server should try to send an external DSN message in the same language as the original message that generated the notification. Valid input for this parameter is `$true` or `$false`.The default value is `$true`.
ExternalDsnMaxMessa	Optional	Microsoft.Exchange.Da	The *ExternalDsnMaxMessageA*

geAttachSize		ta.ByteQuantifiedSize	*ttachSize* parameter specifies the maximum size of the original message attached to an external DSN message. If the original message exceeds this size, only the headers of the original message are included in the DSN message. The default value is 10 megabytes (MB). When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 0 through 2147483647 bytes. If you specify a value of 0, only the original message headers are included in the external DSN message.
ExternalDsnReporting Authority	Optional	Microsoft.Exchange.Da ta.SmtpDomain	The *ExternalDsnReportingAuth ority* parameter specifies

			what the server name should be in the machine-readable part of the external DSN message. The default value is the authoritative domain specified during installation.
ExternalDsnSendHtml	Optional	System.Boolean	The *ExternalDsnSendHtml* parameter specifies whether external DSN messages should be sent by using HTML or whether messages should be sent in plain text. Valid input for this parameter is `$true` or `$false`.The default value is `$true`.
ExternalPostmasterAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *ExternalPostmasterAddress* parameter specifies the email address in the `From` header field of an external DSN message. The default value is `$null`. In the Transport service on a Mailbox server, the value of the external postmaster email address is `postmaster@<defaultacceptedomain>`. If an Edge Transport server hasn't

			yet been through the EdgeSync process, and the *ExternalPostmasterAddress* parameter is set to `$null`, the external postmaster email address on the Edge Transport server is `postmaster@<edgetransportserverfqdn>`. If an Edge Transport server has completed the EdgeSync process, and the *ExternalPostmasterAddress* parameter is set to `$null`, the external postmaster email address on the Edge Transport server is `postmaster@<defaultacceptedomain>`. To override the default behavior, you can specify an email address for the *ExternalPostMasterAddress* parameter.
GenerateCopyOfDSNFor	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *GenerateCopyOfDSNFor* parameter controls the

			non-delivery reports (NDRs) that are copied to a mailbox by specifying the DSN codes that you want to monitor. You must configure the list of monitored DSNs on one Mailbox server and locally on each Edge Transport server in your Exchange organization. On a Mailbox server, NDRs are copied to the mailbox assigned to the Exchange recipient. On Edge Transport servers, NDRs are copied to the mailbox assigned to the external postmaster address. DSN codes are entered as *x.y.z* and are separated by commas. By default, the following DSN codes are monitored: • 5.4.8 • 5.4.6 • 5.4.4 • 5.2.4 • 5.2.0 • 5.1.4 To enter multiple values

			and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. Although these DSN codes are monitored by default, the associated NDRs aren't copied to the Exchange recipient or to the external postmaster address if no mailbox is assigned to the Exchange recipient or to the external postmaster address. By default, no mailbox is assigned to the Exchange recipient or to the external postmaster address.

			To assign a mailbox to the Exchange recipient, use the **Set-OrganizationConfig** cmdlet with the *MicrosoftExchangeRecipientReplyRecipient* parameter. To assign a mailbox to the external postmaster address, create a new mailbox postmaster. The default email address policy of the Exchange organization should automatically add an SMTP address of postmaster@<*Authoritative domain*> to the mailbox.
HeaderPromotionModeSetting	Optional	Microsoft.Exchange.Data.HeaderPromotionMode	The *HeaderPromotionModeSetting* parameter specifies whether named properties are created for custom X-headers on messages received from outside the Exchange organization. You can use one of the following values: • `MustCreate` Exchange creates a named property for each new custom X-header.

			• `MayCreate` Exchange creates a named property for each new custom X-header on messages received from authenticated senders. No named properties are created for custom X-headers on messages received from unauthenticated senders. • `NoCreate` Exchange won't create any named properties based on custom X-headers on incoming messages.
HygieneSuite	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.HygieneSuiteEnum	This parameter is reserved for internal Microsoft use.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
InternalDelayDsnEnabled	Optional	System.Boolean	The *InternalDelayDsnEnabled* parameter specifies whether a delay DSN message should be created for messages sent to or from recipients or senders in the same Exchange organization that couldn't be immediately delivered. Valid input for this

			parameter is `$true` or `$false`. The default value is `$true`.
InternalDsnDefaultLanguage	Optional	System.Globalization.CultureInfo	The *InternalDsnDefaultLanguage* parameter specifies which Exchange server language should be used by default when you create internal DSN messages. The default value is the default Windows server language.
InternalDsnLanguageDetectionEnabled	Optional	System.Boolean	The *InternalDsnLanguageDetectionEnabled* parameter specifies whether the server should try to send an internal DSN message in the same language as the original message that generated the notification. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
InternalDsnMaxMessageAttachSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *InternalDsnMaxMessageAttachSize* parameter specifies the maximum size of the original message that generated

			an internal DSN message. If the original message exceeds this size, only the headers of the original message are included in the DSN message. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 0 through 2147483647 bytes. If you specify a value of 0, only the original message headers are included in the internal DSN message.
InternalDsnReporting Authority	Optional	Microsoft.Exchange.Data.SmtpDomain	The *InternalDsnReportingAuthority* parameter specifies what the server name should be in the internal DSN message. The default value is the authoritative domain specified during

			installation.
InternalDsnSendHtml	Optional	System.Boolean	The *InternalDsnSendHtml* parameter specifies whether internal DSN messages should be sent by using HTML or whether messages should be sent in plain text. Valid input for this parameter is `$true` or `$false`. The default is `$true`.
InternalSMTPServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *InternalSMTPServers* parameter specifies a list of internal SMTP server IP addresses or IP address ranges that should be ignored by Sender ID and connection filtering. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>".`

			... To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
JournalArchivingEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
JournalingReportNdrTo	Optional	Microsoft.Exchange.Data.SmtpAddress	The *JournalingReportNdrTo* parameter specifies the email address to which journal reports are sent if the journaling mailbox is unavailable. By default, if this parameter is left empty, Exchange continues to try to deliver the journal report to the journaling mailbox.
JournalReportDLMemberSubstitutionEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LegacyArchiveJournalingEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LegacyArchiveLiveJournalingEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

LegacyJournalingMigrationEnabled	Optional	System.Boolean	The *LegacyJournalingMigrationEnabled* parameter specifies whether journal messages generated in Microsoft Exchange Server 2003 will be reformatted by the current version of Exchange. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
MaxAllowedAgentGeneratedMessageDepth	Optional	System.UInt32	This parameter is available only in on-premises Exchange 2013. The *MaxAllowedAgentGeneratedMessageDepth* parameter specifies how many times all agents can process any resulting copies of the same message. The default value is 3. Valid input for this parameter is an integer.
MaxAllowedAgentGeneratedMessageDepthPerAgent	Optional	System.UInt32	This parameter is available only in on-premises Exchange 2013.

			The *MaxAllowedAgentGeneratedMessageDepthPerAgent* parameter specifies how many times a single agent can process any resulting copies of the same message. The default value is 2. The value of the *MaxAllowedAgentGeneratedMessageDepth* parameter should be larger than the value of the *MaxAllowedAgentGeneratedMessageDepthPerAgent* parameter.
MaxDumpsterSizePerDatabase	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. This parameter isn't used by Microsoft Exchange Server 2013. It's only used by Microsoft Exchange 2010 servers in a coexistence environment. The *MaxDumpsterSizePerDatabase* parameter specifies the maximum size of the transport dumpster on a

			Hub Transport server for each database. The default value is 18 MB. The valid input range for this parameter is from 0 through 2147483647 KB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. To enable the transport dumpster, the value of the *MaxDumpsterSizePerDatabase* parameter must be greater than 0, and the value of the *MaxDumpsterTime* parameter must be greater than 00:00:00. This parameter has no replacement in Exchange 2013.
MaxDumpsterTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013. This parameter isn't used

			by Microsoft Exchange Server 2013. It's only used by Microsoft Exchange 2010 servers in a coexistence environment. The *MaxDumpsterTime* parameter specifies how long an email message should remain in the transport dumpster on a Hub Transport server. The default value is seven days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 10 days for this parameter, use 10.00:00:00. The valid input range for this parameter is 00:00:00 to 24855.03:14:07. To enable the transport dumpster, the value of the *MaxDumpsterSizePerStorageGroup* parameter must be greater than 0, and the value of the *MaxDumpsterTime*

			parameter must be greater than 00:00:00. This parameter is replaced by the *SafetyNetHoldTime* parameter.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the maximum message size that can be received by recipients in the organization. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 0 through 2097151 KB. If you enter a value of `Unlimited`, no limit is imposed on the message size that can be received

			by recipients in the organization.
MaxRecipientEnvelopeLimit	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxRecipientEnvelopeLimit* parameter specifies the maximum number of recipients in a message. The default value is 5000. The valid input range for this parameter is from 0 through 2147483647. If you enter a value of `Unlimited`, no limit is imposed on the number of recipients in a message. Exchange treats an unexpanded distribution group as one recipient.
MaxRetriesForLocalSiteShadow	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *MaxRetriesForLocalSiteShadow* parameter specifies the maximum number of attempts to make a shadow copy of the message in the local Active Directory site. Valid

			input for this parameter is an integer between 0 and 255. The default value is 2. The total number of attempts to create a shadow copy of the message is controlled by the *ShadowMessagePreferenceSetting* parameter: • If *ShadowMessagePreferenceSetting* is set to `LocalOnly`, the total number of attempts to make a shadow copy of the message is the value of the *MaxRetriesForLocalSiteShadow* parameter. • If *ShadowMessagePreferenceSetting* is set to `PreferRemote`, the total number of attempts to make a shadow copy of the message is the value of the *MaxRetriesForLocalSiteShadow* and *MaxRetriesForRemoteSiteShadow* parameters added together.

			• If *ShadowMessagePreferenceSetting* is set to `RemoteOnly`, the value of *MaxRetriesForLocalSiteShadow* is 0, and the *MaxRetriesForLocalSiteShadow* parameter has no effect on the total number of attempts to create a shadow copy of the message. If a shadow copy of the message isn't created after the specified number of attempts, accepting or rejecting the message is controlled by the *RejectMessageOnShadowFailure* parameter.
MaxRetriesForRemoteSiteShadow	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *MaxRetriesForRemoteSiteShadow* parameter specifies the maximum number of attempts to make a shadow copy of the message in a different Active Directory site. Valid

			input for this parameter is an integer between 0 and 255. The default value is 4. The total number of attempts to create a shadow copy of the message is controlled by the *ShadowMessagePreferenceSetting* parameter: • If *ShadowMessagePreferenceSetting* is set to `RemoteOnly`, the total number of attempts to make a shadow copy of the message is the value of the *MaxRetriesForRemoteSiteShadow* parameter. • If *ShadowMessagePreferenceSetting* is set to `PreferRemote`, the total number of attempts to make a shadow copy of the message is the value of the *MaxRetriesForLocalSiteShadow* and *MaxRetriesForRemoteSiteShadow* parameters added together.

			• If *ShadowMessagePreferenceSetting* is set to `LocalOnly`, the value of *MaxRetriesForRemoteSiteShadow* is 0, and the *MaxRetriesForRemoteSiteShadow* parameter has no effect on the total number of attempts to create a shadow copy of the message. If a shadow copy of the message isn't created after the specified number of attempts, accepting or rejecting the message is controlled by the *RejectMessageOnShadowFailure* parameter.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxSendSize* parameter specifies the maximum message size that can be sent by senders in the organization. The default value is 10 MB. When you enter a value, qualify the value with one

			of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 0 through 2097151 KB. If you enter a value of `Unlimited`, no limit is imposed on the message size that can be sent by senders in the organization.
MigrationEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OpenDomainRoutingEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OrganizationFederatedMailbox	Optional	Microsoft.Exchange.Data.SmtpAddress	The *OrganizationFederatedMailbox* parameter specifies the SMTP address of the federated mailbox used for federated delivery with other organizations.
QueueDiagnosticsAggregationInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013.

			The *QueueDiagnosticsAggregationInterval* parameter specifies the polling interval that's used to retrieve message queue diagnostic information. The default value is `00:01:00` or one minute. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
RedirectDLMessagesForLegacyArchiveJournaling	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RedirectUnprovisionedUserMessagesForLegacyArchiveJournaling	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RejectMessageOnShadowFailure	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *RejectMessageOnShadowFailure* parameter accepts or rejects messages when a shadow copy of a message can't be created. Valid input for this parameter is `$true` or

			`$false`. The default value is `$true`. When this parameter is set to `$true`, messages are rejected with the SMTP code 450 4.5.1. When this parameter is set to `$false`, the message is accepted without making a shadow copy. The number of attempts to make a shadow copy of the message and where to make the shadow copy are controlled by the *MaxRetriesForLocalSiteShadow*, *MaxRetriesForRemoteSiteShadow*, and *ShadowMessagePreferenceSetting* parameter settings.
Rfc2231EncodingEnabled	Optional	System.Boolean	The *Rfc2231EncodingEnabled* parameter specifies whether the RFC 2231 encoding of MIME parameters for outbound messages is enabled in your organization. Valid input for this parameter is `$true` or `$false`. The

			default value is `$false`.
SafetyNetHoldTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013. The *SafetyNetHoldTime* parameter specifies how long a copy of a successfully processed message is retained in Safety Net. Unacknowledged shadow copies of messages auto-expire from Safety Net based on adding the values of the *SafetyNetHoldTime* parameter and the *MessageExpirationTimeout* parameter on the **Set-TransportService** cmdlet. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The default value is `2.00:00:00` or 2 days.
ShadowHeartbeatFrequency	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013. The

			ShadowHeartbeatFrequency parameter specifies the amount of time a server waits before establishing a connection to a primary server to query the discard status of shadow messages. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is 00:00:01 to 1.00:00:00. The default value is `00:02:00` or 2 minutes.
ShadowHeartbeatRetryCount	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. This parameter isn't used by Microsoft Exchange Server 2013. It's only used by Microsoft Exchange 2010 servers in a coexistence environment. The *ShadowHeartbeatRetryCount* parameter specifies the number of time-outs a server waits before

			deciding that a primary server has failed and assumes ownership of shadow messages in the shadow queue for the primary server that's unreachable. Valid input for this parameter is an integer between 1 and 15. The default value is 12. This parameter is replaced by the *ShadowResubmitTimeSpan* parameter.
ShadowHeartbeatTimeoutInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013. This parameter isn't used by Microsoft Exchange Server 2013. It's only used by Microsoft Exchange 2010 servers in a coexistence environment. The *ShadowHeartbeatTimeoutInterval* parameter specifies the amount of time a server waits before establishing a connection to a primary server to query the discard status of shadow messages.

			To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is 00:00:01 to 1.00:00:00. The default value is `00:15:00` or 15 minutes. This parameter is replaced by the *ShadowHeartbeatFrequency* parameter.
ShadowMessageAutoDiscardInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013. The *ShadowMessageAutoDiscardInterval* parameter specifies how long a server retains discard events for shadow messages. A primary server queues discard events until queried by the shadow server. However, if the shadow server doesn't query the primary server for the duration specified in this parameter, the primary

			server deletes the queued discard events. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is `00:00:05` to `90.00:00:00`. The default value is `2.00:00:00` or 2 days.
ShadowMessagePreferenceSetting	Optional	Microsoft.Exchange.Data.ShadowMessagePreference	This parameter is available only in on-premises Exchange 2013. The *ShadowMessagePreferenceSetting* parameter specifies the preferred location for making a shadow copy of a message. Valid values are: • `LocalOnly`: A shadow copy of the message should only be made on a server in the local Active Directory site. • `RemoteOnly`: A shadow copy of the message should only be made on a server in a different Active Directory site. • `PreferRemote`: Try to make a shadow copy of the message in a

			different Active Directory site. If the operation fails, try make a shadow copy of the message on a server in the local Active Directory site. The default value is `PreferRemote`.
ShadowRedundancyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *ShadowRedundancyEnabled* parameter specifies whether shadow redundancy is enabled in the organization. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ShadowResubmitTimeSpan	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is available only in on-premises Exchange 2013. The *ShadowResubmitTimeSpan* parameter specifies amount of time a server waits before deciding that a primary server has failed and assumes ownership of shadow messages in the shadow

			queue for the primary server that's unreachable. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is 00:00:01 to 1.00:00:00. The default value is 03:00:00 or 3 hours. This parameter replaces the *ShadowHeartbeatRetryCount* parameter.
SupervisionTags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *SupervisionTags* parameter specifies the various tags that are used for transport supervision in the organization. When you install Exchange, two tags, `Allow` and `Reject`, are created by default.
TLSReceiveDomainSecureList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013.

			The *TLSReceiveDomainSecureList* parameter specifies the domains from which you want to receive domain secured email by using mutual Transport Layer Security (TLS) authentication. To fully support mutual TLS authentication, you must also perform the following steps: • Enable Domain Security (Mutual Auth TLS) and the TLS authentication method on the Receive connectors that receive messages from the domains that you specified with the *TLSReceiveDomainSecureList* parameter. • Specify the domains to which you want to send domain secured email by using the *TLSSendDomainSecureList* parameter. • Enable Domain Security (Mutual Auth TLS) on the Send connectors that send messages to

			the domains that you specified in the *TLSSendDomainSecureList* parameter. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. The wildcard character (*) isn't supported in the domains listed in the *TLSReceiveDomainSecureList* parameter or in the *TLSSendDomainSecureList* parameter. The default value for both parameters is an empty list ({}).

TLSSendDomainSecureList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *TLSSendDomainSecureList* parameter specifies the domains from which you want to send domain secured email by using mutual TLS authentication. To fully support mutual TLS authentication, you must also perform the following steps: • Enable Domain Security (Mutual Auth TLS) on the Send connectors that send messages to the domains that you specified in the *TLSSendDomainSecureList* parameter. • Specify the domains from which you want to receive domain secured email by using the *TLSReceiveDomainSecureList* parameter. • Enable Domain Security (Mutual Auth TLS) and the TLS authentication method on the Receive

			connectors that receive messages from the domains that you specified in the *TLSReceiveDomainSecureList* parameter. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. Multiple domains may be separated by commas. The wildcard character (*) isn't supported in the domains listed in the *TLSSendDomainSecureList* parameter or in the

			TLSReceiveSecureList parameter. The default values for both parameters are an empty list ({}).
TransportRuleAttachmentTextScanLimit	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is available only in on-premises Exchange 2013. The *TransportRuleAttachmentTextScanLimit* parameter specifies the maximum size of text to extract from attachments for scanning by attachment scanning predicates in transport rules and data loss prevention (DLP) policies. The default value is 150 kilobytes (KB). When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. If the amount of text in the attachment is larger than the value of this

			parameter, only the specified amount of text is scanned. For example, if a 5 megabyte attachment contains 300 kilobytes of text, and the value of *TransportRuleAttachmentTextScanLimit* is 150 kilobytes, only the first 150 kilobytes of text are extracted and scanned.
TransportRuleCollectionAddedRecipientsLimit	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportRuleCollectionRegexCharsLimit	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportRuleLimit	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportRuleMinProductVersion	Optional	System.Version	This parameter is reserved for internal Microsoft use.
TransportRuleRegexValidationTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportRuleSizeLimit	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
VerifySecureSubmitEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *VerifySecureSubmitEnable*

			d parameter verifies that email clients submitting messages from mailboxes on Mailbox servers are using encrypted MAPI submission. The valid values for this parameter are `$true` or `$false`. The default value is `$false` If the *VerifySecureSubmitEnabled* parameter is set to `$true`, and Outlook 2010 or later is used to submit the message, the message is marked as secure. If a previous version of Outlook is used to submit the message, the message is marked as anonymous. If the *VerifySecureSubmitEnabled* parameter is set to `$false`, all MAPI message submissions are marked as secure. Messages submitted from mailboxes on the Mailbox server by using any MAPI client aren't checked for encrypted MAPI submission. If you use

			previous Outlook versions in your Exchange organization, you should set the *VerifySecureSubmitEnabled* parameter to `$false`.
VoicemailJournalingEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *VoicemailJournalingEnabled* parameter specifies whether Unified Messaging voice mail messages are journaled by the Journaling agent. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Xexch50Enabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *Xexch50Enabled* parameter specifies whether Xexch50 authentication should be enabled for backward compatibility with computers running Exchange 2003. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportPipeline

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-TransportPipeline** cmdlet to view each transport agent and the event with which the transport agent is registered.

```
Get-TransportPipeline [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns a list of agents registered in the transport pipeline.

```
Get-TransportPipeline
```

EXAMPLE 2

This example returns a list of agents registered in the transport pipeline with full details for each transport event.

```
Get-TransportPipeline | Format-List
```

Detailed Description

The **Get-TransportPipeline** cmdlet enables you to view all the transport agents configured in the following locations:

- In the Transport service on a Mailbox server.
- In the Front End Transport service on a Client Access server.
- On an Edge Transport server in the perimeter network.

Note:

The associated transport service must be started, and at least one e-mail message must be sent through the server since the last service restart before the transport pipeline can be viewed. Only the transport events and agents that were involved in the processing of e-mail messages since the associated service was last restarted are returned.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport agents" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportServer

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-TransportServer** cmdlet to view the transport configuration information for the Transport service on Mailbox servers or for Edge Transport servers.

```
Get-TransportServer [-Identity <TransportServerIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example provides different results depending on the server role on which it's run. When you run this command on an Edge Transport server, it provides a configuration summary for the local server. Otherwise, it displays a list of all Mailbox servers in your organization.

```
Get-TransportServer
```

EXAMPLE 2

This example retrieves the detailed transport configuration information for the Transport service on the Mailbox server named Mailbox01.

```
Get-TransportServer Mailbox01 | Format-List
```

Detailed Description

The **Get-TransportServer** cmdlet will be removed in a future version of Exchange. You should use the **Get-TransportService** cmdlet instead.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport service" or "Edge Transport server" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't

			supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.TransportServerIdParameter	The *Identity* parameter specifies the server you want to view. When you use this parameter on a Mailbox server, the parameter returns the transport configuration of the Transport service on specified server. You can't use this parameter on an Edge Transport server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-TransportServer

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-18*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-TransportServer** cmdlet to set the transport configuration options for the Transport service on Mailbox servers or for Edge Transport servers.

```
Set-TransportServer -Identity <ServerIdParameter> [-
ActiveUserStatisticsLogMaxAge <EnhancedTimeSpan>] [-
ActiveUserStatisticsLogMaxDirectorySize <ByteQuantifiedSize>] [-
ActiveUserStatisticsLogMaxFileSize <ByteQuantifiedSize>] [-
ActiveUserStatisticsLogPath <LocalLongFullPath>] [-AgentLogEnabled <$true
| $false>] [-AgentLogMaxAge <EnhancedTimeSpan>] [-AgentLogMaxDirectorySize
<Unlimited>] [-AgentLogMaxFileSize <Unlimited>] [-AgentLogPath
<LocalLongFullPath>] [-AntispamAgentsEnabled <$true | $false>] [-Confirm
[<SwitchParameter>]] [-ConnectivityLogEnabled <$true | $false>] [-
ConnectivityLogMaxAge <EnhancedTimeSpan>] [-
ConnectivityLogMaxDirectorySize <Unlimited>] [-ConnectivityLogMaxFileSize
<Unlimited>] [-ConnectivityLogPath <LocalLongFullPath>] [-
ContentConversionTracingEnabled <$true | $false>] [-
DelayNotificationTimeout <EnhancedTimeSpan>] [-
DeltaSyncClientCertificateThumbprint <String>] [-DnsLogEnabled <$true |
$false>] [-DnsLogMaxAge <EnhancedTimeSpan>] [-DnsLogMaxDirectorySize
<Unlimited>] [-DnsLogMaxFileSize <Unlimited>] [-DnsLogPath
<LocalLongFullPath>] [-DomainController <Fqdn>] [-
ExternalDNSAdapterEnabled <$true | $false>] [-ExternalDNSAdapterGuid
<Guid>] [-ExternalDNSProtocolOption <Any | UseUdpOnly | UseTcpOnly>] [-
ExternalDNSServers <MultiValuedProperty>] [-ExternalIPAddress <IPAddress>]

Examples

EXAMPLE 1

This example sets the *DelayNotificationTimeout* parameter to 13 hours on server named Mailbox01.

```
Set-TransportServer Mailbox01 -DelayNotificationTimeout
13:00:00
```

EXAMPLE 2

This example sets the *TransientFailureRetryCount* parameter to 3 and sets the *TransientFailureRetryInterval* parameter to 30 seconds on server named Mailbox01.

```
Set-TransportServer Mailbox01 -TransientFailureRetryCount 3
-TransientFailureRetryInterval 00:00:30
```

EXAMPLE 3

This example sets the *ReceiveProtocolLogPath* parameter to C:\SMTP Protocol Logs\Receive.log on server Mailbox01.

```
Set-TransportServer Mailbox01 -ReceiveProtocolLogPath "C:
\SMTP Protocol Logs\Receive.log"
```

Detailed Description

The **Set-TransportServer** cmdlet will be removed in a future version of Exchange. You should use the **Set-TransportService** cmdlet instead.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport service" and "Edge Transport server" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the server that you want to modify.
ActiveUserStatisticsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ActiveUserStatisticsLogMaxAge* parameter specifies the maximum duration that the per user activity statistics log files are kept. Log files older than the specified value are deleted. The default value

			is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 10 days for this parameter, use 10.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of this parameter to 00:00:00 prevents the automatic removal of server statistics log files.
ActiveUserStatisticsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ActiveUserStatisticsLogMaxDirectorySize* parameter specifies the cap on the size of the per user activity statistics log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 megabyte (MB). The default value is 250 MB. When you enter a value,

			qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ActiveUserStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ActiveUserStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log directory.
ActiveUserStatisticsLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ActiveUserStatisticsLogMaxFileSize* parameter specifies the maximum file size for the per user activity statistics log files. When a log file reaches its maximum file size, a new log file is created. The

			default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ActiveUserStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ActiveUserStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log files.
ActiveUserStatisticsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ActiveUserStatisticsLogPath* parameter specifies the location of per user activity statistics log storage. The default location is %

			`ExchangeInstallPath%TransportRoles\Logs\Hub\ActiveUsersStats`. Setting the value of this parameter to `$null` disables server statistics logging.
AgentLogEnabled	Optional	System.Boolean	The *AgentLogEnabled* parameter specifies whether the agent log is enabled. The default value is `$true`.
AgentLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AgentLogMaxAge* parameter specifies the maximum age for the agent log file. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *AgentLogMaxAge* parameter to 00:00:00 prevents the automatic removal of agent log files because of their age.
AgentLogMaxDirector	Optional	Microsoft.Exchange.Da	The

ySize		ta.Unlimited	*AgentLogMaxDirectorySize* parameter specifies the maximum size of all agent logs in the agent log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *AgentLogMaxFileSize* parameter must be less than or equal to the value of the *AgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log directory.
AgentLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *AgentLogMaxFileSize* parameter specifies the maximum size of each

			agent log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *AgentLogMaxFileSize* parameter must be less than or equal to the value of the *AgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log files.
AgentLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *AgentLogPath* parameter specifies the default agent log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\AgentLog`. Setting the value of this

			parameter to `$null` disables agent logging. However, setting this parameter to `$null` when the value of the *AgentLogEnabled* attribute is `$true` generates event log errors.
AntispamAgentsEnabled	Optional	System.Boolean	The *AntispamAgentsEnabled* parameter specifies whether anti-spam agents are installed on the server specified with the *Identity* parameter. The default value is `$false` for the Transport service on Mailbox servers and `$true` on Edge servers. **Important:** You set this parameter by using a script. You shouldn't modify this parameter manually.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
ConnectivityLogEnabled	Optional	System.Boolean	The *ConnectivityLogEnabled* parameter specifies whether the connectivity log is enabled. The default value is `$true`.
ConnectivityLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectivityLogMaxAge* parameter specifies the maximum age for the connectivity log file. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *ConnectivityLogMaxAge*

			parameter to 00:00:00 prevents the automatic removal of connectivity log files because of their age.
ConnectivityLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxDirectorySize* parameter specifies the maximum size of all connectivity logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 1000 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirect*

			orySize parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log directory.
ConnectivityLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxFileSize* parameter specifies the maximum size of each connectivity log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the

			ConnectivityLogMaxDirectorySize parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log files.
ConnectivityLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ConnectivityLogPath* parameter specifies the default connectivity log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\Connectivity`. Setting the value of this parameter to `$null` disables connectivity logging. However, setting this parameter to `$null` when the value of the *ConnectivityLogEnabled* attribute is `$true` generates event log errors.
ContentConversionTracingEnabled	Optional	System.Boolean	The *ContentConversionTracingEnabled* parameter specifies whether content conversion tracing is

			enabled. Content conversion tracing captures content conversion failures that occur in the Transport service on a Mailbox server or on the Edge server. The default value is `$false`. Content conversion tracing captures a maximum of 128 MB of content conversion failures. When the 128 MB limit is reached, no more content conversion failures are captured. Content conversion tracing captures the complete contents of e-mail messages to the path specified by the *PipelineTracingPath* parameter. Make sure that you restrict access to this directory. The permissions required on the directory specified by the *PipelineTracingPath* parameter are as follows: • Administrators: Full Control • Network Service: Full

			Control • System: Full Control
DelayNotificationTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DelayNotificationTimeout* parameter specifies how long the server waits before it generates a delayed delivery status notification (DSN) message. The default value is 4 hours. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 3.5 hours for this parameter, use 03:30:00. The valid input range for this parameter is from 00:00:01 through 30.00:00:00. The value of the *DelayNotificationTimeout* parameter should always be greater than the value of the *TransientFailureRetryCount* parameter multiplied by the value of the *TransientFailureRetryInter*

			val parameter.
DeltaSyncClientCertificateThumbprint	Optional	System.String	This parameter is reserved for internal Microsoft use.
DnsLogEnabled	Optional	System.Boolean	The *DnsLogEnabled* parameter specifies whether the DNS log is enabled. The default value is `$false`.
DnsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DnsLogMaxAge* parameter specifies the maximum age for the DNS log file. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *DnsLogMaxAge* parameter to `00:00:00` prevents the automatic removal of DNS log files because of their age.
DnsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *DnsLogMaxDirectorySize* parameter specifies the maximum size of all DNS

			logs in the DNS log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 100 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *DnsLogMaxFileSize* parameter must be less than or equal to the value of the *DnsLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the DNS log directory.
DnsLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *DnsLogMaxFileSize* parameter specifies the maximum size of each DNS log file. When a log file reaches its maximum file size, a new log file is

			created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *DnsLogMaxFileSize* parameter must be less than or equal to the value of the *DnsLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the DNS log files.
DnsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *DnsLogPath* parameter specifies the DNS log directory location. The default value is blank (`$null`), which indicates no location is configured. If you enable DNS logging, you need to specify a local file path for the DNS log files by using this parameter. If the path

			contains spaces, enclose the entire path value in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExternalDNSAdapterEnabled	Optional	System.Boolean	The *ExternalDNSAdapterEnabled* parameter specifies one or more Domain Name System (DNS) servers that Exchange uses for external DNS lookups. When the *ExternalDNSAdapterEnabled* parameter is set to `$true`, DNS lookups of

			destinations outside the Exchange organization are performed by using the DNS settings of the external network adapter specified by the value of the *ExternalDNSAdapterGuid* parameter. If you want to specify a custom list of DNS servers used for external Exchange DNS lookups only, you must specify the DNS servers by using the *ExternalDNSServers* parameter, and you must also set the value of the *ExternalDNSAdapterEnabled* parameter to `$false`. The default value of the *ExternalDNSAdapterEnabled* parameter is `$true`.
ExternalDNSAdapterGuid	Optional	System.Guid	The *ExternalDNSAdapterGuid* parameter specifies the network adapter that has the DNS settings used for DNS lookups of destinations that exist outside the Exchange organization. The concept of an external network

			adapter and an internal network adapter is only applicable in a multi-homed Exchange server environment. When no particular network adapter is specified as the network adapter for external DNS lookups, the value of the *ExternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`, and external DNS lookups are performed by using the DNS settings of any available network adapter. You may enter the GUID of a specific network adapter to use for external DNS lookups. The default value of the *ExternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`. **Note:** If the value of the *ExternalDNSAdapterEnabled* parameter is set to `$false`, the value of the *ExternalDNSAdapterGuid* parameter is ignored, and the list of DNS servers from the *ExternalDNSServers*

			parameter is used.
ExternalDNSProtocolOption	Optional	Microsoft.Exchange.Data.ProtocolOption	The *ExternalDNSProtocolOption* parameter specifies which protocol to use when querying external DNS servers. The valid options for this parameter are `Any`, `UseTcpOnly`, and `UseUdpOnly`. The default value is `Any`.
ExternalDNSServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalDNSServers* parameter specifies the list of external DNS servers that the server queries when resolving a remote domain. DNS servers are specified by IP address. The default value is an empty list ({}). To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`

			To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** If the value of the *ExternalDNSAdapterEnabled* parameter is set to `$true`, the *ExternalDNSServers* parameter and its list of DNS servers isn't used.
ExternalIPAddress	Optional	System.Net.IPAddress	The *ExternalIPAddress* parameter specifies the IP address used in the `Received` message header field for every message that travels through the Edge server or the Transport service on a Mailbox server. The IP address in the `Received` header field is used for hop count and routing loop detection. The IP address specified by the *ExternalIPAddress* parameter overrides the external network adapter's actual IP address. Typically, you

			would want to set the value of the *ExternalIPAddress* parameter to match the value of your domain's public MX record. The default value of the *ExternalIPAddress* parameter is blank. This means the actual IP address of the external network adapter is used in the `Received` header field.
FlowControlLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
FlowControlLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
FlowControlLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
FlowControlLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
FlowControlLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
HttpProtocolLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
HttpProtocolLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
HttpProtocolLogLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLev	This parameter is reserved for internal Microsoft use.

		el	
HttpProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
HttpProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
HttpProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
HttpTransportSyncProxyServer	Optional	System.String	This parameter is reserved for internal Microsoft use.
InternalDNSAdapterEnabled	Optional	System.Boolean	The *InternalDNSAdapterEnabled* parameter specifies one or more DNS servers that Exchange uses for internal DNS lookups. When the *InternalDNSAdapterEnabled* parameter is set to `$true`, DNS lookups of destinations inside the Exchange organization are performed by using the DNS settings of the internal network adapter specified by the value of the *InternalDNSAdapterGuid* parameter. If you want to specify a custom list of DNS servers used for

			internal Exchange DNS lookups only, you must specify the DNS servers by using the *InternalDNSServers* parameter, and you must also set the value of the *InternalDNSAdapterEnabled* parameter to `$false`. The default value of the *InternalDNSAdapterEnabled* parameter is `$true`.
InternalDNSAdapterGuid	Optional	System.Guid	The *InternalDNSAdapterGuid* parameter specifies the network adapter that has the DNS settings used for DNS lookups of servers that exist inside the Exchange organization. The concept of an internal network adapter and an external network adapter is only applicable in a multi-homed Exchange server environment. When no particular network adapter is specified as the network adapter for external DNS lookups, the value of the *InternalDNSAdapterGuid* parameter is `00000000-`

			0000-0000-0000-000000000000, and internal DNS lookups are performed by using the DNS settings of any available network adapter. You may enter the GUID of a specific network adapter to use for internal DNS lookups. The default value of the *InternalDNSAdapterGuid* parameter is 00000000-0000-0000-0000-000000000000. **Note:** If the value of the *InternalDNSAdapterEnabled* parameter is set to $false, the value of the *InternalDNSAdapterGuid* parameter is ignored, and the list of DNS servers from the *InternalDNSServers* parameter is used.
InternalDNSProtocolOption	Optional	Microsoft.Exchange.Data.ProtocolOption	The *InternalDNSProtocolOption* parameter specifies which protocol to use when you query internal DNS servers. Valid options for this parameter are Any, UseTcpOnly, or UseUdpOnly. The default value is Any.

InternalDNSServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalDNSServers* parameter specifies the list of DNS servers that should be used when resolving a domain name. DNS servers are specified by IP address. The default value is any empty list ({}). To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** If the *InternalDNSAdapterGuid* parameter is set, and the value of the *InternalDNSAdapterEnabled* parameter is set to

			`$true`, the *InternalDNSServers* parameter and its list of DNS servers isn't used.
IntraOrgConnectorProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *IntraOrgConnectorProtocolLoggingLevel* parameter enables or disables SMTP protocol logging on the implicit and invisible intra-organization Send connectors that are used to transmit messages between Exchange servers in the Exchange organization. Valid values for this parameter are `None` or `Verbose`. The value `Verbose` enables protocol logging for the connector. The value `None` disables protocol logging for the connector. The default value is `None`. When the *IntraOrgConnectorProtocolLoggingLevel* parameter is set to `Verbose`, the information is written to the Send connector protocol log specified by the *SendProtocolLog* parameters.

IntraOrgConnectorSmtpMaxMessagesPerConnection	Optional	System.Int32	The *IntraOrgConnectorSmtpMaxMessagesPerConnection* parameter specifies the maximum number of messages per connection limit on the implicit and invisible intra-organization Send connectors that are used to transmit messages between Exchange servers in the Exchange organization.
IrmLogEnabled	Optional	System.Boolean	The *IrmLogEnabled* parameter enables logging of Information Rights Management (IRM) transactions. IRM logging is enabled by default. Values include: • `$true` Enable IRM logging • `$false` Disable IRM logging
IrmLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *IrmLogMaxAge* parameter specifies the maximum age for the IRM log file. Log files that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it

			as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The valid input range for this parameter is 00:00:00 to 24855.03:14:07. Setting the value of the *IrmLogMaxAge* parameter to 00:00:00 prevents the automatic removal of connectivity log files because of their age.
IrmLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This *IrmLogMaxDirectorySize* parameter specifies the maximum size of all IRM logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are

			treated as bytes. The value of the *IrmLogMaxFileSize* parameter must be less than or equal to the value of the *IrmLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the IRM log directory.
IrmLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This *IrmLogMaxFileSize* parameter specifies the maximum size of each IRM log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are

			treated as bytes. The value of the *IrmLogMaxFileSize* parameter must be less than or equal to the value of the *IrmLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the IRM log files.
IrmLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *IrmLogPath* parameter specifies the default IRM log directory location. The default location is `%ExchangeInstallPath%Logging\IRMLogs`. If you set the value of the *IrmLogPath* parameter to `$null`, you effectively disable IRM logging. However, if you set the value of the *IrmLogPath* parameter to `$null` when the value of the *IrmLogEnabled* attribute is `$true`, Exchange will log

			errors in the Application event log. The preferred way for disabling IRM logging is to set the *IrmLogEnabled* to `$false`.
JournalLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
JournalLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
JournalLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
JournalLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
JournalLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
MaxActiveTransportSyncJobsPerProcessor	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MaxConcurrentMailboxDeliveries	Optional	System.Int32	The *MaxConcurrentMailboxDeliveries* parameter specifies the maximum number of delivery threads that the transport service can have open at the same time to deliver messages to mailboxes. The default value is 20. The valid input range for this parameter is from 1

			through 256. We recommend that you don't modify the default value unless Microsoft Customer Service and Support advises you to do this.
MaxConcurrentMailboxSubmissions	Optional	System.Int32	The *MaxConcurrentMailboxSubmissions* parameter specifies the maximum number of submission threads that the transport service can have open at the same time to send messages from mailboxes. The default value is 20. The valid input range for this parameter is from 1 through 256.
MaxConnectionRatePerMinute	Optional	System.Int32	The *MaxConnectionRatePerMinute* parameter specifies the maximum rate that connections are allowed to be opened with the transport service. If many connections are attempted with the transport service at the same time, the *MaxConnectionRatePerMi*

			nute parameter limits the rate that the connections are opened so that the server's resources aren't overwhelmed. The default value is 1200 connections per minute. The valid input range for this parameter is from 1 through 2147483647.
MaxNumberOfTransportSyncAttempts	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MaxOutboundConnections	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxOutboundConnections* parameter specifies the maximum number of outbound connections that can be open at a time. The default value is 1000. The valid input range for this parameter is from 1 through 2147483647. If you enter a value of `unlimited`, no limit is imposed on the number of outbound connections. The value of the *MaxOutboundConnections* parameter must be greater than or equal to the value of the *MaxPerDomainOutbound*

			Connections parameter.
MaxPerDomainOutboundConnections	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxPerDomainOutboundConnections* parameter specifies the maximum number of concurrent connections to any single domain. The default value is 20. The valid input range for this parameter is from 1 through 2147483647. If you enter a value of `unlimited`, no limit is imposed on the number of outbound connections per domain. The value of the *MaxPerDomainOutboundConnections* parameter must be less than or equal to the value of the *MaxOutboundConnections* parameter.
MessageExpirationTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MessageExpirationTimeout* parameter specifies the maximum time that a particular message can remain in a queue. If a message remains in the queue for longer than this period of time, the

			message is returned to the sender as a permanent failure. The default value is 2 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 3 days for this parameter, use 3.00:00:00. The valid input range for this parameter is from 00:00:05 through 90.00:00:00.
MessageRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MessageRetryInterval* parameter specifies the retry interval for individual messages after a connection failure with a remote server. The default value is 1 minute. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 2 minutes for this parameter, use 00:02:00.

			The valid input range for this parameter is from 00:00:01 through 1.00:00:00. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this.
MessageTrackingLogEnabled	Optional	System.Boolean	The *MessageTrackingLogEnabled* parameter specifies whether message tracking is enabled. The default value is `$true`.
MessageTrackingLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MessageTrackingLogMaxAge* parameter specifies the message tracking log maximum file age. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 20 days for this parameter,

			use 20.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *MessageTrackingLogMaxAge* parameter to 00:00:00 prevents the automatic removal of message tracking log files because of their age.
MessageTrackingLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *MessageTrackingLogMaxDirectorySize* parameter specifies the maximum size of the message tracking log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The maximum size of the message tracking log directory is calculated as the total size of all log files that have the same name prefix. Other files that don't follow the name prefix convention aren't counted in the total directory size calculation.

			Renaming old log files or copying other files into the message tracking log directory could cause the directory to exceed its specified maximum size. For Mailbox servers, the maximum size of the message tracking log directory isn't the specified maximum size because the message tracking log files generated by the Transport service and the Mailbox Transport service have different name prefixes. Message tracking log files for the Transport service or for Edge servers begin with the name prefix *MSGTRK*. Message tracking log files for the Mailbox Transport service begin with the name prefix *MSGTRKM*. For Mailbox servers, the maximum size of the message tracking log directory is two times the specified value. The default value is 1000 MB.

			When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *MessageTrackingLogMaxFileSize* parameter must be less than or equal to the value of the *MessageTrackingLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the message tracking log directory.
MessageTrackingLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MessageTrackingLogMaxFileSize* parameter specifies the maximum size of the message tracking log files. When a log file reaches its maximum file size, a new

			log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *MessageTrackingLogMaxFileSize* parameter must be less than or equal to the value of the *MessageTrackingLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 4294967296 bytes (4 GB). If you enter a value of `unlimited`, no size limit is imposed on the message tracking log files.
MessageTrackingLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *MessageTrackingLogPath* parameter specifies the location of the message tracking logs. The default location is %

			`ExchangeInstallPath%TransportRoles\Logs\MessageTracking`. Setting the value of this parameter to `$null` disables message tracking. However, setting this parameter to `$null` when the value of the *MessageTrackingLogEnabled* attribute is `$true` generates event log errors. The preferred method to disable message tracking is to use the *MessageTrackingLogEnabled* parameter.
MessageTrackingLogSubjectLoggingEnabled	Optional	System.Boolean	The *MessageTrackingLogSubjectLoggingEnabled* parameter specifies whether the message subject should be included in the message tracking log. The default value is `$true`.
OutboundConnectionFailureRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *OutboundConnectionFailureRetryInterval* parameter specifies the retry interval for subsequent connection

			attempts to a remote server where previous connection attempts have failed. The previously failed connection attempts are controlled by the *TransientFailureRetryCount* and *TransientFailureRetryInterval* parameters. For the Transport service on a Mailbox server, the default value of the *OutboundConnectionFailureRetryInterval* parameter is 10 minutes. On an Edge server, the default value is 30 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 15 minutes for this parameter, use 00:15:00. The valid input range for this parameter is from 00:00:01 through 20.00:00:00.
PickupDirectoryMaxH	Optional	Microsoft.Exchange.Da	The

eaderSize		ta.ByteQuantifiedSize	*PickupDirectoryMaxHeaderSize* parameter specifies the maximum message header size that can be submitted to the Pickup directory. The default value is 64 KB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 32768 through 2147483647 bytes.
PickupDirectoryMaxMessagesPerMinute	Optional	System.Int32	The *PickupDirectoryMaxMessagesPerMinute* parameter specifies the maximum number of messages processed per minute by the Pickup directory and by the Replay directory. Each directory can independently process message files at the rate specified by the

			PickupDirectoryMaxMessagesPerMinute parameter. The default value is 100. The valid input range for this parameter is from 1 through 20000.
PickupDirectoryMaxRecipientsPerMessage	Optional	System.Int32	The *PickupDirectoryMaxRecipientsPerMessage* parameter specifies the maximum number of recipients that can be included on an e-mail message. The default value is 100. The valid input range for this parameter is from 1 through 10000.
PickupDirectoryPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *PickupDirectoryPath* parameter specifies the location of the Pickup directory. The Pickup directory is used by administrators and third-party applications to create and submit messages. The default location is `%ExchangeInstallPath%TransportRoles\Pickup`. If the value of the *PickupDirectoryPath*

			parameter is set to `$null`, the Pickup directory is disabled.
PipelineTracingEnabled	Optional	System.Boolean	The *PipelineTracingEnabled* parameter specifies whether to enable pipeline tracing. Pipeline tracing captures message snapshot files that record the changes made to the message by each transport agent configured in the transport service on the server. Pipeline tracing creates verbose log files that accumulate quickly. Pipeline tracing should only be enabled for a short time to provide in-depth diagnostic information that enables you to troubleshoot problems. In addition to troubleshooting, you can use pipeline tracing to validate changes that you make to the configuration of the transport service where you enable pipeline tracing. The default value

			is `$false`.
PipelineTracingPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *PipelineTracingPath* parameter specifies the location of the pipeline tracing logs. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\PipelineTracing`. The path must be local to the Exchange computer. Setting the value of this parameter to `$null` disables pipeline tracing. However, setting this parameter to `$null` when the value of the *PipelineTracingEnabled* attribute is `$true` generates event log errors. The preferred method to disable pipeline tracing is to use the *PipelineTracingEnabled* parameter. Pipeline tracing captures the complete contents of e-mail messages to the path specified by the *PipelineTracingPath* parameter. Make sure that you restrict access to this directory. The permissions

			required on the directory specified by the *PipelineTracingPath* parameter are as follows: • Administrators: Full Control • Network Service: Full Control • System: Full Control
PipelineTracingSenderAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PipelineTracingSenderAddress* parameter specifies the sender e-mail address that invokes pipeline tracing. Only messages from this address generate pipeline tracing output. The address can be either inside or outside the Exchange organization. Depending on your requirements, you may have to set this parameter to different sender addresses and send new messages to start the transport agents or routes that you want to test. The default value of this parameter is `$null`.
PoisonMessageDetectionEnabled	Optional	System.Boolean	The *PoisonMessageDetectionE*

			nabled parameter specifies whether poison messages should be detected. The default value is `$true`. Poison messages are messages determined to be potentially harmful to the Exchange system after a server failure. Poison messages are put in the poison message queue. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this.
PoisonThreshold	Optional	System.Int32	The *PoisonThreshold* parameter specifies the number of times a message can be rejected before it's classified as a poison message. The default value is 2. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this. The valid input range for this parameter is from 1 through 10.

ProcessingSchedulerLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
QueueLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *QueueLogMaxAge* parameter specifies the maximum age of the queue log files. Log files that are older than the specified value are deleted. The default value is 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 10 days for this parameter, use 10.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting

			the value of the *QueueLogMaxAge* parameter to 00:00:00 prevents the automatic removal of queue log files because of their age.
QueueLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *QueueLogMaxDirectorySize* parameter specifies the maximum size of the queue log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 200 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *QueueLogMaxFileSize* parameter must be less than or equal to the value of the *QueueLogMaxDirectorySize* parameter. The valid

			input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the queue log directory.
QueueLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *QueueLogMaxFileSize* parameter specifies the maximum size of the queue log files. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *QueueLogMaxFileSize* parameter must be less than or equal to the value of the *QueueLogMaxDirectorySize* parameter. The valid

			input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the queue log files.
QueueLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *QueueLogPath* parameter specifies the path of the queue log directory. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\QueueViewer`. Setting the value of this parameter to `$null` disables queue logging.
QueueMaxIdleTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *QueueMaxIdleTime* parameter specifies the period of time an empty delivery queue can exist before the queue is removed. The default value is 3 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 5

			minutes for this parameter, use 00:05:00. The valid input range for this parameter is from 00:00:05 through 01:00:00. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this.
ReceiveProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ReceiveProtocolLogMaxAge* parameter specifies the maximum age of the Receive connector protocol log file. Log files that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 20 days for this parameter, use 20.00:00:00. The valid input range for this parameter is from 00:00:00 through

			24855.03:14:07. Setting the value of the *ReceiveProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Receive connector protocol log files because of their age.
ReceiveProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Receive connector protocol log directory shared by all the Receive connectors that exist on the server. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the

			ReceiveProtocolLogMaxFileSize parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log directory.
ReceiveProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxFileSize* parameter specifies the maximum size of the Receive connector protocol log files shared by all the Receive connectors that exist on the server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes)

			• MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log files.
ReceiveProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ReceiveProtocolLogPath* parameter specifies the path of the protocol log directory for all the Receive connectors that exist on the server. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ProtocolLog\SmtpReceive`. Setting the value of this parameter to

			`$null` disables protocol logging for all Receive connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* attribute for any Receive connector on the server is `verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-ReceiveConnector** cmdlet to set the *ProtocolLoggingLevel* to `None` on each Receive connector.
RecipientValidationCacheEnabled	Optional	System.Boolean	The *RecipientValidationCacheEnabled* parameter specifies whether the recipient addresses used by transport agents, such as the Recipient Filtering agent, are cached. The default value is `$true` on Edge servers and `$false` for the Transport service on Mailbox servers.
ReplayDirectoryPath	Optional	Microsoft.Exchange.Da	The *ReplayDirectoryPath*

		ta.LocalLongFullPath	parameter specifies the path of the Replay directory. The Replay directory is used to resubmit exported messages and to receive messages from foreign gateway servers. The default location is `%ExchangeInstallPath%TransportRoles\Replay`. If the value of the *ReplayDirectoryPath* parameter is set to `$null`, the Replay directory is disabled.
ResourceLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ResourceLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ResourceLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ResourceLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ResourceLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
RootDropDirectoryPath	Optional	System.String	The *RootDropDirectoryPath* parameter specifies the top-level location of the

			Drop directory used by all Foreign connectors defined in the Transport service on a Mailbox server. The value of the *RootDropDirectoryPath* parameter may be a local path, or a Universal Naming Convention (UNC) path to a remote server. By default, the *RootDropDirectoryPath* parameter is blank. This indicates the value of *RootDropDirectoryPath* is the Exchange installation folder. The *RootDropDirectoryPath* parameter is used with the *DropDirectory* parameter in the **Set-ForeignConnector** cmdlet to specify the location for outgoing messages going to the address spaces defined on the Foreign connector.
RoutingTableLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RoutingTableLogMaxAge* parameter specifies the maximum routing table log age. Log files older than the specified value

			are deleted. The default value is 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 5 days for this parameter, use 5.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *RoutingTableLogMaxAge* parameter to 00:00:00 prevents the automatic removal of routing table log files because of their age.
RoutingTableLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *RoutingTableLogMaxDirectorySize* parameter specifies the maximum size of the routing table log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 50 MB.

			When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the routing table log directory.
RoutingTableLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *RoutingTableLogPath* parameter specifies the directory location where routing table log files should be stored. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Routing`. Setting the value of the *RoutingTableLogPath* parameter to `$null` disables routing table logging.
SendProtocolLogMaxA	Optional	Microsoft.Exchange.Da	The *SendProtocolLogMaxAge*

ge		ta.EnhancedTimeSpan	parameter specifies the Send connector protocol log file maximum age. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *SendProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Send connector protocol log files because of their age.
SendProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Send connector protocol log directory.

			When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 MB. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log directory.

SendProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxFileSize* parameter specifies the maximum size of the Send connector protocol log files shared by all the Send connectors that exist on a server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807

			bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log files.
SendProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *SendProtocolLogPath* parameter specifies the location of protocol log storage for the Send connectors. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ProtocolLog\SmtpSend`. Setting the value of this parameter to `$null` disables protocol logging for all Send connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* or *IntraOrgConnectorProtocolLoggingLevel* attribute for any Send connector on the server is `verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-SendConnector** cmdlet to set the *ProtocolLoggingLevel*

			parameter to None on each Send connector and to set the *IntraOrgConnectorProtocolLoggingLevel* parameter to None.
ServerStatisticsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ServerStatisticsLogMaxAge* parameter specifies the maximum duration that the server statistics log files are kept. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 60 days for this parameter, use 60.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of this parameter to 00:00:00 prevents the automatic removal of server statistics log files.

ServerStatisticsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ServerStatisticsLogMaxDirectorySize* parameter specifies the cap on the size of the server statistics log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 MB. The default value is 250 MB. When you enter a value, qualify the value with one of the following: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ServerStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ServerStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value

			of `unlimited`, no size limit is imposed on the server statistics log directory.
ServerStatisticsLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ServerStatisticsLogMaxFileSize* parameter specifies the maximum file size for the server statistics log files. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ServerStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ServerStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through

			9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log files.
ServerStatisticsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ServerStatisticsLogPath* parameter specifies the location of server statistics log storage. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ServerStats`. Setting the value of this parameter to `$null` disables server statistics logging.
SmtpEnableAllTlsVersions	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransientFailureRetryCount	Optional	System.Int32	The *TransientFailureRetryCount* parameter specifies the maximum number of immediate connection retries attempted when the server encounters a connection failure with a remote server. The default value is 6. The valid input range for this parameter is from 0 through 15.

			When the value of this parameter is set to 0, the server doesn't immediately attempt to retry an unsuccessful connection, and the next connection attempt is controlled by the *OutboundConnectionFailureRetryInterval* parameter.
TransientFailureRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TransientFailureRetryInterval* parameter controls the connection interval between each connection attempt specified by the *TransientFailureRetryCount* parameter. For the Transport service on a Mailbox server, the default value of the *TransientFailureRetryInterval* parameter is 5 minutes. On an Edge server, the default value is 10 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			For example, to specify 8 minutes for this parameter, use 00:08:00. The valid input range for this parameter is from 00:00:01 through 12:00:00.
TransportMaintenanceLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportMaintenanceLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportMaintenanceLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
TransportMaintenanceLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
TransportMaintenanceLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsPoisonAccountThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsPoisonDetectionEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsPoisonItemThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsSuccessivePoisonItemThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.

TransportSyncEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncExchangeEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncFacebookEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncImapEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLinkedInEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncLogLoggingLevel	Optional	Microsoft.Exchange.Data.SyncLoggingLevel	This parameter is reserved for internal Microsoft use.

TransportSyncLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncMaxDownloadItemsPerConnection	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncMaxDownloadSizePerConnection	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncMaxDownloadSizePerItem	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncPopEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncRemoteConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
UseDowngradedExchangeServerAuth	Optional	System.Boolean	The *UseDowngradedExchangeServerAuth* parameter specifies whether the Generic Security Services application programming interface (GSSAPI) authentication method is used on connections where Transport Layer Security (TLS) is disabled.

			Normally, TLS is required for connections between the Transport services on Mailbox servers in your organization. On TLS secured connections, Kerberos authentication is used by default. However, there may be scenarios where you need to disable TLS between specific Transport services in your organization. When you do that, you need to set this parameter to `$true` to provide an alternative authentication method. The default value is `$false`. You shouldn't set this value to `$true` unless it's absolutely required. If you set this parameter to `$true`, you also need to create a specific Receive connector to service the non-TLS connections. This Receive connector must have remote IP address ranges specified to ensure that it's only used for non-TLS connections. You also must set the *SuppressXAnonymousTls*

			attribute of the Receive connector to `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsLiveHotmailTransportSyncEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WlmLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
WlmLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
WlmLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
WlmLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TransportService

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-TransportService** cmdlet to view the transport configuration information for the Transport service on Mailbox servers or for Edge Transport servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-TransportService [-Identity <TransportServerIdParameter>] [-
DomainController <Fqdn>]
```

Examples

Example 1

This example provides different results depending on the server role on which it's run. When you run this command on an Edge Transport server, it provides a configuration summary for the local server. Otherwise, it displays a list of all Mailbox servers in your organization.

```
Get-TransportService
```

Example 2

This example retrieves the detailed transport configuration information for the Transport service on the Mailbox server named Mailbox1.

```
Get-TransportService Mailbox1 | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Transport service" or "Edge Transport server" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.TransportServerIdParameter	The *Identity* parameter specifies the server you want to view. When you use this parameter on a Mailbox server, the parameter returns the transport configuration of the Transport service on the specified server.

			You can't use this parameter on an Edge Transport server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-TransportService

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-26*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-TransportService** cmdlet to set the transport configuration options for the Transport service on Mailbox servers or for Edge Transport servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-TransportService -Identity <ServerIdParameter> [-

```

Examples

EXAMPLE 1

This example sets the *DelayNotificationTimeout* parameter to 13 hours for the Transport service on a Mailbox server named Mailbox01.

```
Set-TransportService Mailbox01 -DelayNotificationTimeout
13:00:00
```

EXAMPLE 2

This example sets the *TransientFailureRetryCount* parameter to 3 and sets the *TransientFailureRetryInterval* parameter to 30 seconds for the Transport service on a Mailbox server named Mailbox01.

```
Set-TransportService Mailbox01 -TransientFailureRetryCount
3 -TransientFailureRetryInterval 00:00:30
```

EXAMPLE 3

This example sets the *ReceiveProtocolLogPath* parameter to C:\SMTP Protocol Logs\Receive.log for the Transport service on a Mailbox server named Mailbox01.

```
Set-TransportService Mailbox01 -ReceiveProtocolLogPath "C:
\SMTP Protocol Logs\Receive.log"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport service" and "Edge Transport server" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the server that you want to modify.
ActiveUserStatisticsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ActiveUserStatisticsLogMaxAge* parameter specifies the maximum duration that the per user activity statistics log files are kept. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 10 days for this parameter, use 10.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of this parameter to 00:00:00 prevents the automatic removal of server

			statistics log files.
ActiveUserStatisticsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ActiveUserStatisticsLogMaxDirectorySize* parameter specifies the cap on the size of the per user activity statistics log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 megabyte (MB). The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ActiveUserStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ActiveUserStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1

			through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log directory.
ActiveUserStatisticsLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ActiveUserStatisticsLogMaxFileSize* parameter specifies the maximum file size for the per user activity statistics log files. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ActiveUserStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ActiveUserStatisticsLogMaxDirectorySize* parameter.

			The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log files.
ActiveUserStatisticsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ActiveUserStatisticsLogPath* parameter specifies the location of per user activity statistics log storage. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ActiveUsersStats`. Setting the value of this parameter to `$null` disables server statistics logging.
AgentLogEnabled	Optional	System.Boolean	The *AgentLogEnabled* parameter specifies whether the agent log is enabled. The default value is `$true`.
AgentLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AgentLogMaxAge* parameter specifies the maximum age for the agent log file. Log files older than the specified

			value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *AgentLogMaxAge* parameter to 00:00:00 prevents the automatic removal of agent log files because of their age.
AgentLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *AgentLogMaxDirectorySize* parameter specifies the maximum size of all agent logs in the agent log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes)

			Unqualified values are treated as bytes. The value of the *AgentLogMaxFileSize* parameter must be less than or equal to the value of the *AgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log directory.
AgentLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *AgentLogMaxFileSize* parameter specifies the maximum size of each agent log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *AgentLogMaxFileSize* parameter must be less

			than or equal to the value of the *AgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log files.
AgentLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *AgentLogPath* parameter specifies the default agent log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\AgentLog`. Setting the value of this parameter to `$null` disables agent logging. However, setting this parameter to `$null` when the value of the *AgentLogEnabled* attribute is `$true` generates event log errors.
AntispamAgentsEnabled	Optional	System.Boolean	The *AntispamAgentsEnabled* parameter specifies whether anti-spam agents are installed on the server specified with the *Identity* parameter. The default value is `$false` for the

			Transport service on Mailbox servers and `$true` on Edge Transport servers. **Important:** You set this parameter by using a script. You shouldn't modify this parameter manually.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectivityLogEnabled	Optional	System.Boolean	The *ConnectivityLogEnabled* parameter specifies whether the connectivity log is enabled. The default value is `$true`.
ConnectivityLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectivityLogMaxAge* parameter specifies the maximum age for the connectivity log file. Log files older than the specified value are deleted. The default value

			is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *ConnectivityLogMaxAge* parameter to 00:00:00 prevents the automatic removal of connectivity log files because of their age.
ConnectivityLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxDirectorySize* parameter specifies the maximum size of all connectivity logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 1000 MB.

			When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log directory.
ConnectivityLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxFileSize* parameter specifies the maximum size of each connectivity log file. When a log file reaches its maximum file size, a new log file is created. The

			default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log files.
ConnectivityLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ConnectivityLogPath* parameter specifies the default connectivity log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\Connectivity`.

			Setting the value of this parameter to `$null` disables connectivity logging. However, setting this parameter to `$null` when the value of the *ConnectivityLogEnabled* attribute is `$true` generates event log errors.
ContentConversionTracingEnabled	Optional	System.Boolean	The *ContentConversionTracingEnabled* parameter specifies whether content conversion tracing is enabled. Content conversion tracing captures content conversion failures that occur in the Transport service on a Mailbox server or on the Edge Transport server. The default value is `$false`. Content conversion tracing captures a maximum of 128 MB of content conversion failures. When the 128 MB limit is reached, no more content conversion failures are captured. Content conversion

			tracing captures the complete contents of email messages to the path specified by the *PipelineTracingPath* parameter. Make sure that you restrict access to this directory. The permissions required on the directory specified by the *PipelineTracingPath* parameter are as follows: • Administrators: Full Control • Network Service: Full Control • System: Full Control
DelayNotificationTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DelayNotificationTimeout* parameter specifies how long the server waits before it generates a delayed delivery status notification (DSN) message. The default value is 4 hours. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 3.5

			hours for this parameter, use 03:30:00. The valid input range for this parameter is from 00:00:01 through 30.00:00:00. The value of the *DelayNotificationTimeout* parameter should always be greater than the value of the *TransientFailureRetryCount* parameter multiplied by the value of the *TransientFailureRetryInterval* parameter.
DeltaSyncClientCertificateThumbprint	Optional	System.String	This parameter is reserved for internal Microsoft use.
DnsLogEnabled	Optional	System.Boolean	The *DnsLogEnabled* parameter specifies whether the DNS log is enabled. The default value is `$false`.
DnsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DnsLogMaxAge* parameter specifies the maximum age for the DNS log file. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days.

			To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *DnsLogMaxAge* parameter to `00:00:00` prevents the automatic removal of DNS log files because of their age.
DnsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *DnsLogMaxDirectorySize* parameter specifies the maximum size of all DNS logs in the DNS log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 100 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the

			DnsLogMaxFileSize parameter must be less than or equal to the value of the *DnsLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the DNS log directory.
DnsLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *DnsLogMaxFileSize* parameter specifies the maximum size of each DNS log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *DnsLogMaxFileSize* parameter must be less than or equal to the value of the *DnsLogMaxDirectorySize*

			parameter. If you enter a value of `unlimited`, no size limit is imposed on the DNS log files.
DnsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *DnsLogPath* parameter specifies the DNS log directory location. The default value is blank (`$null`), which indicates no location is configured. If you enable DNS logging, you need to specify a local file path for the DNS log files by using this parameter. If the path contains spaces, enclose the entire path value in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active

			Directory Lightweight Directory Services (AD LDS) to read and write data.
ExternalDNSAdapterEnabled	Optional	System.Boolean	The *ExternalDNSAdapterEnabled* parameter specifies one or more Domain Name System (DNS) servers that Exchange uses for external DNS lookups. When the *ExternalDNSAdapterEnabled* parameter is set to `$true`, DNS lookups of destinations outside the Exchange organization are performed by using the DNS settings of the external network adapter specified by the value of the *ExternalDNSAdapterGuid* parameter. If you want to specify a custom list of DNS servers used for external Exchange DNS lookups only, you must specify the DNS servers by using the *ExternalDNSServers* parameter, and you must

			also set the value of the *ExternalDNSAdapterEnabled* parameter to `$false`. The default value of the *ExternalDNSAdapterEnabled* parameter is `$true`.
ExternalDNSAdapterGuid	Optional	System.Guid	The *ExternalDNSAdapterGuid* parameter specifies the network adapter that has the DNS settings used for DNS lookups of destinations that exist outside the Exchange organization. The concept of an external network adapter and an internal network adapter is only applicable in a multi-homed Exchange server environment. When no particular network adapter is specified as the network adapter for external DNS lookups, the value of the *ExternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`, and external DNS lookups are performed by using the DNS settings of any

			available network adapter. You may enter the GUID of a specific network adapter to use for external DNS lookups. The default value of the *ExternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`. **Note:** If the value of the *ExternalDNSAdapterEnabled* parameter is set to `$false`, the value of the *ExternalDNSAdapterGuid* parameter is ignored, and the list of DNS servers from the *ExternalDNSServers* parameter is used.
ExternalDNSProtocolOption	Optional	Microsoft.Exchange.Data.ProtocolOption	The *ExternalDNSProtocolOption* parameter specifies which protocol to use when querying external DNS servers. The valid options for this parameter are `Any`, `UseTcpOnly`, and `UseUdpOnly`. The default value is `Any`.
ExternalDNSServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalDNSServers* parameter specifies the list of external DNS servers that the server queries when resolving a

			remote domain. DNS servers are specified by IP address. The default value is an empty list ({}). To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** If the value of the *ExternalDNSAdapterEnabled* parameter is set to `$true`, the *ExternalDNSServers* parameter and its list of DNS servers isn't used.
ExternalIPAddress	Optional	System.Net.IPAddress	The *ExternalIPAddress* parameter specifies the IP address used in the

			`Received` message header field for every message that travels through the Edge Transport server or the Transport service on a Mailbox server. The IP address in the `Received` header field is used for hop count and routing loop detection. The IP address specified by the *ExternalIPAddress* parameter overrides the external network adapter's actual IP address. Typically, you would want to set the value of the *ExternalIPAddress* parameter to match the value of your domain's public MX record. The default value of the *ExternalIPAddress* parameter is blank. This means the actual IP address of the external network adapter is used in the `Received` header field.
FlowControlLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
FlowControlLogMaxA	Optional	Microsoft.Exchange.Da	This parameter is reserved

ge		ta.EnhancedTimeSpan	for internal Microsoft use.
FlowControlLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
FlowControlLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
FlowControlLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
HttpProtocolLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
HttpProtocolLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
HttpProtocolLogLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	This parameter is reserved for internal Microsoft use.
HttpProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
HttpProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
HttpProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
HttpTransportSyncProxyServer	Optional	System.String	This parameter is reserved for internal Microsoft use.
InternalDNSAdapterEnabled	Optional	System.Boolean	The *InternalDNSAdapterEnabled* parameter specifies one or more DNS servers that Exchange uses for

			internal DNS lookups. When the *InternalDNSAdapterEnabled* parameter is set to `$true`, DNS lookups of destinations inside the Exchange organization are performed by using the DNS settings of the internal network adapter specified by the value of the *InternalDNSAdapterGuid* parameter. If you want to specify a custom list of DNS servers used for internal Exchange DNS lookups only, you must specify the DNS servers by using the *InternalDNSServers* parameter, and you must also set the value of the *InternalDNSAdapterEnabled* parameter to `$false`. The default value of the *InternalDNSAdapterEnabled* parameter is `$true`.
InternalDNSAdapterGuid	Optional	System.Guid	The *InternalDNSAdapterGuid* parameter specifies the network adapter that has the DNS settings used for

			DNS lookups of servers that exist inside the Exchange organization. The concept of an internal network adapter and an external network adapter is only applicable in a multi-homed Exchange server environment. When no particular network adapter is specified as the network adapter for external DNS lookups, the value of the *InternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`, and internal DNS lookups are performed by using the DNS settings of any available network adapter. You may enter the GUID of a specific network adapter to use for internal DNS lookups. The default value of the *InternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`. **Note:** If the value of the *InternalDNSAdapterEnabled* parameter is set to

			`$false`, the value of the *InternalDNSAdapterGuid* parameter is ignored, and the list of DNS servers from the *InternalDNSServers* parameter is used.
InternalDNSProtocolOption	Optional	Microsoft.Exchange.Data.ProtocolOption	The *InternalDNSProtocolOption* parameter specifies which protocol to use when you query internal DNS servers. Valid options for this parameter are `Any`, `UseTcpOnly`, or `UseUdpOnly`.The default value is `Any`.
InternalDNSServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalDNSServers* parameter specifies the list of DNS servers that should be used when resolving a domain name. DNS servers are specified by IP address. The default value is any empty list ({}). To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following

			syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** If the *InternalDNSAdapterGuid* parameter is set, and the value of the *InternalDNSAdapterEnabled* parameter is set to `$true`, the *InternalDNSServers* parameter and its list of DNS servers isn't used.
IntraOrgConnectorProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *IntraOrgConnectorProtocolLoggingLevel* parameter enables or disables SMTP protocol logging on the implicit and invisible intra-organization Send connectors that are used to transmit messages between Exchange servers in the Exchange organization. Valid values for this

			parameter are `None` or `Verbose`. The value `Verbose` enables protocol logging for the connector. The value `None` disables protocol logging for the connector. The default value is `None`. When the *IntraOrgConnectorProtocolLoggingLevel* parameter is set to `Verbose`, the information is written to the Send connector protocol log specified by the *SendProtocolLog* parameters.
IntraOrgConnectorSmtpMaxMessagesPerConnection	Optional	System.Int32	The *IntraOrgConnectorSmtpMaxMessagesPerConnection* parameter specifies the maximum number of messages per connection limit on the implicit and invisible intra-organization Send connectors that are used to transmit messages between Exchange servers in the Exchange organization.
IrmLogEnabled	Optional	System.Boolean	The *IrmLogEnabled* parameter enables

			logging of Information Rights Management (IRM) transactions. IRM logging is enabled by default. Values include: • `$true` Enable IRM logging • `$false` Disable IRM logging
IrmLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *IrmLogMaxAge* parameter specifies the maximum age for the IRM log file. Log files that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The valid input range for this parameter is 00:00:00 to 24855.03:14:07. Setting the value of the *IrmLogMaxAge* parameter to 00:00:00 prevents the automatic removal of connectivity log files because of their age.
IrmLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This *IrmLogMaxDirectorySize* parameter specifies the

			maximum size of all IRM logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *IrmLogMaxFileSize* parameter must be less than or equal to the value of the *IrmLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the IRM log directory.

IrmLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This *IrmLogMaxFileSize* parameter specifies the maximum size of each IRM log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *IrmLogMaxFileSize* parameter must be less than or equal to the value of the *IrmLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the IRM log files.

IrmLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *IrmLogPath* parameter specifies the default IRM log directory location. The default location is `%ExchangeInstallPath%Logging\IRMLogs`. If you set the value of the *IrmLogPath* parameter to `$null`, you effectively disable IRM logging. However, if you set the value of the *IrmLogPath* parameter to `$null` when the value of the *IrmLogEnabled* attribute is `$true`, Exchange will log errors in the Application event log. The preferred way for disabling IRM logging is to set the *IrmLogEnabled* to `$false`.
JournalLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
JournalLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
JournalLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
JournalLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
JournalLogPath	Optional	Microsoft.Exchange.Da	This parameter is reserved

		ta.LocalLongFullPath	for internal Microsoft use.
MaxActiveTransportSyncJobsPerProcessor	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MaxConcurrentMailboxDeliveries	Optional	System.Int32	The *MaxConcurrentMailboxDeliveries* parameter specifies the maximum number of delivery threads that the transport service can have open at the same time to deliver messages to mailboxes. The default value is 20. The valid input range for this parameter is from 1 through 256. We recommend that you don't modify the default value unless Microsoft Customer Service and Support advises you to do this.
MaxConcurrentMailboxSubmissions	Optional	System.Int32	The *MaxConcurrentMailboxSubmissions* parameter specifies the maximum number of submission threads that the transport service can have open at the same time to send messages from mailboxes.

			The default value is 20. The valid input range for this parameter is from 1 through 256.
MaxConnectionRatePerMinute	Optional	System.Int32	The *MaxConnectionRatePerMinute* parameter specifies the maximum rate that connections are allowed to be opened with the transport service. If many connections are attempted with the transport service at the same time, the *MaxConnectionRatePerMinute* parameter limits the rate that the connections are opened so that the server's resources aren't overwhelmed. The default value is 1200 connections per minute. The valid input range for this parameter is from 1 through 2147483647.
MaxNumberOfTransportSyncAttempts	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MaxOutboundConnections	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxOutboundConnections* parameter specifies the

			maximum number of outbound connections that can be open at a time. The default value is 1000. The valid input range for this parameter is from 1 through 2147483647. If you enter a value of `unlimited`, no limit is imposed on the number of outbound connections. The value of the *MaxOutboundConnections* parameter must be greater than or equal to the value of the *MaxPerDomainOutboundConnections* parameter.
MaxPerDomainOutboundConnections	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxPerDomainOutboundConnections* parameter specifies the maximum number of concurrent connections to any single domain. The default value is 20. The valid input range for this parameter is from 1 through 2147483647. If you enter a value of `unlimited`, no limit is imposed on the number of outbound

			connections per domain. The value of the *MaxPerDomainOutboundConnections* parameter must be less than or equal to the value of the *MaxOutboundConnections* parameter.
MessageExpirationTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MessageExpirationTimeout* parameter specifies the maximum time that a particular message can remain in a queue. If a message remains in the queue for longer than this period of time, the message is returned to the sender as a permanent failure. The default value is 2 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 3 days for this parameter, use 3.00:00:00. The valid input range for this parameter is from 00:00:05 through

			90.00:00:00.
MessageRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MessageRetryInterval* parameter specifies the retry interval for individual messages after a connection failure with a remote server. The default value is 1 minute. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 2 minutes for this parameter, use 00:02:00. The valid input range for this parameter is from 00:00:01 through 1.00:00:00. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this.
MessageTrackingLogEnabled	Optional	System.Boolean	The *MessageTrackingLogEnabled* parameter specifies whether message tracking is enabled. The default value is `$true`.

MessageTrackingLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MessageTrackingLogMaxAge* parameter specifies the message tracking log maximum file age. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 20 days for this parameter, use 20.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *MessageTrackingLogMaxAge* parameter to 00:00:00 prevents the automatic removal of message tracking log files because of their age.
MessageTrackingLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *MessageTrackingLogMaxDirectorySize* parameter specifies the maximum

			size of the message tracking log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The maximum size of the message tracking log directory is calculated as the total size of all log files that have the same name prefix. Other files that don't follow the name prefix convention aren't counted in the total directory size calculation. Renaming old log files or copying other files into the message tracking log directory could cause the directory to exceed its specified maximum size. For Mailbox servers, the maximum size of the message tracking log directory isn't the specified maximum size because the message tracking log files generated by the Transport service and the Mailbox Transport service have different name

			prefixes. Message tracking log files for the Transport service or for Edge Transport servers begin with the name prefix *MSGTRK*. Message tracking log files for the Mailbox Transport service begin with the name prefix *MSGTRKM*. For Mailbox servers, the maximum size of the message tracking log directory is two times the specified value. The default value is 1000 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *MessageTrackingLogMaxFileSize* parameter must be less than or equal to the value of the *MessageTrackingLogMax*

			DirectorySize parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the message tracking log directory.
MessageTrackingLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MessageTrackingLogMaxFileSize* parameter specifies the maximum size of the message tracking log files. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *MessageTrackingLogMaxFileSize* parameter must be less than or equal to the

			value of the *MessageTrackingLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 4294967296 bytes (4 GB). If you enter a value of `unlimited`, no size limit is imposed on the message tracking log files.
MessageTrackingLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *MessageTrackingLogPath* parameter specifies the location of the message tracking logs. The default location is `%ExchangeInstallPath%TransportRoles\Logs\MessageTracking`. Setting the value of this parameter to `$null` disables message tracking. However, setting this parameter to `$null` when the value of the *MessageTrackingLogEnabled* attribute is `$true` generates event log errors. The preferred method to disable message tracking is to use the

			MessageTrackingLogEnabled parameter.
MessageTrackingLogSubjectLoggingEnabled	Optional	System.Boolean	The *MessageTrackingLogSubjectLoggingEnabled* parameter specifies whether the message subject should be included in the message tracking log. The default value is `$true`.
OutboundConnectionFailureRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *OutboundConnectionFailureRetryInterval* parameter specifies the retry interval for subsequent connection attempts to a remote server where previous connection attempts have failed. The previously failed connection attempts are controlled by the *TransientFailureRetryCount* and *TransientFailureRetryInterval* parameters. For the Transport service on a Mailbox server, the default value of the *OutboundConnectionFailureRetryInterval*

			parameter is 10 minutes. On an Edge Transport server, the default value is 30 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 15 minutes for this parameter, use 00:15:00. The valid input range for this parameter is from 00:00:01 through 20.00:00:00.
PickupDirectoryMaxHeaderSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *PickupDirectoryMaxHeaderSize* parameter specifies the maximum message header size that can be submitted to the Pickup directory. The default value is 64 KB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are

			treated as bytes. The valid input range for this parameter is from 32768 through 2147483647 bytes.
PickupDirectoryMaxMessagesPerMinute	Optional	System.Int32	The *PickupDirectoryMaxMessagesPerMinute* parameter specifies the maximum number of messages processed per minute by the Pickup directory and by the Replay directory. Each directory can independently process message files at the rate specified by the *PickupDirectoryMaxMessagesPerMinute* parameter. The default value is 100. The valid input range for this parameter is from 1 through 20000.
PickupDirectoryMaxRecipientsPerMessage	Optional	System.Int32	The *PickupDirectoryMaxRecipientsPerMessage* parameter specifies the maximum number of recipients that can be included on an email message. The default value is 100. The valid

			input range for this parameter is from 1 through 10000.
PickupDirectoryPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *PickupDirectoryPath* parameter specifies the location of the Pickup directory. The Pickup directory is used by administrators and third-party applications to create and submit messages. The default location is `%ExchangeInstallPath%TransportRoles\Pickup`. If the value of the *PickupDirectoryPath* parameter is set to `$null`, the Pickup directory is disabled.
PipelineTracingEnabled	Optional	System.Boolean	The *PipelineTracingEnabled* parameter specifies whether to enable pipeline tracing. Pipeline tracing captures message snapshot files that record the changes made to the message by each transport agent configured in the transport service on the

			server. Pipeline tracing creates verbose log files that accumulate quickly. Pipeline tracing should only be enabled for a short time to provide in-depth diagnostic information that enables you to troubleshoot problems. In addition to troubleshooting, you can use pipeline tracing to validate changes that you make to the configuration of the transport service where you enable pipeline tracing. The default value is `$false`.
PipelineTracingPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *PipelineTracingPath* parameter specifies the location of the pipeline tracing logs. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\PipelineTracing`. The path must be local to the Exchange computer. Setting the value of this parameter to `$null` disables pipeline tracing. However, setting this parameter to `$null` when the value of the

			PipelineTracingEnabled attribute is `$true` generates event log errors. The preferred method to disable pipeline tracing is to use the *PipelineTracingEnabled* parameter. Pipeline tracing captures the complete contents of email messages to the path specified by the *PipelineTracingPath* parameter. Make sure that you restrict access to this directory. The permissions required on the directory specified by the *PipelineTracingPath* parameter are as follows: • Administrators: Full Control • Network Service: Full Control • System: Full Control
PipelineTracingSenderAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PipelineTracingSenderAddress* parameter specifies the sender email address that invokes pipeline tracing. Only messages from this address

			generate pipeline tracing output. The address can be either inside or outside the Exchange organization. Depending on your requirements, you may have to set this parameter to different sender addresses and send new messages to start the transport agents or routes that you want to test. The default value of this parameter is `$null`.
PoisonMessageDetectionEnabled	Optional	System.Boolean	The *PoisonMessageDetectionEnabled* parameter specifies whether poison messages should be detected. The default value is `$true`. Poison messages are messages determined to be potentially harmful to the Exchange system after a server failure. Poison messages are put in the poison message queue. We recommend that you don't modify the default value unless Customer Service and Support

			advises you to do this.
PoisonThreshold	Optional	System.Int32	The *PoisonThreshold* parameter specifies the number of times a message can be rejected before it's classified as a poison message. The default value is 2. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this. The valid input range for this parameter is from 1 through 10.
ProcessingSchedulerLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ProcessingSchedulerLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
QueueLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *QueueLogMaxAge* parameter specifies the maximum age of the queue log files. Log files

			that are older than the specified value are deleted. The default value is 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 10 days for this parameter, use 10.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *QueueLogMaxAge* parameter to 00:00:00 prevents the automatic removal of queue log files because of their age.
QueueLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *QueueLogMaxDirectorySize* parameter specifies the maximum size of the queue log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 200 MB.

			When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *QueueLogMaxFileSize* parameter must be less than or equal to the value of the *QueueLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the queue log directory.
QueueLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *QueueLogMaxFileSize* parameter specifies the maximum size of the queue log files. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB.

			When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *QueueLogMaxFileSize* parameter must be less than or equal to the value of the *QueueLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the queue log files.
QueueLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *QueueLogPath* parameter specifies the path of the queue log directory. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\QueueViewer`. Setting the value of this

			parameter to `$null` disables queue logging.
QueueMaxIdleTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *QueueMaxIdleTime* parameter specifies the period of time an empty delivery queue can exist before the queue is removed. The default value is 3 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 5 minutes for this parameter, use 00:05:00. The valid input range for this parameter is from 00:00:05 through 01:00:00. We recommend that you don't modify the default value unless Customer Service and Support advises you to do this.
ReceiveProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ReceiveProtocolLogMaxAge* parameter specifies the maximum age of the Receive connector protocol log file. Log files

			that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 20 days for this parameter, use 20.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *ReceiveProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Receive connector protocol log files because of their age.
ReceiveProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Receive connector protocol log directory shared by all the Receive connectors that exist on the server. When

			the maximum directory size is reached, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log directory.
ReceiveProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxFil*

			eSize parameter specifies the maximum size of the Receive connector protocol log files shared by all the Receive connectors that exist on the server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value

			of `unlimited`, no size limit is imposed on the Receive connector protocol log files.
ReceiveProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ReceiveProtocolLogPath* parameter specifies the path of the protocol log directory for all the Receive connectors that exist on the server. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ProtocolLog\SmtpReceive`. Setting the value of this parameter to `$null` disables protocol logging for all Receive connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* attribute for any Receive connector on the server is `verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-ReceiveConnector** cmdlet to set the *ProtocolLoggingLevel* to

			`None` on each Receive connector.
RecipientValidationCacheEnabled	Optional	System.Boolean	The *RecipientValidationCacheEnabled* parameter specifies whether the recipient addresses used by transport agents, such as the Recipient Filtering agent, are cached. The default value is `$true` on Edge Transport servers and `$false` for the Transport service on Mailbox servers.
ReplayDirectoryPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ReplayDirectoryPath* parameter specifies the path of the Replay directory. The Replay directory is used to resubmit exported messages and to receive messages from foreign gateway servers. The default location is `%ExchangeInstallPath%TransportRoles\Replay`. If the value of the *ReplayDirectoryPath* parameter is set to `$null`, the Replay directory is disabled.

ResourceLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ResourceLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ResourceLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ResourceLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ResourceLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
RootDropDirectoryPath	Optional	System.String	The *RootDropDirectoryPath* parameter specifies the top-level location of the Drop directory used by all Foreign connectors defined in the Transport service on a Mailbox server. The value of the *RootDropDirectoryPath* parameter may be a local path, or a Universal Naming Convention (UNC) path to a remote server. By default, the *RootDropDirectoryPath* parameter is blank. This indicates the value of *RootDropDirectoryPath* is the Exchange installation

			folder. The *RootDropDirectoryPath* parameter is used with the *DropDirectory* parameter in the **Set-ForeignConnector** cmdlet to specify the location for outgoing messages going to the address spaces defined on the Foreign connector.
RoutingTableLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RoutingTableLogMaxAge* parameter specifies the maximum routing table log age. Log files older than the specified value are deleted. The default value is 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 5 days for this parameter, use 5.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the

			RoutingTableLogMaxAge parameter to 00:00:00 prevents the automatic removal of routing table log files because of their age.
RoutingTableLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *RoutingTableLogMaxDirectorySize* parameter specifies the maximum size of the routing table log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 50 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit

			is imposed on the routing table log directory.
RoutingTableLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *RoutingTableLogPath* parameter specifies the directory location where routing table log files should be stored. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Routing`. Setting the value of the *RoutingTableLogPath* parameter to `$null` disables routing table logging.
SendProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SendProtocolLogMaxAge* parameter specifies the Send connector protocol log file maximum age. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter,

			use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *SendProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Send connector protocol log files because of their age.
SendProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Send connector protocol log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 MB. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes)

			Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log directory.
SendProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxFileSize* parameter specifies the maximum size of the Send connector protocol log files shared by all the Send connectors that exist on a server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one

			of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log files.
SendProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *SendProtocolLogPath* parameter specifies the location of protocol log storage for the Send connectors. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ProtocolLog\SmtpSend`. Setting the

			value of this parameter to `$null` disables protocol logging for all Send connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* or *IntraOrgConnectorProtocolLoggingLevel* attribute for any Send connector on the server is `Verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-SendConnector** cmdlet to set the *ProtocolLoggingLevel* parameter to `None` on each Send connector and to set the *IntraOrgConnectorProtocolLoggingLevel* parameter to `None`.
ServerStatisticsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ServerStatisticsLogMaxAge* parameter specifies the maximum duration that the server statistics log files are kept. Log files older than the specified value are deleted. The

			default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 60 days for this parameter, use 60.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of this parameter to 00:00:00 prevents the automatic removal of server statistics log files.
ServerStatisticsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ServerStatisticsLogMaxDirectorySize* parameter specifies the cap on the size of the server statistics log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 MB. The default value is 250 MB. When you enter a value, qualify the value with one

			of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ServerStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ServerStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log directory.
ServerStatisticsLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ServerStatisticsLogMaxFileSize* parameter specifies the maximum file size for the server statistics log files. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB.

			When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ServerStatisticsLogMaxFileSize* parameter must be less than or equal to the value of the *ServerStatisticsLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the server statistics log files.
ServerStatisticsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ServerStatisticsLogPath* parameter specifies the location of server statistics log storage. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Hub\ServerStats`.

			Setting the value of this parameter to `$null` disables server statistics logging.
SmtpEnableAllTlsVersions	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransientFailureRetryCount	Optional	System.Int32	The *TransientFailureRetryCount* parameter specifies the maximum number of immediate connection retries attempted when the server encounters a connection failure with a remote server. The default value is 6. The valid input range for this parameter is from 0 through 15. When the value of this parameter is set to 0, the server doesn't immediately attempt to retry an unsuccessful connection, and the next connection attempt is controlled by the *OutboundConnectionFailureRetryInterval* parameter.
TransientFailureRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TransientFailureRetryInterval* parameter controls the

			connection interval between each connection attempt specified by the *TransientFailureRetryCount* parameter. For the Transport service on a Mailbox server, the default value of the *TransientFailureRetryInterval* parameter is 5 minutes. On an Edge Transport server, the default value is 10 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 8 minutes for this parameter, use 00:08:00. The valid input range for this parameter is from 00:00:01 through 12:00:00.
TransportMaintenanceLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportMaintenanceLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportMaintenanc	Optional	Microsoft.Exchange.Da	This parameter is reserved

eLogMaxDirectorySize		ta.Unlimited	for internal Microsoft use.
TransportMaintenanceLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
TransportMaintenanceLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsPoisonAccountThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsPoisonDetectionEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsPoisonItemThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncAccountsSuccessivePoisonItemThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncExchangeEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncFacebookEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncHubHea	Optional	Microsoft.Exchange.Da	This parameter is reserved

lthLogMaxAge		ta.EnhancedTimeSpan	for internal Microsoft use.
TransportSyncHubHealthLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncHubHealthLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncImapEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLinkedInEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncLogLoggingLevel	Optional	Microsoft.Exchange.Data.SyncLoggingLevel	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncMaxDownloadItemsPerConnection	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
TransportSyncMaxDownloadSizePerConnec	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.

tion			
TransportSyncMaxDownloadSizePerItem	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncPopEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncRemoteConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
UseDowngradedExchangeServerAuth	Optional	System.Boolean	The *UseDowngradedExchangeServerAuth* parameter specifies whether the Generic Security Services application programming interface (GSSAPI) authentication method is used on connections where Transport Layer Security (TLS) is disabled. Normally, TLS is required for connections between the Transport services on Mailbox servers in your organization. On TLS secured connections, Kerberos authentication is used by default. However, there may be scenarios where you need to disable TLS between specific Transport services in your organization. When you

			do that, you need to set this parameter to `$true` to provide an alternative authentication method. The default value is `$false`. You shouldn't set this value to `$true` unless it's absolutely required. If you set this parameter to `$true`, you also need to create a specific Receive connector to service the non-TLS connections. This Receive connector must have remote IP address ranges specified to ensure that it's only used for non-TLS connections. You also must set the *SuppressXAnonymousTls* attribute of the Receive connector to `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.
WindowsLiveHotmailTransportSyncEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WlmLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
WlmLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
WlmLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
WlmLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-X400AuthoritativeDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-X400AuthoritativeDomain** cmdlet to view the configuration information for the X.400 authoritative domains configured in your organization. For more information about how to

configure an X.400 authoritative domain, see Set-X400AuthoritativeDomain.

```
Get-X400AuthoritativeDomain [-Identity
<X400AuthoritativeDomainIdParameter>] [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays detailed information about the X.400 authoritative domain Europe Sales X.400 Domain.

```
Get-X400AuthoritativeDomain "Europe Sales X.400 Domain" |
Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "X.400 domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance

			of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.X400AuthoritativeDomainIdParameter	The *Identity* parameter specifies a string value for the X.400 authoritative domain. Enter either the GUID or the name of the remote domain.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-X400AuthoritativeDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-X400AuthoritativeDomain** cmdlet to create and specify the X.400 authoritative domain for the organization. The X.400 authoritative domain defines the standard fields for the namespace appended to the recipient identity for all mailboxes assigned an X.400 address.

```
New-X400AuthoritativeDomain -Name <String> -X400DomainName <X400Domain> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]] [-X400ExternalRelay <$true | $false>]
```

Examples

EXAMPLE 1

This example creates the X.400 authoritative domain Sales in the private domain Contoso, which is under the administrative domain Fabrikam.

```
New-X400AuthoritativeDomain -Name Sales -X400DomainName
"C=US;A=Fabrikam;P=Contoso;O=Sales"
```

EXAMPLE 2

This example creates an external relay domain for the X.400 namespace Europe organizational unit (OU) under the Sales organization in the private domain Contoso, which is under the administrative domain Fabrikam.

```
New-X400AuthoritativeDomain -Name "Sales Europe" -
X400DomainName
"C=US;A=Fabrikam;P=Contoso;O=Sales;OU1=Europe" -
X400ExternalRelay: $true
```

Detailed Description

X.400 domain names can only include the following ASCII characters:

- A to Z
- a to z
- 0–9
- These punctuation and special characters: (space) ' () + , - . / : = ?

You can use the following X.400 attributes (one each per address):

- **Name** **country** **Abbreviation** C **Maximum character length** 2
- **Name** **administrative domain** **Abbreviation** A **Maximum character length** 16
- **Name** **private domain** **Abbreviation** P **Maximum character length** 16
- **Name** **organization name** **Abbreviation** O **Maximum character length** 64
- **Name** **organizational unit name** **Abbreviation** Ou1-4 **Maximum character length** 32

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "X.400 domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies a unique name for an X.400 authoritative domain object. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, "Display Name". The *Name* parameter can't exceed 64 characters.
X400DomainName	Required	Microsoft.Exchange.Data.X400Domain	The *X400DomainName* parameter specifies the X.400 namespace, which can only include the X.400 organizational components. Specifically, only the following attribute types are supported: • **Label** (Abbreviation) • **C** (Country) • **A** (ADMD) • **P** (PRMD) • **O** (Organization) • **OU1** (Organization unit 1) • **OU2** (Organization unit 2) • **OU3** (Organization unit 3)

			• **OU4** (Organization unit 4) The address attributes must be separated by semicolons, and the address must be enclosed in quotation marks ("), for example, `"C=US;A=ATT;P=Contoso;O=Sales"`
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge

			Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
X400ExternalRelay	Optional	System.Boolean	The *X400ExternalRelay* parameter specifies this authoritative domain as an external relay domain. If you set the *X400ExternalRelay* parameter to `$true`, Microsoft Exchange routes email to the external address and doesn't treat resolution failures to this subdomain as an error.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-X400AuthoritativeDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-X400AuthoritativeDomain** cmdlet to remove an X.400 authoritative domain. When you remove an X.400 authoritative domain, the X.400 authoritative domain object is deleted from Active Directory.

```
Remove-X400AuthoritativeDomain -Identity
<X400AuthoritativeDomainIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the X.400 authoritative domain object for the X.400 authoritative domain Sales.

```
Remove-X400AuthoritativeDomain -Identity Sales
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "X.400 domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.X400AuthoritativeDomainIdParameter	The *Identity* parameter specifies a string value for the X.400 authoritative domain. Enter either the GUID or the name of the X.400 authoritative domain.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't

			supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-X400AuthoritativeDomain

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-X400AuthoritativeDomain** cmdlet to edit an existing X.400 authoritative domain for your organization. The X.400 authoritative domain defines the standard fields for the namespace appended to the recipient identity for all mailboxes assigned an X.400 address.

```
Set-X400AuthoritativeDomain -Identity <X400AuthoritativeDomainIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Name <String>]
[-WhatIf [<SwitchParameter>]] [-X400DomainName <X400Domain>] [-
X400ExternalRelay <$true | $false>]
```

Examples

EXAMPLE 1

This example makes the following changes to an existing X.400 authoritative domain:

- It changes the domain name from Sales to Sales and Marketing.
- It updates the organizational attribute to **Sales and Marketing**.

```
Set-X400AuthoritativeDomain Sales -X400DomainName
"C=US;A=att,P=Contoso;O=Sales and Marketing" -Name "Sales
and Marketing"
```

Detailed Description

X.400 domain names can include only the following ASCII characters:

- A to Z
- a to z
- 0-9
- These punctuation marks and special characters: (space) ' () + , - . / : = ?

You can use the following X.400 attributes (1 each per address):

- **Name** **country** **Abbreviation** C **Maximum character length** 2
- **Name** **administrative domain** **Abbreviation** A **Maximum character length** 16
- **Name** **private domain** **Abbreviation** P **Maximum character length** 16
- **Name** **organization name** **Abbreviation** O **Maximum character length** 64
- **Name** **organizational unit name** **Abbreviation** Ou1-4 **Maximum character length** 32

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "X.400

domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.X400AuthoritativeDomainIdParameter	The *Identity* parameter specifies the display name of the X.400 authoritative domain.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the

			local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Name	Optional	System.String	The *Name* parameter specifies a unique name for an X.400 authoritative domain object. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, "Display Name". The *Name* parameter must contain a maximum of 64 characters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
X400DomainName	Optional	Microsoft.Exchange.Data.X400Domain	The *X400DomainName* parameter specifies the X.400 namespace that can

			only include the X.400 organizational components. Specifically, only the following attribute types are supported: • **Label** (Abbreviation) • **C** (Country) • **A** (ADMD) • **P** (PRMD) • **O** (Organization) • **OU1** (Organization unit 1) • **OU2** (Organization unit 2) • **OU3** (Organization unit 3) • **OU4** (Organization unit 4) The address attributes must be separated by semicolons and the address must be enclosed in quotation marks ("), for example, `"C=US;A=att;P=Contoso;O=Sales"`.
X400ExternalRelay	Optional	System.Boolean	The *X400ExternalRelay* parameter specifies whether this authoritative domain is an external relay domain. If you set the *X400ExternalRelay*

			parameter to `$true`, Exchange routes e-mail to the external address and doesn't treat resolution failures to this subdomain as errors.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-App

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-App** cmdlet to disable (turn off) a specific app for a specific user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-App -Identity <AppIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the Bing Maps app for user Tony.

```
Disable-App -Identity 7a774f0c-7a6f-11e0-85ad-07fb4824019b
-Mailbox Tony
```

For more information, see Manage user access to apps for Outlook.

EXAMPLE 2

This example disables the administrator-installed app FinanceTestApp for user Tony.

```
Disable-App -Identity <GUID for FinanceTestApp> -Mailbox
Tony
```

For more information, see Manage user access to apps for Outlook.

Detailed Description

The **Disable-App** cmdlet requires that the specified app has already been installed (for example, that the app has been installed with the **New-App** cmdlet, or that it's a default app for Microsoft Outlook).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Apps for Outlook" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AppIdParameter	The *Identity* parameter specifies the GUID of the app.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox or mail user. You can use the following values:

			• GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias You can't use this parameter in conjunction with the *Identity* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-App

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-App** cmdlet to enable (turn on) a specific app for a specific user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-App -Identity <AppIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the default Bing Maps app installed for user Tony.

```
Enable-App -Identity 7a774f0c-7a6f-11e0-85ad-07fb4824019b -
Mailbox Tony
```

For more information, see Manage user access to apps for Outlook.

EXAMPLE 2

This example enables the administrator-installed app FinanceTestApp for user Tony.

```
Enable-App -Identity <GUID for FinanceTestApp> -Mailbox
Tony
```

For more information, see Manage user access to apps for Outlook.

Detailed Description

The **Enable-App** cmdlet requires that the specified app has already been installed (for example, that it has been installed with the **New-App** cmdlet, or that it's a default app for Microsoft Outlook).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Apps for Outlook" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AppIdParameter	The *Identity* parameter specifies the GUID of the app.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Mailbox	Optional	Microsoft.Exchange.Co	The *Mailbox* parameter

		nfiguration.Tasks.MailboxIdParameter	specifies the identity of the mailbox or mail user. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-App

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-App** cmdlet to return information about the installed app.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-App [-Identity <AppIdParameter>] [-DomainController <Fqdn>] [-Mailbox
<MailboxIdParameter>] [-Organization <OrganizationIdParameter>] [-
OrganizationApp <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the list of apps installed for user Tony. The Exchange Management Shell returns the name of the app, whether the app is enabled, and the app version number.

```
Get-App -Mailbox Tony
```

EXAMPLE 2

This example displays the version of the Bing Maps app for the currently logged on user.

```
Get-App -Identity 7a774f0c-7a6f-11e0-85ad-07fb4824019b
```

EXAMPLE 3

This example displays the apps installed by administrators for the entire organization.

```
Get-App -OrganizationApp $true
```

For information about installing or removing apps for Outlook, see Install or remove apps for Outlook for your organization.

Detailed Description

The **Get-App** cmdlet returns information about all installed apps or the details of a specific installed app.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Apps for Outlook" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AppIdParameter	The *Identity* parameter specifies the GUID of the app.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox or mail user. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name

			(UPN) • Legacy Exchange DN • SMTP address • Alias You can't use this parameter in conjunction with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationApp	Optional	System.Management.Automation.SwitchParameter	The *OrganizationApp* parameter specifies the apps installed for the organization (not bound to a specific user). This is set to `$false` by default.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-App

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-App** cmdlet to install apps for Outlook.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-App [-FileData <Byte[]>] <COMMON PARAMETERS>

New-App [-Etoken <String>] [-MarketplaceAssetID <String>] [-
MarketplaceQueryMarket <String>] [-MarketplaceServicesUrl <String>]
<COMMON PARAMETERS>

New-App [-FileStream <Stream>] <COMMON PARAMETERS>

New-App [-Url <Uri>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DefaultStateForUser
<Enabled | Disabled | AlwaysEnabled>] [-DomainController <Fqdn>] [-
DownloadOnly <SwitchParameter>] [-Enabled <$true | $false>] [-Mailbox
<MailboxIdParameter>] [-OrganizationApp <SwitchParameter>] [-ProvidedTo
<Everyone | SpecificUsers>] [-UserList <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example installs the Finance Test app manifest file that has been copied to the local hard disk.

```
$Data=Get-Content -Path "C:\Apps\FinanceTestApp.xml" -
Encoding Byte -ReadCount 0

New-App -FileData $Data
```

For more information, see Install or remove apps for Outlook for your organization.

EXAMPLE 2

This example installs the Contoso CRM app manifest.xml from a URL on the Contoso corporate network. The Exchange server must be able to reach the target URL. This app is installed as an organization app and made available to a specific set of users in the organization, and is enabled for those users by default.

```
New-App -OrganizationApp -Url https://Server01.Contoso.com/
apps/ContosoCRMApp/manifest.xml -ProvidedTo SpecificUsers -
UserList "user1,user2,user3,user4,user5" -
DefaultStateForUser Enabled
```

For more information, see Install or remove apps for Outlook for your organization.

Detailed Description

If the app is enabled for the entire organization, users can activate the new app when viewing mail or calendar items within Microsoft Outlook or Microsoft Office Outlook Web App. If an installed app isn't enabled, users can enable the app from Outlook Web App Options. Similarly, if an app is installed, an administrator can enable the app from the Exchange Administration Center or by using the **Enable-App** or **Set-App** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Apps for Outlook" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DefaultStateForUser	Optional	Microsoft.Exchange.Management.Extension.DefaultStateForUser	The *DefaultStateForUser* parameter specifies the default initial state of the organization app for the provided users. This parameter is set to `Disabled` by default. If set to `AlwaysEnabled`, users

			can't disable the app for themselves. You must use the *OrganizationApp* parameter when you use this parameter. The possible values are: • `Enabled` • `Disabled` • `AlwaysEnabled`
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DownloadOnly	Optional	System.Management.Automation.SwitchParameter	The *DownloadOnly* switch specifies whether to get the app manifest file and prompt the user for confirmation before committing to actual installation. This is set to `$false` by default. If the *DownloadOnly* parameter is set to `$true`, the cmdlet only downloads the app manifest file (and displays the app properties)

			without installing the app.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the app is made available to users in the organization. By default, this is set to `$true`. **Caution:** This setting overrides the *ProvidedTo*, *UserList*, and *DefaultStateForUser* settings.This setting doesn't prevent users from installing their own instance of the app if the user has install permissions. This parameter may be set to the following values: • `$true` The app is enabled for the specified users in the organization. This makes the app available for the specified users. • `$false` The app isn't enabled for any users in the organization. This hides the app from all users in the organization.
Etoken	Optional	System.String	This parameter is reserved for internal Microsoft use.
FileData	Optional	System.Byte[]	The *FileData* parameter specifies the location of the app manifest file. You must specify only one

			source location for the app manifest file. You can specify the app manifest file by using the *MarketplaceServicesUrl*, *Url*, or *FileData* parameter. If you use this parameter, use the **Get-Content** cmdlet and this cmdlet together as shown in the example.
FileStream	Optional	System.IO.Stream	The *FileStream* parameter can't be used in the Exchange Management Shell. It's used to support the app uploader and is only used by the Exchange admin center.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox or mail user. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias

MarketplaceAssetID	Optional	System.String	The *MarketplaceAssetID* parameter specifies the office store identifier for the app. This parameter is required if the *MarketplaceServicesUrl* parameter is specified.
MarketplaceQueryMarket	Optional	System.String	The *MarketplaceQueryMarket* parameter specifies the locale that an app is filed under at the office marketplace. For example, an app for the United States market in English uses the value `en-us`. If not specified, this value is set to `en-us`.
MarketplaceServicesUrl	Optional	System.String	The *MarketplaceServicesUrl* parameter specifies the full services URL for the app. You must specify only one source location for the app manifest file. You can specify the app manifest file by using the *MarketplaceServicesUrl*, *Url*, or *FileData* parameter.
OrganizationApp	Optional	System.Management.	The *OrganizationApp*

		Automation.SwitchParameter	parameter specifies the apps that are installed for the organization (not bound to a specific user). This is set to `$false` by default.
ProvidedTo	Optional	Microsoft.Exchange.Data.ApplicationLogic.Extension.ClientExtensionProvidedTo	The *ProvidedTo* parameter specifies the availability of an app in your organization. By default, new apps are available to all users in your organization. You must use the *OrganizationApp* parameter when you use this parameter. The following are the possible values: • `Everyone` This app is provided to every user in the organization. Every user sees this app listed in the **installed apps** list in Outlook Web App Options. When apps in the installed apps list display as enabled, users can use the features of this app in their email. All users are blocked from installing their own instances of this app, including but not limited to users with install apps permissions.

			• `SpecificUsers` This app is provided to only the users specified using the *UserList* parameter. Users that aren't specified don't see this organizational app in their management view, nor will it activate in their mail or calendar items. Specified users are also blocked from installing their own instance of this app. Users that aren't listed aren't blocked from installing their own instance of this app.
Url	Optional	System.Uri	The *Url* parameter specifies the full URL location of the app manifest file you want to install. You must specify only one source location for the app manifest file. You can specify the app manifest file by using the *MarketplaceServicesUrl*, *Url*, or *FileData* parameter.
UserList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UserList* parameter specifies the list of users that are granted access to the organizational app. Use the *UserList* parameter to specify the users that you want to use

			the app.You must use the *OrganizationApp* parameter when you use this parameter. You can use the following values: • GUID • DN • *Domain\account* • UPN • Legacy Exchange DN • SMTP address • Alias
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-App

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-App** cmdlet to uninstall an app.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-App -Identity <AppIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>] [-OrganizationApp
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Finance Test app installed for user Tony.

```
Remove-App -Identity <GUID for FinanceTestApp> -Mailbox
Tony
```

For more information, see Install or remove apps for Outlook for your organization.

Detailed Description

The **Remove-App** cmdlet requires that the specified app has already been installed (for example, that the app has been installed with the **New-App** cmdlet. Apps installed by default can't be uninstalled, but they can be disabled.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Apps for Outlook" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.AppIdParameter	specifies the GUID of the app.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$false`. You must include a colon (:) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox or mail user. You can use the following values: • GUID • Distinguished name (DN)

			• *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias
OrganizationApp	Optional	System.Management.Automation.SwitchParameter	The *OrganizationApp* parameter specifies that the scope of the app is organizational. This is set to `$false` by default. This parameter is required if the targeted app is installed for the organization.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-App

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-App** cmdlet to set configuration properties on an app object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-App -Identity <AppIdParameter> [-Confirm [<SwitchParameter>]] [-
DefaultStateForUser <Enabled | Disabled | AlwaysEnabled>] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-Organization
<OrganizationIdParameter>] [-OrganizationApp <SwitchParameter>] [-
ProvidedTo <Everyone | SpecificUsers>] [-UserList <MultiValuedProperty>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the organization app FinanceTestApp, which was installed to everyone in the organization, to be provided to specific users on the finance team and to be enabled by default.

```
$a= Get-DistributionGroupMember FinanceTeam

Set-App -OrganizationApp -Identity 7a774f0c-7a6f-11e0-85ad-
07fb4824019b -ProvidedTo SpecificUsers -UserList $a -
DefaultStateForUser Enabled
```

For more information, see Manage user access to apps for Outlook.

EXAMPLE 2

This example disables the organization app FinanceTestApp across the organization and hides it from end user view.

```
Set-App -OrganizationApp -Identity 7a774f0c-7a6f-11e0-85ad-07fb4824019b -Enabled:$false
```

For more information, see Manage user access to apps for Outlook.

Detailed Description

The **Set-App** cmdlet can only be used when configuring the availability of an organization app. This task requires that the specified app has already been installed (for example, that the app has been installed with the **New-App** cmdlet, or that it's a default app for Microsoft Outlook).

Default apps in Microsoft Office Outlook Web App and apps that you've installed for use by users in your organization are known as organization apps. Organization apps can't be removed by end users, but can be enabled or disabled. If an app is an organization app (scope default or organization), the delete control on the toolbar is disabled for end users. Administrators are able to remove organization apps. Administrators can't remove default apps, but they can disable them for the entire organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Apps for Outlook" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AppIdParameter	The *Identity* parameter specifies the GUID of the app.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DefaultStateForUser	Optional	Microsoft.Exchange.Management.Extension.DefaultStateForUser	The *DefaultStateForUser* parameter specifies the default initial state of the organization app for the provided users. This parameter is set to `Disabled` by default. If set to `AlwaysEnabled`, users can't disable the app for themselves. You must use the *OrganizationApp* parameter when you use this parameter. The possible values are: • `Enabled` • `Disabled` • `AlwaysEnabled`
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the app is made available to users in the organization. By default, this is set to `$true`. **Caution:**

			This setting overrides the *ProvidedTo*, *UserList*, and *DefaultStateForUser* settings. This setting doesn't prevent users from installing their own instance of the app if the users have install permissions. The following are the possible values: • `$true` App is enabled for the specified users in the organization. This makes the app available for the specified users. • `$false` App isn't enabled for any users in the organization. This hides the app from user view for all users in the organization.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationApp	Optional	System.Management.Automation.SwitchParameter	The *OrganizationApp* parameter specifies that the scope of the app is organizational. This is set to `$false` by default.
ProvidedTo	Optional	Microsoft.Exchange.Data.ApplicationLogic.Extension.ClientExtensionProvidedTo	The *ProvidedTo* parameter specifies the availability of an app in your organization. By default, new apps are available to all users in your organization. You must use the *OrganizationApp*

			parameter when you use this parameter. The following are the possible values: • `Everyone` This app is provided to every user in the organization. Every user sees this app listed in the installed apps list in Outlook Web App Options. When apps in the installed apps list display as enabled, the users are able to use the features of this app in their email. All users are blocked from installing their own instances of this app, including but not limited to users with install apps permissions. • `Specificusers` This app is provided to only the users specified using the *UserList* parameter. Users that aren't specified don't see this organizational app in their management view, nor does it activate in their mail or calendar items. Specified users are also blocked from installing their own instance of this app. Users that aren't listed aren't blocked from installing their own instance of this app.
UserList	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *UserList* parameter specifies the list of users

		y	granted access to the organizational app. Use the *UserList* parameter to specify the users that you want to use the app.You must use the *OrganizationApp* parameter when you use this parameter. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP Address • Alias
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-CalendarDiagnosticAnalysis

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-22*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-CalendarDiagnosticAnalysis** cmdlet to troubleshoot calendar-related reliability issues. You can use this cmdlet to analyze calendar log data captured in your calendar diagnostic log files.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-CalendarDiagnosticAnalysis -CalendarLogs <CalendarLog[]> <COMMON
PARAMETERS>

Get-CalendarDiagnosticAnalysis -LogLocation <String[]> <COMMON PARAMETERS>

COMMON PARAMETERS: [-DetailLevel <Basic | Advanced>] [-GlobalObjectId
<String>] [-OutputAs <HTML | CSV | XML>]
```

Examples

EXAMPLE 1

This example reads the logs for a user with alias Tony into memory, analyzes the logs, and produces the output in a CSV file.

This command collects the logs for a meeting with a specified MeetingID:

```
$logs = Get-CalendarDiagnosticLog -Identity Tony -
MeetingID
040000008200E00074C5B7101A82E008000000009421DCCD5046CD01000
0000000000000010000000010B0349F6B17454685E17D9F9512E71F
```

This command returns a detailed analysis in a CSV file.

```
Get-CalendarDiagnosticAnalysis -CalendarLogs $logs -
DetailLevel Advanced > analysis.csv
```

This command returns a basic analysis in the Exchange Management Shell output.

```
Get-CalendarDiagnosticAnalysis -CalendarLogs $logs
```

Detailed Description

You run the **Get-CalendarDiagnosticAnalysis** cmdlet to analyze calendar data you've retrieved using the **Get-CalendarDiagnosticLog** cmdlet. For more information, see Get-CalendarDiagnosticLog.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar diagnostics" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
CalendarLogs	Required	Microsoft.Exchange.Management.StoreTasks.CalendarLog[]	The *CalendarLogs* parameter specifies the Message ID of the calendar item you want to analyze. You can specify the logs you want to analyze by using the *CalendarLogs* parameter or the *LogLocation* parameter, but not both.
LogLocation	Required	System.String[]	The *LogLocation* parameter specifies the location of the calendar log files you want to

			analyze. You can specify the logs you want to analyze by using the *CalendarLogs* parameter or the *LogLocation* parameter, but not both. If you use this parameter and the logs you want to analyze are located in the C:\logs directory on the computer you're running the cmdlet on, use `"C:\logs"` as the parameter value. If the logs you want to analyze are located on a share, use the format `"\\ServerName\ShareFolder"` where *ServerName**ShareFolder* is the location of the log files on your network.
DetailLevel	Optional	Microsoft.Exchange.Management.StoreTasks.AnalysisDetailLevel	The *DetailLevel* parameter specifies the level of detail you want to see in the analysis output. The default value is `Basic` and returns a summary of the analysis. Specify `Advanced` to see a

			detailed report which includes all of the properties from the calendar logs. `Advanced` should be used only when detailed debugging is necessary.
GlobalObjectId	Optional	System.String	The *GlobalObjectId* parameter specifies the Global ID of the calendar item you want to analyze.
OutputAs	Optional	Microsoft.Exchange.Management.StoreTasks.OutputType	The *OutputAs* parameter specifies the file format you want to output into the Logging directory. The default value is `HTML`. The other output options are csv, and `XML`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-CalendarDiagnosticLog

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-CalendarDiagnosticLog** cmdlet to collect a range of calendar logs. The Calendar Diagnostic logs track important calendar-related event data for each mailbox and can be used to troubleshoot calendar issues that occur in mailboxes. The logs track all calendar items and meeting messages.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-CalendarDiagnosticLog -Identity <MailboxIdParameter> <COMMON
PARAMETERS>

Get-CalendarDiagnosticLog -Identity <MailboxIdParameter> -LogLocation
<String> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Credential <PSCredential>] [-DomainController <Fqdn>]
[-EndDate <ExDateTime>] [-Identity <MailboxIdParameter>] [-Latest
<SwitchParameter>] [-MeetingID <String>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-StartDate <ExDateTime>] [-
Subject <String>]
```

Examples

EXAMPLE 1

This example retrieves the Calendar Diagnostic logs for Tony Smith's mailbox by using the subject Weekly development meeting.

```
Get-CalendarDiagnosticLog -Identity Tony -Subject "Weekly development meeting"
```

EXAMPLE 2

This example retrieves the Calendar Diagnostic logs for Tony Smith's mailbox from 6/1/2012 to 6/30/2012.

```
Get-CalendarDiagnosticLog -Identity Tony -StartDate "6/1/2012 6:00:00 AM" -EndDate "6/30/2012 5:00:00 PM"
```

EXAMPLE 3

This example retrieves the Calendar Diagnostic log data only for the most recent calendar item in Tony Smith's mailbox with a message subject of "Weekly development meeting".

```
Get-CalendarDiagnosticLog -Identity Tony -Subject "Weekly development meeting" -Latest
```

Detailed Description

After you run the **Get-CalendarDiagnosticLog** cmdlet, you can analyze the calendar data using the **Get-CalendarDiagnosticAnalysis** cmdlet. For more information, see Get-CalendarDiagnosticAnalysis.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar diagnostics" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox user's name. This is the name that appears in Active Directory Users and Computers. This is also the user name that appears in **Recipient Properties** on the **User Information** tab. You can use the following values: • Alias • Display name • *Domain\Account* • SMTP address • Distinguished name

			(DN) • Object GUID • User principal name (UPN) • LegacyExchangeDN
LogLocation	Required	System.String	The *LogLocation* parameter specifies the location of the log files. The log files are located in the Exchange Logging directory.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to use to access Active Directory Domain Services (AD DS). This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
EndDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *EndDate* parameter specifies the end date of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
Latest	Optional	System.Management.Automation.SwitchParameter	The *Latest* switch specifies whether to return calendar log data for only the most recent calendar

			item.
MeetingID	Optional	System.String	This parameter is reserved for internal Microsoft use.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the calendar diagnostic information is read from a domain controller in the user's domain. If you use this parameter, multiple reads might be necessary to get the information.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
StartDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies the start date of the date range. Use the short date format

			defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
Subject	Optional	System.String	The *Subject* parameter specifies the subject of the calendar item or meeting request. You can't use this parameter in conjunction with the *MeetingID* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-CalendarNotification

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-CalendarNotification** cmdlet to return a list of all calendar notification settings for a user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-CalendarNotification -Identity <MailboxIdParameter> [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the calendar notification settings for the user Tony Smith using the user's alias.

```
Get-CalendarNotification -Identity "TonySmith"
```

EXAMPLE 2

This example returns the calendar notification settings for the user Tony Smith.

```
Get-CalendarNotification -Identity tony@contoso.com -
ReadFromDomainController
```

EXAMPLE 3

This example returns the calendar notification settings for the user Tony Smith using the user's domain and name.

```
Get-CalendarNotification -Identity "contoso\tonysmith"
```

Detailed Description

The **Get-CalendarNotification** cmdlet retrieves and displays the rules used to trigger the calendar agenda notification, reminder notification, or update notification.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Text messaging settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox ID for the user's mailbox.
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user credentials used to run the command. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies whether the command should return data from the domain controller.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the amount of data returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-CalendarNotification

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Set-CalendarNotification** cmdlet to set text message notifications for calendar events for a user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-CalendarNotification -Identity <MailboxIdParameter> [-
CalendarUpdateNotification <$true | $false>] [-
CalendarUpdateSendDuringWorkHour <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DailyAgendaNotification <$true | $false>] [-
DailyAgendaNotificationSendTime <TimeSpan>] [-DomainController <Fqdn>] [-
IgnoreDefaultScope <SwitchParameter>] [-MeetingReminderNotification <$true
| $false>] [-MeetingReminderSendDuringWorkHour <$true | $false>] [-
NextDays <Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables calendar updates to be sent in text messages to the user Tony Smith.

```
Set-CalendarNotification -Identity "tony@contoso.com" -
CalendarUpdateNotification $true
```

EXAMPLE 2

This example enables calendar updates and meeting reminders to be sent in text messages to the user Tony Smith.

```
Set-CalendarNotification -Identity "TonySmith" -
CalendarUpdateNotification $true -
MeetingReminderNotification $true -
MeetingReminderSendDuringWorkHour $true
```

EXAMPLE 3

This example enables a daily agenda to be sent in text messages to the user Tony Smith.

```
Set-CalendarNotification -Identity contoso\tonysmith -
DailyAgendaNotification $true
```

Detailed Description

Users can receive text message notifications of changes to calendar events and daily agendas. Use the **Set-CalendarNotification** cmdlet to configure these notifications for a user.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Text messaging settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox ID for the user.
CalendarUpdateNotification	Optional	System.Boolean	The *CalendarUpdateNotification* parameter specifies whether calendar notifications are enabled for the user.
CalendarUpdateSendDuringWorkHour	Optional	System.Boolean	The *CalendarUpdateSendDuringWorkHour* parameter specifies whether calendar notifications are sent during working hours.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DailyAgendaNotification	Optional	System.Boolean	The *DailyAgendaNotification* parameter specifies whether a daily agenda should be sent to the user's mobile phone.
DailyAgendaNotificationSendTime	Optional	System.TimeSpan	The *DailyAgendaNotificationSendTime* parameter specifies the time to send the daily agenda. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, a time span of 2 days and 8 hours is shown: 02.08:00:00.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter isn't implemented yet.
MeetingReminderNotification	Optional	System.Boolean	The *MeetingReminderNotification* parameter specifies whether meeting reminders are sent to the user's mobile phone.
MeetingReminderSendDuringWorkHour	Optional	System.Boolean	The *MeetingReminderSendDuringWorkHour* parameter specifies whether meeting reminders are only sent during working hours.
NextDays	Optional	System.Int32	The *NextDays* parameter specifies how many days should be sent in the daily agenda.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-CalendarProcessing

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-06-10*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-CalendarProcessing** cmdlet to view the calendar processing options for resource mailboxes, which include the Calendar Attendant, resource booking assistant, and calendar configuration. Note that the settings returned by this cmdlet are editable only on resource mailboxes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-CalendarProcessing -Identity <MailboxIdParameter> [-DomainController
```

```
<Fqdn>] [-ReadFromDomainController <SwitchParameter>] [-ResultSize
<Unlimited>]
```

Examples

EXAMPLE 1

This example shows the calendar processing options for the resource mailbox Room 212.

```
Get-CalendarProcessing -Identity "Room 212" | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar processing" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the resource mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account`

			Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainControl*

			ler switch specifies that information should be read from a domain controller in the user's domain. If you run the command `Set-AdServerSettings -ViewEntireForest $true` to include all objects in the forest and you don't use the *ReadFromDomainControl ler* switch, it's possible that information will be read from a global catalog that has outdated information. When you use the *ReadFromDomainControl ler* switch, multiple reads might be necessary to get the information. You don't have to specify a value with this switch. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.
ResultSize	Optional	Microsoft.Exchange.Da ta.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that

			match the query, use `unlimited` for the value of this parameter. The default value is `1000`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-CalendarProcessing

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-09-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-CalendarProcessing** cmdlet to modify calendar processing options for resource mailboxes, which include the Calendar Attendant, resource booking assistant, and calendar configuration. Note that this cmdlet is effective only on resource mailboxes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-CalendarProcessing -Identity <MailboxIdParameter> [-
AddAdditionalResponse <$true | $false>] [-AdditionalResponse <String>] [-
AddNewRequestsTentatively <$true | $false>] [-AddOrganizerToSubject <$true
| $false>] [-AllBookInPolicy <$true | $false>] [-AllowConflicts <$true |
$false>] [-AllowRecurringMeetings <$true | $false>] [-AllRequestInPolicy
<$true | $false>] [-AllRequestOutOfPolicy <$true | $false>] [-
AutomateProcessing <None | AutoUpdate | AutoAccept>] [-BookingWindowInDays
<Int32>] [-BookInPolicy <RecipientIdParameter[]>] [-Confirm
[<SwitchParameter>]] [-ConflictPercentageAllowed <Int32>] [-
DeleteAttachments <$true | $false>] [-DeleteComments <$true | $false>] [-
DeleteNonCalendarItems <$true | $false>] [-DeleteSubject <$true | $false>]
[-DomainController <Fqdn>] [-EnableResponseDetails <$true | $false>] [-
EnforceSchedulingHorizon <$true | $false>] [-ForwardRequestsToDelegates
<$true | $false>] [-IgnoreDefaultScope <SwitchParameter>] [-
MaximumConflictInstances <Int32>] [-MaximumDurationInMinutes <Int32>] [-
OrganizerInfo <$true | $false>] [-ProcessExternalMeetingMessages <$true |
$false>] [-RemoveForwardedMeetingNotifications <$true | $false>] [-
```

```
RemoveOldMeetingMessages <$true | $false>] [-RemovePrivateProperty <$true
| $false>] [-RequestInPolicy <RecipientIdParameter[]>] [-
RequestOutOfPolicy <RecipientIdParameter[]>] [-ResourceDelegates
<RecipientIdParameter[]>] [-ScheduleOnlyDuringWorkHours <$true | $false>]
[-TentativePendingApproval <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example automates the processing of calendar requests to the resource mailbox Conf 212.

```
Set-CalendarProcessing -Identity "Conf 212" -
AutomateProcessing AutoAccept -DeleteComments $true -
AddOrganizerToSubject $true -AllowConflicts $false
```

EXAMPLE 2

This example disables automatic processing for the resource mailbox Car 53.

```
Set-CalendarProcessing -Identity "Car 53" -
AutomateProcessing None
```

EXAMPLE 3

This example allows the Calendar Attendant to approve in-policy requests from all users.

```
Set-CalendarProcessing -Identity "5th Floor Conference
Room" -AutomateProcessing AutoAccept -AllBookInPolicy $true
```

EXAMPLE 4

This example allows all users to submit in-policy requests, but the request is still subject to approval by a delegate.

```
Set-CalendarProcessing -Identity "5th Floor Conference
Room" -AutomateProcessing AutoAccept -AllRequestInPolicy
$true
```

EXAMPLE 5

This example allows the Calendar Attendant to accept out-of-policy requests from David Pelton. The request is still subject to approval by a delegate.

```
Set-CalendarProcessing -Identity "Room 221" -
AutomateProcessing AutoAccept -RequestOutOfPolicy
DavidPelton@contoso.com
```

EXAMPLE 6

This example allows a list of users to submit in-policy meeting requests to the equipment mailbox for Car 53.

```
Set-CalendarProcessing -Identity "Car 53" -
AutomateProcessing AutoAccept -BookInPolicy
"ayla@contoso.com","tony@contoso.com"
```

EXAMPLE 7

This example rejects meeting requests from any user who isn't a member of the Exchange organization.

```
Set-CalendarProcessing -Identity "Room 221" -
ProcessExternalMeetingMessages $false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar processing" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the resource mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name`

			(DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AddAdditionalResponse	Optional	System.Boolean	The *AddAdditionalResponse* parameter specifies whether additional information would be sent from the resource mailbox when responding to meeting requests. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.

			This parameter is used only on resource mailboxes where the *AutomateProcessing* parameter is set to `AutoAccept`.
AdditionalResponse	Optional	System.String	The *AdditionalResponse* parameter specifies the additional information to be included in responses to meeting requests. This parameter is meaningful only when the *AddAdditionalRepsponse* parameter is set to `$true`.
AddNewRequestsTentatively	Optional	System.Boolean	The *AddNewRequestsTentatively* parameter specifies whether to have the Calendar Attendant put new calendar items tentatively on the calendar. If the *AddNewRequestsTentatively* parameter is set to $false, only existing calendar items are updated by the Calendar Attendant Valid input for this parameter is `$true` or `$false`. The default value

			is `$true`.
AddOrganizerToSubject	Optional	System.Boolean	The *AddOrganizerToSubject* parameter specifies whether the meeting organizer's name is used as the subject of the meeting request. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter is used only on resource mailboxes where the *AutomateProcessing* parameter is set to `AutoAccept`.
AllBookInPolicy	Optional	System.Boolean	The *AllBookInPolicy* parameter specifies whether to automatically approve in-policy requests from all users. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowConflicts	Optional	System.Boolean	The *AllowConflicts* parameter specifies whether to allow conflicting meeting requests. Valid input for

			this parameter is `$true` or `$false`. The default value is `$false`.
AllowRecurringMeetings	Optional	System.Boolean	The *AllowRecurringMeetings* parameter specifies whether to allow recurring meetings. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllRequestInPolicy	Optional	System.Boolean	The *AllRequestInPolicy* parameter specifies whether to allow all users to submit in-policy requests. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. These requests are subject to approval by a resource mailbox delegate unless the *AllBookInPolicy* parameter is set to `$true`.
AllRequestOutOfPolicy	Optional	System.Boolean	The *AllRequestOutOfPolicy* parameter specifies whether to allow all users to submit out-of-policy requests. Valid input for this parameter is `$true` or

			`$false`. The default value is `$false`. Out-of-policy requests are subject to approval by a resource mailbox delegate.
AutomateProcessing	Optional	Microsoft.Exchange.Data.Storage.CalendarProcessingFlags	The *AutomateProcessing* parameter enables or disables calendar processing on the mailbox. This parameter takes the following values: • `None` Both the resource booking attendant and the Calendar Attendant are disabled on the mailbox. • `AutoUpdate` Only the Calendar Attendant processes meeting requests and responses. • `AutoAccept` Both the Calendar Attendant and resource booking attendant are enabled on the mailbox. This means that the Calendar Attendant updates the calendar, and then the resource booking assistant accepts the meeting based upon the policies. The default value on a resource mailbox is `AutoAccept`. The default

			value on a user mailbox is `AutoUpdate`, but you can't change the value on a user mailbox.
BookingWindowInDays	Optional	System.Int32	The *BookingWindowInDays* parameter specifies the maximum number of days in advance that the resource can be reserved. Valid input is an integer from 0 through 1080. The default value is 180 days. The value 0 means today.
BookInPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *BookInPolicy* parameter specifies a comma-separated list of users who are allowed to submit in-policy meeting requests to the resource mailbox. Any in-policy meeting requests from these users are automatically approved. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name`

			Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
ConflictPercentageAllowed	Optional	System.Int32	The *ConflictPercentageAllowed* parameter specifies the maximum percentage of meeting conflicts for new recurring meeting requests. Valid input for this parameter is an integer from 0 through 100. The default value is 0. If a new recurring meeting request conflicts with existing reservations for the resource more than the percentage specified by this parameter, the recurring meeting request is automatically declined. When the value is 0, no conflicts are permitted for new recurring meeting requests.
DeleteAttachments	Optional	System.Boolean	The *DeleteAttachments* parameter specifies whether to remove attachments from all incoming messages. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.

			This parameter is used only on resource mailboxes where the *AutomateProcessing* parameter is set to `AutoAccept`.
DeleteComments	Optional	System.Boolean	The *DeleteComments* parameter specifies whether to remove or keep any text in the message body of incoming meeting requests. Valid input for this parameter is `$true` or `$false`. This parameter is used only on resource mailboxes where the *AutomateProcessing* parameter is set to `AutoAccept`.
DeleteNonCalendarItems	Optional	System.Boolean	The *DeleteNonCalendarItems* parameter specifies whether to remove or keep all non-calendar items received by the resource mailbox. Valid input for this parameter is `$true` or `$false`. The

			default value is `$true`.
DeleteSubject	Optional	System.Boolean	The *DeleteSubject* parameter specifies whether to remove or keep the subject of incoming meeting requests. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter is used only on resource mailboxes where the *AutomateProcessing* parameter is set to `AutoAccept`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnableResponseDetails	Optional	System.Boolean	The *EnableResponseDetails* parameter specifies whether to include the

			reasons for accepting or declining a meeting in the response email message. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, the reasons for accepting or declining a meeting in the response email message are included.
EnforceSchedulingHorizon	Optional	System.Boolean	The *EnforceSchedulingHorizon* parameter controls the behavior of recurring meetings that extend beyond the date specified by the *BookingWindowInDays* parameter. Valid values for this parameter are: • `$true` A recurring meeting request is automatically declined if the meetings start on or before the date specified by the *BookingWindowInDays* parameter, and the meetings extend beyond the specified date. • `$false` A recurring meeting request is

			automatically accepted if the meetings start on or before the date specified by the *BookingWindowInDays* parameter, and the meetings extend beyond the specified date. However, the number of meetings is automatically reduced so meetings won't occur after the specified date. The default value is `$true`.
ForwardRequestsToDelegates	Optional	System.Boolean	The *ForwardRequestsToDelegates* parameter specifies whether to forward incoming meeting requests to the delegates defined for the resource mailbox. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* switch tells the command to ignore the default recipient scope setting for the Exchange Management Shell session, and to use the entire forest as the scope. This allows the command

			to access Active Directory objects that aren't currently available in the default scope. Using the *IgnoreDefaultScope* switch introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
MaximumConflictInstances	Optional	System.Int32	The *MaximumConflictInstances* parameter specifies the maximum number of conflicts for new recurring meeting requests when the *AllowRecurringMeetings* parameter is set to `$true`. Valid input for this parameter is an integer from 0 through `INT32`

			(2147483647). The default value is 0. If a new recurring meeting request conflicts with existing reservations for the resource more than the number of times specified by the *MaximumConflictInstances* parameter value, the recurring meeting request is automatically declined. When the value is 0, no conflicts are permitted for new recurring meeting requests.
MaximumDurationInMinutes	Optional	System.Int32	The *MaximumDurationInMinutes* parameter specifies the maximum duration in minutes for meeting requests. Valid input for this parameter is an integer from 0 through `INT32` (2147483647). The default value is 1440 (24 hours). When the value is set to 0, the maximum duration of a meeting is unlimited. For recurring meetings, the value of this

			parameter applies to the length of an individual meeting instance.
OrganizerInfo	Optional	System.Boolean	The *OrganizerInfo* parameter specifies whether to have mailboxes send organizer information when a meeting request is declined because of conflicts. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, resource mailboxes send organizer information when a meeting request is declined because of conflicts.
ProcessExternalMeetingMessages	Optional	System.Boolean	The *ProcessExternalMeetingMessages* parameter specifies whether to process meeting requests that originate outside the Exchange organization. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.

			By default, meeting requests that originate outside of the organization are rejected.
RemoveForwardedMeetingNotifications	Optional	System.Boolean	The *RemoveForwardedMeetingNotifications* parameter specifies whether forwarded meeting notifications are moved to the Deleted Items folder after they're processed by the Calendar Attendant. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RemoveOldMeetingMessages	Optional	System.Boolean	The *RemoveOldMeetingMessages* parameter specifies whether the Calendar Attendant removes old and redundant updates and responses. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
RemovePrivateProperty	Optional	System.Boolean	The *RemovePrivateProperty* parameter specifies

			whether to clear the private flag for incoming meeting requests. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, the private flag for incoming meeting requests is cleared. To ensure the private flag that was sent by the organizer in the original request remains as specified, set tthis parameter to `$false`.
RequestInPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *RequestInPolicy* parameter specifies a comma-separated list of users who are allowed to submit in-policy meeting requests to the resource mailbox. All in-policy meeting requests from these users are subject to approval by a resource mailbox delegate. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com

			/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
RequestOutOfPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *RequestOutOfPolicy* parameter specifies a comma-separated list of users who are allowed to submit out-of-policy requests. Out-of-policy requests are subject to approval by a

			resource mailbox delegate. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com

ResourceDelegates	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ResourceDelegates* parameter specifies a comma-separated list of users who are resource mailbox delegates. Resource mailbox delegates can approve or reject requests sent to the resource mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/

			ou=AdministrativeGroup/ cn=Recipients/ cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
ScheduleOnlyDuring WorkHours	Optional	System.Boolean	The *ScheduleOnlyDuringWork Hours* parameter specifies whether to allow meetings to be scheduled outside of the working hours that are defined for the resource mailbox. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If set to `$true`, meeting requests for times outside the working hours of the resource mailbox will be rejected. You configure the working hours of the resource mailbox by using the *WorkDays*, *WorkingHoursStartTime*, *WorkingHoursEndTime* and *WorkingHoursTimeZone*

			parameters on the **Set-MailboxCalendarConfiguration** cmdlet.
TentativePendingApproval	Optional	System.Boolean	The *TentativePendingApproval* parameter specifies whether to mark pending requests as tentative on the calendar. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If set to `$false`, pending requests are marked as free.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-InboxRule

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-InboxRule** cmdlet to disable an Inbox rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-InboxRule -Identity <InboxRuleIdParameter> [-
AlwaysDeleteOutlookRulesBlob <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Mailbox <MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the Inbox rule MoveAnnoncements in the mailbox Joe@Contoso.com.

```
Disable-InboxRule -Identity "MoveAnnouncements" -Mailbox
"Joe@Contoso.com"
```

Detailed Description

Important:
When you create, modify, remove, enable, or disable an Inbox rule on Microsoft Exchange Server 2013, any client-side rules created by Microsoft Outlook are removed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Inbox rules" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.InboxRuleIdParameter	The *Identity* parameter specifies the identity of the Inbox rule to be disabled.
AlwaysDeleteOutlookRulesBlob	Optional	System.Management.Automation.SwitchParameter	The *AlwaysDeleteOutlookRulesBlob* parameter suppresses a warning that end users or administrators get if they use Outlook Web App or Windows PowerShell to modify Inbox rules.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt produced if rules created by Outlook exist on the mailbox. When taking an action using Inbox rules on Exchange 2013, any client-side rules are removed.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox to which the Inbox rule belongs.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-InboxRule

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-InboxRule** cmdlet to enable an Inbox rule. Inbox rules are used to process messages in the Inbox based on conditions specified and take actions such as moving a message to a specified folder or deleting a message.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-InboxRule -Identity <InboxRuleIdParameter> [-
AlwaysDeleteOutlookRulesBlob <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Mailbox <MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the Inbox rule Move To Junk Mail for User 1. Values for parameters such as the *Mailbox* or *InboxRule* parameter that contain spaces must be enclosed in quotation marks (").

```
Enable-InboxRule "Move To Junk Mail" -Mailbox "User 1"
```

Detailed Description

Important:
When you create, modify, remove, enable, or disable an Inbox rule on Microsoft Exchange Server 2013, any client-side rules created by Microsoft Outlook are removed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Inbox rules" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.InboxRuleIdParameter	The *Identity* parameter specifies the display name or GUID of the Inbox rule.
AlwaysDeleteOutlookRulesBlob	Optional	System.Management.Automation.SwitchParameter	The *AlwaysDeleteOutlookRulesBlob* parameter suppresses a warning that end users or administrators get if they use Outlook Web App or Windows PowerShell to modify Inbox rules.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt produced if rules created by Outlook exist on the mailbox. When taking an action using Inbox rules on Exchange 2013, any client-side rules are removed.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox where the Inbox rule is located. You can use one of the

			following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-InboxRule

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-InboxRule** cmdlet to view Inbox rule properties. Inbox rules are used to process messages in the Inbox based on conditions specified and take actions such as moving a message to a specified folder or deleting a message.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-InboxRule [-Identity <InboxRuleIdParameter>] [-DescriptionTimeFormat
<String>] [-DescriptionTimeZone <ExTimeZoneValue>] [-DomainController
<Fqdn>] [-IncludeHidden <SwitchParameter>] [-Mailbox <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves all Inbox rules for the mailbox Joe@Contoso.com.

```
Get-InboxRule -Mailbox Joe@Contoso.com
```

EXAMPLE 2

This example retrieves the Inbox rule `ReceivedLastYear` from the mailbox joe@contoso.com on which the *ReceivedBeforeDate* parameter was set when the rule was created. The *DescriptionTimeFormat* and *DescriptionTimeZone* parameters are used in this example to specify formatting of the time and the time zone used in the rule's **Description** property.

```
Get-InboxRule "ReceivedLastYear" -Mailbox joe@contoso.com -
DescriptionTimeFormat "mm/dd/yyyy" -DescriptionTimeZone
"Pacific Standard Time"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Inbox

rules" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DescriptionTimeFormat	Optional	System.String	The *DescriptionTimeFormat* parameter specifies the format in which time values are returned in the rule description. You must use standard time value format settings, for example: *mm/dd/yyyy*, where *mm* is the 2-digit month, *dd* is the 2-digit day, and *yyyy* is the 4-digit year.
DescriptionTimeZone	Optional	Microsoft.Exchange.Data.Storage.Management.ExTimeZoneValue	The *DescriptionTimeZone* parameter specifies the format in which the time zone for time values is returned in the rule description. Use a valid Microsoft Windows time zone name. You can use the Windows PowerShell command-line interface to retrieve time zone names from the registry, for example: `$timezone = Get-ChildItem "HKLM :\Software\Microsoft\Windows NT`

			`\CurrentVersion\Timezones" | For-Each {Get-ItemProperty $_.PSPath}; $timezone | Format-Table pschildname,display -auto`
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.InboxRuleIdParameter	The *Identity* parameter specifies the identity of an Inbox rule.
IncludeHidden	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the mailbox to which the Inbox rule belongs. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN

			• SmtpAddress • Alias

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-InboxRule

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-InboxRule** cmdlet to remove an Inbox rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-InboxRule -Identity <InboxRuleIdParameter> [-
AlwaysDeleteOutlookRulesBlob <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Mailbox <MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Inbox rule ProjectA-MoveToFolderA from the mailbox Joe@Contoso.com.

```
Remove-InboxRule -Mailbox Joe@Contoso.com -Identity
"ProjectA-MoveToFolderA"
```

EXAMPLE 2

This example removes all Inbox rules from the mailbox Joe@Contoso.com.

```
Get-InboxRule -Mailbox "Joe@Contoso.com" | Remove-InboxRule
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Inbox rules" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.InboxRuleIdParameter	The *Identity* parameter specifies the name of the Inbox rule to be removed.
AlwaysDeleteOutlookRulesBlob	Optional	System.Management.Automation.SwitchParameter	The *AlwaysDeleteOutlookRulesBlob* parameter suppresses a warning that end users or administrators get if they use Outlook Web App or Windows PowerShell to modify Inbox rules.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt produced if rules created by Microsoft Office Outlook exist on the mailbox. When taking an action using Inbox rules on Microsoft Exchange Server 2013, any client-side rules are removed.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the mailbox to which the Inbox rule belongs. You can use one of the following values: • GUID • Distinguished name

			(DN) • *Domain\Name* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-InboxRule

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-28*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-InboxRule** cmdlet to create an Inbox rule for a mailbox. Inbox rules are used to process messages in the Inbox based on conditions specified and take actions such as moving a message to a specified folder or deleting a message.

You must have adequate permissions on the mailbox to create an Inbox rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-InboxRule -Name <String> [-ApplyCategory <MultiValuedProperty>] [-
BodyContainsWords <MultiValuedProperty>] [-CopyToFolder
<MailboxFolderIdParameter>] [-DeleteMessage <$true | $false>] [-
ExceptIfBodyContainsWords <MultiValuedProperty>] [-
ExceptIfFlaggedForAction <String>] [-ExceptIfFrom <RecipientIdParameter[]
>] [-ExceptIfFromAddressContainsWords <MultiValuedProperty>] [-
ExceptIfHasAttachment <$true | $false>] [-ExceptIfHasClassification
<MessageClassificationIdParameter[]>] [-ExceptIfHeaderContainsWords
<MultiValuedProperty>] [-ExceptIfMessageTypeMatches <AutomaticReply |
AutomaticForward | Encrypted | Calendaring | CalendaringResponse |
PermissionControlled | Voicemail | Signed | ApprovalRequest | ReadReceipt
| NonDeliveryReport>] [-ExceptIfMyNameInCcBox <$true | $false>] [-
ExceptIfMyNameInToBox <$true | $false>] [-ExceptIfMyNameInToOrCcBox <$true
| $false>] [-ExceptIfMyNameNotInToBox <$true | $false>] [-
ExceptIfReceivedAfterDate <ExDateTime>] [-ExceptIfReceivedBeforeDate

[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example raises the message importance to `High` if the mailbox owner is in the To field. In addition, the message is flagged for action.

```
New-InboxRule "CheckActionRequired" -MyNameInToBox $true -
FlaggedForAction Any -MarkImportance "High"
```

Detailed Description

The **New-InboxRule** cmdlet exposes rule predicates and actions, in addition to the parameters such as a rule name and the mailbox identity, required to create an Inbox rule.

Important:
When you create, modify, remove, enable, or disable an Inbox rule on Microsoft Exchange Server 2013, any client-side rules created by Microsoft Outlook are removed.

Predicate parameters used for conditions, such as *SubjectOrBodyContainsWords*, also have an exception parameter. When conditions specified in an exception are matched, the rule isn't applied to the message. Exception parameters begin with *ExceptIf*. For example, the exception parameter for *SubjectOrBodyContainsWords* is *ExceptIfSubjectOrBodyContainsWords*.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Inbox rules" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
FromMessageId	Required	Microsoft.Exchange.Configuration.Tasks.MailboxStoreObjectIdParameter	The *FromMessageId* parameter specifies a message ID to create an Inbox rule based on the properties of that message. You must specify the Base64-

			encoded StoreObjectId of the message. Valid values include one of the following: • MailboxId\StoreObjectId • StoreObjectId When you create an Inbox rule by specifying the *FromMessageId* parameter, the following properties of that message are used to create the rule: • **Subject** The message subject is added to the **SubjectContainsWords** property of the rule. • **From** The message sender is added to the **From** property of the rule. • **To** and **Cc**recipients Recipients in the To and Cc fields of the message are added to the **SentTo** property of the rule.
Name	Required	System.String	The *Name* parameter specifies a name for the Inbox rule being created.
ValidateOnly	Required	System.Management.Automation.SwitchParameter	The *ValidateOnly* switch tells the cmdlet to evaluate the conditions

			and requirements necessary to perform the operation and then reports whether the operation will succeed or fail. No changes are made when the *ValidateOnly* switch is used.
AlwaysDeleteOutlookRulesBlob	Optional	System.Management.Automation.SwitchParameter	The *AlwaysDeleteOutlookRulesBlob* parameter suppresses a warning that end users or administrators get if they use Outlook Web App or Windows PowerShell to modify Inbox rules.
ApplyCategory	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ApplyCategory* parameter specifies one or more categories to apply to a message.
BodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BodyContainsWords* parameter specifies one or more words or phrases to check the message body for. If phrases contain a space, you must enclose it in quotation marks ("). Use a comma to separate phrases.
Confirm	Optional	System.Management.	The *Confirm* switch can be

		Automation.SwitchParameter	used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
CopyToFolder	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *CopyToFolder* parameter specifies the name of an existing mailbox folder to copy the message to.
DeleteMessage	Optional	System.Boolean	The *DeleteMessage* parameter specifies whether the message is sent to the Deleted Items folder. If set to `$true`, the message is sent to the Deleted Items folder.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
ExceptIfBodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfBodyContainsWords* parameter specifies one or more words or phrases to check the message body for. If the message body contains the specified words or phrases, the Inbox rule action isn't applied.
ExceptIfFlaggedForAction	Optional	System.String	The *ExceptIfFlaggedForAction* parameter specifies one or more message flags for which to check. You can use the following values: • `Any` • `Call` • `DoNotForward` • `FollowUp` • `ForYourInformation` • `Forward` • `NoResponseNecessary` • `Read` • `Reply` • `ReplyToAll` • `Review` If the requested action in the message matches the requested action specified in this parameter, the Inbox rule action isn't applied.
ExceptIfFrom	Optional	Microsoft.Exchange.Configuration.Tasks.Reci	The *ExceptIfFrom* parameter specifies a

		pientIdParameter[]	recipient to check in the From field of the message. If the message sender matches the senders specified in this parameter, the Inbox rule action isn't applied.
ExceptIfFromAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfFromAddressContainsWords* parameter specifies one or more words to check in the sender's address. If the sender's address contains the specified words, the Inbox rule action isn't applied to the message.
ExceptIfFromSubscription	Optional	Microsoft.Exchange.Transport.Sync.Common.Subscription.AggregationSubscriptionIdentity[]	This parameter is available only in the cloud-based service. The *ExceptIfFromSubscription* parameter specifies an exception when a message is received from a POP, IMAP, or Hotmail subscription.
ExceptIfHasAttachment	Optional	System.Boolean	The *ExceptIfHasAttachment* parameter specifies whether the rule should

			apply to messages with attachments. Valid values include `$true` and `$false`. We recommend that you set the value to `$true`. If the *ExceptIfHasAttachment* parameter is set to `$true` and the message has an attachment, the Inbox rule action isn't applied.
ExceptIfHasClassification	Optional	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter[]	The *ExceptIfHasClassification* parameter checks the message for the specified classification name. Use the **Get-MessageClassification** cmdlet to retrieve a list of classifications defined in the organization. If the message classification matches the classification specified in this parameter, the Inbox rule action isn't applied.
ExceptIfHeaderContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfHeaderContainsWords* parameter specifies one or more words to check for in the specified message header.

			If the message header contains the words specified in this parameter, the Inbox rule action isn't applied.
ExceptIfMessageTypeMatches	Optional	Microsoft.Exchange.Data.Storage.InboxRuleMessageType	The *ExceptIfMessageTypeMatches* parameter specifies a message type. You can use the following values: • `AutomaticReply` • `AutomaticForward` • `Encrypted` • `Calendaring` • `CalendaringResponse` • `PermissionControlled` • `Voicemail` • `Signed` • `ApprovalRequest` • `ReadReceipt` • `NonDeliveryReport` If the message type equals one of the preceding values, the Inbox rule action isn't applied.
ExceptIfMyNameInCcBox	Optional	System.Boolean	The *ExceptIfMyNameInCcBox* parameter specifies that the Cc field of messages be checked for the mailbox owner's address. This parameter accepts `$true` or `$false`. If the name of the recipient whose Inbox is being edited is in the Cc

			box, the Inbox rule action isn't applied.
ExceptIfMyNameInToBox	Optional	System.Boolean	The *ExceptIfMyNameInToBox* parameter specifies that the To field of messages be checked for the mailbox owner's address. If the name of the recipient whose Inbox is being edited is in the To box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfMyNameInToOrCcBox	Optional	System.Boolean	The *ExceptIfMyNameInToOrCcBox* parameter specifies that the To or Cc fields of messages be checked for the mailbox owner's address. If the name of the recipient whose Inbox is being edited is in the To or Cc box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfMyNameNotIn	Optional	System.Boolean	The *ExceptIfMyNameNotInToB*

ToBox			*ox* parameter matches messages where the mailbox owner isn't addressed in the To field of the message. If the name of the recipient whose Inbox is being edited is not in the To box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfReceivedAfterDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ExceptIfReceivedAfterDate* parameter specifies to check for messages received after the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and

			time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**. If the message was received after the date specified in this parameter, the Inbox rule action isn't applied.
ExceptIfReceivedBeforeDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ExceptIfReceivedBeforeDate* parameter specifies to check for messages received before the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in

			quotation marks ("), for example, **"10/05/2010 5:00 PM"**. If the message was received before the time specified in this parameter, the Inbox rule action isn't applied.
ExceptIfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfRecipientAddressContainsWords* parameter specifies one or more words to check in the message recipient's address. If the recipient address contains one or more words specified in this parameter, the Inbox rule action isn't applied.
ExceptIfSentOnlyToMe	Optional	System.Boolean	The *ExceptIfSentOnlyToMe* parameter specifies to check for messages where the mailbox owner is the only recipient. This parameter accepts `$true` or `$false`. If the message is only sent to the recipient whose Inbox rule is being edited, the Inbox rule action isn't

			applied.
ExceptIfSentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentTo* parameter specifies to check message recipients for the recipient specified. If the message was sent to the recipient specified in this parameter, the Inbox rule action isn't applied.
ExceptIfSubjectContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfSubjectContainsWords* parameter specifies one or more words or phrases to check in the message subject. If the message subject contains one or more words or phrases specified in this parameter, the Inbox rule action isn't applied.
ExceptIfSubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfSubjectOrBodyContainsWords* parameter specifies one or more words or phrases to check in the message subject or body. If the message subject or body contains one or more of the words or

			phrases specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithImportance	Optional	Microsoft.Exchange.Data.Storage.Importance	The *ExceptIfWithImportance* parameter specifies a message importance level. Valid values include one of the following: • `Low` • `Normal` • `High` If the message importance matches the importance specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithinSizeRangeMaximum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfWithinSizeRangeMaximum* parameter specifies the maximum message size. When using this parameter, you must also specify the minimum message size value using the *ExceptIfWithinSizeRangeMinimum* parameter. If the message size exceeds the maximum value specified in this parameter, the Inbox rule action isn't applied.

ExceptIfWithinSizeRangeMinimum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfWithinSizeRangeMinimum* parameter specifies the minimum message size. When using this parameter, you must also specify a maximum message size value using the *ExceptIfWithinSizeRangeMaximum* parameter. If the message size is smaller than the minimum value specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithSensitivity	Optional	Microsoft.Exchange.Data.Storage.Sensitivity	The *ExceptIfWithSensitivity* parameter specifies a message sensitivity level. You can use the following values: • `Normal` • `Personal` • `Private` • `CompanyConfidential` If the sensitivity matches the sensitivity value specified in this parameter, the Inbox rule action isn't applied.
FlaggedForAction	Optional	System.String	The *FlaggedForAction*

			parameter specifies one or more message flags for which to check. Values include: • `Any` • `Call` • `DoNotForward` • `FollowUp` • `ForYourInformation` • `Forward` • `NoResponseNecessary` • `Read` • `Reply` • `ReplyToAll` • `Review`
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether the command suppresses the confirmation prompt produced if rules created by Microsoft Outlook exist on the mailbox. When taking an action using Inbox rules on Exchange 2013, any client-side rules are removed.
ForwardAsAttachmentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ForwardAsAttachmentTo* parameter specifies a recipient to forward the message to as an attachment.
ForwardTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ForwardTo* parameter specifies a recipient to forward the message to.
From	Optional	Microsoft.Exchange.Co	The *From* parameter

		nfiguration.Tasks.RecipientIdParameter[]	specifies the identity of the sender as a rule condition.
FromAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *FromAddressContainsWords* parameter specifies one or more words to check in the From field of the message.
FromSubscription	Optional	Microsoft.Exchange.Transport.Sync.Common.Subscription.AggregationSubscriptionIdentity[]	This parameter is available only in the cloud-based service. The *FromSubscription* parameter specifies the condition when a message is received from a POP, IMAP, or Hotmail subscription.
HasAttachment	Optional	System.Boolean	The *HasAttachment* parameter specifies whether to check for messages with attachments.
HasClassification	Optional	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter[]	The *HasClassification* parameter checks messages for the specified message classification.
HeaderContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *HeaderContainsWords* parameter specifies one

			or more words to match in the specified message header.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox for which the rule is being created. The following values can be used: • `GUID` • `Distinguished name (DN)` • *Domain\Account* • `User principal name (UPN)` • `LegacyExchangeDN` • `SmtpAddress` • `Alias`
MarkAsRead	Optional	System.Boolean	The *MarkAsRead* parameter specifies whether to mark the message as read. When set to `$true`, the *MarkAsRead* parameter marks the message as read.
MarkImportance	Optional	Microsoft.Exchange.Data.Storage.Importance	The *MarkImportance* parameter specifies that the message importance be marked with one of the following values: • `Low` • `Normal` • `High`
MessageTypeMatches	Optional	Microsoft.Exchange.Data.Storage.InboxRuleM	The *MessageTypeMatches* parameter specifies a message type. You can

		essageType	use the following values: • `AutomaticReply` • `AutomaticForward` • `Encrypted` • `Calendaring` • `CalendaringResponse` • `PermissionControlled` • `Voicemail` • `Signed` • `ApprovalRequest` • `ReadReceipt` • `NonDeliveryReport`
MoveToFolder	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *MoveToFolder* parameter specifies an existing mailbox folder to which the message is copied.
MyNameInCcBox	Optional	System.Boolean	The *MyNameInCcBox* parameter specifies that the mailbox for which the rule is being created should appear in the Cc field of the message. To use this predicate, set the value to `$true`.
MyNameInToBox	Optional	System.Boolean	The *MyNameInToBox* parameter specifies that the mailbox for which the rule is being created should appear in the To field of the message. To use this predicate, set the value to `$true`.
MyNameInToOrCcBox	Optional	System.Boolean	The *MyNameInToOrCcBox* parameter specifies that the mailbox for which the

			rule is being created should appear in the To or Cc fields of the message. To add this condition, set the value to `$true`.
MyNameNotInToBox	Optional	System.Boolean	The *MyNameNotInToBox* parameter checks that the mailbox owner's name isn't in the To box. We recommend that you set the value to `$true` to use this predicate.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Priority	Optional	System.Int32	The *Priority* parameter sets a priority for the Inbox rule.
ReceivedAfterDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ReceivedAfterDate* parameter specifies a date. The rule is applied to messages received after the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/

			yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
ReceivedBeforeDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ReceivedBeforeDate* parameter specifies a date. The rule is applied only to messages received before the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in

			quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
RecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RecipientAddressContainsWords* parameter specifies one or more words to check for in a recipient address.
RedirectTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *RedirectTo* parameter specifies a recipient to redirect the message to.
SendTextMessageNotificationTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SendTextMessageNotificationTo* parameter specifies one or more text message recipients to send a notification to.
SentOnlyToMe	Optional	System.Boolean	The *SentOnlyToMe* parameter specifies whether the mailbox owner is specified as the only recipient. You can use the following values: • `$true` • `$false`
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies the identity of a recipient as a condition.
StopProcessingRules	Optional	System.Boolean	The *StopProcessingRules* parameter specifies that

			Exchange stop processing additional rules if the conditions of this Inbox rule are met.
SubjectContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SubjectContainsWords* parameter specifies one or more keywords to be matched in the subject field of a message.
SubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SubjectOrBodyContainsWords* parameter specifies one or more words to be matched in the message subject or body.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WithImportance	Optional	Microsoft.Exchange.Data.Storage.Importance	The *WithImportance* parameter checks messages with the

			specified importance level. You can use the following values: • `High` • `Normal` • `Low`
WithinSizeRangeMaximum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *WithinSizeRangeMaximum* parameter specifies the maximum message size. When using this parameter, you must also specify a minimum message size value using the *WithinSizeRangeMinimum* parameter.
WithinSizeRangeMinimum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *WithinSizeRangeMinimum* parameter specifies the minimum message size. When using this parameter, you must also specify a maximum message size value using the *WithinSizeRangeMaximum* parameter.
WithSensitivity	Optional	Microsoft.Exchange.Data.Storage.Sensitivity	The *WithSensitivity* parameter specifies a message sensitivity level. Valid values include one of the following: • `Normal`

			• Personal • Private • CompanyConfidential

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-InboxRule

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-28*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-InboxRule** cmdlet to modify an existing Inbox rule. Inbox rules are used to process messages in the Inbox based on conditions specified and take actions such as moving a message to a specified folder or deleting a message.

For information about the parameter sets in the Syntax section below, see Syntax.

Examples

EXAMPLE 1

This example modifies the action of the existing Inbox rule ProjectContoso. The *MarkImportance* parameter is used to mark the message with high importance.

```
Set-InboxRule ProjectContoso -MarkImportance "High"
```

Detailed Description

The **Set-InboxRule** cmdlet exposes rule predicates and actions, in addition to the parameters such as a rule name and the mailbox identity, required to create an Inbox rule.

Important:
When you create, modify, remove, enable, or disable an Inbox rule on Microsoft Exchange Server 2013, some client-side rules including disabled client-side rules and outbound rules that were created by Microsoft Outlook are removed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Inbox rules" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.InboxRuleIdParameter	The *Identity* parameter specifies the name of the Inbox rule to be modified.
AlwaysDeleteOutlookRulesBlob	Optional	System.Management.Automation.SwitchParameter	The *AlwaysDeleteOutlookRulesBlob* parameter suppresses a warning that end users or administrators get if they use Outlook Web App or Windows PowerShell to modify Inbox rules.
ApplyCategory	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ApplyCategory* parameter specifies one or more categories to apply to a message.
BodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BodyContainsWords* parameter specifies one or more words or phrases to check the message body for. If phrases contain a space, you must enclose it in quotation marks ("). Use a comma to separate phrases.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
CopyToFolder	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *CopyToFolder* parameter specifies the name of an existing mailbox folder to copy the message to.
DeleteMessage	Optional	System.Boolean	The *DeleteMessage* parameter specifies whether the message is sent to the Deleted Items folder. If set to `$true`, the *DeleteMessage* parameter specifies that the message is sent to the Deleted Items folder.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in the cloud-based service. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExceptIfBodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ExceptIfBodyContainsWor*

		y	*ds* parameter specifies one or more words or phrases to check the message body for. If the message body contains the specified words or phrases, the Inbox rule action isn't applied.
ExceptIfFlaggedForAction	Optional	System.String	The *ExceptIfFlaggedForAction* parameter specifies one or more message flags to check the message for. Valid values include: • `Any` • `Call` • `DoNotForward` • `FollowUp` • `ForYourInformation` • `Forward` • `NoResponseNecessary` • `Read` • `Reply` • `ReplyToAll` • `Review` If the requested action in the message matches the requested action specified in this parameter, the Inbox rule action isn't applied.
ExceptIfFrom	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfFrom* parameter specifies one or more senders. If the message sender matches the senders specified in

			this parameter, the Inbox rule action isn't applied.
ExceptIfFromAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfFromAddressContainsWords* parameter specifies one or more words to check the sender's address for. If the sender's address contains the specified words, the Inbox rule action isn't applied to the message.
ExceptIfFromSubscription	Optional	Microsoft.Exchange.Transport.Sync.Common.Subscription.AggregationSubscriptionIdentity[]	This parameter is available only in the cloud-based service. The *ExceptIfFromSubscription* parameter specifies an exception when a message is received from a POP, IMAP, or Hotmail subscription.
ExceptIfHasAttachment	Optional	System.Boolean	The *ExceptIfHasAttachment* parameter specifies whether the message has attachments. Valid values include `$true` and `$false`. We recommend you set the value to `$true`. If the message has an

			attachment, the Inbox rule action isn't applied.
ExceptIfHasClassification	Optional	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter[]	The *ExceptIfHasClassification* parameter checks the message for the specified classification name. Use the **Get-MessageClassification** cmdlet to retrieve a list of classifications defined in the organization. If the message classification matches the classification specified in this parameter, the Inbox rule action isn't applied.
ExceptIfHeaderContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfHeaderContainsWords* parameter specifies one or more values for a header. If the message header contains the words specified in this parameter, the Inbox rule action isn't applied.
ExceptIfMessageTypeMatches	Optional	Microsoft.Exchange.Data.Storage.InboxRuleMessageType	The *ExceptIfMessageTypeMatches* parameter specifies a message type. Valid

			values include one of the following: • `AutomaticReply` • `AutomaticForward` • `Encrypted` • `Calendaring` • `CalendaringResponse` • `PermissionControlled` • `Voicemail` • `Signed` • `ApprovalRequest` • `ReadReceipt` • `NonDeliveryReport` If the message type equals one of the preceding values, the Inbox rule action isn't applied.
ExceptIfMyNameInCcBox	Optional	System.Boolean	The *ExceptIfMyNameInCcBox* parameter specifies that the Cc field of messages is checked for the mailbox owner's address. If the name of the recipient whose Inbox is being edited is in the Cc box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfMyNameInToBox	Optional	System.Boolean	The *ExceptIfMyNameInToBox* parameter specifies that the To field of messages is checked for the mailbox owner's address.

			If the name of the recipient whose Inbox is being edited is in the To box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfMyNameInToOrCcBox	Optional	System.Boolean	The *ExceptIfMyNameInToOrCcBox* parameter specifies that the To or Cc field of messages is checked for the mailbox owner's address. If the name of the recipient whose Inbox is being edited is in the To or Cc box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfMyNameNotInToBox	Optional	System.Boolean	The *ExceptIfMyNameNotInToBox* parameter matches messages where the mailbox owner isn't addressed in the To field of the message. If the name of the recipient whose Inbox is being edited isn't in the To

			box, the Inbox rule action isn't applied. This parameter accepts `$true` or `$false`.
ExceptIfReceivedAfterDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ExceptIfReceivedAfterDate* parameter specifies to check for messages received after the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**. If the message was received after the date specified, the Inbox rule

			action isn't applied.
ExceptIfReceivedBeforeDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ExceptIfReceivedBeforeDate* parameter specifies to check for messages received before the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**. If the message was received before the time specified in this parameter, the Inbox rule action isn't applied.

ExceptIfRecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfRecipientAddressContainsWords* parameter specifies one or more words to check in the message recipient's address. If the recipient address contains one or more words specified in this parameter, the Inbox rule action isn't applied.
ExceptIfSentOnlyToMe	Optional	System.Boolean	The *ExceptIfSentOnlyToMe* parameter specifies to check for messages where the mailbox owner is the only recipient. This parameter accepts `$true` or `$false`. If the message is only sent to the recipient whose Inbox rule is being edited, the Inbox rule action isn't applied.
ExceptIfSentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentTo* parameter specifies to check message recipients for the recipient specified. If the message is sent to the recipient specified in this parameter, the Inbox

			rule action isn't applied.
ExceptIfSubjectContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfSubjectContainsWords* parameter specifies one or more words or phrases to check in the message subject. If the message subject contains one or more words or phrases specified in this parameter, the Inbox rule action isn't applied.
ExceptIfSubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptIfSubjectOrBodyContainsWords* parameter specifies one or more words or phrases to check in the message subject or body. If the message subject or body contains one or more of the words or phrases specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithImportance	Optional	Microsoft.Exchange.Data.Storage.Importance	The *ExceptIfWithImportance* parameter checks the message for the specified importance level. Valid

			values include: • High • Normal • Low If the message importance matches the importance specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithinSizeRangeMaximum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfWithinSizeRangeMaximum* parameter specifies a maximum message size. When using this parameter, you must also specify the minimum message size using the *ExceptIfWithinSizeRangeMinimum* parameter. If the message size exceeds the maximum value specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithinSizeRangeMinimum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *ExceptIfWithinSizeRangeMinimum* parameter specifies a minimum message size. When using this parameter, you must also specify the maximum message size using the *ExceptIfWithinSizeRangeM*

			aximum parameter. If the message size is smaller than the minimum value specified in this parameter, the Inbox rule action isn't applied.
ExceptIfWithSensitivity	Optional	Microsoft.Exchange.Data.Storage.Sensitivity	The *ExceptIfWithSensitivity* parameter checks messages for the specified sensitivity level. Valid values include: • `Normal` • `Personal` • `Private` • `CompanyConfidential` If the sensitivity matches the sensitivity value specified in this parameter, the Inbox rule action isn't applied.
FlaggedForAction	Optional	System.String	The *FlaggedForAction* parameter specifies one or more message flags to check the message for. Valid values include: • `Any` • `Call` • `DoNotForward` • `FollowUp` • `ForYourInformation` • `Forward` • `NoResponseNecessary` • `Read` • `Reply` • `ReplyToAll` • `Review`

Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt produced if rules created by Outlook exist on the mailbox. When taking an action using Inbox rules on Exchange 2013, any client-side rules are removed.
ForwardAsAttachmentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ForwardAsAttachmentTo* parameter specifies a recipient to forward the message to as an attachment.
ForwardTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ForwardTo* parameter specifies the identity of a recipient to forward the message to.
From	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *From* parameter specifies the identity of the sender as a rule condition.
FromAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *FromAddressContainsWords* parameter specifies one or more words to check in the From address of the message.

FromSubscription	Optional	Microsoft.Exchange.Transport.Sync.Common.Subscription.AggregationSubscriptionIdentity[]	This parameter is available only in the cloud-based service. The *FromSubscription* parameter specifies the condition when a message is received from a POP, IMAP, or Hotmail, subscription.
HasAttachment	Optional	System.Boolean	The *HasAttachment* parameter specifies whether to check for messages with attachments.
HasClassification	Optional	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter[]	The *HasClassification* parameter checks messages for the specified message classification.
HeaderContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *HeaderContainsWords* parameter specifies one or more words to match in the specified message header.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of the mailbox for which the new rule is being created. You can use the following values: • GUID

			• Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
MarkAsRead	Optional	System.Boolean	The *MarkAsRead* parameter specifies whether to mark the message as read. When set to `$true`, the *MarkAsRead* parameter marks the message as read.
MarkImportance	Optional	Microsoft.Exchange.Data.Storage.Importance	The *MarkImportance* parameter specifies that the message importance be marked with one of the following values: • `Low` • `Normal` • `High`
MessageTypeMatches	Optional	Microsoft.Exchange.Data.Storage.InboxRuleMessageType	The *MessageTypeMatches* parameter specifies a message type to apply the rule to. Valid values include: • `AutomaticReply` • `AutomaticForward` • `Encrypted` • `Calendaring` • `CalendaringResponse` • `PermissionControlled` • `Voicemail` • `Signed` • `ApprovalRequest`

			• `ReadReceipt` • `NonDeliveryReport`
MoveToFolder	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *MoveToFolder* parameter specifies an existing mailbox folder to which the message is copied.
MyNameInCcBox	Optional	System.Boolean	The *MyNameInCcBox* parameter specifies that the mailbox for which the rule is being created should appear in the Cc field of the message. To use this predicate, set the value to `$true`.
MyNameInToBox	Optional	System.Boolean	The *MyNameInToBox* parameter specifies that the mailbox for which the rule is being created should appear in the To field of the message. To use this predicate, set the value to `$true`.
MyNameInToOrCcBox	Optional	System.Boolean	The *MyNameInToOrCcBox* parameter specifies that the mailbox for which the rule is being created should appear in the To or Cc fields of the message. To add this condition, set the value to `$true`.
MyNameNotInToBox	Optional	System.Boolean	The *MyNameNotInToBox*

			parameter specifies that the mailbox for which the rule is being created should not appear in the To field of the message. To use this predicate, set the value to `$true`.
Name	Optional	System.String	The *Name* parameter specifies a name for the Inbox rule.
Priority	Optional	System.Int32	The *Priority* parameter specifies a priority for the Inbox rule.
ReceivedAfterDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ReceivedAfterDate* parameter specifies a date. The rule is applied to messages received after the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If

			you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
ReceivedBeforeDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *ReceivedBeforeDate* parameter specifies a date. The rule is applied only to messages received before the specified date. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
RecipientAddressContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *RecipientAddressContains*

		y	*Words* parameter specifies one or more words to check for in the recipient address.
RedirectTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *RedirectTo* parameter specifies a recipient to redirect the message to.
SendTextMessageNotificationTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SendTextMessageNotificationTo* parameter specifies one or more text message recipients to send a notification to.
SentOnlyToMe	Optional	System.Boolean	The *SentOnlyToMe* parameter specifies whether a message is sent only to the mailbox owner.
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies the identity of a recipient as a condition.
StopProcessingRules	Optional	System.Boolean	The *StopProcessingRules* parameter specifies whether Exchange stops processing additional rules if the conditions of this Inbox rule are met. If set to `$true`, the *StopProcessingRules* parameter instructs

			Exchange to stop processing additional rules if the conditions of this Inbox rule are met.
SubjectContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SubjectContainsWords* parameter specifies one or more keywords to be matched in the subject field of a message.
SubjectOrBodyContainsWords	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SubjectOrBodyContainsWords* parameter specifies one or more words to be matched in the message subject or body.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WithImportance	Optional	Microsoft.Exchange.Data.Storage.Importance	The *WithImportance* parameter specifies that messages with the

			specified importance level are checked. Valid values include: • `High` • `Normal` • `Low`
WithinSizeRangeMaximum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *WithinSizeRangeMaximum* parameter specifies the maximum message size. When using this parameter, you must also specify a minimum message size value using the *WithinSizeRangeMinimum* parameter.
WithinSizeRangeMinimum	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *WithinSizeRangeMinimum* parameter specifies the minimum message size. When using this parameter, you must also specify a maximum message size value using the *WithinSizeRangeMaximum* parameter.
WithSensitivity	Optional	Microsoft.Exchange.Data.Storage.Sensitivity	The *WithSensitivity* parameter specifies a message sensitivity level. Valid values include one of the following: • `Normal`

			• Personal • Private • CompanyConfidential

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Connect-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Connect-Mailbox** cmdlet to connect a disconnected mailbox to an Active Directory user object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Connect-Mailbox [-ActiveSyncMailboxPolicy <MailboxPolicyIdParameter>] [-
AddressBookPolicy <AddressBookMailboxPolicyIdParameter>] [-Alias <String>]
[-AllowLegacyDNMismatch <SwitchParameter>] [-Archive <SwitchParameter>] [-
ManagedFolderMailboxPolicy <MailboxPolicyIdParameter>] [-
ManagedFolderMailboxPolicyAllowed <SwitchParameter>] [-RetentionPolicy
<MailboxPolicyIdParameter>] [-User <UserIdParameter>] <COMMON PARAMETERS>

Connect-Mailbox -ValidateOnly <SwitchParameter> <COMMON PARAMETERS>

Connect-Mailbox -Shared <SwitchParameter> [-ActiveSyncMailboxPolicy
<MailboxPolicyIdParameter>] [-Alias <String>] [-ManagedFolderMailboxPolicy
<MailboxPolicyIdParameter>] [-ManagedFolderMailboxPolicyAllowed
<SwitchParameter>] [-RetentionPolicy <MailboxPolicyIdParameter>] [-User
<UserIdParameter>] <COMMON PARAMETERS>

Connect-Mailbox -Room <SwitchParameter> [-ActiveSyncMailboxPolicy
<MailboxPolicyIdParameter>] [-Alias <String>] [-ManagedFolderMailboxPolicy
<MailboxPolicyIdParameter>] [-ManagedFolderMailboxPolicyAllowed
<SwitchParameter>] [-RetentionPolicy <MailboxPolicyIdParameter>] [-User
<UserIdParameter>] <COMMON PARAMETERS>

Connect-Mailbox -Equipment <SwitchParameter> [-ActiveSyncMailboxPolicy
<MailboxPolicyIdParameter>] [-Alias <String>] [-ManagedFolderMailboxPolicy
<MailboxPolicyIdParameter>] [-ManagedFolderMailboxPolicyAllowed
```

```
<SwitchParameter>] [-RetentionPolicy <MailboxPolicyIdParameter>] [-User
<UserIdParameter>] <COMMON PARAMETERS>

Connect-Mailbox -LinkedDomainController <Fqdn> -LinkedMasterAccount
<UserIdParameter> [-ActiveSyncMailboxPolicy <MailboxPolicyIdParameter>] [-
Alias <String>] [-LinkedCredential <PSCredential>] [-
ManagedFolderMailboxPolicy <MailboxPolicyIdParameter>] [-
ManagedFolderMailboxPolicyAllowed <SwitchParameter>] [-RetentionPolicy
<MailboxPolicyIdParameter>] [-User <UserIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Database <DatabaseIdParameter> -Identity
<StoreMailboxIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Force <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example connects John Evans' (john@contoso.com) disconnected mailbox. The example doesn't specify a user object to connect the mailbox to, so the command attempts to find a uniquely matched user object to connect the mailbox to.

```
Connect-Mailbox -Database "Mailbox Database" -Identity
"John Evans"
```

EXAMPLE 2

This example connects a linked mailbox.

```
Connect-Mailbox -Identity "John Evans" -Database "MBXDB02"
-LinkedDomainController FabrikamDC01 -LinkedMasterAccount
john@fabrikam.com
```

EXAMPLE 3

This example connects an equipment mailbox.

```
Connect-Mailbox -Identity "CAR001" -Database
"MBXResourceDB" -Equipment -User "CAR001"
```

EXAMPLE 4

This example connects a room mailbox.

```
Connect-Mailbox -Identity "ConfRm212" -Database
"MBXResourceDB" -Room -User "Conference Room 212"
```

Detailed Description

If you link a mailbox to an existing Active Directory user object, that Active Directory user object has full access to the mailbox and all mail in the mailbox. If you use the *User* parameter to specify the Active Directory user account, make sure you specify the correct account. If you don't use the *User* parameter, we recommend that you use the *ValidateOnly* parameter to verify which user account the mailbox is connected to.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Database* parameter specifies the Exchange database that contains the mailbox that you want to connect. You can use the following values: • GUID of the database • Database name
Equipment	Required	System.Management.Automation.SwitchParameter	The *Equipment* switch specifies that the type of resource is equipment, if this mailbox is a resource mailbox. This switch is required only if you're connecting a resource mailbox.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	The *Identity* parameter specifies the mailbox object in the Exchange

			database to connect to an Active Directory user object. This parameter doesn't specify an Active Directory object. You can use the following values: • GUID of the mailbox • Display name • LegacyExchangeDN
LinkedDomainController	Required	Microsoft.Exchange.Data.Fqdn	The *LinkedDomainController* parameter specifies the domain controller in the forest where the user account resides, if this mailbox is a linked mailbox. The domain controller in the forest where the user account resides is used to get security information for the account specified by the *LinkedMasterAccount* parameter. This parameter is required only if you're connecting a linked mailbox.
LinkedMasterAccount	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *LinkedMasterAccount* parameter specifies the master account in the forest where the user account resides, if this

			mailbox is a linked mailbox. The master account is the account to which the mailbox links. The master account grants access to the mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias This parameter is required only if you're connecting a linked mailbox.
Room	Required	System.Management.Automation.SwitchParameter	The *Room* switch specifies that the type of resource is a room, if this mailbox is a resource mailbox. This switch is required only if you're connecting a resource mailbox.
Shared	Required	System.Management.Automation.SwitchParameter	The *Shared* switch specifies that you're creating a shared mailbox. A shared mailbox is a mailbox to which multiple

			users can log on. This mailbox isn't associated with any of the users that can log on. It's associated with a disabled user account. This switch is required only if you're connecting a shared mailbox.
ValidateOnly	Required	System.Management.Automation.SwitchParameter	The *ValidateOnly* switch tells the cmdlet to evaluate the conditions and requirements necessary to perform the operation and then reports whether the operation will succeed or fail. No changes are made when the *ValidateOnly* switch is used.
ActiveSyncMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *ActiveSyncMailboxPolicy* parameter specifies the Microsoft ActiveSync mailbox policy to enable for the mailbox after it's connected.
AddressBookPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.AddressBookMailboxPolicyIdParameter	The *AddressBookPolicy* parameter specifies the Address book policy to apply to this mailbox

			when it's connected.
Alias	Optional	System.String	The *Alias* parameter specifies the alias (mail nickname) for the mailbox after it's connected. The alias can be a combination of characters separated by a period with no intervening spaces. Don't use special characters in the alias.
AllowLegacyDNMismatch	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies whether to connect the archive mailbox. You don't have to specify a value with this switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, administrative input is prompted. If the *Force* switch is provided in the command, but the value is omitted, its default value is `$true`.
LinkedCredential	Optional	System.Management.Automation.PSCredential	The *LinkedCredential* parameter specifies credentials to use to access the domain controller specified by the *LinkedDomainController* parameter. This parameter

			is optional, even if you're enabling a linked mailbox.
ManagedFolderMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *ManagedFolderMailboxPolicy* parameter specifies a managed folder policy object for the mailbox.
ManagedFolderMailboxPolicyAllowed	Optional	System.Management.Automation.SwitchParameter	The *ManagedFolderMailboxPolicyAllowed* switch bypasses the warning that messaging records management (MRM) features aren't supported for email clients using versions of Microsoft Outlook earlier than Office Outlook 2007. When a managed folder mailbox policy is assigned to a mailbox using the *ManagedFolderMailboxPolicy* parameter, the warning appears by default unless the *ManagedFolderMailboxPolicyAllowed* switch is used. **Note:** Outlook 2003 Service Pack 3 clients are supported but are provided limited functionality for MRM.

RetentionPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *RetentionPolicy* parameter specifies the name of a retention policy that you want applied to this mailbox. Retention policies consist of tags that are applied to mailbox folders and mail items to determine the period of time that the items should be retained.
User	Optional	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *User* parameter specifies the user object in Active Directory to which you want to connect the Exchange mailbox object. If you don't specify this parameter, the command uses the **LegacyExchangeDN** and **DisplayName** attributes of the Exchange mailbox object to find a user account that matches the mailbox object. If it can't find a unique match, it doesn't connect the mailbox.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-Mailbox** cmdlet to disable the mailbox of an existing user, InetOrgPerson object, or public folder mailbox and remove that object's Exchange attributes from Active Directory. The user account associated with the mailbox remains in Active Directory, but it's no longer associated with a mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-Mailbox <COMMON PARAMETERS>

Disable-Mailbox [-Archive <SwitchParameter>] <COMMON PARAMETERS>
```

```
Disable-Mailbox [-RemoteArchive <SwitchParameter>] <COMMON PARAMETERS>

Disable-Mailbox [-Arbitration <SwitchParameter>] [-
DisableArbitrationMailboxWithOABsAllowed <SwitchParameter>] [-
DisableLastArbitrationMailboxAllowed <SwitchParameter>] <COMMON
PARAMETERS>

Disable-Mailbox [-PublicFolder <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-IgnoreLegalHold <SwitchParameter>] [-
IncludeSoftDeletedObjects <SwitchParameter>] [-PreserveEmailAddresses
<SwitchParameter>] [-PreventRecordingPreviousDatabase <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the mailbox of user John Woods, whose alias is john, and removes all the mailbox attributes from Active Directory.

```
Disable-Mailbox john@contoso.com
```

EXAMPLE 2

This example disables the remote archive for the mailbox of user John Woods, whose alias is john.

```
Disable-Mailbox -Identity john@contoso.com -RemoteArchive
```

Detailed Description

The **Disable-Mailbox** cmdlet removes the mailbox's Exchange attributes from Active Directory. The mailbox isn't deleted and can be reconnected to its user at a later date by using the **Connect-Mailbox** cmdlet.

The **Disable-Mailbox** cmdlet also performs the clean-up task on the individual mailbox, so the mailbox is disconnected immediately after this task completes.

Under normal circumstances, a mailbox is marked as disconnected immediately after the **Disable-Mailbox** or **Remove-Mailbox** command completes. However, if the mailbox was disabled or removed while the Microsoft Exchange Information Store service was stopped, or if it was disabled or removed by an external means other than Exchange management interfaces, the status of the mailbox object in the Exchange mailbox database won't be marked as disconnected.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient

Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name`

			Example: JPhillips@contoso.com
Arbitration	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies whether to disconnect the archive mailbox from the associated mailbox user.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You

			must include a colon (:) in the syntax.
DisableArbitrationMailboxWithOABsAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *DisableArbitrationMailboxWithOABsAllowed* parameter is used bypass the checks for offline address books (OABs) within the specified arbitration mailbox that is being disabled, and disable the arbitration mailbox even if OABs are present in the mailbox.
DisableLastArbitrationMailboxAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *DisableLastArbitrationMailboxAllowed* switch specifies whether to disable the specified mailbox if it's the last arbitration mailbox in the organization. You don't have to specify a value with this parameter. If you disable the last arbitration

			mailbox in the organization, you can't have user-created distribution groups or moderated recipient functionality.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default

			scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IgnoreLegalHold	Optional	System.Management.Automation.SwitchParameter	The *IgnoreLegalHold* switch ignores the legal hold status of the mailbox and allows you to disable a mailbox that's on legal hold. **⚠Warning:** When you disable a mailbox, the mailbox is disconnected from the user account. After you disable a mailbox, you can't include it in a discovery search. Disconnected mailboxes are permanently deleted from the mailbox database after the deleted mailbox retention period expires. Check with your

			organization's legal or Human Resources department before disabling a mailbox that's on legal hold.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PreserveEmailAddresses	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PreventRecordingPreviousDatabase	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PublicFolder	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *PublicFolder* parameter specifies that the mailbox to disable is a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. You have to include this parameter to disable a public folder mailbox.
RemoteArchive	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013.

			The *RemoteArchive* parameter specifies whether to disconnect the remote archive for this mailbox. A remote archive exists in a cloud-based service. When you use this parameter, the **RemoteRecipientType** property for the mailbox is reset to specify that this mailbox doesn't have a remote archive. You don't need to specify a value with this parameter. When you use this parameter, you can't use the *Archive* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-Mailbox** cmdlet to mailbox-enable an existing user, public folder mailbox, or Active Directory **InetOrgPerson** object.

For information about the parameter sets in the Syntax section below, see Syntax.

Examples

EXAMPLE 1

This example creates a mailbox for the existing user Ayla. The mailbox is created in Database01.

```
Enable-Mailbox -Identity Contoso\Ayla -Database Database01
```

EXAMPLE 2

This example creates a remote archive for the existing user Ayla. The archive is created with the following settings:

- The archive database has the GUID 82025f12-8000-4d5e-8059-c052f9355125.
- The archive domain is archive.contoso.com.

```
Enable-Mailbox -Identity ayla@contoso.com -RemoteArchive -
ArchiveDatabase "82025f12-8000-4d5e-8059-c052f9355125" -
ArchiveDomain "archive.contoso.com"
```

Detailed Description

Mailbox-enabling an existing user or **InetOrgPerson** object creates additional mailbox attributes on the user object in Active Directory. When the user logs on to the mailbox or receives email messages, a mailbox object in the Exchange database is created.

Use the *Identity* parameter to specify the user or **InetOrgPerson** object for whom the mailbox is enabled. Use the *Database* parameter to specify the Exchange database that contains the mailbox.

Important:
When mailbox-enabling an existing user, if an alias isn't specified, Exchange uses the name and converts all non-ASCII characters to question mark (?) characters. In some languages that use nonstandard character sets, the user account may have a non-ASCII value for the name. In this case, when you mailbox-enable the user, the alias is changed to all question mark characters. To avoid this, confirm that the user account has an ASCII name before you create the new mailbox, or make sure you specify a value for the alias.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Arbitration	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
ArchiveDomain	Required	Microsoft.Exchange.Data.SmtpDomain	This parameter is available only in on-premises Exchange 2013. The *ArchiveDomain* parameter specifies the cloud-based domain on which the archive associated with this mailbox exists. For example, if the SMTP email address of the user is tony@contoso.com, the

			SMTP domain could be archive.contoso.com. **Note:** Only use this parameter if the archive is hosted in a cloud-based service.
Discovery	Required	System.Management.Automation.SwitchParameter	The *Discovery* parameter specifies that this mailbox is a Discovery mailbox. Discovery mailboxes are created as target mailboxes for Discovery searches. You don't have to include a value with this parameter. After being created or enabled, a Discovery mailbox can't be converted to another type of mailbox. For more information, see In-Place eDiscovery.
Equipment	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Equipment* parameter specifies that the type of resource is equipment, if this mailbox is a resource mailbox. This parameter is required only if you're enabling a resource

			mailbox.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *Identity* parameter specifies the user or **InetOrgPerson** object that you want to mailbox-enable. You can use one of the following values: • GUID • Distinguished name (DN) • Display name • *Domain\Account* • User principal name (UPN)
LinkedDomainController	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *LinkedDomainController* parameter specifies the domain controller in the forest where the user account resides. The domain controller in this forest is used to get security information for the account specified by the *LinkedMasterAccount* parameter. This parameter is required only if you're creating a linked mailbox. Use the fully qualified

			domain name (FQDN) of the domain controller you want to use as the value for this parameter.
LinkedMasterAccount	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	This parameter is available only in on-premises Exchange 2013. The *LinkedMasterAccount* parameter specifies the master account in the forest where the user account resides. The master account is the account to link the mailbox to. The master account grants access to the mailbox. This parameter is required only if you're creating a linked mailbox. You can use one of the following values: • GUID • DN • *Domain\Account* • UPN • LegacyExchangeDN • SmtpAddress • Alias
LinkedRoom	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013.

			The *LinkedRoom* parameter is used to specify that the mailbox being enabled is a linked resource mailbox. A linked resource mailbox is useful in a scenario where you have an account in an authentication forest and you want it to be directly linked to a resource mailbox in resource forest.
PublicFolder	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *PublicFolder* parameter specifies that the mailbox to enable is a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. This parameter is required if you're enabling a public folder mailbox.
Room	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Room* parameter specifies that the type of

			resource is a room, if this mailbox is a resource mailbox. This parameter is required only if you're enabling a resource mailbox. You don't have to specify a value with this parameter.
Shared	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Shared* parameter specifies that you're creating a shared mailbox. A shared mailbox is a mailbox to which multiple users can log on. This mailbox isn't associated with any of the users that can log on. It's associated with a disabled user account. This parameter is required only if you're creating a shared mailbox.
AccountDisabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ActiveSyncMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013.

			The *ActiveSyncMailboxPolicy* parameter specifies the mailbox policy to enable for the mailbox that you create. If you don't specify this parameter, the default mailbox policy is used.
AddOnSKUCapability	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
AddressBookPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.AddressBookMailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *AddressBookPolicy* parameter specifies the address book policy to apply to this mailbox. For more information about address book policies, see Address book policies.
Alias	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Alias* parameter specifies the email alias of the mailbox that you're enabling. The alias can be a combination of characters separated by a period

			with no intervening spaces. Don't use special characters in the alias.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter specifies that when this mailbox is enabled, an archive will be created.
ArchiveDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArchiveDatabase* parameter specifies the Exchange database that contains the archive associated with this mailbox. You can use the following values: • GUID of the database • Database name
ArchiveGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
ArchiveName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ArchiveName* parameter specifies the name of the archive mailbox. This is the name displayed to users in Microsoft Office Outlook Web App and Microsoft Outlook. The default name is Online Archive - *<Mailbox User's Display*

			Name>.
BypassModerationCheck	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Database	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies which Exchange database contains the new mailbox. You can use one of the following values: • GUID of the database • Database name
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name for the mailbox. The *DisplayName* is the name that appears in the Exchange Administration

			Center.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies whether to suppress warning or confirmation messages. This parameter can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* parameter isn't provided in the command, administrative input is prompted. If the *Force* parameter is provided in the command, but the value is omitted, its default value is `$true`.
HoldForMigration	Optional	System.Management.	This parameter is

		Automation.SwitchParameter	available only in on-premises Exchange 2013. The *HoldForMigration* parameter specifies whether to prevent any client or user, except the Microsoft Exchange Mailbox Replication service (MRS) process, from logging into a public folder mailbox. You must use this parameter when you create the first public folder, which is called the *hierarchy mailbox*, in your organization.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
LinkedCredential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *LinkedCredential* parameter specifies credentials to use to access the domain controller specified by the *LinkedDomainController* parameter. This parameter is optional, even if you're enabling a linked mailbox.

MailboxPlan	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPlanIdParameter	This parameter is reserved for internal Microsoft use.
ManagedFolderMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderMailboxPolicy* parameter specifies the managed folder mailbox policy to enable for the mailbox that you create. If you don't specify this parameter, the default managed folder mailbox policy is used.
ManagedFolderMailboxPolicyAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderMailboxPolicyAllowed* parameter specifies whether to bypass the warning that messaging records management (MRM) features aren't supported for email clients using versions of Outlook earlier than Office Outlook 2007. When a managed folder mailbox

			policy is assigned to a mailbox using the *ManagedFolderMailboxPolicy* parameter, the warning appears by default unless the *ManagedFolderMailboxPolicyAllowed* parameter is used. **Note:** Outlook 2003 Service Pack 3 clients are supported but are provided limited functionality for MRM.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress* parameter specifies the primary SMTP address for the mailbox. By default, the primary SMTP address is generated based on the default email address policy. If you specify a primary SMTP address by using this parameter, the command sets the **EmailAddressPolicyEna**

			bled attribute of the mailbox to `$false`, and the email addresses of this mailbox aren't automatically updated based on email address policies.
RemoteArchive	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoteArchive* parameter specifies that when the mailbox is enabled, a remote archive for this mailbox will be created. A remote archive exists in a cloud-based service. You don't have to specify a value with this parameter. You can't use the *Archive* parameter in conjunction with this parameter.
RetentionPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *RetentionPolicy* parameter specifies the name of a retention policy that you want applied to this mailbox. Retention

			policies consist of tags that are applied to mailbox folders and mail items to determine the period of time that the items should be retained.
RoleAssignmentPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *RoleAssignmentPolicy* parameter specifies the management role assignment policy to assign to the mailbox when it's created or enabled. If you don't include this parameter when you create or enable a mailbox, the default assignment policy is used. If the assignment policy name contains spaces, enclose the name in quotation marks ("). If you don't want to assign an assignment policy when a mailbox is created or enabled, specify a value of `$null`. For more information about assignment policies, see Understanding management role assignment policies.
SKUAssigned	Optional	System.Boolean	This parameter is reserved

			for internal Microsoft use.
SKUCapability	Optional	Microsoft.Exchange.Data.Directory.Capability	This parameter is reserved for internal Microsoft use.
TargetAllMDBs	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
UsageLocation	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-Mailbox** cmdlet to view mailbox objects and attributes, populate property pages, or supply mailbox information to other tasks.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-Mailbox [-Identity <MailboxIdParameter>] <COMMON PARAMETERS>

Get-Mailbox [-MailboxPlan <MailboxPlanIdParameter>] <COMMON PARAMETERS>

Get-Mailbox [-Server <ServerIdParameter>] <COMMON PARAMETERS>

Get-Mailbox [-Database <DatabaseIdParameter>] <COMMON PARAMETERS>

Get-Mailbox [-Anr <String>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Arbitration <SwitchParameter>] [-Archive <SwitchParameter>] [-AuxMailbox
<SwitchParameter>] [-Credential <PSCredential>] [-DomainController <Fqdn>]
[-Filter <String>] [-IgnoreDefaultScope <SwitchParameter>] [-
InactiveMailboxOnly <SwitchParameter>] [-IncludeInactiveMailbox
<SwitchParameter>] [-IncludeSoftDeletedMailbox <SwitchParameter>] [-
Monitoring <SwitchParameter>] [-Organization <OrganizationIdParameter>] [-
OrganizationalUnit <OrganizationalUnitIdParameter>] [-PublicFolder
<SwitchParameter>] [-ReadFromDomainController <SwitchParameter>] [-
RecipientTypeDetails <RecipientTypeDetails[]>] [-RemoteArchive
<SwitchParameter>] [-ResultSize <Unlimited>] [-SoftDeletedMailbox
<SwitchParameter>] [-SortBy <String>] [-UsnForReconciliationSearch
<Int64>]
```

Examples

EXAMPLE 1

This example returns a list of all the mailboxes in your organization.

```
Get-Mailbox -ResultSize unlimited
```

EXAMPLE 2

This example returns a list of all the mailboxes in your organization in the Users OU.

```
Get-Mailbox -OrganizationalUnit Users
```

EXAMPLE 3

This example returns all the mailboxes that resolve from the ambiguous name resolution search on the string "Chr" that are in the domain named DC01. This example returns mailboxes for users such as Chris Ashton, Christian Hess, and Christa Geller.

```
Get-Mailbox -Anr Chr -DomainController DC01
```

EXAMPLE 4

This example returns information about the mailbox named Chris, including archive mailbox information.

```
Get-Mailbox -Identity Chris -Archive
```

EXAMPLE 5

This example returns information about the mailbox ed@contoso.com, including information about his remote archive mailbox.

```
Get-Mailbox -Identity ed@contoso.com -RemoteArchive
```

Detailed Description

The **Get-Mailbox** cmdlet retrieves the attributes and objects for a mailbox. No parameters are required. If the cmdlet is used without a parameter, all mailboxes in the organization are listed.

Note:

To accurately evaluate the current storage quota status using the **Get-Mailbox** cmdlet, you must look at the **UseDatabaseQuotaDefaults** property in addition to the **ProhibitSendQuota**, **ProhibitSendReceiveQuota**, and **IssueWarningQuota** properties. A value of True for the **UseDatabaseQuotaDefaults** property means that the per-mailbox settings are ignored and the mailbox database limits are used. If this property is set to True and the **ProhibitSendQuota**, **ProhibitSendReceiveQuota**, and **IssueWarningQuota** properties are set to unlimited, the mailbox doesn't have unlimited size. Instead, you must reference the mailbox database storage limits to see what the limits for the mailbox are. A value of False for the **UseDatabaseQuotaDefaults** property means that the per-mailbox settings are used.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Arbitration	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing

			approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter specifies whether to return information about the recipient's archive mailbox.
AuxMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.

Database	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies the database from which to get the mailbox. You can use the following values: • GUID of the database • Database name This parameter can't be used with the *Filter* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • Display name • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the

			following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
InactiveMailboxOnly	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *InactiveMailboxOnly* parameter specifies the command to return only inactive mailboxes. An inactive mailbox is a mailbox that has been removed or soft-deleted. An inactive mailbox can be recovered for up to 30 days after it's removed.

			This parameter is available only in the cloud-based service.
IncludeInactiveMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *IncludeInactiveMailbox* parameter specifies the command to return both active and inactive mailboxes. An inactive mailbox is a mailbox that has been removed or soft-deleted. An inactive mailbox can be recovered for up to 30 days after it's removed. This parameter is available only in the cloud-based service.
IncludeSoftDeletedMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
MailboxPlan	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPlanIdParameter	This parameter is available only in the cloud-based service. The *MailboxPlan* parameter specifies the command to return mailboxes associated with

			this mailbox plan. A mailbox plan specifies the permissions and features available to a mailbox user. The mailbox plan name you provide must be included in the service plan for the organization in which this mailbox belongs.
Monitoring	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Monitoring* parameter specifies a list of mailboxes that have a value of `MonitoringMailbox` for the *RecipientTypeDetails* property. Two monitoring mailboxes are automatically created for each mailbox database in your organization: one for monitoring the health of public folders and one for monitoring the health of site mailboxes.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies an organizational unit (OU) and is used to limit the results. If you use this parameter, you only get mailboxes in the container that you specify. You can use either the OU or the domain name. If you use the OU, you must specify the canonical name of the OU.
PublicFolder	Optional	System.Management.Automation.SwitchParameter	The *PublicFolder* parameter specifies that the mailbox is a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. This parameter is required to display information about a public folder mailbox.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information

			is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest and don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.
RecipientTypeDetails	Optional	Microsoft.Exchange.Data.Directory.Recipient.RecipientTypeDetails[]	The *RecipientTypeDetails* parameter specifies the type of recipients returned. Recipient types are divided into recipient types and subtypes. Each recipient type contains all common properties for all subtypes. For example, the type `UserMailbox` represents a user account in Active Directory that has an associated mailbox. Because there are several mailbox types, each

			mailbox type is identified by the *RecipientTypeDetails* parameter. For example, a conference room mailbox has *RecipientTypeDetails* set to `RoomMailbox`, whereas a user mailbox has *RecipientTypeDetails* set to `UserMailbox`. This parameter accepts the following values: • `RoomMailbox` • `EquipmentMailbox` • `LegacyMailbox` • `LinkedMailbox` • `UserMailbox` • `DiscoveryMailbox` • `SharedMailbox`
RemoteArchive	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoteArchive* parameter specifies whether to disconnect the remote archive for this mailbox. A remote archive exists in a cloud-based service. When you use this parameter, you can't use the *Archive* parameter.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum

			number of results to return. If you want to return all mailboxes that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *Server* parameter specifies an individual server and is used to limit the results. If you use this parameter, you only get mailboxes that reside on the server that you specify. Use the common name of the server that you want to specify.
SoftDeletedMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *SoftDeletedMailbox* parameter specifies a list of deleted mailboxes that were deleted within the last 30 days.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results.

			You can sort by only one attribute at a time. You can sort by the following attributes: • Alias • Display name • Name The results are sorted in ascending order.
UsnForReconciliationSearch	Optional	System.Int64	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-Mailbox** cmdlet to create a user in Active Directory and mailbox-enable this new user.

For information about the parameter sets in the Syntax section below, see Syntax.

Examples

EXAMPLE 1

This example creates a user Chris Ashton in Active Directory and creates a mailbox for the user. The mailbox is located on Mailbox Database 1. The password must be reset at the next logon. To set the initial value of the password, this example creates a variable (*$password*), prompts you to enter

a password, and assigns that password to the variable as a **SecureString** object.

```
$password = Read-Host "Enter password" -AsSecureString
New-Mailbox -UserPrincipalName chris@contoso.com -Alias
chris -Database "Mailbox Database 1" -Name ChrisAshton -
OrganizationalUnit Users -Password $password -FirstName
Chris -LastName Ashton -DisplayName "Chris Ashton" -
ResetPasswordOnNextLogon $true
```

EXAMPLE 2

This example creates a user in Active Directory and a resource mailbox for a conference room. The resource mailbox is located in Mailbox Database 1. The password must be reset at the next logon. The Exchange Management Shell prompts for the value of the initial password because it's not specified.

```
New-Mailbox -UserPrincipalName confmbx@contoso.com -Alias
confmbx -Name ConfRoomMailbox -Database "Mailbox Database
1" -OrganizationalUnit Users -Room -
ResetPasswordOnNextLogon $true
```

EXAMPLE 3

This example creates an enabled user account in Active Directory and a room mailbox for a conference room in an on-premises Exchange organization. The *RoomMailboxPassword* parameter specifies the password for the user account.

```
New-Mailbox -UserPrincipalName confroom1010@contoso.com -
Alias confroom1010 -Name "Conference Room 1010" -Room -
EnableRoomMailboxAccount $true -RoomMailboxPassword
(ConvertTo-SecureString -String P@ssw0rd -AsPlainText -
Force)
```

EXAMPLE 4

This example creates the shared mailbox "Sales Department" and grants *Full Access* and *Send on Behalf* permissions for the security group "MarketingSG". Users who are members of the security group will be granted the permissions to the mailbox.

Note:

This example assumes that you've already created a mail-enabled security group named "MarketingSG" by using the **New-DistributionGroup** cmdlet.

```
New-Mailbox -Shared -Name "Sales Department" -DisplayName
```

```
"Sales Department" -Alias Sales
Set-Mailbox -Identity Sales -GrantSendOnBehalfTo
MarketingSG
Add-MailboxPermission -Identity Sales -User MarketingSG -
AccessRights FullAccess -InheritanceType All
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountDisabled	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *AccountDisabled* parameter specifies whether to create the mailbox in a disabled state. You don't have to specify a value with this parameter.
Arbitration	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are executing the command is an arbitration mailbox. Arbitration mailboxes are

			used for managing approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
ArchiveDomain	Required	Microsoft.Exchange.Data.SmtpDomain	This parameter is available only in on-premises Exchange 2013. The *ArchiveDomain* parameter specifies the cloud-based services domain on which the archive associated with this mailbox exists. For example, if the SMTP email address of the user is tony@contoso.com, the SMTP domain could be archive.contoso.com.
Discovery	Required	System.Management.Automation.SwitchParameter	The *Discovery* parameter specifies that this mailbox is a Discovery mailbox. Discovery mailboxes are created as target mailboxes for Discovery searches. After being created or enabled, a Discovery mailbox can't be repurposed or

			converted to another type of mailbox. You don't have to include a value with this parameter. For more information, see In-Place eDiscovery.
EnableRoomMailboxAccount	Required	System.Boolean	Use the *EnableRoomMailboxAccount* parameter and the `$true` value to specify that the corresponding account in Active Directory for the new room mailbox is enabled when the mailbox is created. Both the *Room* and *RoomMailboxPassword* parameters are also required to create a logon-enabled room mailbox. When you create a room mailbox using only the *Room* parameter, the account in Active Directory is logon-disabled, which prevents users from signing in to the mailbox. When you include the *EnableRoomMailboxAcco*

			unt and *RoomMailboxPassword* parameters, the account in Active Directory is logon-enabled, which is required for implementing some scenarios, such as the Lync Room System. In Exchange Online, a logon-enabled room mailbox doesn't require a license.
Equipment	Required	System.Management.Automation.SwitchParameter	The *Equipment* parameter specifies that the type of resource is equipment, if this mailbox is a resource mailbox. This parameter is required only if you're creating a resource mailbox.
FederatedIdentity	Required	System.String	This parameter is available only in the cloud-based service. The *FederatedIdentity* parameter associates an on-premises Active Directory user with a Microsoft Office user.
ImportLiveId	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *ImportLiveId*

			parameter imports an unmanaged Microsoft account (formerly known as a Windows Live ID) into the cloud-based domain. An unmanaged Microsoft account was created in the domain before the domain was enrolled in the cloud-based service. Importing a Microsoft account into the domain lets you save any settings associated with the Microsoft account, like instant messaging contacts. However, the Microsoft account is now subject to the security and privacy policies of the organization.
LinkedDomainController	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *LinkedDomainController* parameter specifies the domain controller in the forest where the user account resides. The domain controller in this forest is used to get

			security information for the account specified by the *LinkedMasterAccount* parameter. This parameter is required only if you're creating a linked mailbox.
LinkedMasterAccount	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *LinkedMasterAccount* parameter specifies the master account in the forest where the user account resides. The master account is the account to link the mailbox to. The master account grants access to the mailbox. This parameter is required only if you're creating a linked mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account`

			Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
LinkedRoom	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *LinkedRoom* parameter is used to specify that the mailbox being created is a linked resource mailbox. A linked resource mailbox is useful in a scenario where you have an account in an authentication forest and you want it to be directly linked to a resource mailbox in resource forest.

MicrosoftOnlineServicesID	Required	Microsoft.Exchange.Data.WindowsLiveId	This parameter is available only in the cloud-based service. The *MicrosoftOnlineServicesID* parameter specifies the user ID for the object. This parameter only applies to objects in the cloud-based service. It isn't available for on-premises deployments.
Name	Required	System.String	The *Name* parameter specifies the user's name. This is the name that appears in Active Directory Users and Computers.
Password	Required	System.Security.SecureString	The *Password* parameter specifies the initial password for the newly created user. This parameter isn't required if you're creating a linked mailbox, resource mailbox, or shared mailbox, because the user account for these types of mailboxes is disabled.
PublicFolder	Required	System.Management.Automation.SwitchPar	The *PublicFolder* parameter specifies that

		ameter	the new mailbox will be a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. This parameter is required to create a public folder mailbox. The first public folder mailbox created in your Exchange organization is called the *primary hierarchy mailbox*. It contains the writeable copy of the hierarchy of public folders for the organization and public folder content. There can be only one writeable copy of the public folder hierarchy in your organization. All other public folder mailboxes are called *secondary public folder mailboxes* and contain a read-only copy of the hierarchy and the content for public folders.
Room	Required	System.Management.	The *Room* parameter

		Automation.SwitchParameter	specifies that the type of resource is a room, if this mailbox is a resource mailbox. This parameter is required only if you're creating a resource mailbox.
Shared	Required	System.Management.Automation.SwitchParameter	The *Shared* parameter specifies that you're creating a shared mailbox. A shared mailbox is a mailbox to which multiple users can log on. This mailbox isn't associated with any of the users that can log on. It's associated with a disabled user account. This parameter is required only if you're creating a shared mailbox.
UseExistingLiveId	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *UseExistingLiveId* parameter uses the specified Microsoft account (formerly known as a Windows Live ID) that already exists in the cloud-based domain. The

			specified Microsoft account can't have a mailbox associated with it.
UserPrincipalName	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *UserPrincipalName* parameter specifies the UPN for this mailbox. This is the logon name for the user. The UPN consists of a user name and a suffix. Typically, the suffix is the domain name where the user account resides.
WindowsLiveID	Required	Microsoft.Exchange.Data.WindowsLiveId	This parameter is available only in the cloud-based service. The *WindowsLiveID* parameter specifies the Microsoft account (formerly known as a Windows Live ID) of the mailbox.
ActiveSyncMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *ActiveSyncMailboxPolicy* parameter specifies the mailbox policy to enable for the mailbox that you create. If you don't specify this parameter, the default

			mailbox policy is used.
AddOnSKUCapability	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
AddressBookPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.AddressBookMailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *AddressBookPolicy* parameter specifies the address book policy to apply to this mailbox. For more information about address book policies, see Address book policies.
Alias	Optional	System.String	The *Alias* parameter specifies the email alias of the user that you're creating. The alias can be a combination of characters separated by a period with no intervening spaces. Don't use special characters in the alias.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage

			the moderation process.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter specifies whether to create an archive mailbox for the specified user. You don't have to specify a value with this parameter.
ArchiveDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArchiveDatabase* parameter specifies the Exchange database that contains the archive associated with this mailbox. You can use the following values: • GUID of the database • Database name
AuxMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
BypassLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Database	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies which Exchange database contains the new user's mailbox. You can use the following values: • GUID of the database • Database name
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name for the new user created with this mailbox. The value of the *DisplayName* parameter is the name that appears in the Exchange Administration Center. The value of the *DisplayName* parameter also appears in Active Directory Users and Computers on the user **Properties General** tab.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EvictLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *EvictLiveId* parameter specifies whether to remove an unmanaged Microsoft account (formerly known as a Windows Live ID) from the cloud-based domain. An unmanaged Microsoft account was created in the domain before the domain was enrolled in the cloud-based service. Evicting a Microsoft account from the domain lets you save any settings associated with the Microsoft account, like instant messaging

			contacts.
ExternalDirectoryObjectId	Optional	System.String	This parameter is reserved for internal Microsoft use.
FirstName	Optional	System.String	The *FirstName* parameter specifies the first name of the user that you create.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies whether to suppress warning or confirmation messages. This parameter can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* parameter isn't provided in the command, administrative input is prompted. If the *Force* parameter is provided in the command, but the value is omitted, its default value is `$true`.
ForestWideDomainControllerAffinityByExecutingUser	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
HoldForMigration	Optional	System.Management.Automation.SwitchParameter	The *HoldForMigration* parameter prevents any client or user, except the Microsoft Exchange

			Mailbox Replication service (MRS) process, from logging into a public folder mailbox. Use this parameter when creating the first public folder mailbox in Exchange 2013 if you plan to migrate legacy public folders from Exchange 2010 or Exchange 2007 to Exchange 2013. **⚠Warning:** Use this parameter only if you plan to migrate legacy public folders to Exchange 2013. If you use this parameter but don't have legacy public folders to migrate, you won't be able to create any public folders.
ImmutableId	Optional	System.String	The *ImmutableId* parameter is used by Outlook Live Directory Sync (OLSync) and specifies a unique and immutable identifier in the form of an SMTP address for an Exchange mailbox that's used for federated delegation when requesting Security Assertion Markup Language (SAML) tokens.

			If federation is configured for this mailbox and you don't set this parameter when you create the mailbox, Exchange will create the value for the immutable ID based upon the mailbox's **ExchangeGUID** and the federated account name space, for example, 7a78e7c8-620e-4d85-99d3-c90d90f29699@mail.contoso.com. You must set the *ImmutableId* parameter if Active Directory Federation Services (AD FS) is deployed to allow single sign-on into off-premises mailboxes and AD FS is configured to use a different attribute than **ExchangeGUID** for sign-on token requests. Both, Exchange and AD FS must request the same token for the same user to ensure proper functionality for a cross-premise Exchange deployment scenario.

Initials	Optional	System.String	The *Initials* parameter specifies the initials of the user that you create.
IsExcludedFromServingHierarchy	Optional	System.Boolean	The *IsExcludedFromServingHierarchy* parameter prevents users from accessing the public folder hierarchy on the specified public folder mailbox. For load-balancing purposes, users are equally distributed across public folder mailboxes by default. When this parameter is set on a public folder mailbox, that mailbox isn't included in this automatic load-balancing and won't be accessed by users to retrieve the public folder hierarchy. However, if an administrator has set the *DefaultPublicFolderMailbox* property on a user mailbox to a specific public folder mailbox, the user will still access the specified public folder mailbox even if the *IsExcludedFromServingHie*

			rarchy parameter is set for that public folder mailbox.
Languages	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Languages* parameter specifies the language preferences for this mailbox, in order of preference. Several Exchange components display information to a mailbox user in the preferred language, if that language is supported. Some of those components include quota messages, non-delivery reports (NDRs), the Outlook Web App user interface, and Unified Messaging (UM) voice prompts. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`

			To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
LastName	Optional	System.String	The *LastName* parameter specifies the last name of the user that you create.
LinkedCredential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *LinkedCredential* parameter specifies credentials to use to access the domain controller specified by the *LinkedDomainController* parameter. This parameter is optional, even if you're enabling a linked mailbox.
MailboxContainerGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
MailboxPlan	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPlanIdParameter	This parameter is available only in the cloud-based service. The *MailboxPlan* parameter specifies the mailbox plan to associate

			with this mailbox. A mailbox plan specifies the permissions and features available to a mailbox user. The mailbox plan name you provide must be included in the service plan of the organization in which this mailbox resides.
MailboxProvisioningConstraint	Optional	Microsoft.Exchange.Data.Directory.MailboxProvisioningConstraint	This parameter is reserved for internal Microsoft use.
MailboxProvisioningPreferences	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ManagedFolderMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderMailboxPolicy* parameter specifies the managed folder mailbox policy to enable for the mailbox that you create.
ManagedFolderMailboxPolicyAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The

			ManagedFolderMailboxPolicyAllowed parameter specifies whether to bypass the warning that messaging records management (MRM) features aren't supported for email clients using versions of Microsoft Outlook earlier than Office Outlook 2007. When a managed folder mailbox policy is assigned to a mailbox using the *ManagedFolderMailboxPolicy* parameter, the warning appears by default unless the *ManagedFolderMailboxPolicyAllowed* parameter is used.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to this mailbox. To designate more than one user, separate the users with commas. This parameter is required if you set the

			ModerationEnabled parameter to `$true`. If you leave this parameter blank and there's a user who's already specified as the manager of this mailbox, the *ModeratedBy* parameter is automatically set to the *ManagedBy* parameter of the mailbox. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the mailbox. The two possible values for this parameter are `$true` or `$false`. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
NetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
Office	Optional	System.String	The *Office* parameter specifies the Microsoft Office attribute for this mailbox.

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the container where the user is created.
OriginalNetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Phone	Optional	System.String	The *Phone* parameter specifies the user's telephone number for this mailbox.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary SMTP address of the mailbox.
QueryBaseDNRestrictionEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RemoteAccountPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.RemoteAccountPolicyIdParameter	This parameter is reserved for internal Microsoft use.
RemoteArchive	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013.

			The *RemoteArchive* parameter specifies whether to disconnect the remote archive for this mailbox. A remote archive exists in a cloud-based service. When you use this parameter, you can't use the *Archive* parameter.
RemotePowerShellEnabled	Optional	System.Boolean	The *RemotePowerShellEnabled* parameter specifies whether the user can use remote PowerShell. Remote PowerShell is required to open the Exchange Management Shell or the Exchange Administration Center. Access to remote PowerShell is required even if you're trying to open the Shell or the EAC on the local server.
RemovedMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.RemovedMailboxIdParameter	This parameter is reserved for internal Microsoft use.
ResetPasswordOnNextLogon	Optional	System.Boolean	The *ResetPasswordOnNextLog*

			on parameter specifies whether the password in the *Password* parameter must be reset the next time the user logs on. If set to `$true`, the *ResetPasswordOnNextLogon* parameter specifies that the password in the *Password* parameter must be reset the next time the user logs on.
ResourceCapacity	Optional	System.Int32	The *ResourceCapacity* parameter specifies capacity, if this mailbox is a resource mailbox. You must specify a non-negative integer.
RetentionPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *RetentionPolicy* parameter specifies the name of a retention policy that you want applied to this mailbox. Retention policies consist of tags that are applied to mailbox folders and mail items to determine the period of time that the

			items should be retained.
RoleAssignmentPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *RoleAssignmentPolicy* parameter specifies the management role assignment policy to assign to the mailbox when it's created or enabled. If you don't include this parameter when you create or enable a mailbox, the default assignment policy is used. If the assignment policy name contains spaces, enclose the name in quotation marks ("). If you don't want to assign an assignment policy when a mailbox is created or enabled, specify a value of `$null`. For more information about assignment policies, see Understanding management role assignment policies.
RoomMailboxPassword	Optional	System.Security.SecureString	Use the *RoomMailboxPassword* parameter to specify a password when using the *EnableRoomMailboxAccount* parameter to create a

			logon-enabled room mailbox. Use the following syntax to specify the password: `-RoomMailboxPassword (ConvertTo-SecureString -String <password> -AsPlainText -Force)`.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies the logon name used to support clients and servers running older versions of the operating system, such as Microsoft Windows NT 4.0, Windows 95, Windows 98, and LAN Manager. This attribute must be less than 20 characters to support older clients. If you don't specify the *SamAccountName* parameter, Active Directory creates a **SAMAccountName** attribute automatically, based on the UPN.
SendModerationNotifi	Optional	Microsoft.Exchange.Da	The

cations		ta.Directory.Recipient.TransportModerationNotificationFlags	*SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated mailbox. You can specify one of the following values: • `Always` • `Internal` • `Never` If you want notifications to be sent to all senders, set this value to `Always`. If you want notifications to be sent only to the senders who are internal to your organization, set this value to `Internal`. To disable all status notifications, set this value to `Never`. **Note:** The sender is always notified if the message is rejected by the moderators, regardless of the value of this parameter. The default value is `Never`.
SharingPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.SharingPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *SharingPolicy*

			parameter specifies the identity of the sharing policy associated with this mailbox.
SKUAssigned	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
SKUCapability	Optional	Microsoft.Exchange.Data.Directory.Capability	This parameter is reserved for internal Microsoft use.
TargetAllMDBs	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ThrottlingPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *ThrottlingPolicy* parameter specifies the identity of the throttling policy that you want to specify for this mailbox.
UsageLocation	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-Mailbox** cmdlet to delete the user account associated with a specific mailbox from Active Directory and to process the associated, disconnected mailbox as directed by the specified parameters.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-Mailbox -Identity <MailboxIdParameter> [-KeepWindowsLiveID
<SwitchParameter>] [-Permanent <$true | $false>] <COMMON PARAMETERS>

Remove-Mailbox -Database <DatabaseIdParameter> -StoreMailboxIdentity
<StoreMailboxIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Arbitration <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-Disconnect <SwitchParameter>] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-ForReconciliation <SwitchParameter>]
[-IgnoreDefaultScope <SwitchParameter>] [-IgnoreLegalHold
<SwitchParameter>] [-PublicFolder <SwitchParameter>] [-
RemoveArbitrationMailboxWithOABsAllowed <SwitchParameter>] [-
RemoveLastArbitrationMailboxAllowed <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disconnects the user John Rodman's (john) mailbox from the user account and removes the mailbox object from Active Directory. The mailbox remains in the Exchange database for the deleted mailbox retention period configured for the mailbox database.

```
Remove-Mailbox -Identity contoso\john
```

EXAMPLE 2

This example disconnects the user John Rodman's (john) mailbox from the user account, removes the mailbox object from Active Directory, and removes the mailbox from the Exchange database.

```
Remove-Mailbox -Identity contoso\john -Permanent $true
```

EXAMPLE 3

This example removes John Rodman's mailbox from the Exchange database, assuming the mailbox has already been disconnected from the user. The example uses the **Get-Mailbox** cmdlet to retrieve the mailbox GUID value using the display name of the disconnected mailbox. This value is needed for the *StoreMailboxIdentity* parameter of the **Remove-Mailbox** cmdlet.

```
$Temp = Get-Mailbox | Where {$_.DisplayName -eq 'John
Rodman'}
Remove-Mailbox -Database Server01\Database01 -
StoreMailboxIdentity $Temp.MailboxGuid
```

Detailed Description

Use the *Identity* parameter alone to disconnect the mailbox from the user and remove the user object from Active Directory. The mailbox object still exists. By default, this mailbox remains in the Exchange database for 30 days, and then is deleted.

Use the *Identity* and *Permanent* parameters to disconnect the mailbox from the user, remove the user object from Active Directory, and remove the mailbox object from the Exchange database. The mailbox object doesn't remain in the Exchange database as a disconnected mailbox.

Use the *Database* and *StoreMailboxIdentity* parameters to remove a mailbox object from the Exchange database. In this case, the mailbox object has already been disconnected from the user. For example, if you run the **Disable-Mailbox** cmdlet, the Exchange mailbox object still exists, but is disconnected from the Active Directory user object. You can use the *Database* and *StoreMailboxIdentity* parameters to remove this disconnected mailbox object.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies the database that contains the mailbox object. You can use one of the following values: • GUID • Database name This parameter must be used in conjunction with the *StoreMailboxIdentity* parameter. The *Database* parameter can't be used with the *Identity* parameter. If you've disconnected a mailbox from its associated user and want to remove the mailbox object from the Exchange store, use the *Database* and *StoreMailboxIdentity* parameters.

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter identifies the mailbox object that you want to remove. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name`

			Example: JPhillips@contoso.com The *Identity* parameter can't be used with the *Database* parameter.
StoreMailboxIdentity	Required	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *StoreMailboxIdentity* parameter specifies the mailbox object to remove. The *StoreMailboxIdentity* parameter is used in conjunction with the *Database* parameter to remove the mailbox object from the Exchange database. If you've disconnected a mailbox from its associated user and want to remove the mailbox object from the Exchange store, use the *Database* and *StoreMailboxIdentity* parameters.
Arbitration	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are

			executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing approval workflow. For example, an arbitration mailbox is used for handling moderated recipients and distribution group membership approval.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Disconnect	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
ForReconciliation	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell

			session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IgnoreLegalHold	Optional	System.Management.Automation.SwitchParameter	The *IgnoreLegalHold* switch ignores the legal hold status of the mail user and allows you to remove the mailbox that's on legal hold. **Caution:** After you remove a mailbox, you can't include it in a discovery search. Depending on the

			command parameters you use, removed mailboxes are either purged immediately or when the deleted mailbox retention period expires. Check with your organization's legal or Human Resources department before disabling a mailbox that's on legal hold.
KeepWindowsLiveID	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *KeepWindowsLiveID* parameter preserves the Microsoft account (formerly known as a Windows Live ID) that's associated with the deleted mailbox.
Permanent	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *Permanent* parameter, when used in conjunction with the *Identity* parameter, specifies whether to disconnect the mailbox from the user, remove the associated user object from Active Directory, and remove the mailbox

			object from the Exchange database. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.
PublicFolder	Optional	System.Management.Automation.SwitchParameter	The *PublicFolder* parameter specifies that the mailbox to remove is a public folder mailbox. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders. You have to include this parameter to remove a public folder mailbox.
RemoveArbitrationMailboxWithOABsAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoveArbitrationMailboxWithOABsAllowed* parameter is used bypass the checks for offline address books (OABs) within the specified arbitration mailbox that is being removed, and remove the arbitration mailbox even if OABs are

			present in the mailbox.
RemoveLastArbitrationMailboxAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoveLastArbitrationMailboxAllowed* switch specifies whether the mailbox that you're trying to use is the last arbitration mailbox in the organization.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Search-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-28*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Search-Mailbox** cmdlet to search a mailbox and copy the results to a specified target mailbox, delete messages from the source mailbox, or both.

```
Search-Mailbox -TargetFolder <String> -TargetMailbox <MailboxIdParameter>
[-DeleteContent <SwitchParameter>] [-LogLevel <Suppress | Basic | Full>]
[-LogOnly <SwitchParameter>] <COMMON PARAMETERS>

Search-Mailbox [-DeleteContent <SwitchParameter>] <COMMON PARAMETERS>

Search-Mailbox -EstimateResultOnly <SwitchParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxOrMailUserIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-DoNotIncludeArchive
<SwitchParameter>] [-Force <SwitchParameter>] [-IncludeUnsearchableItems
<SwitchParameter>] [-SearchDumpster <SwitchParameter>] [-
SearchDumpsterOnly <SwitchParameter>] [-SearchQuery <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example searches the mailbox of Joe Healy and copies the search results to the DiscoveryMailbox in the folder JoeHealy-ProjectHamilton.

```
Search-Mailbox -Identity "Joe Healy" -SearchQuery
"Subject:Project Hamilton" -TargetMailbox
"DiscoveryMailbox" -TargetFolder "JoeHealy-ProjectHamilton"
-LogLevel Full
```

EXAMPLE 2

This example searches April Stewart's mailbox for messages that contain the phrase "Your bank statement" in the subject and logs the result in the SearchAndDeleteLog folder in the administrator's mailbox. Messages aren't copied to the target mailbox.

```
Search-Mailbox -Identity "April Stewart" -SearchQuery
'Subject:"Your bank statement"' -TargetMailbox
"administrator" -TargetFolder "SearchAndDeleteLog" -LogOnly
-LogLevel Full
```

EXAMPLE 3

This example searches April Stewart's mailbox for messages that contain the phrase "Your bank statement" in the subject and deletes the messages from the source mailbox.

```
Search-Mailbox -Identity "April Stewart" -SearchQuery
'Subject:"Your bank statement"' -DeleteContent
```

EXAMPLE 4

This example searches all mailboxes in your organization for messages that contain the words "election", "candidate", or "vote". The search results are copied to the Discovery Search Mailbox in the folder AllMailboxes-Election.

```
Get-Mailbox | Search-Mailbox -SearchQuery 'election OR
candidate OR vote' -TargetMailbox "Discovery Search
Mailbox" -TargetFolder "AllMailboxes-Election" -LogLevel
Full
```

Detailed Description

You can use the **Search-Mailbox** cmdlet to search messages in a specified mailbox and perform any of the following tasks:

- Copy messages to a specified target mailbox.
- Delete messages from the source mailbox.
- Copy messages from the source mailbox and delete them from the target mailbox.
- Perform single item recovery to recover items from a user's Recoverable Items folder.
- Clean up the Recoverable Items folder for a mailbox when it has reached the Recoverable Items hard quota.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" and "Delete mailbox content" entries in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
EstimateResultOnly	Required	System.Management.Automation.SwitchParameter	The *EstimateResultOnly* switch specifies that only an estimate of the total number and size of messages returned by the search be provided. Messages aren't copied to the target mailbox. You can't use this switch with the *TargetMailbox* parameter.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Identity* parameter specifies the identity of the mailbox to search. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2

			• `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
TargetFolder	Required	System.String	The *TargetFolder* parameter specifies a folder name in which search results are saved in the target mailbox. The folder is created in the target mailbox upon execution.
TargetMailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *TargetMailbox* parameter specifies the identity of the destination mailbox where search results are copied. You can use the following values: • Alias • Display name • *Domain\Account* • SMTP address • DN

			• Object GUID • UPN • LegacyExchangeDN When you specify a value for the *TargetMailbox* parameter, you must also specify the *TargetFolder* parameter. You can't use this parameter with the *EstimateResultOnly* switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeleteContent	Optional	System.Management.Automation.SwitchParameter	The *DeleteContent* switch specifies that the messages returned by the search be permanently deleted from the source mailbox. When used with the *TargetMailbox* parameter, messages are copied to the target mailbox and removed from the source mailbox.

			If you set the logging level for the search to `Basic` or `Full`, you must specify a target mailbox and a target folder to place the log in. To delete messages from the source mailbox without copying them to the target mailbox, don't specify the *TargetMailbox*, *TargetFolder*, and *LogLevel* parameters. **Important:** You need to be assigned the Mailbox Import Export management role to use this switch. By default, this role isn't assigned to any role group. Typically, you assign a role to a built-in or custom role group. Or you can assign a role to a user, or a universal security group. Before you use the *DeleteContent* switch to delete content, we recommend that you test search parameters by using the *LogOnly* parameter, as shown in Example 2.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DoNotIncludeArchive	Optional	System.Management.Automation.SwitchParameter	The *DoNotIncludeArchive* switch specifies that the user's archive mailbox shouldn't be included in the search. You don't need to specify a value for this switch.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch overrides the confirmation prompt displayed when your use the *DeleteContent* switch to permanently delete messages.
IncludeUnsearchableItems	Optional	System.Management.Automation.SwitchParameter	The *IncludeUnsearchableItems* switch specifies whether to include items that couldn't be indexed by Exchange Search. When set to `$true`, the *IncludeUnsearchableItems* switch specifies that items that couldn't be indexed by Exchange Search should be included in the

			search results.
LogLevel	Optional	Microsoft.Exchange.Data.Storage.Infoworker.MailboxSearch.LoggingLevel	The *LogLevel* parameter specifies the logging level for the search. It can have one of the following values: • `Suppress` No logs are kept. • `Basic` Basic information about the query and who ran it is kept. • `Full` In addition to the information kept by the `Basic` log level, the `Full` log level adds a complete list of search results. The default log level is `Basic`.
LogOnly	Optional	System.Management.Automation.SwitchParameter	The *LogOnly* switch specifies that a search be performed and only a log be generated. Messages returned by the search aren't copied to the target mailbox. The logging level is specified by using the *LogLevel* parameter.
SearchDumpster	Optional	System.Management.Automation.SwitchParameter	The *SearchDumpster* parameter specifies whether to search the Recoverable Items folder, which is the storage

			location in which items deleted from the Deleted Items folder or hard-deleted items are stored until they're purged from the mailbox database. By default, the Recoverable Items folder is always searched. To exclude the folder from the search, set the *SearchDumpster* switch to `$false`, for example,- `SearchDumpster:$false`
SearchDumpsterOnly	Optional	System.Management.Automation.SwitchParameter	The *SearchDumpsterOnly* switch specifies that only the Recoverable Items folder of the specified mailbox be searched. You can also use this switch with the *DeleteContent* switch to delete messages from the Recoverable Items folder and reduce the size of the folder.
SearchQuery	Optional	System.String	The *SearchQuery* parameter specifies a search string or a query formatted using Keyword Query Language (KQL). For more details about KQL, see Keyword Query Language syntax

			reference. If this parameter is empty, all messages are returned.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-Mailbox

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-08-21*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-Mailbox** cmdlet to modify the settings of an existing mailbox. You can use this cmdlet for one mailbox at a time. To perform bulk management, you can pipeline the output of various **Get-** cmdlets (for example, the **Get-Mailbox** or **Get-User** cmdlets) and configure several mailboxes in a single-line command. You can also use the **Set-Mailbox** cmdlet in scripts.

For information about the parameter sets in the Syntax section below, see Syntax.

```

Examples

EXAMPLE 1

This example delivers John Woods's email messages to John's mailbox and also forwards them to Manuel Oliveira's (manuel@contoso.com) mailbox.

```
Set-Mailbox -Identity John -DeliverToMailboxAndForward
$true -ForwardingSMTPAddress manuel@contoso.com
```

EXAMPLE 2

This example uses the **Get-Mailbox** cmdlet to find all the mailboxes in the Marketing organizational unit, and then uses the **Set-Mailbox** cmdlet to configure these mailboxes. The custom warning, prohibit send, and prohibit send and receive limits are set to 200 megabytes (MB), 250 MB, and 280 MB respectively, and the mailbox database's default limits are ignored. This command can be used to configure a specific set of mailboxes to have larger or smaller limits than other mailboxes in the organization.

```
Get-Mailbox -OrganizationalUnit "Marketing" | Set-Mailbox -
IssueWarningQuota 209715200 -ProhibitSendQuota 262144000 -
ProhibitSendReceiveQuota 293601280 -
UseDatabaseQuotaDefaults $false
```

EXAMPLE 3

This example uses the **Get-User** command to find all users in the Customer Service department, and then uses the **Set-Mailbox** command to change the maximum message size for sending messages to 2 MB.

```
Get-User -Filter "Department -eq 'Customer Service'" | Set-
Mailbox -MaxSendSize 2097152
```

EXAMPLE 4

This example sets the MailTip translation in French and Chinese.

```
Set-Mailbox John@contoso.com -MailTipTranslations ("FR:
C'est la langue française", "CHT: 這是漢語語言")
```

EXAMPLE 5

This example resets the password for Florence Flipo's mailbox. The next time she signs in to her mailbox, she'll have to reset the new password.

```
Set-Mailbox florencef -Password (ConvertTo-SecureString -
String 'P@$$w0rd1' -AsPlainText -Force) -OldPassword
(ConvertTo-SecureString -String 'Pa$$word1' -AsPlainText -
Force) -ResetPasswordOnNextLogon $true
```

EXAMPLE 6

This example removes the message tracking organization capability from the arbitration mailbox named SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c} and assigns it to an arbitration mailbox named SystemMailbox{1f05a927-b864-48a7-984d-95b1adfbfe2d}.

```
Set-Mailbox -Arbitration -Identity "SystemMailbox{bb558c35-
97f1-4cb9-8ff7-d53741dc928c}" -MessageTracking $false

Set-Mailbox -Arbitration -Identity "SystemMailbox{1f05a927-
b864-48a7-984d-95b1adfbfe2d}" -MessageTracking $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AddAggregatedAccount	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
AggregatedMailboxGuid	Required	System.Guid	This parameter is reserved for internal Microsoft use.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. This parameter accepts the following values: • `Alias`

			Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
RemoveAggregatedAccount	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
AcceptMessagesOnlyF	Optional	Microsoft.Exchange.Da	The

rom		ta.MultiValuedProperty	*AcceptMessagesOnlyFrom* parameter specifies the mailbox users, mail users, and mail contacts that can send email messages to this mailbox. You can also specify Exchange as a valid recipient for this parameter. If you configure a mailbox to accept messages only from the Exchange recipient, the mailbox receives only system-generated messages. You can use any of the following values for the valid senders: • DN • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address By default, this parameter is blank, which enables the mailbox to accept messages from all senders.

			To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this mailbox. You can use any of the following values for the allowed distribution groups: • DN • Canonical name

			• GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address. By default, this parameter is blank, which enables the mailbox to accept messages from all senders. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
AcceptMessagesOnlyFromSendersOrMembe	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *AcceptMessagesOnlyFrom*

rs		y	*SendersOrMembers* parameter specifies the recipients who can send email messages to this mailbox. You can specify users, contacts, or distribution groups. If you specify a distribution group, messages are accepted from all recipients that are members of that distribution group. You can also specify Exchange as a valid recipient for this parameter. If you configure a distribution group to accept messages only from the Exchange recipient, the distribution group only receives system-generated messages. You can use any of the following values for the valid senders: • DN • Canonical name • GUID • Name • Display name • Alias • Exchange DN

			• Primary SMTP email address By default, the value of this parameter is blank, which enables the distribution group to accept messages from all senders. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
AddOnSKUCapability	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
AddressBookPolicy	Optional	Microsoft.Exchange.Co	The *AddressBookPolicy*

		nfiguration.Tasks.AddressBookMailboxPolicyIdParameter	parameter specifies the address book policy that applies to this mailbox. For more information about address book policies, see Address book policies.
Alias	Optional	System.String	The *Alias* parameter specifies the alias (mail nickname) of the user. The alias can be a combination of characters separated by a period with no intervening spaces. Don't use special characters in the alias.
AntispamBypassEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *AntispamBypassEnabled* parameter specifies whether to skip anti-spam processing on this mailbox. The two possible values for this parameter are `$true` or `$false`.
ApplyMandatoryProperties	Optional	System.Management.Automation.SwitchParameter	The *ApplyMandatoryProperties* parameter specifies whether to modify the

			mandatory properties of a mailbox. Creating a mailbox through the Microsoft Exchange extensions to the Active Directory Users and Computers console isn't supported. If a mailbox is created with this tool, it's identified as a legacy mailbox, even though it resides on a server running Microsoft Exchange. This parameter modifies the mandatory properties of a mailbox in this state to correct the problem and remove the legacyMailbox tag from the mailbox.
Arbitration	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Arbitration* parameter specifies that the mailbox for which you are executing the command is an arbitration mailbox. Arbitration mailboxes are used for managing approval workflow. For example, an arbitration

			mailbox is used for handling moderated recipients and distribution group membership approval.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process.
ArchiveDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArchiveDatabase* parameter specifies the Exchange database that contains the archive associated with this mailbox. You can use the following values: • GUID of the database • Database name
ArchiveDomain	Optional	Microsoft.Exchange.Data.SmtpDomain	This parameter is available only in on-premises Exchange 2013. The *ArchiveDomain* parameter specifies the cloud-based service domain on which the

			archive associated with this mailbox exists. For example, if the SMTP email address of the user is tony@mail.contoso.com, the SMTP domain could be hosted.contoso.com.
ArchiveName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ArchiveName* parameter specifies the name of the archive mailbox. This is the name displayed to users in Microsoft Office Outlook Web App and Microsoft Outlook. The default name is "Online Archive - *<Mailbox User's Display Name>*".
ArchiveQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *ArchiveQuota* parameter specifies the archive mailbox size at which messages will no longer be accepted. The value must be greater than the value of the *ArchiveWarningQuota* parameter. The valid input range for either

			parameter is from 1 through 9223372036854775807 bytes. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.
ArchiveStatus	Optional	Microsoft.Exchange.Data.Directory.Recipient.ArchiveStatusFlags	This parameter is reserved for internal Microsoft use.
ArchiveWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *ArchiveWarningQuota* parameter specifies the archive mailbox size at which a warning message is sent to the user. The value must be less than the value of the *ArchiveQuota* parameter. The valid input range for either parameter is from 1 through

			9223372036854775807 bytes. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes.
AuditAdmin	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AuditAdmin* parameter specifies the operations to log for administrators. Valid values include: • `None` • `Update` • `Copy` • `Move` • `MoveToDeletedItems` • `SoftDelete` • `HardDelete` • `FolderBind` • `SendAs` • `SendOnBehalf` • `MessageBind` By default, the `Update`, `Move`, `MoveToDeletedItems`, `SoftDelete`, `HardDelete`, `FolderBind`, `SendAs`, and `SendOnBehalf` actions performed by administrators are logged. To enter multiple values and overwrite any existing

			entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** The *AuditEnabled* parameter must be set to `$true` to enable logging.
AuditDelegate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AuditDelegate* parameter specifies the operations to log for delegate users. Valid values include: • `None` • `Update` • `Move` • `MoveToDeletedItems` • `SoftDelete` • `HardDelete` • `FolderBind` • `SendAs` • `SendOnBehalf` By default, the `Update`, `SoftDelete`, `HardDelete`,

			and `SendAs` actions performed by delegates are logged. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** The *AuditEnabled* parameter must be set to `$true` to enable logging.
AuditEnabled	Optional	System.Boolean	The *AuditEnabled* parameter specifies whether to enable or disable mailbox audit logging. If auditing is enabled, actions specified in the *AuditAdmin*,

			AuditDelegate, and *AuditOwner* parameters are logged. Valid values include: • `$true` Mailbox audit logging is enabled. • `$false` Mailbox audit logging is disabled. The default value is `$false`.
AuditLogAgeLimit	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AuditLogAgeLimit* parameter specifies the period for which audit logs for a mailbox are retained. Logs older than the specified period are removed. The default value is 90 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 10 days for this parameter, use 10.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of this parameter to 00:00:00 prevents the automatic

			removal of server statistics log files.
AuditOwner	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *AuditOwner* parameter specifies the operations to log for mailbox owners. Valid values include: • `None` • `Update` • `Move` • `MoveToDeletedItems` • `SoftDelete` • `HardDelete` By default, mailbox access by the owner isn't logged. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax:

			`@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. **Note:** The *AuditEnabled* parameter must be set to `$true` to enable logging.
BypassLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
BypassModerationFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassModerationFromSendersOrMembers* parameter specifies the recipients whose messages bypass moderation when sending to this mailbox. You can use any of the following values: • DN • Canonical name • GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address. By default, this parameter is blank, which ensures that all messages are moderated when this mailbox is configured for

			moderation. Senders designated as moderators for this mailbox are never moderated. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
CalendarLoggingQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *CalendarLoggingQuota* parameter specifies the quota in the Recoverable

			Items folder that's used to store logs generated when changes are made to a calendar item. When the mailbox exceeds this quota, calendar logging is disabled until the Messaging records management feature removes older calendar logs to free more space. The default quota size is 6 GB.
CalendarRepairDisabled	Optional	System.Boolean	The *CalendarRepairDisabled* parameter specifies that this mailbox won't have its calendar items repaired by the Calendar Repair Assistant. The two possible values for this parameter are `$true` or `$false`. The default is `$false`.
CalendarVersionStoreDisabled	Optional	System.Boolean	The *CalendarVersionStoreDisabled* parameter specifies that calendar changes in a user's mailbox aren't logged. The two possible values for this parameter are `$true` or `$false`. The

			default value is `$false`. By default, all changes to a calendar item are recorded in the mailbox of a user to keep older versions of meeting items.
ClientExtensions	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *ClientExtensions* parameter specifies whether the organization-wide client extensions (also called *Apps for Outlook*) will be installed in the specified arbitration mailbox. Only one arbitration mailbox (also called the *organization mailbox*) in the organization can be configured to store client extensions. The two possible values for this parameter are `$true` or `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateDTMFMap	Optional	System.Boolean	The *CreateDTMFMap* parameter specifies that a dual tone multi-frequency (DTMF) map be created for the user.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.

CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify

			custom attributes. You can use these attributes to store additional information.
CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional

			information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
Database	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies the database that contains the mailbox object. You can use one of the following values: • GUID

			• Database name
DefaultPublicFolderMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *DefaultPublicFolderMailbox* parameter assigns a specific public folder mailbox to the user. By default, the public folder mailbox used by a user is automatically selected by an algorithm that load-balances users across all public folder mailboxes.
DeliverToMailboxAndForward	Optional	System.Boolean	The *DeliverToMailboxAndForward* parameter specifies whether messages sent to this mailbox are forwarded to another address. If the *DeliverToMailboxAndForward* parameter is set to `$true`, messages are delivered to the mailbox and to the forwarding address. If set to `$false`, messages are delivered only to the forwarding address.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the

			display name for the user account associated with this mailbox. The display name is used by Microsoft Outlook.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DowngradeHighPriorityMessagesEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *DowngradeHighPriorityMessagesEnabled* parameter specifies whether to prevent the mailbox from sending high priority messages to an X.400 mail system. If this parameter is set to `$true` and the mailbox sends a high priority message destined to an

			X.400 mail system, the message priority is changed to normal priority.
DumpsterMessagesPerFolderCountReceiveQuota	Optional	System.Int32	The *DumpsterMessagesPerFolderCountReceiveQuota* parameter specifies the maximum number of messages that can be contained in each folder in the Recoverable Items folder (called *the dumpster* in previous versions of Exchange). When a folder exceeds this limit, it can't store new messages. For example, if the Deletions folder in the Recoverable Items folder has exceeded the message count limit and the mailbox owner attempts to permanently delete items from their mailbox, the deletion will fail.
DumpsterMessagesPerFolderCountWarningQuota	Optional	System.Int32	The *DumpsterMessagesPerFolderCountWarningQuota* parameters specifies the number of messages that

			each folder in the Recoverable Items folder (called *the dumpster* in previous versions of Exchange) can hold before Exchange sends a warning message to the mailbox owner and logs an event to the application event log. When this quota is reached, warning messages and logged events occur once a day.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	The *EmailAddresses* parameter specifies all the proxy addresses of the mailbox. It includes the primary SMTP address as one of the proxy addresses. If you use this parameter, you can't use the *PrimarySmtpAddress* parameter. **Important:** Exchange doesn't validate custom addresses for proper formatting. You must ensure that the custom address you specify complies with the format requirements for that address type. Because X.400 addresses are considered custom

			addresses in Exchange, they also aren't validated, and you must provide the correct syntax when specifying an X.400 address.
EmailAddressPolicyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *EmailAddressPolicyEnabled* parameter specifies whether the email address policy for this mailbox is enabled. The two possible values for this parameter are `$true` or `$false`.
EnableRoomMailboxAccount	Optional	System.Boolean	Use the *EnableRoomMailboxAccount* parameter to enable or disable the Active Directory user account that corresponds to a room mailbox. Use the `$true` value to enable the user account or use `$false` to disable a logon-enabled user account. To logon-enable a user account, you also have to use the *RoomMailboxPassword* parameter to specify a password for the user

			account. Logon-enabled Active Directory user accounts for room mailboxes are required for solutions such as the Lync Room System. In Exchange Online, a logon-enabled room mailbox doesn't require a license. **Important:** After configuring a logon-enabled room mailbox using the *EnableRoomMailboxAccount* and *RoomMailboxPassword* parameters in an on-premises Exchange organization, you have to enable the corresponding user account in Active Directory Users and Computers or by running the **Enable-ADAccount** cmdlet in Windows PowerShell.
EndDateForRetentionHold	Optional	System.DateTime	The *EndDateForRetentionHold* parameter specifies the end date for retention hold for messaging records management (MRM). To use this parameter, the *RetentionHoldEnabled* parameter must be set to

			`$true`.
EvictLiveId	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ExtendedPropertiesCountQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *ExtendedPropertiesCountQuota* property is used to configure the Named Properties and NonMAPI Named Properties quotas for a mailbox. This should typically only be done if you are experiencing QuotaExceededException or MapiExceptionNamedPropsQuotaExceeded errors.
ExtensionCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute*

			parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ExtensionCustomAttribute*

		y	*1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information

			about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExternalOofOptions	Optional	Microsoft.Exchange.Data.Directory.Recipient.ExternalOofOptions	The *ExternalOofOptions* parameter specifies the option for sending an Out of Office message to external senders. You can

			use the following values: • `External` • `InternalOnly`
FederatedIdentity	Optional	System.String	This parameter is available only in the cloud-based service. The *FederatedIdentity* parameter associates an on-premises Active Directory user with a Microsoft Office user.
FolderHierarchyChildrenCountReceiveQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *FolderHierarchyChildrenCountReceiveQuota* parameter specifies the maximum number of subfolders that can be created in a mailbox folder. The mailbox owner won't be able to create a new subfolder when this limit is reached.
FolderHierarchyChildrenCountWarningQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *FolderHierarchyChildrenCountWarningQuota* parameter specifies the

			number of subfolders that can be created in a mailbox folder before Exchange sends a warning message to the mailbox owner and logs an event to the application event log. When this quota is reached, warning messages and logged events occur once a day.
FolderHierarchyDepthReceiveQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *FolderHierarchyDepthReceiveQuota* parameter specifies the maximum number of levels in the folder hierarchy of a mailbox folder. The mailbox owner won't be able to create another level in the folder hierarchy of the mailbox folder when this limit is reached.
FolderHierarchyDepthWarningQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The

			FolderHierarchyDepthWarningQuota parameter specifies the number of levels in the folder hierarchy of a mailbox folder that can be created before Exchange sends a warning message to the mailbox owner and logs an event to the application event log. When this quota is reached, warning messages and logged events occur once a day.
FoldersCountReceiveQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *FoldersCountReceiveQuota* parameter is used to specify a maximum number of folders within a mailbox, typically a public folder mailbox. If this value is configured and the limit is reached, no new folders will be able to be created.
FoldersCountWarningQuota	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013.

			The *FoldersCountWarningQuota* parameter is used to display a warning message that the folder hierarchy is full when the value specified for this parameter is reached. This parameter is typically used for public folder mailboxes.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the warning or confirmation messages that appear during specific configuration changes.
ForestWideDomainControllerAffinityByExecutingUser	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ForwardingAddress	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *ForwardingAddress* parameter specifies a forwarding address.
ForwardingSmtpAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *ForwardingSmtpAddress* parameter specifies a forwarding SMTP address.
GMGen	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013.

			The *GMGen* parameter specifies the arbitration mailbox (also called the *organization mailbox*) for group metrics generation for the organization. In MailTips, group metrics information is used to indicate the number of recipients a message will be sent to or whether recipients are outside your organization. The two possible values for this parameter are `$true` or `$false`.
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies the DN of other mailboxes that can send messages on behalf of this mailbox.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether this mailbox is hidden from other address lists. The two possible values for this parameter are `$true` or `$false`.

IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.

ImListMigrationCompleted	Optional	System.Boolean	The *ImListMigrationCompleted* parameter specifies whether a UM-enabled user's Microsoft Lync 2013 contacts have been successfully moved from their Exchange 2013 mailbox to a Lync 2013 server. This indicates the mailbox can be safely migrated from Exchange 2013 back to Exchange 2010 or Exchange 2007. The value `$false` indicates that the user's Lync contacts have not been moved. The default value is `$false`. Lync 2013 supports storing the user's Lync contacts in their Exchange 2013 mailbox. This feature is known as the *unified contact store*. Exchange 2010 and Exchange 2007 don't support the unified contact store. Before you migrate a user's Exchange 2013 mailbox back to Exchange 2010 or Exchange 2007, the Lync administrator needs to

			move the user's Lync contacts from the unified contact store back to a Lync 2013 server. **Note:** You shouldn't migrate a mailbox back to Exchange 2010 or Exchange 2007 while the user's Lync contacts are stored in the unified contact store. If you do, the user could permanently lose access to their Lync contacts. After you contact the Lync administrator and verify that the user's Lync contacts have been moved back to the Lync server, you should be able to complete the migration. If you need to migrate the mailbox despite the potential data loss, you can set the *ImListMigrationCompleted* parameter to `$false`.
ImmutableId	Optional	System.String	The *ImmutableId* parameter is used by Outlook Live Directory Sync (OLSync) and specifies a unique and immutable identifier in the form of an SMTP address for an Exchange mailbox that's used for federated delegation when requesting Security Assertion Markup

			Language (SAML) tokens. If federation is configured for this mailbox and you don't set this parameter when you create the mailbox, Exchange will create the value for the immutable ID based upon the mailbox's **ExchangeGUID** and the federated account namespace, for example, 7a78e7c8-620e-4d85-99d3-c90d90f29699@mail.contoso.com. You must set the *ImmutableId* parameter if Active Directory Federation Services (AD FS) is deployed to allow single sign-on into off-premises mailboxes and AD FS is configured to use a different attribute than **ExchangeGUID** for sign-on token requests. Both, Exchange and AD FS must request the same token for the same user to ensure proper functionality for a cross-premise Exchange

			deployment scenario.
IsExcludedFromServingHierarchy	Optional	System.Boolean	The *IsExcludedFromServingHierarchy* parameter prevents users from accessing the public folder hierarchy on the specified public folder mailbox. For load-balancing purposes, users are equally distributed across public folder mailboxes by default. When this parameter is set on a public folder mailbox, that mailbox isn't included in this automatic load-balancing and won't be accessed by users to retrieve the public folder hierarchy. However, if an administrator has set the *DefaultPublicFolderMailbox* property on a user mailbox to a specific public folder mailbox, the user will still access the specified public folder mailbox even if the *IsExcludedFromServingHierarchy* parameter is set for that public folder mailbox.

			Note: This parameter should only be used during public folder migrations. Do not use this parameter once the initial migration validation is complete.
IsHierarchyReady	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
IssueWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *IssueWarningQuota* parameter specifies the mailbox size at which a warning message is sent to the user. You must specify either an integer or unlimited. If you set this attribute on a mailbox, that mailbox setting overrides the value set for this attribute on the mailbox database.
JournalArchiveAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is reserved for internal Microsoft use.
Languages	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Languages* parameter specifies the language preferences for this mailbox, in order of preference. Several Exchange components display information to a mailbox user in the preferred language, if that language is supported.

			Some of those components include quota messages, non-delivery reports (NDRs), the Outlook Web App user interface, and Unified Messaging (UM) voice prompts. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
LinkedCredential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *LinkedCredential* parameter specifies

			credentials to use to access the domain controller specified by the *LinkedDomainController* parameter. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
LinkedDomainController	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *LinkedDomainController* parameter specifies the domain controller in the forest where the user account resides, if this mailbox is a linked mailbox. The domain controller in the forest where the user account resides is used to get security information for the account specified by the *LinkedMasterAccount* parameter.

LinkedMasterAccount	Optional	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	This parameter is available only in on-premises Exchange 2013. The *LinkedMasterAccount* parameter specifies the master account in the forest where the user account resides, if this mailbox is a linked mailbox. The master account is the account to which the mailbox links. The master account grants access to the mailbox. You can use one of the following values: • GUID • DN • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
LitigationHoldDate	Optional	System.DateTime	The *LitigationHoldDate* parameter specifies the date when the mailbox is placed on litigation hold. The parameter is populated automatically when placing a mailbox on litigation hold. This can be used for informational

			or reporting purposes. **Note:** When using the Exchange Management Shell to place the mailbox on litigation hold, you can optionally specify any date as the *LitigationHoldDate*, but the mailbox is placed on litigation hold when the cmdlet is run.
LitigationHoldDuration	Optional	Microsoft.Exchange.Data.Unlimited	The *LitigationHoldDuration* parameter specifies how long the mailbox will be on litigation hold. Use days to specify the duration. **Tip:** You have to use the *IncludeLitigationHoldDuration* parameter with the **Get-Mailbox** cmdlet to view the value of the litigation-hold duration.
LitigationHoldEnabled	Optional	System.Boolean	The *LitigationHoldEnabled* parameter specifies that the mailbox is under litigation hold and that messages can't be deleted from the user's account. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`. After a mailbox is placed

			on litigation hold, deleted items and all versions of changed items are retained in the Recoverable Items folder. Items that are purged from the dumpster are also retained and the items are held indefinitely. If you enable litigation hold, single-item recovery quotas aren't applied.
LitigationHoldOwner	Optional	System.String	The *LitigationHoldOwner* parameter specifies the user who placed the mailbox on litigation hold. The parameter is populated automatically when placing a mailbox on litigation hold. This can be used for informational and reporting purposes. **Note:** When using the Shell to place a mailbox on litigation hold, you can optionally specify a string value for this parameter.
MailboxContainerGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
MailboxMessagesPerFolderCountReceiveQuota	Optional	System.Int32	The *MailboxMessagesPerFolderCountReceiveQuota*

			parameter specifies the maximum number of messages for a mailbox folder. When this limit is reached, the folder can't receive new messages.
MailboxMessagesPerFolderCountWarningQuota	Optional	System.Int32	The *MailboxMessagesPerFolderCountWarningQuota* parameter specifies the number of messages that a mailbox folder can hold before Exchange sends a warning message to the mailbox owner and logs an event to the application event log. When this quota is reached, warning messages and logged events occur once a day.
MailboxPlan	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPlanIdParameter	This parameter is reserved for internal Microsoft use.
MailboxProvisioningConstraint	Optional	Microsoft.Exchange.Data.Directory.MailboxProvisioningConstraint	This parameter is reserved for internal Microsoft use.
MailboxProvisioningPreferences	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
MailRouting	Optional	System.Boolean	This parameter is reserved

			for internal Microsoft use.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message displayed to senders when they start drafting an email message to this recipient. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *MailTipTranslations* parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each language, you must provide the locale, followed by a colon and the specific *MailTip* parameter message in that language. Each *MailTip* parameter message must be less than or equal to 250 characters. Multiple languages can be separated by commas. To enter multiple values and overwrite any existing

			entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
ManagedFolderMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderMailboxPolicy* parameter specifies a managed folder mailbox policy that controls MRM for the mailbox. If the parameter is set to `$null`, Exchange removes the managed folder mailbox policy from the mailbox but any managed folders in the mailbox remain.

ManagedFolderMailboxPolicyAllowed	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderMailboxPolicyAllowed* parameter bypasses the warning that MRM features aren't supported for email clients running versions of Outlook earlier than Office Outlook 2007. When a managed folder mailbox policy is assigned to a mailbox using the *ManagedFolderMailboxPolicy* parameter, the warning appears by default unless the *ManagedFolderMailboxPolicyAllowed* parameter is used. **Note:** Although Outlook 2003 Service Pack 3 clients are supported, they have limited MRM functionality.
Management	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *Management* parameter specifies the arbitration mailbox (also

			call an *organization mailbox*) used to manage mailbox moves and mailbox migrations. The two possible values for this parameter are `$true` or `$false`.
MaxBlockedSenders	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *MaxBlockedSenders* parameter specifies the maximum number of senders that can be included in the blocked senders list. Blocked senders are senders that are considered junk senders by the mailbox user and are used in junk email rules. This parameter is validated only when the junk email rules are updated using Outlook Web App or web services.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxReceiveSize* parameter specifies the

			maximum size of messages that this mailbox can receive. You must specify either an integer or `unlimited`.
MaxSafeSenders	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *MaxSafeSenders* parameter specifies the maximum number of senders that can be included in the safe senders list. Safe senders are senders that are trusted by the mailbox user and are used in junk email rules. This parameter is only validated when the junk email rules are updated using cloud-based organizations or services.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxSendSize* parameter specifies the maximum size of messages that this mailbox can send. You

			must specify either an integer or `unlimited`.
MessageTracking	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MessageTracking* parameter designates the specified arbitration mailbox (also called an *organization mailbox*) as the anchor mailbox for cross-organizational message tracking scenarios. By default, the message tracking organizational capability is assigned to the arbitration mailbox named SystemMailbox{bb558c35-97f1-4cb9-8ff7-d53741dc928c}. Values for this parameter are either `$true` or `$false`.
MessageTrackingReadStatusEnabled	Optional	System.Boolean	The *MessageTrackingReadStatusEnabled* parameter specifies that this mailbox can view the read status of sent messages. The two

			possible values for this parameter are `$true` or `$false`. If you set this parameter to `$false`, the read status won't be displayed to senders who view delivery reports for messages they send to this user and only the time that the message was delivered to the mailbox is available. The default value is `$true`.
MicrosoftOnlineServicesID	Optional	Microsoft.Exchange.Data.SmtpAddress	The *MicrosoftOnlineServicesID* parameter specifies the user ID for the object. This parameter only applies to objects in the cloud-based service. It isn't available for on-premises deployments.
Migration	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users who are responsible for moderating the messages sent to this mailbox. To designate more than one user, separate the users with

			commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the mailbox. To enable moderation, set this parameter to `$true`. To disable moderation, set

			this parameter to `$false`. The default value is `$false`.
Name	Optional	System.String	The *Name* parameter specifies the **Name** attribute for this mailbox. The **Name** attribute is used for the common name in Active Directory.
NetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
NewPassword	Optional	System.Security.SecureString	This parameter is available only in on-premises Exchange 2013. The *NewPassword* parameter is used when an end-user changes their password in Outlook Web App. Administrators use the *Password* parameter to reset an end-user's password.
OABGen	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *OABGen* parameter specifies the arbitration mailbox (also called an *organization mailbox*) used for offline address

			book (OAB) file generation and storage for the organization. OAB requests are sent to the server where this arbitration mailbox is located. The two possible values for this parameter are `$true` or `$false`.
Office	Optional	System.String	The *Office* parameter specifies the Microsoft Office attribute for this mailbox.
OfflineAddressBook	Optional	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	This parameter is available only in on-premises Exchange 2013. The *OfflineAddressBook* parameter specifies the associated OAB.
OldPassword	Optional	System.Security.SecureString	This parameter is available only in on-premises Exchange 2013. The *OldPassword* parameter specifies the existing password for a mailbox. You have to include this parameter when using the **Set-Mailbox** cmdlet to directly change the

			password for a mailbox. To reset a password without having to specify the old password, you must be assigned the Reset Password role.
OMEncryption	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OriginalNetID	Optional	Microsoft.Exchange.Data.NetID	This parameter is reserved for internal Microsoft use.
Password	Optional	System.Security.SecureString	The *Password* parameter resets the password of the user account associated with the mailbox. To reset a password without having to include the *OldPassword* parameter, you must be assigned the Reset Password role.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress* parameter specifies the address that external users see when they receive a message from this mailbox. If you use this parameter, you can't use the

			EmailAddresses parameter because the *EmailAddresses* parameter includes the primary SMTP address.
ProhibitSendQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ProhibitSendQuota* parameter specifies the mailbox size at which the user associated with this mailbox can no longer send messages. You must specify either an integer or `unlimited`. If you set this attribute on a mailbox, that mailbox setting overrides the value set for this attribute on the mailbox database.
ProhibitSendReceiveQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ProhibitSendReceiveQuota* parameter specifies the mailbox size at which the user associated with this mailbox can no longer send or receive messages. You must specify either an integer or `unlimited`. If you set this attribute on a mailbox, that mailbox setting overrides the value set for this attribute on

			the mailbox database.
PstProvider	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
PublicFolder	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *PublicFolder* parameter specifies that the target mailbox is a public folder mailbox. This parameter is required when you use the **Set-Mailbox** cmldet to modify public folder mailboxes. Public folder mailboxes are specially designed mailboxes to store the hierarchy and content of public folders.
QueryBaseDN	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	This parameter is reserved for internal Microsoft use.
QueryBaseDNRestrictionEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RecipientLimits	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *RecipientLimits* parameter specifies the

			maximum number of recipients per message to which this mailbox can send. You must specify either an integer or `unlimited`. If you set this attribute on a mailbox, that mailbox setting overrides the value set for this attribute in the Transport service.
RecoverableItemsQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *RecoverableItemsQuota* parameter specifies the limit for the Recovery Items folder. When you reach the quota limit, you can't put any more items in the Recovery Items folder.
RecoverableItemsWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *RecoverableItemsWarningQuota* parameter specifies the quota for when a warning event is entered

			in Event Viewer.
RejectMessagesFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFrom* parameter specifies the recipients from whom messages are rejected. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies distribution lists. Messages from any member of these distribution lists are

			rejected. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromSendersOrMembers* parameter specifies the identity of recipients from whom messages are rejected. You can use any of the following values for the valid senders: • DN • Canonical name • GUID

			• Name • Display name • Alias • Exchange DN • Primary SMTP email address To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
RemoteAccountPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.RemoteAccountPolicyIdParameter	This parameter is reserved for internal Microsoft use.
RemoteRecipientType	Optional	Microsoft.Exchange.Data.Directory.Recipient.	This parameter is reserved for internal Microsoft use.

		RemoteRecipientType	
RemoveManagedFolderAndPolicy	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoveManagedFolderAndPolicy* parameter specifies whether to remove all MRM 1.0 policies and attributes from a mailbox. If you use this parameter, MRM 1.0 policies and MRM 1.0 properties from any managed folders that were created as part of any MRM 1.0 policies are removed. Managed folders that are empty are also removed from the mailbox, and managed folders that contain items are converted to standard folders.
RemovePicture	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemovePicture* switch specifies whether to remove the picture that a user has added to a

			mailbox. A picture file can be added to the mailbox by using the **Import-RecipientDataProperty** cmdlet.
RemoveSpokenName	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoveSpokenName* switch specifies whether to remove the spoken name that a user has added to a mailbox. A sound file can be added to the mailbox by using the **Import-RecipientDataProperty** cmdlet.
RequireSecretQA	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether senders must be authenticated. The two possible values for this parameter are `$true` or `$false`.
ResetPasswordOnNextLogon	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013.

			The *ResetPasswordOnNextLogon* parameter specifies whether to require users to change their password the next time they sign in to their mailbox. If the *ResetPasswordOnNextLogon* parameter is set to `$true`, it requires users to change their password the next time they sign in to their mailbox. Valid input for this parameter is `$true` or `$false`.
ResourceCapacity	Optional	System.Int32	The *ResourceCapacity* parameter specifies capacity, if this mailbox is a resource mailbox. You must specify a non-negative integer.
ResourceCustom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ResourceCustom* parameter specifies additional information about the resource. You can define custom properties for resource mailboxes using the **Set-ResourceConfig** command and use this parameter to set those custom properties.

			To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
RetainDeletedItemsFor	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RetainDeletedItemsFor* parameter specifies the length of time to keep deleted items. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a 15-hour interval, enter

			15:00:00.
RetainDeletedItemsUntilBackup	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *RetainDeletedItemsUntilBackup* parameter specifies whether to retain deleted items until the next backup. The two possible values for this parameter are `$true` or `$false`.
RetentionComment	Optional	System.String	The *RetentionComment* parameter specifies a comment displayed in Outlook regarding the user's retention hold status. This comment can only be set if the *RetentionHoldEnabled* parameter is set to `$true`. This comment should be localized to the user's preferred language.
RetentionHoldEnabled	Optional	System.Boolean	The *RetentionHoldEnabled* parameter specifies whether retention hold is enabled for messaging retention policies. The two

			possible values for this parameter are `$true` or `$false`. To set the start date for retention hold, use the *StartDateForRetentionHold* parameter.
RetentionPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *RetentionPolicy* parameter specifies the name of a retention policy that you want applied to this mailbox. Retention policies consist of tags that are applied to mailbox folders and mail items to determine the period of time that the items should be retained.
RetentionUrl	Optional	System.String	The *RetentionUrl* parameter specifies the URL or an external web page with additional details about the organization's messaging retention policies. This URL can be used to expose details regarding retention policies in general, which is usually a customized legal or IT website for the company.

RoleAssignmentPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *RoleAssignmentPolicy* parameter specifies the management role assignment policy to assign to the mailbox when it's created or enabled. If you don't include this parameter when you create or enable a mailbox, the default assignment policy is used. If the assignment policy name contains spaces, enclose the name in quotation marks ("). If you don't want to assign an assignment policy when a mailbox is created or enabled, specify a value of `$null`. For more information, see Understanding management role assignment policies.
RoomMailboxPassword	Optional	System.Security.SecureString	Use the *RoomMailboxPassword* parameter to specify a password when you're using the *EnableRoomMailboxAccount* parameter to enable the Active Directory user

			account for a room mailbox. Use the following format: -`RoomMailboxPassword (ConvertTo-SecureString -String` *`password`* `-AsPlainText -Force)`. To set the password when enabling the Active Directory user account for a room mailbox, you must be assigned the Reset Password role.
RulesQuota	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *RulesQuota* parameter specifies the limit for the size of rules for this mailbox. When you enter a value, qualify the value with one of the following: • B (bytes) • KB (kilobytes) Unqualified values are treated as bytes. The default value for this parameter is 64 KB. The maximum value is 256 KB. **Note:** The quota for mailbox rules applies only to enabled rules. There is no restriction on the number of disabled rules a mailbox can have. However, the total size of

			rules that are enabled or active can't exceed the value specified for this parameter.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies the user name for earlier operating systems such as Microsoft Windows NT 4.0, Windows 98, Windows 95, and LAN Manager. This parameter is used to support clients and servers running older versions of the operating system. This attribute must be less than 20 characters in length.
SCLDeleteEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *SCLDeleteEnabled* parameter specifies whether messages that meet the spam confidence level (SCL) threshold specified by the *SCLDeleteThreshold* parameter are deleted. You can use the following

			values: • `$true` • `$false`
SCLDeleteThreshold	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *SCLDeleteThreshold* parameter specifies the SCL at which a message is deleted, if the *SCLDeleteEnabled* parameter is set to `$true`. You must specify an integer from 0 through 9 inclusive.
SCLJunkEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *SCLJunkEnabled* parameter specifies whether messages that meet the SCL threshold specified by the *SCLJunkThreshold* parameter are moved to the Junk Email folder. You can use the following values: • `$true` • `$false`
SCLJunkThreshold	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013.

			The *SCLJunkThreshold* parameter specifies the SCL threshold. Messages with an SCL greater than the value that you specify for the *SCLJunkThreshold* parameter are moved to the Junk Email folder, if the *SCLJunkEnabled* parameter is set to `$true`. You must specify an integer from 0 through 9 inclusive.
SCLQuarantineEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *SCLQuarantineEnabled* parameter specifies whether messages that meet the SCL threshold specified by the *SCLQuarantineThreshold* parameter are quarantined. If a message is quarantined, it's sent to the quarantine mailbox where the messaging administrator can review it. You can use the following values: • `$true` • `$false`

SCLQuarantineThreshold	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *SCLQuarantineThreshold* parameter specifies the SCL at which a message is quarantined, if the *SCLQuarantineEnabled* parameter is set to `$true`. You must specify an integer from 0 through 9 inclusive.
SCLRejectEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *SCLRejectEnabled* parameter specifies whether messages that meet the SCL threshold specified by the *SCLRejectThreshold* parameter are rejected. If a message is rejected, it's deleted and a rejection response is sent to the sender. You can use the following values: • `$true` • `$false`
SCLRejectThreshold	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013.

			The *SCLRejectThreshold* parameter specifies the SCL at which a message is rejected, if the *SCLRejectEnabled* parameter is set to `$true`. You must specify an integer from 0 through 9 inclusive.
SecondaryAddress	Optional	System.String	The *SecondaryAddress* parameter specifies the secondary address used by the UM-enabled user.
SecondaryDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	The *SecondaryDialPlan* parameter specifies a secondary UM dial plan to use. This parameter is provided to create a secondary proxy address.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when a message they sent to the moderated distribution group is rejected by one of the moderators. You can specify one of the following values: • `Always`

			• `Internal` • `Never` Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent to only the senders that are internal to your organization. Set this parameter to `Never` to disable all status notifications. The default value is `Never`.
SharingPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.SharingPolicyIdParameter	The *SharingPolicy* parameter specifies the sharing policy associated with this mailbox.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.
SingleItemRecoveryEn	Optional	System.Boolean	The

abled			*SingleItemRecoveryEnabled* parameter specifies whether to prevent the Recovery Items folder from being purged. When this parameter is set to `$true`, it prevents the Recovery Items folder from being purged. It prevents any items from being removed that have been deleted or edited. The possible values for this parameter are `$true` or `$false`. The default value is `$false`.
SkipMailboxProvisioningConstraintValidation	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
SKUAssigned	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
SKUCapability	Optional	Microsoft.Exchange.Data.Directory.Capability	This parameter is reserved for internal Microsoft use.
StartDateForRetentionHold	Optional	System.DateTime	The *StartDateForRetentionHold* parameter specifies the start date for retention hold for MRM. To use this parameter, the *RetentionHoldEnabled* parameter must be set to

			`$true`.
SuiteServiceStorage	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TenantUpgrade	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ThrottlingPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.ThrottlingPolicyIdParameter	This parameter is available only in on-premises Exchange 2013. The *ThrottlingPolicy* parameter specifies the identity of the throttling policy for this mailbox.
Type	Optional	Microsoft.Exchange.Management.RecipientTasks.ConvertibleMailboxSubType	The *Type* parameter specifies the type for the mailbox. You can use the following values: • `Regular` • `Room` • `Equipment` • `Shared`
UMDataStorage	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *UMDataStorage* parameter specifies the arbitration mailbox (also called the *organization mailbox*) used to store UM call data records and UM custom prompts. This capability can be assigned to only one arbitration

			mailbox for the organization. The two possible values for this parameter are `$true` or `$false`.
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UMDtmfMap* parameter specifies whether you want to create a user-defined DTMF map for the UM-enabled user.
UMGrammar	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *UMGrammar* parameter specifies the arbitration mailbox (also called the *organization mailbox*) for UM directory speech grammar generation for the organization. UM directory speech grammars will be generated and used on the Mailbox server of this arbitration mailbox. UM directory speech grammars are used in speech-enabled directory search features, such as UM auto attendants.

			The two possible values for this parameter are `$true` or `$false`.
UnifiedMailbox	Optional	Microsoft.Exchange.Data.Directory.CrossTenantObjectId	This parameter is reserved for internal Microsoft use.
UsageLocation	Optional	Microsoft.Exchange.Data.Directory.CountryInfo	This parameter is reserved for internal Microsoft use.
UseDatabaseQuotaDefaults	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *UseDatabaseQuotaDefaults* parameter specifies that this mailbox uses the quota attributes specified for the mailbox database where this mailbox resides. The quota attributes are: • **ProhibitSendQuota** • **ProhibitSendReceiveQuota** • **IssueWarningQuota** • **RulesQuota** The two possible values for this parameter are `$true` or `$false`.
UseDatabaseRetentio	Optional	System.Boolean	This parameter is available only in on-

nDefaults			premises Exchange 2013. The *UseDatabaseRetentionDefaults* parameter specifies that this mailbox uses the **MailboxRetention** attribute specified for the mailbox database where this mailbox resides. The two possible values for this parameter are `$true` or `$false`.
UserCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UserCertificate* parameter specifies the digital certificate used to sign a user's email messages.
UserPrincipalName	Optional	System.String	The *UserPrincipalName* parameter specifies the UPN for this mailbox. This is the logon name for the user. The UPN consists of a user name and a suffix. Typically, the suffix is the domain name where the user account resides.
UserSMimeCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *UserSMimeCertificate* parameter specifies the

			SMIME certificate used to sign a user's email messages.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the Windows email address for this mailbox. This address isn't used by Exchange.
WindowsLiveID	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in the cloud-based service. The *WindowsLiveID* parameter renames the Microsoft account (formerly known as a Windows Live ID) associated with the

			mailbox.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxAutoReplyConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxAutoReplyConfiguration** cmdlet to retrieve Automatic Replies settings for a specific mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxAutoReplyConfiguration -Identity <MailboxIdParameter> [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns Automatic Replies settings for all mailboxes in the Exchange organization.

```
Get-Mailbox | Get-MailboxAutoReplyConfiguration
```

EXAMPLE 2

This example retrieves Automatic Replies settings for Tony's mailbox at contoso.com.

```
Get-MailboxAutoReplyConfiguration -Identity 'contoso.com/
Users/Tony Smith'
```

EXAMPLE 3

This example retrieves all Automatic Replies settings for all mailboxes in the Exchange organization.

```
Get-Mailbox | Get-MailboxAutoReplyConfiguration -ResultSize
unlimited
```

Detailed Description

You can use the **Get-MailboxAutoReplyConfiguration** cmdlet to retrieve all the mailboxes enabled for Automatic Replies. When run, the cmdlet returns Automatic Replies settings for the specified mailbox that include the following:

- Mailbox identity value
- Whether Automatic Replies is enabled, scheduled, or disabled for the mailbox
- Start and end date, time during which Automatic Replies will be sent
- Whether external senders receive Automatic Replies (none, known senders, or all)
- Automatic Replies message to be sent to internal and external senders

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Automatic replies" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies a unique identifier associated with a mailbox. Accepted values for the mailbox are as follows: • GUID • ADObjectID • Distinguished name (DN)

			• *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Credential	Optional	System.Management.Automation.PSCredential	This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include

			all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Microsoft Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of settings to return. If you want to return all settings that match the command, use `unlimited` for the value of this parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxAutoReplyConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxAutoReplyConfiguration** cmdlet to configure Automatic Replies settings for a specific mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxAutoReplyConfiguration -Identity <MailboxIdParameter> [-
AutoReplyState <Disabled | Enabled | Scheduled>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-EndTime <DateTime>] [-
ExternalAudience <None | Known | All>] [-ExternalMessage <String>] [-
IgnoreDefaultScope <SwitchParameter>] [-InternalMessage <String>] [-
StartTime <DateTime>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures Automatic Replies for Tony's mailbox to be sent between the specified start and end dates and includes an internal message.

```
Set-MailboxAutoReplyConfiguration -Identity tony -
AutoReplyState Scheduled -StartTime "7/10/2012 08:00:00" -
EndTime "7/15/2012 17:00:00" -InternalMessage "Internal
auto-reply message"
```

EXAMPLE 2

This example configures Automatic Replies for Tony's mailbox to be sent and includes an internal and an external message.

```
Set-MailboxAutoReplyConfiguration -Identity tony -
AutoReplyState Enabled -InternalMessage "Internal auto-
reply message." -ExternalMessage "External auto-reply
message."
```

Detailed Description

You can disable Automatic Replies for a specified mailbox or organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Automatic replies" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies a unique identifier associated with a mailbox. You can use any value that uniquely identifies a mailbox. Accepted values for the mailbox are as follows: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
AutoReplyState	Optional	Microsoft.Exchange.InfoWorker.Common.OOF.OofState	The *AutoReplyState* parameter specifies whether the mailbox is enabled for Automatic Replies. Accepted values are as follows: • `Enabled` If you use this value, auto-replies are

			sent until the value is changed to `Disabled`. • `Disabled` This is the default value. • `Scheduled` If you use this value, you must also specify the *StartTime* and *EndTime* parameters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EndTime	Optional	System.DateTime	The *EndTime* parameter specifies the end date and time that Automatic Replies are sent for the

			specified mailbox. To use this parameter, the *AutoReplyState* parameter must be set to `Scheduled`.
ExternalAudience	Optional	Microsoft.Exchange.InfoWorker.Common.OOF.ExternalAudience	The *ExternalAudience* parameter specifies whether Automatic Replies are sent to external senders. Accepted values are as follows: • `None` This is the default value. • `Known` • `All`
ExternalMessage	Optional	System.String	The *ExternalMessage* parameter specifies the Automatic Replies message that's sent to external senders or senders outside the organization.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default

			scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
InternalMessage	Optional	System.String	The *InternalMessage* parameter specifies the Automatic Replies message that's sent to internal senders or senders within the organization.
StartTime	Optional	System.DateTime	The *StartTime* parameter specifies the start date and time that Automatic Replies are sent for the specified mailbox. To use this parameter, the *AutoReplyState* parameter must be set to `Scheduled`.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxCalendarFolder

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxCalendarFolder** cmdlet to retrieve the publishing or sharing settings for a specified mailbox calendar folder.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxCalendarFolder -Identity <MailboxFolderIdParameter> [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns all provided publishing information for the specified calendar folder in Kai's mailbox. In this example, the *Identity* parameter specifies the mailbox with the alias format.

```
Get-MailboxCalendarFolder -Identity kai:\Calendar
```

EXAMPLE 2

This example returns all provided publishing information for the specified calendar folder in Kai's mailbox. This example also specifies DC1 as the domain controller to retrieve this information from Active Directory.

```
Get-MailboxCalendarFolder -Identity kai:\Calendar -
DomainController DC1
```

EXAMPLE 3

This example returns all provided publishing information for the specified calendar folder in Kai's mailbox. In this example, the *Identity* parameter specifies the mailbox with the *domain\account* format.

```
Get-MailboxCalendarFolder -Identity contoso\kai:\Calendar
```

Detailed Description

The **Get-MailboxCalendarFolder** cmdlet retrieves information for the specified calendar folder. This information includes the calendar folder name, whether the folder is currently published or shared, the start and end range of calendar days published, the level of details published for the calendar, whether the published URL of the calendar can be searched on the web, and the published URL for the calendar.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the mailbox and folder path or folder name to the calendar folder that has the publishing settings configured. You can use the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxCalendarFolder

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxCalendarFolder** cmdlet to configure publishing or sharing settings on a calendar folder of a specified mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxCalendarFolder -Identity <MailboxFolderIdParameter> [-Confirm
[<SwitchParameter>]] [-DetailLevel <AvailabilityOnly | LimitedDetails |
FullDetails | Editor>] [-DomainController <Fqdn>] [-PublishDateRangeFrom
<OneDay | ThreeDays | OneWeek | OneMonth | ThreeMonths | SixMonths |
OneYear>] [-PublishDateRangeTo <OneDay | ThreeDays | OneWeek | OneMonth |
ThreeMonths | SixMonths | OneYear>] [-PublishEnabled <$true | $false>] [-
ResetUrl <SwitchParameter>] [-SearchableUrlEnabled <$true | $false>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the level of details to publish for Kai's shared calendar to `LimitedDetails`, which means limited details are displayed.

```
Set-MailboxCalendarFolder -Identity kai:\Calendar -
DetailLevel LimitedDetails
```

EXAMPLE 2

This example enables the calendar in Kai's mailbox to be searchable on the web.

```
Set-MailboxCalendarFolder -Identity kai:\Calendar -
SearchableUrlEnabled $true
```

Detailed Description

The **Set-MailboxCalendarFolder** cmdlet configures publishing information. The calendar folder can be configured as follows:

- Whether the calendar folder is enabled for publishing
- Range of start and end calendar days to publish
- Level of detail to publish for the calendar
- Whether the published URL of the calendar is enabled for search on the web

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the mailbox and folder path or folder name to the calendar folder that has the publishing settings configured. You can use the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Confirm	Optional	System.Management.	The *Confirm* switch

		Automation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DetailLevel	Optional	Microsoft.Exchange.Data.Storage.DetailLevelEnumType	The *DetailLevel* parameter specifies the level of calendar detail that's published and available to anonymous users. You can use the following values: • `AvailabilityOnly` • `LimitedDetails` • `FullDetails` • `Editor` The default value is `AvailabilityOnly`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

PublishDateRangeFrom	Optional	Microsoft.Exchange.Data.Storage.Management.DateRangeEnumType	The *PublishDateRangeFrom* parameter specifies the number of days of calendar information to publish before the current date. You can use the following values: • `OneDay` • `ThreeDays` • `OneWeek` • `OneMonth` • `ThreeMonths` • `SixMonths` • `OneYear` The default value is `ThreeMonths`.
PublishDateRangeTo	Optional	Microsoft.Exchange.Data.Storage.Management.DateRangeEnumType	The *PublishDateRangeTo* parameter specifies the number of days of calendar information to publish after the current date. You can use the following values: • `OneDay` • `ThreeDays` • `OneWeek` • `OneMonth` • `ThreeMonthS` • `SixMonths` • `OneYear` The default value is `ThreeMonths`.
PublishEnabled	Optional	System.Boolean	The *PublishEnabled* parameter specifies whether the specified calendar should be

			enabled for publishing. The default value is `$true`.
ResetUrl	Optional	System.Management.Automation.SwitchParameter	The *ResetUrl* parameter replaces the existing non-public URL with a new URL for a calendar that has been published without being publicly searchable.
SearchableUrlEnabled	Optional	System.Boolean	The *SearchableUrlEnabled* parameter specifies whether the published calendar URL can be searched on the web. The default value is `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-MailboxDiagnosticLogs

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-18*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Export-MailboxDiagnosticLogs** cmdlet to export diagnostic data from user and system mailboxes in Microsoft Exchange Server 2013 Enterprise.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-MailboxDiagnosticLogs -ComponentName <String> -Identity
<MailUserOrGeneralMailboxIdParameter> [-Archive <SwitchParameter>] <COMMON
PARAMETERS>

Export-MailboxDiagnosticLogs -ExtendedProperties <SwitchParameter> -
Identity <MailUserOrGeneralMailboxIdParameter> [-Archive
<SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example retrieves the out-of-office diagnostic log for the user John Smith.

```
Export-MailboxDiagnosticLogs -ComponentName OOF -Identity
JohnSmith
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ComponentName	Required	System.String	The *ComponentName* parameter specifies the component for which to retrieve the logs. Any log that was created with the common logging code and is stored in the root of the mailbox works. The cmdlet accepts the following names: • OOF • Sharing • MeetingMessageProcessingAgent • SharingSyncAssistant • MRM • InternetCalendar • Calendar
ExtendedProperties	Required	System.Management.Automation.SwitchParameter	The *ExtendedProperties* parameter specifies whether to retrieve all of the well-known properties from the mailbox table that are useful for troubleshooting.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.Mail	The *Identity* parameter specifies what mailbox the

		UserOrGeneralMailboxIdParameter	diagnostic logs are being retrieved from. The mailboxes can be piped from the **Get-Mailbox** cmdlet.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter retrieves the diagnostics logs of the archive mailbox instead of the primary mailbox.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is

			created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest and don't use this parameter, it's possible that the user information is read from a global catalog with outdated

			information. If you use this parameter, multiple reads might be necessary to get the information.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxExportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxExportRequest** cmdlet to view the detailed status of an ongoing export request that was initiated by using the New-MailboxExportRequest cmdlet.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxExportRequest [-AccountPartition <AccountPartitionIdParameter>]
[-Identity <MailboxExportRequestIdParameter>] [-Organization
<OrganizationIdParameter>] <COMMON PARAMETERS>

Get-MailboxExportRequest [-AccountPartition <AccountPartitionIdParameter>]
[-BatchName <String>] [-HighPriority <$true | $false>] [-Mailbox
<MailboxOrMailUserIdParameter>] [-Name <String>] [-Organization
<OrganizationIdParameter>] [-RequestQueue <DatabaseIdParameter>] [-Status
<None | Queued | InProgress | AutoSuspended | CompletionInProgress |
Synced | Completed | CompletedWithWarning | Suspended | Failed>] [-Suspend
<$true | $false>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the status of the ongoing export request with the identity tony\DB01toPST.

```
Get-MailboxExportRequest -Identity "tony\DB01toPST"
```

EXAMPLE 2

This example returns the status of export requests in the Attachment_CompanyReport batch that completed.

```
Get-MailboxExportRequest -BatchName
"Attachment_CompanyReport" -Status Completed
```

EXAMPLE 3

This example returns all export requests that have the name DB01toPST where the export has been suspended.

```
Get-MailboxExportRequest -Name "DB01toPST" -Suspend $true
```

Detailed Description

The search criteria for the **Get-MailboxExportRequest** cmdlet is a Boolean **And** statement. If you use multiple parameters, you narrow your search and reduce your search results.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name given to a batch export request. You can't use this parameter in conjunction with the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
HighPriority	Optional	System.Boolean	The *HighPriority* parameter specifies that the cmdlet returns requests that were created with the *HighPriority* flag. The *HighPriority* flag indicates that the request should be processed before other lower priority requests in the queue. You can't use this parameter in conjunction with the *Identity* parameter.
Identity	Optional	Microsoft.Exchange.MailboxReplicationService.MailboxExportRequestIdParameter	The *Identity* parameter specifies the identity of the export request. By default, export requests are named <*alias*>\MailboxExport*X* (where *X* = 0–9). If you specified a name for the export request when the request was created using the **New-MailboxExportRequest**

			cmdlet, use the following syntax: <*alias*>\<*name*>. Microsoft Exchange Server 2013 automatically precedes the request with the mailbox's alias. This parameter can't be used in conjunction with the following parameters: • *BatchName* • *Mailbox* • *Name* • *Status* • *Suspend* • *HighPriority*
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Mailbox* parameter specifies the identity of the mailbox or mail user from which contents are being exported. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias You can't use this parameter in conjunction

			with the *Identity* parameter.
Name	Optional	System.String	The *Name* parameter specifies that export requests that have the specified name are returned. Use this parameter to search on the name that you provided when you created the export request. If you didn't specify a name when the request was created, the default name is MailboxExport*X* (where *X* = 0–9). You can't use this parameter in conjunction with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter specifies the organization you want configuration data from.
RequestQueue	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies that the cmdlet retrieves requests that are based in a queue on the specified database. By default, the

			request is created in a queue on the same database as where the mailbox is hosted.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Status	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestStatus	The *Status* parameter specifies that export requests with the specified status are returned. You can use the following values: • `AutoSuspended` • `Completed` • `CompletionInProgress` • `CompletedWithWarning` • `Failed` • `InProgress` • `None` • `Queued` • `Suspended` **Note:** `CompletionInProgress` and `AutoSuspended` don't apply to export requests and won't return any information. You can't use this parameter in conjunction with the *Identity*

			parameter.
Suspend	Optional	System.Boolean	The *Suspend* parameter specifies whether to return mailboxes with export requests that have been suspended. This parameter accepts `$true` or `$false`. You can't use this parameter in conjunction with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxExportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-29*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-MailboxExportRequest** cmdlet to begin the process of exporting contents of a primary mailbox or archive to a .pst file.

Note:
This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't

assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxExportRequest -FilePath <LongPath> -Mailbox
<MailboxOrMailUserIdParameter> [-AssociatedMessagesCopyOption <DoNotCopy |
MapByMessageClass | Copy>] [-ConflictResolutionOption <KeepSourceItem |
KeepLatestItem | KeepAll>] [-ContentFilter <String>] [-
ContentFilterLanguage <CultureInfo>] [-ExcludeDumpster <SwitchParameter>]
[-ExcludeFolders <String[]>] [-IncludeFolders <String[]>] [-IsArchive
<SwitchParameter>] [-SourceRootFolder <String>] [-TargetRootFolder
<String>] [-AcceptLargeDataLoss <SwitchParameter>] [-BadItemLimit
<Unlimited>] [-BatchName <String>] [-CompletedRequestAgeLimit <Unlimited>]
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-InternalFlags
<InternalMrsFlag[]>] [-LargeItemLimit <Unlimited>] [-Name <String>] [-
Priority <Lowest | Lower | Low | Normal | High | Higher | Highest |
Emergency>] [-SkipMerging <SkippableMergeComponent[]>] [-Suspend
<SwitchParameter>] [-SuspendComment <String>] [-WhatIf
[<SwitchParameter>]] [-WorkloadType <None | Local | Onboarding |
Offboarding | TenantUpgrade | LoadBalancing | Emergency |
RemotePstIngestion | SyncAggregation>]
```

Examples

EXAMPLE 1

This example exports the user Ayla Kol's primary mailbox to a .pst file on the network shared folder PSTFileShare on SERVER01.

```
New-MailboxExportRequest -Mailbox AylaKol -FilePath "\
\SERVER01\PSTFileShare\Ayla_Recovered.pst"
```

EXAMPLE 2

This example exports the user Kweku's archive to a .pst file on the network shared folder PSTFileShare on SERVER01.

```
New-MailboxExportRequest -Mailbox Kweku -FilePath "\
\SERVER01\PSTFileShare\Kweku_Archive.pst" -IsArchive
```

EXAMPLE 3

This example exports messages that contain the words "company" and "profit" in the body of the message for the user Tony received before January 1, 2012.

```
New-MailboxExportRequest -Mailbox Tony -ContentFilter
{(body -like "*company*") -and (body -like "*profit*") -and
(Received -lt "01/01/2012")} -FilePath "\\SERVER01
\PSTFileShare\Tony_CompanyProfits.pst"
```

EXAMPLE 4

This example exports all messages from Kweku's Inbox to the .pst file InPlaceHold.

```
New-MailboxExportRequest -Mailbox Kweku -IncludeFolders
"#Inbox#" -FilePath \\SERVER01\PSTFileShare\Kweku
\InPlaceHold.pst
```

Detailed Description

You can create more than one mailbox export request per mailbox, and each mailbox export request must have a unique name. Microsoft Exchange automatically generates up to 10 unique names for a mailbox export request. However, to create more than 10 export requests for a mailbox, you need to specify a unique name when creating the export request. You can remove existing export requests with the Remove-MailboxExportRequest cmdlet before starting a new request with the default request name <*alias*>\MailboxExport*X* (where *X* = 0–9).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

You need to grant the following permission to the group Exchange Trusted Subsystem to the network share where you want to export or import PST files:

- To import PST files from the share: Read permission
- To save exported PST files to the share: Read/Write permission.

If you don't grant this permission, you will receive an error message stating that Exchange is unable to establish a connection to the PST file on the network share.

Parameters

Parameter	Required	Type	Description
FilePath	Required	Microsoft.Exchange.Data.LongPath	The *FilePath* parameter specifies the network share path of the .pst file to which data is exported, for example, \\SERVER01\PST Files\exported.pst. UNRESOLVED_TOKEN_VAL(GENL_ImportExport_Exc

			hangeTrustedSubsystemPerms)
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Mailbox* parameter specifies the mailbox or mail-enabled user from which to export contents. You can use the following values: • Alias • SMTP address • Display name
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
AssociatedMessagesCopyOption	Optional	Microsoft.Exchange.MailboxReplicationService.FAICopyOption	The *AssociatedMessagesCopyOption* parameter specifies whether associated messages are copied when the request

			is processed. Associated messages are special messages that contain hidden data with information about rules, views, and forms. By default, associated messages are copied. This parameter accepts the following values: • `DoNotCopy` The associated messages aren't copied. • `MapByMessageClass` This option finds the corresponding associated message by looking up the **MessageClass** attribute of the source message. If there's an associated message of this class in both source and target folders, it overwrites the associated message in the target. If there isn't an associated message in the target, it creates a copy in the target. • `Copy` This option copies associated messages from the source to the target. If the same message type exists both in the source and the target location, these associated messages are duplicated. This is the default option. **Note:**

			Content filtering doesn't apply to associated messages.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process

			is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a descriptive name for exporting a batch of mailboxes. You can use the name in the *BatchName* parameter as a string search when you use the **Get-MailboxExportRequest** cmdlet.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request will be kept after it has completed before being automatically removed. The default *CompletedRequestAgeLimit* is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

ConflictResolutionOption	Optional	Microsoft.Exchange.MailboxReplicationService.ConflictResolutionOption	The *ConflictResolutionOption* parameter specifies the action for the Microsoft Exchange Mailbox Replication service (MRS) to take if there are multiple matching messages in the target. This parameter takes the following values: • `KeepSourceItem` • `KeepLatestItem` • `KeepAll` The default value is `KeepSourceItem`.
ContentFilter	Optional	System.String	The *ContentFilter* parameter specifies message content to search for. Only contents that match the *ContentFilter* parameter will be exported into the .pst file.
ContentFilterLanguage	Optional	System.Globalization.CultureInfo	The *ContentFilterLanguage* parameter specifies the language being used in the *ContentFilter* parameter for string searches. The valid input for the *ContentFilterLanguage*

			parameter is the string names listed in the **Culture Name** column in the Microsoft .NET Class Library class reference available at CultureInfo Class.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExcludeDumpster	Optional	System.Management.Automation.SwitchParameter	The *ExcludeDumpster* parameter specifies whether to exclude the Recoverable Items folder. You don't have to include a value with this parameter. If you don't specify this parameter, the Recoverable Items folder is copied with the following subfolders: • Deletions • Versions • Purges
ExcludeFolders	Optional	System.String[]	The *ExcludeFolders* parameter specifies the list of folders to exclude

			during the export. Folder names aren't case-sensitive, and there are no character restrictions. Use the following syntax: `<FolderName>/*` Use this syntax to denote a personal folder under the folder specified in the *SourceRootFolder* parameter, for example, "MyProjects" or "MyProjects/FY2010". `#<FolderName>#/*` Use this syntax to denote a well-known folder regardless of the folder's name in another language. For example, `#Inbox#` denotes the Inbox folder even if the Inbox is localized in Turkish, which is Gelen Kutusu. Well-known folders include the following types: • Inbox • SentItems • DeletedItems • Calendar • Contacts • Drafts • Journal • Tasks • Notes • JunkEmail • CommunicationHistory • Voicemail

			• Fax • Conflicts • SyncIssues • LocalFailures • ServerFailures If the user creates a personal folder with the same name as a well-known folder and the # symbol surrounding it, you can use a back slash (\) as an escape character to specify that folder. For example, if a user creates a folder named #Notes# and you want to specify that folder, but not the well-known Notes folder, use the following syntax: `\#Notes\#`. **Note:** Wildcard characters can't be used in folder names.
IncludeFolders	Optional	System.String[]	The *IncludeFolders* parameter specifies the list of folders to include during the export. Folder names aren't case-sensitive, and there are no character restrictions. Use the following syntax: `<FolderName>/*` Use this syntax to denote a

			personal folder under the folder specified in the *SourceRootFolder* parameter, for example, "MyProjects" or "MyProjects/FY2010". `#<FolderName>#/*` Use this syntax to denote a well-known folder regardless of the folder's name in another language. For example, `#Inbox#` denotes the Inbox folder even if the Inbox is localized in Turkish, which is Gelen Kutusu. Well-known folders include the following types: • Inbox • SentItems • DeletedItems • Calendar • Contacts • Drafts • Journal • Tasks • Notes • JunkEmail • CommunicationHistory • Voicemail • Fax • Conflicts • SyncIssues • LocalFailures • ServerFailures If the user creates a personal folder with the

			same name as a well-known folder and the # symbol surrounding it, you can use a back slash (\) as an escape character to specify that folder. For example, if a user creates a folder named #Notes# and you want to specify that folder, but not the well-known Notes folder, use the following syntax: `\#Notes\#`. **Note:** Wildcard characters can't be used in folder names.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
IsArchive	Optional	System.Management.Automation.SwitchParameter	The *IsArchive* switch specifies that you're exporting from the user's archive.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the mailbox. Use 0 to not

			skip any large items. If any number above 50 is specified then the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
Name	Optional	System.String	The *Name* parameter specifies the name of the specific request for tracking and display purposes. Because you can have multiple export requests per mailbox, Exchange precedes the name with the mailbox's alias. For example, if you create an export request for a user's mailbox that has the alias Kweku and specify the value of this parameter as PC1toArchive, the identity of this export request is Kweku\PC1toArchive. If you don't specify a name using this

			parameter, Exchange generates up to 10 request names per mailbox, which is MailboxExport*X* (where *X* = 0–9). The identity of the request is displayed and searchable as <*alias*>\MailboxExport*X*.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies steps in the export that should be skipped. This parameter is used primarily for debugging purposes.
SourceRootFolder	Optional	System.String	The *SourceRootFolder* parameter specifies the root folder of the mailbox from which data is exported. If this parameter isn't specified, the

			command exports all folders.
Suspend	Optional	System.Management.Automation.SwitchParameter	The *Suspend* switch specifies whether to suspend the request. If you use this switch, the request is queued, but the request won't reach the status of **InProgress** until you resume the request with the relevant resume cmdlet. You don't have to specify a value with this switch.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
TargetRootFolder	Optional	System.String	The *TargetRootFolder* parameter specifies the top-level folder in which to export data. If you don't specify this parameter, the command exports folders to the top of the folder structure in the target .pst file. Content is merged under existing folders, and

			new folders are created if they don't already exist in the target folder structure.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WorkloadType	Optional	Microsoft.Exchange.MailboxReplicationService.RequestWorkloadType	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxExportRequest

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MailboxExportRequest** cmdlet to remove fully or partially completed export requests. You can create multiple export requests for a specified mailbox provided that you specify a distinct name. Completed export requests aren't cleared automatically; they need to be removed by using this cmdlet.

Note:
This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

Note:
When a partially completed export request is removed, content already exported isn't removed from the PST file. If you want to start a new export request to the same file name and start with an empty PST file, you need to rename or delete the previous PST file.

```
Remove-MailboxExportRequest -Identity <MailboxExportRequestIdParameter>
<COMMON PARAMETERS>

Remove-MailboxExportRequest -RequestGuid <Guid> -RequestQueue
<DatabaseIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the second export request Ayla\MailboxExport1.

```
Remove-MailboxExportRequest -Identity "Ayla\MailboxExport1"
```

EXAMPLE 2

This example removes all export requests that have the status of Completed.

```
Get-MailboxExportRequest -Status Completed | Remove-
MailboxExportRequest
```

EXAMPLE 3

This example cancels the export request by using the *RequestGuid* parameter for a mailbox or archive on MBXDB01.

```
Remove-MailboxExportRequest -RequestQueue MBXDB01 -
RequestGuid 25e0eaf2-6cc2-4353-b83e-5cb7b72d441f
```

Detailed Description

The parameter set that requires the *Identity* parameter allows you to remove a fully or partially completed export request.

The parameter set that requires the *RequestGuid* and *RequestQueue* parameters is used for Microsoft Exchange Mailbox Replication service (MRS) debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxExportRequestIdParameter	The *Identity* parameter specifies the identity of the export request. By default, export requests are named <*alias*>\MailboxExport*X* (where *X* = 0–9). Use the following syntax: <*alias*>\<*name*>. You can't use this parameter in conjunction with the *RequestGuid* parameter.
RequestGuid	Required	System.Guid	The *RequestGuid* parameter specifies the unique identifier for the

			export request. To find the export request GUID, use the **Get-MailboxExportRequest** cmdlet. If you specify the *RequestGuid* parameter, you must also specify the *RequestQueue* parameter. You can't use this parameter in conjunction with the *Identity* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the mailbox database on which the request is being performed. This parameter accepts the following values: • GUID of the database • Database name
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	The *DomainController*

		ta.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-MailboxExportRequest

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-MailboxExportRequest** cmdlet to resume an export request that was suspended or failed.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-MailboxExportRequest -Identity <MailboxExportRequestIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes the export request kweku\export.

```
Resume-MailboxExportRequest -Identity kweku\export
```

EXAMPLE 2

This example resumes any failed export move requests.

```
Get-MailboxExportRequest -Status Failed | Resume-
MailboxExportRequest
```

Detailed Description

The **Resume-MailboxExportRequest** cmdlet can be pipelined with the **Get-MailboxExportRequest** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxExportRequestIdParameter	The *Identity* parameter specifies the identity of the export request. By default, export requests are named <*alias*>\MailboxExport*X* (where *X* = 0–9). Use the following syntax: <*alias*>\<*name*>.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxExportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxExportRequest** cmdlet to change export request options after the request has been created. You can use the **Set-MailboxExportRequest** cmdlet to recover from failed export requests.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxExportRequest [-AcceptLargeDataLoss <SwitchParameter>] [-
BadItemLimit <Unlimited>] [-BatchName <String>] [-CompletedRequestAgeLimit
<Unlimited>] [-InternalFlags <InternalMrsFlag[]>] [-LargeItemLimit
<Unlimited>] [-Priority <Lowest | Lower | Low | Normal | High | Higher |
Highest | Emergency>] [-SkipMerging <SkippableMergeComponent[]>] <COMMON
PARAMETERS>

Set-MailboxExportRequest -RehomeRequest <SwitchParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxExportRequestIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the second export request Ayla\MailboxExport1 to accept up to 10 corrupt mailbox items.

```
Set-MailboxExportRequest -Identity "Ayla\MailboxExport1\" -
BadItemLimit 10
```

Detailed Description

You can pipeline the **Set-MailboxExportRequest** cmdlet from the Get-MailboxExportRequest cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxExportRequestIdParameter	The *Identity* parameter specifies the identity of the export request. By default, export requests are named <*alias*>\MailboxExport*X* (where

			X = 0–9). If you specify a name for the export request, use the following syntax: *<alias>**<name>*.
RehomeRequest	Required	System.Management.Automation.SwitchParameter	The *RehomeRequest* parameter specifies to the Microsoft Exchange Mailbox Replication service (MRS) that the request needs to be moved to the same database as the mailbox that's being exported. This parameter is used primarily for debugging purposes.
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination

			mailbox or .pst file.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and

			any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name of the batch.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request will be kept after it has completed before being automatically removed. The default value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the order in which this request is processed in the request queue. Requests are

			processed in order, based on server health, status, priority, and last update time.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies steps in the export that should be skipped. This parameter is used primarily for debugging purposes.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-MailboxExportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-MailboxExportRequest** cmdlet to suspend an export request any time after the request was created, but before the request reaches the status of `Completed`. You can resume the request by using the Resume-MailboxExportRequest cmdlet.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-MailboxExportRequest -Identity <MailboxExportRequestIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-SuspendComment
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends the second export request for Ayla's mailbox with the identity Ayla \MailboxExport1.

```
Suspend-MailboxExportRequest -Identity "Ayla
\MailboxExport1"
```

EXAMPLE 2

This example suspends all export requests that are in progress by using the Get-MailboxExportRequest cmdlet to retrieve all requests with a status of `InProgress`, and then pipelining the output to the **Suspend-MailboxExportRequest** cmdlet with the suspend comment "Resume after 22:00 (10 P.M.)".

```
Get-MailboxExportRequest -Status InProgress | Suspend-
```

```
MailboxExportRequest -SuspendComment "Resume after 22:00
(10 P.M.)"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxExportRequestIdParameter	The *Identity* parameter specifies the identity of the export request. By default, export requests are named <*alias*>\MailboxExport*X* (where *X* = 0–9). Use the following syntax: <*alias*>\<*name*>.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Dat	The *DomainController*

		a.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxExportRequestStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxExportRequestStatistics** cmdlet to view detailed information about export requests.

Note:
This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxExportRequestStatistics -Identity
<MailboxExportRequestIdParameter> <COMMON PARAMETERS>

Get-MailboxExportRequestStatistics -RequestQueue <DatabaseIdParameter> [-
RequestGuid <Guid>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DomainController
<Fqdn>] [-IncludeReport <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the default statistics for the second export request for Tony Smith. The type of information returned by default includes name, mailbox, and status.

```
Get-MailboxExportRequestStatistics -Identity Tony
\MailboxExport1
```

EXAMPLE 2

This example returns statistics for Tony Smith's mailbox and exports the report to a .csv file.

```
Get-MailboxExportRequestStatistics -Identity Tony
\MailboxExport | Export-CSV \\SERVER01
\ExportRequest_Reports\Tony_Exportstats.csv
```

EXAMPLE 3

This example returns additional information about the export request for Tony Smith's mailbox by using the *IncludeReport* parameter and by pipelining the results to the **Format-List** command. (The export request was created using the **New-MailboxExportRequest**.)

```
Get-MailboxExportRequestStatistics -Identity Tony\LegalHold
-IncludeReport | Format-List
```

EXAMPLE 4

This example returns default statistics for an export request being processed by the instance of MRS running on the server CAS01. This command only returns information for export requests currently being processed by an instance of MRS. If the request is already finished, it won't be returned.

```
Get-MailboxExportRequestStatistics -RequestQueue
MailboxDatabase01
```

EXAMPLE 5

This example returns additional information for all the export requests that have a status of `Failed` by using the *IncludeReport* parameter, and then saves the information to the text file AllExportReports.txt.

```
Get-MailboxExportRequest -Status Failed | Get-
MailboxExportRequestStatistics -IncludeReport | Format-List
> AllExportReports.txt
```

Detailed Description

You can pipeline the **Get-MailboxExportRequestStatistics** cmdlet from the Get-MailboxExportRequest cmdlet.

The *RequestQueue* parameter syntax set is for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxExportRequestIdParameter	The *Identity* parameter specifies the identity of the export request. By default, export requests are named <*alias*>\MailboxExport*X* (where *X* = 0–9). If you specified a name for the export request when it was created by using the New-MailboxExportRequest cmdlet, use the following syntax: <*alias*>\<*name*>. This parameter can't be used with the *RequestGuid*, or *RequestQueue* parameters.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the mailbox database on which the mailbox or archive of the request resides. You can use one of the following values: • GUID of the database • Database name This parameter can't be used in conjunction with

			the *Identity* parameter.
Diagnostic	Optional	System.Management.Automation.SwitchParameter	The *Diagnostic* switch specifies whether to retrieve extremely detailed information about the mailbox export request.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
RequestGuid	Optional	System.Guid	The *RequestGuid* parameter specifies the unique identifier for the export request. To find the export request GUID, use the Get-MailboxExportRequest cmdlet. If you specify the *RequestGuid* parameter, you must also specify the *RequestQueue* parameter. You can't use this

			parameter in conjunction with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxFolder

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxFolder** cmdlet to retrieve folders for a specified mailbox when the mailbox owner runs the command.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxFolder [-Identity <MailboxFolderIdParameter>] <COMMON
PARAMETERS>

Get-MailboxFolder -GetChildren <SwitchParameter> [-Identity
<MailboxFolderIdParameter>] [-MailFolderOnly <SwitchParameter>] [-
ResultSize <Unlimited>] <COMMON PARAMETERS>

Get-MailboxFolder -Recurse <SwitchParameter> [-Identity
<MailboxFolderIdParameter>] [-MailFolderOnly <SwitchParameter>] [-
ResultSize <Unlimited>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the Inbox folder in Tony's mailbox. The *Identity* parameter is supplied in the format of <*Mailbox Identity*>:<*Folder*>.

```
Get-MailboxFolder -Identity Tony:\Inbox
```

EXAMPLE 2

This example returns the root folders in Tony's mailbox. The *Identity* parameter is supplied in the format of <*Mailbox Identity*>.

```
Get-MailboxFolder -Identity Tony
```

EXAMPLE 3

This example returns the first level of mail folders in Tony's mailbox.

```
Get-MailboxFolder -Identity Tony -GetChildren -
MailFolderOnly
```

EXAMPLE 4

This example returns information about all the subfolders under Inbox in Tony's mailbox.

```
Get-MailboxFolder -Identity Tony:\Inbox -GetChildren
```

EXAMPLE 5

This example returns all levels of folders under Inbox in Tony's mailbox.

```
Get-MailboxFolder -Identity Tony:\Inbox -Recurse
```

Detailed Description

If the mailbox isn't specified, the cmdlet returns the specified folders in the mailbox of the mailbox owner currently running the command. This command checks that the mailbox specified in the *Identity* parameter is a valid Exchange mailbox before retrieving the requested folders. The cmdlet returns all folders if the *MailFolderOnly* parameter isn't specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folders" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
GetChildren	Required	System.Management.Automation.SwitchParameter	The *GetChildren* parameter specifies whether to return only the first level of subfolders under the specified parent folder. You can't specify both this parameter and the *Recurse* parameter at the same time. The default value is `$false`.
Recurse	Required	System.Management.Automation.SwitchParameter	The *Recurse* parameter specifies whether to return the specified parent folder and all of its subfolders. You can't specify both this parameter and the *GetChildren* parameter at the same time. The default value is `$false`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active

			Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the mailbox and the folder that the command returns information about. If the folder isn't specified, the command returns information about folders in the root hierarchy of the specified mailbox. You can specify values in the following format: *<Mailbox Identity>:<Parent>* Valid values for *<Mailbox Identity>* include: • GUID • ADObjectID • Distinguished name (DN) • *Domain\username* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias • Store object ID of the parent folder Values for *<Parent>* can be both the store object ID and a path string such as

			\Inbox\Personal.
MailFolderOnly	Optional	System.Management.Automation.SwitchParameter	The *MailFolderOnly* parameter specifies whether to return only the mail folders in the specified mailbox. The default value is `$false`.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of settings to return. If you want to return all settings that match the command, use `unlimited` for the value of this parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxFolder

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **New-MailboxFolder** cmdlet to create a folder in a mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxFolder -Name <String> -Parent <MailboxFolderIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the folder Personal under the Inbox folder of Tony's mailbox.

```
New-MailboxFolder -Parent Tony:\Inbox -Name Personal
```

EXAMPLE 2

This example creates the folder Personal in the root folder hierarchy of Tony's mailbox.

```
New-MailboxFolder -Parent Tony -Name Personal
```

EXAMPLE 3

This example creates the folder Personal under the Inbox folder in the mailbox for Tony who's running the command.

```
New-MailboxFolder -Parent :\Inbox -Name Personal
```

Detailed Description

If no parent folder is specified, the cmdlet creates a mail folder in the root folder hierarchy of the mailbox. If the mailbox isn't specified, the cmdlet creates the folder in the mailbox of the user currently running the task. When run, the cmdlet returns the new folder name and the folder path as the output.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folders" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Name	Required	System.String	The *Name* parameter specifies the name of the new folder.
Parent	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Parent* parameter specifies values of the mailbox identity and the parent folder under which the new folder is to be created. If the parent folder isn't specified, the cmdlet creates the folder in the root folder hierarchy of the specified mailbox. You can specify the values in this format: <*Mailbox Identity*>:<*Parent*> Valid values for <*Mailbox Identity*> include: • GUID • ADObjectID • Distinguished name (DN) • *Domain**username* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias • Store object ID of the parent folder Values for <*Parent*> can

			be both the store object ID and a path string such as "\Inbox\Personal".
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-MailboxFolderPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-19*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Add-MailboxFolderPermission** cmdlet to manage folder-level permissions for all folders within a user's mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-MailboxFolderPermission -Identity <MailboxFolderIdParameter> -
AccessRights <MailboxFolderAccessRight[]> -User
<MailboxFolderUserIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example assigns permissions for Ed to access Ayla's Marketing mailbox folder and applies the Owner role to his access of that folder.

```
Add-MailboxFolderPermission -Identity ayla@contoso.com:
\Marketing -User Ed@contoso.com -AccessRights Owner
```

EXAMPLE 2

This example assigns permissions for a user to access specific folders in another user's mailbox in an Exchange Online or Office 365 environment. Do the following:

1. Connect to Exchange Online by using remote PowerShell. For info about how to do this, go to the following Microsoft website:**Connect to Exchange Online using remote PowerShell**.
2. Enter a command using the following syntax to assign access permissions to the specific folder:

```
Add-MailboxFolderPermission -Identity <SMTP address or
alias of recipient>:<Folder path> -AccessRights <Permission
you want to grant the recipient> -User < SMTP address or
alias of recipient to be granted access>
```

This example assigns permissions for Ed to access Ayla's Marketing mailbox folder and applies the Owner role to his access of that folder.

```
Add-MailboxFolderPermission -Identity ayla@contoso.com:
\Marketing -User Ed@contoso.com -AccessRights Owner
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folder permissions" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccessRights	Required	Microsoft.Exchange.Management.StoreTasks.MailboxFolderAccessRight[]	The *AccessRights* parameter specifies the permissions for the user with the following access rights: • **ReadItems** The user has the right to read items within the

			specified folder. • **CreateItems** The user has the right to create items within the specified folder. • **EditOwnedItems** The user has the right to edit the items that the user owns in the specified folder. • **DeleteOwnedItems** The user has the right to delete items that the user owns in the specified folder. • **EditAllItems** The user has the right to edit all items in the specified folder. • **DeleteAllItems** The user has the right to delete all items in the specified folder. • **CreateSubfolders** The user has the right to create subfolders in the specified folder. • **FolderOwner** The user is the owner of the specified folder. The user has the right to view and move the folder and create subfolders. The user

			can't read items, edit items, delete items, or create items. • **FolderContact** The user is the contact for the specified public folder. • **FolderVisible** The user can view the specified folder, but can't read or edit items within the specified public folder. The *AccessRights* parameter also specifies the permissions for the user with the following roles, which are a combination of the rights listed previously: • **None** FolderVisible • **Owner** CreateItems, ReadItems, CreateSubfolders, FolderOwner, FolderContact, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • **PublishingEditor** CreateItems,

			ReadItems, CreateSubfolders, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • **Editor** CreateItems, ReadItems, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • **PublishingAuthor** CreateItems, ReadItems, CreateSubfolders, FolderVisible, EditOwnedItems, DeleteOwnedItems • **Author** CreateItems, ReadItems, FolderVisible, EditOwnedItems, DeleteOwnedItems • **NonEditingAuthor** CreateItems, ReadItems, FolderVisible • **Reviewer** ReadItems, FolderVisible • **Contributor** CreateItems, FolderVisible

			The following roles apply specifically to calendar folders: • **AvailabilityOnly** View only availability data • **LimitedDetails** View availability data with subject and location
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the recipient and folder that you want to change the permissions for. This parameter takes the following format: *<SMTP Address or Alias of Recipient>*:*<Folder path>*. The following is an example: john@contoso.com:\Calendar
User	Required	Microsoft.Exchange.Management.StoreTasks.MailboxFolderUserIdParameter	The *User* parameter specifies who's granted permission to view or modify the folder contents of the user specified in the *Identity* parameter. This parameter accepts only users and distribution lists that have SMTP addresses. Security Groups are not allowed. The following values are

			acceptable: • Alias • SMTP address
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxFolderPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxFolderPermission** cmdlet to view the folder-level permissions for a folder or a specific user's permissions for a folder.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxFolderPermission -Identity <MailboxFolderIdParameter> [-
DomainController <Fqdn>] [-User <MailboxFolderUserIdParameter>]
```

Examples

EXAMPLE 1

This example returns the current list of user permissions for John's Reports mailbox folder under the Marketing folder.

```
Get-MailboxFolderPermission -Identity john@contoso.com:
\Marketing\Reports
```

EXAMPLE 2

This example returns the permissions that Ayla has to view John's Marketing Reports folder.

```
Get-MailboxFolderPermission -Identity john@contoso.com:
\Marketing\Reports -User Ayla@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folder permissions" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the mailbox and folder for which you want to view permissions. This parameter takes the following format: <*SMTP Address or Alias of the mailbox*>:<*Folder path*>, for example, john@contoso.com:\Calendar.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
User	Optional	Microsoft.Exchange.Management.StoreTasks.MailboxFolderUserIdParameter	The *User* parameter specifies who's granted permission to view or modify folder contents of the user and folder specified in the *Identity* parameter. You can use the following values: • Alias • SMTP address

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxFolderPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MailboxFolderPermission** cmdlet to remove folder-level permissions for a user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxFolderPermission -Identity <MailboxFolderIdParameter> -User
<MailboxFolderUserIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes John's permission to modify Kim's mailbox folder Training.

```
Remove-MailboxFolderPermission -Identity kim@contoso.com:
\Training -User john@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folder permissions" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the user and folder for whom you want to modify permissions. This parameter takes the following format: *<SMTP Address or Alias of the recipient>:<Folder path>*, for example, john@contoso.com:\Calendar.
User	Required	Microsoft.Exchange.M	The *User* parameter specifies who's granted

		anagement.StoreTasks.MailboxFolderUserIdParameter	permissions to view or modify folder contents of the user specified in the *Identity* parameter. The following values are acceptable: • Alias • SMTP address
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxFolderPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxFolderPermission** cmdlet to update folder-level permissions for all folders within a user's mailbox. The cmdlet differs from the Add-MailboxFolderPermission cmdlet in that it edits an existing permission entry.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxFolderPermission -Identity <MailboxFolderIdParameter> -
AccessRights <MailboxFolderAccessRight[]> -User
<MailboxFolderUserIdParameter> [-Confirm [<SwitchParameter>]] [-
```

```
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example assigns permissions for Ed to access Ayla's Marketing mailbox folder and applies the Owner role to his access of that folder.

```
Set-MailboxFolderPermission -Identity ayla@contoso.com:
\Marketing -User Ed@contoso.com -AccessRights Owner
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folders" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccessRights	Required	Microsoft.Exchange.Management.StoreTasks.MailboxFolderAccessRight[]	The *AccessRights* parameter specifies the permissions for the user with the following access rights: • **ReadItems** The user has the right to read items within the specified folder. • **CreateItems** The user has the right to create items within the specified folder. • **EditOwnedItems** The user has the right to edit the items that the user

			owns in the specified folder. • **DeleteOwnedItems** The user has the right to delete items that the user owns in the specified folder. • **EditAllItems** The user has the right to edit all items in the specified folder. • **DeleteAllItems** The user has the right to delete all items in the specified folder. • **CreateSubfolders** The user has the right to create subfolders in the specified folder. • **FolderOwner** The user is the owner of the specified folder. The user has the right to view and move the folder and create subfolders. The user can't read items, edit items, delete items, or create items. • **FolderContact** The user is the contact for the specified folder. • **FolderVisible** The user can view the

			specified folder, but can't read or edit items within the specified folder. The *AccessRights* parameter also specifies the permissions for the user with the following roles, which are a combination of the rights listed previously: • **None** FolderVisible • **Owner** CreateItems, ReadItems, CreateSubfolders, FolderOwner, FolderContact, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • **PublishingEditor** CreateItems, ReadItems, CreateSubfolders, FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • **Editor** CreateItems, ReadItems,

			FolderVisible, EditOwnedItems, EditAllItems, DeleteOwnedItems, DeleteAllItems • **PublishingAuthor** CreateItems, ReadItems, CreateSubfolders, FolderVisible, EditOwnedItems, DeleteOwnedItems • **Author** CreateItems, ReadItems, FolderVisible, EditOwnedItems, DeleteOwnedItems • **NonEditingAuthor** CreateItems, ReadItems, FolderVisible • **Reviewer** ReadItems, FolderVisible • **Contributor** CreateItems, FolderVisible The following roles apply specifically to calendar folders: • **AvailabilityOnly** View only availability data • **LimitedDetails** View availability data with subject and location

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxFolderIdParameter	The *Identity* parameter specifies the recipient and folder that you want to change the permissions for. This parameter takes the following format: *<SMTP Address or Alias of Recipient>*:*<Folder path>*. The following is an example: john@contoso.com:\Calendar
User	Required	Microsoft.Exchange.Management.StoreTasks.MailboxFolderUserIdParameter	The *User* parameter specifies who's granted permission to view or modify the folder contents of the user specified in the *Identity* parameter. The following values are acceptable: • Alias • SMTP address
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxFolderStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxFolderStatistics** cmdlet to retrieve information about the folders in a specified mailbox, including the number and size of items in the folder, the folder name and ID, and other information.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxFolderStatistics -Identity <MailboxOrMailUserIdParameter> [-
Archive <SwitchParameter>] [-DomainController <Fqdn>] [-FolderScope
<Calendar | Contacts | DeletedItems | Drafts | Inbox | JunkEmail | Journal
| Notes | Outbox | SentItems | Tasks | All | ManagedCustomFolder |
RssSubscriptions | SyncIssues | ConversationHistory | Personal |
RecoverableItems | NonIpmRoot | LegacyArchiveJournals>] [-IncludeAnalysis
<SwitchParameter>] [-IncludeOldestAndNewestItems <SwitchParameter>]
```

Examples

EXAMPLE 1

This example doesn't specify the *FolderScope* parameter and retrieves all the information about the user Chris in the Contoso domain.

```
Get-MailboxFolderStatistics -Identity contoso\chris
```

EXAMPLE 2

This example uses the *FolderScope* parameter to view the statistics for calendar folders for the user Chris.

```
Get-MailboxFolderStatistics -Identity Chris -FolderScope
Calendar
```

EXAMPLE 3

This example uses the *Archive* parameter to view the statistics for Ayla's archive.

```
Get-MailboxFolderStatistics -Identity Ayla@contoso.com -
Archive
```

EXAMPLE 4

This example uses the *IncludeAnalysis* parameter to view the statistics of Tony's Recoverable Items folder.

```
Get-MailboxFolderStatistics -Identity "Tony" -FolderScope RecoverableItems -IncludeAnalysis
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox folder permissions" entry in the Recipients Permissions topic.

Note:

A mailbox can have hidden items that are never visible to the user and are only used by applications. The **Get-MailboxFolderStatistics** cmdlet can return hidden items for the following values: FolderSize, FolderAndSubfolderSize, ItemsInFolder, and ItemsInFolderAndSubfolders.

Note:

The **Get-MailboxFolderStatistics** cmdlet shouldn't be confused with the **Get-MailboxStatistics** cmdlet. For more information, see Get-MailboxStatistics.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail-enabled user. You can use one of the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name

			(UPN) • LegacyExchangeDN • SMTP address • Alias
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter specifies whether to return the usage statistics of the archive associated with the mailbox or mail-enabled user. You don't need to provide a value with this parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
FolderScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ElcFolderType	This parameter is available only in on-premises Exchange 2013. The *FolderScope* parameter specifies the scope of the search by folder type. Valid parameter values include: • `All` • `Calendar` • `Contacts`

			• ConversationHistory • DeletedItems • Drafts • Inbox • JunkEmail • Journal • LegacyArchiveJournals • ManagedCustomFolder • NonIpmRoot • Notes • Outbox • Personal • RecoverableItems • RssSubscriptions • SentItems • SyncIssues • Tasks If the ManagedCustomFolder value is entered, the command returns the output for all managed custom folders. If the RecoverableItems value is entered, the command returns the output for the Recoverable Items folder and the Deletions, Purges, and Versions subfolders.
IncludeAnalysis	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IncludeAnalysis* parameter specifies whether to scan all items within a folder and return statistics related to the folder and item size. This parameter should be used for troubleshooting

			purposes, and it may take a long time to complete. You don't need to provide a value with this parameter.
IncludeOldestAndNewestItems	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IncludeOldestAndNewestItems* parameter specifies whether to return the dates of the oldest and newest items in each folder.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxImportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxImportRequest** cmdlet to view the detailed status of an ongoing import request that was initiated using the **New-MailboxImportRequest** cmdlet.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxImportRequest [-AccountPartition <AccountPartitionIdParameter>]
[-Identity <MailboxImportRequestIdParameter>] [-Organization
<OrganizationIdParameter>] <COMMON PARAMETERS>

Get-MailboxImportRequest [-AccountPartition <AccountPartitionIdParameter>]
[-BatchName <String>] [-HighPriority <$true | $false>] [-Mailbox
<MailboxOrMailUserIdParameter>] [-Name <String>] [-Organization
<OrganizationIdParameter>] [-RequestQueue <DatabaseIdParameter>] [-Status
<None | Queued | InProgress | AutoSuspended | CompletionInProgress |
Synced | Completed | CompletedWithWarning | Suspended | Failed>] [-Suspend
<$true | $false>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the default information regarding the status of the ongoing import request with the identity tony\Recovered. The type of information returned by default includes name, mailbox, and status.

```
Get-MailboxImportRequest -Identity "tony\Recovered"
```

EXAMPLE 2

This example returns the status of import requests in the ImportingDB1PSTs batch that completed.

```
Get-MailboxImportRequest -BatchName "ImportingDB1PSTs" -
Status Completed
```

EXAMPLE 3

This example returns all import requests that have the name Recovered where the import has been suspended.

```
Get-MailboxImportRequest -Name "Recovered" -Suspend $true
```

Detailed Description

The search criteria for the **Get-MailboxImportRequest** cmdlet is a Boolean **And** statement. If you use multiple parameters, you narrow your search and reduce your search results.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name given to a batch import request. You can't use this parameter in conjunction with the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active

			Directory.
HighPriority	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *HighPriority* parameter specifies that the cmdlet should return requests that were created with the *HighPriority* flag. The *HighPriority* flag indicates that the request should be processed before other lower priority requests in the queue. You can't use this parameter in conjunction with the *Identity* parameter.
Identity	Optional	Microsoft.Exchange.MailboxReplicationService.MailboxImportRequestIdParameter	The *Identity* parameter specifies the identity of the import request. By default, import requests are named <*alias*>\MailboxImport*X* (where *X* = 0–9). If you specify a name for the import request, use the following syntax: <*alias*>\<*name*>. Microsoft Exchange Server 2013 automatically precedes the request with

			the mailbox's alias. This parameter can't be used in conjunction with the following parameters: • *BatchName* • *Mailbox* • *Name* • *Status* • *Suspend* • *HighPriority*
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Mailbox* parameter specifies the identity of the mailbox or mail user into which content is being imported. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias You can't use this parameter in conjunction with the *Identity* parameter.
Name	Optional	System.String	The *Name* parameter specifies that import requests that have the

			specified name are returned. Use this parameter to search on the name that you provided when you created the import request. If you didn't specify a name when the request was created, the default name is MailboxImport*X* (where *X* = 0-9). You can't use this parameter in conjunction with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter specifies the organization you want configuration data from.
RequestQueue	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *RequestQueue* parameter specifies that the cmdlet retrieves requests that are based in a queue on the specified database. By default, the request is created in a queue on the same

			database as where the mailbox is hosted.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Status	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestStatus	The *Status* parameter specifies that import requests with the specified status are returned. You can use the following values: • `AutoSuspended` • `Completed` • `CompletionInProgress` • `CompletedWithWarning` • `Failed` • `InProgress` • `None` • `Queued` • `Suspended` **Note:** `CompletionInProgress` and `AutoSuspended` don't apply to import requests and won't return any information. You can't use this parameter in conjunction with the *Identity* parameter.

Suspend	Optional	System.Boolean	The *Suspend* parameter specifies whether to return mailboxes with import requests that have been suspended. This parameter accepts `$true` or `$false`. You can't use this parameter in conjunction with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxImportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-28*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-MailboxImportRequest** cmdlet to begin the process of importing a .pst file to a mailbox or archive. You can create more than one mailbox import request per mailbox and each mailbox import request must have a unique name. Microsoft Exchange automatically generates up to 10 unique names for a mailbox import request. However, to create more than 10 import requests for a mailbox, you need to specify a unique name when creating the import request, or you can remove existing import requests with the Remove-MailboxExportRequest cmdlet before starting a

new import request with the default request *<Alias>*\MailboxImport*X* (where *X* = 0–9).

By default, the import checks for duplication of items and doesn't copy the data from the .pst file into the mailbox or archive if a matching item exists in the target mailbox or target archive.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxImportRequest -FilePath <LongPath> -Mailbox
<MailboxOrMailUserIdParameter> [-AssociatedMessagesCopyOption <DoNotCopy |
MapByMessageClass | Copy>] [-ConflictResolutionOption <KeepSourceItem |
KeepLatestItem | KeepAll>] [-ContentCodePage <Int32>] [-ExcludeDumpster
<SwitchParameter>] [-ExcludeFolders <String[]>] [-IncludeFolders <String[]
>] [-IsArchive <SwitchParameter>] [-RemoteCredential <PSCredential>] [-
RemoteHostName <Fqdn>] [-SourceRootFolder <String>] [-TargetRootFolder
<String>] [-AcceptLargeDataLoss <SwitchParameter>] [-BadItemLimit
<Unlimited>] [-BatchName <String>] [-CompletedRequestAgeLimit <Unlimited>]
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-InternalFlags
<InternalMrsFlag[]>] [-LargeItemLimit <Unlimited>] [-Name <String>] [-
Priority <Lowest | Lower | Low | Normal | High | Higher | Highest |
Emergency>] [-SkipMerging <SkippableMergeComponent[]>] [-Suspend
<SwitchParameter>] [-SuspendComment <String>] [-WhatIf
[<SwitchParameter>]] [-WorkloadType <None | Local | Onboarding |
Offboarding | TenantUpgrade | LoadBalancing | Emergency |
RemotePstIngestion | SyncAggregation>]
```

Examples

EXAMPLE 1

This example imports a recovered .pst file on SERVER01 into the user Ayla's primary mailbox. Only data in the .pst file's Inbox is imported. The data is imported into the RecoveredFiles folder of the target mailbox for Ayla.

```
New-MailboxImportRequest -Mailbox Ayla -FilePath \\SERVER01
\PSTFiles\Recovered.pst -TargetRootFolder "RecoveredFiles"
-IncludeFolders "#Inbox#"
```

EXAMPLE 2

This example imports a .pst file into Kweku's archive folder. The *TargetRootFolder* isn't specified; therefore, content is merged under existing folders and new folders are created if they don't already exist in the target folder structure.

```
New-MailboxImportRequest -Mailbox Kweku -IsArchive -
FilePath \\SERVER01\PSTFiles\Archives\Kweku\Archive2012.pst
```

EXAMPLE 3

This example imports all of the .pst files on a shared folder. Each .pst file name is named after a corresponding user's alias. The command creates an import request for all the .pst files and imports the data into the matching mailbox.

```
Dir \\SERVER01\PSTshareRO\Recovered\*.pst | %{ New-
MailboxImportRequest -Name RecoveredPST -BatchName
Recovered -Mailbox $_.BaseName -FilePath $_.FullName -
TargetRootFolder SubFolderInPrimary}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

You need to grant the following permission to the group Exchange Trusted Subsystem to the network share where you want to export or import PST files:

- To import PST files from the share: Read permission
- To save exported PST files to the share: Read/Write permission.

If you don't grant this permission, you will receive an error message stating that Exchange is unable to establish a connection to the PST file on the network share.

Parameters

Parameter	Required	Type	Description
FilePath	Required	Microsoft.Exchange.Data.LongPath	The *FilePath* parameter specifies the network share path of the .pst file from which data is imported, for example, \\SERVER01\PST Files\ToImport.pst. You need to grant the following permission to the group Exchange Trusted Subsystem to the network share where you

			want to export or import PST files: • To import PST files from the share: Read permission • To save exported PST files to the share: Read/Write permission. If you don't grant this permission, you will receive an error message stating that Exchange is unable to establish a connection to the PST file on the network share.
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Mailbox* parameter specifies the mailbox or mail-enabled user into which to import contents. You can use the following values: • Alias • SMTP address • Display name
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read

			from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
AssociatedMessagesCopyOption	Optional	Microsoft.Exchange.MailboxReplicationService.FAICopyOption	The *AssociatedMessagesCopyOption* parameter specifies whether associated messages are copied when the request is processed. Associated messages are special messages that contain hidden data with information about rules, views, and forms. By default, associated messages are copied. This parameter accepts the following values: • `DoNotCopy` The associated messages aren't copied. • `MapByMessageClass` This option finds the corresponding associated message by looking up the **MessageClass** attribute of the source message. If there's an associated message of this class in both source and target

			folders, it overwrites the associated message in the target. If there isn't an associated message in the target, it creates a copy in the target. • `Copy` This option copies associated messages from the source to the target. If the same message type exists both in the source and the target location, these associated messages are duplicated. This is the default option. **Note:** Content filtering doesn't apply to associated messages.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use `0` to not skip bad items. The valid input range for this parameter is from `0` through `2147483647`. The default value is `0`. We recommend that you keep the default value `0` and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the

			BadItemLimit parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a descriptive name for importing a batch of mailboxes. You can use the name in the *BatchName* parameter as a string search when you use the **Get-MailboxImportRequest** cmdlet.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request will be kept after it has completed before being automatically removed. The default value of the

			CompletedRequestAgeLimit parameter is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConflictResolutionOption	Optional	Microsoft.Exchange.MailboxReplicationService.ConflictResolutionOption	The *ConflictResolutionOption* parameter specifies the action for the Microsoft Exchange Mailbox Replication service (MRS) to take if there are multiple matching messages in the target. This parameter takes the following values: • `KeepSourceItem` • `KeepLatestItem` • `KeepAll` The default value is `KeepSourceItem`.
ContentCodePage	Optional	System.Int32	The *ContentCodePage* parameter specifies the specific code page to use for an ANSI pst file. The

			ANSI pst file is the Outlook 97 to Outlook 2002 pst format files. You can find the valid values in the Code Page Identifiers topic.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExcludeDumpster	Optional	System.Management.Automation.SwitchParameter	The *ExcludeDumpster* parameter specifies whether to exclude the Recoverable Items folder. You don't have to include a value with this parameter. If you don't specify this parameter, the Recoverable Items folder is copied with the following subfolders: • Deletions • Versions • Purges
ExcludeFolders	Optional	System.String[]	The *ExcludeFolders* parameter specifies the list of folders to exclude during the import.

			Folder names aren't case-sensitive, and there are no character restrictions. Use the following syntax: `<FolderName>/*` Use this syntax to denote a personal folder under the folder specified in the *SourceRootFolder* parameter, for example, "MyProjects" or "MyProjects/FY2010". `#<FolderName>#/*` Use this syntax to denote a well-known folder regardless of the folder's name in another language. For example, `#Inbox#` denotes the Inbox folder even if the Inbox is localized in Turkish, which is Gelen Kutusu. Well-known folders include the following types: • Inbox • SentItems • DeletedItems • Calendar • Contacts • Drafts • Journal • Tasks • Notes • JunkEmail • CommunicationHistory • Voicemail • Fax

			• Conflicts • SyncIssues • LocalFailures • ServerFailures If the user creates a personal folder with the same name as a well-known folder and the # symbol surrounding it, you can use a back slash (\) as an escape character to specify that folder. For example, if a user creates a folder named #Notes# and you want to specify that folder, but not the well-known Notes folder, use the following syntax: `\#Notes\#`. **Note:** Wildcard characters can't be used in folder names. If the *TargetRootFolder* parameter isn't specified when the Recoverable Items folder is imported, the recoverable item content is placed in the Recoverable Items folder of the target mailbox or archive.
IncludeFolders	Optional	System.String[]	The *IncludeFolders* parameter specifies the

			list of folders to include during the import. Folder names aren't case-sensitive, and there are no character restrictions. Use the following syntax: `<FolderName>/*` Use this syntax to denote a personal folder under the folder specified in the *SourceRootFolder* parameter, for example, "MyProjects" or "MyProjects/FY2010". `#<FolderName>#/*` Use this syntax to denote a well-known folder regardless of the folder's name in another language. For example, `#Inbox#` denotes the Inbox folder even if the Inbox is localized in Turkish, which is Gelen Kutusu. Well-known folders include the following types: • Inbox • SentItems • DeletedItems • Calendar • Contacts • Drafts • Journal • Tasks • Notes • JunkEmail • CommunicationHistory

			• Voicemail • Fax • Conflicts • SyncIssues • LocalFailures • ServerFailures If the user creates a personal folder with the same name as a well-known folder and the # symbol surrounding it, you can use a back slash (\) as an escape character to specify that folder. For example, if a user creates a folder named #Notes# and you want to specify that folder, but not the well-known Notes folder, use the following syntax: `\#Notes\#`. **Note:** Wildcard characters can't be used in folder names.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
IsArchive	Optional	System.Management.Automation.SwitchPar	The *IsArchive* switch specifies that you're

		ameter	importing the .pst file into the user's archive.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
Name	Optional	System.String	The *Name* parameter specifies the name of the specific request for tracking and display purposes. Because you can have multiple import requests per mailbox, Exchange precedes the name with the mailbox's alias. For example, if you create an import request for a user's mailbox that

			has the alias Kweku and specify the value of this parameter as PC1toArchive, the identity of this import request is Kweku\PC1toArchive. If you don't specify a name using this parameter, Exchange generates up to 10 request names per mailbox, which is MailboxImport*X* (where *X* = 0–9). The identity of the request is displayed and searchable as <*alias*>\MailboxImport*X*.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time.
RemoteCredential	Optional	System.Management.Automation.PSCredential	The *RemoteCredential* parameter specifies an administrator who has permission to perform the mailbox import request. For example,

			Administrator@humongousinsurance.com.
RemoteHostName	Optional	Microsoft.Exchange.Data.Fqdn	The *RemoteHostName* parameter specifies the FQDN of the cross-forest organization from which you're making the import request.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies steps in the import that should be skipped. This parameter is used primarily for debugging purposes.
SourceRootFolder	Optional	System.String	The *SourceRootFolder* parameter specifies the root folder of the .pst file from which data is imported. When specified, the folder hierarchy outside the value of the *SourceRootFolder* parameter isn't imported, and the *SourceRootFolder* parameter is mapped to the *TargetRootFolder* parameter. If this parameter isn't specified, the command imports all

			folders.
Suspend	Optional	System.Management.Automation.SwitchParameter	The *Suspend* switch specifies whether to suspend the request. If you use this switch, the request is queued, but the request won't reach the status of **InProgress** until you resume the request with the relevant resume cmdlet. You don't have to specify a value with this switch.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
TargetRootFolder	Optional	System.String	The *TargetRootFolder* parameter specifies the top-level mailbox folder that the imported content is placed in. If you don't specify this parameter, the command imports folders to the top of the folder structure in the target mailbox or archive. If the folder already exists,

			content is merged under existing folders, and new folders are created if they don't already exist in the target folder structure.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WorkloadType	Optional	Microsoft.Exchange.MailboxReplicationService.RequestWorkloadType	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxImportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MailboxImportRequest** cmdlet to remove fully or partially completed import requests. Completed import requests aren't automatically cleared. Requests need to be removed by using the **Remove-MailboxImportRequest** cmdlet. Multiple import requests can exist against the same mailbox if you provide a distinct import request name.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

Note:

Removing a partially completed import request removes the request from the Microsoft Exchange Mailbox Replication service (MRS) job queue. Any import progress that was made until the removal won't be reverted.

```
Remove-MailboxImportRequest -Identity <MailboxImportRequestIdParameter>
<COMMON PARAMETERS>

Remove-MailboxImportRequest -RequestGuid <Guid> -RequestQueue
<DatabaseIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the second import request for Ayla's mailbox Ayla\MailboxImport1.

```
Remove-MailboxImportRequest -Identity "Ayla\MailboxImport1"
```

EXAMPLE 2

This example cancels the import request by using the *RequestGuid* parameter for a mailbox or archive on MBXDB01.

```
Remove-MailboxImportRequest -RequestQueue MBXDB01 -
RequestGuid 25e0eaf2-6cc2-4353-b83e-5cb7b72d441f
```

EXAMPLE 3

This example removes all completed import requests.

```
Get-MailboxImportRequest -Status Completed | Remove-
MailboxImportRequest
```

Detailed Description

The parameter set that requires the *Identity* parameter allows you to remove a fully or partially completed import request.

The parameter set that requires the *RequestGuid* and *RequestQueue* parameters is used for MRS debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxImportRequestIdParameter	The *Identity* parameter specifies the identity of the import request. By default, import requests are named <*alias*>\MailboxImport*X* (where *X* = 0–9). If you created the request using the *Name* parameter, use the following syntax: <*alias*>\<*name*>. You can't use this parameter in conjunction

			with the *RequestGuid* parameter.
RequestGuid	Required	System.Guid	The *RequestGuid* parameter specifies the unique identifier for the import request. To find the import request GUID, use the Get-MailboxImportRequest cmdlet. If you specify the *RequestGuid* parameter, you must also specify the *RequestQueue* parameter. You can't use this parameter in conjunction with the *Identity* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the mailbox database on which the request is being performed. This parameter accepts the following values: • GUID of the database • Database name
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-MailboxImportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-MailboxImportRequest** cmdlet to resume an import request that was suspended or failed.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-MailboxImportRequest -Identity <MailboxImportRequestIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes the second import request for Kweku's mailbox kweku\MailboxImport1

```
Resume-MailboxImportRequest -Identity kweku\MailboxImport1
```

EXAMPLE 2

This example resumes all failed import requests.

```
Get-MailboxImportRequest -Status Failed | Resume-
MailboxImportRequest
```

Detailed Description

This cmdlet can be pipelined with the **Get-MailboxImportRequest** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxImportRequestIdParameter	The *Identity* parameter specifies the identity of the import request. By default, import requests are named <*alias*>\MailboxImport*X* (where *X* = 0–9). If you created the request using the *Name* parameter, use the following syntax: <*alias*>\<*name*>.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Dat	The *DomainController*

		a.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxImportRequest

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxImportRequest** cmdlet to change import request options after the request has been created. You can use the **Set-MailboxImportRequest** cmdlet to recover from failed import requests.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxImportRequest [-AcceptLargeDataLoss <SwitchParameter>] [-
BadItemLimit <Unlimited>] [-BatchName <String>] [-CompletedRequestAgeLimit
<Unlimited>] [-InternalFlags <InternalMrsFlag[]>] [-LargeItemLimit
<Unlimited>] [-Priority <Lowest | Lower | Low | Normal | High | Higher |
Highest | Emergency>] [-RemoteCredential <PSCredential>] [-RemoteHostName
<Fqdn>] [-SkipMerging <SkippableMergeComponent[]>] <COMMON PARAMETERS>

Set-MailboxImportRequest -RehomeRequest <SwitchParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxImportRequestIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the import request Kweku\Import to accept up to five corrupted mailbox items.

```
Set-MailboxImportRequest -Identity "Kweku\Import" -
BadItemLimit 5
```

EXAMPLE 2

This example finds all import requests that have a status of Suspended, and then gives them a batch name of April14.

```
Get-MailboxImportRequest -Status Suspended | Set-
MailboxImportRequest -BatchName April14
```

Detailed Description

You can pipeline the **Set-MailboxImportRequest** cmdlet from the Get-MailboxImportRequest cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxImportRequestIdParameter	The *Identity* parameter specifies the identity of the import request. By default, import requests are named <*alias*>\MailboxImport*X* (where *X* = 0–9). If you specified a name for the import request with the New-MailboxImportRequest cmdlet, use the following syntax: <*alias*>\<*name*>.
RehomeRequest	Required	System.Management.Automation.SwitchParameter	The *RehomeRequest* parameter specifies to the Microsoft Exchange Mailbox Replication service (MRS) that the request needs to be moved to the same database as the mailbox

			being imported. This parameter is used primarily for debugging purposes.
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use `0` to not skip bad items. The valid input range for this parameter is from `0` through `2147483647`. The default value is `0`. We recommend that

			you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name of the batch.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request is kept after it has completed before being automatically removed.

			The default *CompletedRequestAgeLimit* parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items

			to skip if the request encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the order in which this request is processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time.
RemoteCredential	Optional	System.Management.Automation.PSCredential	The *RemoteCredential* parameter specifies an administrator who has permission to perform the mailbox import request. For example, Administrator@

			humongousinsurance.com.
RemoteHostName	Optional	Microsoft.Exchange.Data.Fqdn	The *RemoteHostName* parameter specifies the FQDN of the cross-forest organization from which you're configuring the import request.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies the steps in the import that should be skipped. This parameter is used primarily for debugging purposes.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-MailboxImportRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-MailboxImportRequest** cmdlet to suspend an import request any time after the request was created, but before the request reaches the status of `Completed`. You can resume the move request by using the Resume-MailboxImportRequest cmdlet.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-MailboxImportRequest -Identity <MailboxImportRequestIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-SuspendComment
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends the second import request for Ayla's mailbox with the identity Ayla \MailboxImport1.

```
Suspend-MailboxImportRequest -Identity "Ayla
\MailboxImport1"
```

EXAMPLE 2

This example suspends all import requests that are in progress by using the Get-MailboxImportRequest cmdlet to retrieve all requests with a Status of `InProgress`, and then pipelining the output to the **Suspend-MailboxImportRequest** cmdlet with the suspend comment "Resume after 22:00 (10 P.M.)".

```
Get-MailboxImportRequest -Status InProgress | Suspend-MailboxImportRequest -SuspendComment "Resume after 22:00 (10 P.M.)"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxImportRequestIdParameter	The *Identity* parameter specifies the identity of the import request. By default, import requests are named <*alias*>\MailboxImport*X* (where *X* = 0–9). If you created the request by using the *Name* parameter, use the following syntax: <*alias*>\<*name*>.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxImportRequestStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxImportRequestStatistics** cmdlet to view detailed information about import requests.

Note:

This cmdlet is available only in the Mailbox Import Export role, and by default, that role isn't assigned to a role group. To use this cmdlet, you need to add the Mailbox Import Export role to a role group (for example, to the Organization Management role group). For more information, see the "Add a role to a role group" section in Manage role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxImportRequestStatistics -Identity
<MailboxImportRequestIdParameter> <COMMON PARAMETERS>

Get-MailboxImportRequestStatistics -RequestQueue <DatabaseIdParameter> [-
RequestGuid <Guid>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DomainController
```

```
<Fqdn>] [-IncludeReport <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the default statistics for the second import request for Tony Smith. The type of information returned by default includes name, mailbox, and status.

```
Get-MailboxImportRequestStatistics -Identity Tony
\MailboxImport1
```

EXAMPLE 2

This example returns the detailed statistics for the second import request for Tony Smith's mailbox and exports the report to a .csv file.

```
Get-MailboxImportRequestStatistics -Identity Tony
\MailboxImport1 | Export-CSV \\SERVER01
\ImportRequest_Reports\Tony_Importstats.csv
```

EXAMPLE 3

This example returns additional information about the import request for Tony Smith's mailbox by using the *IncludeReport* parameter and by pipelining the results to the **Format-List** command.

```
Get-MailboxImportRequestStatistics -Identity Tony\LegalHold
-IncludeReport | Format-List
```

EXAMPLE 4

This example returns additional information for all the import requests that have a status of `Failed` by using the *IncludeReport* parameter, and then saves the information to the text file AllImportReports.txt.

```
Get-MailboxImportRequest -Status Failed | Get-
MailboxImportRequestStatistics -IncludeReport | Format-List
> AllImportReports.txt
```

Detailed Description

You can pipeline the **Get-MailboxImportRequestStatistics** cmdlet from the **Get-MailboxImportRequest** cmdlet.

The *RequestQueue* parameter syntax set is for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Import Export" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxImportRequestIdParameter	The *Identity* parameter specifies the identity of the import request. By default, import requests are named <*alias*>\MailboxImport*X* (where *X* = 0–9). If you specified a name when you created the import request, use the following syntax: <*alias*>\<*name*>.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the mailbox database on which the mailbox or archive of the request resides. You can use one of the following values: • GUID of the database • Database name This parameter can't be used in conjunction with the *Identity* or *MRSInstance* parameters.
Diagnostic	Optional	System.Management.	The *Diagnostic* switch

		Automation.SwitchParameter	specifies whether to retrieve extremely detailed information about the mailbox import request statistics.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
RequestGuid	Optional	System.Guid	The *RequestGuid* parameter specifies the unique identifier for the import request. To find the import request GUID, use the **Get-MailboxImportRequest** cmdlet. If you specify the *RequestGuid* parameter, you must also specify the *RequestQueue* parameter. You can't use this parameter in conjunction with the *Identity*

			parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-MailboxPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-19*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Add-MailboxPermission** cmdlet to add permissions to a mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-MailboxPermission -Identity <MailboxIdParameter> -Owner
<SecurityPrincipalIdParameter> <COMMON PARAMETERS>

Add-MailboxPermission -AccessRights <MailboxRights[]> -Identity
<MailboxIdParameter> -User <SecurityPrincipalIdParameter> [-AutoMapping
<$true | $false>] [-Deny <SwitchParameter>] [-InheritanceType <None | All
| Descendents | SelfAndChildren | Children>] <COMMON PARAMETERS>

Add-MailboxPermission -Instance <MailboxAcePresentationObject> [-
AccessRights <MailboxRights[]>] [-AutoMapping <$true | $false>] [-Deny
<SwitchParameter>] [-Identity <MailboxIdParameter>] [-InheritanceType
<None | All | Descendents | SelfAndChildren | Children>] [-User
<SecurityPrincipalIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-IgnoreDefaultScope <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example grants Kevin Kelly full access to Terry Adams's mailbox.

Note:
The *Identity* parameter requires the full name of the user to be enclosed in quotation marks (").

```
Add-MailboxPermission -Identity "Terry Adams" -User
KevinKelly -AccessRights FullAccess -InheritanceType All
```

EXAMPLE 2

This example sets Tony Smith as the owner of the resource mailbox Room 222.

```
Add-MailboxPermission -Identity "Room 222" -Owner "Tony
Smith"
```

EXAMPLE 3

This example grants the user Mark Steele Full Access permission to Jeroen Cool's mailbox and disables the auto-mapping feature.

```
Add-MailboxPermission -Identity JeroenC -User 'Mark Steele'
-AccessRights FullAccess -InheritanceType All -AutoMapping
$false
```

EXAMPLE 4

This example assigns full access permissions to all user mailboxes in an Exchange Online or Office 365 environment.

1. Connect to Exchange Online by using remote PowerShell. For info about how to do this, go to the following Microsoft website:**Connect to Exchange Online using remote PowerShell**.
2. Enter a command using the following syntax to assign full access permissions to all user mailboxes:

```
Get-Mailbox -ResultSize unlimited -Filter
{(RecipientTypeDetails -eq 'UserMailbox') -and (Alias -ne
'Admin')} | Add-MailboxPermission -User <user, role group
or security group> -AccessRights fullaccess -
InheritanceType all
```

For example, to assign full access permissions to all user mailboxes for the administrator account admin@contoso.com, run the following command.

```
Get-Mailbox -ResultSize unlimited -Filter
```

```
{(RecipientTypeDetails -eq 'UserMailbox') -and (Alias -ne
'Admin')} | Add-MailboxPermission -User admin@contoso.com -
AccessRights fullaccess -InheritanceType all
```

Detailed Description

Running this cmdlet updates the Active Directory object specified by the *Identity* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Permissions and delegation" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccessRights	Required	Microsoft.Exchange.Management.RecipientTasks.MailboxRights[]	The *AccessRights* parameter specifies the rights needed to perform the operation. Valid values include: • `FullAccess` • `ExternalAccount` • `DeleteItem` • `ReadPermission` • `ChangePermission` • `ChangeOwner`
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the mailbox that's getting permissions added. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name`

			Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Instance	Required	Microsoft.Exchange.Management.RecipientTasks.MailboxAcePresentationObject	The *Instance* parameter is no longer used and will be deprecated.
Owner	Required	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *Owner* parameter specifies the owner of the mailbox object.

User	Required	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *User* parameter specifies the user mailbox that the permissions are being granted to on the other mailbox.
AutoMapping	Optional	System.Boolean	The *AutoMapping* parameter specifies whether to ignore the auto-mapping feature in Microsoft Outlook. If a user is granted Full Access permissions to another user's mailbox or to a shared mailbox, Outlook, through Autodiscover, automatically loads all mailboxes to which the user has full access. This parameter accepts `$true` or `$false` values.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
Deny	Optional	System.Management.	The *Deny* switch specifies

		Automation.SwitchParameter	whether to deny permissions to the user on the mailbox.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController*

			parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
InheritanceType	Optional	System.DirectoryServices.ActiveDirectorySecurityInheritance	The *InheritanceType* parameter specifies whether permissions are inherited by folders within the mailbox.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxPermission** cmdlet to retrieve permissions on a mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxPermission [-User <SecurityPrincipalIdParameter>] <COMMON
PARAMETERS>

Get-MailboxPermission [-Owner <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxIdParameter> [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns permissions on the mailbox by its SMTP address john@contoso.com.

```
Get-MailboxPermission -Identity john@contoso.com | Format-
List
```

EXAMPLE 2

This example returns permissions that the user Ayla has on John's mailbox.

```
Get-MailboxPermission -Identity john@contoso.com -User
"Ayla"
```

EXAMPLE 3

This example returns the owner information for the resource mailbox Room222.

```
Get-MailboxPermission -Identity Room222 -Owner
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Permissions and delegation" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter identifies the mailbox. You can use one of the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This

			credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Owner	Optional	System.Management.Automation.SwitchParameter	The *Owner* parameter returns the owner information for the mailbox identified in the *Identity* parameter. This parameter can't be used with the *User* parameter.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient

			scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of recipient objects returned.
User	Optional	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *User* parameter specifies the UPN, *domain**user*, or the alias of the user. This parameter can't be used with the *Owner* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxPermission

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MailboxPermission** cmdlet to remove permissions from a user's mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxPermission -AccessRights <MailboxRights[]> -Identity
<MailboxIdParameter> -User <SecurityPrincipalIdParameter> [-Deny
<SwitchParameter>] [-InheritanceType <None | All | Descendents |
SelfAndChildren | Children>] <COMMON PARAMETERS>

Remove-MailboxPermission -Instance <MailboxAcePresentationObject> [-
AccessRights <MailboxRights[]>] [-Deny <SwitchParameter>] [-Identity
<MailboxIdParameter>] [-InheritanceType <None | All | Descendents |
SelfAndChildren | Children>] [-User <SecurityPrincipalIdParameter>]
<COMMON PARAMETERS>

Remove-MailboxPermission -Identity <MailboxIdParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-IgnoreDefaultScope <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes user Test2's full access rights to Test1's mailbox.

```
Remove-MailboxPermission -Identity Test1 -User Test2 -
AccessRights FullAccess -InheritanceType All
```

Detailed Description

The **Remove-MailboxPermission** cmdlet allows you to remove permissions from a user's mailbox, for example, removing full access to another user's mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Permissions and delegation" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccessRights	Required	Microsoft.Exchange.Management.RecipientTasks.MailboxRights[]	The *AccessRights* parameter specifies the rights required to perform the operation. You can use the following values: • `FullAccess` • `SendAs` • `ExternalAccount` • `DeleteItem` • `ReadPermission` • `ChangePermission` • `ChangeOwner`
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter identifies the mailbox. You can use the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Instance	Required	Microsoft.Exchange.M	This parameter is

		anagement.RecipientTasks.MailboxAcePresentationObject	available only in on-premises Exchange 2013. The *Instance* parameter enables you to pass an entire object to the command to be processed. It's mainly used in scripts where an entire object must be passed to the command.
User	Required	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *User* parameter specifies the user mailbox that will get permissions removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Deny	Optional	System.Management.Automation.SwitchParameter	The *Deny* parameter denies permissions to the user on the Active Directory object.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity*

			parameter. Other forms of identification, such as alias or GUID, aren't accepted.
InheritanceType	Optional	System.DirectoryServices.ActiveDirectorySecurityInheritance	The *InheritanceType* parameter specifies whether permissions are inherited to folders within the mailbox.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxRestoreRequest

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxRestoreRequest** cmdlet to view detailed status of an ongoing restore request that was initiated by using the New-MailboxRestoreRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxRestoreRequest [-AccountPartition
<AccountPartitionIdParameter>] [-Identity
<MailboxRestoreRequestIdParameter>] [-Organization
<OrganizationIdParameter>] <COMMON PARAMETERS>

Get-MailboxRestoreRequest [-AccountPartition
<AccountPartitionIdParameter>] [-BatchName <String>] [-HighPriority <$true
| $false>] [-Name <String>] [-Organization <OrganizationIdParameter>] [-
RequestQueue <DatabaseIdParameter>] [-SourceDatabase
<DatabaseIdParameter>] [-Status <None | Queued | InProgress |
AutoSuspended | CompletionInProgress | Synced | Completed |
CompletedWithWarning | Suspended | Failed>] [-Suspend <$true | $false>] [-
TargetMailbox <MailboxOrMailUserIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the status of the in-progress and queued restore request with the identity ayla \MailboxRestore.

```
Get-MailboxRestoreRequest -Identity "ayla\MailboxRestore"
```

EXAMPLE 2

This example returns the status of in-progress and queued restore requests that are being restored to the mailbox database MBD01.

```
Get-MailboxRestoreRequest -RequestQueue MBD01
```

EXAMPLE 3

This example returns all restore requests that have the name RestoreToMBD01 where the restore request has been suspended.

```
Get-MailboxRestoreRequest -Name "RestoreToMBD01" -Suspend
$true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name given to a batch of restore requests. You can't use this parameter with the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
HighPriority	Optional	System.Boolean	The *HighPriority* parameter specifies that restore requests with the specified priority range are returned. Use one of

			the following values: • `$true` Returns restore requests that were created with a priority of Emergency, Highest, Higher, or High • `$false` Returns restore requests that were created with a priority of Normal, Low, Lower, or Lowest
Identity	Optional	Microsoft.Exchange.MailboxReplicationService.MailboxRestoreRequestIdParameter	The *Identity* parameter specifies the identity of the restore request. The *Identity* parameter consists of the alias of the mailbox to be restored and the name that was specified when the restore request was created. The identity of the restore request uses the following syntax: <*alias*>\<*name*>. If you didn't specify a name for the restore request when it was created, Exchange automatically generated the default name MailboxRestore. Exchange generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9).

			You can't use this parameter with the *Name* parameter.
Name	Optional	System.String	The *Name* parameter specifies that any restore request that has the specified name is returned. Use this parameter to search on the name you provided when you created the restore request. If you didn't specify a name for the restore request when it was created, Exchange automatically generated the default name MailboxRestore. Exchange generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9). You can't use this parameter with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

RequestQueue	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the mailbox database on which the mailbox or archive of the request resides. You can use one of the following values: • GUID of the database • Database name
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
SourceDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *SourceDatabase* parameter specifies that the cmdlet should only return restore requests for mailboxes that are being restored from the specified source database. You can use the following values: • GUID of the database • Database name You can't use this parameter with the *Identity* parameter.

Status	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestStatus	The *Status* parameter specifies that restore requests with the specified status are returned. You can use the following values: • `AutoSuspended` • `Completed` • `CompletedWithWarning` • `CompletionInProgress` • `Failed` • `InProgress` • `None` • `Queued` • `Suspended` You can't use this parameter with the *Identity* parameter.
Suspend	Optional	System.Boolean	The *Suspend* parameter specifies that the cmdlet should only return restore requests that have been suspended. This parameter accepts `$true` or `$false`. You can't use this parameter with the *Identity* parameter.
TargetMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *TargetMailbox* parameter specifies the identity of the target mailbox. You can use the following values: • GUID • Distinguished name (DN)

			• *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias You can't use this parameter with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxRestoreRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-02*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-MailboxRestoreRequest** cmdlet to restore a soft-deleted or disconnected mailbox. This cmdlet starts the process of moving content from the soft-deleted mailbox, disabled mailbox, or any mailbox in a recovery database into a connected primary or archive mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxRestoreRequest -SourceDatabase <DatabaseIdParameter> [-
AllowLegacyDNMismatch <SwitchParameter>] [-AssociatedMessagesCopyOption
<DoNotCopy | MapByMessageClass | Copy>] [-ConflictResolutionOption
<KeepSourceItem | KeepLatestItem | KeepAll>] [-ExcludeDumpster
<SwitchParameter>] [-ExcludeFolders <String[]>] [-IncludeFolders <String[]
>] <COMMON PARAMETERS>
```

```
New-MailboxRestoreRequest -RemoteDatabaseGuid <Guid> -RemoteHostName
<Fqdn> -RemoteRestoreType <None | RecoveryDatabase | DisconnectedMailbox |
SoftDeletedRecipient> [-AllowLegacyDNMismatch <SwitchParameter>] [-
AssociatedMessagesCopyOption <DoNotCopy | MapByMessageClass | Copy>] [-
ConflictResolutionOption <KeepSourceItem | KeepLatestItem | KeepAll>] [-
ExcludeDumpster <SwitchParameter>] [-ExcludeFolders <String[]>] [-
IncludeFolders <String[]>] [-RemoteCredential <PSCredential>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -SourceStoreMailbox <StoreMailboxIdParameter> -
TargetMailbox <MailboxOrMailUserIdParameter> [-AcceptLargeDataLoss
<SwitchParameter>] [-BadItemLimit <Unlimited>] [-BatchName <String>] [-
CompletedRequestAgeLimit <Unlimited>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-InternalFlags <InternalMrsFlag[]>] [-
LargeItemLimit <Unlimited>] [-Name <String>] [-Priority <Lowest | Lower |
Low | Normal | High | Higher | Highest | Emergency>] [-SkipMerging
<SkippableMergeComponent[]>] [-SourceRootFolder <String>] [-Suspend
<SwitchParameter>] [-SuspendComment <String>] [-TargetIsArchive
<SwitchParameter>] [-TargetRootFolder <String>] [-WhatIf
[<SwitchParameter>]] [-WorkloadType <None | Local | Onboarding |
Offboarding | TenantUpgrade | LoadBalancing | Emergency |
RemotePstIngestion | SyncAggregation>]
```

Examples

EXAMPLE 1

To create a restore request, you must provide the **DisplayName**, **LegacyDN**, or **MailboxGUID** for the soft-deleted or disabled mailbox. This example uses the Get-MailboxStatistics cmdlet to return the **DisplayName**, **LegacyDN**, **MailboxGUID**, and **DisconnectReason** for all mailboxes on mailbox database MBD01 that have a disconnect reason of `SoftDeleted` or `Disabled`.

```
Get-MailboxStatistics -Database MBD01 | Where
{ $_.DisconnectReason -eq "SoftDeleted" -or
$_.DisconnectReason -eq "Disabled" } | Format-List
LegacyDN, DisplayName, MailboxGUID, DisconnectReason
```

This example restores the source mailbox with the MailboxGUID 1d20855f-fd54-4681-98e6-e249f7326ddd on mailbox database MBD01 to the target mailbox with the alias Ayla.

```
New-MailboxRestoreRequest -SourceDatabase "MBD01" -
SourceStoreMailbox 1d20855f-fd54-4681-98e6-e249f7326ddd -
TargetMailbox Ayla
```

EXAMPLE 2

This example restores the content of the source mailbox with the **DisplayName** of Tony Smith on mailbox database MBD01 to the archive mailbox for Tony@contoso.com.

```
New-MaiboxRestoreRequest -SourceDatabase "MBD01" -
SourceStoreMailbox "Tony Smith" -TargetMailbox
Tony@contoso.com -TargetIsArchive
```

Detailed Description

When mailboxes are moved from a Microsoft Exchange Server 2013 or Exchange Server 2010 Service Pack 1 or later versions database to any other database, Exchange doesn't fully delete the mailbox from the source database immediately upon completion of the move. Instead, the mailbox in the source mailbox database is switched to a *soft-deleted* state, which allows mailbox data to be accessed during a mailbox restore operation by using the new **MailboxRestoreRequest** cmdlet set. The soft-deleted mailboxes are retained in the source database until either the deleted mailbox retention period expires or you use the **Remove-StoreMailbox** cmdlet to purge the mailbox.

To view soft-deleted mailboxes, run the Get-MailboxStatistics cmdlet against a database and look for results that have a **DisconnectReason** with a value of `SoftDeleted`. For more information, see EXAMPLE 1 later in this topic.

A mailbox is marked as Disabled a short time after the **Disable-Mailbox** or **Remove-Mailbox** command completes.

Note:

The mailbox won't be marked as Disabled until the Microsoft Exchange Information Store service determines that Active Directory has been updated with the disabled mailbox's information. You can expedite the process by running the **Update-StoreMailboxState** cmdlet against that database.

Exchange retains disabled mailboxes in the mailbox database based on the deleted mailbox retention settings configured for that mailbox database. After the specified period of time, the mailbox is permanently deleted.

To view disabled mailboxes, run the **Get-MailboxStatistics** cmdlet against a database and look for results that have a **DisconnectReason** with a value of `Disabled`. For more information, see EXAMPLE 1 later in this topic.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
RemoteDatabaseGuid	Required	System.Guid	This parameter is reserved for internal Microsoft use.
RemoteHostName	Required	Microsoft.Exchange.Data.Fqdn	This parameter is reserved for internal Microsoft use.

RemoteRestoreType	Required	Microsoft.Exchange.Management.RecipientTasks.RemoteRestoreType	This parameter is reserved for internal Microsoft use.
SourceDatabase	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *SourceDatabase* parameter specifies the identity of the database from which you're restoring the soft-deleted or disconnected mailbox.
SourceStoreMailbox	Required	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	The *SourceStoreMailbox* parameter specifies the identity of the mailbox from which you want to restore content. This parameter accepts the following values: • MailboxGUID • LegacyExchangeDN • DisplayName You can find this information by running the Get-MailboxStatistics cmdlet.
TargetMailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *TargetMailbox* parameter specifies the identity of the mailbox or mail user to which you want to restore content. The target mailbox or mail user needs to exist before

			you can run this command successfully. This parameter accepts the following values: • GUID • Alias • LegacyExchangeDN • *Domain\Account Name* • SMTP address
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
AllowLegacyDNMismatch	Optional	System.Management.Automation.SwitchParameter	The *AllowLegacyDNMismatch* parameter specifies that if the LegacyExchangeDN of the source physical mailbox and the target mailbox don't match, continue the operation. By

			default, this cmdlet checks to make sure that the LegacyExchangeDN on the source physical mailbox is present on the target user in the form of the LegacyExchangeDN or an X500 proxy address that corresponds to the LegacyExchangeDN. This check prevents you from accidentally restoring a source mailbox into the incorrect target mailbox. You don't have to provide a value with this parameter.
AssociatedMessagesCopyOption	Optional	Microsoft.Exchange.MailboxReplicationService.FAICopyOption	The *AssociatedMessagesCopyOption* parameter specifies whether associated messages are copied when the request is processed. Associated messages are special messages that contain hidden data with information about rules, views, and forms. By default, associated messages are copied. This parameter accepts the

			following values: • `DoNotCopy` The associated messages aren't copied. • `MapByMessageClass` This option finds the corresponding associated message by looking up the **MessageClass** attribute of the source message. If there's an associated message of this class in both source and target folders, it overwrites the associated message in the target. If there isn't an associated message in the target, it creates a copy in the target. • `Copy` This option copies associated messages from the source to the target. If the same message type exists both in the source and the target location, these associated messages are duplicated. This is the default option. **Note:** Content filtering doesn't apply to associated messages.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use `0` to not

			skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a descriptive name for restoring a batch of mailboxes. You can use the name in the *BatchName* parameter as

			a string search when you use the **Get-MailboxRestoreRequest** cmdlet.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the status of a completed restore request is set to `Completed`. If this parameter is set to a value of `0`, the status is cleared immediately instead of being changed to `Completed`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConflictResolutionOption	Optional	Microsoft.Exchange.MailboxReplicationService.ConflictResolutionOption	The *ConflictResolutionOption* parameter specifies the action for the Microsoft Exchange Mailbox Replication service (MRS) to take if there are

			multiple matching messages in the target. This parameter takes the following values: • `KeepSourceItem` • `KeepLatestItem` • `KeepAll` The default value is `KeepSourceItem`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExcludeDumpster	Optional	System.Management.Automation.SwitchParameter	The *ExcludeDumpster* parameter specifies whether to exclude the Recoverable Items folder. You don't have to include a value with this parameter. If you don't specify this parameter, the Recoverable Items folder is copied with the following subfolders: • Deletions • Versions • Purges
ExcludeFolders	Optional	System.String[]	The *ExcludeFolders* parameter specifies the

			list of folders to exclude during the restore request. Folder names aren't case-sensitive, and there are no character restrictions. Use the following syntax: `<FolderName>/*` Use this syntax to denote a personal folder under the folder specified in the *SourceRootFolder* parameter, for example, "MyProjects" or "MyProjects/FY2010". `#<FolderName>#/*` Use this syntax to denote a well-known folder regardless of the folder's name in another language. For example, `#Inbox#` denotes the Inbox folder even if the Inbox is localized in Turkish, which is Gelen Kutusu. Well-known folders include the following types: • Inbox • SentItems • DeletedItems • Calendar • Contacts • Drafts • Journal • Tasks • Notes • JunkEmail

			• CommunicationHistory • Voicemail • Fax • Conflicts • SyncIssues • LocalFailures • ServerFailures If the user creates a personal folder with the same name as a well-known folder and the # symbol surrounding it, you can use a back slash (\) as an escape character to specify that folder. For example, if a user creates a folder named #Notes# and you want to specify that folder, but not the well-known Notes folder, use the following syntax: `\#Notes\#`. **Note:** Wildcard characters can't be used in folder names.
IncludeFolders	Optional	System.String[]	The *IncludeFolders* parameter specifies the list of folder to include during the restore request. Folder names aren't case-sensitive, and there are no character restrictions. Use

			the following syntax: `<FolderName>/*` Use this syntax to denote a personal folder under the folder specified in the *SourceRootFolder* parameter, for example, "MyProjects" or "MyProjects/FY2010". `#<FolderName>#/*` Use this syntax to denote a well-known folder regardless of the folder's name in another language. For example, `#Inbox#` denotes the Inbox folder even if the Inbox is localized in Turkish, which is Gelen Kutusu. Well-known folders include the following types: • Inbox • SentItems • DeletedItems • Calendar • Contacts • Drafts • Journal • Tasks • Notes • JunkEmail • CommunicationHistory • Voicemail • Fax • Conflicts • SyncIssues • LocalFailures

			• ServerFailures If the user creates a personal folder with the same name as a well-known folder and the # symbol surrounding it, you can use a back slash (\) as an escape character to specify that folder. For example, if a user creates a folder named #Notes# and you want to specify that folder, but not the well-known Notes folder, use the following syntax: `\#Notes\#`. **Note:** Wildcard characters can't be used in folder names.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of items to skip in the mailbox because these items exceed the item size limit for the target mailbox database. Use 0 to not skip any large

			items. **Note:** If you set the *LargeItemLimit* parameter to 51 or higher, you have to include the *AcceptLargeDataLoss* parameter.
Name	Optional	System.String	The *Name* parameter specifies the name of the specific request for tracking and display purposes. Because you can have multiple restore requests per mailbox, Exchange precedes the name with the mailbox's alias. For example, if you create an export request for a user's mailbox that has the alias Kweku and specify the value of this parameter as RestoreFailedMoves, the identity of this export request is Kweku \RestoreFailedMoves. If you didn't specify a name for the restore request when it was created, Exchange automatically generates the default name MailboxRestore. Exchange

			generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9).
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the priority of the mailbox restore request. Use one of the following values: • `Emergency` • `Highest` • `Higher` • `High` • `Normal` • `Low` • `Lower` • `Lowest`
RemoteCredential	Optional	System.Management.Automation.PSCredential	This parameter is reserved for internal Microsoft use.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies folder-related items to skip when restoring the mailbox. Use one of the following values: • `FolderRules` • `FolderACLs` • `InitialConnectionValidation` Use this parameter only if a restore request fails because of folder rules, folder access control lists (ACLs), or initial connection validation.

SourceRootFolder	Optional	System.String	The *SourceRootFolder* parameter specifies the root folder of the mailbox from which data is restored. If this parameter isn't specified, the command restores all folders.
Suspend	Optional	System.Management.Automation.SwitchParameter	The *Suspend* switch specifies whether to suspend the request. If you use this switch, the request is queued, but the request won't reach the status of **InProgress** until you resume the request with the relevant resume cmdlet. You don't have to specify a value with this switch.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
TargetIsArchive	Optional	System.Management.Automation.SwitchParameter	The *TargetIsArchive* parameter specifies that the content is restored into the specified target

			mailbox's archive.
TargetRootFolder	Optional	System.String	The *TargetRootFolder* parameter specifies the top-level folder in which to restore data. If you don't specify this parameter, the command restores folders to the top of the folder structure in the target mailbox or archive. Content is merged under existing folders, and new folders are created if they don't already exist in the target folder structure.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WorkloadType	Optional	Microsoft.Exchange.MailboxReplicationService.RequestWorkloadT	The *WorkLoadType* parameter specifies the type of restore request based on the type of

		ype	Exchange deployment or the purpose of the restore request. Use one of the following values: • None • Local • Onboarding • Offboarding • TenantUpgrade • LoadBalancing • Emergency

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxRestoreRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MailboxRestoreRequest** cmdlet to remove fully or partially completed restore requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxRestoreRequest -Identity <MailboxRestoreRequestIdParameter>
<COMMON PARAMETERS>

Remove-MailboxRestoreRequest -RequestGuid <Guid> -RequestQueue
<DatabaseIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the second restore request Ayla\MailboxRestore1.

```
Remove-MailboxRestoreRequest -Identity "Ayla
\MailboxRestore1"
```

EXAMPLE 2

This example removes all restore requests that have the status of Completed.

```
Get-MailboxRestoreRequest -Status Completed | Remove-
MailboxRestoreRequest
```

EXAMPLE 3

This example cancels the restore request by using the *RequestGuid* parameter for a request stored on MBXDB01. The parameter set that requires the *RequestGuid* and *RequestQueue* parameters is used for MRS debugging purposes only. You should only use this parameter set if instructed by Microsoft Customer Service and Support.

```
Remove-MailboxRestoreRequest -RequestQueue MBXDB01 -
RequestGuid 25e0eaf2-6cc2-4353-b83e-5cb7b72d441f
```

Detailed Description

The parameter set that requires the *Identity* parameter allows you to remove a fully or partially completed restore request.

The parameter set that requires the *RequestGuid* and *RequestQueue* parameters is used for Microsoft Exchange Mailbox Replication service (MRS) debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.M	The *Identity* parameter

		ailboxReplicationService.MailboxRestoreRequestIdParameter	specifies the identity of the restore request. The *Identity* parameter consists of the alias of the mailbox to be restored and the name that was specified when the restore request was created. The identity of the restore request uses the following syntax: <*alias*>\<*name*>. If you didn't specify a name for the restore request when it was created, Exchange automatically generated a default name MailboxRestore. Exchange generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9).
RequestGuid	Required	System.Guid	The *RequestGuid* parameter specifies the unique identifier for the restore request. To find the GUID, use the Get-MailboxRestoreRequest cmdlet. If you specify the *RequestGuid* parameter, you must also specify the

			RequestQueue parameter. This parameter can't be used in conjunction with the *Identity* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the target mailbox database on which the mailbox or archive of the request resides. You can use one of the following values: • GUID of the database • Database name If you specify the *RequestQueue* parameter, you must also specify the *RequestGuid* parameter. This parameter can't be used in conjunction with the *Identity* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	The *DomainController*

		ta.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-MailboxRestoreRequest

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-MailboxRestoreRequest** cmdlet to resume a restore request that was suspended or failed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-MailboxRestoreRequest -Identity <MailboxRestoreRequestIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes the restore request with the identity kweku\RestoreFromDB01.

```
Resume-MailboxRestoreRequest -Identity "kweku
\RestoreFromDB01"
```

EXAMPLE 2

This example resumes any restore request with the status of Failed.

```
Get-MailboxRestoreRequest -Status Failed | Resume-
MailboxRestoreRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxRestoreRequestIdParameter	The *Identity* parameter specifies the identity of the restore request. The *Identity* parameter

			consists of the alias of the mailbox to be restored and the name that was specified when the restore request was created. The identity of the restore request uses the following syntax: *<alias>**<name>*. If you didn't specify a name for the restore request when it was created, Exchange automatically generated the default name MailboxRestore. Exchange generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9).
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxRestoreRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxRestoreRequest** cmdlet to change restore request options after the request has been created. You can use this cmdlet to recover from failed restore requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxRestoreRequest [-AcceptLargeDataLoss <SwitchParameter>] [-
BadItemLimit <Unlimited>] [-BatchName <String>] [-CompletedRequestAgeLimit
<Unlimited>] [-InternalFlags <InternalMrsFlag[]>] [-LargeItemLimit
<Unlimited>] [-Priority <Lowest | Lower | Low | Normal | High | Higher |
Highest | Emergency>] [-SkipMerging <SkippableMergeComponent[]>] <COMMON
PARAMETERS>

Set-MailboxRestoreRequest -RehomeRequest <SwitchParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxRestoreRequestIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-RemoteCredential
<PSCredential>] [-RemoteHostName <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the second restore request for Ayla\MailboxRestore1 to skip 10 corrupt mailbox items.

```
Set-MailboxRestoreRequest -Identity "Ayla\MailboxRestore1"
-BadItemLimit 10
```

EXAMPLE 2

This example changes the first restore request for Kweku's mailbox to skip 100 corrupt items. Because the *BadItemLimit* is greater than 50, the *AcceptLargeDataLoss* parameter must be specified.

```
Set-MailboxRestoreRequest -Identity "Kweku\MailboxRestore"
-BadItemLimit 100 -AcceptLargeDataLoss
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxRestoreRequestIdParameter	The *Identity* parameter specifies the identity of the restore request. The *Identity* parameter consists of the alias of the mailbox to be restored and the name that was specified when the restore request was created. The identity of the restore request uses the following syntax: <*alias*>\<*name*> If you didn't specify a name for the restore request when it was created, Exchange automatically generated the default name MailboxRestore. Exchange generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9).
RehomeRequest	Required	System.Management.Automation.SwitchPar	The *RehomeRequest* switch specifies that the

		ameter	mailbox restore request be moved to a different mailbox database. Use this parameter to edit a mailbox restore request in the case where the source mailbox database from the original move request has to be removed.
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this

			parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name of the batch. Use this parameter to change, create, or remove a batch name. To remove a batch name, set the *BatchName* parameter value to an

			empty string or to null, for example, `-BatchName ""` or `-BatchName $null`.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the status of a completed restore request is set to `Completed`. If this parameter is set to a value of `0`, the status is cleared immediately instead of changing it to `Completed`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of items to skip in the mailbox because these items exceed the item size limit in the target mailbox data. Use `0` to not skip any large items. **Note:** If you set the *LargeItemLimit* parameter to 51 or higher, you must also include the *AcceptLargeDataLoss* parameter.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the priority of the mailbox restore request. Use one of the following values: • `Emergency` • `Highest` • `Higher` • `High` • `Normal` • `Low` • `Lower` • `Lowest`
RemoteCredential	Optional	System.Management.Automation.PSCredential	This parameter is reserved for internal Microsoft use.

RemoteHostName	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is reserved for internal Microsoft use.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies folder-related items to skip when restoring the mailbox. Use one of the following values: • `FolderRules` • `FolderACLs` • `InitialConnectionValidation` Use this parameter only if a restore request fails because of folder rules, folder access control lists (ACLs), or initial connection validation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-MailboxRestoreRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-MailboxRestoreRequest** cmdlet to suspend a restore request any time after the request was created, but before the request reaches the status of Completed. You can resume the restore request by using the Resume-MailboxRestoreRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-MailboxRestoreRequest -Identity <MailboxRestoreRequestIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-SuspendComment
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends the second restore request for Ayla's mailbox with the identity Ayla \MailboxRestore1.

```
Suspend-MailboxRestoreRequest -Identity "Ayla
\MailboxRestore1"
```

EXAMPLE 2

This example suspends all restore requests that are in progress by using the Get-MailboxRestoreRequest cmdlet to retrieve all requests with a status of `InProgress`, and then pipelines the output to the **Suspend-MailboxRestoreRequest** cmdlet with the suspend comment "Resume after 10:00 PM."

```
Get-MailboxRestoreRequest -Status InProgress | Suspend-
```

```
MailboxRestoreRequest -SuspendComment "Resume after 10:00
PM"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxRestoreRequestIdParameter	The *Identity* parameter specifies the identity of the restore request. The *Identity* parameter consists of the alias of the mailbox to be restored and the name that was specified when the restore request was created. The identity of the restore request uses the following syntax: *<alias>**<name>*. If you didn't specify a name for the restore request when it was created, Exchange automatically generated the default name MailboxRestore. Exchange generates up

			to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9).
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxRestoreRequestStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxRestoreRequestStatistics** cmdlet to view detailed information about restore requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxRestoreRequestStatistics -Identity
<MailboxRestoreRequestIdParameter> <COMMON PARAMETERS>

Get-MailboxRestoreRequestStatistics -RequestQueue <DatabaseIdParameter> [-
```

```
RequestGuid <Guid>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DomainController
<Fqdn>] [-IncludeReport <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the default statistics for the restore request with the identity Tony \MailboxRestore1. The type of information returned by default includes name, mailbox, status, and percent complete.

```
Get-MailboxRestoreRequestStatistics -Identity "Tony
\MailboxRestore1"
```

EXAMPLE 2

This example returns the statistics for Tony Smith's mailbox and exports the report to a CSV file.

```
Get-MailboxRestoreRequestStatistics -Identity Tony
\MailboxRestore | Export-CSV \\SERVER01
\RestoreRequest_Reports\Tony_Restorestats.csv
```

EXAMPLE 3

This example returns additional information about the restore request for Tony Smith's mailbox by using the *IncludeReport* parameter and by pipelining the results to the **Format-List** command.

```
Get-MailboxRestoreRequestStatistics -Identity Tony
\MailboxRestore -IncludeReport | Format-List
```

EXAMPLE 4

This example returns default statistics for a restore request being processed by the instance of MRS running on the server CAS01. This command only returns information for restore requests currently being processed by an instance of MRS. If the Client Access server is finished processing all restore requests, no information is returned. This command is for debugging purposes only and should only be performed if requested by Microsoft Customer Service and Support.

```
Get-MailboxRestoreRequestStatistics -MRSInstance
CAS01.contoso.com
```

EXAMPLE 5

This example returns additional information for all the restore requests that have a status of `Failed`

by using the *IncludeReport* parameter, and then saves the information to the text file AllRestoreReports.txt in the location where the command is being run.

```
Get-MailboxRestoreRequest -Status Failed | Get-MailboxRestoreRequestStatistics -IncludeReport | Format-List > AllRestoreReports.txt
```

Detailed Description

The *RequestQueue* and *MRSInstance* parameter syntax sets are for debugging purposes only and should only be used when directed by Microsoft Customer Service and Support.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox restore request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MailboxRestoreRequestIdParameter	The *Identity* parameter specifies the identity of the restore request. The *Identity* parameter consists of the alias of the mailbox to be restored and the name that was specified when the restore request was created. The identity of the restore request uses the following syntax: <*alias*>\<*name*>. If you didn't specify a name for the restore request when it was created, Exchange automatically generated

			the default name MailboxRestore. Exchange generates up to 10 names, starting with MailboxRestore and then MailboxRestore*X* (where *X* = 1–9). This parameter can't be used in conjunction with the *MRSInstance* or *RequestQueue* parameters.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the target mailbox database on which the mailbox or archive of the request resides. You can use one of the following values: • GUID of the database • Database name This parameter can't be used in conjunction with the *Identity* or *MRSInstance* parameters.
Diagnostic	Optional	System.Management.Automation.SwitchParameter	The *Diagnostic* switch specifies whether to retrieve extremely detailed information about the mailbox restore request.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
RequestGuid	Optional	System.Guid	The *RequestGuid* parameter specifies the unique identifier for the restore request. To find the GUID, use the Get-MailboxRestoreRequest cmdlet.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxStatistics

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-23*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxStatistics** cmdlet to obtain information about a mailbox, such as the size of the mailbox, the number of messages it contains, and the last time it was accessed. In addition, you can get the move history or a move report of a completed move request.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxStatistics -Identity <GeneralMailboxOrMailUserIdParameter> [-
Archive <SwitchParameter>] [-CopyOnServer <ServerIdParameter>] <COMMON
PARAMETERS>

Get-MailboxStatistics -Database <DatabaseIdParameter> [-CopyOnServer
<ServerIdParameter>] [-Filter <String>] [-StoreMailboxIdentity
<StoreMailboxIdParameter>] <COMMON PARAMETERS>

Get-MailboxStatistics -Server <ServerIdParameter> [-Filter <String>] [-
IncludePassive <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-IncludeMoveHistory
<SwitchParameter>] [-IncludeMoveReport <SwitchParameter>] [-NoADLookup
<SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves the mailbox statistics for the mailbox of the user Ayla Kol by using its associated alias AylaKol.

```
Get-MailboxStatistics -Identity AylaKol
```

EXAMPLE 2

This example retrieves the mailbox statistics for all mailboxes on the server MailboxServer01.

```
Get-MailboxStatistics -Server MailboxServer01
```

EXAMPLE 3

This example retrieves the mailbox statistics for the specified mailbox.

```
Get-MailboxStatistics -Identity contoso\chris
```

EXAMPLE 4

This example retrieves the mailbox statistics for all mailboxes in the specified mailbox database.

```
Get-MailboxStatistics -Database "Mailbox Database"
```

EXAMPLE 5

This example retrieves the mailbox statistics for the disconnected mailboxes for all mailbox databases in the organization. The **-ne** operator means not equal.

```
Get-MailboxDatabase | Get-MailboxStatistics -Filter
'DisconnectDate -ne $null'
```

EXAMPLE 6

This example retrieves the mailbox statistics for a single disconnected mailbox. The value for the *StoreMailboxIdentity* parameter is the mailbox GUID of the disconnected mailbox. You can also use the LegacyDN.

```
Get-MailboxStatistics -Database "Mailbox Database" -
StoreMailboxIdentity 3b475034-303d-49b2-9403-ae022b43742d
```

EXAMPLE 7

This example returns the summary move history for the completed move request for Ayla Kol's mailbox. If you don't pipeline the output to the **Format-List** cmdlet, the move history doesn't display.

```
Get-MailboxStatistics -Identity AylaKol -IncludeMoveHistory
| Format-List
```

EXAMPLE 8

This example returns the detailed move history for the completed move request for Ayla Kol's mailbox. This example uses a temporary variable to store the mailbox statistics object. If the mailbox has been moved multiple times, there are multiple move reports. The last move report is always `MoveReport[0]`.

```
$temp=Get-MailboxStatistics -Identity AylaKol -
IncludeMoveHistory
$temp.MoveHistory[0]
```

EXAMPLE 9

This example returns the detailed move history and a verbose detailed move report for Ayla Kol's mailbox. This example uses a temporary variable to store the move request statistics object and outputs the move report to a CSV file.

```
$temp=Get-MailboxStatistics -Identity AylaKol -
IncludeMoveReport
$temp.MoveHistory[0] | Export-CSV C:\MoveReport_AylaKol.csv
```

Detailed Description

On Mailbox servers only, you can use the **Get-MailboxStatistics** cmdlet without parameters. In this case, the cmdlet returns the statistics for all mailboxes on all databases on the local server.

Note:

The **Get-MailboxStatistics** cmdlet requires at least one of the following parameters to complete successfully: *Server*, *Database*, or *Identity*.

You can use the **Get-MailboxStatistics** cmdlet to return detailed move history and a move report for completed move requests to troubleshoot a move request. To view the move history, you must pass this cmdlet as an object. Move histories are retained in the mailbox database and are numbered incrementally, and the last executed move request is always numbered 0. For more information, see "EXAMPLE 7," "EXAMPLE 8," and "EXAMPLE 9" in this topic.

Note:

You can only see move reports and move history for completed move requests.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies the name of the mailbox database. When you specify a value for the *Database* parameter, the Exchange Management Shell

			returns statistics for all the mailboxes on the database specified. You can use the following values: • GUID • Database This parameter accepts pipeline input from the **Get-MailboxDatabase** cmdlet.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GeneralMailboxOrMailUserIdParameter	The *Identity* parameter specifies a mailbox. When you specify a value for the *Identity* parameter, the command looks up the mailbox specified in the *Identity* parameter, connects to the server where the mailbox resides, and returns the statistics for the mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)`

			Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *Server* parameter specifies the server from which you want to obtain mailbox statistics. You can use one of the following values: • Fully qualified domain name (FQDN)

			• NetBIOS name When you specify a value for the *Server* parameter, the command returns statistics for all the mailboxes on all the databases, including recovery databases, on the specified server. If you don't specify this parameter, the command returns logon statistics for the local server.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch parameter specifies whether to return mailbox statistics for the archive mailbox associated with the specified mailbox. You don't have to specify a value with this parameter.
CopyOnServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *CopyOnServer* parameter is used to retrieve statistics from a specific database copy on the server specified with the *Server* parameter.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Filter* parameter specifies a filter to filter the results of the **Get-MailboxStatistics** cmdlet. For example, to display all disconnected mailboxes on a specific mailbox database, use the following syntax for this parameter: `-Filter 'DisconnectDate -ne $null'`
IncludeMoveHistory	Optional	System.Management.Automation.SwitchParameter	The *IncludeMoveHistory* switch specifies whether to return additional information about the mailbox that includes the history of a completed move request, such as

			status, flags, target database, bad items, start times, end times, duration that the move request was in various stages, and failure codes.
IncludeMoveReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeMoveReport* switch specifies whether to return a verbose detailed move report for a completed move request, such as server connections and move stages. **Note:** Because the output of this command is verbose, you should send the output to a .CSV file for easier analysis.
IncludePassive	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. Without the *IncludePassive* parameter, the cmdlet retrieves statistics from active database copies only. Using the *IncludePassive* parameter, you can have the cmdlet return statistics from all active and passive database copies.

NoADLookup	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *NoADLookup* switch specifies that information is retrieved from the mailbox database, and not from Active Directory. This helps improve cmdlet performance when querying a mailbox database that contains a large number of mailboxes.
StoreMailboxIdentity	Optional	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	This parameter is available only in on-premises Exchange 2013. The *StoreMailboxIdentity* parameter specifies the mailbox identity when used with the *Database* parameter to return statistics for a single mailbox on the specified database. You can use one of the following values: • MailboxGuid • LegacyDN Use this syntax to retrieve information about disconnected mailboxes, which don't have a

			corresponding Active Directory object or that has a corresponding Active Directory object that doesn't point to the disconnected mailbox in the mailbox database.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailMessage

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MailMessage** cmdlet to create an email message for the specified user mailbox and place the email message in the Drafts folder of the user's mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailMessage [-Body <String>] [-BodyFormat <PlainText | Html | Rtf>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Subject
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an email message in the Drafts folder with the subject and body specified by the *Subject* and *Body* parameters. The message body is rendered in plain text because no format for the message body is specified.

```
New-MailMessage -Subject "Delivery Report" -Body "Click
here to view this report"
```

EXAMPLE 2

This example creates an empty email message in the Drafts folder because no subject or message body is specified.

```
New-MailMessage
```

EXAMPLE 3

This example creates an email message in the Drafts folder with the subject and body specified by the *Subject* and *Body* parameters. The message body is rendered in HTML format.

```
New-MailMessage -Subject "Delivery Information" -Body
"Click here to see details" -BodyFormat Html
```

Detailed Description

If the cmdlet is run without specifying the *Subject* or *Body* parameters, an empty email message is placed in the user's Drafts folder.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Body	Optional	System.String	The *Body* parameter specifies the content of the body section of the new email message.
BodyFormat	Optional	Microsoft.Exchange.Data.Providers.MailBodyFo	The *BodyFormat* parameter specifies the

		rmat	format of the message body. The values can be `PlainText`, `Rtf` (Rich Text Format), or `Html`. By default, if the *BodyFormat* parameter isn't specified when the *Body* parameter is used, the message body is rendered in plain text.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory.
Subject	Optional	System.String	The *Subject* parameter specifies the content of the subject field of the new email message.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MessageCategory

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MessageCategory** cmdlet to retrieve a message category from the specified mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MessageCategory [-Identity <MessageCategoryIdParameter>] [-
DomainController <Fqdn>] [-Mailbox <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves message categories from the mailbox User1.

```
Get-MessageCategory -Mailbox "User1"
```

Detailed Description

The **Get-MessageCategory** cmdlet is used by the web management interface in Microsoft Exchange to populate fields that display message category information.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message categories" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MessageCategoryIdParameter	The *Identity* parameter specifies the name of the message category to be retrieved.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the identity of a mailbox user to retrieve the message category from.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-RecipientDataProperty

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Export-RecipientDataProperty** cmdlet to download a user's picture or spoken name sound file. The picture and audio files display in the **Global Address List** property dialog box, contact card, reading pane, and meeting requests in Microsoft Outlook and Microsoft Office

Outlook Web App.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-RecipientDataProperty [-Picture <SwitchParameter>] <COMMON
PARAMETERS>

Export-RecipientDataProperty [-SpokenName <SwitchParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxUserContactIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports Tony Smith's spoken name audio file and saves it to the local computer.

```
Export-RecipientDataProperty -Identity tony@contoso.com -
SpokenName | ForEach { $_.FileData | Add-Content C:
\tonysmith.wma -Encoding Byte}
```

EXAMPLE 2

This example exports Ayla Kol's picture file to the local computer.

```
Export-RecipientDataProperty -Identity "Ayla" -Picture |
ForEach { $_.FileData | Add-Content C:\aylakol.jpg -
Encoding Byte}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient data properties" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxUserContactIdPara	The *Identity* parameter specifies the mailbox or mail contact from which

		meter	you want to export the recipient data. You can use the following values: • Distinguished name (DN) • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Picture	Optional	System.Management.	The *Picture* switch

		Automation.SwitchParameter	specifies that the file you're exporting is the user's picture file. You can't use this parameter in conjunction with the *SpokenName* switch. You can only export one file type at a time.
SpokenName	Optional	System.Management.Automation.SwitchParameter	The *SpokenName* switch specifies that the file you're exporting is the user's audio file. This cmdlet exports the WMA 9-voice format. You can't use this parameter in conjunction with the *Picture* switch. You can only export one file type at a time.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-RecipientDataProperty

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Import-RecipientDataProperty** cmdlet to add a picture or an audio file of a spoken name to a mailbox or contact. The picture and audio files display on the **Global Address List** property dialog box, contact card, reading pane, and meeting requests in Microsoft Outlook and Microsoft Office Outlook Web App.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-RecipientDataProperty [-Picture <SwitchParameter>] <COMMON
PARAMETERS>

Import-RecipientDataProperty [-SpokenName <SwitchParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -FileData <Byte[]> -Identity
<MailboxUserContactIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example imports the audio file for Tony Smith's spoken name.

```
Import-RecipientDataProperty -Identity "Tony Smith" -
SpokenName -FileData ([Byte[]]$(Get-Content -Path "M:
```

```
\AudioFiles\TonySmith.wma" -Encoding Byte -ReadCount 0))
```

EXAMPLE 2

This example imports the picture file for Ayla Kol.

```
Import-RecipientDataProperty -Identity Ayla -Picture -
FileData ([Byte[]]$(Get-Content -Path "M:\Employee Photos
\AylaKol.jpg" -Encoding Byte -ReadCount 0))
```

Detailed Description

Importing and exporting files require a specific syntax because importing and exporting use Remote PowerShell.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient data properties" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the location and file name of the picture or audio file.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxUserContactIdParameter	The *Identity* parameter specifies the mailbox or contact that you're adding the picture or spoken name file to. You can use one of the following values: • Alias • Canonical name • Display name • Distinguished name

			(DN) • Exchange DN • GUID • Name • Primary SMTP email address
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Picture	Optional	System.Management.Automation.SwitchParameter	The *Picture* switch specifies that the file you're importing is a picture file. The picture must be a JPEG file and shouldn't be larger than 10 kilobytes (KB). You can't use this parameter in

			conjunction with the *SpokenName* switch. You can only import one file type at a time.
SpokenName	Optional	System.Management.Automation.SwitchParameter	The *SpokenName* switch specifies that the file you're importing is an audio file. The maximum file size should be less than 32 KB. You can use one of the following formats: • WMA 9-voice • PCM 8-KHz, 16-bits, mono format You can't use this switch in conjunction with the *Picture* switch. You can only import one file type at a time.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ResourceConfig

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ResourceConfig** cmdlet to get resource property schema data from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ResourceConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example gets the resource property schema data from Active Directory, where test.Contoso.com is the domain controller for that site.

```
Get-ResourceConfig -DomainController test.Contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Resource mailbox schema configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter is reserved for internal use only.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ResourceConfig

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ResourceConfig** cmdlet to set resource property schema and resource locations on the **Resource Config** object in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ResourceConfig [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ResourcePropertySchema
<MultiValuedProperty>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds equipment and room resources to the custom **Resource Config** list in Active Directory.

Note:

All entries must start with either `Room/` or `Equipment/`. Setting a new entry using the **Set-ResourceConfig** cmdlet overwrites all existing entries; it doesn't add a new entry to the list. Use the **Get-ResourceConfig** cmdlet to query the existing entries, and then append to the list. To add or remove entries without overwriting the current entries, see "EXAMPLE 2" and "EXAMPLE 3" in the Examples section.

```
Set-ResourceConfig -DomainController server1.contoso.com -
ResourcePropertySchema ("Room/16Seats","Equipment/
Projector","Room/8Seats","Equipment/Whiteboard")
```

EXAMPLE 2

This example creates three custom resource properties for room mailboxes and two custom resource properties for equipment mailboxes. This example also demonstrates two methods for adding new custom resource properties. The syntax of both commands can be used interchangeably. Perform the following steps:

1. Read the current resource configuration and store it in a temporary variable called `$ResourceConfiguration`.

```
$ResourceConfiguration = Get-ResourceConfig
```

2. Create the custom properties AV, TV, and Whiteboard for room mailboxes.

Note:

This example assumes that some of the meeting rooms in your organization have audio-visual equipment, TV, or whiteboards. It also assumes that you want to differentiate the rooms that have the specified features from others that don't have these features.

```
$ResourceConfiguration.ResourcePropertySchema+=("Room/AV")
$ResourceConfiguration.ResourcePropertySchema.Add("Room/
TV")
$ResourceConfiguration.ResourcePropertySchema+=("Room/
Whiteboard")
```

3. Create the custom properties Car and Van for equipment mailboxes by running the following

commands.

Note:

This example assumes that your organization uses equipment mailboxes to track the scheduling of company vehicles, and you plan to use the custom resource properties to specify the vehicle type.

```
$ResourceConfiguration.ResourcePropertySchema.Add("Equipmen
t/Car")
$ResourceConfiguration.ResourcePropertySchema+=("Equipment/
Van")
```

4. Update the resource configuration of your organization by using the modified resource property schema.

```
Set-ResourceConfig -ResourcePropertySchema
$ResourceConfiguration.ResourcePropertySchema
```

EXAMPLE 3

This example removes two of the custom resource properties for room mailboxes that were created in the previous example. The commands also demonstrate two methods for removing a custom resource property. The syntax of both commands can be used interchangeably.

1. Read the current resource configuration and store it in a temporary variable called `$ResourceConfiguration`.

```
$ResourceConfiguration = Get-ResourceConfig
```

2. Remove the custom properties AV and TV for room mailboxes.

```
$ResourceConfiguration.ResourcePropertySchema-=("Room/AV")
$ResourceConfiguration.ResourcePropertySchema.Remove("Room/
TV")
```

3. Update the resource configuration of your organization by using the modified resource property schema.

```
Set-ResourceConfig -ResourcePropertySchema
$ResourceConfiguration.ResourcePropertySchema
```

Detailed Description

Custom resource properties are features for room or equipment mailboxes. Administrators can indicate that a resource has a specific feature by assigning the corresponding custom resource property to that resource mailbox.

Important:
Custom resource properties can't include spaces.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Resource mailbox schema configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
ResourcePropertySche	Optional	Microsoft.Exchange.Dat	The

ma		a.MultiValuedProperty	*ResourcePropertySchema* parameter specifies a list of custom strings that you can use to tag resources.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-ServiceEmailChannel

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-ServiceEmailChannel** cmdlet to disable the .NET service channel for a specific user. The .NET service channel enables Microsoft Exchange to store information that it later forwards to applications or devices that aren't permanently connected to the server running Exchange.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-ServiceEmailChannel -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the .NET service channel for the user Jeff Hay.

```
Disable-ServiceEmailChannel -Identity JeffHay
```

EXAMPLE 2

This example disables the .NET service channel for the user Jeff Hay after confirmation is given.

```
Disable-ServiceEmailChannel -Identity JeffHay -Confirm
$true
```

EXAMPLE 3

This example disables the .NET service channel for the user Jeff Hay without requiring confirmation.

```
Disable-ServiceEmailChannel -Identity JeffHay -Confirm
$false
```

Detailed Description

The **Disable-ServiceEmailChannel** cmdlet deletes the receive folder in the user's mailbox under the root folder.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access service email channel settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the user for which you want to enable the .NET service channel. The user specified must be a valid user in Active Directory who has an Exchange mailbox.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-ServiceEmailChannel

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-ServiceEmailChannel** cmdlet to enable the .NET service channel for a specific user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-ServiceEmailChannel -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the .NET service channel for the user Tony Smith.

```
Enable-ServiceEmailChannel -Identity "fourthcoffee\tony"
```

EXAMPLE 2

This example enables the .NET service channel for the user Tony Smith.

```
Enable-ServiceEmailChannel -Identity "tony@contoso.com"
```

EXAMPLE 3

This example enables the .NET service channel for the user Tony Smith.

```
Enable-ServiceEmailChannel -Identity "TonySmith"
```

Detailed Description

The .NET service channel enables Microsoft Exchange to store information that it later forwards to applications or devices that aren't permanently connected to the server running Exchange. This cmdlet creates a receive folder in the user's mailbox under the root folder named Service E-mail.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access service email channel settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the user for which you want to enable the .NET service channel. The user specified must be a valid user in Active

			Directory who has an Exchange mailbox.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UserPhoto

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-UserPhoto** cmdlet to view information about the user photos feature that allows users to associate a picture with their account. User photos are stored in Active Directory and appear in on-premises and cloud-based client applications, such as Microsoft Office Outlook Web App, Microsoft Office Lync, and Microsoft SharePoint.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-UserPhoto [-Anr <String>] <COMMON PARAMETERS>

Get-UserPhoto [-Identity <MailboxIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-Filter <String>]
[-IgnoreDefaultScope <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-Preview <SwitchParameter>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>] [-
SortBy <String>]
```

Examples

EXAMPLE 1

This example displays information about the user photo configured for Susan Burk.

```
Get-UserPhoto "Susan Burk"
```

EXAMPLE 2

This example displays information about the user photo that was uploaded to Pilar Pinilla's account, but wasn't saved.

```
Get-UserPhoto "Pilar Pinilla" -Preview
```

Detailed Description

The user photos feature allows users to associate a picture with their account. User photos are stored in the user's Active Directory account and in the root directory of the user's Exchange mailbox. The user photo feature must be set for a user before you can run the **Get-UserPhoto** cmdlet to view information about the user's photo. Otherwise, you get an error message saying the user photo doesn't exist for the specified users. Administrators use the **Set-UserPhoto** cmdlet or the Exchange Administration Center to configure user photos. Users can upload, preview, and save a user photo to their account by using the Outlook Web App Options page.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient provisioning permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous

			name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the account used to read Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active

			Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the user. You can use one of the following values: • GUID • Distinguished name (DN) • Display name • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to

			access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParam	The *OrganizationalUnit* parameter returns objects only from the specified

		eter	organizational unit (OU).
Preview	Optional	System.Management.Automation.SwitchParameter	The *Preview* parameter retrieves information about the preview photo for the user account. The preview photo is the photo object that was uploaded to the user's account, but wasn't saved, for example, if a user uploads a photo in Outlook Web App Options, but doesn't save it. If you use the *Preview* parameter after a user photo is saved, this cmdlet returns an error saying the preview photo doesn't exist.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this parameter, it's possible that the user information is read from a global

			catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers running Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute to sort by. This parameter sorts by a single attribute in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-UserPhoto

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-UserPhoto** cmdlet to delete the photo associated with a user's account. The user photo feature allows users to associate a picture with their account. User photos appear in on-premises and cloud-based client applications, such as Microsoft Office Outlook Web App, Microsoft Office Lync, and Microsoft SharePoint. This cmdlet deletes the photo associated with a user's account.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-UserPhoto -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the photo associated with Ann Beebe's user account.

```
Remove-UserPhoto "Ann Beebe"
```

Detailed Description

Use the **Remove-UserPhoto** cmdlet to delete the user photo currently associated with a user's account. User photos are stored in the user's Active Directory account and in the root directory of the user's Exchange mailbox, both of which are deleted when you run this cmdlet. Administrators can also use the Exchange Administration Center to delete user photos by accessing the user's Outlook Web App Options page.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient provisioning permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the user. You can use one of the following values:

			• GUID • Distinguished name (DN) • Display name • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.	The *IgnoreDefaultScope*

		Automation.SwitchParameter	parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-UserPhoto

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-UserPhoto** cmdlet to configure the user photos feature that allows users to associate a picture with their account. User photos are stored in Active Directory and appear in on-premises and cloud-based client applications, such as Microsoft Office Outlook Web App, Microsoft Office Lync, and Microsoft SharePoint.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-UserPhoto -Identity <MailboxIdParameter> -PictureData <Byte[]> <COMMON
PARAMETERS>

Set-UserPhoto -Cancel <SwitchParameter> -Identity <MailboxIdParameter>
<COMMON PARAMETERS>

Set-UserPhoto -Identity <MailboxIdParameter> -Preview <SwitchParameter> [-
```

```
PictureData <Byte[]>] [-PictureStream <Stream>] <COMMON PARAMETERS>

Set-UserPhoto -Identity <MailboxIdParameter> -PictureStream <Stream>
<COMMON PARAMETERS>

<COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-IgnoreDefaultScope <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example uploads and saves a photo to Paul Cannon's user account using a single command.

```
Set-UserPhoto "Paul Cannon" -PictureData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\PaulCannon.jpg"))
```

EXAMPLE 2

This example shows how to use two commands to upload and save a preview photo to Ann Beebe's user account.

This command uploads a preview photo to Ann Beebe's user account.

```
Set-UserPhoto "Ann Beebe" -PictureData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\AnnBeebe.jpg")) -Preview
```

To save the preview photo that was uploaded using the previous command, run the following command.

```
Set-UserPhoto "Ann Beebe" -Save
```

To delete the preview photo that was uploaded using the first command in this example, run the following command.

```
Set-UserPhoto "Ann Beebe" -Cancel
```

Detailed Description

The user photos feature allows users to associate a picture with their account. User photos are stored in the user's Active Directory account and in the root directory of the user's Exchange

mailbox. Administrators use the **Set-UserPhoto** cmdlet or the Exchange Administration Center (EAC) to configure user photos. Users can upload, preview, and save a user photo to their account by using the Outlook Web App Options page. When a user uploads a photo, a preview of the photo is displayed on the Outlook Web App Options page. This is the preview state, and creates the same result as running the **Set-UserPhoto** cmdlet using the *Preview* parameter. If the user clicks **Save**, the preview photo is saved as the user's photo. This is the same result as running the `Set-UserPhoto -Save` command or running both the `Set-UserPhoto -Preview` and `Set-UserPhoto -Save` commands. If the user cancels the preview photo on the Outlook Web App Options page, then the `Set-UserPhoto -Cancel` command is called.

A user photo must be set for a user before you can run the **Get-UserPhoto** cmdlet to view information about the user's photo. Otherwise, you'll get an error message saying the user photo doesn't exist for the specified user. Alternatively, you can run the `Get-UserPhoto -Preview` command to view information about a preview photo.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient provisioning permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Cancel	Required	System.Management.Automation.SwitchParameter	The *Cancel* parameter deletes the photo currently uploaded as the preview photo. To delete the photo currently associated with a user's account, use the **Remove-UserPhoto** command. The *Cancel* parameter only deletes the preview photo.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the user. You can use one of the following values:

			• GUID • Distinguished name (DN) • Display name • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
PictureData	Required	System.Byte[]	The *PictureData* parameter specifies the photo file that will be uploaded to the user's account. Use the following syntax for this parameter. `([System.IO.File]::ReadAllBytes("<`**file name and path**`>"))`. The following is an example. `([System.IO.File]::ReadAllBytes("C:\Documents\Pictures\MyPhoto.jpg"))`.
PictureStream	Required	System.IO.Stream	The *PictureStream* parameter specifies the photo that will be uploaded to the user's account. This parameter is used by client applications such as Outlook Web App when users add a photo. To upload a photo using Windows PowerShell, use

			the *PictureData* parameter to specify the photo file.
Preview	Required	System.Management.Automation.SwitchParameter	The *Preview* parameter uploads a preview photo for the user account. A preview photo is the photo object that is uploaded to the user's account, but isn't saved. For example, if a user uploads a photo in Outlook Web App Options to preview before saving it. If you use the *Preview* parameter to upload a preview photo, you have to run the `Set-UserPhoto -Save` command to save it as the user's photo.
Save	Required	System.Management.Automation.SwitchParameter	The *Save* parameter specifies that the photo that's uploaded to the user's account will be saved as the user's photo.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the

			DomainController parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Dismount-Database

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Dismount-Database** cmdlet to dismount a database on a computer running Microsoft Exchange Server 2013 that has the Mailbox server role installed. You can run this command only if the Microsoft Exchange Information Store service is running.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Dismount-Database -Identity <DatabaseIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example dismounts the database `MyDatabase`.

```
Dismount-Database -Identity MyDatabase
```

Note:

Regardless of where you run this cmdlet, it operates against the server hosting the active copy of the database.

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the GUID or distinguished name (DN) that represents a specific database.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Mount-Database

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Mount-Database** cmdlet to mount a database on a server running Microsoft Exchange Server 2013 with the Mailbox server role installed. The cmdlet mounts the database only if the Microsoft Exchange Information Store service and Microsoft Exchange Replication service are running.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Mount-Database -Identity <DatabaseIdParameter> [-AcceptDataLoss
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mounts the database MyDatabase.

```
Mount-Database -Identity ExchangeServer1.Contoso.com
\MyDatabase
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the GUID or distinguished name (DN) that represents a specific database. The *Identity* parameter label is optional.
AcceptDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptDataLoss* parameter specifies that the command accepts the data loss caused by missing committed transaction log files without asking for user confirmation.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies a forced mount of an empty database. The parameter also overrides any errors or warnings during the database mount.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Move-DatabasePath

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Move-DatabasePath** cmdlet to set a new path to the location of a database on the specified Mailbox server and to move the related files to that location.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Move-DatabasePath -Identity <DatabaseIdParameter> [-ConfigurationOnly
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-EdbFilePath <EdbFilePath>] [-Force <SwitchParameter>] [-
LogFolderPath <NonRootLocalLongFullPath>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets a new path for the mailbox database specified by the mailbox database name. To perform the move operation, the database must be temporarily dismounted, making it inaccessible to all users. If the database is currently dismounted, it isn't remounted upon completion.

```
Move-DatabasePath -Identity MyDatabase01 -EdbFilePath C:
\NewFolder\MyDatabase01.edb
```

Detailed Description

When you use the **Move-DatabasePath** cmdlet, consider the following:

- This cmdlet fails if it's run while the database is being backed up.
- If the specified database is mounted when this cmdlet is run, the database is automatically dismounted and then remounted, and is unavailable to users while it's dismounted.
- This cmdlet normally can be run on the affected Mailbox server only. An exception is that this cmdlet can be run on an administrator's workstation when using the *ConfigurationOnly* parameter with a value of `$true`.
- This cmdlet can't be run against replicated mailbox databases. To move the path of a replicated database, you must first remove all replicated copies, and then you can perform the move operation. After the move operation is complete, you can add copies of the mailbox database.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or name of the database.
ConfigurationOnly	Optional	System.Management.Automation.SwitchParameter	The *ConfigurationOnly* switch specifies whether the configuration of the database changes without moving any files. A value of `$true` changes the

			configuration. A value of `$false` changes the configuration and moves the files. The default value is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EdbFilePath	Optional	Microsoft.Exchange.Data.EdbFilePath	The *EdbFilePath* parameter specifies a new file path for the database. All current database files are moved to this location. The default location is

			<ExchangeInstallDirectory>\Mailbox\LocalCopies\MBDatabase.edb. This file path can't be the same as the path for the backup copy of the database.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
LogFolderPath	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *LogFolderPath* parameter specifies the folder where log files are stored.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-DatabaseSchema

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-DatabaseSchema** cmdlet to upgrade the database schema for one or more databases after an Exchange software update that includes database schema updates has been installed on Mailbox servers in a database availability group (DAG). Some software updates for Exchange may include database schema updates. After such an update has been installed on all members of a DAG, the administrator must run the **Update-DatabaseSchema** cmdlet for each

database in the DAG to trigger the database schema update. The in-place database schema upgrade engine ensures that no schema updates occur until all members of the DAG have compatible versions of the software.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-DatabaseSchema -Identity <DatabaseIdParameter> <COMMON PARAMETERS>

Update-DatabaseSchema -Identity <DatabaseIdParameter> -MajorVersion
<UInt16> -MinorVersion <UInt16> <COMMON PARAMETERS>

COMMON PARAMETERS: [-AllowFileRestore <$true | $false>] [-
AutoDagExcludeFromMonitoring <$true | $false>] [-AutoDatabaseMountDial
<Lossless | GoodAvailability | BestAvailability>] [-
BackgroundDatabaseMaintenance <$true | $false>] [-CircularLoggingEnabled
<$true | $false>] [-Confirm [<SwitchParameter>]] [-DatabaseGroup <String>]
[-DataMoveReplicationConstraint <None | SecondCopy | SecondDatacenter |
AllDatacenters | AllCopies | CINoReplication | CISecondCopy |
CISecondDatacenter | CIAllDatacenters | CIAllCopies>] [-
DeletedItemRetention <EnhancedTimeSpan>] [-DomainController <Fqdn>] [-
EventHistoryRetentionPeriod <EnhancedTimeSpan>] [-IssueWarningQuota
<Unlimited>] [-MaintenanceSchedule <Schedule>] [-MountAtStartup <$true |
$false>] [-Name <String>] [-QuotaNotificationSchedule <Schedule>] [-
RetainDeletedItemsUntilBackup <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the database schema for database DB1.

```
Update-DatabaseSchema DB1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the mailbox database for which you want to set one or more attributes. You can use the

			following values: • GUID • Distinguished name (DN) • Name of the mailbox database
MajorVersion	Required	System.UInt16	This parameter is reserved for internal Microsoft use.
MinorVersion	Required	System.UInt16	This parameter is reserved for internal Microsoft use.
AllowFileRestore	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AutoDagExcludeFromMonitoring	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AutoDatabaseMountDial	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AutoDatabaseMountDial	This parameter is reserved for internal Microsoft use.
BackgroundDatabaseMaintenance	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
CircularLoggingEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You

			don't have to specify a value with the *Confirm* switch.
DatabaseGroup	Optional	System.String	This parameter is reserved for internal Microsoft use.
DataMoveReplicationConstraint	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DataMoveReplicationConstraintParameter	This parameter is reserved for internal Microsoft use.
DeletedItemRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EventHistoryRetentionPeriod	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
IssueWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
MaintenanceSchedule	Optional	Microsoft.Exchange.Data.Schedule	This parameter has been deprecated in Exchange 2013.
MountAtStartup	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

Name	Optional	System.String	This parameter is reserved for internal Microsoft use.
QuotaNotificationSchedule	Optional	Microsoft.Exchange.Data.Schedule	This parameter has been deprecated in Exchange 2013.
RetainDeletedItemsUntilBackup	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ExchangeSearch

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-ExchangeSearch** cmdlet to test that Exchange Search is currently enabled and is indexing new email messages in a timely manner.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-ExchangeSearch [-Archive <SwitchParameter>] [-Identity
<MailboxIdParameter>] <COMMON PARAMETERS>

Test-ExchangeSearch [-Server <ServerIdParameter>] <COMMON PARAMETERS>

Test-ExchangeSearch [-MailboxDatabase <DatabaseIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-IndexingTimeoutInSeconds <Int32>] [-MonitoringContext
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests Exchange Search results for the mailbox database on which the specified mailbox resides.

```
Test-ExchangeSearch -Identity john@contoso.com
```

EXAMPLE 2

This example tests Exchange Search against the mailbox database EXCH01-SG1-MDB1 with an indexing time-out of 30 seconds.

```
Test-ExchangeSearch -MailboxDatabase "EXCH01-SG1-MDB1" -
IndexingTimeoutInSeconds 30
```

EXAMPLE 3

This example tests Exchange Search results for the mailbox database on which the specified mailbox resides. The *Verbose* switch is used to display detailed information.

```
Test-ExchangeSearch -Identity john@contoso.com -Verbose
```

Detailed Description

The **Test-ExchangeSearch** cmdlet creates a hidden message and an attachment visible only to Exchange Search. Unless a mailbox is specified in the *Identity* parameter, the hidden message is stored in the System Attendant mailbox. The command waits for the message to be indexed and then searches for the content. It reports success or failure depending on whether the message is found after the interval set in the *IndexingTimeoutInSeconds* parameter has elapsed.

You can use the *Verbose* switch to get detailed information about each step performed by the cmdlet as part of the test.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Search" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies that the test be run against the archive mailbox for the mailbox user specified in the *Identity* parameter. When the *Archive* switch is used, you must also use the *Identity* parameter to specify the mailbox.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox that you want to test Exchange Search against. If this parameter isn't specified, the System Attendant mailbox is used. The *Identity* and *MailboxDatabase* parameters can't be used together.
IndexingTimeoutInSeconds	Optional	System.Int32	The *IndexingTimeoutInSeconds* parameter specifies, in seconds, the maximum amount of time to wait between adding the new email message to the test mailbox and waiting for it to be returned in a

			search result. The default value is 120 seconds. If this parameter isn't specified, the default interval is used.
MailboxDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *MailboxDatabase* parameter specifies the mailbox database to test Exchange Search against. The *MailboxDatabase* and *Identity* parameters can't be used together.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations

			Manager.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server for the recipient that you want to test Exchange Search against.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-FailedContentIndexDocuments

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-FailedContentIndexDocuments** cmdlet to retrieve a list of documents for a mailbox, mailbox database, or Mailbox server that couldn't be indexed by Exchange Search.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-FailedContentIndexDocuments -Identity <MailboxIdParameter> [-Archive
<SwitchParameter>] <COMMON PARAMETERS>

Get-FailedContentIndexDocuments -Server <ServerIdParameter> <COMMON
PARAMETERS>

Get-FailedContentIndexDocuments -MailboxDatabase <DatabaseIdParameter>
<COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-EndDate <DateTime>] [-
ErrorCode <Int32>] [-FailureMode <Transient | Permanent | All>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>] [-
StartDate <DateTime>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example retrieves a list of items that couldn't be indexed by Exchange Search from the mailbox of user Terry Adams.

```
Get-FailedContentIndexDocuments -Identity "Terry Adams"
```

EXAMPLE 2

This example retrieves a list of items that couldn't be indexed by Exchange Search from the mailbox database Mailbox Database MDB2.

```
Get-FailedContentIndexDocuments -MailboxDatabase "Mailbox
Database MDB2"
```

Detailed Description

The **Get-FailedContentIndexDocuments** cmdlet returns a list of documents that couldn't be indexed. The most common reason is that there was no filter available for that document type or

there was an attachment within the document. For example, the PDF filter isn't available by default. If an email message contains a PDF document, because there is no PDF filter, the document is marked as failed content indexing.

After a new filter is installed, only new messages with attachments of the type for which the filter is installed are indexed. If you want to index older messages for the document type, the mailbox has to be moved.

The cmdlet output provides details about items in a mailbox that couldn't be indexed, including an error code and the reason for failure.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Get unsearchable items" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
MailboxDatabase	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *MailboxDatabase* parameter specifies the database from which to

			get the mailbox. You can use the following values: • GUID of the database • Database name • DN
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *Server* parameter specifies a Mailbox server. You can use the following values: • Name • GUID • DN
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch restricts the scope of the cmdlet to the user's archive. When using the *Archive* switch, you must also specify the *Identity* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

Credential	Optional	System.Management.Automation.PSCredential	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
EndDate	Optional	System.DateTime	The *EndDate* parameter specifies the end date of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must

			enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
ErrorCode	Optional	System.Int32	The *ErrorCode* parameter allows you to retrieve documents that failed indexing with a specific error code. You can use the cmdlet without this parameter to list all failed documents for a mailbox, a mailbox database or a Mailbox server. The output includes the error codes and reason for failure. If required, you can then restrict the output to a specific error code from the results.
FailureMode	Optional	Microsoft.Exchange.Search.Core.Abstraction.FailureMode	The *FailureMode* parameter specifies the type of error. Use the following values. • `Transient` Returns items that couldn't be indexed due to transient errors. Exchange Search attempts to index these items again. • `Permanent` Returns items that couldn't be indexed due to a permanent error. Exchange Search does

			not attempt to index these items again. • All Returns items that couldn't be indexed regardless of nature of failure.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
StartDate	Optional	System.DateTime	The *StartDate* parameter specifies the start date of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxDatabase

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-23*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxDatabase** cmdlet to retrieve one or more mailbox database objects from a server or organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxDatabase -Server <ServerIdParameter> <COMMON PARAMETERS>
```

```
Get-MailboxDatabase [-Identity <DatabaseIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-DumpsterStatistics
<SwitchParameter>] [-IncludePreExchange2013 <SwitchParameter>] [-Status
<SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves information about all the mailbox databases in the Exchange organization, including the mailbox databases that reside on computers running Exchange 2013 and earlier versions of Exchange.

```
Get-MailboxDatabase -IncludePreExchange2013
```

EXAMPLE 2

This example retrieves information about MailboxDatabase01 on Server01. This example also retrieves the status information, and pipes the output to the **Format-List** cmdlet so that you can view all the information about the mailbox database.

```
Get-MailboxDatabase -Identity MailboxDatabase01 -Server
Server01 -Status | Format-List
```

Detailed Description

If you use the **Get-MailboxDatabase** cmdlet with no parameters, it retrieves information about all mailbox databases in the Exchange organization. If you use the **Get-MailboxDatabase** cmdlet with the *Server* parameter, it retrieves information about all mailbox databases on the server that you specify.

The following list describes the properties that are returned in the results.

- **Name** Name of the database.
- **Server** Server hosting the database.
- **Recovery** Specifies whether the new database is designated as a recovery database.
- **ReplicationType** Replication type of the database.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Database Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name of the server from which to retrieve mailbox database information. If you specify this parameter, the command retrieves information about all of the mailbox databases on the server that you specify.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
DumpsterStatistics	Optional	System.Management.Automation.SwitchParameter	The *DumpsterStatistics* switch specifies that transport dumpster statistics be returned with the database status.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies a mailbox database. You can use the following values: • GUID • Distinguished name (DN) • Database name

			If you have multiple databases with the same name, the command retrieves all databases with the same name in the specified scope.
IncludePreExchange2013	Optional	System.Management.Automation.SwitchParameter	The *IncludePreExchange2013* switch parameter specifies whether to return information about the mailbox databases that reside on computers running Microsoft Exchange Server 2013 and earlier versions of Exchange.
Status	Optional	System.Management.Automation.SwitchParameter	The *Status* switch specifies whether to retrieve the available free space in the database root and information about the following attributes: • **BackupInProgress** • **Mounted** • **OnlineMaintenanceInProgress** You don't need to specify a value with this switch. If you specify this switch, you should format the

			output in such a way that you can view the additional attributes, for example, pipe the output to the **Format-List** cmdlet.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxDatabase

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-MailboxDatabase** cmdlet to create a mailbox database, or a recovery database. Each database you create must have a unique name in the organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxDatabase -Name <String> [-AutoDagExcludeFromMonitoring <$true |
$false>] [-IsExcludedFromInitialProvisioning <SwitchParameter>] [-
IsExcludedFromProvisioning <$true | $false>] [-IsSuspendedFromProvisioning
<$true | $false>] [-OfflineAddressBook <OfflineAddressBookIdParameter>] [-
PublicFolderDatabase <DatabaseIdParameter>] <COMMON PARAMETERS>

New-MailboxDatabase -Recovery <SwitchParameter> [-Name <String>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -Server <ServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-EdbFilePath
<EdbFilePath>] [-LogFolderPath <NonRootLocalLongFullPath>] [-
MailboxProvisioningAttributes <MailboxProvisioningAttributes>] [-
SkipDatabaseLogFolderCreation <SwitchParameter>] [-WhatIf
```

```
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the mailbox database DB1. This example also uses a non-default location for the database file.

```
New-MailboxDatabase -Name "DB1" -EdbFilePath D:
\ExchangeDatabases\DB1\DB1.edb
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox database permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the new mailbox database.
Recovery	Required	System.Management.Automation.SwitchParameter	The *Recovery* parameter specifies that the new database is designated as a recovery database.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server on which you want to create the database.
AutoDagExcludeFrom	Optional	System.Boolean	The

Monitoring			*AutoDagExcludeFromMonitoring* parameter specifies that the database being created should not be monitored by managed availability.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EdbFilePath	Optional	Microsoft.Exchange.Data.EdbFilePath	The *EdbFilePath* parameter specifies the path to the database files. The default value is %programfiles%

			\Microsoft\Exchange Server\V15\Mailbox \<*Database name*>.edb.
IsExcludedFromInitialProvisioning	Optional	System.Management.Automation.SwitchParameter	The *IsExcludedFromInitialProvisioning* parameter specifies that this database is temporarily not considered by the mailbox provisioning load balancer. If the *IsExcludedFromInitialProvisioning* parameter is enabled, new mailboxes aren't added automatically to this database.
IsExcludedFromProvisioning	Optional	System.Boolean	The *IsExcludedFromProvisioning* parameter specifies whether this database is considered by the mailbox provisioning load balancer. If the *IsExcludedFromProvisioning* parameter is set to `$true`, no new mailboxes are automatically added to this database.

IsSuspendedFromProvisioning	Optional	System.Boolean	The *IsSuspendedFromProvisioning* parameter specifies whether this database is temporarily considered by the mailbox provisioning load balancer.
LogFolderPath	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *LogFolderPath* parameter specifies the folder location for log files.
MailboxProvisioningAttributes	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailboxProvisioningAttributes	This parameter is reserved for internal Microsoft use.
OfflineAddressBook	Optional	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *OfflineAddressBook* parameter specifies the associated offline address book (OAB) for the new mailbox database.
PublicFolderDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *PublicFolderDatabase* parameter specifies the associated public folder database for the new mailbox database.
SkipDatabaseLogFolde	Optional	System.Management.A	This parameter is

rCreation		utomation.SwitchParameter	reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxDatabase

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MailboxDatabase** cmdlet to delete a mailbox database object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxDatabase -Identity <DatabaseIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mailbox database MailboxDatabase01.

```
Remove-MailboxDatabase -Identity MailboxDatabase01
```

Detailed Description

If the mailbox database has a database copy, the **Remove-MailboxDatabase** cmdlet also removes the copy.

The **Remove-MailboxDatabase** cmdlet removes only the database object from Active Directory. It doesn't remove the physical database files. You must remove the database files manually after you run the **Remove-MailboxDatabase** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Database Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the mailbox database to remove. You can use one of the following values: • GUID • Distinguished name (DN) • Name of the mailbox database

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxDatabase

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-27*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxDatabase** cmdlet to configure a variety of properties for a mailbox database.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxDatabase -Identity <DatabaseIdParameter> [-AllowFileRestore
<$true | $false>] [-AutoDagExcludeFromMonitoring <$true | $false>] [-
AutoDatabaseMountDial <Lossless | GoodAvailability | BestAvailability>] [-
BackgroundDatabaseMaintenance <$true | $false>] [-CalendarLoggingQuota
<Unlimited>] [-CircularLoggingEnabled <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DatabaseGroup <String>] [-
DataMoveReplicationConstraint <None | SecondCopy | SecondDatacenter |
AllDatacenters | AllCopies | CINoReplication | CISecondCopy |
CISecondDatacenter | CIAllDatacenters | CIAllCopies>] [-
DeletedItemRetention <EnhancedTimeSpan>] [-DomainController <Fqdn>] [-
EventHistoryRetentionPeriod <EnhancedTimeSpan>] [-IndexEnabled <$true |
$false>] [-IsExcludedFromInitialProvisioning <$true | $false>] [-
IsExcludedFromProvisioning <$true | $false>] [-IssueWarningQuota
<Unlimited>] [-IsSuspendedFromProvisioning <$true | $false>] [-
JournalRecipient <RecipientIdParameter>] [-MailboxLoadBalanceEnabled
<$true | $false>] [-MailboxLoadBalanceMaximumEdbFileSize
<ByteQuantifiedSize>] [-MailboxLoadBalanceOverloadedThreshold <Int32>] [-
MailboxLoadBalanceRelativeLoadCapacity <Int32>] [-
MailboxLoadBalanceUnderloadedThreshold <Int32>] [-
MailboxProvisioningAttributes <MailboxProvisioningAttributes>] [-
MailboxRetention <EnhancedTimeSpan>] [-MaintenanceSchedule <Schedule>] [-
MountAtStartup <$true | $false>] [-Name <String>] [-OfflineAddressBook
<OfflineAddressBookIdParameter>] [-ProhibitSendQuota <Unlimited>] [-
ProhibitSendReceiveQuota <Unlimited>] [-PublicFolderDatabase
<DatabaseIdParameter>] [-QuotaNotificationSchedule <Schedule>] [-
RecoverableItemsQuota <Unlimited>] [-RecoverableItemsWarningQuota
<Unlimited>] [-RetainDeletedItemsUntilBackup <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the length of time that deleted items are retained. If a specific mailbox has its

own item retention set, that value is used instead of this value, which is set on the mailbox database.

```
Set-MailboxDatabase "Mailbox Database01" -
DeletedItemRetention 7.00:00:00
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Database Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the mailbox database for which you want to set one or more attributes. You can use the following values: • GUID • Distinguished name (DN) • Name of the mailbox database If you don't specify the server name, the command searches for the database on the local server.
AllowFileRestore	Optional	System.Boolean	The *AllowFileRestore* parameter specifies whether to allow restoring

			a database from a backup. The two possible values are `$true` or `$false`. If you specify `$true`, the command allows a database that doesn't match the database entry in Active Directory to be mounted. If you specify `$false`, the command doesn't allow a database that doesn't match the database entry in Active Directory to be mounted, so you won't be able to replace an existing database with a newly created database.
AutoDagExcludeFromMonitoring	Optional	System.Boolean	The *AutoDagExcludedFromMonitoring* is to exclude a mailbox database from the ServerOneCopyMonitor which alerts an administrator when a replicated database has only one healthy copy available. The default setting for this property is False. If this property is not set to True for a

			database and there is only one copy of the database, alerts will be issued.
AutoDatabaseMountDial	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AutoDatabaseMountDial	This parameter is reserved for internal Microsoft use.
BackgroundDatabaseMaintenance	Optional	System.Boolean	The *BackgroundDatabaseMaintenance* parameter specifies whether the Extensible Storage Engine (ESE) performs database maintenance. The two possible values are `$true` or `$false`. If you specify `$true`, the mailbox database reads the object during database mount and initializes the database to perform the background database maintenance. If you specify `$false`, the mailbox database reads the object during database mount and initializes the database without the option to perform the background database maintenance.

CalendarLoggingQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *CalendarLoggingQuota* parameter specifies how much space to allocate for calendar logging information.
CircularLoggingEnabled	Optional	System.Boolean	The *CircularLoggingEnabled* parameter specifies whether circular logging is enabled. If this parameter is set to `$true`, circular logging is enabled. The default value is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DatabaseGroup	Optional	System.String	This parameter is reserved for internal Microsoft use.
DataMoveReplicationConstraint	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DataMoveReplicationConstraint	The *DataMoveReplicationConstraint* parameter specifies the throttling behavior for

		Parameter	high availability mailbox moves. The possible values include: • `None` Moves shouldn't be throttled to ensure high availability. Use this setting if the database isn't part of a database availability group (DAG). • `SecondCopy` At least one passive mailbox database copy must have the most recent changes synchronized. This is the default value. Use this setting to indicate that the database is replicated to one or more mailbox database copies. • `SecondDatacenter` At least one passive mailbox database copy in another Active Directory site must have the most recent changes replicated. Use this setting to indicate that the database is replicated to database copies in multiple Active Directory sites. • `AllDatacenters` At least one passive mailbox database copy in each Active Directory site must have the most recent changes replicated. Use this setting to indicate that the database is replicated to database

			copies in multiple Active Directory sites. • `AllCopies` All copies of the database must have the most recent changes replicated. Use this setting to indicate that the database is replicated to one or more mailbox database copies. **Note:** Any value other than `None` enables the Microsoft Exchange Mailbox Replication service to coordinate with Active Manager. For more information, see Active Manager.
DeletedItemRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DeletedItemRetention* parameter specifies the length of time to keep deleted items. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a 15-hour interval, enter 15:00:00. The maximum length of time to retain deleted items is 24,855 days. By default, deleted items are retained for 14 days. This attribute applies

			to all mailboxes in this mailbox database that don't have their own item retention attribute set.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EventHistoryRetentionPeriod	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *EventHistoryRetentionPeriod* parameter specifies the length of time to keep event data. This event data is stored in the event history table in the Exchange store. It includes information about changes to various objects in the mailbox database. You can use this parameter to prevent the event history table from becoming too large and using too much disk space. To specify a value, enter it as a time span: dd.hh:mm:ss where d =

			days, h = hours, m = minutes, and s = seconds. For example, to specify a 15-hour interval, enter 15:00:00.
IndexEnabled	Optional	System.Boolean	The *IndexEnabled* parameter specifies whether Exchange Search indexes this mailbox database. The two possible values are `$true` or `$false`. The default value is `$true`.
IsExcludedFromInitialProvisioning	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
IsExcludedFromProvisioning	Optional	System.Boolean	The *IsExcludedFromProvisioning* parameter specifies that this database is permanently not considered by the mailbox provisioning load balancer. If the *IsExcludedFromProvisioning* parameter is enabled, new mailboxes aren't added automatically to this database. You can manually add a mailbox if your role permits.
IssueWarningQuota	Optional	Microsoft.Exchange.Da	The *IssueWarningQuota*

		ta.Unlimited	parameter specifies the mailbox size at which a warning message is sent to the user. This attribute applies to all mailboxes in this mailbox database that don't have their own warning quota attribute set. You must specify either an integer or unlimited. The default value is 1.9 gigabytes (GB).
IsSuspendedFromProvisioning	Optional	System.Boolean	The *IsSuspendedFromProvisioning* parameter specifies that this database is temporarily not considered by the mailbox provisioning load balancer.
JournalRecipient	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *JournalRecipient* parameter specifies the mailbox to which journal reports are sent.
MailboxLoadBalanceEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
MailboxLoadBalanceMaximumEdbFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
MailboxLoadBalanceO	Optional	System.Int32	This parameter is reserved

verloadedThreshold			for internal Microsoft use.
MailboxLoadBalanceRelativeLoadCapacity	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MailboxLoadBalanceUnderloadedThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MailboxProvisioningAttributes	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailboxProvisioningAttributes	This parameter is reserved for internal Microsoft use.
MailboxRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MailboxRetention* parameter specifies the length of time to keep deleted mailboxes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a 15-hour interval, enter 15:00:00. The maximum length of time to retain mailboxes is 24,855 days. By default, deleted mailboxes are retained for 30 days. This attribute applies to all mailboxes in this mailbox database.
MaintenanceSchedule	Optional	Microsoft.Exchange.Data.Schedule	This parameter has been deprecated in Exchange

			2013. While it can be used to change the *MaintenanceSchedule* property of a database, that property is ignored in Exchange 2013 because scheduled maintenance no longer exists.
MountAtStartup	Optional	System.Boolean	The *MountAtStartup* parameter specifies whether to mount this mailbox database when the Microsoft Exchange Information Store service starts. The two possible values for this parameter are `$true` or `$false`.
Name	Optional	System.String	The *Name* parameter specifies the name of the mailbox database.
OfflineAddressBook	Optional	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *OfflineAddressBook* parameter specifies the associated address book for this mailbox database.
ProhibitSendQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ProhibitSendQuota* parameter specifies the mailbox size at which users associated with mailboxes in this mailbox database can no longer send messages. This

			attribute applies to all mailboxes in this mailbox database that don't have their own prohibit send quota attributes set. You must specify either an integer or unlimited.
ProhibitSendReceiveQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *ProhibitSendReceiveQuota* parameter specifies the mailbox size at which the user associated with this mailbox can no longer send or receive messages. This attribute applies to all mailboxes in this mailbox database that don't have their own prohibit send receive quota attributes set. You must specify either an integer or unlimited.
PublicFolderDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter has been deprecated in Exchange 2013 and it no longer does anything.
QuotaNotificationSchedule	Optional	Microsoft.Exchange.Data.Schedule	This parameter has been deprecated in Exchange 2013 and it no longer does anything.

RecoverableItemsQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *RecoverableItemsQuota* parameter specifies the limit for the Recovery Items folder. When you reach the quota limit, you can't put any more items in the Recovery Items folder.
RecoverableItemsWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *RecoverableItemsWarningQuota* parameter specifies the quota for when a warning event is entered in Event Viewer.
RetainDeletedItemsUntilBackup	Optional	System.Boolean	The *RetainDeletedItemsUntilBackup* parameter specifies whether to retain deleted items until the next backup occurs. The two possible values for this parameter are `$true` or `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-MailboxQuarantine

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-MailboxQuarantine** cmdlet to quarantine mailboxes that affect the availability of the mailbox database.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-MailboxQuarantine -Identity <GeneralMailboxIdParameter> [-
AllowMigration <SwitchParameter>] [-Confirm [<SwitchParameter>]] [-
Duration <EnhancedTimeSpan>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example quarantines the mailbox for the user Brian Johnson.

```
Enable-MailboxQuarantine "Brian Johnson"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GeneralMailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use any value that uniquely identifies the mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-

			4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
AllowMigration	Optional	System.Management.Automation.SwitchParameter	The *AllowMigration* switch allows a quarantined mailbox to be moved to another mailbox database or to the cloud. Moving a mailbox is one method of correcting data corruption that's required before releasing the mailbox from quarantine. You don't have to specify a value with the *AllowMigration* switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You

			must include a colon (:) in the syntax.
Duration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *Duration* parameter specifies how long the mailbox should remain quarantined. The default duration is 24 hours. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-MailboxQuarantine

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-MailboxQuarantine** cmdlet to release quarantined mailboxes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-MailboxQuarantine -Identity <GeneralMailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example releases the mailbox for the user Brian Johnson from quarantine.

```
Disable-MailboxQuarantine "Brian Johnson"
```

Detailed Description

Mailboxes are quarantined when they affect the availability of the mailbox database. Typically a software fix from Microsoft is required before releasing a mailbox from quarantine. If a fix isn't deployed before releasing the mailbox, the quarantine on the mailbox will be re-enabled if the condition recurs. The default quarantine duration is 24 hours.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.GeneralMailboxIdParameter	specifies the mailbox. You can use any value that uniquely identifies the mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name`

			Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxRepairRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxRepairRequest** cmdlet to display information about current mailbox repair requests. Mailbox repair requests are created using the **New-MailboxRepairRequest** cmdlet to detect and fix mailbox corruptions.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxRepairRequest -Identity <StoreIntegrityCheckJobIdParameter> [-
Detailed <SwitchParameter>] <COMMON PARAMETERS>

Get-MailboxRepairRequest -Database <DatabaseIdParameter> [-StoreMailbox
<StoreMailboxIdParameter>] <COMMON PARAMETERS>

Get-MailboxRepairRequest -Mailbox <MailboxIdParameter> [-Archive
<SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays the value of the *Identity* property for all mailbox repair requests for all mailbox servers in your organization; the second command displays information about a specific mailbox repair request that was returned by the first command.

```
Get-MailboxDatabase | Get-MailboxRepairRequest | FT
Identity

Get-MailboxRepairRequest -Identity 5b8ca3fa-8227-427f-af04-
9b4f206d611f\335c2b06-321d-4e73-b2f7-3dc2b02d0df5\374289de-
b899-42dc-8391-4f8579935f1f | FL
```

EXAMPLE 2

This example displays repair request information for the mailbox of Ann Beebe using the *Mailbox* parameter.

```
Get-MailboxRepairRequest -Mailbox "Ann Beebe" | FL
```

EXAMPLE 3

This example uses the *Database* and *StoreMailbox* parameters to display the *Identity* property of the repair request for the mailbox of Ann Beebe.

```
$MailboxGuid = Get-MailboxStatistics annb

Get-MailboxRepairRequest -Database $MailboxGuid.Database -
StoreMailbox $MailboxGuid.MailboxGuid | FL Identity
```

Detailed Description

The **Get-MailboxRepairRequest** cmdlet displays information about mailbox repair requests. This information includes:

- The mailbox GUID.
- The type of corruption that was specified when the mailbox repair request was created.
- The progress of the repair request in percentage of completion.
- The number of corruptions detected and fixed.
- The status of the repair request; values are `Queued`, `Running`, `Succeeded` and `Failed`.
- The date and time when the mailbox repair request was created and when it finished.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox repair request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Database* parameter specifies the database on which you run this command. If you use this parameter, all mailboxes on the database are searched for corruptions. You can use the following values:

			• GUID of the database • Database name You can't use this parameter with the *Mailbox* parameter.
Identity	Required	Microsoft.Exchange.Management.Tasks.StoreIntegrityCheckJobIdParameter	The *Identity* parameter specifies the mailbox repair request to display information about. Mailbox repair requests are identified by a complex GUID that is created when a new mailbox repair request is created. This GUID consists of a database ID, a Request ID, and a job ID. The format is `<DatabaseGuid>\<RequestGuid>\<JobGuid>`.
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the mailbox that you want to get mailbox repair request information about. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN)

			• LegacyExchangeDN • SMTP address • Alias You can't use this parameter with the *Database* parameter.
Archive	Optional	System.Management.Automation.SwitchParameter	If the associated archive mailbox was included when the mailbox repair request was created, use the *Archive* parameter to display information about the archive mailbox. If you don't specify this parameter, only information about the primary mailbox is returned. You can't use this parameter with the *Database* parameter.
Detailed	Optional	System.Management.Automation.SwitchParameter	Use the *Detailed* parameter to display mailbox-level repair tasks associated with the repair request.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
StoreMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	The *StoreMailbox* parameter specifies the mailbox GUID of the mailbox that you want to get mailbox repair request information about. Use this parameter with the *Database* parameter. Use the Get-MailboxStatistics cmdlet to find the mailbox GUID for a mailbox.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxRepairRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-MailboxRepairRequest** cmdlet to detect and fix mailbox corruptions. You can run this command against a specific mailbox or against a database. While this task is running, mailbox access is disrupted only for the mailbox being repaired. If you're running this command against a database, only the mailbox being repaired is disrupted. All other mailboxes on the database remain operational.

For information about the parameter sets in the Syntax section below, see Syntax.

Note:

After you begin the repair request, it can't be stopped unless you dismount the database.

```
New-MailboxRepairRequest -Mailbox <MailboxIdParameter> [-Archive
<SwitchParameter>] <COMMON PARAMETERS>

New-MailboxRepairRequest -Database <DatabaseIdParameter> [-StoreMailbox
<StoreMailboxIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -CorruptionType <MailboxCorruptionType[]> [-Confirm
[<SwitchParameter>]] [-DetectOnly <SwitchParameter>] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example detects and repairs all folder views for the mailbox tony@contoso.com.

```
New-MailboxRepairRequest -Mailbox tony@contoso.com -
CorruptionType FolderView
```

EXAMPLE 2

This example only detects and reports on `ProvisionedFolder` and `SearchFolder` corruption issues to Ayla Kol's mailbox. This command doesn't repair the mailbox.

```
New-MailboxRepairRequest -Mailbox ayla -CorruptionType
ProvisionedFolder,SearchFolder -DetectOnly
```

EXAMPLE 3

This example detects and repairs `AggregateCounts` for all mailboxes on mailbox database MBX-DB01.

```
New-MailboxRepairRequest -Database MBX-DB01 -CorruptionType
AggregateCounts
```

EXAMPLE 4

This example detects and repairs all corruption types for Ayla Kol's mailbox and archive.

```
New-MailboxRepairRequest -Mailbox ayla -CorruptionType
ProvisionedFolder,SearchFolder,AggregateCounts,Folderview -
Archive
```

EXAMPLE 5

This example creates a variable that identifies Ann Beebe's mailbox and then uses the variable to specify the values for the *Database* and *StoreMailbox* parameters to create a request to detect and repair all corruption types.

```
$Mailbox = Get-MailboxStatistics annb

New-MailboxRepairRequest -Database $Mailbox.Database -
StoreMailbox $Mailbox.MailboxGuid -CorruptionType
ProvisionedFolder,SearchFolder,AggregateCounts,Folderview
```

Detailed Description

To avoid any performance problems, there are limits placed on the number of simultaneous repair requests that can be submitted per server. Only one request can be active for a database-level repair, or up to 100 requests can be active for a mailbox-level repair per server.

The **New-MailboxRepairRequest** cmdlet detects and fixes the following types of mailbox corruptions:

- Search folder corruptions (`SearchFolder`)
- Aggregate counts on folders that aren't reflecting correct values (`AggregateCounts`)
- Views on folders that aren't returning correct contents (`FolderView`)
- Provisioned folders that are incorrectly pointing into parent folders that aren't provisioned (`ProvisionedFolder`)

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox repair request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
CorruptionType	Required	Microsoft.Exchange.Management.Tasks.MailboxCorruptionType[]	The *CorruptionType* parameter specifies the type of corruption that

			you want to detect and repair. You can use the following values: • `SearchFolder` • `AggregateCounts` • `ProvisionedFolder` • `FolderView` You can search for multiple corruption types at a time. Separate multiple types with a comma, for example, `SearchFolder,AggregateCounts`.
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Database* parameter specifies the database on which you run this command. If you use this parameter, all mailboxes on the database are searched for corruptions. To avoid performance issues, you're limited to one active database repair request at a time. You can use the following values: • GUID of the database • Database name You can't use this parameter in conjunction with the *Mailbox* parameter.
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.Mail	The *Mailbox* parameter specifies the mailbox on

		boxIdParameter	which you run this command. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias You can't use this parameter in conjunction with the *Database* parameter.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter specifies whether to detect corruptions or repair the archive mailbox associated with the specified mailbox. If you don't specify this parameter, only the primary mailbox is repaired. You can't use this parameter in conjunction with the *Database* parameter.
Confirm	Optional	System.Management.	The *Confirm* switch can be

		Automation.SwitchParameter	used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DetectOnly	Optional	System.Management.Automation.SwitchParameter	The *DetectOnly* parameter specifies that you want this command to report errors, but not fix them. You don't have to specify a value with this parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies that the cmdlet should run immediately and not wait to be dispatched by workload management.
StoreMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.Stor	The *StoreMailbox* parameter specifies the

		eMailboxIdParameter	mailbox GUID of the mailbox you want to repair. Use this parameter with the *Database* parameter. Run the Get-MailboxStatistics cmdlet to find the mailbox GUID for a mailbox.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxRepairRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MailboxRepairRequest** cmdlet to remove mailbox repair requests from a mailbox database that were created using the **New-MailboxRepairRequest** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxRepairRequest -Identity <StoreIntegrityCheckJobIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes all mailbox repair requests for the mailbox database EXCH-MBX-01.

```
Get-MailboxDatabase -Identity "EXCH-MBX-01" | Get-
MailboxRepairRequest | Remove-MailboxRepairRequest
```

EXAMPLE 2

This example removes all related mailbox repair requests that have the same `<DatabaseGuid>\<RequestGuid>`. The example uses the **Get-MailboxRepairRequest** cmdlet to display the value of the *Identity* parameter for all mailbox repair request for EXCH-MBX-02 mailbox database.

```
Get-MailboxDatabase -Identity "EXCH-MBX-02" | Get-
MailboxRepairRequest | FL Identity

Remove-MailboxRepairRequest -Identity 5b8ca3fa-8227-427f-
af04-9b4f206d611f\335c2b06-321d-4e73-b2f7-3dc2b02d0df5
```

EXAMPLE 3

This example deletes a specific mailbox repair request by specifying the unique `<DatabaseGuid>\<RequestGuid>\<JobGuid>` identity value. The example also uses the **Get-MailboxRepairRequest** cmdlet to display the identities of all mailbox repair request for the EXCH-MBX-02 mailbox database.

```
Get-MailboxDatabase -Identity "EXCH-MBX-02" | Get-
MailboxRepairRequest | FL Identity

Remove-MailboxRepairRequest -Identity 5b8ca3fa-8227-427f-
af04-9b4f206d611f\189c7852-49bd-4737-a53e-6e6caa5a183c
\1d8ca58a-186f-4dc6-b481-f835b548a929
```

Detailed Description

You can run the **Remove-MailboxRepairRequest** cmdlet to remove all mailbox repair requests for a specific database, for a group of related mailbox repair requests, or for a specific mailbox repair request. Mailbox repair requests are identified by a complex GUID with the following format: `<DatabaseGuid>\<RequestGuid>\<JobGuid>`. The `DatabaseGuid` identifies the mailbox database where the mailbox being repaired is located. The `RequestGuid` identifies related requests that may contain more than one job if the request runs more than one task or targets more than one mailbox. The `JobGuid` identifies a unique job. See the examples to remove all requests on a mailbox database, remove a group of related requests that share the same `RequestGuid`, or remove a specific request by specifying the complete `<DatabaseGuid>\<RequestGuid>\<JobGuid>` value.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox repair request" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Tasks.StoreIntegrityCheckJobIdParameter	The *Identity* parameter specifies the mailbox repair request to remove. Mailbox repair requests are identified by a complex GUID that is created when a new mailbox repair request is created. This GUID consists of a database ID, a Request ID, and a

			job ID. The format is `<DatabaseGuid>\<RequestGuid>\<JobGuid>`. Use the Get-MailboxRepairRequest cmdlet to find the identity of a mailbox repair request.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on

			the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-MapiConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-17*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Test-MapiConnectivity** cmdlet to verify server functionality by logging on to the mailbox that you specify. If you don't specify a mailbox, the cmdlet logs on to the SystemMailbox on the database that you specify.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-MAPIConnectivity [-IncludePassive <SwitchParameter>] [-Server
<ServerIdParameter>] <COMMON PARAMETERS>

Test-MAPIConnectivity -Database <DatabaseIdParameter> [-CopyOnServer
<ServerIdParameter>] <COMMON PARAMETERS>
```

```
Test-MAPIConnectivity -Identity <MailboxIdParameter> [-Archive
<SwitchParameter>] [-CopyOnServer <ServerIdParameter>] [-
EnableSoftDeletedRecipientLogon <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-ActiveDirectoryTimeout <Int32>] [-
AllConnectionsTimeout <Int32>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-MonitoringContext <$true | $false>] [-
PerConnectionTimeout <Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests connectivity to the server Server01.

```
Test-MapiConnectivity -Server "Server01"
```

EXAMPLE 2

This example tests connectivity to a mailbox, specified as a domain name and user name.

```
Test-MapiConnectivity -Identity "midwest\john"
```

Detailed Description

The **Test-MapiConnectivity** cmdlet verifies server functionality. This cmdlet logs on to the mailbox that you specify (or to the SystemMailbox if you don't specify the *Identity* parameter) and retrieves a list of items in the Inbox. Logging on to the mailbox tests two critical protocols used when a client connects to a Mailbox server: MAPI and LDAP. During authentication, the **Test-MapiConnectivity** cmdlet indirectly verifies that the MAPI server, Exchange store, and Directory Service Access (DSAccess) are working.

The cmdlet logs on to the mailbox that you specify using the credentials of the account with which you're logged on to the local computer. After a successful authentication, the **Test-MapiConnectivity** cmdlet accesses the mailbox to verify that the database is working. If a successful connection to a mailbox is made, the cmdlet also determines the time that the logon attempt occurred.

There are three distinct parameters that you can use with the command: *Database*, *Identity*, and *Server*:

- The *Database* parameter takes a database identity and tests the ability to log on to the system mailbox on the specified database.
- The *Identity* parameter takes a mailbox identity and tests the ability to log on to a specific mailbox.
- The *Server* parameter takes a server identity and tests the ability to log on to each system mailbox on the specified server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "MAPI connectivity" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *Database* parameter specifies the database on which to test the connectivity to the system mailbox. If you don't specify this parameter or the *Identity* parameter, the command tests the SystemMailbox on each active database on the server that you specify, or on the local server if you don't specify the *Server* parameter.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies a mailbox to test. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name

			(UPN) • Legacy Exchange DN • SMTP address • Alias This parameter accepts pipeline input from the **Get-Mailbox** or **Get-Recipient** cmdlet. If an object is piped from the **Get-Mailbox** cmdlet or **Get-Recipient** cmdlet, this parameter isn't required. If you don't specify this parameter, the cmdlet tests the SystemMailbox on the database that you specify.
ActiveDirectoryTimeout	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *ActiveDirectoryTimeout* parameter specifies the amount of time, in seconds, allowed for each Active Directory operation to complete before the operation times out. The default value is 15 seconds.

AllConnectionsTimeout	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *AllConnectionsTimeout* parameter specifies the amount of time, in seconds, allowed for all connections to complete before the cmdlet times out. The time-out countdown doesn't begin until all information necessary to perform the connections is gathered from Active Directory.The default value is 90 seconds.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* parameter specifies whether to test the MAPI connectivity of the personal archive associated with the specified mailbox. If you don't specify this parameter, only the primary mailbox is tested.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To

			suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
CopyOnServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *CopyOnServer* parameter is used to test MAPI connectivity to a specific database copy on the servers specified with the *Server* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
EnableSoftDeletedRecipientLogon	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IncludePassive	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013.

			Without the *IncludePassive* parameter, the cmdlet tests MAPI connectivity from active database copies only. Using the *IncludePassive* parameter, you can have the cmdlet test MAPI connectivity from all active and passive database copies.
MonitoringContext	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed

			to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
PerConnectionTimeout	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *PerConnectionTimeout* parameter specifies the amount of time, in seconds, allowed for each connection to complete before the connection times out. The default value is 10 seconds.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *Server* parameter specifies the server on which you will test the MAPI connectivity. The command tests the MAPI connectivity to each system mailbox hosted on active databases on the specified server. If you don't specify this parameter, the command

			tests the mailbox on the local server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SearchDocumentFormat

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SearchDocumentFormat** cmdlet to retrieve details of file formats supported by

Exchange Search.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SearchDocumentFormat [-Identity <SearchDocumentFormatId>] [-Server
<ServerIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves a list of all file formats supported by Exchange Search.

```
Get-SearchDocumentFormat
```

EXAMPLE 2

This example retrieves all properties of the docx file format.

```
Get-SearchDocumentFormat docx | Format-List *
```

Detailed Description

In Microsoft Exchange Server 2013, Exchange Search includes built-in support for indexing many file formats. Output from the **Get-SearchDocumentFormat** cmdlet includes details about each supported file format, including whether content indexing is enabled for the file format, the format handler, and the file extension (such as .docx).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Search - diagnostics" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Optional	Microsoft.Exchange.Management.Search.SearchDocumentFormatId	The *Identity* parameter specifies the identity of a file format.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange

			2013. The *Server* parameter specifies the name of the server against which the command is executed.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-SearchDocumentFormat

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-SearchDocumentFormat** cmdlet to add a format-specific filter to those used by Exchange search.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-SearchDocumentFormat -Extension <String> -Identity
<SearchDocumentFormatId> -MimeType <String> -Name <String> [-Confirm
[<SwitchParameter>]] [-Enabled <$true | $false>] [-Server
<ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates a new search document format with an extension of .sct and a MIME type of

text/scriptlet.

```
New-SearchDocumentFormat -Name "Proprietary SCT Formats" -
MimeType text/scriptlet -Extension .sct -Identity
ProprietarySCT1
```

Detailed Description

After running the **New-SearchDocumentFormat** cmdlet, your must run the following cmdlet to restart the search service. There will be a brief search outage.

```
Restart-Service HostControllerService
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Search - diagnostics" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Extension	Required	System.String	The *Extension* parameter specifies the file type to be processed by the filter, and is designated by the common file extension associated with the file type. Examples include .MP3, .JPG, and .PNG. Note the leading period.
Identity	Required	Microsoft.Exchange.Management.Search.SearchDocumentFormatId	The *Identity* parameter uniquely identifies the new search document format. For example, an identity of "PropSCT" might specify a proprietary document

			format which is supported by a custom **IFilter**. The *Identity* parameter must be unique within the search document formats.
MimeType	Required	System.String	The *MimeType* parameter specifies the MIME type of the format.
Name	Required	System.String	The *Name* specifies a friendly name for the format, but does not need to be unique. For example, you might have several different formats (supported by custom **IFilters**) that are used to index output from a proprietary system called "My Business Output". You could use the *Name* parameter to create a category of formats called "My Business Output Formats", and uniquely identify each format within that group using the *Identity* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the new format is enabled at creation. Valid input for this parameter is `$true` or `$false`. The default is `$true`.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-SearchDocumentFormat

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-SearchDocumentFormat** cmdlet to remove a format-specific filter from those used by Exchange search. Only filters added with **New-SearchDocumentFormat** can be removed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-SearchDocumentFormat -Identity <SearchDocumentFormatId> [-Confirm
[<SwitchParameter>]] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the search document format with an identity equal to "sct".

```
Remove-SearchDocumentFormat -Identity sct
```

Detailed Description

After running the **Remove-SearchDocumentFormat** cmdlet, your must run the following cmdlet to restart the search service. There will be a brief search outage.

```
Restart-Service HostControllerService
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Search - diagnostics" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Search.SearchDocumentFormatId	The *Identity* parameter uniquely identifies the format to be removed. You can use the **Get-SearchDocumentFormat** cmdlet to view the identities of the installed formats.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation

			prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SearchDocumentFormat

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-SearchDocumentFormat** cmdlet to enable or disable the file format for Exchange Search.

Important:
When you disable a file format for content indexing by Exchange Search, contents of the file become unsearchable by Exchange Search clients such as Microsoft Office Outlook Web App, Microsoft Outlook in online mode, and In-Place eDiscovery.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-SearchDocumentFormat -Enabled <$true | $false> -Identity
<SearchDocumentFormatId> [-Confirm [<SwitchParameter>]] [-Server
<ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This command disables the Zip file format for indexing by Exchange Search.

```
Set-SearchDocumentFormat ZIP -Enabled $false
```

Detailed Description

In Microsoft Exchange Server 2013, Exchange Search includes built-in support for indexing many file formats. If you disable indexing for a supported file format, items containing an attachment of that file type aren't considered unsearchable. When you perform an In-Place eDiscovery search, and you select the option to include unsearchable items, only items that are actually unsearchable are returned. Items that weren't searched because the associated file format is set as unsearchable aren't returned.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Search - diagnostics" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Enabled	Required	System.Boolean	The *Enabled* parameter specifies whether the file format is enabled. Set the parameter to `$false` to disable the format for content indexing.
Identity	Required	Microsoft.Exchange.Management.Search.SearchDocumentFormatId	The *Identity* parameter specifies the identity of the file format.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name of the server against which the command is executed.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-StoreMailbox

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-StoreMailbox** cmdlet to purge the mailbox and all of its message content from the mailbox database. This results in permanent data loss for the mailbox being purged. You can only run this cmdlet against disconnected or soft-deleted mailboxes. Running this command against an active mailbox fails, and you receive an error.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-StoreMailbox -Database <DatabaseIdParameter> -Identity
<StoreMailboxIdParameter> -MailboxState <Disabled | SoftDeleted> [-Confirm
[<SwitchParameter>]] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example purges the soft-deleted mailbox for Ayla Kol from mailbox database MBD01.

```
Remove-StoreMailbox -Database MBD01 -Identity Ayla -
MailboxState SoftDeleted
```

EXAMPLE 2

This example permanently purges the disconnected mailbox with the GUID 2ab32ce3-fae1-4402-9489-c67e3ae173d3 from mailbox database MBD01.

```
Remove-StoreMailbox -Database MBD01 -Identity "2ab32ce3-
fae1-4402-9489-c67e3ae173d3" -MailboxState Disabled
```

EXAMPLE 3

This example permanently purges all soft-deleted mailboxes from mailbox database MBD01.

```
Get-MailboxStatistics -Database MBD01 | where
{$_.DisconnectReason -eq "SoftDeleted"} | foreach {Remove-
StoreMailbox -Database $_.database -Identity $_.mailboxguid
-MailboxState SoftDeleted}
```

Detailed Description

When mailboxes are moved from a Microsoft Exchange Server 2013 database to any other

database, Exchange doesn't fully delete the mailbox from the source database immediately upon completion of the move. Instead, the mailbox in the source mailbox database is switched to a *soft-deleted* state, which allows mailbox data to be accessed during a mailbox restore operation by using the new **MailboxRestoreRequest** cmdlet set. The soft-deleted mailboxes are retained in the source database until the deleted mailbox retention period expires.

To view soft-deleted mailboxes, run the Get-MailboxStatistics cmdlet against a database using the property **DisconnectReason** with a value of `SoftDeleted`.

A mailbox is marked as Disabled immediately after the **Disable-Mailbox** or **Remove-Mailbox** command completes. Exchange retains disabled mailboxes in the mailbox database based on the deleted mailbox retention settings configured for that mailbox database. After the specified period of time, the mailbox is permanently deleted.

To view disabled mailboxes, run the **Get-MailboxStatistics** cmdlet against a database using the property **DisconnectReason** with a value of `Disabled`.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remove store mailbox" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Database* parameter specifies the identity of the mailbox database on which the mailbox that you want to remove resides. This parameter accepts the following values: • Database name • GUID
Identity	Required	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	The *Identity* parameter specifies the identity of the mailbox that you want to remove. This parameter accepts the following

			values: • GUID • Distinguished name (DN) • User principal name (UPN) • LegacyExchangeDN • *Domain\Account Name* • SMTP address
MailboxState	Required	Microsoft.Exchange.Management.StoreTasks.MailboxStateParameter	The *MailboxState* parameter specifies the mailbox state on the source mailbox database. This parameter accepts the following values: • `Disabled` • `SoftDeleted`
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-StoreMailboxState

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-StoreMailboxState** cmdlet to synchronize the mailbox state for a mailbox in the Exchange mailbox store with the state of the corresponding Active Directory user account.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-StoreMailboxState -Database <DatabaseIdParameter> -Identity
<StoreMailboxIdParameter> [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the mailbox state for a mailbox located on the mailbox database MDB01 and whose GUID is 4a830e3f-fd07-4629-baa1-8bce16b86d88.

```
Update-StoreMailboxState -Database MDB01 -Identity
4a830e3f-fd07-4629-baa1-8bce16b86d88
```

EXAMPLE 2

This example updates the mailbox state for all mailboxes on the mailbox database MDB02.

```
Get-MailboxStatistics -Database MDB02 | ForEach { Update-
StoreMailboxState -Database $_.Database -Identity
$_.MailboxGuid -Confirm:$false }
```

EXAMPLE 3

This example updates the mailbox state for all disconnected mailboxes on the mailbox database MDB03.

```
Get-MailboxStatistics -Database MDB03 | Where
{ $_.DisconnectReason -ne $null } | ForEach { Update-
StoreMailboxState -Database $_.Database -Identity
$_.MailboxGuid -Confirm:$false }
```

Detailed Description

The **Update-StoreMailboxState** cmdlet forces the mailbox store state in the Exchange store to be synchronized with Active Directory. In some cases, it's possible that the store state for a mailbox to become out-of-sync with the state of the corresponding Active Directory user account. This can result from Active Directory replication latency. For example, if a mailbox-enabled user account is disabled in Active Directory but isn't marked as disabled in the Exchange mailbox store. In this case, running the **Update-StoreMailboxState** will synchronize the mailbox store state with the state of the Active Directory user account and mark the mailbox as disabled in the mailbox store. You can use this command to troubleshoot issues that may be a result when the store state for a mailbox is unexpected or if you suspect that the store state is different than the state for the corresponding Active Directory account.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remove store mailbox" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Database* parameter specifies the identity of the mailbox database that contains the mailbox that you want to update the store state for. This parameter accepts the following values: • Database name • GUID
Identity	Required	Microsoft.Exchange.Configuration.Tasks.StoreMailboxIdParameter	The *Identity* parameter specifies the identity of the mailbox that you want to update the store state for. Use the mailbox GUID as the value for this parameter. Run the following command to obtain the mailbox GUID and other information for all mailboxes in your organization. `Get-MailboxDataba`
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the

			confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-StoreUsageStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox database cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-17*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-StoreUsageStatistics** cmdlet to aid in diagnosing performance issues with your servers or databases.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-StoreUsageStatistics -Identity <GeneralMailboxIdParameter> [-
CopyOnServer <ServerIdParameter>] <COMMON PARAMETERS>

Get-StoreUsageStatistics -Database <DatabaseIdParameter> [-CopyOnServer
<ServerIdParameter>] <COMMON PARAMETERS>

Get-StoreUsageStatistics -Server <ServerIdParameter> [-IncludePassive
<SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Filter <String>]
```

Examples

Below are some examples of how to use the **Get-StoreUsageStatistics** cmdlet.

EXAMPLE 1

This example retrieves store usage statistics for all active databases on server EX1.

```
Get-StoreUsageStatistics -Server EX1 | ft -auto
```

EXAMPLE 2

This example retrieves store usage statistics for all active and passive databases on server EX1.

```
Get-StoreUsageStatistics -Server EX1 -IncludePassive | ft -
auto
```

EXAMPLE 3

This example retrieves store usage statistics for database DB1, and sorts the output by the 10 highest log file generators.

```
Get-StoreUsageStatistics -Database DB1 | Sort-Object
LogRecordBytes -desc | Select-Object -First 10 | ft
DigestCategory, *guid, LogRecordBytes, *time* -auto
```

Detailed Description

The Microsoft Exchange Information Store collects per-user information on latency, input/output (I/

O), page counts, processor usage, and *TimeInServer*. The *TimeInServer* metric represents the total time that synchronous and asynchronous requests spend in the Microsoft Exchange Information Store for a user's mailbox. You can retrieve this resource information in the Microsoft Exchange Information Store for the 25 highest usage accounts on a specified database. Usage of a mailbox is defined as the amount of server time spent in performing operations for that mailbox. The cmdlet reports the top 25 users for every one-minute period for the last 10 minutes (250 objects per ten-minute interval). The resource usage is an indicator of the load that different users are placing on the server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox databases" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Database	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Database* parameter specifies the name of the mailbox database. When you specify a value for the *Database* parameter, the Exchange Management Shell returns usage statistics for the top 25 mailboxes on the database specified. You can use the following value: • *Database*
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GeneralMailboxIdParameter	The *Identity* parameter specifies a mailbox. When you specify a value for the *Identity* parameter, the command looks up the mailbox specified in the

			Identity parameter, connects to the server where the mailbox resides, and returns the statistics for the mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias **Note:** Results are returned for the mailbox only if it's one of the top 25 users of store resources.
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server from which you want to obtain mailbox statistics. You can use one of the following values: • Fully qualified domain name (FQDN) • NetBIOS name When you specify a value for the *Server* parameter, the command returns

			usage statistics for the top 25 mailboxes on all the active databases on the specified server. If you don't specify this parameter, the command returns logon statistics for the local server.
CopyOnServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *CopyOnServer* parameter is used to retrieve statistics from a specific database copy from the server specified with the *Server* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients.
IncludePassive	Optional	System.Management.Automation.SwitchParameter	Without the *IncludePassive* parameter, the cmdlet retrieves statistics from active database copies only. Using the *IncludePassive* parameter, you can have

			the cmdlet return statistics from all active and passive database copies.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Mailbox server cmdlets

Exchange Server 2013 > Exchange Management Shell > Exchange 2013 cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-08*

Test-AssistantHealth

Get-MailboxServer

Set-MailboxServer

Test-MRSHealth

Test-AssistantHealth

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox server cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-AssistantHealth** cmdlet to verify that the Microsoft Exchange Mailbox Assistants service (MSExchangeMailboxAssistants) is healthy, to recover from health issues, and to report the

status of the diagnosis or recovery action.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-AssistantHealth [-IncludeCrashDump <SwitchParameter>] [-
MaxProcessingTimeInMinutes <UInt32>] [-MonitoringContext
<SwitchParameter>] [-ResolveProblems <SwitchParameter>] [-ServerName
<ServerIdParameter>] [-WatermarkBehindWarningThreholdInMinutes <UInt32>]
[-Confirm [<SwitchParameter>]] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example detects and repairs the mailbox assistant's health on MBXSVR01, includes the error information, and formats the output to a list.

```
Test-AssistantHealth -ServerName MBXSVR01 -IncludeCrashDump
-ResolveProblems | Format-List
```

EXAMPLE 2

This example detects the mailbox assistant's health on the local Mailbox server. The *MaxProcessingTimeInMinutes* parameter specifies 30 minutes as the maximum amount of time the service is allowed to process an event without responding, and formats the output to a list.

```
Test-AssistantHealth -MaxProcessingTimeInMinutes 30 |
Format-List
```

Detailed Description

The Mailbox Assistants service runs on all servers that have the Mailbox server role installed. This service is responsible for scheduling and dispatching several assistants that ensure mailboxes function correctly.

By default, when you run this cmdlet, it returns the *RunspaceId*, events, and performance counters in a table format.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Assistants" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
IncludeCrashDump	Optional	System.Management.Automation.SwitchParameter	The *IncludeCrashDump* parameter specifies that the command should take an error report prior to taking any recovery actions. This parameter should only be used if running from a local computer. If you use the parameter while connected remotely, the command fails. The default value for this parameter is `$false`. You don't have to specify a value with this parameter.
MaxProcessingTimeInMinutes	Optional	System.UInt32	The *MaxProcessingTimeInMinutes* parameter specifies the maximum amount of

			time the MSExchangeMailboxAssistants service is allowed to process an event without responding. You can specify a value from 1 through 3600 minutes. The default value is 15 minutes.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
ResolveProblems	Optional	System.Management.Automation.SwitchParameter	This *ResolveProblems* parameter specifies that if the command detects an issue, it attempts to fix it. This command attempts to fix the following issues: • Starts the Mailbox

			Assistants service if it isn't running. • Restarts the Mailbox Assistants service if it detects that the service is hung or deadlocked for more than 15 minutes. You don't have to specify a value with this parameter.
ServerName	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *ServerName* parameter specifies the identity of the Mailbox server on which the mailbox assistant that's being tested resides. If this parameter isn't specified, the command runs on the local server. If the local server isn't a Mailbox server, the command fails.
WatermarkBehindWarningThreholdInMinutes	Optional	System.UInt32	The *WatermarkBehindWarningThreholdInMinutes* parameter specifies the threshold for watermark age. Event watermarks indicate the last time that events were successfully processed by an assistant.

			An event watermark that hasn't been updated in a while may indicate a problem. For each Mailbox Assistant, the **Test-AssistantHealth** cmdlet compares the current time with the time stamp of the last event watermark to determine the watermark age. If that age exceeds the value set by the *WatermarkBehindWarningThreholdInMinutes* parameter, a warning is generated. You can specify a value from 1 through 10080 minutes. The default value is 60 minutes.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxServer

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox server cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxServer** cmdlet to return a Mailbox server object and all its attributes. If no parameter is specified, a complete list of the Mailbox servers in the entire organization is returned.

```
Get-MailboxServer [-Identity <MailboxServerIdParameter>] [-
DomainController <Fqdn>] [-Status <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves all the Mailbox servers in the organization.

```
Get-MailboxServer
```

EXAMPLE 2

This example retrieves the specific server instance Server1.

```
Get-MailboxServer -Identity Server1
```

Detailed Description

To view all the Mailbox server attributes that this cmdlet returns, you must pipe the command to the **Format-List** cmdlet.

The **ExchangeVersion** attribute returned is the minimum version of Microsoft Exchange that you can use to manage the returned object. This attribute isn't the same as the version of Microsoft Exchange that's displayed in the Exchange Administration Center when you select **Server Configuration**.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox server configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *Identity* parameter specifies the Mailbox server. You can use the following values: • Name • GUID • Distinguished name (DN)
Status	Optional	System.Management.Automation.SwitchParameter	The *Status* parameter specifies whether you want to get additional

			status information, such as locale. You don't need to specify a value with this parameter. If you specify this parameter, you should format the output in such a way that you can view the additional attributes, for example, pipe the output to the **Format-List** cmdlet.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxServer

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox server cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxServer** cmdlet to modify the configuration settings and attributes of an Exchange 2013 Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxServer -Identity <MailboxServerIdParameter> [-

```

Examples

EXAMPLE 1

This example throttles the Calendar Repair Assistant to detect and repair calendar inconsistencies for the Mailbox server MBX02 in a 7-day period. During that 7-day period, all mailboxes will be scanned, and at the end of the period, the process will start over.

```
Set-MailboxServer -Identity MBX02 -CalendarRepairWorkCycle
7.00:00:00 -CalendarRepairWorkCycleCheckpoint 7.00:00:00
```

EXAMPLE 2

This example throttles the Managed Folder Assistant, which applies message retention settings to all mailboxes for the Mailbox server MBX02 in a 10-day period. During that 10-day period, all mailboxes will be scanned, and at the end of the period, the process will start over.

```
Set-MailboxServer -Identity MBX02 -ManagedFolderWorkCycle
10.00:00:00 -ManagedFolderWorkCycleCheckpoint 10.00:00:00
```

EXAMPLE 3

This example throttles the Sharing Policy and Sharing Sync Assistants to apply sharing policies, sync shared calendars, and free/busy information for the mailboxes on server MBX02 in a 7-day period. During that 7-day period, all mailboxes will be scanned, and at the end of the period, the process will start over.

```
Set-MailboxServer -Identity MBX02 -SharingPolicyWorkCycle
7.00:00:00 -SharingPolicyWorkCycleCheckpoint 7.00:00:00 -
SharingSyncWorkCycle 7.00:00:00 -
SharingSyncWorkCycleCheckpoint 7.00:00:00
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Server Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *Identity* parameter specifies the Mailbox server. You can use the following values: • GUID • Distinguished name (DN) • Name of a Mailbox server
AutoDagServerConfigured	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AutoDatabaseMountDial	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AutoDatabaseMountDial	The *AutoDatabaseMountDial* parameter specifies the automatic database mount behavior for a continuous replication environment after a database failover. You can use the following values: • `BestAvailability` If you specify this value, the database automatically mounts immediately after a failover if the copy queue length is less than or equal to 12. The copy queue length is the

			number of logs recognized by the passive copy that needs to be replicated. If the copy queue length is more than 12, the database doesn't automatically mount. When the copy queue length is less than or equal to 12, Exchange attempts to replicate the remaining logs to the passive copy and mounts the database. • `GoodAvailability` If you specify this value, the database automatically mounts immediately after a failover if the copy queue length is less than or equal to six. The copy queue length is the number of logs recognized by the passive copy that needs to be replicated. If the copy queue length is more than six, the database doesn't automatically mount. When the copy queue length is less than or equal to six, Exchange attempts to replicate the remaining logs to the passive copy and mounts the database. • `Lossless` If you specify this value, the database doesn't automatically mount until all logs that were generated on the

			active copy have been copied to the passive copy. This setting also causes Active Manager's best copy selection algorithm to sort potential candidates for activation based on the database copy's activation preference value and not its copy queue length. The default value is `GoodAvailability`. If you specify either `BestAvailability` or `GoodAvailability`, and all of the logs from the active copy haven't been replicated to the passive copy, you may lose some mailbox data. However, the transport dumpster feature, (which is enabled by default) helps protect against data loss by resubmitting messages that are in the transport dumpster queue.
CalendarRepairIntervalEndWindow	Optional	System.Int32	The *CalendarRepairIntervalEndWindow* parameter specifies the number of days into the future to repair calendars. For

			example, if this parameter is set to 90, the Calendar Repair Assistant repairs calendars on this Mailbox server 90 days from now. The default value is 30 days.
CalendarRepairLogDirectorySizeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CalendarRepairLogDirectorySizeLimit* parameter specifies the size limit for all log files for the Calendar Repair Assistant. After the limit is reached, the oldest files are deleted. The maximum size of the calendar repair log directory is calculated as the total size of all log files that have the same name prefix. Other files that don't follow the name prefix convention aren't counted in the total directory size calculation. Renaming old log files or copying other files into the calendar repair log directory could cause the directory to exceed its specified maximum size.

			Calendar repair log files for the Mailbox server role begin with the name prefix CRA. The default value is `unlimited`. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.
CalendarRepairLogEnabled	Optional	System.Boolean	The *CalendarRepairLogEnabled* parameter specifies whether the Calendar Repair Attendant logs items that it repairs. The repair log doesn't contain failed repair attempts. The default value is `$true`.
CalendarRepairLogFileAgeLimit	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *CalendarRepairLogFileAgeLimit* parameter specifies how long to retain calendar repair logs. Log files that exceed the

			maximum retention period are deleted. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a 30-day interval, enter 30.00:00:00. The default value is 00.00:00:00, which specifies that there's no limit on file retention (and not that files are overwritten immediately).
CalendarRepairLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *CalendarRepairLogPath* parameter specifies the path to the directory that stores the calendar repair log files. The default value is <*Exchange installation path*>v15\Logging\Calendar Repair Assistant.
CalendarRepairLogSubjectLoggingEnabled	Optional	System.Boolean	The *CalendarRepairLogSubjectLoggingEnabled* parameter specifies that the subject of the repaired

			calendar item is logged in the calendar repair log. The default value is `$true`.
CalendarRepairMissingItemFixDisabled	Optional	System.Boolean	The *CalendarRepairMissingItemFixDisabled* parameter specifies that the Calendar Repair Assistant won't fix missing attendee calendar items for mailboxes homed on this Mailbox server. The default value is `$false`.
CalendarRepairMode	Optional	Microsoft.Exchange.Data.CalendarRepairType	The *CalendarRepairMode* parameter specifies the mode that the Calendar Repair Assistant will run in.
CalendarRepairWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *CalendarRepairWorkCycle* parameter specifies the time span in which all mailboxes on the specified server will be scanned by the Calendar Repair Assistant. Calendars that have inconsistencies will be flagged and repaired according to the interval specified by the *CalendarRepairWorkCycleCheckpoint* parameter.

			To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 7 days for this parameter, use 07.00:00:00. The Calendar Repair Assistant will process all mailboxes on this server every 7 days.
CalendarRepairWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *CalendarRepairWorkCycleCheckpoint* parameter specifies the time span at which all mailboxes will be identified as needing work completed on them. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 1 day for this parameter, use 1.00:00:00. The Calendar Repair Assistant will process all mailboxes on this server every day.
Confirm	Optional	System.Management.	The *Confirm* switch

		Automation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DarTaskStoreTimeBasedAssistantWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
DarTaskStoreTimeBasedAssistantWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
DatabaseCopyActivationDisabledAndMoveNow	Optional	System.Boolean	The *DatabaseCopyActivationDisabledAndMoveNow* parameter specifies whether to prevent databases from being mounted on this server if there are other healthy copies of the databases on other servers. It will also immediately move any mounted databases on the server to other servers if copies exist and are healthy. Setting this parameter won't cause databases to move to a

			server that has the *DatabaseCopyAutoActivationPolicy* parameter set to `Blocked`.
DatabaseCopyAutoActivationPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DatabaseCopyAutoActivationPolicyType	The *DatabaseCopyAutoActivationPolicy* parameter specifies the type of automatic activation available for mailbox database copies on the specified Mailbox server(s). Values for this parameter are: • `Blocked` Databases can't be automatically activated on the specified Mailbox server(s). In addition, this stops server locator requests to the specified server, which prevents access to manually activated databases on the server if all DAG members are configured with a value of blocked. • `IntrasiteOnly` The database copy is allowed to be activated on Mailbox servers in the same Active Directory site. This prevents cross-site failover and activation. • `Unrestricted` There are no special restrictions on activating

			mailbox database copies on the specified Mailbox server(s).
DirectoryProcessorWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
DirectoryProcessorWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FaultZone	Optional	System.String	This parameter is reserved for internal Microsoft use.
FolderLogForManagedFoldersEnabled	Optional	System.Boolean	The *FolderLogForManagedFoldersEnabled* parameter specifies whether the folder log for managed folders is enabled for messages that were moved to managed folders. The two possible values for this parameter are `$true` or `$false`. If you specify `$true`, information about folders that have managed folder mailbox policies applied to them is

			logged.
ForceGroupMetricsGeneration	Optional	System.Boolean	The *ForceGroupMetricsGeneration* parameter specifies that group metrics information must be generated on the Mailbox server regardless of whether that server generates an offline address book (OAB). By default, group metrics are generated only on servers that generate OABs. Group metrics information is used by MailTips to inform senders about how many recipients their messages will be sent to. You need to use this parameter if your organization doesn't generate OABs and you want the group metrics data to be available.
GroupMailboxWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
GroupMailboxWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
InferenceDataCollectionWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.

InferenceDataCollectionWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
InferenceTrainingWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
InferenceTrainingWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
IsExcludedFromProvisioning	Optional	System.Boolean	The *IsExcludedFromProvisioning* parameter specifies that the Mailbox server isn't considered by the OAB provisioning load balancer. If the *IsExcludedFromProvisioning* parameter is set to `$true`, the server won't be used for provisioning a new OAB or for moving existing OABs.
JournalingLogForManagedFoldersEnabled	Optional	System.Boolean	The *JournalingLogForManagedFoldersEnabled* parameter specifies whether the log for managed folders is enabled for journaling. The two possible values for this parameter are `$true` or `$false`. If you specify `$true`, information

			about messages that were journaled is logged. The logs are located at the location you specify with the *LogPathForManagedFolders* parameter.
JunkEmailOptionsCommitterWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
Locale	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Locale* parameter specifies the locale. A locale is a collection of language-related user preferences such as writing system, calendar, and date format. The following are examples: • en-US (English - United States) • de-AT (German - Austria) • es-CL (Spanish - Chile) For more information, see CultureInfo Class.
LogDirectorySizeLimitForManagedFolders	Optional	Microsoft.Exchange.Data.Unlimited	The *LogDirectorySizeLimitForManagedFolders* parameter specifies the size limit for all managed folder log files from a single message database.

			After the limit is reached for a set of managed folder log files from a message database, the oldest files are deleted to make space for new files. The size of the managed folder log files is calculated as the total size of all log files that have the same name prefix. For example, for a file with the name Managed_Folder_Assistant[Mailbox Database 01] 20061018-1.log, the prefix is Managed_Folder_Assistant[Mailbox Database 01]. If you rename log files or copy other files into the managed folder log directory, these files aren't counted in the log files size calculation. The managed folder log files for each message database have a unique name prefix. Therefore, this limit applies to the log files for each message database, and not to all the log files in the

			directory. If you have more than one message database, the maximum size of the managed folder log directory isn't the size specified in the *LogDirectorySizeLimitForManagedFolders* parameter because the managed folder log files generated by different databases have different name prefixes. The maximum size of the managed folder log directory is *X* times the specified value if you have *X* message databases. You must specify either an integer or unlimited. The default value is `unlimited`. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.

LogFileAgeLimitForManagedFolders	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LogFileAgeLimitForManagedFolders* parameter specifies how long to retain managed folder logs. Log files that exceed the maximum retention period are deleted. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a 30-day interval, enter 30.00:00:00. The default value is 00.00:00:00, which specifies that there's no limit on file retention (and not that files are overwritten immediately).
LogFileSizeLimitForManagedFolders	Optional	Microsoft.Exchange.Data.Unlimited	The *LogFileSizeLimitForManagedFolders* parameter specifies the maximum size for each managed folder log file. When the log file size limit is reached, a new log file is created. The default value is 10 megabytes (MB).

			When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.
LogPathForManagedFolders	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *LogPathForManagedFolders* parameter specifies the path to the directory that stores the managed folder log files. The default value is <*Exchange installation path*>v15\Logging\ Managed Folder Assistant.
MailboxAssociationReplicationWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
MailboxAssociationReplicationWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
MailboxProcessorWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MailboxProcessorWorkCycle* parameter specifies how often to scan for locked mailboxes. The default value is 1 day.

ManagedFolderAssistantSchedule	Optional	Microsoft.Exchange.Common.ScheduleInterval[]	The *ManagedFolderAssistantSchedule* parameter specifies the intervals each week during which the Managed Folder Assistant applies messaging records management (MRM) settings to managed folders. The format is *StartDay.Time-EndDay.Time*. You can use the following values for the start and end days: • Full name of the day • Abbreviated name of the day • Integer from 0 through 6, where 0 = Sunday The start time and end time must be at least 15 minutes apart. Minutes are rounded down to 0, 15, 30, or 45. If you specify more than one interval, there must be at least 15 minutes between each interval. The following are examples: • "Sun.11:30 PM-Mon.1:30 AM"

			• 6.22:00-6.22:15 (The assistant will run from Saturday at 10:00 PM until Saturday at 10:15 PM.) • "Monday.4:30 AM-Monday.5:30 AM","Wednesday.4:30 AM-Wednesday.5:30 AM" (The assistant will run on Monday and Wednesday mornings from 4:30 until 5:30.) • "Sun.1:15 AM-Monday.23:00" If the Managed Folder Assistant doesn't finish processing the mailboxes on the server during the time that you've scheduled, it automatically resumes processing where it left off the next time it runs.
ManagedFolderWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ManagedFolderWorkCycle* parameter specifies the time span in which all mailboxes on the specified server will be processed by the Managed Folder Assistant. The Managed Folder Assistant applies

			retention policies according to the *ManagedFolderWorkCycleCheckpoint* interval. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 7 days for this parameter, use 07.00:00:00. The Managed Folder Assistant will process all mailboxes on this server every 7 days.
ManagedFolderWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ManagedFolderWorkCycleCheckpoint* parameter specifies the time span at which to refresh the list of mailboxes so that new mailboxes that have been created or moved will be part of the work queue. Also, as mailboxes are prioritized, existing mailboxes that haven't been successfully processed for a long time will be placed higher in the queue and will have a

			greater chance of being processed again in the same work cycle. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 24 hours for this parameter, use 24:00:00.
MAPIEncryptionRequired	Optional	System.Boolean	The *MAPIEncryptionRequired* parameter specifies whether Exchange blocks MAPI clients that don't use encrypted remote procedure calls (RPCs). The two possible values for this parameter are `$true` or `$false`.
MaximumActiveDatabases	Optional	System.Int32	The *MaximumActiveDatabases* parameter specifies the number of databases that can be mounted on this Mailbox server. This parameter accepts numeric values. When the maximum number is reached, the

			database copies on the server won't be activated if a failover or switchover occurs. If the copies are already active on a server, the Information Store on the server won't allow databases to be mounted.
MaximumPreferredActiveDatabases	Optional	System.Int32	The *MaximumPreferredActiveDatabases* parameter specifies a preferred maximum number of databases that a server should have. This value is different from the actual maximum, which is configured using the *MaximumActiveDatabases* parameter. The value of *MaximumPreferredActiveDatabases* is only honored during best copy and server selection, database and server switchovers, and when rebalancing the DAG.
MaxTransportSyncDispatchers	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MigrationLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.

MigrationLogLoggingLevel	Optional	Microsoft.Exchange.Data.MigrationEventType	This parameter is reserved for internal Microsoft use.
MigrationLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
MigrationLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
MigrationLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
OABGeneratorWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *OABGeneratorWorkCycle* parameter specifies the time span in which the OAB generation on the specified server will be processed. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 7 days for this parameter, use 07.00:00:00.
OABGeneratorWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *OABGeneratorWorkCycleCheckpoint* parameter specifies the time span at which to run OAB generation. To specify a value, enter it

			as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 24 hours for this parameter, use 24:00:00.
PeopleCentricTriageWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
PeopleCentricTriageWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
PeopleRelevanceWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
PeopleRelevanceWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ProbeTimeBasedAssistantWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ProbeTimeBasedAssistantWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
PublicFolderWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *PublicFolderWorkCycle* parameter is used by the public folder assistant to determine how often the mailboxes in a database are processed by the assistant.

PublicFolderWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *PublicFolderWorkCycleCheckpoint* determines how often the mailbox list for a database is evaluated. The processing speed is also calculated.
RetentionLogForManagedFoldersEnabled	Optional	System.Boolean	The *RetentionLogForManagedFoldersEnabled* parameter specifies whether the Managed Folder Assistant logs information about messages that have reached their retention limits. The two possible values for this parameter are `$true` or `$false`. If you specify `$true`, information about messages that have been processed because they have reached their retention limits is logged.
SearchIndexRepairTimeBasedAssistantWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
SearchIndexRepairTimeBasedAssistantWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
SharePointSignalStoreWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.

SharePointSignalStoreWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
SharingPolicySchedule	Optional	Microsoft.Exchange.Common.ScheduleInterval[]	The *SharingPolicySchedule* parameter specifies the intervals each week during which the sharing policy runs. The Sharing Policy Assistant checks permissions on shared calendar items and contact folders in users' mailboxes against the assigned sharing policy. The assistant lowers or removes permissions according to the policy. The format is *StartDay.Time-EndDay.Time*. You can use the following values for the start and end days: • Full name of the day • Abbreviated name of the day • Integer from 0 through 6, where 0 = Sunday The start time and end time must be at least 15 minutes apart. Minutes are rounded down to 0, 15, 30, or 45. If you

			specify more than one interval, there must be at least 15 minutes between each interval. The following are examples: • "Sun.11:30 PM-Mon.1:30 AM" • 6.22:00-6.22:15 (The assistant will run from Saturday at 10:00 PM until Saturday 10:15 PM.)
SharingPolicyWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SharingPolicyWorkCycle* parameter specifies the time span in which all mailboxes on the specified server will be scanned by the Sharing Policy Assistant. The Sharing Policy Assistant scans all mailboxes and enables or disables sharing polices according to the interval specified by the *SharingPolicyWorkCycle*. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			For example, if you specify 7 days for this parameter, use 07.00:00:00. The Sharing Policy Assistant will process all mailboxes on this server every 7 days.
SharingPolicyWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SharingPolicyWorkCycleCheckpoint* parameter specifies the time span at which to refresh the list of mailboxes so that new mailboxes that have been created or moved will be part of the work queue. Also, as mailboxes are prioritized, existing mailboxes that haven't been successfully processed for a long time will be placed higher in the queue and will have a greater chance of being processed again in the same work cycle. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify

			1 day for this parameter, use 1.00:00:00. The Sharing Policy Assistant will process all mailboxes on this server every day.
SharingSyncWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SharingSyncWorkCycle* parameter specifies the time span in which all mailboxes on the specified server will be synced to the cloud-based service by the Sharing Sync Assistant. Mailboxes that require syncing will be synced according to the interval specified by the *SharingSyncWorkCycleCheckpoint* parameter. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 7 days for this parameter, use 07.00:00:00. The Sharing Sync Assistant will process all mailboxes on this server every 7 days.

SharingSyncWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SharingSyncWorkCycleCheckpoint* parameter specifies the time span at which to refresh the list of mailboxes so that new mailboxes that have been created or moved will be part of the work queue. Also, as mailboxes are prioritized, existing mailboxes that haven't been successfully processed for a long time will be placed higher in the queue and will have a greater chance of being processed again in the same work cycle. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 1 day for this parameter, use 1.00:00:00. The Sharing Sync Assistant will process all mailboxes on this server every day.
SiteMailboxWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SiteMailboxWorkCycle*

			parameter specifies the time span in which the site mailbox information on the specified server will be processed. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 7 days for this parameter, use 07.00:00:00.
SiteMailboxWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SiteMailboxWorkCycleCheckpoint* parameter specifies the time span at which to refresh the site mailbox workcycle. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 24 hours for this parameter, use 24:00:00.
StoreDsMaintenanceWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreDsMaintenance	Optional	Microsoft.Exchange.Da	This parameter is reserved

WorkCycleCheckpoint		ta.EnhancedTimeSpan	for internal Microsoft use.
StoreIntegrityCheckWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreIntegrityCheckWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreMaintenanceWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreMaintenanceWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreScheduledIntegrityCheckWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreScheduledIntegrityCheckWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreUrgentMaintenanceWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
StoreUrgentMaintenanceWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
SubjectLogForManagedFoldersEnabled	Optional	System.Boolean	The *SubjectLogForManagedFoldersEnabled* parameter specifies whether the subject of messages is displayed in managed folder logs. The two possible values for this parameter are `$true` or

			`$false`. If you specify `$false`, the subject of messages is blank in the managed folder logs. The default value is `$false`.
SubmissionServerOverrideList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
TopNWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TopNWorkCycle* parameter specifies the time span in which all mailboxes that have Unified Messaging on the specified server will be scanned by the TopN Words Assistant. The TopN Words Assistant scans voice mail for the most frequently used words to aid in transcription. The most common words are then indexed according to the interval specified by the *TopNWorkCycleCheckpoint* parameter. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			For example, if you specify 7 days for this parameter, use 07.00:00:00. The TopN Words Assistant will process all mailboxes on which Unified Messaging is enabled on this server every 7 days.
TopNWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TopNWorkCycleCheckpoint* parameter specifies the time span at which to refresh the list of mailboxes so that new mailboxes that have been created or moved will be part of the work queue. Also, as mailboxes are prioritized, existing mailboxes that haven't been successfully processed for a long time will be placed higher in the queue and will have a greater chance of being processed again in the same work cycle. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			For example, if you specify 1 day for this parameter, use 1.00:00:00. The TopN Words Assistant will process all mailboxes on this server every day.
TransportSyncDispatchEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncLogLoggingLevel	Optional	Microsoft.Exchange.Data.SyncLoggingLevel	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
TransportSyncMailboxHealthLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransportSyncMailboxHealthLogFilePath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.
TransportSyncMailboxHealthLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
TransportSyncMailbox	Optional	Microsoft.Exchange.Da	This parameter is reserved

HealthLogMaxDirectorySize		ta.ByteQuantifiedSize	for internal Microsoft use.
TransportSyncMailboxHealthLogMaxFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
UMReportingWorkCycle	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *UMReportingWorkCycle* parameter specifies the time span in which the arbitration mailbox named SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9} on the specified server will be scanned by the Unified Messaging Reporting Assistant. The Unified Messaging Reporting Assistant updates the Call Statistics reports by reading Unified Messaging call data records for an organization on a regular basis. By default, it's scheduled to run once every 24 hours. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			For example, if you specify 7 days for this parameter, use 07.00:00:00. The Unified Messaging Reporting Assistant will process all mailboxes that have Unified Messaging enabled on this server every 7 days. **Note:** Changing the default work cycle for this assistant might impact the performance of the Mailbox server for your organization.
UMReportingWorkCycleCheckpoint	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *UMReportingWorkCycleCheckpoint* parameter specifies the time span at which the arbitration mailbox named SystemMailbox{e0dc1c29-89c3-4034-b678-e6c29d823ed9} will be marked by processing. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, if you specify 1 day for this parameter, use 1.00:00:00.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-MRSHealth

Exchange Management Shell > Exchange 2013 cmdlets > Mailbox server cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-MRSHealth** cmdlet to test the health of an instance of the Microsoft Exchange Mailbox Replication service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-MRSHealth [-Identity <ServerIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-MaxQueueScanAgeSeconds
```

```
<Int32>] [-MonitoringContext <$true | $false>] [-MRSProxyCredentials
<PSCredential>] [-MRSProxyServer <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the health of the Mailbox Replication service on all Mailbox servers.

```
Get-MailboxServer | Test-MRSHealth
```

EXAMPLE 2

This example tests the health of the Mailbox Replication service on the Mailbox server named MBX01.

```
Test-MRSHealth MBX01
```

Detailed Description

The Microsoft Exchange Mailbox Replication service runs on Mailbox servers. This command ensures that the Mailbox Replication service is running and that it responds to a remote procedure call (RPC) ping check.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the server on which to perform the health test. You can use any value that uniquely identifies the server. For example: • Name • Distinguished name (DN) • `ExchangeLegacyDN` • GUID If you don't specify the server, the command runs on the local server.
MaxQueueScanAgeSeconds	Optional	System.Int32	The *MaxQueueScanAgeSeconds* parameter specifies the threshold for the **last queue scan** property. If the time stamp on the **last queue scan** property is older than the value

			specified by this parameter, an error event is created that shows the Mailbox Replication service isn't scanning mailbox database queues. The default value is 1800 seconds (30 minutes).
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
MRSProxyCredentials	Optional	System.Management.	The *MRSProxyCredentials*

		Automation.PSCredential	parameter specifies the credentials that are required for the **MRSProxyPingCheck** test on the server that's specified by the *MRSProxyServer* parameter. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
MRSProxyServer	Optional	Microsoft.Exchange.Data.Fqdn	The *MRSProxyServer* parameter specifies the fully qualified domain name (FQDN) of the target server for the **MRSProxyPingCheck** test. The Microsoft Replication proxy service is part of the Mailbox Replication service, and is used for remote mailbox moves. However, the Mailbox Replication proxy service communicates only with the Mailbox Replication

			service on another server. You can test the Mailbox Replication proxy service in the following ways: • If you specify an *MRSProxyServer* value, and you specify the source server by using the *Identity* parameter, the test is performed between that server and the target server specified by the *MRSProxyServer* parameter. • If you specify an *MRSProxyServer* value, and you don't specify a source server by using the *Identity* parameter, the test is performed between the local server and the target server specified by the *MRSProxyServer* parameter. • If you don't specify an *MRSProxyServer* value or an *Identity* value, the test is performed between the Mailbox Replication service and the Mailbox Replication

			proxy service on the local server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Complete-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Complete-MigrationBatch** cmdlet to finalize a migration batch for a local move, cross-forest move, or remote move migration that has successfully finished initial synchronization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Complete-MigrationBatch [-Identity <MigrationBatchIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-NotificationEmails
<MultiValuedProperty>] [-Organization <OrganizationIdParameter>] [-
Partition <MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example completes the migration batch LocalMove1 and sends a notification email message to the specified users.

```
Complete-MigrationBatch -Identity LocalMove1 -
NotificationEmails admin@contoso.com,lucio@contoso.com
```

Detailed Description

After a migration batch for a local or cross-forest move has successfully run and has a status state of Synced, use the **Complete-MigrationBatch** cmdlet to finalize the migration batch. Finalization is the last phase performed during a local or cross-forest move. When you finalize a migration batch, the cmdlet does the following for each mailbox in the migration batch:

- Runs a final incremental synchronization.
- Configures the user's Microsoft Outlook profile to point to the new target domain.
- Converts the source mailbox to a mail-enabled user in the source domain.

When the finalization process is complete, you can remove the batch by using the **Remove-MigrationBatch** cmdlet.

If a migration batch has a status of Completed with Errors, you can rerun the **Complete-MigrationBatch** cmdlet. The cmdlet will attempt to finalize the failed users.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *Identity* parameter identifies the name of the migration batch. The value for this parameter is specified by the *Name* parameter for the **New-MigrationBatch** cmdlet. Use the **Get-MigrationBatch** cmdlet to determine the value of this parameter for the migration batch.
NotificationEmails	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmails* parameter specifies one or more email addresses that status

			reports are sent to after the migration batch is completed. Specify the value as a string array and separate multiple email addresses with commas. If you don't use this parameter, the final status report is sent to the administrator who runs the **Complete-MigrationBatch** cmdlet.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MigrationBatch** cmdlet to retrieve status information about the current migration batch.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MigrationBatch [-Identity <MigrationBatchIdParameter>] <COMMON
PARAMETERS>

Get-MigrationBatch [-Endpoint <MigrationEndpointIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DiagnosticArgument
<String>] [-DomainController <Fqdn>] [-IncludeReport <SwitchParameter>] [-
Organization <OrganizationIdParameter>] [-Partition <MailboxIdParameter>]
[-Status <Created | Syncing | Stopping | Stopped | Completed | Failed |
Removing | Synced | IncrementalSyncing | Completing | CompletedWithErrors
| SyncedWithErrors | Corrupted | Waiting | Starting>]
```

Examples

EXAMPLE 1

This example displays status information for the migration batch LocalMove2.

```
Get-MigrationBatch -Identity LocalMove2
```

EXAMPLE 2

This example displays information about all migration batches associated with the migration endpoint exsrv1.contoso.com.

```
Get-MigrationBatch -Endpoint exsrv1.contoso.com
```

Detailed Description

The **Get-MigrationBatch** cmdlet displays status information about the current migration batch. This information includes the following information:

- Status of the migration batch
- Total number of mailboxes being migrated
- Number of successfully completed migrations
- Migration errors
- Date and time when the migration was started

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Diagnostic	Optional	System.Management.Automation.SwitchParameter	The *Diagnostic* parameter returns additional information that you can use to troubleshoot migration errors or send to Microsoft Customer Service and Support.
DiagnosticArgument	Optional	System.String	This parameter is reserved for internal Microsoft use.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Endpoint	Optional	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *Endpoint* parameter returns a list of migration batches associated with the specified migration endpoint. If you use this parameter, you can't include the *Identity* parameter.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *Identity* parameter identifies the name of the current migration batch. The value for this parameter is specified by the *Name* parameter of the **New-MigrationBatch** cmdlet. If you use this parameter, you can't include the *Endpoint* parameter.
IncludeReport	Optional	System.Management.Automation.SwitchPar	The *IncludeReport* parameter returns

		ameter	additional information about the specified migration batch. This information is displayed in the **Report** field.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
Status	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationBatchStatus	The *Status* parameter returns a list of migration batches that have the specified status state. Use one of the following values: • `Completed` • `CompletedWithErrors` • `Completing` • `Corrupted` • `Created` • `Failed` • `IncrementalSyncing` • `Removing` • `Starting` • `Stopped` • `Syncing` • `Stopping` • `Synced` • `SyncedwithErrors` • `Waiting`

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MigrationBatch** cmdlet to submit a new migration request for a batch of users. The cmdlet is used to move mailboxes in an Exchange on-premises organization, migrate on-premises mailboxes to Exchange Online (also called *onboarding*), or migrate Exchange Online mailboxes back to an on-premises Exchange organization (also called *offboarding*) in an Exchange hybrid deployment. You can also use this cmdlet to perform another type of onboarding migration, which is called an IMAP migration. In this type of migration, mailbox data is migrated from on-premises mailboxes on an IMAP server to Exchange Online mailboxes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MigrationBatch [-ArchiveOnly <SwitchParameter>] [-BadItemLimit
<Unlimited>] [-CSVData <Byte[]>] [-DisallowExistingUsers
<SwitchParameter>] [-ExcludeFolders <MultiValuedProperty>] [-
LargeItemLimit <Unlimited>] [-PrimaryOnly <SwitchParameter>] [-
SourceEndpoint <MigrationEndpointIdParameter>] [-TargetArchiveDatabases
<MultiValuedProperty>] [-TargetDatabases <MultiValuedProperty>] [-
TargetDeliveryDomain <String>] <COMMON PARAMETERS>

New-MigrationBatch -CSVData <Byte[]> -Local <SwitchParameter> [-
ArchiveOnly <SwitchParameter>] [-BadItemLimit <Unlimited>] [-
DisallowExistingUsers <SwitchParameter>] [-PrimaryOnly <SwitchParameter>]
[-TargetArchiveDatabases <MultiValuedProperty>] [-TargetDatabases
<MultiValuedProperty>] <COMMON PARAMETERS>

New-MigrationBatch -CSVData <Byte[]> -XO1 <SwitchParameter> <COMMON
PARAMETERS>

New-MigrationBatch -CSVData <Byte[]> [-ArchiveOnly <SwitchParameter>] [-
BadItemLimit <Unlimited>] [-DisallowExistingUsers <SwitchParameter>] [-
LargeItemLimit <Unlimited>] [-PrimaryOnly <SwitchParameter>] [-
TargetArchiveDatabases <MultiValuedProperty>] [-TargetDatabases
<MultiValuedProperty>] [-TargetDeliveryDomain <String>] [-TargetEndpoint
<MigrationEndpointIdParameter>] <COMMON PARAMETERS>

New-MigrationBatch -UserIds <MigrationUserIdParameter[]> [-DisableOnCopy
<SwitchParameter>] <COMMON PARAMETERS>

New-MigrationBatch -Users <MigrationUser[]> [-DisableOnCopy
<SwitchParameter>] <COMMON PARAMETERS>
```

```
COMMON PARAMETERS: -Name <String> [-AllowIncrementalSyncs <$true |
$false>] [-AutoComplete <SwitchParameter>] [-AutoRetryCount <Int32>] [-
AutoStart <SwitchParameter>] [-CompleteAfter <DateTime>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Locale <CultureInfo>] [-
NotificationEmails <MultiValuedProperty>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-
ReportInterval <TimeSpan>] [-SkipSteps <SkippableMigrationSteps[]>] [-
StartAfter <DateTime>] [-TimeZone <ExTimeZoneValue>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a migration batch for a local move, where the mailboxes in the specified CSV file are moved to a different mailbox database. This CSV file contains a single column with the email address for the mailboxes that will be moved. The header for this column must be named **EmailAddress**. The migration batch in this example must be started manually by using the **Start-MigrationBatch** cmdlet or the Exchange admin center. Alternatively, you can use the *AutoStart* parameter to start the migration batch automatically.

```
New-MigrationBatch -Local -Name LocalMove1 -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\LocalMove1.csv")) -TargetDatabases MBXDB2

Start-MigrationBatch -Identity LocalMove1
```

EXAMPLE 2

This example creates a migration batch for a cross-forest enterprise move, where the mailboxes for the mail users specified in the CSV file are moved to a different forest. A new migration endpoint is created, which identifies the domain where the mailboxes are currently located. The endpoint is used to create the migration batch. Then the migration batch is started with the **Start-MigrationBatch** cmdlet. Note that cross-forest moves are initiated from the target forest, which is the forest that you want to move the mailboxes to.

```
$Credentials = Get-Credential

$MigrationEndpointSource = New-MigrationEndpoint -
ExchangeRemoteMove -Name Forest1Endpoint -Autodiscover -
EmailAddress administrator@forest1.contoso.com -Credentials
$Credentials

$CrossForestBatch = New-MigrationBatch -Name
CrossForestBatch1 -SourceEndpoint
```

```
$MigrationEndpointSource.Identity -TargetDeliveryDomain
forest2.contoso.com -TargetDatabases MBXDB1 -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\CrossForestBatch1.csv"))

Start-MigrationBatch -Identity $CrossForestBatch.Identity
```

EXAMPLE 3

This example creates a migration batch for an onboarding remote move migration from an on-premises Exchange organization to Exchange Online. The syntax is similar to that of a cross-forest move, but it's initiated from the Exchange Online organization. A new migration endpoint is created, which points to the on-premises organization as the source location of the mailboxes that will be migrated. This endpoint is used to create the migration batch. Then the migration batch is started with the **Start-MigrationBatch** cmdlet.

```
$Credentials = Get-Credential

$MigrationEndpointOnPrem = New-MigrationEndpoint -
ExchangeRemoteMove -Name OnpremEndpoint -Autodiscover -
EmailAddress administrator@onprem.contoso.com -Credentials
$Credentials

$OnboardingBatch = New-MigrationBatch -Name
RemoteOnBoarding1 -SourceEndpoint
$MigrationEndpointOnprem.Identity -TargetDeliveryDomain
cloud.contoso.com -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\RemoteOnBoarding1.csv"))

Start-MigrationBatch -Identity $OnboardingBatch.Identity
```

EXAMPLE 4

This example creates a migration batch for an offboarding remote move migration from Exchange Online to an on-premises Exchange organization. Like an onboarding remote move, it's initiated from the Exchange Online organization. First a Migration Endpoint is created that contains information about how to connect to the on-premises organization. The endpoint is used as the TargetEndpoint when creating the migration batch, which is then started with the **Start-MigrationBatch** cmdlet. The *TargetDatabases* parameter specifies multiple on-premises databases that the migration service can select as the target database to move the mailbox to.

```
$Credentials = Get-Credential

$MigrationEndpointOnPrem = New-MigrationEndpoint -
ExchangeRemoteMove -Name OnpremEndpoint -Autodiscover -
EmailAddress administrator@onprem.contoso.com -Credentials
$Credentials

$OffboardingBatch = New-MigrationBatch -Name
RemoteOffBoarding1 -TargetEndpoint
$MigrationEndpointOnprem.Identity -TargetDeliveryDomain
onprem.contoso.com -TargetDatabases
@(MBXDB01,MBXDB02,MBXDB03) -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\RemoteOffBoarding1.csv"))

Start-MigrationBatch -Identity $OffboardingBatch.Identity
```

EXAMPLE 5

This example creates a migration batch for the cutover Exchange migration CutoverBatch that's automatically started. The example uses the **Test-MigrationServerAvailability** cmdlet to obtain and test the connection settings to the on-premises Exchange server, and then uses those connection settings to create a migration endpoint. The endpoint is then used to create the migration batch. This example also includes the optional *TimeZone* parameter.

```
$credentials = Get-Credential

$TSMA = Test-MigrationServerAvailability -
ExchangeOutlookAnywhere -Autodiscover -EmailAddress
administrator@contoso.com -Credentials $credentials

$SourceEndpoint = New-MigrationEndpoint -
ExchangeOutlookAnywhere -Name SourceEndpoint -
ConnectionSettings $TSMA.ConnectionSettings

New-MigrationBatch -Name CutoverBatch -SourceEndpoint
$SourceEndpoint.Identity -TimeZone "Pacific Standard Time"
-AutoStart
```

EXAMPLE 6

This example creates and starts a migration batch for a staged Exchange migration. The example uses the **New-MigrationEndpoint** cmdlet to create a migration endpoint for the on-premises Exchange server, and then uses that endpoint to create the migration batch. The migration batch is started with the **Start-MigrationBatch** cmdlet.

```
$Credentials = Get-Credential

$MigrationEndpoint = New-MigrationEndpoint -
ExchangeOutlookAnywhere -Name ContosoEndpoint -Autodiscover
-EmailAddress administrator@contoso.com -Credentials
$Credentials

$StagedBatch1 = New-MigrationBatch -Name StagedBatch1 -
SourceEndpoint $MigrationEndpoint.Identity -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\StagedBatch1.csv"))

Start-MigrationBatch -Identity $StagedBatch1.Identity
```

EXAMPLE 7

This example creates a migration endpoint for the connection settings to the IMAP server. Then an IMAP migration batch is created that uses the CSV migration file IMAPmigration_1.csv and excludes the contents of the Deleted Items and Junk Email folders. This migration batch is pending until it's started with the **Start-MigrationBatch** cmdlet.

```
New-MigrationEndpoint -IMAP -Name IMAPEndpoint1 -
RemoteServer imap.contoso.com -Port 993

New-MigrationBatch -Name IMAPbatch1 -CSVData
([System.IO.File]::ReadAllBytes("C:\Users\Administrator
\Desktop\IMAPmigration_1.csv")) -SourceEndpoint
IMAPEndpoint1 -ExcludeFolders "Deleted Items","Junk Email"
```

Detailed Description

Use the **New-MigrationBatch** cmdlet to create a migration batch to migrate mailboxes and mailbox data in one of the following migration scenarios.

Moves in on-premises Exchange organizations

- **Local move:** A local move is where you move mailboxes from one mailbox database to another. A local move occurs within a single forest. For more information, see Example 1.

- **Cross-forest enterprise move:** In a cross-forest enterprise move, mailboxes are moved to a different forest. Cross-forest moves are initiated either from the target forest, which is the forest that you want to move the mailboxes to, or from the source forest, which is the forest that currently hosts the mailboxes. For more information, see Example 2.

Onboarding and offboarding in Exchange Online

- **Onboarding remote move migration:** In a hybrid deployment, you can move mailboxes from an on-premises Exchange organization to Exchange Online. This is also known as an *onboarding* remote move migration because you on-board mailboxes to Exchange Online. For more information, see Example 3.
- **Offboarding remote move migration:** You can also perform an *offboarding* remote move migration, where you migrate Exchange Online mailboxes to your on-premises Exchange organization. For more information, see Example 4.

Note:
Both onboarding and offboarding remote move migrations are initiated from your Exchange Online organization.

- **Cutover Exchange migration:** This is another type of onboarding migration and is used to migrate all mailboxes in an on-premises Exchange organization to Exchange Online. You can migrate a maximum of 1,000 Microsoft Exchange Server 2003, Exchange Server 2007, or Exchange Server 2010 mailboxes using a cutover migration. Mailboxes will be automatically provisioned in Exchange Online when you perform a cutover Exchange migration. For more information, see Example 5.
- **Staged Exchange migration:** You can also migrate a subset of mailboxes from an on-premises Exchange organization to Exchange Online. This is another type of onboarding migration. You can migrate only Exchange 2003 and Exchange 2007 mailboxes using a staged Exchange migration. Migrating Exchange 2010 and Exchange 2013 mailboxes isn't supported using a staged migration. Prior to running a staged migration, you have to use directory synchronization or some other method to provision mail users in your Exchange Online organization. For more information, see Example 6.
- **IMAP migration:** This onboarding migration type migrates mailbox data from an IMAP server (including Exchange) to Exchange Online. For an IMAP migration, you must first provision mailboxes in Exchange Online before you can migrate mailbox data. For more information, see Example 7.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Local	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Local* parameter specifies a local move, where mailboxes are moved to a different mailbox database within the same forest.
Name	Required	System.String	The *Name* parameter specifies an identifying name for the migration batch.
UserIds	Required	Microsoft.Exchange.Management.Migration.MigrationUserIdParameter[]	The *UserIds* parameter specifies an array of one or more user identities to be included in the migration batch.
Users	Required	Microsoft.Exchange.Migration.MigrationUser[]	The *Users* parameter specifies an array of one or more users to be included in the migration batch.
XO1	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
AllowIncrementalSyncs	Optional	System.Boolean	The *AllowIncrementalSyncs* parameter specifies whether to allow

			incremental synchronization. During incremental synchronization, the source and target mailboxes are synchronized. This means that any new messages sent to the source mailbox are copied to the corresponding target mailbox. This occurs every 24 hours. You can use one of the following values for this parameter: • `$true` Enables incremental synchronization; this is the default value. • `$false` Prevents incremental synchronizations. If you use this value, the migration batch will go into **Stopped** state after initial synchronization is complete. To complete a migration batch for local moves, cross-forest moves, or remote move migrations, you have to enable incremental synchronization by using the **Set-MigrationBatch** cmdlet.

ArchiveOnly	Optional	System.Management.Automation.SwitchParameter	The *ArchiveOnly* parameter specifies whether to migrate only the archive mailboxes from the source to the target destination for the users specified in the migration batch. Primary mailboxes aren't migrated when this parameter is used. This parameter can only be used for local moves and remote move migrations. You can use the *TargetArchiveDatabases* parameter to specify the database to migrate the archive mailboxes to. You can also specify the target archive database in the CSV file. If you don't specify the target archive database, the cmdlet uses the automatic mailbox distribution logic to select the database.
AutoComplete	Optional	System.Management.Automation.SwitchParameter	The *AutoComplete* parameter specifies whether to force the finalization of the individual mailboxes in a

			migration batch when the initial synchronization for a mailbox is successfully completed. Alternatively, you have to run the **Complete-MigrationBatch** cmdlet to finalize a migration batch. This parameter can only be used for local moves and remote move migrations. This parameter will force the individual mailboxes to be finalized as soon as the mailbox has completed initial synchronization. **Important:** If you're migrating mailboxes from Exchange Online to an on-premises Exchange Server 2007 organization, you must include the *AutoComplete* parameter. This parameter is required because offboarding cloud-based mailboxes to an Exchange 2007 organization is performed offline, and mailboxes in the migration batch must be finalized after the initial synchronization is successfully completed.
AutoRetryCount	Optional	System.Int32	The *AutoRetryCount*

			parameter specifies the number of attempts to restart the migration batch to migrate mailboxes that encountered errors.
AutoStart	Optional	System.Management.Automation.SwitchParameter	The *AutoStart* parameter specifies whether to immediately start the processing of the new migration batch. If you don't use the *AutoStart* parameter, you have to manually start the migration batch by using the **Start-MigrationBatch** cmdlet.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the migration request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647 and the value `unlimited`. The default value is 0. We recommend that you keep the default value 0 and

			only change the *BadItemLimit* parameter value if the move or migration fails.
CompleteAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CSVData	Optional	System.Byte[]	The *CSVData* parameter specifies the CSV file that contains information about the user mailboxes to be moved or migrated. The required attributes in the header row of the CSV file vary depending on the type of migration. For more information, see CSV files for mailbox migration. Use the following format for the value of this parameter: `([System.IO.File]::Rea`

			`dAllBytes(<path of the CSV migration file>))`. The following is an example: `CSVData: ([System.IO.File]::ReadAllBytes("C:\Users\Administrator\Desktop\MigrationBatch_1.csv"))`
DisableOnCopy	Optional	System.Management.Automation.SwitchParameter	The *DisableOnCopy* parameter specifies that if copying items from one batch to another, the original job item will be disabled.
DisallowExistingUsers	Optional	System.Management.Automation.SwitchParameter	The *DisallowExistingUsers* parameter specifies whether to prevent the migration of mailboxes that are currently being migrated in a different migration batch. A validation warning is displayed for any pre-existing mailbox in the target destination.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
ExcludeFolders	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in the cloud-based service. For an IMAP migration, the *ExcludeFolders* parameter specifies mailbox folders that you don't want to migrate from the on-premises messaging system to the cloud-based mailboxes. Use folder names relative to the IMAP root on the on-premises mail server. Specify the value as a string array and separate multiple folder names with commas.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items in each mailbox in the migration batch that will be skipped. When the number of large items exceeds this value, the migration for the mailbox fails. The default value is 0,

			which means that the migration fails if the mailbox contains any large items. For an on-premises Exchange organization, the size limit is defined by the target mailbox database. In Exchange Online, items up to 35 megabytes (MB) are migrated.
Locale	Optional	System.Globalization.CultureInfo	This parameter is available only in on-premises Exchange 2013. The *Locale* parameter specifies the language for the organization.
NotificationEmails	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmails* parameter specifies one or more email addresses that migration status reports are sent to. Specify the value as a string array, and separate multiple email addresses with commas. If you don't use this parameter, the status report isn't sent.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
PrimaryOnly	Optional	System.Management.Automation.SwitchParameter	The *PrimaryOnly* parameter specifies that only the primary mailboxes are migrated from the source destination to the target organization for the users specified in the migration batch. Archive mailboxes aren't migrated when this parameter is used. This parameter can only be used for local moves and remote move migrations.
ReportInterval	Optional	System.TimeSpan	This parameter is reserved for internal Microsoft use.
SkipSteps	Optional	Microsoft.Exchange.Data.Storage.Management.SkippableMigrationSteps[]	The *SkipSteps* parameter allows you to skip the step of setting the target email address on the source mailbox. This prevents mail from being forwarded from the original mailbox to the new mailbox that was

			migrated to the target destination. Use one of the following values with this parameter: • `SettingTargetAddress` • `None` This parameter is only enforced for migration batches for a staged Exchange migration.
SourceEndpoint	Optional	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *SourceEndpoint* parameter specifies the name of the migration endpoint for the current location of the mailboxes specified in the migration batch. The migration endpoint specified by this parameter contains the connection settings that will be used by the migration process to connect to the server where the mailboxes specified in the migration batch are located.
StartAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
TargetArchiveDatabases	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *TargetArchiveDatabases* parameter specifies the database where the

			archive mailboxes specified in the migration batch will be migrated to. You can also specify multiple databases for the value of this parameter. The migration service selects one database as the target database to move the archive mailbox to. For example: `-TargetArchiveDatabases @(MBXDB01,MBXDB02,MBXDB03)` This parameter can only be used for local moves and remote move migrations.
TargetDatabases	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *TargetDatabases* parameter specifies the identity of the database that you're moving mailboxes to. You can use the following values: • Database GUID • Database name If you don't specify the *TargetDatabases* parameter for a local move, the cmdlet uses the automatic mailbox distribution logic to select the database.

			You can also specify multiple databases for the value of this parameter. The migration service will select one as the target database to move the mailbox to. For example: -`TargetDatabases @(MBXDB01,MBXDB02,MBXDB03)` This parameter can only be used for local moves and remote move migrations.
TargetDeliveryDomain	Optional	System.String	The *TargetDeliveryDomain* parameter specifies the FQDN of the external email address created in the source forest for the mail-enabled user when the migration batch is complete. This parameter is required when creating remote move onboarding and remote offboarding migration batches.
TargetEndpoint	Optional	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *TargetEndpoint* parameter specifies the name of the migration endpoint for the destination where the mailboxes specified in the

			migration batch will be moved or migrated to. The migration endpoint specified by this parameter contains the connection settings that will be used by the migration process to connect to the server where the mailboxes will be moved.
TimeZone	Optional	Microsoft.Exchange.Data.Storage.Management.ExTimeZoneValue	The *TimeZone* parameter specifies the time zone of the administrator who submits the migration batch. Use a valid Windows time zone name. You can use Windows PowerShell to retrieve time zone names from the registry, for example: `Get-ChildItem "HKLM:\Software\Microsoft\Windows NT\CurrentVersion\Time zones" | Format-List pschildname`
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MigrationBatch** cmdlet to delete a migration batch that either isn't running or has been completed. If necessary, you can run the **Get-MigrationBatch** cmdlet to determine the status of a migration batch before you remove it.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MigrationBatch [-Identity <MigrationBatchIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Organization <OrganizationIdParameter>] [-Partition
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the migration batch Cutover1.

```
Remove-MigrationBatch -Identity Cutover1
```

EXAMPLE 2

This example removes the corrupted migration batch LocalMove1.

```
Remove-MigrationBatch -Identity LocalMove1 -Force
```

Detailed Description

The **Remove-MigrationBatch** cmdlet removes a migration batch. All subscriptions are deleted, and any object related to the migration batch is also deleted.

If you use the *Force* parameter with this cmdlet, the individual user requests and subscriptions that were part of the removed migration batch aren't removed. You have to remove the individual migration user requests with the `Remove-MigrationUser <Identity> -Force` command.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange

			2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to remove a corrupted migration batch. Corrupted migration batches have a status of **Corrupted**. If you try to remove a corrupted migration batch without using this switch, you receive an error saying the migrated batch can't be found. If you use this parameter to remove a corrupted migration batch, the individual user requests (also called *job items*) and subscriptions that were part of the removed migration batch aren't

			removed. You have to remove the individual migration user requests with the `Remove-MigrationUser <Identity> -Force` command.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *Identity* parameter identifies the migration batch that you want to remove. The value for this parameter is the name that was specified when the migration batch was created.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MigrationBatch** cmdlet to update a migration request for a batch of users. For more information, see New-MigrationBatch.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MigrationBatch -Identity <MigrationBatchIdParameter> [-
AllowIncrementalSyncs <$true | $false>] [-AutoRetryCount <Int32>] [-
BadItemLimit <Unlimited>] [-CompleteAfter <DateTime>] [-Confirm
[<SwitchParameter>]] [-CSVData <Byte[]>] [-DomainController <Fqdn>] [-
LargeItemLimit <Unlimited>] [-NotificationEmails <MultiValuedProperty>] [-
Organization <OrganizationIdParameter>] [-Partition <MailboxIdParameter>]
[-ReportInterval <TimeSpan>] [-StartAfter <DateTime>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates MigrationBatch01 with new *AutoRetryCount* and *AllowIncrementalSyncs*

parameter settings.

```
Set-MigrationBatch -Identity MigrationBatch01 -
AutoRetryCount 5 -AllowIncrementalSyncs $true
```

Detailed Description

The **Set-MigrationBatch** cmdlet configures your existing migration batches to migrate mailboxes and mailbox data in one of the following scenarios:

- Local move
- Cross-forest move
- Remote move
- Cutover Exchange migration
- Staged Exchange migration
- IMAP migration

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *Identity* parameter specifies the name of the migration batch that you want to update configuration settings for.
AllowIncrementalSyncs	Optional	System.Boolean	The *AllowIncrementalSyncs* parameter specifies whether to enable or disable incremental syncs on mailbox moves and migrations.

AutoRetryCount	Optional	System.Int32	The *AutoRetryCount* parameter specifies the number of attempts to restart the migration batch to migrate mailboxes that encountered errors.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails.
CompleteAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CSVData	Optional	System.Byte[]	The *CSVData* parameter specifies the CSV file that contains information about the user mailboxes to be moved or migrated. The required attributes in the header row of the CSV file vary depending on the type of migration. Use the following format for the value of this parameter: `([System.IO.File]::ReadAllBytes(<path of the CSV migration file>))`. The following is an example: `CSVData: ([System.IO.File]::ReadAllBytes("C:\Users\Administrator\Desktop\MigrationBatch_1.csv"))`
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-

			premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the size of large items to skip if the request encounters such items in the mailbox. Use 0 to not skip large items. The valid input range for this parameter is from 0 through 2147483647. The default value is 50. We recommend that you keep the default value 0 and only change the *LargeItemLimit* parameter value if the request fails.
NotificationEmails	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmails* parameter specifies one or more email addresses that

			migration status reports are sent to. Specify the value as a string array, and separate multiple email addresses with commas. If you don't use this parameter, the status report isn't sent.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
ReportInterval	Optional	System.TimeSpan	This parameter is reserved for internal Microsoft use.
StartAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Start-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Start-MigrationBatch** cmdlet to start a move request or migration batch that was created with the **New-MigrationBatch** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Start-MigrationBatch [-Identity <MigrationBatchIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-Validate
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example starts the migration batch SEM1.

```
Start-MigrationBatch -Identity SEM1
```

Detailed Description

The **Start-MigrationBatch** cmdlet starts a pending migration batch that was created, but not started, with the **New-MigrationBatch** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *Identity* parameter identifies the migration batch that you want to start. Use the migration batch *Name* parameter as the value for this parameter. Use the **Get-MigrationBatch** cmdlet to identify the name of the migration batch.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
Validate	Optional	System.Management.Automation.SwitchParameter	The *Validate* parameter specifies whether to start the migration batch in the validation stage of the migration process. If you include this parameter, the migration performs a validation check of the mailboxes in the batch.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Stop-MigrationBatch

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Stop-MigrationBatch** cmdlet to stop the processing of a migration batch that's in progress.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Stop-MigrationBatch [-Identity <MigrationBatchIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example stops the migration batch that's currently being processed by the migration service.

```
Stop-MigrationBatch
```

EXAMPLE 2

This example stops the migration batch MigrationBatch1.

```
Stop-MigrationBatch -Identity MigrationBatch1
```

Detailed Description

The **Stop-MigrationBatch** cmdlet stops the migration batch that's being processed in your on-premises Exchange organization or by the cloud-based migration service running in Microsoft Office 365. You can only stop migration batches that have mailboxes that are still in the process of being migrated or are waiting to be migrated. Stopping a migration won't affect mailboxes that have been migrated already. The migration of mailboxes that are being actively migrated is stopped immediately. If all migration requests in a migration batch are completed or failed, this cmdlet won't run.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *Identity* parameter identifies the name of the current migration batch. The value for this parameter is specified by the *Name* parameter of the **New-MigrationBatch** cmdlet.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MigrationConfig

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Get-MigrationConfig** cmdlet to retrieve migration configuration settings on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MigrationConfig [-Identity <MigrationConfigIdParameter>] [-
DomainController <Fqdn>] [-Partition <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the settings for the migration configuration.

```
Get-MigrationConfig
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationConfigIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MigrationConfig

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-08*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MigrationConfig** cmdlet to edit migration configurations for a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MigrationConfig [-Identity <MigrationConfigIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Features <None |
MultiBatch | Endpoints | UpgradeBlock | PAW>] [-MaxConcurrentMigrations
<Unlimited>] [-MaxNumberOfBatches <Int32>] [-Partition
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the migration system to have a maximum of 50 batches at any time.

```
Set-MigrationConfig -MaxNumberOfBatches 50
```

EXAMPLE 2

This example sets the migration system to only allow 100 concurrent migrations.

```
Set-MigrationConfig -MaxConcurrentMigrations 100
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
Features	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationFeature	The *Features* parameter specifies the set of features to enable for the migration system. Use one of the following values: • `None` • `MultiBatch` • `Endpoints` • `UpgradeBlock`
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationConfigIdParameter	This parameter is reserved for internal Microsoft use.
MaxConcurrentMigrations	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxConcurrentMigrations* parameter specifies the maximum number of active migrations that your organization can run at any specific time.
MaxNumberOfBatches	Optional	System.Int32	The *MaxNumberOfBatches* parameter specifies the maximum number of batches that your organization can migrate at any time.
Partition	Optional	Microsoft.Exchange.Co	This parameter is reserved

		nfiguration.Tasks.MailboxIdParameter	for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MigrationEndpoint

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-17*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MigrationEndpoint** cmdlet to retrieve migration endpoint settings for source or

destination servers for cutover or staged Exchange migrations, IMAP migrations, and remote moves.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MigrationEndpoint [-Identity <MigrationEndpointIdParameter>] <COMMON
PARAMETERS>

Get-MigrationEndpoint -Type <None | IMAP | XO1 | ExchangeOutlookAnywhere |
BulkProvisioning | ExchangeRemoteMove | ExchangeLocalMove | PSTImport>
<COMMON PARAMETERS>

Get-MigrationEndpoint -ConnectionSettings <ExchangeConnectionSettings>
<COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DiagnosticArgument
<String>] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the settings for the migration endpoint, OnboardingME01.

```
Get-MigrationEndpoint -Identity OnboardingME01
```

Detailed Description

The **Get-MigrationEndpoint** cmdlet retrieves settings for different types of migration:

- **Cross-forest move** Move mailboxes between two different on-premises Exchange forests. Cross-forest moves require the use of a RemoteMove endpoint.
- **Remote move** In a hybrid deployment, a remote move involves *onboarding* or *offboarding* migrations. Remote moves require the use of a RemoteMove endpoint. Onboarding moves mailboxes from an on-premises Exchange organization to Exchange Online in Office 365, and uses a RemoteMove endpoint as the source endpoint of the migration batch. Offboarding moves mailboxes from Exchange Online in Office 365 to an on-premises Exchange organization and uses a RemoteMove endpoint as the target endpoint of the migration batch.
- **Cutover Exchange migration** Migrate all mailboxes in an on-premises Exchange organization to Exchange Online in Office 365. Cutover Exchange migration requires the use of an Exchange endpoint.
- **Staged Exchange migration** Migrate a subset of mailboxes from an on-premises Exchange organization to Exchange Online in Office 365. Staged Exchange migration requires the use of an Exchange endpoint.
- **IMAP migration** Migrate mailbox data from an on-premises Exchange organization or other email system to Exchange Online in Office 365. For an IMAP migration, you must first create the cloud-based mailboxes before you migrate mailbox data. IMAP migrations require the use of an

IMAP endpoint.

- **Local** Move mailboxes between different servers or databases within a single on-premises Exchange forest. Local moves don't require the use of an endpoint.

For more information about the different move and migration scenarios, see:

- Mailbox moves in Exchange 2013
- Manage on-premises moves

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
ConnectionSettings	Required	Microsoft.Exchange.Data.Storage.Management.ExchangeConnectionSettings	The *ConnectionSettings* parameter specifies the configuration settings of source or target servers for which you want to find a matching endpoint.
Type	Required	Microsoft.Exchange.Data.Storage.Management.MigrationType	The *Type* parameter specifies what type of migration you want configuration settings for: • Remote moves and migrations • Cutover or staged Exchange migrations • IMAP migrations • PST Import
Diagnostic	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
DiagnosticArgument	Optional	System.String	This parameter is reserved

			for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *Identity* parameter specifies the name of the migration endpoint you want to retrieve settings for.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MigrationEndpoint

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-17*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MigrationEndpoint** cmdlet to configure the connection settings for cross-forests moves, remote move migrations, cutover or staged Exchange migrations, and IMAP migrations.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MigrationEndpoint -ExchangeRemoteMove <SwitchParameter> -RemoteServer
<Fqdn> [-Credentials <PSCredential>] <COMMON PARAMETERS>

New-MigrationEndpoint -Autodiscover <SwitchParameter> -Credentials
<PSCredential> -EmailAddress <SmtpAddress> -ExchangeOutlookAnywhere
<SwitchParameter> [-MailboxPermission <Admin | FullAccess>] [-
SourceMailboxLegacyDN <String>] [-TestMailbox <MailboxIdParameter>]
<COMMON PARAMETERS>

New-MigrationEndpoint -Credentials <PSCredential> -ExchangeOutlookAnywhere
<SwitchParameter> [-Authentication <Basic | Digest | Ntlm | Fba |
WindowsIntegrated | LiveIdFba | LiveIdBasic | WSSecurity | Certificate |
NegoEx | OAuth | Adfs | Kerberos | Negotiate | LiveIdNegotiate |
Misconfigured>] [-EmailAddress <SmtpAddress>] [-ExchangeServer <String>]
[-MailboxPermission <Admin | FullAccess>] [-NspiServer <String>] [-
RpcProxyServer <Fqdn>] [-SourceMailboxLegacyDN <String>] [-TestMailbox
<MailboxIdParameter>] <COMMON PARAMETERS>

New-MigrationEndpoint -PSTImport <SwitchParameter> -RemoteServer <Fqdn> [-
Credentials <PSCredential>] <COMMON PARAMETERS>

New-MigrationEndpoint -Autodiscover <SwitchParameter> -Credentials
<PSCredential> -EmailAddress <SmtpAddress> -ExchangeRemoteMove
<SwitchParameter> <COMMON PARAMETERS>

New-MigrationEndpoint -IMAP <SwitchParameter> -RemoteServer <Fqdn> [-
Authentication <Basic | Digest | Ntlm | Fba | WindowsIntegrated |
LiveIdFba | LiveIdBasic | WSSecurity | Certificate | NegoEx | OAuth | Adfs
| Kerberos | Negotiate | LiveIdNegotiate | Misconfigured>] [-Port <Int32>]
[-Security <None | Ssl | Tls>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-MaxConcurrentIncrementalSyncs <Unlimited>] [-
MaxConcurrentMigrations <Unlimited>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-
SkipVerification <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an endpoint for remote moves by using the *Autodiscover* parameter to detect the settings.

```
New-MigrationEndpoint -Name Endpoint1 -ExchangeRemoteMove -
Autodiscover -EmailAddress tonysmith@contoso.com -
Credentials (Get-Credential contoso\tonysmith)
```

EXAMPLE 2

This example creates an endpoint for remote moves by specifying the settings manually.

```
New-MigrationEndpoint -Name Endpoint2 -ExchangeRemoteMove -
RemoteServer MRSServer.contoso.com -Credentials (Get-
Credential Contoso.com\Administrator)
```

EXAMPLE 3

This example creates an Outlook Anywhere migration endpoint by using the *Autodiscover* parameter to detect the connection settings to the on-premises organization. Outlook Anywhere endpoints are used for cutover and staged Exchange migrations. The **Get-Credential** cmdlet is used to obtain the credentials for an on-premises account that has the necessary administrative privileges in the domain and that can access the mailboxes that will be migrated. When prompted for the user name, you can use either the email address or the domain\user name format for the administrator account. This account can be the same one that is specified by the *EmailAddress* parameter.

```
$Credentials = Get-Credential

New-MigrationEndpoint -ExchangeOutlookAnywhere -Name EXCH-
AutoDiscover -Autodiscover -EmailAddress
administrator@contoso.com -Credentials $Credentials
```

EXAMPLE 4

This example creates an Outlook Anywhere migration endpoint by specifying the connection settings manually. Outlook Anywhere endpoints are used for cutover and staged Exchange migrations. The value for the *ExchangeServer* parameter specifies the on-premises Exchange server that hosts the mailboxes that will be migrated. The value for the *RPCProxyServer* parameter specifies a Client Access server in the on-premises organization. The *EmailAddress* parameter can specify any mailbox in the on-premises domain.

```
New-MigrationEndpoint -ExchangeOutlookAnywhere -Name
EXCH_Manual -ExchangeServer EXCH-01-MBX.contoso.com -
```

```
RPCProxyServer EXCH-02-CAS.contoso.com -Credentials (Get-
Credential administrator@contoso.com) -EmailAddress
annb@contoso.com
```

Important:
It's recommended that you use a migration endpoint created with connection settings that are automatically discovered (see Example 3) because the Autodiscover service will be used to connect to each user mailbox in the migration batch. If you manually specify the connection settings for the endpoint and a user mailbox isn't located on the server specified by the *ExchangeServer* parameter, the migration for that user will fail. This is important if you have multiple on-premises Exchange servers. Otherwise, you may need to create different migration endpoints that correspond to each on-premises server.

EXAMPLE 5

This example creates an IMAP migration endpoint. The value for the *RemoteServer* parameter specifies the FQDN of the IMAP server that hosts the mailboxes that will be migrated. The endpoint is configured to use port 993 for SSL encryption.

```
New-MigrationEndpoint -IMAP -Name IMAPEndpoint -
RemoteServer imap.contoso.com -Port 993 -Security Ssl
```

EXAMPLE 6

This example creates an IMAP migration endpoint that supports 50 concurrent migrations and 10 concurrent incremental synchronizations. The endpoint is configured to use port 143 for TLS encryption.

```
New-MigrationEndpoint -IMAP -Name IMAP_TLS_Endpoint -
RemoteServer imap.contoso.com -Port 143 -Security Tls -
MaxConcurrentMigrations
50 -MaxConcurrentIncrementalSyncs 10
```

Detailed Description

The **New-MigrationEndpoint** cmdlet configures the connection settings for different types of migrations:

- **Cross-forest move:** Move mailboxes between two different on-premises Exchange forests. Cross-forest moves require the use of a Remote Move endpoint.
- **Remote move migration:** In a hybrid deployment, a remote move migration involves *onboarding* or *offboarding* migrations. Remote move migrations also require the use of an Exchange remote move endpoint. Onboarding moves mailboxes from an on-premises Exchange organization to Exchange Online in Office 365, and uses a remote move endpoint as the source endpoint of the migration batch. Offboarding moves mailboxes from Exchange Online in Office 365 to an on-

premises Exchange organization and uses a remote move endpoint as the target endpoint of the migration batch.

- **Cutover Exchange migration:** Migrate all mailboxes in an on-premises Exchange organization to Exchange Online in Office 365. A cutover Exchange migration requires the use of an Outlook Anywhere migration endpoint.
- **Staged Exchange migration:** Migrate a subset of mailboxes from an on-premises Exchange organization to Exchange Online in Office 365. A staged Exchange migration requires the use of an Outlook Anywhere migration endpoint.
- **IMAP migration:** Migrate mailbox data from an on-premises Exchange organization or other email system to Exchange Online in Office 365. For an IMAP migration, you must first create the cloud-based mailboxes before you migrate mailbox data. IMAP migrations require the use of an IMAP endpoint.

Note:
Moving mailboxes between different servers or databases within a single on-premises Exchange forest (called a *local move*) doesn't require a migration endpoint.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Autodiscover	Required	System.Management.Automation.SwitchParameter	For an Exchange migration, the *Autodiscover* parameter specifies whether to get other connection settings for the on-premises server from the Autodiscover service.
EmailAddress	Required	Microsoft.Exchange.Data.SmtpAddress	The *EmailAddress* parameter specifies the email address used by the Autodiscover service or in some cases used to validate the endpoint

			when you specify the connection settings manually.
ExchangeOutlookAnywhere	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *ExchangeOutlookAnywhere* parameter specifies the type of endpoint for staged and cutover migrations.
ExchangeRemoteMove	Required	System.Management.Automation.SwitchParameter	The *ExchangeRemoteMove* parameter specifies the type of endpoint for cross-forest moves and remote move migrations in a hybrid deployment.
IMAP	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *IMAP* parameter specifies the type of endpoint for IMAP migrations.
Name	Required	System.String	The *Name* parameter specifies the name you give to the new migration endpoint. You can use the

			Name parameter when you run the **New-MigrationBatch** cmdlet.
PSTImport	Required	System.Management.Automation.SwitchParameter	The *PSTImport* parameter specifies the type of endpoint for PST Import migrations.
RemoteServer	Required	Microsoft.Exchange.Data.Fqdn	The *RemoteServer* parameter specifies the FQDN of the remote server, which depends on the protocol type for moves: • For cross-forest moves and remote move migrations, this parameter refers to the Client Access server in the on-premises organization. • For IMAP migrations, this parameter refers to the IMAP server.
Authentication	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	This parameter is available only in the cloud-based service. The *Authentication* parameter specifies the authentication method used by the on-premises mail server. If you don't

			include this parameter, `Basic` authentication is used.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Credentials	Optional	System.Management.Automation.PSCredential	The *Credentials* parameter specifies the credentials to connect to the source or target endpoint for all Exchange migration types. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in the cloud-based service. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExchangeServer	Optional	System.String	This parameter is available only in the cloud-based service. The *ExchangeServer* parameter specifies the FQDN of the on-premises Exchange server that hosts the mailboxes that will be migrated. This parameter is used when you create an Outlook Anywhere migration endpoint for cutover and staged Exchange migrations. This parameter is required only when you don't use the *Autodiscover* parameter.
MailboxPermission	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationMailboxPermission	This parameter is available only in the cloud-based service. The *MailboxPermission* parameter specifies what permissions to use to access the source mailbox

			during Outlook Anywhere onboarding (staged Exchange migration and cutover Exchange migration). The migration administrator account specified for the endpoint must have one of the following permissions: • `Admin`: The account is a domain administrator who can access any mailbox they want to migrate. • `FullAccess`: The account is assigned either the Full Access permission to the mailboxes they want to migrate or the Receive As permission to the mailbox database that hosts the mailboxes that will be migrated. If this parameter isn't specified, the cmdlet tries to access source mailboxes using the domain administrator permission and if that fails, it then tries to access the source mailboxes using the Full Access or Receive As permissions. This parameter can't be

			used for creating non-Outlook Anywhere migration endpoints.
MaxConcurrentIncrementalSyncs	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxConcurrentIncrementalSyncs* parameter specifies the maximum number of incremental syncs allowed per endpoint. The default value is 20.
MaxConcurrentMigrations	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxConcurrentMigrations* parameter specifies the maximum number of mailboxes that are migrated during initial sync. This parameter is applicable for all migration types. The default value is 100.
NspiServer	Optional	System.String	This parameter is available only in the cloud-based service. The *NspiServer* parameter specifies the remote Name Service Provider Interface (NSPI) server location for cutover and staged migrations. You must provide the FQDN of

			the server.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
Port	Optional	System.Int32	This parameter is available only in the cloud-based service. For an IMAP migration, the *Port* parameter specifies the TCP port number used by the migration process to connect to the remote server. This parameter is required when you want to migrate data from an on-premises IMAP server to cloud-based mailboxes.
RpcProxyServer	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in the cloud-based service. The *RpcProxyServer* parameter specifies the FQDN of the Client Access server for the on-premises Exchange organization. This parameter is used when

			you create an Outlook Anywhere migration endpoint for cutover and staged Exchange migrations. Typically, this FQDN will be the same as your Outlook Web App URL; for example, mail.contoso.com. This is also the URL for the proxy server that Outlook uses to connect to an Exchange server. This parameter is required only when you don't use the *Autodiscover* parameter.
Security	Optional	Microsoft.Exchange.Data.IMAPSecurityMechanism	This parameter is available only in the cloud-based service. The *Security* parameter specifies the encryption method used by the IMAP server for an IMAP migration. Options are None, SSL (the default), or TLS. This parameter is required when you want to migrate data from an on-premises IMAP server to cloud-based mailboxes.

SkipVerification	Optional	System.Management.Automation.SwitchParameter	The *SkipVerification* switch specifies whether to skip verifying that the remote server is reachable when creating a migration endpoint. The default value is `$false`.
SourceMailboxLegacyDN	Optional	System.String	This parameter is available only in the cloud-based service. The *SourceMailboxLegacyDN* parameter specifies the LegacyExchangeDN of an on-premises mailbox used to test the ability of the migration service to create a connection using this endpoint. The cmdlet tries to access this mailbox using the credentials for the administrator account specified in the command.
TestMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in the cloud-based service. The *TestMailbox* parameter specifies an Exchange Online mailbox used as the target by the migration service to verify

			the connection using this endpoint. If this parameter isn't specified, the migration service uses the migration arbitration mailbox in the Exchange Online organization to verify the connection. This parameter is only used to create Outlook Anywhere migration endpoints.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MigrationEndpoint

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MigrationEndpoint** cmdlet to remove existing migration endpoints for source or destination servers for cutover or staged Exchange migrations, IMAP migrations, and remote moves.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MigrationEndpoint -Identity <MigrationEndpointIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the migration endpoint CrossForestME01.

```
Remove-MigrationEndpoint -Identity CrossForestME01
```

Detailed Description

Use the **Remove-MigrationEndpoint** cmdlet to remove an existing migration endpoint.

For more information about migration endpoints, see Set-MigrationEndpoint and New-MigrationEndpoint.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *Identity* parameter specifies the name of the migration endpoint you want to remove.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Co	This parameter is

		nfiguration.Tasks.MailboxIdParameter	reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MigrationEndpoint

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MigrationEndpoint** cmdlet to edit settings for cutover or staged Exchange migrations, IMAP migrations, and remote moves.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MigrationEndpoint -Identity <MigrationEndpointIdParameter> [-
Authentication <Basic | Digest | Ntlm | Fba | WindowsIntegrated |
LiveIdFba | LiveIdBasic | WSSecurity | Certificate | NegoEx | OAuth | Adfs
| Kerberos | Negotiate | LiveIdNegotiate | Misconfigured>] [-Confirm
[<SwitchParameter>]] [-Credentials <PSCredential>] [-DomainController
<Fqdn>] [-EmailAddress <SmtpAddress>] [-ExchangeServer <String>] [-
MailboxPermission <Admin | FullAccess>] [-MaxConcurrentIncrementalSyncs
<Unlimited>] [-MaxConcurrentMigrations <Unlimited>] [-NspiServer <String>]
[-Organization <OrganizationIdParameter>] [-Partition
<MailboxIdParameter>] [-Port <Int32>] [-RemoteServer <Fqdn>] [-
RpcProxyServer <Fqdn>] [-Security <None | Ssl | Tls>] [-SkipVerification
<SwitchParameter>] [-SourceMailboxLegacyDN <String>] [-TestMailbox
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the *MaxConcurrentIncrementalSyncs* setting to 50 on the CutoverExchangeEndpoint01 migration endpoint using the NSPI server Server01.

```
Set-MigrationEndpoint -Identity CutoverExchangeEndpoint01 -
MaxConcurrentIncrementalSyncs 50 -NspiServer
Server01.contoso.com
```

EXAMPLE 2

This example changes the *MaxConcurrentMigrations* setting to 10 on the Onboardingmigrationendpoint01 migration endpoint using the remote server, Server01.

```
Set-MigrationEndpoint -Identity
Onboardingmigrationendpoint01 -MaxConcurrentMigrations 10 -
RemoteServer Server01.contoso.com
```

Detailed Description

Use the **Set-MigrationEndpoint** cmdlet to configure settings for different types of migration:

- **Cross-forest move** Move mailboxes between two different on-premises Exchange forests. Cross-forest moves require the use of a RemoteMove endpoint.
- **Remote move** In a hybrid deployment, a remote move involves *onboarding* or *offboarding* migrations. Remote moves require the use of a RemoteMove endpoint. Onboarding moves mailboxes from an on-premises Exchange organization to Exchange Online in Office 365, and uses a RemoteMove endpoint as the source endpoint of the migration batch. Offboarding moves mailboxes from Exchange Online in Office 365 to an on-premises Exchange organization and

uses a RemoteMove endpoint as the target endpoint of the migration batch.

- **Cutover Exchange migration** Migrate all mailboxes in an on-premises Exchange organization to Exchange Online in Office 365. Cutover Exchange migration requires the use of an Exchange endpoint.
- **Staged Exchange migration** Migrate a subset of mailboxes from an on-premises Exchange organization to Exchange Online in Office 365. Staged Exchange migration requires the use of an Exchange endpoint.
- **IMAP migration** Migrate mailbox data from an on-premises Exchange organization or other email system to Exchange Online in Office 365. For an IMAP migration, you must first create the cloud-based mailboxes before you migrate mailbox data. IMAP migrations require the use of an IMAP endpoint.
- **Local** Move mailboxes between different servers or databases within a single on-premises Exchange forest. Local moves don't require the use of an endpoint.

For more information about the different move and migration scenarios, see:

- Mailbox moves in Exchange 2013
- Manage on-premises moves

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *Identity* parameter specifies the name of the migration endpoint you want to configure.
Authentication	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	This parameter is available only in the cloud-based service. The *Authentication* parameter specifies the authentication method used by the on-premises mail server.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Credentials	Optional	System.Management.Automation.PSCredential	The *Credentials* parameter specifies the credentials to use for connecting to the remote endpoint. Credentials should be used when creating either a staged or cutover Exchange endpoint or a RemoteMove endpoint. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in the cloud-based service. The *EmailAddress* parameter specifies the email address of an administrator account that can access the remote server.
ExchangeServer	Optional	System.String	This parameter is available only in the cloud-based service. The *ExchangeServer* parameter specifies the on-premises source Exchange server for cutover and staged migrations. This parameter is applicable only to staged and cutover Exchange endpoints which don't use Autodiscovery.
MailboxPermission	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationMailboxPermission	This parameter is available only in the cloud-based service. The *MailboxPermission* parameter specifies what

			permissions should be used to access the source mailbox during OutlookAnywhere onboarding (Staged Exchange Migration and Cutover Exchange Migration). This parameter is not for non-OutlookAnywhere migrations. The account specified must have the following permissions: 1. FullAccess permission. The account has Full-Access permission to the mailboxes they want to migrate. 2. Admin permission. The account is a domain administrator who can access any mailbox they want to migrate.
MaxConcurrentIncrementalSyncs	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxConcurrentIncrementalSyncs* parameter specifies the maximum number of incremental syncs allowed for this endpoint at a specified time. This value must be less or equal to

			MaxConcurrentMigrations parameter.
MaxConcurrentMigrations	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxConcurrentMigrations* parameter specifies the maximum number of mailboxes that will be migrated for this endpoint at a specified time. This parameter is applicable for all migration types.
NspiServer	Optional	System.String	This parameter is available only in the cloud-based service. The *NspiServer* parameter specifies the FQDN of the remote Name Service Provider Interface (NSPI) server. This parameter is only applicable to staged and cutover Exchange endpoints that don't use Autodiscovery.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.

Port	Optional	System.Int32	This parameter is available only in the cloud-based service. For an IMAP migration, the *Port* parameter specifies the TCP port number used by the migration process to connect to the remote server.
RemoteServer	Optional	Microsoft.Exchange.Data.Fqdn	The *RemoteServer* parameter specifies the remote server depending on the protocol type for moves. • For Microsoft Exchange Server 2013 and Exchange Server 2010 moves, this parameter refers to the FQDN of a Client Access server or array, or group of Client Access servers behind a supported network load balancer. • For IMAP moves, this parameter refers to the FQDN of the IMAP server.
RpcProxyServer	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in the cloud-based service. For a staged Exchange migration, the

			RpcProxyServer parameter specifies the FQDN of the RPC proxy server for the on-premises Exchange server. This parameter is only applicable to staged and cutover Exchange endpoints that don't use Autodiscovery
Security	Optional	Microsoft.Exchange.Data.IMAPSecurityMechanism	This parameter is reserved for internal Microsoft use.
SkipVerification	Optional	System.Management.Automation.SwitchParameter	The *SkipVerification* switch specifies whether to skip verifying that the remote server is reachable when creating a migration endpoint. The default value is `$false`.
SourceMailboxLegacyDN	Optional	System.String	This parameter is available only in the cloud-based service. The *SourceMailboxLegacyDN* parameter specifies a mailbox on the target server. Use the LegacyExchangeDN for the on-premises test mailbox as the value for this parameter. The cmdlet tries

			to access this mailbox using the credentials for the administrator account on the target server.
TestMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in the cloud-based service. The *TestMailbox* parameter specifies a mailbox on the target server. Use the primary SMTP address as the value for this parameter. The cmdlet tries to access this mailbox using the credentials for the administrator account on the target server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-MigrationReport

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

The **Export-MigrationReport** is used by the Exchange migration process to enable an administrator to download a CSV file that contains migration errors for a selected migration batch. This cmdlet isn't run by an administrator in Windows PowerShell.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-MigrationReport <COMMON PARAMETERS>

Export-MigrationReport -CsvStream <Stream> -Identity
<MigrationReportIdParameter> <COMMON PARAMETERS>

Export-MigrationReport -Identity <MigrationReportIdParameter> -RowCount
<Int32> -StartingRowIndex <Int32> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-Partition
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

There are no examples for using this cmdlet because the values used for the required parameters are generated by and available only to the migration process.

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
CsvStream	Required	System.IO.Stream	This parameter is reserved for internal Microsoft use.
Identity	Required	Microsoft.Exchange.Management.Migration.MigrationReportIdParameter	This parameter is reserved for internal Microsoft use.
RowCount	Required	System.Int32	This parameter is reserved for internal Microsoft use.
StartingRowIndex	Required	System.Int32	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Dat	This parameter is available only in on-

		a.Fqdn	premises Exchange 2013. This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-MigrationServerAvailability

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-17*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Test-MigrationServerAvailability** cmdlet to test the availability of the target server in preparation to perform cross-forest mailbox moves, migration of on-premises mailboxes to Exchange Online, or to migrate on-premises mailbox data from an IMAP server to Exchange Online mailboxes. For all migration types, the cmdlet attempts to verify the connection settings used to connect to the target server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-MigrationServerAvailability <COMMON PARAMETERS>

Test-MigrationServerAvailability -Imap <SwitchParameter> -Port <Int32> -
RemoteServer <Fqdn> [-Authentication <Basic | Digest | Ntlm | Fba |
WindowsIntegrated | LiveIdFba | LiveIdBasic | WSSecurity | Certificate |
NegoEx | OAuth | Adfs | Kerberos | Negotiate | LiveIdNegotiate |
Misconfigured>] [-Security <None | Ssl | Tls>] <COMMON PARAMETERS>

Test-MigrationServerAvailability -ExchangeRemoteMove <SwitchParameter> -
RemoteServer <Fqdn> [-Credentials <PSCredential>] <COMMON PARAMETERS>

Test-MigrationServerAvailability -Credentials <PSCredential> -PSTImport
<SwitchParameter> -RemoteServer <Fqdn> [-FilePath <String>] <COMMON
PARAMETERS>

Test-MigrationServerAvailability -Credentials <PSCredential> -
ExchangeOutlookAnywhere <SwitchParameter> -ExchangeServer <String> -
RPCProxyServer <Fqdn> [-Authentication <Basic | Digest | Ntlm | Fba |
WindowsIntegrated | LiveIdFba | LiveIdBasic | WSSecurity | Certificate |
NegoEx | OAuth | Adfs | Kerberos | Negotiate | LiveIdNegotiate |
Misconfigured>] [-EmailAddress <SmtpAddress>] [-MailboxPermission <Admin |
FullAccess>] [-SourceMailboxLegacyDN <String>] [-TestMailbox
<MailboxIdParameter>] <COMMON PARAMETERS>

Test-MigrationServerAvailability -Autodiscover <SwitchParameter> -
Credentials <PSCredential> -EmailAddress <SmtpAddress> -ExchangeRemoteMove
<SwitchParameter> <COMMON PARAMETERS>

Test-MigrationServerAvailability -Autodiscover <SwitchParameter> -
Credentials <PSCredential> -EmailAddress <SmtpAddress> -
ExchangeOutlookAnywhere <SwitchParameter> [-MailboxPermission <Admin |
FullAccess>] [-SourceMailboxLegacyDN <String>] [-TestMailbox
<MailboxIdParameter>] <COMMON PARAMETERS>
```

```
Test-MigrationServerAvailability -Endpoint <MigrationEndpointIdParameter>
<COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

For IMAP migrations, this example verifies the connection to the IMAP mail server imap.contoso.com.

```
Test-MigrationServerAvailability -Imap -RemoteServer
imap.contoso.com -Port 143
```

EXAMPLE 2

This example uses the *Autodiscover* and *ExchangeOutlookAnywhere* parameters to verify the connection to an on-premises Exchange server in preparation for migrating on-premises mailboxes to Exchange Online. You can use a similar example to test the connection settings for a staged Exchange migration or a cutover Exchange migration.

```
$Credentials = Get-Credential

Test-MigrationServerAvailability -ExchangeOutlookAnywhere -
Autodiscover -EmailAddress administrator@contoso.com -
Credentials $Credentials
```

EXAMPLE 3

This example verifies the connection to a server running Microsoft Exchange Server 2003 named exch2k3.contoso.com and uses NTLM for the authentication method.

```
$Credentials = Get-Credential

Test-MigrationServerAvailability -ExchangeOutlookAnywhere -
ExchangeServer exch2k3.contoso.com -Credentials
$Credentials -RPCProxyServer mail.contoso.com -
Authentication NTLM
```

EXAMPLE 4

This example verifies the connection settings to a remote server, and then uses those settings to

create a migration endpoint.

```
$Credentials = Get-Credential

$TSMA = Test-MigrationServerAvailability -
ExchangeRemoteMove -Autodiscover -EmailAddress
administrator@contoso.com -Credentials $Credentials

New-MigrationEndpoint -ExchangeRemoteMove -Name
ContosoEndpoint -ConnectionSettings
$TSMA.ConnectionSettings
```

Detailed Description

The **Test-MigrationServerAvailability** cmdlet verifies that you can communicate with the on-premises mail server that houses the mailbox data that you want to migrate to cloud-based mailboxes. When you run this cmdlet, you must specify the migration type. You can specify whether to communicate with an IMAP server or with an Exchange server.

For an IMAP migration, this cmdlet uses the server's fully qualified domain name (FQDN) and a port number to verify the connection. If the verification is successful, use the same connection settings when you create a migration request with the **New-MigrationBatch** cmdlet.

For an Exchange migration, this cmdlet uses one of the following settings to communicate with the on-premises server:

- For Exchange 2003, it uses the server's FQDN and credentials for an administrator account that can access the server.
- For Exchange Server 2007 and later versions, you can connect using the Autodiscover service and the email address of an administrator account that can access the server.

If the verification is successful, you can use the same settings to create a migration endpoint. For more information, see:

- New-MigrationEndpoint
- New-MigrationBatch

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description

Autodiscover	Required	System.Management.Automation.SwitchParameter	The *Autodiscover* parameter specifies that the cmdlet should use the Autodiscover service to obtain the connection settings for the target server.
Credentials	Required	System.Management.Automation.PSCredential	The *Credentials* parameter specifies the logon credentials for an account that can access mailboxes on the target server. Specify the *username* in the *domain\username* format or the user principal name (UPN) (user@example.com) format. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
EmailAddress	Required	Microsoft.Exchange.Data.SmtpAddress	The *EmailAddress* parameter specifies the email address of an administrator account that can access the remote server. This parameter is

			required when you use the *Autodiscover* parameter.
Endpoint	Required	Microsoft.Exchange.Management.Migration.MigrationEndpointIdParameter	The *Endpoint* parameter specifies the name of the migration endpoint to connect to. A migration endpoint contains the connection settings and other migration configuration settings. If you include this parameter, the **Test-MigrationServerAvailability** cmdlet attempts to verify the ability to connect to the remote server using the settings in the migration endpoint.
ExchangeOutlookAnywhere	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *ExchangeOutlookAnywhere* parameter specifies a migration type for migrating on-premises mailboxes to Exchange Online. Use this parameter if you plan to migrate mailboxes to Exchange Online using a

			staged Exchange migration or a cutover Exchange migration.
ExchangeRemoteMove	Required	System.Management.Automation.SwitchParameter	The *ExchangeRemoteMove* parameter specifies a type of migration where mailboxes are moved with full fidelity between two on-premises forests or between an on-premises forest and Exchange Online. Use this parameter if you plan to perform a cross-forest move or migrate mailboxes between an on-premises Exchange organization and Exchange Online in a hybrid deployment.
ExchangeServer	Required	System.String	This parameter is available only in the cloud-based service. The *ExchangeServer* parameter specifies the FQDN of the on-premises Exchange server. Use this parameter when you plan to perform a staged Exchange migration or a cutover Exchange

			migration. This parameter is required if you don't use the *Autodiscover* parameter.
Imap	Required	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *Imap* parameter specifies an IMAP migration as the migration type. This parameter is required when you want to migrate data from an IMAP mail server to Exchange Online mailboxes.
Port	Required	System.Int32	This parameter is available only in the cloud-based service. The *Port* parameter specifies the TCP port number used by the IMAP migration process to connect to the target server. This parameter is required only for IMAP migrations. The standard is to use port 143 for unencrypted connections, port 143 for Transport Layer Security

			(TLS), and port 993 for Secure Sockets Layer (SSL).
PSTImport	Required	System.Management.Automation.SwitchParameter	The *PSTImport* parameter specifies that the migration endpoint being tested is for PST Imports.
RemoteServer	Required	Microsoft.Exchange.Data.Fqdn	The *RemoteServer* parameter specifies the FQDN of the on-premises mail server. This parameter is required when you want to perform one of the following migration types: • Cross-forest move • Remote move (hybrid deployments) • IMAP migration
RPCProxyServer	Required	Microsoft.Exchange.Data.Fqdn	This parameter is available only in the cloud-based service. The *RPCProxyServer* parameter specifies the FQDN of the RPC proxy server for the on-premises Exchange server. This parameter is required when you don't use the *Autodiscover* parameter. Use this parameter if you

			plan to perform a staged Exchange migration or a cutover Exchange migration to migrate mailboxes to Exchange Online.
Authentication	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	This parameter is available only in the cloud-based service. The *Authentication* parameter specifies the authentication method used by the on-premises mail server. Use `Basic` or `NTLM`. If you don't include this parameter, `Basic` authentication is used. The parameter is only used for cutover Exchange migrations and staged Exchange migrations.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

FilePath	Optional	System.String	The *FilePath* parameter specifies the path containing the PST files when testing a PST Import migration endpoint.
MailboxPermission	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationMailboxPermission	This parameter is available only in the cloud-based service. The *MailboxPermission* parameter specifies what permissions are assigned to the migration administrator account defined by the *Credentials* parameter. You make the permissions assignment to test the connectivity to a user mailbox on the source mail server when you're testing the connection settings in preparation for a staged or cutover Exchange migration or for creating an Exchange Outlook Anywhere migration endpoint. Specify one of the following values for the account defined by the *Credentials* parameter: • **FullAccess** The

			account has been assigned the Full-Access permission to the mailboxes that will be migrated. • **Admin** The account is a member of the Domain Admins group in the organization that hosts the mailboxes that will be migrated. This parameter isn't used for testing the connection to the remote server for a remote move migration or an IMAP migration.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
Security	Optional	Microsoft.Exchange.Data.IMAPSecurityMechanism	This parameter is available only in the cloud-based service. The *Security* parameter specifies the encryption method used by the remote mail server. The options are `None`, `Tls`, or `Ssl`. Use this parameter

			only when testing the connection to an IMAP server or in preparation for creating a migration endpoint for an IMAP migration.
SourceMailboxLegacyDN	Optional	System.String	This parameter is available only in the cloud-based service. The *SourceMailboxLegacyDN* parameter specifies a mailbox on the target server. Use the *LegacyExchangeDN* for the on-premises test mailbox as the value for this parameter. The cmdlet will attempt to access this mailbox using the credentials for the administrator account on the target server.
TestMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is available only in the cloud-based service. The *TestMailbox* parameter specifies a mailbox on the target server. Use the primary SMTP address as the

			value for this parameter. The cmdlet will attempt to access this mailbox using the credentials for the administrator account on the target server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MigrationStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MigrationStatistics** cmdlet to view detailed information about migration requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MigrationStatistics [-Identity <MigrationStatisticsIdParameter>] [-
Diagnostic <SwitchParameter>] [-DiagnosticArgument <String>] [-
DomainController <Fqdn>] [-Partition <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example returns the default statistics for the migration batch MigBatch01.

```
Get-MigrationStatistics -Identity MigBatch01 -Diagnostic
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Diagnostic	Optional	System.Management.Automation.SwitchParameter	The *Diagnostic* parameter returns additional information that you can use to troubleshoot migration errors or send to Microsoft Customer Service and Support.
DiagnosticArgument	Optional	System.String	This parameter is reserved for internal

			Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationStatisticsIdParameter	The *Identity* parameter specifies the identity of the migration batch.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MigrationUser

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MigrationUser** cmdlet to view information about move and migration users.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MigrationUser [-Identity <MigrationUserIdParameter>] <COMMON
PARAMETERS>

Get-MigrationUser -MailboxGuid <Guid> <COMMON PARAMETERS>

Get-MigrationUser [-BatchId <MigrationBatchIdParameter>] [-Status <Queued
| Syncing | Failed | Synced | IncrementalFailed | Completing | Completed |
CompletionFailed | Corrupted | Provisioning | ProvisionUpdating |
CompletionSynced | Validating | IncrementalSyncing | IncrementalSynced |
CompletedWithWarnings | Stopped | IncrementalStopped | Starting | Stopping
| Removing>] [-StatusSummary <Active | Failed | Synced | Completed |
Stopped>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-Partition <MailboxIdParameter>] [-ResultSize
<Unlimited>]
```

Examples

EXAMPLE 1

This example retrieves status information about the recently migrated user, Tony Smith.

```
Get-MigrationUser -Identity TonySmith@contoso.com
```

EXAMPLE 2

This example retrieves more detailed information about any ongoing migration for the user with the specified mailbox GUID.

```
Get-MigrationUser -MailboxGuid b6a6795c-a010-4f67-aaaa-
da372d56fcb9 | Get-MigrationUserStatistics
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
MailboxGuid	Required	System.Guid	The *MailboxGuid* parameter specifies the GUID of a mailbox for which you want to view the migration information.
BatchId	Optional	Microsoft.Exchange.Management.Migration.MigrationBatchIdParameter	The *BatchId* parameter specifies the name of the migration batch for which you want to return users.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. This parameter is reserved for internal Microsoft use.
Identity	Optional	Microsoft.Exchange.Management.Migration.MigrationUserIdParameter	The *Identity* parameter specifies the particular user that you want to retrieve information about. The *Identity* parameter is represented as an email address.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.

ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all users that match the query, use unlimited for the value of this parameter. The default value is 1000.
Status	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationUserStatus	The *Status* parameter returns information about migration users that have the specified status state. Use one of the following values: • `Completed` • `CompletedWithWarnings` • `Completing` • `CompletionFailed` • `CompletionSynced` • `Corrupted` • `Failed` • `IncrementalFailed` • `IncrementalStopped` • `IncrementalSynced` • `IncrementalSyncing` • `Provisioning` • `ProvisionUpdating` • `Queued` • `Removing` • `Starting` • `Stopped` • `Stopping` • `Synced` • `Syncing` • `Validating`
StatusSummary	Optional	Microsoft.Exchange.Data.Storage.Management.MigrationUserStatusSummary	The *StatusSummary* parameter returns abbreviated information about migration users that have the specified status value. Use one of

			the following values: • Active • Completed • Failed • Stopped • Synced

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MigrationUser

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MigrationUser** cmdlet to remove a migration user from a batch.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MigrationUser -Identity <MigrationUserIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Organization <OrganizationIdParameter>] [-Partition
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the migration user Tony Smith from a migration batch.

```
Remove-MigrationUser -Identity TonySmith
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Move and Migration Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Migration.MigrationUserIdParameter	The *Identity* parameter specifies the user that you want to remove from the migration batch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies that some specific checks and removal steps should be skipped and that the migration user should be forcibly removed. This parameter is used to work around issues where the migration user needs to be removed to fix issues when the user or data is corrupted, or to prevent such issues from occurring
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MigrationUserStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-08*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MigrationUserStatistics** cmdlet to view detailed information about the migration requested for a specific user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MigrationUserStatistics -Identity <MigrationUserIdParameter> [-
Diagnostic <SwitchParameter>] [-DiagnosticArgument <String>] [-
DomainController <Fqdn>] [-IncludeReport <SwitchParameter>] [-
LimitSkippedItemsTo <Int32>] [-Organization <OrganizationIdParameter>] [-
Partition <MailboxIdParameter>]
```

Examples

EXAMPLE 1

This example uses the *IncludeReport* parameter to display detailed information about the migration status for the user.

```
Get-MigrationUserStatistics -Identity
davidp@corp.contoso.com -IncludeReport | FL
Status,Error,Report
```

EXAMPLE 2

This example displays the number of mailbox items that failed to migrate, which are called skipped items, and information about each skipped item.

```
Get-MigrationUserStatistics -Identity
davidp@corp.contoso.com | FL SkippedItemCount,SkippedItems
```

This example displays results information in the *SkippedItems* property for a maximum of 20 skipped items.

```
Get-MigrationUserStatistics -Identity
davidp@corp.contoso.com -LimitSkippedItemsTo 20 | FL
SkippedItemCount,SkippedItems
```

EXAMPLE 3

This example displays detailed information about users in the migration batch named *StagedBatch1*.

```
Get-MigrationUser -BatchId StagedBatch1 | Get-
MigrationUserStatistics
```

EXAMPLE 4

This example displays detailed information about users from all current migration batches.

```
Get-MigrationUser | Get-MigrationUserStatistics
```

EXAMPLE 5

This example uses the *Diagnostic* parameter to display detailed troubleshooting information about the migration for the user.

```
Get-MigrationUserStatistics -Identity
davidp@corp.contoso.com -Diagnostic | FL
Status,Error,DiagnosticInfo
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox move and migration permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Migration.MigrationUserIdParameter	The *Identity* parameter specifies the user that you want to retrieve information about. Use an email address as the value for the *Identity* parameter.
Diagnostic	Optional	System.Management.Automation.SwitchParameter	The *Diagnostic* switch specifies whether to retrieve extremely detailed information about the user migration. The information provided is too much for a typical person to comprehend. Microsoft Support can use this information to troubleshoot user migration problems. You typically use this

			parameter at the request of support personnel.
DiagnosticArgument	Optional	System.String	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
LimitSkippedItemsTo	Optional	System.Int32	The *LimitSkippedItemsTo* parameter specifies the maximum number of skipped items to display information about in the *SkippedItems* property

			in command output. For example, if this parameter is set to 5, the cmdlet returns information for up to five skipped items for the specified user, even if there are more than five skipped items.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Partition	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Get-MoveRequest** cmdlet to view the detailed status of an ongoing asynchronous mailbox move that was initiated by using the New-MoveRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MoveRequest [-AccountPartition <AccountPartitionIdParameter>] [-
Identity <MoveRequestIdParameter>] [-IncludeSoftDeletedObjects
<SwitchParameter>] <COMMON PARAMETERS>

Get-MoveRequest [-AccountPartition <AccountPartitionIdParameter>] [-
BatchName <String>] [-Flags <None | CrossOrg | IntraOrg | Push | Pull |
Offline | Protected | RemoteLegacy | HighPriority | Suspend |
SuspendWhenReadyToComplete | MoveOnlyPrimaryMailbox |
MoveOnlyArchiveMailbox | TargetIsAggregatedMailbox | Join | Split>] [-
HighPriority <$true | $false>] [-IncludeSoftDeletedObjects
<SwitchParameter>] [-MoveStatus <None | Queued | InProgress |
AutoSuspended | CompletionInProgress | Synced | Completed |
CompletedWithWarning | Suspended | Failed>] [-Offline <$true | $false>] [-
Protect <$true | $false>] [-RemoteHostName <Fqdn>] [-SourceDatabase
<DatabaseIdParameter>] [-Suspend <$true | $false>] [-
SuspendWhenReadyToComplete <$true | $false>] [-TargetDatabase
<DatabaseIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Credential <PSCredential>] [-DomainController <Fqdn>]
[-Organization <OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ResultSize <Unlimited>] [-SortBy
<String>]
```

Examples

EXAMPLE 1

This example retrieves the status of the ongoing mailbox move for Tony Smith's mailbox (tony@contoso.com).

```
Get-MoveRequest -Identity 'tony@contoso.com'
```

EXAMPLE 2

This example retrieves the status of ongoing mailbox moves to the target database DB05.

```
Get-MoveRequest -MoveStatus InProgress -TargetDatabase DB05
```

EXAMPLE 3

This example retrieves the status of move requests in the FromDB01ToDB02 batch that completed, but had warnings.

```
Get-MoveRequest -BatchName "FromDB01ToDB02" -MoveStatus
CompletedWithWarning
```

Detailed Description

The search criteria for the **Get-MoveRequest** cmdlet is a Boolean **And** statement. If you use multiple parameters, it narrows your search and reduces your search results.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name that was given to a batch move request. You can't use this parameter with the *Identity* parameter.
Credential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This

			credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential. If you don't specify the *Credential* parameter, the credential of the current user is used.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Flags	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestFlags	The *Flags* parameter specifies the move type to retrieve information for. The following values may be used: • `CrossOrg` • `HighPriority` • `IntraOrg` • `Join` • `MoveOnlyArchiveMailbox` • `MoveOnlyPrimaryMailbox` • `None` • `Offline` • `Protected` • `Pull` • `Push` • `RemoteLegacy` • `Split` • `Suspend`

			• `SuspendWhenReadyToComplete` • `TargetIsAggregatedMailbox`
HighPriority	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *HighPriority* parameter specifies that the cmdlet returns requests that were created with the *HighPriority* flag. The *HighPriority* flag indicates that the request should be processed before other lower priority requests in the queue. You can't use this parameter with the *Identity* parameter.
Identity	Optional	Microsoft.Exchange.MailboxReplicationService.MoveRequestIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail user. You can use the following values: 1. GUID distingushed name 2. Domain\User 3. User principal name (UPN) 4. Legacy Exchange SMTP addressAlias This parameter can't be used with the following parameters:

			• *BatchName* • *HighPriority* • *MoveStatus* • *Offline* • *Protect* • *RemoteHostName* • *SourceDatabase* • *Suspend* • *SuspendWhenReadyToComplete* • *TargetDatabase*
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IncludeSoftDeletedObjects* parameter specifies whether to return mailboxes that have been soft deleted. This parameter accepts `$true` or `$false`.
MoveStatus	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestStatus	The *MoveStatus* parameter returns move requests in the specified status. You can use the following values: • `AutoSuspended` • `Completed` • `CompletedWithWarning` • `CompletionInProgress` • `Failed` • `InProgress` • `None` • `Queued` `Suspended`

			You can't use this parameter with the *Identity* parameter.
Offline	Optional	System.Boolean	The *Offline* parameter specifies whether to return mailboxes that are being moved in offline mode. This parameter accepts `$true` or `$false`. You can't use this parameter with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies an organizational unit (OU) and is used to limit the results. If you use this parameter, you only get move requests that pertain to mailboxes in the container that you specify. You can use either the OU or the domain name. If you use the OU, you must specify the canonical name of the OU.
Protect	Optional	System.Boolean	This parameter is available

			only in on-premises Exchange 2013. The *Protect* parameter returns mailboxes being moved in protected mode. This parameter accepts `$true` or `$false`. You can't use this parameter with the *Identity* parameter.
RemoteHostName	Optional	Microsoft.Exchange.Data.Fqdn	The *RemoteHostName* parameter specifies the FQDN of the cross-forest organization from which you're moving the mailbox. You can't use this parameter with the *Identity* parameter.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. The

			results are sorted in ascending order.
SourceDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *SourceDatabase* parameter specifies that all mailboxes being moved from the specified source database are returned. You can use the following values: • GUID of the database • Database name You can't use this parameter with the *Identity* parameter.
Suspend	Optional	System.Boolean	The *Suspend* parameter specifies whether to return mailboxes with moves that have been suspended. This parameter accepts `$true` or `$false`. You can't use this parameter with the *Identity* parameter.
SuspendWhenReadyToComplete	Optional	System.Boolean	The *SuspendWhenReadytoComplete* parameter specifies whether to return mailboxes that have been

			moved with the **New-MoveRequest** command and its *SuspendWhenReadyToComplete* switch. This parameter accepts `$true` or `$false`. You can't use this parameter with the *Identity* parameter.
TargetDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *TargetDatabase* parameter specifies whether to return all mailboxes that are being moved to the specified target database. You can use the following values: • GUID of the database • Database name You can't use this parameter with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-23*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MoveRequest** cmdlet to begin the process of an asynchronous mailbox or personal archive move. You can also check mailbox readiness to be moved by using the *WhatIf* parameter.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MoveRequest [-ArchiveOnly <SwitchParameter>] [-ArchiveTargetDatabase
<DatabaseIdParameter>] [-DoNotPreserveMailboxSignature <SwitchParameter>]
[-ForcePull <SwitchParameter>] [-ForcePush <SwitchParameter>] [-
PrimaryOnly <SwitchParameter>] [-TargetDatabase <DatabaseIdParameter>]
<COMMON PARAMETERS>

New-MoveRequest -Remote <SwitchParameter> -RemoteHostName <Fqdn> [-
ArchiveDomain <String>] [-ArchiveOnly <SwitchParameter>] [-
ArchiveTargetDatabase <DatabaseIdParameter>] [-
IgnoreTenantMigrationPolicies <SwitchParameter>] [-PrimaryOnly
<SwitchParameter>] [-RemoteCredential <PSCredential>] [-
RemoteGlobalCatalog <Fqdn>] [-RemoteOrganizationName <String>] [-
TargetDatabase <DatabaseIdParameter>] [-TargetDeliveryDomain <Fqdn>]
<COMMON PARAMETERS>

New-MoveRequest -RemoteCredential <PSCredential> -RemoteGlobalCatalog
<Fqdn> -RemoteLegacy <SwitchParameter> [-IgnoreTenantMigrationPolicies
<SwitchParameter>] [-RemoteTargetDatabase <String>] [-TargetDatabase
<DatabaseIdParameter>] [-TargetDeliveryDomain <Fqdn>] <COMMON PARAMETERS>

New-MoveRequest -Outbound <SwitchParameter> -RemoteHostName <Fqdn> [-
ArchiveDomain <String>] [-ArchiveOnly <SwitchParameter>] [-
IgnoreTenantMigrationPolicies <SwitchParameter>] [-PrimaryOnly
<SwitchParameter>] [-RemoteArchiveTargetDatabase <String>] [-
RemoteCredential <PSCredential>] [-RemoteGlobalCatalog <Fqdn>] [-
RemoteOrganizationName <String>] [-RemoteTargetDatabase <String>] [-
TargetDeliveryDomain <Fqdn>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <MailboxOrMailUserIdParameter> [-
AcceptLargeDataLoss <SwitchParameter>] [-AllowLargeItems
<SwitchParameter>] [-BadItemLimit <Unlimited>] [-BatchName <String>] [-
CheckInitialProvisioningSetting <SwitchParameter>] [-CompleteAfter
<DateTime>] [-CompletedRequestAgeLimit <Unlimited>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ForceOffline
<SwitchParameter>] [-IgnoreRuleLimitErrors <SwitchParameter>] [-
IncrementalSyncInterval <TimeSpan>] [-InternalFlags <InternalMrsFlag[]>]
[-LargeItemLimit <Unlimited>] [-PreventCompletion <SwitchParameter>] [-
Priority <Lowest | Lower | Low | Normal | High | Higher | Highest |
Emergency>] [-Protect <SwitchParameter>] [-SkipMoving
<SkippableMoveComponent[]>] [-StartAfter <DateTime>] [-Suspend
```

```
<SwitchParameter>] [-SuspendComment <String>] [-SuspendWhenReadyToComplete
<SwitchParameter>] [-WhatIf [<SwitchParameter>]] [-WorkloadType <None |
Local | Onboarding | Offboarding | TenantUpgrade | LoadBalancing |
Emergency | RemotePstIngestion | SyncAggregation>]
```

Examples

EXAMPLE 1

This example tests a mailbox's readiness to move to the new database DB01 within the same forest and for completeness of the command by using the *WhatIf* switch. When you use the *WhatIf* switch, the system performs checks on the mailbox, and if the mailbox isn't ready, you receive an error.

```
New-MoveRequest -Identity 'tony@alpineskihouse.com' -
TargetDatabase "DB01" -WhatIf
```

EXAMPLE 2

This example moves Tony Smith's mailbox to the new database DB01.

```
New-MoveRequest -Identity 'tony@alpineskihouse.com' -
TargetDatabase "DB01"
```

EXAMPLE 3

This example creates a batch move request for all mailboxes on the database DB01 and moves them to the database DB02 with the *BatchName* parameter value DB01toDB02.

```
Get-Mailbox -Database DB01 | New-MoveRequest -
TargetDatabase DB02 -BatchName "DB01toDB02"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.Mail	The *Identity* parameter specifies the identity of the mailbox or mail user.

		boxOrMailUserIdParameter	You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias
Outbound	Required	System.Management.Automation.SwitchParameter	The *Outbound* switch specifies that this mailbox move is a cross-forest move and is being initiated from the source forest. You don't have to specify a value with this parameter. You can't use this parameter in conjunction with the *Remote* switch.
Remote	Required	System.Management.Automation.SwitchParameter	The *Remote* switch specifies that the move you're initiating is outside of your organization, and that this move is being initiated from the target forest. You don't have to specify a value with this parameter.

			You can't use this parameter in conjunction with the *Outbound* switch.
RemoteCredential	Required	System.Management.Automation.PSCredential	The *RemoteCredential* parameter specifies an administrator who has permission to perform the mailbox move, for example, Administrator@humongousinsurance.com. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
RemoteGlobalCatalog	Required	Microsoft.Exchange.Data.Fqdn	The *RemoteGlobalCatalog* parameter specifies the fully qualified domain name (FQDN) of the global catalog server for the remote forest.
RemoteHostName	Required	Microsoft.Exchange.Data.Fqdn	The *RemoteHostName* parameter specifies the FQDN of the cross-forest organization from which you're moving the mailbox.

RemoteLegacy	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RemoteLegacy* switch specifies that this mailbox move is from a remote forest that doesn't have Exchange Server 2013 installed. You don't have to specify a value with this parameter.
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
AllowLargeItems	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *AllowLargeItems* switch specifies that items

			larger than the target mailbox limits are copied without failure. You can't use the *AllowLargeItems* switch and the *LargeItemLimit* parameter together in the same command.
ArchiveDomain	Optional	System.String	The *ArchiveDomain* parameter specifies the FQDN of the external domain to which you're moving the archive. This parameter is used for moving the archive to a cloud-based service.
ArchiveOnly	Optional	System.Management.Automation.SwitchParameter	The *ArchiveOnly* parameter specifies that you're moving only the personal archive associated with the mailbox. You can't use this parameter in conjunction with the *PrimaryOnly* parameter.
ArchiveTargetDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArchiveTargetDatabase*

			parameter specifies the Exchange target database to which you're moving the personal archive. If this parameter isn't specified, the archive is moved to the same database as the primary mailbox. You can use the following values for this parameter: • GUID of the database • Database name
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you

			receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a descriptive name for moving a batch of mailboxes. You can then use the name in the *BatchName* parameter as a search string when you use the Get-MoveRequest cmdlet.
CheckInitialProvisioningSetting	Optional	System.Management.Automation.SwitchParameter	In Microsoft Exchange Server 2013, there is a setting, **IsExcludedFromProvisioning** on each mailbox database that allows it to be excluded from provisioning new mailboxes. The *CheckInitialProvisioningSetting* parameter specifies

			the **IsExcludedFromProvisioning** setting when choosing the target database if none is provided.
CompleteAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request will be kept after it has completed before being automatically removed. The default *CompletedRequestAgeLimit* parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-

			premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DoNotPreserveMailboxSignature	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *DoNotPreserveMailboxSignature* parameter specifies that the command doesn't preserve the mailbox mapping signature. We recommend that you use this parameter only if the move request fails because the Named Property identifiers are depleted. If you specify this parameter, the mailbox user is required to restart Microsoft Outlook when the move request is complete.
ForceOffline	Optional	System.Management.	The *ForceOffline*

		Automation.SwitchParameter	parameter forces a mailbox move to be performed in offline mode. Moving a mailbox in offline mode means the user will have no access to email during the mailbox move.
ForcePull	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ForcePull* parameter specifies that the type of move should be a Pull move. This parameter can be used for local moves only.
ForcePush	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ForcePush* parameter specifies that the type of move should be a Push move. This parameter can be used for local moves only.
IgnoreRuleLimitErrors	Optional	System.Management.Automation.SwitchParameter	The *IgnoreRuleLimitErrors* parameter specifies that the command doesn't move the user's rules to the target server running

			Exchange.
IgnoreTenantMigrationPolicies	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IncrementalSyncInterval	Optional	System.TimeSpan	The *IncrementalSyncInterval* parameter specifies the wait time between incremental syncs. This parameter is used together with the *StartAfter* and *CompleteAfter* parameters to create a move request that will do periodic incremental syncs after the initial sync is complete.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	This parameter is available only in on-premises Exchange 2013. The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request

			encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
PreventCompletion	Optional	System.Management.Automation.SwitchParameter	The *PreventCompletion* parameter specifies that this cmdlet initializes, but isn't completed. This parameter accepts `$true` or `$false`. The default value is `$false`. If you specify `$true`, you have to run the **Resume-MoveRequest** cmdlet to complete the move request.
PrimaryOnly	Optional	System.Management.Automation.SwitchParameter	The *PrimaryOnly* parameter specifies that the command should only move the primary mailbox; the personal archive isn't moved. You

			don't have to specify a value with this parameter. You can't use this parameter in conjunction with the *ArchiveOnly* parameter.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	This parameter is available only in on-premises Exchange 2013. The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time.
Protect	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
RemoteArchiveTargetDatabase	Optional	System.String	The *RemoteArchiveTargetDatabase* parameter specifies the name of the target database in the remote forest to which you're moving the personal archive. Use this parameter when moving users with archives from

			the local forest to a remote forest. For moves from a remote forest to the local forest, use the *ArchiveTargetDatabase* parameter. If you use this parameter, you must specify the *Remote* or *RemoteLegacy* parameter.
RemoteOrganizationName	Optional	System.String	This parameter is reserved for internal Microsoft use.
RemoteTargetDatabase	Optional	System.String	The *RemoteTargetDatabase* parameter specifies the name of the target database in the remote forest. Use this parameter when moving mailboxes from the local forest to a remote forest. For moves from a remote forest to the local forest, use the *TargetDatabase* parameter. If you use this parameter, you must specify the *Remote* or *RemoteLegacy* parameter.
SkipMoving	Optional	Microsoft.Exchange.Management.RecipientT	The *SkipMoving* parameter allows certain

		asks.SkippableMoveComponent[]	stages of a mailbox move to be skipped for debugging purposes. Don't use this parameter unless directed to do so by a support professional or specific documentation.
StartAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
Suspend	Optional	System.Management.Automation.SwitchParameter	The *Suspend* switch specifies whether to suspend the request. If you use this switch, the request is queued, but the request won't reach the status of **InProgress** until you resume the request with the relevant resume cmdlet. You don't have to specify a value with this switch.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
SuspendWhenReadyToComplete	Optional	System.Management.Automation.SwitchParameter	The *SuspendWhenReadyToComplete* switch specifies

			whether to suspend the move request before it reaches the status of **CompletionInProgress**. After the move is suspended, it has a status of **AutoSuspended**. You can then manually complete the move by using the **Resume-MoveRequest** command. **Note:** You can only use the *SuspendWhenReadyToComplete* switch for online mailbox moves and when moving mailboxes from Exchange Server 2007 or Exchange 2010 mailbox databases.
TargetDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *TargetDatabase* parameter specifies the identity of the database that you're moving the mailbox to. If you don't specify the *TargetDatabase* parameter, the command uses the automatic mailbox distribution logic to determine the database to move to.

			You can use the following values: • GUID of the database • Database name
TargetDeliveryDomain	Optional	Microsoft.Exchange.Data.Fqdn	The *TargetDeliveryDomain* parameter specifies the FQDN of the external email address created in the source forest for the mail-enabled user when the move request is complete. This parameter is allowed only when performing remote moves with the *Remote* or *RemoteLegacy* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. The *WhatIf* switch can also be used to test a mailbox's readiness to be moved. By using the *WhatIf* switch, you can view any errors that will occur without adding the mailbox to the move request queue. You don't have to specify a value

			with the *WhatIf* switch.
WorkloadType	Optional	Microsoft.Exchange.MailboxReplicationService.RequestWorkloadType	This parameter is available only in on-premises Exchange 2013. This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MoveRequest** cmdlet to cancel a mailbox move initiated using the New-MoveRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MoveRequest -Identity <MoveRequestIdParameter> <COMMON PARAMETERS>

Remove-MoveRequest -MailboxGuid <Guid> -MoveRequestQueue
<DatabaseIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mailbox move request for Ayla Kol's mailbox.

```
Remove-MoveRequest -Identity 'Ayla@humongousinsurance.com'
```

EXAMPLE 2

This example cancels a mailbox move for a mailbox by using the *MailboxGuid* parameter for a mailbox on MBXDB01.

Note:

The *MailboxGuid* and *MoveRequestQueue* parameters are for debugging purposes only.

```
Remove-MoveRequest -MoveRequestQueue MBXDB01 -MailboxGuid
25e0eaf2-6cc2-4353-b83e-5cb7b72d441f
```

Detailed Description

The *MoveRequestQueue* and *MailboxGuid* parameters are for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MoveRequestIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail user. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account*

			• User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias You can't use this parameter in conjunction with the *MailboxGuid* or *MoveRequestQueue* parameters.
MailboxGuid	Required	System.Guid	This parameter is available only in on-premises Exchange 2013. The *MailboxGuid* parameter specifies the GUID of the mailbox for which you want to remove the move request. If you specify the *MailboxGuid* parameter, you must also specify the *MoveRequestQueue* parameter. You can't use this parameter in conjunction with the *Identity* parameter.
MoveRequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *MoveRequestQueue*

			parameter specifies the database on which the move request is queued. You can use the following values: • GUID of the database • Database name You can't use this parameter in conjunction with the *Identity* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-MoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Resume-MoveRequest** cmdlet to resume a move request that has been suspended or has failed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-MoveRequest -Identity <MoveRequestIdParameter> [-
SuspendWhenReadyToComplete <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes the move request of Tony Smith's mailbox.

```
Resume-MoveRequest -Identity "Tony@contoso.com"
```

EXAMPLE 2

This example resumes any failed move requests.

```
Get-MoveRequest -MoveStatus Failed | Resume-MoveRequest
```

EXAMPLE 3

This example resumes any move requests that have the suspend comment "Resume after 10 P.M."

```
Get-MoveRequest -MoveStatus Suspended | Get-
MoveRequestStatistics |Where {$_.Message -like "*resume
after 10 P.M."} | Resume-MoveRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MoveRequestIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail user. You can use the following values:

			• GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$false`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendWhenReadyToComplete	Optional	System.Management.Automation.SwitchPar	The *SuspendWhenReadyToCo*

		ameter	*mplete* parameter specifies whether to return mailboxes that have been moved with the **New-MoveRequest** command and its *SuspendWhenReadyToComplete* switch. This parameter accepts `$true` or `$false`. You can't use this parameter in conjunction with the *Identity* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MoveRequest** cmdlet to change move request options after the move request has been created. You can use the **Set-MoveRequest** cmdlet to recover from failed move requests.

```
Set-MoveRequest -Identity <MoveRequestIdParameter> [-AcceptLargeDataLoss
<SwitchParameter>] [-ArchiveTargetDatabase <DatabaseIdParameter>] [-
BadItemLimit <Unlimited>] [-BatchName <String>] [-CompleteAfter
<DateTime>] [-CompletedRequestAgeLimit <Unlimited>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreRuleLimitErrors
<$true | $false>] [-IncrementalSyncInterval <TimeSpan>] [-InternalFlags
<InternalMrsFlag[]>] [-LargeItemLimit <Unlimited>] [-PreventCompletion
<$true | $false>] [-Priority <Lowest | Lower | Low | Normal | High |
Higher | Highest | Emergency>] [-Protect <$true | $false>] [-
RemoteCredential <PSCredential>] [-RemoteGlobalCatalog <Fqdn>] [-
RemoteHostName <Fqdn>] [-SkipMoving <SkippableMoveComponent[]>] [-
StartAfter <DateTime>] [-SuspendWhenReadyToComplete <$true | $false>] [-
TargetDatabase <DatabaseIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the move request for Ayla to accept up to five corrupt mailbox items.

```
Set-MoveRequest -Identity Ayla@humongousinsurance.com -
BadItemLimit 5
```

Detailed Description

You can pipeline the **Set-MoveRequest** cmdlet from the **Get-MoveRequestStatistics**, **Get-MoveRequest**, or **Get-Mailbox** cmdlets.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox

moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MoveRequestIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail user. You can use the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.

ArchiveTargetDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *ArchiveTargetDatabase* parameter specifies the Exchange target database to which you're moving the personal archive. You can use this parameter to change the target database only if the move request has a **MoveStatus** value of Queued. You can use the following values to specify the target database: • GUID of the database • Database name
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep

			the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a different name for a batch.
CompleteAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request is kept after it has completed before being automatically removed.

			The default *CompletedRequestAgeLimit* parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreRuleLimitErrors	Optional	System.Boolean	The *IgnoreRuleLimitErrors* parameter specifies that the command won't move the user's rules to the target server running Microsoft Exchange.

IncrementalSyncInterval	Optional	System.TimeSpan	The *IncrementalSyncInterval* parameter specifies the wait time between incremental syncs. This parameter is used together with the *StartAfter* and *CompleteAfter* parameters to create a move request that will do periodic incremental syncs after the initial sync is complete.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	This parameter is available only in on-premises Exchange 2013. The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the

			AcceptLargeDataLoss parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* parameter value only when large items are encountered.
PreventCompletion	Optional	System.Boolean	The *PreventCompletion* parameter specifies that this cmdlet initializes, but isn't completed. This parameter accepts `$true` or `$false`. The default value is `$false`. If you specify `$true`, you have to run the **Resume-MoveRequest** cmdlet to complete the move request.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	This parameter is available only in on-premises Exchange 2013. The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health,

			status, priority, and last update time.
Protect	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RemoteCredential	Optional	System.Management.Automation.PSCredential	The *RemoteCredential* parameter specifies an administrator who has permission to perform the mailbox move, for example, Administrator@humongousinsurance.com. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
RemoteGlobalCatalog	Optional	Microsoft.Exchange.Data.Fqdn	The *RemoteGlobalCatalog* parameter specifies the FQDN of the global catalog server for the remote forest.
RemoteHostName	Optional	Microsoft.Exchange.Data.Fqdn	The *RemoteHostName* parameter specifies the FQDN of the cross-forest organization from which you're moving the mailbox.

SkipMoving	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMoveComponent[]	The *SkipMoving* parameter allows certain stages of a mailbox move to be skipped for debugging purposes. Do not use this parameter unless directed to do so by a support professional or specific documentation.
StartAfter	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
SuspendWhenReadyToComplete	Optional	System.Boolean	The *SuspendWhenReadyToComplete* parameter specifies whether to suspend the move request before it reaches the status of CompletionInProgress. The move request then has a status of AutoSuspended. You can manually complete the move by using the **Resume-MoveRequest** command.
TargetDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *TargetDatabase* parameter specifies the

			identity of the database that you're moving the mailbox to. You can use this parameter to change the target database only if the move request has a **MoveStatus** value of `Queued`. You can use the following values: • GUID of the database • Database name
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-MoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Suspend-MoveRequest** cmdlet to suspend a move request any time after the move request was created, but before it reaches the status of CompletionInProgress. You can resume the move request by using the Resume-MoveRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-MoveRequest -Identity <MoveRequestIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-SuspendComment <String>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends the move request for Ayla's mailbox.

```
Suspend-MoveRequest -Identity "Ayla@humongousinsurance.com"
```

EXAMPLE 2

This example suspends all move requests that are in progress by using the Get-MoveRequest cmdlet to retrieve all move requests with a *MoveStatus* value of `InProgress`, and then pipelining the output to the **Suspend-MoveRequest** cmdlet.

```
Get-MoveRequest -MoveStatus InProgress | Suspend-
MoveRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MoveRequestIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail user. You can use one of the following values: • GUID • Distinguished Name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SMTP address • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description as to why the request was suspended.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn’t accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn’t return data.

Get-MoveRequestStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-08-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MoveRequestStatistics** cmdlet to view detailed information about move requests.

Note:

Some of the failure messages that are returned by this cmdlet are temporary and don't indicate that a request has actually failed. If the **Status** value is `Queued` or `InProgress`, then the request is proceeding normally.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MoveRequestStatistics -Identity <MoveRequestIdParameter> <COMMON
PARAMETERS>

Get-MoveRequestStatistics -MoveRequestQueue <DatabaseIdParameter> [-
MailboxGuid <Guid>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DomainController
<Fqdn>] [-IncludeReport <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the default statistics for Tony Smith's mailbox, which include the status, mailbox size, archive mailbox size, and the percentage complete.

```
Get-MoveRequestStatistics -Identity Tony@contoso.com
```

EXAMPLE 2

This example returns the detailed statistics for Tony Smith's mailbox by pipelining the results to the **Format-List** command.

```
Get-MoveRequestStatistics -Identity "contoso\tony" |
Format-List
```

EXAMPLE 3

This example returns additional information about the mailbox move for Tony Smith's mailbox and exports the report to a .csv file.

```
Get-MoveRequestStatistics -Identity Tony@contoso.com -
IncludeReport | Export-CSV C:\MRStats.csv
```

EXAMPLE 4

This example returns default statistics for all mailboxes whose move requests are in progress or haven't been cleared for the database MBXDB02.

```
Get-MoveRequestStatistics -MoveRequestQueue "MBXDB02"
```

Detailed Description

The *MoveRequestQueue* parameter syntax set is for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox moves" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.MoveRequestIdParameter	The *Identity* parameter specifies the identity of the mailbox or mail user. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • Legacy Exchange DN • SMTP address • Alias

			This parameter can't be used with the *MoveRequestQueue* or *MailboxGuid* parameters.
MoveRequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *MoveRequestQueue* parameter specifies the mailbox database on which the move request resides. You can use one of the following values: • GUID of the database • Database name This parameter can't be used with the *Identity* or *MRSInstance* parameters.
Diagnostic	Optional	System.Management.Automation.SwitchParameter	The *Diagnostic* switch specifies whether to retrieve extremely detailed information about the mailbox import request.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory.
IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
MailboxGuid	Optional	System.Guid	This parameter is available only in on-premises Exchange 2013. The *MailboxGuid* parameter specifies the GUID of a mailbox for which you want to view the move request statistics. This parameter can't be used with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderMigrationRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolderMigrationRequest** cmdlet to view the detailed status of on-going public folder migration requests that were initiated by using the **New-PublicFolderMigrationRequest** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderMigrationRequest [-AccountPartition
<AccountPartitionIdParameter>] [-Identity
<PublicFolderMigrationRequestIdParameter>] [-Organization
<OrganizationIdParameter>] <COMMON PARAMETERS>

Get-PublicFolderMigrationRequest [-AccountPartition
<AccountPartitionIdParameter>] [-BatchName <String>] [-HighPriority <$true
| $false>] [-Name <String>] [-Organization <OrganizationIdParameter>] [-
RequestQueue <DatabaseIdParameter>] [-Status <None | Queued | InProgress |
AutoSuspended | CompletionInProgress | Synced | Completed |
CompletedWithWarning | Suspended | Failed>] [-Suspend <$true | $false>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the status of in-progress migration requests.

```
Get-PublicFolderMigrationRequest
```

EXAMPLE 2

This example returns all migration requests that have the name PFMigrate10_11_12, and the request has been suspended.

```
Get-PublicFolderMigrationRequest -Identity
"PFMigrate10_11_12" | Format-List Suspended,AutoSuspended
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name that was given to a batch migration request. You can't use this parameter in conjunction with the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
HighPriority	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013.

			The *HighPriority* parameter specifies that the command returns all migration requests with a status of *HighPriority*.
Identity	Optional	Microsoft.Exchange.MailboxReplicationService.PublicFolderMigrationRequestIdParameter	The *Identity* parameter specifies the identity of the public folder. You can use the following values: • GUID • Name You can't use this parameter in conjunction with the following parameters: • *BatchName* • *RequestQueue* • *Status* • *Suspend*
Name	Optional	System.String	The *Name* parameter specifies the name of the public folder migration request.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RequestQueue	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *RequestQueue* parameter specifies the

			identity of the mailbox database on which the migration request has been run. You can't use this parameter in conjunction with the *Identity* parameter.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Status	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestStatus	The *Status* parameter returns migration requests in the specified status. You can use the following values: • `AutoSuspended` • `Completed` • `CompletedWithWarning` • `CompletionInProgress` • `Failed` • `InProgress` • `None` • `Queued` • `Suspended` You can't use this parameter in conjunction with the *Identity* parameter.

Suspend	Optional	System.Boolean	The *Suspend* parameter specifies whether to return public folder migration requests that have been suspended. This parameter accepts `$true` or `$false`. You can't use this parameter in conjunction with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-PublicFolderMigrationRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-02*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-PublicFolderMigrationRequest** cmdlet to begin the process of migrating public folders from Microsoft Exchange Server 2007 or Exchange Server 2010 to Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-PublicFolderMigrationRequest -SourceDatabase <DatabaseIdParameter>
<COMMON PARAMETERS>
```

```
New-PublicFolderMigrationRequest -OutlookAnywhereHostName <Fqdn> -
RemoteCredential <PSCredential> -RemoteMailboxLegacyDN <String> -
RemoteMailboxServerLegacyDN <String> [-AuthenticationMethod <Basic |
Digest | Ntlm | Fba | WindowsIntegrated | LiveIdFba | LiveIdBasic |
WSSecurity | Certificate | NegoEx | OAuth | Adfs | Kerberos | Negotiate |
LiveIdNegotiate | Misconfigured>] [-Organization
<OrganizationIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AcceptLargeDataLoss <SwitchParameter>] [-BadItemLimit
<Unlimited>] [-BatchName <String>] [-CompletedRequestAgeLimit <Unlimited>]
[-Confirm [<SwitchParameter>]] [-CSVData <Byte[]>] [-CSVStream <Stream>]
[-DomainController <Fqdn>] [-InternalFlags <InternalMrsFlag[]>] [-
LargeItemLimit <Unlimited>] [-Name <String>] [-Priority <Lowest | Lower |
Low | Normal | High | Higher | Highest | Emergency>] [-SkipMerging
<SkippableMergeComponent[]>] [-Suspend <SwitchParameter>] [-SuspendComment
<String>] [-WhatIf [<SwitchParameter>]] [-WorkloadType <None | Local |
Onboarding | Offboarding | TenantUpgrade | LoadBalancing | Emergency |
RemotePstIngestion | SyncAggregation>]
```

Examples

EXAMPLE 1

This example creates a public folder migration request from the Exchange 2010 source public folder database PFDB01 and uses the CSVData.csv file that was created using the **Export-PublicFolderStatistics.ps1** script. For more information, see Migrate public folders to Exchange 2013 from previous versions.

```
New-PublicFolderMigrationRequest -SourceDatabase PFDB01 -
CSVData (Get-Content C:\PFMigration\CSVData.csv -Encoding
Byte)
```

Detailed Description

Migrating public folders is a multi-step process. For more information before you attempt a public folder migration, see Migrate public folders to Exchange 2013 from previous versions.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
OutlookAnywhereHostName	Required	Microsoft.Exchange.Data.Fqdn	This parameter is reserved for internal Microsoft use.

RemoteCredential	Required	System.Management.Automation.PSCredential	This parameter is available only in the cloud-based service. The *RemoteCredential* parameter specifies an administrator who has permission to perform the migration request, for example, Administrator@humongousinsurance.com. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential. You must use this parameter in conjunction with the *RemoteMailboxServerLegacyDN* parameter.
RemoteMailboxLegacyDN	Required	System.String	This parameter is available only in the cloud-based service. The *RemoteMailboxLegacyDN* parameter specifies the mailbox of the remote credentials specified in

			the *RemoteCredential* parameter. You must use this parameter in conjunction with the *RemoteMailboxServerLegacyDN* parameter.
RemoteMailboxServerLegacyDN	Required	System.String	This parameter is available only in the cloud-based service. The *RemoteMailboxServerLegacyDN* parameter specifies the server legacy distinguished name (DN) of the back-end server. To find the **LegacyExchangeServerDN** property, run the following command: `Get-ExchangeServer <Identity> | Format-List LegacyExchangeServerDN`.
SourceDatabase	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *SourceDatabase* parameter specifies the identity of the database on which the public folders that are being migrated resides. You can

			use the following values: • GUID of the database • Database name
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
AuthenticationMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	This parameter is reserved for internal Microsoft use.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use `0` to not skip bad items. The valid input range for this parameter is from `0` through `2147483647`. The

			default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a descriptive name for the public folder migration batch. You can use the *BatchName* parameter as a search string when you use the **Get-PublicFolderMigrationRequest** cmdlet.
CompletedRequestAg	Optional	Microsoft.Exchange.Da	The

eLimit		ta.Unlimited	*CompletedRequestAgeLimit* parameter specifies how long the request is kept after it has completed before being automatically removed. The default *CompletedRequestAgeLimit* parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
CSVData	Optional	System.Byte[]	The *CSVData* parameter specifies the mapping file output generated by the **PublicFoldertoMailboxMapGenerator.ps1** script. Use this parameter for local migrations. This parameter can't be used in conjunction with the *CSVStream* parameter. You must use this parameter if you don't

			use *CSVStream* parameter.
CSVStream	Optional	System.IO.Stream	The *CSVStream* parameter specifies the mapping file output generated by the **PublicFoldertoMailboxMapGenerator.ps1** script. Use this parameter for remote migrations. This parameter can't be used in conjunction with the *CSVData* parameter. You must use this parameter if you don't use *CSVData* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for

			debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* parameter value only when large items are encountered.
Name	Optional	System.String	The *Name* parameter specifies the name of the public folder migration request.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	This parameter is available only in on-premises Exchange 2013. The *Priority* parameter

			specifies the priority setting that you want to use for the migration to be completed. This prioritizes against any Microsoft Exchange Mailbox Replication service (MRS) process. This parameter accepts the following values: • `Lowest` • `Lower` • `Low` • `Normal` • `High` • `Higher` • `Highest` • `Emergency` If you don't specify a value, the default value is `Normal`, which means that the request is prioritized by the time and date it was accepted into the MRS queue.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies whether certain stages of a public folder migration are skipped for debugging purposes. Don't use this parameter unless directed to do so by a Microsoft Customer Service and Support or specific documentation.

Suspend	Optional	System.Management.Automation.SwitchParameter	The *Suspend* switch specifies whether to suspend the request. If you use this switch, the request is queued, but the request won't reach the status of **InProgress** until you resume the request with the relevant resume cmdlet. You don't have to specify a value with this switch.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

WorkloadType	Optional	Microsoft.Exchange.MailboxReplicationService.RequestWorkloadType	This parameter is available only in on-premises Exchange 2013. The *WorkloadType* parameter specifies the type of request and the purpose for being performed. This information is used by Exchange. This parameter accepts the following values: • `None` • `Local` • `Onboarding` • `Offboarding` • `TenantUpgrade` • `LoadBalancing` • `Emergency`

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PublicFolderMigrationRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-PublicFolderMigrationRequest** cmdlet to cancel or complete a migration request that was initiated using the **New-PublicFolderMigrationRequest** cmdlet. You use must this cmdlet to remove the public folder migration request before you can create another public folder migration request.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PublicFolderMigrationRequest -Identity
<PublicFolderMigrationRequestIdParameter> <COMMON PARAMETERS>

Remove-PublicFolderMigrationRequest -RequestGuid <Guid> -RequestQueue
<DatabaseIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example cancels any public folder migration request that's actively running.

```
Get-PublicFolderMigrationRequest | Remove-
PublicFolderMigrationRequest
```

EXAMPLE 2

This example cancels a migration request by using the *RequestGuid* parameter for a mailbox on MBXDB01.

Note:

The *RequestGuid* and *RequestQueue* parameters are for debugging purposes only.

```
Remove-PublicFolderMigrationRequest -RequestQueue MBXDB01 -
RequestGuid 25e0eaf2-6cc2-4353-b83e-5cb7b72d441f
```

Detailed Description

The *RequestQueue* and *RequestGuid* parameters are for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMigrationRequestIdParameter	The *Identity* parameter specifies the identity of the public folder migration request. You can't use this parameter in conjunction with the *RequestGuid* or *RequestQueue* parameters.
RequestGuid	Required	System.Guid	This parameter is available only in on-premises Exchange 2013. The *RequestGuid* parameter specifies the GUID of the migration request. If you specify the *RequestGuid* parameter, you must also specify the *RequestQueue* parameter. You can't use this parameter in conjunction with the *Identity* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *RequestQueue* parameter specifies the database on which the migration request is

			queued. If you specify the *RequestQueue* parameter, you must also specify the *RequestGuid* parameter. You can use the following values: • GUID of the database • Database name You can't use this parameter in conjunction with the *Identity* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-PublicFolderMigrationRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Resume-PublicFolderMigrationRequest** cmdlet to resume a migration request that failed

or has been suspended or auto-suspended.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-PublicFolderMigrationRequest -Identity
<PublicFolderMigrationRequestIdParameter> [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes the migration request PublicFolderMigration.

```
Resume-PublicFolderMigrationRequest -Identity
"PublicFolderMigration"
```

EXAMPLE 2

This example resumes any failed migration requests.

```
Get-PublicFolderMigrationRequest -Status Failed | Resume-
PublicFolderMigrationRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMigrationRequestIdParameter	The *Identity* parameter specifies the identity of the migration request. This parameter accepts the following values: • GUID • Name
Confirm	Optional	System.Management.	The *Confirm* switch can be

		Automation.SwitchParameter	used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PublicFolderMigrationRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-PublicFolderMigrationRequest** cmdlet to change migration request options after the request has been created. You can use the **Set-PublicFolderMigrationRequest** cmdlet to recover from failed migration requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PublicFolderMigrationRequest [-AcceptLargeDataLoss <SwitchParameter>]
[-BadItemLimit <Unlimited>] [-BatchName <String>] [-
CompletedRequestAgeLimit <Unlimited>] [-InternalFlags <InternalMrsFlag[]>]
[-LargeItemLimit <Unlimited>] [-Priority <Lowest | Lower | Low | Normal |
High | Higher | Highest | Emergency>] [-SkipMerging
<SkippableMergeComponent[]>] <COMMON PARAMETERS>

Set-PublicFolderMigrationRequest -RemoteCredential <PSCredential> <COMMON
PARAMETERS>

Set-PublicFolderMigrationRequest -RehomeRequest <SwitchParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <PublicFolderMigrationRequestIdParameter> [-
AuthenticationMethod <Basic | Digest | Ntlm | Fba | WindowsIntegrated |
LiveIdFba | LiveIdBasic | WSSecurity | Certificate | NegoEx | OAuth | Adfs
| Kerberos | Negotiate | LiveIdNegotiate | Misconfigured>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-OutlookAnywhereHostName
<Fqdn>] [-PreventCompletion <$true | $false>] [-RemoteMailboxLegacyDN
<String>] [-RemoteMailboxServerLegacyDN <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the setting of the PublicFolderMigration migration request to accept up to five corrupted public folder items.

```
Set-PublicFolderMigrationRequest -Identity
PublicFolderMigration -BadItemLimit 5
```

Detailed Description

You can pipeline the **Set-PublicFolderMigrationRequest** cmdlet from the **Get-PublicFolderMigrationRequestStatistics**, **Get-PublicFolderMigrationRequst**, or the **Get-PublicFolder** cmdlets.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMigrationRequestIdParameter	The *Identity* parameter specifies the identity of the public folder migration request.
RehomeRequest	Required	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RehomeRequest* parameter specifies to the Microsoft Exchange Mailbox Replication service (MRS) that the

			request needs to be moved to the same database as the public folder being migrated. This parameter is used primarily for debugging purposes.
RemoteCredential	Required	System.Management.Automation.PSCredential	This parameter is available only in the cloud-based service. The *RemoteCredential* parameter specifies an administrator who has permission to perform the migration request, for example, Administrator@humongousinsurance.com. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51

			or higher. Items are considered corrupted if the item can't be read from the source database or can't be written to the target database. Corrupted items won't be available in the destination mailbox or .pst file.
AuthenticationMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	This parameter is reserved for internal Microsoft use.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use `0` to not skip bad items. The valid input range for this parameter is from `0` through `2147483647`. The default value is `0`. We recommend that you keep the default value `0` and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the

			BadItemLimit parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
BatchName	Optional	System.String	The *BatchName* parameter specifies a descriptive name for the public folder batch migration. You can use the *BatchName* parameter as a search string when you use the **Get-PublicFolderMigrationRequest** cmdlet.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request is kept after it has completed before being automatically removed. The default

			CompletedRequestAgeLimit parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Da	The *LargeItemLimit*

		ta.Unlimited	parameter specifies the number of large items to skip if the request encounters such items in the mailbox. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* parameter value only when large items are encountered.
OutlookAnywhereHostName	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is reserved for internal Microsoft use.
PreventCompletion	Optional	System.Boolean	The *PreventCompletion* parameter specifies that this cmdlet initializes, but isn't completed. This parameter accepts `$true` or `$false`. The default value is `$false`. If you specify `$true`, you have to run the **Resume-PublicFolderMigrationRequest** cmdlet to complete the migration

			request.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	This parameter is available only in on-premises Exchange 2013. The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time. This parameter accepts the following values: • `Lowest` • `Lower` • `Low` • `Normal` • `High` • `Higher` • `Highest` • `Emergency` If you don't specify a value, the default value is `Normal`, which means that the request is prioritized by the time and date it was accepted into the queue.
RemoteMailboxLegacyDN	Optional	System.String	This parameter is available only in the cloud-based service. The *RemoteMailboxLegacyDN*

			parameter specifies the **ExchangeLegacyDN** of the remote mailbox.
RemoteMailboxServerLegacyDN	Optional	System.String	This parameter is available only in the cloud-based service. The *RemoteMailboxServerLegacyDN* parameter specifies the server legacy DN of the back-end server. To find the **LegacyExchangeServerDN** value, run the following command: `Get-ExchangeServer <Identity> | Format-List LegacyExchangeServerDN`.
SkipMerging	Optional	Microsoft.Exchange.Management.RecipientTasks.SkippableMergeComponent[]	The *SkipMerging* parameter specifies whether certain stages of a migration are to be skipped for debugging purposes. Don't use this parameter unless directed to do so by Microsoft Customer Service and Support or specific documentation.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-PublicFolderMigrationRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Suspend-PublicFolderMigrationRequest** cmdlet to suspend a migration request any time after the request was created, but before it reaches the status of *CompletionInProgress*. You can resume the migration request by using the **Resume-PublicFolderMigrationRequest** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-PublicFolderMigrationRequest -Identity
<PublicFolderMigrationRequestIdParameter> [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-SuspendComment <String>] [-WhatIf
```

```
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends the public folder migration request PFMigReq1.

```
Suspend-PublicFolderMigrationRequest -Identity PFMigReq1
```

EXAMPLE 2

This example suspends all migration requests that are in progress by using the Get-PublicFolderMigrationRequest cmdlet to retrieve all migration requests with a *Status* value of `InProgress`, and then pipelining the output to the **Suspend-PublicFolderMigrationRequest** cmdlet.

```
Get-PublicFolderMigrationRequest -Status InProgress |
Suspend-PublicFolderMigrationRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMigrationRequestIdParameter	The *Identity* parameter specifies the identity of the migration request. This parameter accepts the following values: • GUID • Name
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that

			appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description as to why the request was suspended.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderMigrationRequestStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-03*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PublicFolderMigrationRequestStatistics** cmdlet to view detailed information about migration requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderMigrationRequestStatistics -Identity
<PublicFolderMigrationRequestIdParameter> <COMMON PARAMETERS>

Get-PublicFolderMigrationRequestStatistics -RequestQueue
<DatabaseIdParameter> [-RequestGuid <Guid>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DomainController
<Fqdn>] [-IncludeReport <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns default statistics for all migration requests that are in progress or haven't been cleared for the database MBXDB02.

```
Get-PublicFolderMigrationRequestStatistics -RequestQueue
"MBXDB02"
```

EXAMPLE 2

This example returns additional information about the migration request and exports the report to a CSV file.

```
Get-PublicFolderMigrationRequestStatistics -Identity
"PFMigrate_MarketingReports" -IncludeReport | Export-CSV C:
\PFMigstats.csv
```

Detailed Description

The *RequestQueue* parameter is for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMigrationRequestIdParameter	The *Identity* parameter specifies the identity of the public folder migration request. You can use one of the following values: • GUID • Name This parameter can't be used in conjunction with

			the *RequestQueue* or *RequestGuid* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *RequestQueue* parameter specifies the mailbox database on which the migration request resides. You can use one of the following values: • GUID of the database • Database name This parameter can't be used in conjunction with the *Identity* parameter.
Diagnostic	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
RequestGuid	Optional	System.Guid	This parameter is available only in on-premises Exchange 2013. The *RequestGuid* parameter specifies the GUID of a migration request. This parameter can't be used in conjunction with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderMoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-PublicFolderMoveRequest** cmdlet to view the detailed status of an ongoing public folder move that was initiated using the New-PublicFolderMoveRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderMoveRequest [-AccountPartition
<AccountPartitionIdParameter>] [-Identity
<PublicFolderMoveRequestIdParameter>] [-Organization
<OrganizationIdParameter>] <COMMON PARAMETERS>

Get-PublicFolderMoveRequest [-AccountPartition
<AccountPartitionIdParameter>] [-BatchName <String>] [-HighPriority <$true
| $false>] [-Name <String>] [-Organization <OrganizationIdParameter>] [-
RequestQueue <DatabaseIdParameter>] [-Status <None | Queued | InProgress |
AutoSuspended | CompletionInProgress | Synced | Completed |
CompletedWithWarning | Suspended | Failed>] [-Suspend <$true | $false>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the status of an in-progress public folder move request with the identity \PublicFolderMove, which is the default name assigned to public folder moves.

```
Get-PublicFolderMoveRequest -Identity \PublicFolderMove
```

EXAMPLE 2

This example returns the status of in-progress and queued requests that are on the source database MBD01.

```
Get-PublicFolderMoveRequest -RequestQueue MBD01
```

Detailed Description

Public folder move requests are used to move public folders between public folder mailboxes. After the move request is complete, you need to update the hierarchy using the Update-PublicFolderMailbox cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
BatchName	Optional	System.String	The *BatchName* parameter specifies the name that was given to a batch public folder move request. You can't use this parameter in conjunction with the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
HighPriority	Optional	System.Boolean	The *HighPriority* parameter specifies that the cmdlet returns requests that were created with the *HighPriority* flag. The *HighPriority* flag indicates that the request should be processed before other lower priority requests in the queue.

			You can't use this parameter in conjunction with the *Identity* parameter.
Identity	Optional	Microsoft.Exchange.MailboxReplicationService.PublicFolderMoveRequestIdParameter	The *Identity* parameter specifies the identity of the public folder move request. The default identity assigned to public folder move requests is `\PublicFolderMove`. This parameter can't be used in conjunction with the following parameters: • *BatchName* • *HighPriority* • *Name* • *RequestQueue* • *Suspend* • *Status*
Name	Optional	System.String	The *Name* parameter specifies the name of the public folder move request. If you didn't specify a name when creating the move request, `PublicFolderMove` will be the default name assigned to the request. You can't use this parameter in conjunction

			with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RequestQueue	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the target mailbox database on which the public folder of the request resides. You can use one of the following values: • GUID of the database • Database name You can't use this parameter in conjunction with the *Identity* parameter.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Status	Optional	Microsoft.Exchange.Data.Directory.Recipient.RequestStatus	The *Status* parameter specifies whether to return public folders that are in a specific status.

			This parameter accepts the following values: • `None` • `Queued` • `InProgress` • `AutoSuspended` • `CompletionInProgress` • `Completed` • `CompletedWithWarning` • `Suspended` • `Failed` You can't use this parameter in conjunction with the *Identity* parameter.
Suspend	Optional	System.Boolean	The *Suspend* parameter specifies whether to return public folders with moves that have been suspended. This parameter accepts `$true` or `$false`. You can't use this parameter in conjunction with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-PublicFolderMoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-PublicFolderMoveRequest** cmdlet to begin the process of moving public folder contents between public folder mailboxes. Moving public folders only moves the physical contents of the public folder; it doesn't change the logical hierarchy. When the move request is completed, you must run the **Remove-PublicFolderMoveRequest** cmdlet to remove the request or wait until the time specified in the *CompletedRequestAgeLimit* parameter has passed. The request must be removed before you can run another move request.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-PublicFolderMoveRequest -Folders <PublicFolderIdParameter[]> -
TargetMailbox <MailboxIdParameter> [-AcceptLargeDataLoss
<SwitchParameter>] [-AllowLargeItems <SwitchParameter>] [-BadItemLimit
<Unlimited>] [-CompletedRequestAgeLimit <Unlimited>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-InternalFlags
<InternalMrsFlag[]>] [-LargeItemLimit <Unlimited>] [-Name <String>] [-
Organization <OrganizationIdParameter>] [-Priority <Lowest | Lower | Low |
Normal | High | Higher | Highest | Emergency>] [-Suspend
<SwitchParameter>] [-SuspendComment <String>] [-SuspendWhenReadyToComplete
<SwitchParameter>] [-WhatIf [<SwitchParameter>]] [-WorkloadType <None |
Local | Onboarding | Offboarding | TenantUpgrade | LoadBalancing |
Emergency | RemotePstIngestion | SyncAggregation>]
```

Examples

EXAMPLE 1

This example begins the move request for the public folder \CustomerEngagements from public folder mailbox DeveloperReports to DeveloperReports01.

```
New-PublicFolderMoveRequest -Folders \DeveloperReports
\CustomerEngagements -TargetMailbox DeveloperReports01
```

EXAMPLE 2

This example begins the move request for public folders under the \Dev public folder branch to the target public folder mailbox DeveloperReports01.

Note:

You can also move a branch of public folders by using the **Move-PublicFolderBranch.ps1** script.

```
New-PublicFolderMoveRequest -Folders \Dev
\CustomerEngagements,\Dev\RequestsforChange,\Dev\Usability
-TargetMailbox DeveloperReports01
```

Detailed Description

The **New-PublicFolderMoveRequest** cmdlet moves public folders from a source public folder mailbox to a target public folder mailbox. To move the public folder mailbox to another mailbox database, use the New-MoveRequest cmdlet. To ensure that this folder is already in the target public folder mailbox, run the **Update-PublicFolderMailbox** cmdlet against the target public folder mailbox. You can only perform one move request at a time. You can also move public folders by using the **Move-PublicFolderBranch.ps1** script.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Folders	Required	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter[]	The *Folders* parameter specifies the public folders that you want to move. If the public folder has child public folders, child public folders won't be moved unless you explicitly state them in the command. You can move multiple public folders by separating them with a comma, for example, \Dev\CustomerEngagements, \Dev\RequestsforChange, \Dev\Usability.

TargetMailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *TargetMailbox* parameter specifies the target public folder mailbox that you want to move the public folders to. This parameter accepts the following: • Alias • Canonical DN • Display name • Distinguished name (DN) • *Domain\Account* • GUID • ImmutableId • SMTP address • User principal name (UPN)
AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* is set to 51 or higher. Items are considered corrupted if the item can't be read from the source mailbox or can't be written to the target mailbox. Corrupted items won't be available in the destination mailbox.
AllowLargeItems	Optional	System.Management.	The *AllowLargeItems*

		Automation.SwitchParameter	parameter specifies that you can move large items only when large items are encountered. Large items are email messages with a maximum of 1,023 attachments.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use 0 to not skip bad items. The valid input range for this parameter is from 0 through 2147483647. The default value is 0. We recommend that you keep the default value 0 and only change the *BadItemLimit* parameter value if the request fails. **Note:** If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the

			command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request will be kept after it has completed before being automatically removed. The default *CompletedRequestAgeLimit* parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the public folder. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss* parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
Name	Optional	System.String	The *Name* parameter specifies the name of the public folder move request. If you don't

			specify a name, the default name is `PublicFolderMove`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time. This parameter accepts the following: • `Lowest` • `Lower` • `Low` • `Normal` • `High` • `Higher` • `Highest` • `Emergency`
Suspend	Optional	System.Management.Automation.SwitchParameter	The *Suspend* switch specifies whether to suspend the request. If you use this switch, the request is queued, but the request won't reach the status of **InProgress** until you resume the request with the relevant resume cmdlet. You don't have to

			specify a value with this switch.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
SuspendWhenReadyToComplete	Optional	System.Management.Automation.SwitchParameter	The *SuspendWhenReadyToComplete* switch specifies whether to suspend the request before it reaches the status of **CompletionInProgress**. After the move is suspended, it has a status of **AutoSuspended**. You can then manually complete the move by using the **Resume-PublicFolderMoveRequest** command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WorkloadType	Optional	Microsoft.Exchange.MailboxReplicationService.RequestWorkloadType	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PublicFolderMoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-PublicFolderMoveRequest** cmdlet to cancel a mailbox move initiated using the New-MoveRequest cmdlet. After the move has been finalized, you can't undo the move request.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PublicFolderMoveRequest -Identity
<PublicFolderMoveRequestIdParameter> <COMMON PARAMETERS>

Remove-PublicFolderMoveRequest -RequestGuid <Guid> -RequestQueue
<DatabaseIdParameter> <COMMON PARAMETERS>
```

```
COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the public folder move request \PublicFolderMove.

```
Remove-PublicFolderMoveRequest -Identity \PublicFolderMove
```

EXAMPLE 2

This example cancels a public folder move by using the *RequestGuid* parameter for a public folder move request on MBXDB01.

Note:

The *RequestGuid* and *RequestQueue* parameters are for debugging purposes only.

```
Remove-PublicFolderMoveRequest -RequestQueue MBXDB01 -
RequestGuid 25e0eaf2-6cc2-4353-b83e-5cb7b72d441f
```

Detailed Description

The *RequestQueue* and *RequestGuid* parameters are for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMoveRequestIdParameter	The *Identity* parameter specifies the identity of the public folder move request. The default identity is \PublicFolderMove. You can't use this

			parameter in conjunction with the *RequestGuid* or *RequestQueue* parameter.
RequestGuid	Required	System.Guid	The *RequestGuid* parameter specifies the GUID of the public folder move request. If you specify the *RequestGuid* parameter, you must also specify the *RequestQueue* parameter. You can't use this parameter in conjunction with the *Identity* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the target database on which the move request is queued. You can use the following values: • GUID of the database • Database name You can't use this parameter in conjunction with the *Identity* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when

			this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-PublicFolderMoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-PublicFolderMoveRequest** cmdlet to resume a public folder move request that has been suspended or has failed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-PublicFolderMoveRequest -Identity
<PublicFolderMoveRequestIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes the public folder move request \PublicFolderMove.

```
Resume-PublicFolderMoveRequest -Identity \PublicFolderMove
```

EXAMPLE 2

This example resumes failed public folder move requests.

```
Get-PublicFolderMoveRequest -MoveStatus Failed | Resume-
PublicFolderMoveRequest
```

EXAMPLE 3

This example resumes a move request that has the suspend comment "Resume after 10 P.M."

```
Get-PublicFolderMoveRequest -MoveStatus Suspended | Get-
PublicFolderMoveRequestStatistics |Where {$_.Message -like
"*resume after 10 P.M."} | Resume-PublicFolderMoveRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMoveRequestIdParameter	The *Identity* parameter specifies the identity of the public folder move request. The default identity is \PublicFolderMove.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PublicFolderMoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-PublicFolderMoveRequest** cmdlet to change a public folder move request after the

move request has been created. You can use the **Set-PublicFolderMoveRequest** cmdlet to recover from a failed move request.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PublicFolderMoveRequest -Identity <PublicFolderMoveRequestIdParameter>
[-AcceptLargeDataLoss <SwitchParameter>] [-BadItemLimit <Unlimited>] [-
CompletedRequestAgeLimit <Unlimited>] [-InternalFlags <InternalMrsFlag[]>]
[-LargeItemLimit <Unlimited>] [-Priority <Lowest | Lower | Low | Normal |
High | Higher | Highest | Emergency>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-SuspendWhenReadyToComplete <$true | $false>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the public folder move request \PublicFolderMove to accept up to five corrupted public folder items.

```
Set-PublicFolderMoveRequest -Identity \PublicFolderMove -
BadItemLimit 5
```

Detailed Description

You can pipeline the **Set-PublicFolderMoveRequest** cmdlet from the **Get-PublicFolderMoveRequestStatistics** or **Get-PublicFolderMoveRequest** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMoveRequestIdParameter	The *Identity* parameter specifies the identity of the public folder move request. The default identity of a public folder move request is \PublicFolderMove.

AcceptLargeDataLoss	Optional	System.Management.Automation.SwitchParameter	The *AcceptLargeDataLoss* parameter specifies that a large amount of data loss is acceptable if the *BadItemLimit* parameter is set to 51 or higher. Items are considered corrupted if the items can't be read from the source mailbox or can't be written to the target mailbox. Corrupted items won't be available in the destination mailbox.
BadItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *BadItemLimit* parameter specifies the number of bad items to skip if the request encounters corruption in the mailbox. Use `0` to not skip bad items. The valid input range for this parameter is from `0` through `2147483647`. The default value is `0`. We recommend that you keep the default value `0` and only change the *BadItemLimit* parameter value if the request fails.

			Note: If you set the *BadItemLimit* parameter to more than 50, the command fails, and you receive a warning stating: "Please confirm your intention to accept a large amount of data loss by specifying *AcceptLargeDataLoss*." If you receive this warning, you need to run the command again, this time using the *AcceptLargeDataLoss* parameter. No further warnings appear, and any corrupted items aren't available after the process is complete.
CompletedRequestAgeLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *CompletedRequestAgeLimit* parameter specifies how long the request is kept after it has completed before being automatically removed. The default *CompletedRequestAgeLimit* parameter value is 30 days.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run.

			To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
InternalFlags	Optional	Microsoft.Exchange.Management.RecipientTasks.InternalMrsFlag[]	The *InternalFlags* parameter specifies the optional steps in the request. This parameter is used primarily for debugging purposes.
LargeItemLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *LargeItemLimit* parameter specifies the number of large items to skip if the request encounters such items in the public folder. Use 0 to not skip any large items. If any number above 50 is specified, the *AcceptLargeDataLoss*

			parameter must also be specified. The default value is 0. We recommend that you use the default value of 0 and increase the *LargeItemLimit* only when large items are encountered.
Priority	Optional	Microsoft.Exchange.MailboxReplicationService.RequestPriority	The *Priority* parameter specifies the order in which this request should be processed in the request queue. Requests are processed in order, based on server health, status, priority, and last update time.
SuspendWhenReadyToComplete	Optional	System.Boolean	The *SuspendWhenReadyToComplete* parameter specifies whether to suspend the request before it reaches the status of **CompletionInProgress**. After the move is suspended, it has a status of **AutoSuspended**. You can then manually

			complete the move by using the **Resume-PublicFolderMoveRequest** command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-PublicFolderMoveRequest

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-PublicFolderMoveRequest** cmdlet to suspend a move request any time after the move request was created, but before it reaches the status of **CompletionInProgress**. You can resume the move request by using the Resume-PublicFolderMoveRequest cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-PublicFolderMoveRequest -Identity
<PublicFolderMoveRequestIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-SuspendComment <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends the public folder move request \PublicFolderMove.

```
Suspend-PublicFolderMoveRequest -Identity \PublicFolderMove
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMoveRequestIdParameter	The *Identity* parameter specifies the identity of the public folder move request. The default identity is \PublicFolderMove.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default

			when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies a description about why the request was suspended. You can only use this parameter if you specify the *Suspend* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PublicFolderMoveRequestStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Move and migration cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-PublicFolderMoveRequestStatistics** cmdlet to view detailed information about public folder move requests.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PublicFolderMoveRequestStatistics -Identity
<PublicFolderMoveRequestIdParameter> <COMMON PARAMETERS>

Get-PublicFolderMoveRequestStatistics -RequestQueue <DatabaseIdParameter>
[-RequestGuid <Guid>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Diagnostic <SwitchParameter>] [-DomainController
<Fqdn>] [-IncludeReport <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the default statistics for the public folder move request \PublicFolderMove.

```
Get-PublicFolderMoveRequestStatistics -Identity
\PublicFolderMove
```

EXAMPLE 2

This example returns the detailed statistics for the move request \PublicFolderMove by pipelining the results to the **Format-List** command.

```
Get-PublicFolderMoveRequestStatistics -Identity
\PublicFolderMove | Format-List
```

Detailed Description

The *RequestQueue* parameter is for debugging purposes only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Public folders" entry in the Sharing and collaboration permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MailboxReplicationService.PublicFolderMoveRequestIdParameter	The *Identity* parameter specifies the identity of the public folder move request. The default public folder move request identity is \PublicFolderMove. This parameter can't be used with the *RequestQueue* parameter.
RequestQueue	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *RequestQueue* parameter specifies the mailbox database on

			which the move request resides. You can use one of the following values: • GUID of the database • Database name This parameter is for debugging purposes only. This parameter can't be used with the *Identity* parameter.
Diagnostic	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeReport	Optional	System.Management.Automation.SwitchParameter	The *IncludeReport* switch specifies whether to return additional details, which can be used for troubleshooting.
RequestGuid	Optional	System.Guid	The *RequestGuid* parameter specifies the GUID of the public folder move request for which you want to view the request statistics.

			This parameter can't be used with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ExchangeAssistanceConfig

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ExchangeAssistanceConfig** cmdlet to view the configuration information for the URLs that Microsoft Exchange Help uses to connect to the source of the documentation.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ExchangeAssistanceConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example shows the configuration information that the web management interface uses to locate the source of the documentation for Contoso.com.

```
Get-ExchangeAssistanceConfig -Identity Contoso.com
```

EXAMPLE 2

This example shows the configuration information for all organizations and formats the information into a table.

```
Get-ExchangeAssistanceConfig | Format-Table
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Exchange Help settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the identity of the organization.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ExchangeAssistanceConfig

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ExchangeAssistanceConfig** cmdlet to modify the Microsoft Exchange Help configurations for your organization.

```
Set-ExchangeAssistanceConfig [-Identity <OrganizationIdParameter>] [-
CommunityLinkDisplayEnabled <$true | $false>] [-CommunityURL <Uri>] [-
Confirm [<SwitchParameter>]] [-ControlPanelFeedbackEnabled <$true |
$false>] [-ControlPanelFeedbackURL <Uri>] [-ControlPanelHelpURL <Uri>] [-
DomainController <Fqdn>] [-ExchangeHelpAppOnline <$true | $false>] [-
ManagementConsoleFeedbackEnabled <$true | $false>] [-
ManagementConsoleFeedbackURL <Uri>] [-ManagementConsoleHelpURL <Uri>] [-
OWAFeedbackEnabled <$true | $false>] [-OWAFeedbackURL <Uri>] [-OWAHelpURL
<Uri>] [-OWALightFeedbackEnabled <$true | $false>] [-OWALightFeedbackURL
<Uri>] [-OWALightHelpURL <Uri>] [-PrivacyLinkDisplayEnabled <$true |
$false>] [-PrivacyStatementURL <Uri>] [-WhatIf [<SwitchParameter>]] [-
WindowsLiveAccountPageURL <Uri>] [-WindowsLiveAccountURLEnabled <$true |
$false>]
```

Examples

EXAMPLE 1

This example changes the Help location for the Exchange Administration Center.

```
Set-ExchangeAssistanceConfig -ExchangeHelpAppOnline $false
-ManagementConsoleHelpURL 'http://exhelponline'
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Help settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
CommunityLinkDisplayEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
CommunityURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ControlPanelFeedbackEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ControlPanelFeedbackURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
ControlPanelHelpURL	Optional	System.Uri	The *ControlPanelHelpURL* parameter specifies the URL for where Help is being hosted for the web management interface.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExchangeHelpAppOnline	Optional	System.Boolean	The *ExchangeHelpAppOnline* specifies whether to indicate that your organization is using the Exchange Help online that's hosted on Microsoft TechNet. The default value is `$true`. If set to `$false`, you need to change the following parameters' URLs to point to the location where your Help is hosted: • *ControlPanelHelpURL* • *ManagementConsoleHelpURL* • *OWAHelpURL* • *OWALightHelpURL*
Identity	Optional	Microsoft.Exchange.Co	This parameter is reserved

		nfiguration.Tasks.OrganizationIdParameter	for internal Microsoft use.
ManagementConsoleFeedbackEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ManagementConsoleFeedbackURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
ManagementConsoleHelpURL	Optional	System.Uri	The *ManagementConsoleHelpURL* parameter specifies the URL for where Help is being hosted.
OWAFeedbackEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OWAFeedbackURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
OWAHelpURL	Optional	System.Uri	The *OWAHelpURL* parameter specifies the URL for where Help is being hosted for the standard version of Microsoft Office Outlook Web App.
OWALightFeedbackEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OWALightFeedbackURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
OWALightHelpURL	Optional	System.Uri	The *OWALightHelpURL* parameter specifies the

			URL for where Help is being hosted for the light version of Outlook Web App.
PrivacyLinkDisplayEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
PrivacyStatementURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsLiveAccountPageURL	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
WindowsLiveAccountURLEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-ExchangeHelp

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-ExchangeHelp** cmdlet to download and integrate the latest version of Help for all cmdlets on the local Microsoft Exchange 2013 server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-ExchangeHelp [-Force <SwitchParameter>]
```

Examples

EXAMPLE 1

To download and integrate the latest version of Help for all Exchange cmdlets on the local Exchange server, run the following command.

```
Update-ExchangeHelp
```

Detailed Description

If you have multiple Exchange servers in your organization, you need to run **Update-ExchangeHelp** on each server. To update Help on a specific Exchange server, connect to the server using remote Shell, and then run **Update-ExchangeHelp** in the remote Shell session. For more information, see Connect to Exchange using remote Shell.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Help settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description

Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter. By default, the **Update-ExchangeHelp** cmdlet has a throttling period of one hour. If you run this cmdlet within one hour of the last time you ran it, it won't check for updates. You can use the *Force* switch to bypass the throttling restriction and force the cmdlet to check for updates.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ExchangeServer

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ExchangeServer** cmdlet to obtain the attributes of a specified server. If a server isn't specified, the cmdlet obtains the attributes of all the servers in the Exchange organization.

Note:

When you run the **Get-ExchangeServer** cmdlet with no parameters, it returns the attributes of all the servers in the Exchange organization. To return specific server properties (including domain controller information) where the **Get-ExchangeServer** cmdlet has to contact servers directly or perform a complex or slow calculation, make sure you use the *Status* parameter.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ExchangeServer -Domain <Fqdn> <COMMON PARAMETERS>

Get-ExchangeServer [-Identity <ServerIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Status <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves the attributes of all the servers in the Exchange organization.

```
Get-ExchangeServer | Format-List
```

Detailed Description

To view all the Exchange server attributes that this cmdlet returns, you must pipe the command to the **Format-List** cmdlet.

The **ExchangeVersion** attribute returned is the minimum version of Microsoft Exchange that you can use to manage the returned object. This attribute isn't the same as the version of Exchange displayed in the Exchange Administration Center when you select **Server Configuration**.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Domain	Required	Microsoft.Exchange.Data.Fqdn	The *Domain* parameter specifies the fully qualified domain name (FQDN) of the domain. If you use this parameter, you can't use the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance

			of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the identity of the server. If you use this parameter, you can't use the *Domain* parameter.
Status	Optional	System.Management.Automation.SwitchParameter	The *Status* parameter specifies the status of the server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ExchangeServer

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ExchangeServer** cmdlet to set Exchange attributes in Active Directory for a specified server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ExchangeServer -Identity <ServerIdParameter> [-Confirm
[<SwitchParameter>]] [-CustomerFeedbackEnabled <$true | $false>] [-
DomainController <Fqdn>] [-ErrorReportingEnabled <$true | $false>] [-
InternetWebProxy <Uri>] [-MailboxProvisioningAttributes
<MailboxProvisioningAttributes>] [-MailboxRelease <None | E14 | E15>] [-
MonitoringGroup <String>] [-ProductKey <ProductKey>] [-
StaticConfigDomainController <String>] [-StaticDomainControllers
<MultiValuedProperty>] [-StaticExcludedDomainControllers
<MultiValuedProperty>] [-StaticGlobalCatalogs <MultiValuedProperty>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables error reporting on the specified server.

```
Set-ExchangeServer -Identity TestServer.Contoso.com -
ErrorReportingEnabled: $false
```

EXAMPLE 2

This example enrolls an Exchange server into the Customer Experience Improvement Program. In this example, the server name is SERVER01.

```
Set-ExchangeServer -Identity 'SERVER01' -
CustomerFeedbackEnabled $true
```

EXAMPLE 3

This example removes an Exchange server from the Customer Experience Improvement Program. In this example, the server name is SERVER01.

```
Set-ExchangeServer -Identity 'SERVER01' -
CustomerFeedbackEnabled $false
```

Detailed Description

The **Set-ExchangeServer** cmdlet sets generic Exchange attributes in Active Directory for a specified computer. You can only use this task on one server at a time. If you want to bulk manage your servers running Microsoft Exchange, add this task to a script.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or name of the server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CustomerFeedbackEnabled	Optional	System.Boolean	The *CustomerFeedbackEnabled* parameter specifies whether the Exchange server is enrolled in the Microsoft Customer Experience Improvement Program (CEIP). The CEIP collects anonymous information about how you use Exchange and

			problems that you might encounter. If you decide not to participate in the CEIP, the servers are opted-out automatically.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ErrorReportingEnabled	Optional	System.Boolean	The *ErrorReportingEnabled* parameter specifies whether error reporting is enabled.
InternetWebProxy	Optional	System.Uri	The *InternetWebProxy* parameter specifies

			which web proxy servers, such as computers running Forefront Threat Management Gateway, Exchange should use to reach the Internet.
MailboxProvisioningAttributes	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailboxProvisioningAttributes	This parameter is reserved for internal Microsoft use.
MailboxRelease	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MailboxRelease	This parameter is reserved for internal Microsoft use.
MonitoringGroup	Optional	System.String	The *MonitoringGroup* parameter specifies how to add your Exchange 2013 servers to monitoring groups. You can add your servers to an existing group or create a monitoring group based on location or deployment, or to partition monitoring responsibility among your servers.
ProductKey	Optional	Microsoft.Exchange.Management.SystemConfi	The *ProductKey* parameter specifies the

		gurationTasks.ProductKey	server product key.
StaticConfigDomainController	Optional	System.String	The *StaticConfigDomainController* parameter specifies whether to configure a domain controller to be used by the server via Directory Service Access (DSAccess).
StaticDomainControllers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *StaticDomainControllers* parameter specifies whether to configure a list of domain controllers to be used by the server via DSAccess.
StaticExcludedDomainControllers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *StaticExcludedDomainControllers* parameter specifies whether to exclude a list of domain controllers from being used by the server.
StaticGlobalCatalogs	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *StaticGlobalCatalogs* parameter specifies whether to configure a list of global catalogs to

			be used by the server via DSAccess.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ExchangeServerAccessLicense

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ExchangeServerAccessLicense** cmdlet to return a list of licenses in use in your

Microsoft Exchange Server 2013 organization. This refers to the specific legal name of the license, as defined in the Microsoft Product List and is representative of your licenses when you run this cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ExchangeServerAccessLicense
```

Examples

EXAMPLE 1

This example retrieves a list of Exchange 2013 licenses in your organization.

```
Get-ExchangeServerAccessLicense
```

Detailed Description

The **Get-ExchangeServerAccessLicense** cmdlet returns a list of licenses in use in your Exchange 2013 organization. The cmdlet returns a collection of these license names:

- Exchange 15 Standard CAL
- Exchange 15 Enterprise CAL
- Exchange 15 Server Standard Edition
- Exchange 15 Enterprise Edition

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell Infrastructure Permissions" section in the Exchange and Shell infrastructure permissions topic.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ExchangeServerAccessLicenseUser

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ExchangeServerAccessLicenseUser** cmdlet to return a list of unique users for the specified license name. Each object contains the fully qualified domain name (FQDN) or primary SMTP address of the mailbox and the license name to which it's associated.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ExchangeServerAccessLicenseUser -LicenseName <String>
```

Examples

EXAMPLE 1

This example returns the unique users for your license name, Exchange 2013 Server Standard Edition.

```
Get-ExchangeServerAccessLicenseUser -LicenseName "Exchange Server 2013 Standard Edition"
```

Detailed Description

The **Get-ExchangeServerAccessLicenseUser** cmdlet returns a collection of unique users for the specified license name. The list of unique users represents an estimate of your licenses when you run this cmdlet. Each object contains the FQDN or primary SMTP address of the mailbox and the license name to which it's associated.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
LicenseName	Required	System.String	The *LicenseName* parameter specifies a license type for the

			servers in your organization. License types include the following: • Exchange 2013 Standard client access license (CAL) • Exchange 2013 Enterprise CAL • Exchange 2013 Server Standard Edition • Exchange 2013 Server Enterprise Edition

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OrganizationConfig

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-OrganizationConfig** cmdlet to get configuration data for an Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OrganizationConfig [-Identity <OrganizationIdParameter>] <COMMON
```

```
PARAMETERS>

Get-OrganizationConfig [-AccountPartition <AccountPartitionIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example gets the organization configuration information for the domain controller ContosoDC.

```
Get-OrganizationConfig -DomainController ContosoDC
```

EXAMPLE 2

This example gets the configuration information for the tenant organization.

```
Get-OrganizationConfig Export-Cli c:\myFile.xml
```

For more information, see **Troubleshoot a hybrid deployment**.

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Shell infrastructure permissions" section in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the organization you want configuration data from.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OrganizationConfig

Exchange Management Shell > Exchange 2013 cmdlets > Organization cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-24*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-OrganizationConfig** cmdlet to configure various settings of an Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OrganizationConfig [-Identity <OrganizationIdParameter>] <COMMON
PARAMETERS>

Set-OrganizationConfig [-AdfsAuthenticationConfiguration <String>] <COMMON
PARAMETERS>

Set-OrganizationConfig [-AdfsAudienceUris <MultiValuedProperty>] [-
AdfsEncryptCertificateThumbprint <String>] [-AdfsIssuer <Uri>] [-

Examples

EXAMPLE 1

This example creates a distribution group naming policy using the following configuration:

- Distribution groups will be created in the Users\Groups container.
- The words curse, bad, and offensive will be blocked from being used in distribution group names.
- All distribution groups will be prefixed with "DL_" and suffixed with an underscore (_) and the user's department and country code.

```
Set-OrganizationConfig -DistributionGroupDefaultOU Users
\Groups -DistributionGroupNameBlockedWordsList
curse,bad,offensive -DistributionGroupNamingPolicy
"DL_<GroupName>_<Department><CountryCode>"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange server configuration settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
ActivityBasedAuthenticationTimeoutEnabled	Optional	System.Boolean	The *ActivityBasedAuthenticationTimeoutEnabled*

			parameter specifies whether the timed logoff feature is enabled. The default value is `$true`.
ActivityBasedAuthenticationTimeoutInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ActivityBasedAuthenticationTimeoutInterval* parameter specifies the time span for logoff. You enter this value as a time span: *hh*:*mm*:*ss* where *hh* = hours, *mm* = minutes and *ss* = seconds. Valid values for this parameter are from `00:05:00` to `08:00:00` (5 minutes to 8 hours). The default value is `06:00:00` (6 hours).
ActivityBasedAuthenticationTimeoutWithSingleSignOnEnabled	Optional	System.Boolean	The *ActivityBasedAuthenticationTimeoutWithSingleSignOnEnabled* parameter specifies whether to keep single sign-on enabled. The default value is `$true`.
AdfsAudienceUris	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *AdfsAudienceUris* parameter specifies one

			or more external URLs that are used for Active Directory Federation Services (AD FS) claims-based authentication. For example, the external Outlook Web App and external Exchange admin center (EAC) URLs. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. For more information about configuring AD FS claims based authentication in

			Exchange, see Using AD FS claims-based authentication with Outlook Web App and EAC.
AdfsAuthenticationConfiguration	Optional	System.String	This parameter is reserved for internal Microsoft use.
AdfsEncryptCertificateThumbprint	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *AdfsEncryptCertificateThumbprint* parameter specifies the service communication SSL certificate that's used for AD FS claims-based authentication. This parameter uses a certificate thumbprint (GUID) value to identify the certificate. To get the thumbprint value for the service communication SSL certificate, open Windows PowerShell on the AD FS server and run the command `Get-ADFSCertificate -CertificateType "Service-Communications"`. For

			more information, see Get-ADFSCertificate.
AdfsIssuer	Optional	System.Uri	This parameter is available only in on-premises Exchange 2013. The *AdfsIssuer* parameter specifies URL of the AD FS server that's used for AD FS claims-based authentication. This is the URL where AD FS relying parties send users for authentication. To get this value, open Windows PowerShell on the AD FS server and run the command `Get-ADFSEndpoint -AddressPath /adfs/ls | Format-List FullUrl`.
AdfsSignCertificateThumbprints	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *AdfsSignCertificateThumbprints* parameter specifies one or more X.509 token-signing certificates that are used for AD FS claims-based authentication. This parameter uses certificate thumbprint values

			(GUIDs) to identify the certificates. To get the thumbprint values of the primary and secondary token-signing certificates, open Windows PowerShell on the AD FS server and run the command `Get-ADFSCertificate -CertificateType "Token-signing"`. For more information, see Get-ADFSCertificate. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.

AppsForOfficeEnabled	Optional	System.Boolean	The *AppsForOfficeEnabled* parameter specifies whether to enable apps for Microsoft Outlook features. By default, the parameter is set to `$true`. If the flag is set to `$false`, no new apps can be activated for any user in the organization.
AVAuthenticationService	Optional	Microsoft.Exchange.Data.ProtocolConnectionSettings	This parameter is reserved for internal Microsoft use.
ByteEncoderTypeFor7BitCharsets	Optional	System.Int32	The *ByteEncoderTypeFor7BitCharsets* parameter specifies the 7-bit transfer encoding method for MIME format for messages sent to this remote domain. The valid values for this parameter are: • 0 Always use default 7-bit transfer encoding for HTML and plain text. • 1 Always use QP (quoted-printable) encoding for HTML and plain text. • 2 Always use Base64 encoding for HTML and plain text. • 5 Use QP encoding for HTML and plain text

			unless line wrapping is enabled in plain text. If line wrapping is enabled, use 7-bit encoding for plain text. • 6 Use Base64 encoding for HTML and plain text, unless line wrapping is enabled in plain text. If line wrapping is enabled in plain text, use Base64 encoding for HTML, and use 7-bit encoding for plain text. • 13 Always use QP encoding for HTML. Always use 7-bit encoding for plain text. • 14 Always use Base64 encoding for HTML. Always use 7-bit encoding for plain text. If no value is specified, Exchange always uses QP encoding for HTML and plain text.
CalendarVersionStoreEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
CustomerFeedbackEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *CustomerFeedbackEnabled* parameter specifies whether the server running Microsoft Exchange is enrolled in the Microsoft Customer Experience Improvement Program.
DefaultPublicFolderAgeLimit	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DefaultPublicFolderAgeLimit* parameter specifies the default age limit for public folders across the entire organization. A public folder is automatically deleted when this age limit is exceeded. This attribute applies to all public folders in the organization that don't have their own **AgeLimit** setting.
DefaultPublicFolderDeletedItemRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DefaultPublicFolderDeletedItemRetention* parameter specifies the default value

			of the length of time to retain deleted items for public folders across the entire organization. This attribute applies to all public folders in the organization that don't have their own **RetainDeletedItemsFor** attribute set.
DefaultPublicFolderIssueWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *DefaultPublicFolderIssueWarningQuota* parameter specifies the default value across the entire organization for the public folder size at which a warning message is sent to this folder's owners, warning that the public folder is almost full. This attribute applies to all public folders within the organization that don't have their own warning quota attribute set. The default value of this attribute is `unlimited`. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes)

			• `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 0 through 2199023254529 bytes(2 TB). If you enter a value of `unlimited`, no size limit is imposed on the public folder.
DefaultPublicFolderMaxItemSize	Optional	Microsoft.Exchange.Data.Unlimited	The *DefaultPublicFolderMaxItemSize* parameter specifies the default maximum size for posted items within public folders across the entire organization. Items larger than the value of the *DefaultPublicFolderMaxItemSize* parameter are rejected. This attribute applies to all public folders within the organization that don't have their own **MaxItemSize** attribute set. The default value of this attribute is `unlimited`. When you enter a value, qualify the value with one

			of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 0 through 2199023254529 bytes (2 TB). If you enter a value of `unlimited`, no size limit is imposed on the public folder.
DefaultPublicFolderMovedItemRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DefaultPublicFolderMovedItemRetention* parameter specifies how long items that have been moved between mailboxes are kept in the source mailbox for recovery purposes before being removed by the Public Folder Assistant. When you move folder contents between mailboxes, a copy of the original data is left on the source mailbox, inaccessible for users but available for recovery by

			system administrators. If the move process fails and you want to roll it back, use the `Set-PublicFolder -OverrideContentMailbox` command to recover data. For more information, see Set-PublicFolder.
DefaultPublicFolderProhibitPostQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *DefaultPublicFolderProhibitPostQuota* parameter specifies the size of a public folder at which users are notified that the public folder is full. Users can't post to a folder whose size is larger than the *DefaultPublicFolderProhibitPostQuota* parameter value. The default value of this attribute is `unlimited`. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for

			this parameter is from 0 through 2199023254529 bytes (2 TB). If you enter a value of `unlimited`, no size limit is imposed on the public folder.
DistributionGroupDefaultOU	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *DistributionGroupDefaultOU* parameter specifies the container where distribution groups are created by default.
DistributionGroupNameBlockedWordsList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *DistributionGroupNameBlockedWordsList* parameter specifies words that can't be included in the names of distribution groups. Separate multiple values with commas.
DistributionGroupNamingPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DistributionGroupNamingPolicy	The *DistributionGroupNamingPolicy* parameter specifies the template applied to the name of distribution groups that are created in the organization. You can enforce that a prefix or suffix be applied to all distribution groups. Prefixes and suffixes can be either a string or an

			attribute, and you can combine strings and attributes. When creating a naming policy, use the following syntax: "prefix<*GroupName*>suffix" **Note:** Don't set the <*GroupName*>. Users create the name when they create the distribution group. You can have multiple prefixes and suffixes. You can use the following attributes that will be gathered from the user who's creating the distribution group mailbox settings: • Department • Company • Office • StateOrProvince • CountryorRegion • CountryCode • Title • CustomAttribute1 to CustomAttribute15 To create a naming policy using an attribute, use the following syntax: `"<PrefixAttribute><GroupName><SuffixAttribut`

			e>". For example, to create a naming policy using the Department as a prefix and CustomAttribute1 as the suffix: "<Department><GroupName><CustomAttribute1>". To create a naming policy using strings, use the following syntax "string<GroupName>string". For example to create a naming policy using the string "DL_" as the prefix use the following syntax: "DL_<GroupName>".
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge

			Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
EwsAllowEntourage	Optional	System.Boolean	The *EwsAllowEntourage* parameter specifies whether to enable or disable Entourage 2008 to access Exchange Web Services (EWS) for the entire organization. The default value is `$true`.
EwsAllowList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *EwsAllowList* parameter specifies the applications (user agent strings) that can access EWS when the *EwsApplicationAccessPolicy* parameter is set to `EnforceAllowList`.
EwsAllowMacOutlook	Optional	System.Boolean	The *EwsAllowMacOutlook* parameter specifies whether to enable or disable Microsoft Outlook for Mac 2011 to access EWS for the entire organization.
EwsAllowOutlook	Optional	System.Boolean	The *EwsAllowOutlook* parameter enables or

			disables Microsoft Office Outlook 2007 to access EWS for the entire organization. Outlook 2007 uses EWS for free and busy information, out-of-office settings, and calendar sharing.
EwsApplicationAccessPolicy	Optional	Microsoft.Exchange.Data.Directory.EwsApplicationAccessPolicy	The *EwsApplicationAccessPolicy* parameter defines which applications other than Entourage, Mac Outlook, and Outlook can access EWS. If set to `EnforceAllowList`, only applications specified in the *EwsAllowList* parameter are allowed access to EWS. If set to `EnforceBlockList`, every application is allowed access to EWS except the ones specified in the *EwsBlockList* parameter.
EwsBlockList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *EwsBlockList* parameter specifies the applications that can't access EWS when the *EwsApplicationAccessPolicy* parameter is set to `EnforceBlockList`.

EwsEnabled	Optional	System.Boolean	The *EwsEnabled* parameter specifies whether to globally enable or disable EWS access for the entire organization, regardless of what application is making the request. When the *EwsEnabled* parameter is set to `$false`, EWS access is turned off, regardless of the values of the *EwsAllowEntourage*, *EwsAllowMacOutlook*, and *EwsAllowOutlook* parameters. For the *EwsAllowEntourage*, *EwsAllowMacOutlook*, *EwsAllowOutlook* parameters to be meaningful, the *EwsEnabled* parameter must be set to `$true`.
ExchangeNotificationEnabled	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *ExchangeNotificationEnabled* parameter enables or disables Exchange notifications sent to

			administrators regarding their organizations. Valid input for this parameter is `$true` or `$false`.
ExchangeNotificationRecipients	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in the cloud-based service. The *ExchangeNotificationRecipients* parameter specifies the recipients for Exchange notifications sent to administrators regarding their organizations. If the *ExchangeNotificationEnabled* parameter is set to `$false`, no notification messages are sent. Be sure to enclose values that contain spaces in quotation marks (") and separate multiple values with commas. If this parameter isn't set, Exchange notifications are sent to all administrators.
ForwardSyncLiveIdBusinessInstance	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
HierarchicalAddressBookRoot	Optional	Microsoft.Exchange.Configuration.Tasks.User	The *HierarchicalAddressBookR*

		ContactGroupIdParameter	*oot* parameter specifies the user, contact, or group to be used as the root organization for a hierarchical address book in the Exchange organization. Setting a value for this parameter enables the hierarchical address book to be automatically displayed in Outlook for the organization. The default value is `$null`. This parameter accepts the following values: • Distinguished name (DN) • Canonical name • GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the identity of the tenant organization.
Industry	Optional	Microsoft.Exchange.Data.Directory.IndustryType	This parameter is available only in on-premises Exchange 2013. The *Industry* parameter

			specifies the industry that best represents your organization.
IsExcludedFromOffboardMigration	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *IsExcludedFromOffboardMigration* parameter specifies that no new moves from the cloud to your on-premises organization are permitted. When this flag is set, no offboarding move requests are allowed.
IsExcludedFromOnboardMigration	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *IsExcludedFromOnboardMigration* parameter specifies that no new moves from your on-premises organization to the cloud are permitted. When this flag is set, no onboarding move requests are allowed.
IsFfoMigrationInProgr	Optional	System.Boolean	This parameter is reserved

ess			for internal Microsoft use.
IsGuidPrefixedLegacyDnDisabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
IsMailboxForcedReplicationDisabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
IsProcessEhaMigratedMessagesEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
IsSyncPropertySetUpgradeAllowed	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
MailTipsAllTipsEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MailTipsAllTipsEnabled* parameter specifies whether MailTips are enabled. The default value is `$true`.
MailTipsExternalRecipientsTipsEnabled	Optional	System.Boolean	The *MailTipsExternalRecipientsTipsEnabled* parameter specifies whether MailTips for external recipients are enabled. The default value is `$false`.
MailTipsGroupMetricsEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The

			MailTipsGroupMetricsEnabled parameter specifies whether MailTips that rely on group metrics data are enabled. The default value is `$true`.
MailTipsLargeAudienceThreshold	Optional	System.UInt32	The *MailTipsLargeAudienceThreshold* parameter specifies what a large audience is. The default value is `25`.
MailTipsMailboxSourcedTipsEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MailTipsMailboxSourcedTipsEnabled* parameter specifies whether MailTips that rely on mailbox data (out-of-office or full mailbox) are enabled.
ManagedFolderHomepage	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderHomepage* parameter specifies the URL of the web page that's displayed when users click the **Managed**

			Folders folder in Microsoft Outlook. If a URL isn't specified, Outlook doesn't display a managed folders home page.
MapiHttpEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MapiHttpEnabled* parameter enables or disables Microsoft Outlook connections to mailboxes by using the MAPIHTTP protocol. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
MaxConcurrentMigrations	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is available only in on-premises Exchange 2013. The *MaxConcurrentMigrations* parameter specifies the maximum number of concurrent migrations that your organization can configure at any specific time.
MicrosoftExchangeRecipientEmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollec	This parameter is available only in on-

		tion	premises Exchange 2013. The *MicrosoftExchangeRecipientEmailAddresses* parameter specifies one or more email addresses for the recipient. All valid Microsoft Exchange email address types may be used. You can specify multiple values for this parameter as a comma-delimited list. If the *MicrosoftExchangeRecipientEmailAddressPolicyEnabled* parameter is set to `$true`, the email addresses are automatically generated by the default email address policy. This means you can't use the *MicrosoftExchangeRecipientEmailAddresses* parameter. Email addresses that you specify by using the *MicrosoftExchangeRecipientEmailAddresses* parameter replace any existing email addresses already configured.

MicrosoftExchangeRecipientEmailAddressPolicyEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MicrosoftExchangeRecipientEmailAddressPolicyEnabled* parameter specifies whether the default email address policy is automatically applied to the Exchange recipient. The default value is `$true`. If this parameter is set to `$true`, Exchange automatically adds new email addresses to the Exchange recipient when email address policies are added or modified in the Exchange organization. If this parameter is set to `$false`, you must manually add new email addresses to the Exchange recipient when email address policies are added or modified. If you change the value of the *MicrosoftExchangeRecipientEmailAddressPolicyEnabled* parameter from

			`$false` to `$true`, any email addresses that you defined by using the *MicrosoftExchangeRecipientEmailAddresses* parameter are preserved. However, the value of the *MicrosoftExchangeRecipientPrimarySmtpAddress* parameter reverts to MicrosoftExchange329e71ec88ae4615bbc36ab6ce41109e@<*Accepted Domain in Highest Priority Email Address Policy*>.
MicrosoftExchangeRecipientPrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *MicrosoftExchangeRecipientPrimarySmtpAddress* parameter specifies the primary return SMTP email address for the Exchange recipient. If the *MicrosoftExchangeRecipientEmailAddressPolicyEnabled* parameter is set to `$true`, you can't use the *MicrosoftExchangeRecipientPrimarySmtpAddress*

			parameter. If you modify the value of the *MicrosoftExchangeRecipientPrimarySmtpAddress* parameter, the value is automatically added to the list of email addresses defined in the *MicrosoftExchangeRecipientEmailAddresses* parameter. The *MicrosoftExchangeRecipientPrimarySmtpAddress* parameter is meaningful only if the Exchange recipient has more than one defined SMTP email address. If the *MicrosoftExchangeRecipientEmailAddresses* parameter has only one defined SMTP email address, the value of the *MicrosoftExchangeRecipientPrimarySmtpAddress* parameter and the *MicrosoftExchangeRecipientEmailAddresses* parameter are the same.
MicrosoftExchangeRec	Optional	Microsoft.Exchange.Co	This parameter is

ipientReplyRecipient		nfiguration.Tasks.RecipientIdParameter	available only in on-premises Exchange 2013. The *MicrosoftExchangeRecipientReplyRecipient* parameter specifies the recipient that should receive messages sent to the Exchange recipient. Typically, you would configure a mailbox to receive the messages sent to the Exchange recipient. You can use any of the following values for the specified recipient: • DN • Canonical name • GUID • Name • Display name • Alias • Exchange DN • Primary SMTP email address If you don't configure a recipient for the Exchange recipient, messages sent to the Exchange recipient are discarded.
OrganizationSummary	Optional	Microsoft.Exchange.Data.MultiValuedPropert	This parameter is available only in on-

		y	premises Exchange 2013. The *OrganizationSummary* parameter specifies a summarized description that best represents your organization.
PreferredInternetCodePageForShiftJis	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
PublicComputersDetectionEnabled	Optional	System.Boolean	The *PublicComputersDetectionEnabled* parameter specifies whether Exchange Online will detect when a user signs in to Outlook Web App from a public or private computer or network, and then enforces the attachment handling settings from public networks. The default is `$false`. However, if you set this parameter to `$true`, Exchange Online will determine if the user is signing in to Outlook Web App from a public computer, and all public attachment handling rules will be applied and enforced.

PublicFolderMigrationComplete	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *PublicFolderMigrationComplete* parameter is used during public folder migration. When you set the *PublicFolderMigrationComplete* parameter to `$true`, transport starts rerouting the queued messages to a new destination. The default value is `$false`.
PublicFoldersEnabled	Optional	Microsoft.Exchange.Data.Directory.PublicFoldersDeployment	The *PublicFoldersEnabled* parameter specifies how public folders are deployed in your organization. This parameter uses one of the following values. • `Local` The public folders are deployed locally in your organization. • `Remote` The public folders are deployed in the remote forest. • `None` No public folders are deployed for this organization.
PublicFoldersLockedF	Optional	System.Boolean	This parameter is available only in on-

orMigration			premises Exchange 2013. The *PublicFoldersLockedForMigration* parameter specifies whether users are locked out from accessing down level public folder servers. When you set the *PublicFoldersLockedForMigration* parameter to `$true`, users are locked out from accessing down level public folder servers. This is used for public folder migration during final stages. The default value is `$false`, which means that the user is able to access public folder servers.
ReadTrackingEnabled	Optional	System.Boolean	The *ReadTrackingEnabled* parameter specifies whether the tracking for read status for messages in an organization is enabled. The default value is `$false`.
ReleaseTrack	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ReleaseTrack	This parameter is reserved for internal Microsoft use.

RemotePublicFolderMailboxes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RemotePublicFolderMailboxes* parameter specifies the identities of the public folder objects (represented as mail user objects locally) corresponding to the public folder mailboxes created in the remote forest. The public folder values set here are used only if the public folder deployment is a remote deployment.
RequiredCharsetCoverage	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
RmsoSubscriptionStatus	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RmsoSubscriptionStatusFlags	This parameter is reserved for internal Microsoft use.
SCLJunkThreshold	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *SCLJunkThreshold* parameter specifies the spam confidence level (SCL) threshold. Messages with an SCL greater than the value that you specify for the *SCLJunkThreshold*

			parameter are moved to the Junk Email folder. Valid values are integers from 0 through 9, inclusive.
SharePointUrl	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
SIPAccessService	Optional	Microsoft.Exchange.Data.ProtocolConnectionSettings	This parameter is reserved for internal Microsoft use.
SIPSessionBorderController	Optional	Microsoft.Exchange.Data.ProtocolConnectionSettings	This parameter is reserved for internal Microsoft use.
SiteMailboxCreationURL	Optional	System.Uri	The *SiteMailboxCreationURL* parameter specifies whether to create a site from a Microsoft Exchange Server 2013 mailbox. **Note:** The mailbox must be running Microsoft Outlook 2013.
TenantRelocationsAllowed	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
UMAvailableLanguages	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The

			UMAvailableLanguages parameter will be removed in future versions of the product.
WACDiscoveryEndpoint	Optional	System.String	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-ADPermission** cmdlet to add permissions to an Active Directory object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-ADPermission -Identity <ADRawEntryIdParameter> -Owner
<SecurityPrincipalIdParameter> <COMMON PARAMETERS>

Add-ADPermission -Identity <ADRawEntryIdParameter> -User
<SecurityPrincipalIdParameter> [-AccessRights <ActiveDirectoryRights[]>]
[-ChildObjectTypes <ADSchemaObjectIdParameter[]>] [-Deny
<SwitchParameter>] [-ExtendedRights <ExtendedRightIdParameter[]>] [-
InheritanceType <None | All | Descendents | SelfAndChildren | Children>]
[-InheritedObjectType <ADSchemaObjectIdParameter>] [-Properties
<ADSchemaObjectIdParameter[]>] <COMMON PARAMETERS>
```

```
Add-ADPermission -Instance <ADAcePresentationObject> [-AccessRights
<ActiveDirectoryRights[]>] [-ChildObjectTypes <ADSchemaObjectIdParameter[]
>] [-Deny <SwitchParameter>] [-ExtendedRights <ExtendedRightIdParameter[]
>] [-Identity <ADRawEntryIdParameter>] [-InheritanceType <None | All |
Descendents | SelfAndChildren | Children>] [-InheritedObjectType

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example grants Send As permissions for Aaron Painter to Terry Adams's mailbox.

```
Add-ADPermission -Identity "Terry Adams" -User AaronPainter
-AccessRights ExtendedRight -ExtendedRights "Send As"
```

EXAMPLE 2

This example configures the IP Secured Inbound Receive connector to accept anonymous SMTP messages.

Caution:

This example assumes that another security mechanism is used to ensure the Receive connector can't be used to send unsolicited commercial email messages. We recommend that you don't allow external clients to send messages anonymously through a Receive connector.

```
Add-AdPermission "IP Secured Inbound" -User "NT AUTHORITY
\ANONYMOUS LOGON" -ExtendedRights ms-Exch-SMTP-Submit,ms-
Exch-SMTP-Accept-Any-Recipient,ms-Exch-Bypass-Anti-Spam
```

Detailed Description

The **ADPermission** cmdlets can be used to directly modify Active Directory access control lists (ACLs). Although some Microsoft Exchange Server 2013 features may continue to use the **ADPermission** cmdlets to manage permissions, for example transport Send and Receive connectors, Exchange 2013 no longer uses customized ACLs to manage administrative permissions. If you want to grant or deny administrative permissions in Exchange 2013, you must use Role Based Access Control (RBAC). For more information about RBAC, see Permissions.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Legacy permissions" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ADRawEntryIdParameter	The *Identity* parameter specifies the identity of the object that's getting permissions added. You can specify either the distinguished name (DN) of the object or the object's name if it's unique. If the DN or name contains spaces, enclose the name in quotation marks (").
Instance	Required	Microsoft.Exchange.Management.RecipientTasks.ADAcePresentationObject	The *Instance* parameter enables you to pass an entire object to the command to be processed. It's mainly used in scripts where an entire object must be passed to the command.
Owner	Required	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *Owner* parameter specifies the owner of the Active Directory object. If the name of the owner contains spaces, enclose the name in quotation marks ("). The *Owner* parameter can only be used with the

			Identity parameter and no other parameters.
User	Required	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *User* parameter specifies the user that the permissions are being granted to on the object. If the name contains spaces, enclose the name in quotation marks (").
AccessRights	Optional	System.DirectoryServices.ActiveDirectoryRights[]	The *AccessRights* parameter specifies the rights needed to perform the operation. Valid values include: • `CreateChild` • `DeleteChild` • `ListChildren` • `Self` • `ReadProperty` • `WriteProperty` • `DeleteTree` • `ListObject` • `ExtendedRight` • `Delete` • `ReadControl` • `GenericExecute` • `GenericWrite` • `GenericRead` • `WriteDacl` • `WriteOwner` • `GenericAll` • `Synchronize` • `AccessSystemSecurity`
ChildObjectTypes	Optional	Microsoft.Exchange.Configuration.Tasks.ADSchemaObjectIdParameter[]	The *ChildObjectTypes* parameter specifies what type of object the permission should be applied to. The *ChildObjectTypes* parameter can only be

			used if the *AccessRights* parameter is set to `CreateChild` or `DeleteChild`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Deny	Optional	System.Management.Automation.SwitchParameter	The *Deny* switch specifies whether to deny permissions to the user on the Active Directory object.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge

			Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExtendedRights	Optional	Microsoft.Exchange.Configuration.Tasks.ExtendedRightIdParameter[]	The *ExtendedRights* parameter specifies the extended rights needed to perform the operation.
InheritanceType	Optional	System.DirectoryServices.ActiveDirectorySecurityInheritance	The *InheritanceType* parameter specifies whether permissions are inherited.
InheritedObjectType	Optional	Microsoft.Exchange.Configuration.Tasks.ADSchemaObjectIdParameter	The *InheritedObjectType* parameter specifies what kind of object inherits this access control entry (ACE).
Properties	Optional	Microsoft.Exchange.Configuration.Tasks.ADSchemaObjectIdParameter[]	The *Properties* parameter specifies what properties the object contains. The *Properties* parameter can only be used if the *AccessRights* parameter is set to `ReadProperty`, `writeProperty` or `Self`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ADPermission

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ADPermission** cmdlet to get permissions on an Active Directory object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ADPermission [-User <SecurityPrincipalIdParameter>] <COMMON
PARAMETERS>

Get-ADPermission [-Owner <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <ADRawEntryIdParameter> [-DomainController
<Fqdn>]
```

Examples

EXAMPLE 1

This example returns the permissions that have been applied to the user Ed.

```
Get-ADPermission -Identity Ed
```

EXAMPLE 2

This example returns the permissions that have been granted to the user Chris on the Contoso.com Receive connector.

```
Get-ADPermission "Contoso.com" -User Chris
```

Detailed Description

The **ADPermission** cmdlets can be used to directly modify Active Directory access control lists (ACLs). Although some Microsoft Exchange Server 2013 features may continue to use the **ADPermission** cmdlets to manage permissions, for example transport Send and Receive connectors, Exchange 2013 no longer uses customized ACLs to manage administrative permissions. If you want to grant or deny administrative permissions in Exchange 2013, you must use Role Based Access Control (RBAC). For more information about RBAC, see Permissions.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Legacy permissions" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ADRawEntryIdParameter	The *Identity* parameter specifies the identity of the object for which you're retrieving permissions. You can retrieve the permissions for any Active Directory object

			using its distinguished name (DN). If the object is an Exchange object, you might be able to use the object's name. If the DN or the object's name contains spaces, enclose the value in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Owner	Optional	System.Management.Automation.SwitchParameter	The *Owner* switch specifies that the owner of the object specified in the *Identity* parameter should be returned. If the *Owner*

			switch is used, the *User* parameter can't be used.
User	Optional	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *User* parameter specifies that only the access control entries (ACEs) granted to the specified user on the object specified in the *Identity* parameter should be returned. If the *User* parameter is used, the *Owner* switch can't be used. If the name of the user contains spaces, enclose the name in quotation marks (").

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ADPermission

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ADPermission** cmdlet to remove permissions from an Active Directory object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ADPermission -Identity <ADRawEntryIdParameter> -User
<SecurityPrincipalIdParameter> [-AccessRights <ActiveDirectoryRights[]>]
[-ChildObjectTypes <ADSchemaObjectIdParameter[]>] [-Deny
<SwitchParameter>] [-ExtendedRights <ExtendedRightIdParameter[]>] [-
InheritanceType <None | All | Descendents | SelfAndChildren | Children>]
[-InheritedObjectType <ADSchemaObjectIdParameter>] [-Properties
<ADSchemaObjectIdParameter[]>] <COMMON PARAMETERS>

Remove-ADPermission -Identity <ADRawEntryIdParameter> <COMMON PARAMETERS>

Remove-ADPermission -Instance <ADAcePresentationObject> [-AccessRights
<ActiveDirectoryRights[]>] [-ChildObjectTypes <ADSchemaObjectIdParameter[]
>] [-Deny <SwitchParameter>] [-ExtendedRights <ExtendedRightIdParameter[]
>] [-Identity <ADRawEntryIdParameter>] [-InheritanceType <None | All |
Descendents | SelfAndChildren | Children>] [-InheritedObjectType
<ADSchemaObjectIdParameter>] [-Properties <ADSchemaObjectIdParameter[]>]
[-User <SecurityPrincipalIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the *Send As* permissions from user Kim on the user Administrator.

```
Remove-ADPermission -Identity Administrator -User Kim -
ExtendedRights "Send As"
```

EXAMPLE 2

This example removes the ability for anonymous users to send messages through the Receive connector IP Secured Inbound.

```
Remove-ADPermission "IP Secured Inbound" -User "NT
AUTHORITY\ANONYMOUS LOGON" -ExtendedRights ms-Exch-SMTP-
Submit,ms-Exch-SMTP-Accept-Any-Recipient,ms-Exch-Bypass-
Anti-Spam
```

Detailed Description

The **ADPermission** cmdlets can be used to directly modify Active Directory access control lists (ACLs). Although some Microsoft Exchange Server 2013 features may continue to use the

ADPermission cmdlets to manage permissions, for example transport Send and Receive connectors, Exchange 2013 no longer uses customized ACLs to manage administrative permissions. If you want to grant or deny administrative permissions in Exchange 2013, you must use Role Based Access Control (RBAC). For more information about RBAC, see Permissions.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Legacy permissions" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ADRawEntryIdParameter	The *Identity* parameter specifies the object from which the permission should be removed. You can specify either the distinguished name (DN) of the object or the object's name if it's unique. If the DN or name contains spaces, enclose the name in quotation marks (").
Instance	Required	Microsoft.Exchange.Management.RecipientTasks.ADAcePresentationObject	The *Instance* parameter enables you to pass an entire object to the command to be processed. It's mainly used in scripts where an entire object must be passed to the command.
User	Required	Microsoft.Exchange.Configuration.Tasks.Secu	The *User* parameter specifies the user object

		rityPrincipalIdParameter	that will have permissions removed.
AccessRights	Optional	System.DirectoryServices.ActiveDirectoryRights[]	The *AccessRights* parameter specifies the rights needed to perform the operation. Valid values include: • `CreateChild` • `DeleteChild` • `ListChildren` • `Self` • `ReadProperty` • `WriteProperty` • `DeleteTree` • `ListObject` • `ExtendedRight` • `Delete` • `ReadControl` • `GenericExecute` • `GenericWrite` • `GenericRead` • `WriteDacl` • `WriteOwner` • `GenericAll` • `Synchronize` • `AccessSystemSecurity`
ChildObjectTypes	Optional	Microsoft.Exchange.Configuration.Tasks.ADSchemaObjectIdParameter[]	The *ChildObjectTypes* parameter specifies what type of object the permission should be removed from. The *ChildObjectTypes* parameter can only be used if the *AccessRights* parameter is set to `CreateChild` or `DeleteChild`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that

			appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
Deny	Optional	System.Management.Automation.SwitchParameter	The *Deny* switch specifies whether the permission to remove is a deny permission.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExtendedRights	Optional	Microsoft.Exchange.Configuration.Tasks.Exte	The *ExtendedRights* parameter specifies the

		ndedRightIdParameter[]	extended rights to remove.
InheritanceType	Optional	System.DirectoryServices.ActiveDirectorySecurityInheritance	The *InheritanceType* parameter specifies whether permissions are inherited.
InheritedObjectType	Optional	Microsoft.Exchange.Configuration.Tasks.ADSchemaObjectIdParameter	The *InheritedObjectType* parameter specifies what kind of object inherits this access control entry (ACE).
Properties	Optional	Microsoft.Exchange.Configuration.Tasks.ADSchemaObjectIdParameter[]	The *Properties* parameter specifies what properties the object contains. The *Properties* parameter can only be used if the *AccessRights* parameter is set to `ReadProperty`, `WriteProperty`, or `Self`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ManagementRole

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ManagementRole** cmdlet to view management roles that have been created in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ManagementRole [-Cmdlet <String>] [-CmdletParameters <String[]>] [-
Identity <RoleIdParameter>] [-RoleType <Custom | UnScoped |

NetworkingManagement>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example lists all the roles that have been created in your organization.

```
Get-ManagementRole
```

EXAMPLE 2

This example lists all the roles that are children of the Mail Recipients management role. The command performs a recursive query of all the child roles of the specified parent role. This recursive query finds every child role from the immediate children of the parent to the last child role in the hierarchy. In a recursive list, the parent role is also returned in the list.

```
Get-ManagementRole "Mail Recipients" -Recurse
```

EXAMPLE 3

This example lists all the roles that contain both the *Identity* and *Database* parameters. Roles that contain only one parameter or the other aren't returned.

```
Get-ManagementRole -CmdletParameters Identity, Database
```

EXAMPLE 4

This example lists all the roles that have a type of `UnScopedTopLevel`. These roles contain custom scripts or non-Exchange cmdlets.

```
Get-ManagementRole -RoleType UnScopedTopLevel
```

EXAMPLE 5

This example retrieves only the Transport Rules role and passes the output of the **Get-ManagementRole** cmdlet to the **Format-List** cmdlet. The **Format-List** cmdlet then shows only the *Name* and *RoleType* properties of the Transport Rules role. For more information about pipelining and the **Format-List** cmdlet, see Pipelining and Working with command output.

```
Get-ManagementRole "Transport Rules" | Format-List Name,
RoleType
```

EXAMPLE 6

This example lists the immediate children of the Mail Recipients role. Only the child roles that hold the Mail Recipients role as their parent role are returned. The Mail Recipients role isn't returned in the list.

```
Get-ManagementRole "Mail Recipients" -GetChildren
```

Detailed Description

You can view management roles in several ways, from listing all the roles in your organization to listing only the child roles of a specified parent role. You can also view the details of a specific role by piping the output of the **Get-ManagementRole** cmdlet to the **Format-List** cmdlet.

For more information about management roles, see Understanding management roles.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
GetChildren	Required	System.Management.Automation.SwitchParameter	The *GetChildren* parameter retrieves a list of all the roles that were created based on the parent role specified in the *Identity* parameter. Only the immediate child roles of the parent role are

			included. The *GetChildren* parameter can only be used with the *Identity* and *RoleType* parameters.
Recurse	Required	System.Management.Automation.SwitchParameter	The *Recurse* parameter retrieves a list of all the roles that were created based on the parent role specified in the *Identity* parameter. The role specified in the *Identity* parameter, its child roles, and their children are returned. The *Recurse* parameter can only be used with the *Identity* and *RoleType* parameters.
Cmdlet	Optional	System.String	The *Cmdlet* parameter returns a list of all roles that include the specified cmdlet.
CmdletParameters	Optional	System.String[]	The *CmdletParameters* parameter returns a list of all roles that include the specified parameter or parameters. You can specify more than one parameter by separating each

			parameter with a comma. If you specify multiple parameters, only the roles that include all of the specified parameters are returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter	The *Identity* parameter specifies the role you want to view. If the role you want to view contains spaces, enclose the name in quotation marks ("). You can use the wildcard character (*) and a partial role name to match multiple roles.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.Orga	The *Organization* parameter is reserved

		nizationIdParameter	for internal Microsoft use.
RoleType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RoleType	The *RoleType* parameter returns a list of roles that match the specified role type. For a list of valid role types, see Understanding management roles.
Script	Optional	System.String	The *Script* parameter returns a list of all roles that include the specified script.
ScriptParameters	Optional	System.String[]	The *ScriptParameters* parameter returns a list of all roles that include the specified parameter or parameters. You can specify more than one parameter by separating each parameter with a comma. If you specify multiple parameters, only the roles that include all of the specified parameters are returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ManagementRole

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-ManagementRole** cmdlet to create a management role based on an existing role or create an unscoped management role.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ManagementRole -Parent <RoleIdParameter> <COMMON PARAMETERS>

New-ManagementRole -UnScopedTopLevel <SwitchParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
Description <String>] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-Organization <OrganizationIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the management role Redmond Journaling View-Only based on the Journaling parent role.

```
New-ManagementRole -Name "Redmond Journaling View-Only" -
Parent Journaling
```

After the role is created, the **Remove-ManagementRoleEntry** cmdlet is used along with the **Where** cmdlet to remove all the management role entries that aren't needed on the role. You can't add role entries to the newly created role because it already has all the role entries that exist on its parent role, Journaling. The *WhatIf* switch is used to verify that the correct role entries are removed.

```
Get-ManagementRoleEntry "Redmond Journaling View-Only\*" |
Where { $_.Name -NotLike "Get*" } | Remove-
ManagementRoleEntry -WhatIf
```

After confirmation that the command removes the correct role entries, the same command is run again without the *WhatIf* switch.

```
Get-ManagementRoleEntry "Redmond Journaling View-Only\*" |
Where { $_.Name -NotLike "Get*" } | Remove-
ManagementRoleEntry
```

For more information about pipelining and the **Where** cmdlet, see the following topics:

- Pipelining
- Working with command output

EXAMPLE 2

This example creates the unscoped management role In-house scripts. The user running the command, or the role group the user is a member of, is assigned the Unscoped Role Management management role. This assignment is required to use the *UnScopedTopLevel* switch.

```
New-ManagementRole -Name "In-house scripts" -
UnScopedTopLevel
```

Detailed Description

You can either create a management role based on an existing role, or you can create an unscoped role that's empty. If you create a role based on an existing role, you start with the management role entries that exist on the existing role. You can then remove entries to customize the role. If you create an unscoped role, the role can contain custom scripts or cmdlets that aren't part of Exchange.

Caution:
An unscoped role doesn't have any scope restrictions applied. Scripts or third-party cmdlets included in an unscoped role can view or modify any object in the Exchange organization. The ability to create an unscoped management role isn't granted by default. To create an unscoped management role, you must assign the Unscoped Role Management management role to a role group you're a member of. For more information about how to create an unscoped management role, see Create an unscoped role.

After you create a role, you can change the management role entries on the role and assign the role with a management scope to a user or universal security group (USG).

For more information about management roles, see Understanding management roles.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the role. The maximum length of the name is 64 characters. If the name contains spaces, enclose the name in quotation marks (").
Parent	Required	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter	The *Parent* parameter specifies the identity of the role to copy. If the name of the role contains spaces, enclose the name in quotation marks ("). If you specify the *Parent* parameter, you can't use the *UnScopedTopLevel* switch.
UnScopedTopLevel	Required	System.Management.Automation.SwitchParameter	The *UnScopedTopLevel* switch specifies that the role should be a custom, empty role. If you specify the

			UnScopedTopLevel switch, you can't use the *Parent* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies the description that's displayed when the management role is viewed using the **Get-ManagementRole** cmdlet. Enclose the description in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on

			the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ManagementRole

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ManagementRole** cmdlet to remove custom management roles that you don't need anymore.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ManagementRole -Identity <RoleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Recurse <SwitchParameter>] [-UnScopedTopLevel <SwitchParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the single role ExampleRole1.

```
Remove-ManagementRole ExampleRole1
```

EXAMPLE 2

This example runs the **Remove-ManagementRole** cmdlet with the *WhatIf* switch. The *WhatIf* switch lets the command run as if it were going to perform the action you specified but doesn't commit any changes. Instead, it displays the results of what would have happened, so you can verify that the actions are correct.

```
Remove-ManagementRole ExampleRole2 -Recurse -WhatIf
```

If the results are as expected, the following command can be used to remove the `ExampleRole2` parent role and all its child roles.

```
Remove-ManagementRole ExampleRole2 -Recurse
```

EXAMPLE 3

This example uses the **Get-ManagementRole** cmdlet to get a list of roles that contain the string "Example" in the role name, and then pipes the list to the **Remove-ManagementRole** cmdlet. The **Remove-ManagementRole** cmdlet, because the *WhatIf* switch is specified, displays the roles that would have been removed but doesn't commit any changes. If the results are as expected, the command can be run again without the *WhatIf* switch to remove the roles.

```
Get-ManagementRole *Example* | Remove-ManagementRole -
WhatIf
```

EXAMPLE 4

This example removes the In-house scripts unscoped top-level management role. Because this is an unscoped top-level role, the *UnScopedTopLevel* switch must be used.

```
Remove-ManagementRole "In-house scripts" -UnScopedTopLevel
```

For more information about unscoped top-level management roles, see Understanding management roles.

Detailed Description

You need to remove all the management role assignments from a role before you delete it. If the role is the parent of child roles, the child roles must be removed before you remove the parent role, or you must use the *Recurse* parameter when you remove the parent role. You can only remove custom roles. Built-in roles, such as the Mail Recipients role, can't be removed. For more information about how to remove a custom role, see Remove a role.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management roles" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter	The *Identity* parameter specifies the custom role to remove. If the name of the role contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
Recurse	Optional	System.Management.Automation.SwitchParameter	The *Recurse* parameter removes all child roles of the role specified with the *Identity* parameter, and then removes the specified role. **Caution:** The *Recurse* parameter removes all child roles of the specified role. We recommend that you first

			use the command with the *WhatIf* switch to confirm that the action to be taken is correct.
UnScopedTopLevel	Optional	System.Management.Automation.SwitchParameter	The *UnScopedTopLevel* switch specifies that the role you're trying to remove is an unscoped top-level role. You must use this switch if you want to remove an unscoped top-level role.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ManagementRoleAssignment

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ManagementRoleAssignment** cmdlet to retrieve management role assignments.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ManagementRoleAssignment [-AssignmentMethod <AssignmentMethod[]>] [-
Role <RoleIdParameter>] [-RoleAssignee <RoleAssigneeIdParameter>] <COMMON
PARAMETERS>

Get-ManagementRoleAssignment [-Identity <RoleAssignmentIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-ConfigWriteScope <None | NotApplicable |
OrganizationConfig | CustomConfigScope | PartnerDelegatedTenantScope |
ExclusiveConfigScope>] [-CustomConfigWriteScope
<ManagementScopeIdParameter>] [-CustomRecipientWriteScope
<ManagementScopeIdParameter>] [-Delegating <$true | $false>] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-Exclusive <$true |
$false>] [-ExclusiveConfigWriteScope <ManagementScopeIdParameter>] [-
ExclusiveRecipientWriteScope <ManagementScopeIdParameter>] [-
GetEffectiveUsers <SwitchParameter>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-Organization <OrganizationIdParameter>] [-
RecipientOrganizationalUnitScope <OrganizationalUnitIdParameter>] [-
RecipientWriteScope <None | NotApplicable | Organization | MyGAL | Self |
MyDirectReports | OU | CustomRecipientScope | MyDistributionGroups |
MyExecutive | ExclusiveRecipientScope | MailboxICanDelegate>] [-
RoleAssigneeType <User | SecurityGroup | RoleAssignmentPolicy |
MailboxPlan | ForeignSecurityPrincipal | RoleGroup |
PartnerLinkedRoleGroup | LinkedRoleGroup | Computer>] [-WritableDatabase
<DatabaseIdParameter>] [-WritableRecipient <GeneralRecipientIdParameter>]
[-WritableServer <ServerIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the Denver Help Desk role assignment using the **Get-ManagementRoleAssignment** cmdlet and pipes the output to the **Format-List** cmdlet. For more information about the **Format-List** cmdlet, see Working with command output.

```
Get-ManagementRoleAssignment "Denver Help Desk" | Format-
List
```

EXAMPLE 2

This example retrieves all the role assignments that are enabled and have been designated as delegating role assignments.

```
Get-ManagementRoleAssignment -Enabled $true -Delegating
$true
```

EXAMPLE 3

This example retrieves all the role assignments that include the MyGAL recipient-based scope restriction type.

```
Get-ManagementRoleAssignment -RecipientWriteScope MyGAL
```

EXAMPLE 4

This example retrieves all the role assignments associated with the Organization Management management role.

```
Get-ManagementRoleAssignment -Role "Mail Recipients"
```

EXAMPLE 5

This example retrieves a list of all the users and the role assignments that can modify the recipient Bob.

```
Get-ManagementRoleAssignment -WritableRecipient Bob -
GetEffectiveUsers
```

EXAMPLE 6

This example retrieves a list of all exclusive scopes that can modify server objects that match Redmond Executive Servers. The command also lists the users who are effectively assigned the role assignments through role groups or USGs.

```
Get-ManagementRoleAssignment -ExclusiveConfigWriteScope
"Redmond Executive Servers" -GetEffectiveUsers
```

EXAMPLE 7

This example retrieves all the role assignments that can modify the database Contoso Sales.

```
Get-ManagementRoleAssignment -WritableDatabase "Contoso
Sales"
```

Detailed Description

You can retrieve role assignments in a variety of ways including by assignment type, scope type, or name, and whether the assignment is enabled or disabled. You can also view a list of role assignments that provide access to a specified recipient, server, or database.

For more information about management role assignments, see Understanding management role assignments.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role assignments" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
AssignmentMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AssignmentMethod[]	The *AssignmentMethod* parameter specifies the type of role assignment to include in the results returned by the cmdlet. You can specify one or more of the following values: • `Direct` • `SecurityGroup` • `RoleGroup` • `RoleAssignmentPolicy` If you provide more than one value, separate each value with a comma. You must specify a value with the *RoleAssignee* parameter if you use the *AssignmentMethod* parameter.
ConfigWriteScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ConfigWrit	The *ConfigWriteScope* parameter specifies the type of management

		eScopeType	configuration scope to include in the results returned by the cmdlet. The valid values are `None`, `OrganizationConfig`, `CustomConfigScope`, and `ExclusiveConfigScope`.
CustomConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *CustomConfigWriteScope* parameter returns only the regular role assignments that include the specified configuration-based regular scope. This parameter can only be used to retrieve regular configuration-based scopes. To retrieve a list of exclusive configuration-based scopes, use the *ExclusiveConfigWriteScope* parameter instead. If the scope name contains spaces, enclose it in quotation marks (").
CustomRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.Man	The *CustomRecipientWriteSco*

		agementScopeIdParameter	*pe* parameter returns only the regular role assignments that include the specified recipient-based regular scope. This parameter can only be used to retrieve regular recipient-based scopes. To retrieve a list of exclusive recipient-based scopes, use the *ExclusiveRecipientWriteScope* parameter instead. If the scope name contains spaces, enclose it in quotation marks (").
Delegating	Optional	System.Boolean	The *Delegating* parameter specifies whether delegating or regular role assignments should be returned. By default, both delegating and regular scopes are returned. To return only delegating role assignments, specify a value of `$true`. To return only regular role assignments, specify a value of `$false`.
DomainController	Optional	Microsoft.Exchange.Da	This parameter is

		ta.Fqdn	available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether enabled or disabled role assignments should be returned. To return enabled role assignments, specify a value of `$true`. To return disabled role assignments, specify a value of `$false`.
Exclusive	Optional	System.Boolean	The *Exclusive* parameter specifies whether exclusive or regular role assignments should be returned. By default, both exclusive and regular scopes are returned. To return only exclusive role assignments, specify a value of `$true`. To return only regular role

			assignments, specify a value of `$false`.
ExclusiveConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *ExclusiveConfigWriteScope* parameter returns only the exclusive role assignments that include the specified configuration-based exclusive scope. This parameter can only be used to retrieve exclusive configuration-based scopes. To retrieve a list of regular configuration-based scopes, use the *CustomConfigWriteScope* parameter instead. If the scope name contains spaces, enclose it in quotation marks (").
ExclusiveRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *ExclusiveRecipientWriteScope* parameter returns only the exclusive role assignments that include the specified recipient-

			based exclusive scope. This parameter can only be used to retrieve exclusive recipient-based scopes. To retrieve a list of regular recipient-based scopes, use the *CustomRecipientWriteScope* parameter instead. If the scope name contains spaces, enclose it in quotation marks (").
GetEffectiveUsers	Optional	System.Management.Automation.SwitchParameter	The *GetEffectiveUsers* switch specifies that the command should show the list of users in the role groups, assignment policies, or USGs associated with a role assignment. The users are effectively assigned the role assignment through their role group, assignment policy, or USG.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RoleAssignmentIdParameter	The *Identity* parameter specifies the name of the role assignment to retrieve. If the name of the role assignment contains spaces, enclose it in

			quotation marks ("). If the *RoleAssignee* parameter is used, you can't use the *Identity* parameter.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RecipientOrganizationalUnitScope	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientOrganizationalUnitScope* parameter returns only the role assignments that include the specified organizational unit (OU). If the OU tree contains spaces, enclose it in quotation marks (").
RecipientWriteScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RecipientWriteScopeType	The *RecipientWriteScope* parameter returns only the role assignments associated with the recipient scope restriction type specified. The valid values are `None`, `MyGAL`, `Self`, `OU`, `CustomRecipientScope`, `MyDistributionGroups`, and

			`ExclusiveRecipientScope`.
Role	Optional	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter	The *Role* parameter returns only the role assignments associated with the specified management role. If the name of the role contains spaces, enclose it in quotation marks (").
RoleAssignee	Optional	Microsoft.Exchange.Configuration.Tasks.RoleAssigneeIdParameter	The *RoleAssignee* parameter specifies the role group, assignment policy, user, or universal security group (USG) for which you want to view role assignments. If the *RoleAssignee* parameter is used, you can't use the *Identity* parameter. By default, the command returns both direct role assignments to the role assignee, and indirect role assignments granted to a role assignee through role groups or assignment policies. If the name of the user or USG contains spaces, enclose it in quotation marks (").

RoleAssigneeType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RoleAssigneeType	The *RoleAssigneeType* parameter specifies the type of role assignee to return. The valid values are `User`, `SecurityGroup`, `RoleAssignmentPolicy`, `ForeignSecurityPrincipal`, `RoleGroup`, `LinkedRoleGroup`, and `Computer`.
WritableDatabase	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	This parameter is available only in on-premises Exchange 2013. The *WritableDatabase* parameter specifies the database object you want to test to determine which role assignments allow it to be modified. The command takes into account the roles and scopes associated with each role assignment. If the database name contains spaces, enclose it in quotation marks ("). If this parameter is used with the *GetEffectiveUsers* switch, all the users who can modify the database object indirectly through role groups and USGs are

			also returned. Without the *GetEffectiveUsers* switch, only the role groups, users, and USGs directly assigned the role assignment are returned.
WritableRecipient	Optional	Microsoft.Exchange.Configuration.Tasks.GeneralRecipientIdParameter	The *WritableRecipient* parameter specifies the recipient object you want to test to determine which role assignments allow it to be modified. The command takes into account the roles and scopes associated with each role assignment. If the recipient name contains spaces, enclose it in quotation marks ("). If this parameter is used with the *GetEffectiveUsers* switch, all of the users who can modify the recipient object indirectly through role groups and USGs are also returned. Without the *GetEffectiveUsers* switch, only the role groups, users, and USGs directly assigned the role assignment are returned.

WritableServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	This parameter is available only in on-premises Exchange 2013. The *WritableServer* parameter specifies the server object you want to test to determine which role assignments allow it to be modified. The command takes into account the roles and scopes associated with each role assignment. If the server object name contains spaces, enclose it in quotation marks ("). If this parameter is used with the *GetEffectiveUsers* switch, all of the users who can modify the server object indirectly through role groups and USGs are also returned. Without the *GetEffectiveUsers* switch, only the role groups, users, and USGs directly assigned the role assignment are returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ManagementRoleAssignment

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-ManagementRoleAssignment** cmdlet to assign a management role to a management role group, management role assignment policy, user, or universal security group (USG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ManagementRoleAssignment -User <UserIdParameter> [-Delegating
<SwitchParameter>] <COMMON PARAMETERS>

New-ManagementRoleAssignment -SecurityGroup <SecurityGroupIdParameter> [-
Delegating <SwitchParameter>] <COMMON PARAMETERS>

New-ManagementRoleAssignment -Policy <MailboxPolicyIdParameter> <COMMON
PARAMETERS>

New-ManagementRoleAssignment -Computer <ComputerIdParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: -Role <RoleIdParameter> [-Confirm [<SwitchParameter>]]
[-CustomConfigWriteScope <ManagementScopeIdParameter>] [-
CustomRecipientWriteScope <ManagementScopeIdParameter>] [-DomainController
<Fqdn>] [-ExclusiveConfigWriteScope <ManagementScopeIdParameter>] [-
ExclusiveRecipientWriteScope <ManagementScopeIdParameter>] [-Force
<SwitchParameter>] [-IgnoreDehydratedFlag <SwitchParameter>] [-Name
<String>] [-Organization <OrganizationIdParameter>] [-
RecipientOrganizationalUnitScope <OrganizationalUnitIdParameter>] [-
RecipientRelativeWriteScope <None | NotApplicable | Organization | MyGAL |
Self | MyDirectReports | OU | CustomRecipientScope | MyDistributionGroups
| MyExecutive | ExclusiveRecipientScope | MailboxICanDelegate>] [-
UnScopedTopLevel <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example assigns the Mail Recipients role to the Tier 2 Help Desk role group.

```
New-ManagementRoleAssignment -Role "Mail Recipients" -
SecurityGroup "Tier 2 Help Desk"
```

EXAMPLE 2

This example assigns the MyVoiceMail role to the "Sales end-users" role assignment policy. First, the **IsEndUserRole** property on the MyVoiceMail role is verified to be sure it's set to `$true`, indicating it's an end-user role:

```
Get-ManagementRole "MyVoiceMail" | Format-Table Name,
IsEndUserRole
```

After the role has been verified to be an end-user role, the role is assigned to the "Sales end-users" role assignment policy.

```
New-ManagementRoleAssignment -Role "MyVoiceMail" -Policy
"Sales end-users"
```

EXAMPLE 3

This example assigns the Eng Help Desk role to the Eng HD Personnel role group. The assignment restricts the recipient write scope of the role to the contoso.com/Engineering/Users OU. Users who are members of the Eng HD Personnel role group can only create, modify, or remove objects contained within that OU.

```
New-ManagementRoleAssignment -Role "Eng Help Desk" -
SecurityGroup "Eng HD Personnel" -
RecipientOrganizationalUnitScope contoso.com/Engineering/
Users
```

EXAMPLE 4

This example assigns the Distribution Groups role to the North America Exec Assistants role group. The assignment restricts the recipient write scope of the role to the scope specified in the North America Recipients custom recipient management scope. Users who are members of the North America Exec Assistants role group can only create, modify, or remove distribution group objects that match the specified custom recipient management scope.

```
New-ManagementRoleAssignment -Role "Distribution Groups" -
SecurityGroup "North America Exec Assistants" -
```

```
CustomRecipientWriteScope "North America Recipients"
```

EXAMPLE 5

This example assigns the Exchange Servers role to John. Because John should only manage the servers running Exchange located in Sydney, the role assignment restricts the configuration write scope of the role to the scope specified in the Sydney Servers custom configuration role group. John can only manage servers that match the specified custom configuration management scope.

```
New-ManagementRoleAssignment -Name "Exchange Servers_John"
-Role "Exchange Servers" -User John -CustomConfigWriteScope
"Sydney Servers"
```

EXAMPLE 6

This example assigns the Mail Recipients role to the Executive Administrators role group. The assignment restricts the recipient write scope of the role to the scope specified in the Exclusive-Executive Recipients exclusive recipient management scope. Because the Exclusive-Executive Recipients scope is an exclusive scope, only users of the Executive Administrators can manage the executive recipients that match the exclusive recipient scope. No other users, unless they're also assigned an assignment that uses an exclusive scope that matches the same users, can modify the executive recipients.

```
New-ManagementRoleAssignment -Name "Excl-Mail
Recipients_Executive Administrators" -Role "Mail
Recipients" -SecurityGroup "Executive Administrators" -
ExclusiveRecipientWriteScope "Exclusive-Executive
Recipients"
```

EXAMPLE 7

This example assigns the Mail Recipients role to the Contoso Sub - Seattle role group. The administrators in this role group should only be allowed to create and manage mail recipients in specific databases that have been allocated for use by the Contoso subsidiary, A. Datum Corporation (adatum.com). Also, this group of administrators should only be allowed to manage the Contoso employees located in the Seattle office. This is done by creating a role assignment with both a database scope, to limit management of mail recipients to only the databases in the database scope, and a recipient OU scope, to limit access to only the recipient objects within the Contoso Seattle OU.

```
New-ManagementRoleAssignment -Name "Mail Recipients_Contoso
Seattle" -Role "Mail Recipients" -SecurityGroup "Contoso
Sub - Seattle" -CustomConfigWriteScope "Contoso Databases"
-RecipientOrganizationalUnitScope adatum.com/Contoso/
```

```
Seattle/Users
```

Detailed Description

When you add a new role assignment, you can specify a built-in or custom role that was created using the **New-ManagementRole** cmdlet and specify an organizational unit (OU) or predefined or custom management scope to restrict the assignment.

You can create custom management scopes using the **New-ManagementScope** cmdlet and can view a list of existing scopes using the **Get-ManagementScope** cmdlet. If you choose not to specify an OU, or predefined or custom scope, the implicit write scope of the role applies to the role assignment.

For more information about management role assignments, see Understanding management role assignments.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role assignments" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Computer	Required	Microsoft.Exchange.Configuration.Tasks.ComputerIdParameter	This parameter is available only in on-premises Exchange 2013. The *Computer* parameter specifies the name of the computer to assign the management role to. If you specify the *Computer* parameter, you can't specify the *SecurityGroup*, *User*, or *Policy* parameters.

Policy	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Policy* parameter specifies the name of the management role assignment policy to assign the management role to. The **IsEndUserRole** property of the role you specify using the *Role* parameter must be set to `$true`. If you specify the *Policy* parameter, you can't specify the *SecurityGroup*, *Computer*, or *User* parameters. If the policy name contains spaces, enclose the name in quotation marks (").
Role	Required	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter	The *Role* parameter specifies the existing role to assign. If the role name contains spaces, enclose the name in quotation marks (").
SecurityGroup	Required	Microsoft.Exchange.Configuration.Tasks.SecurityGroupIdParameter	The *SecurityGroup* parameter specifies the name of the management role group or universal USG to assign the management

			role to. If you specify the *SecurityGroup* parameter, you can't specify the *Policy*, *Computer*, or *User* parameters. If the role group or USG name contains spaces, enclose the name in quotation marks (").
User	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *User* parameter specifies the name or alias of the user to assign the management role to. If you specify the *User* parameter, you can't specify the *SecurityGroup*, *Computer*, or *Policy* parameters. If the value contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
CustomConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *CustomConfigWriteScope* parameter specifies the existing configuration scope to associate with this management role assignment. If you use the *CustomConfigWriteScope* parameter you can't use the *ExclusiveConfigWriteScope* parameter. If the management scope name contains spaces, enclose the name in quotation marks (").
CustomRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *CustomRecipientWriteScope* parameter specifies the existing recipient-based management scope to associate with

			this management role assignment. If the management scope name contains spaces, enclose the name in quotation marks ("). If you use the *CustomRecipientWriteScope* parameter, you can't use the *RecipientOrganizationalUnitScope* or *ExclusiveRecipientWriteScope* parameters.
Delegating	Optional	System.Management.Automation.SwitchParameter	The *Delegating* parameter specifies whether the user or USG assigned to the role can delegate the role to other users or groups. You don't have to specify a value with the *Delegating* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
ExclusiveConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *ExclusiveConfigWriteScope* parameter specifies the exclusive configuration-based management scope to associate with the new role assignment. If you use the *ExclusiveConfigWriteScope* parameter, you can't use the *CustomConfigWriteScope* parameter. If the scope name contains spaces, enclose the name in quotation marks (").
ExclusiveRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *ExclusiveRecipientWriteScope* parameter specifies the exclusive recipient-based management scope to

			associate with the new role assignment. If you use the *ExclusiveRecipientWriteScope* parameter, you can't use the *CustomRecipientWriteScope* or *RecipientOrganizationalUnitScope* parameters. If the scope name contains spaces, enclose the name in quotation marks (").
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.

IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	The *Name* parameter specifies a name for the new management role assignment. The maximum length of the name is 64 characters. If the management role assignment name contains spaces, enclose the name in quotation marks ("). If you don't specify a name, one will be created automatically.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RecipientOrganizationalUnitScope	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientOrganizationalUnitScope* parameter specifies the OU to scope the new role assignment to. If you use the *RecipientOrganizationalUnitScope* parameter, you can't use the

			CustomRecipientWriteScope or *ExclusiveRecipientWriteScope* parameters. To specify an OU, use the syntax: *domain/ou*. If the OU name contains spaces, enclose the domain and OU in quotation marks (").
RecipientRelativeWriteScope	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RecipientWriteScopeType	The *RecipientRelativeWriteScope* parameter specifies the type of restriction to apply to a recipient scope. The available types are `None`, `Organization`, `MyGAL`, `Self`, and `MyDistributionGroups`. The *RecipientRelativeWriteScope* parameter is automatically set when the *CustomRecipientWriteScope* or *RecipientOrganizationalUnitScope* parameters are used. **Note:** Even though the `NotApplicable`, `OU`,

			`MyDirectReports`, `CustomRecipientScope`, `MyExecutive`, `MailboxICanDelegate` and `ExclusiveRecipientScope` values appear in the syntax block for this parameter, they can't be used directly on the command line. They are used internally by the cmdlet.
UnScopedTopLevel	Optional	System.Management.Automation.SwitchParameter	The *UnScopedTopLevel* switch specifies that the role provided with the *Role* parameter is an unscoped top level management role. You can only create a role assignment using the *UnScopedTopLevel* switch if the role specified using the *Role* parameter is an unscoped top level role.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ManagementRoleAssignment

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ManagementRoleAssignment** cmdlet to remove management role assignments.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ManagementRoleAssignment -Identity <RoleAssignmentIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Recipients_Seattle Recipient Management role assignment.

```
Remove-ManagementRoleAssignment "Recipients_Seattle
Recipient Management"
```

EXAMPLE 2

This example retrieves a list of role assignments that begin with the string "Detroit" and attempts to remove them with the **Remove-ManagementRoleAssignment** cmdlet. Because the *WhatIf* switch is included with the **Remove-ManagementRoleAssignment** command, the command displays the changes that would have occurred but doesn't commit any changes.

```
Get-ManagementRoleAssignment Detroit* | Remove-
ManagementRoleAssignment -WhatIf
```

After the list of role assignments to be removed is confirmed, this command is used to remove the role assignments.

```
Get-ManagementRoleAssignment Detroit* | Remove-
ManagementRoleAssignment
```

Detailed Description

When you remove a role assignment, the management role group, management role assignment, user, or universal security group (USG) that was assigned the associated role can no longer access the cmdlets or parameters made available by the role. For more information about management role assignments, see Understanding management role assignments.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role assignments" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleAssignmentIdParameter	The *Identity* parameter specifies the name of the role assignment to remove. If the role assignment name contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchPara	The *Confirm* switch causes the command to

		meter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't

			provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ManagementRoleAssignment

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ManagementRoleAssignment** cmdlet to modify existing management role assignments.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ManagementRoleAssignment [-CustomConfigWriteScope
<ManagementScopeIdParameter>] [-RecipientRelativeWriteScope <None |
NotApplicable | Organization | MyGAL | Self | MyDirectReports | OU |
CustomRecipientScope | MyDistributionGroups | MyExecutive |
ExclusiveRecipientScope | MailboxICanDelegate>] <COMMON PARAMETERS>

Set-ManagementRoleAssignment [-CustomConfigWriteScope
<ManagementScopeIdParameter>] [-CustomRecipientWriteScope
<ManagementScopeIdParameter>] <COMMON PARAMETERS>

Set-ManagementRoleAssignment [-CustomConfigWriteScope
<ManagementScopeIdParameter>] [-RecipientOrganizationalUnitScope
<OrganizationalUnitIdParameter>] <COMMON PARAMETERS>

Set-ManagementRoleAssignment [-ExclusiveConfigWriteScope
<ManagementScopeIdParameter>] [-ExclusiveRecipientWriteScope
<ManagementScopeIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <RoleAssignmentIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-Force <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the Mail Recipients_Denver Help Desk role assignment. When a role assignment is disabled, the users assigned the role can no longer run cmdlets granted by the role.

```
Set-ManagementRoleAssignment "Mail Recipients_Denver Help
Desk" -Enabled $false
```

EXAMPLE 2

This example changes the recipient scope for the MyGAL_KimA role assignment to MyGAL. When the recipient scope is changed to a predefined value, any previously defined OUs or custom scopes are overwritten.

```
Set-ManagementRoleAssignment "MyGAL_KimA" -
RecipientRelativeWriteScope MyGAL
```

EXAMPLE 3

This example restricts the Mail Recipients_Marketing Admins role assignment to the contoso.com/North America/Marketing/Users OU. Users who are members of the Marketing Admins role group assigned the role assignment can create, modify, and remove objects only in the specified OU. When the *RecipientOrganizationalUnitScope* parameter is used, any predefined or custom scopes on the role assignment are overwritten.

```
Set-ManagementRoleAssignment "Mail Recipients_Marketing
Admins" -RecipientOrganizationalUnitScope "contoso.com/
North America/Marketing/Users"
```

EXAMPLE 4

This example restricts the Distribution Groups_Cairns Admins role assignment using the Cairns Recipients custom recipient management scope. Users that are members of the Cairns Admins role group assigned the role assignment can create, modify, and remove only the distribution group objects that match the Cairns Recipients custom recipient management scope.

```
Set-ManagementRoleAssignment "Distribution Groups_Cairns
Admins" -CustomRecipientWriteScope "Cairns Recipients"
```

Detailed Description

When you modify a role assignment, you can specify a new predefined or custom management scope or provide an organizational unit (OU) to scope the existing role assignment.

You can create custom management scopes using the **New-ManagementScope** cmdlet and can view a list of existing scopes using the **Get-ManagementScope** cmdlet. If you choose not to specify an OU, predefined scope, or custom scope, the implicit write scope of the role applies to the role assignment.

For more information about management role assignments, see Understanding management role assignments.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role assignments" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.RoleAssignmentIdParameter	specifies the name of the management role assignment to modify. If the name of the management role contains spaces, enclose it in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CustomConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *CustomConfigWriteScope* parameter specifies the existing configuration management scope to associate with this management role assignment. If the management scope name contains spaces,

			enclose it in quotation marks ("). If you use the *CustomConfigWriteScope* parameter, you can't use the *ExclusiveConfigWriteScope* parameter. To remove a scope, specify a value of `$null`.
CustomRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *CustomRecipientWriteScope* parameter specifies the existing recipient-based management scope to associate with this management role assignment. If the management scope name contains spaces, enclose it in quotation marks ("). If you use the *CustomRecipientWriteScope* parameter, you can't use the *RecipientOrganizationalUnitScope*, *RecipientRelativeWriteScope*, or *ExclusiveRecipientWriteScope* parameters, and

			any configured OU or predefined scope on the role assignment is overwritten. To remove a scope, specify a value of `$null`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the management role assignment is enabled or disabled. The valid values are `$true` and `$false`.
ExclusiveConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *ExclusiveConfigWriteSco*

			pe parameter specifies the existing configuration exclusive management scope to associate with this management role assignment. If the management scope name contains spaces, enclose it in quotation marks ("). If you use the *ExclusiveConfigWriteScope* parameter, you can't use the *CustomConfigWriteScope* parameter. To remove a scope, specify a value of `$null`.
ExclusiveRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *ExclusiveRecipientWriteScope* parameter specifies the existing recipient-based exclusive management scope to associate with this management role assignment. If the management scope name contains spaces, enclose it in quotation marks (").

			If you use the *ExclusiveRecipientWriteScope* parameter, you can't use the *CustomRecipientWriteScope*, *RecipientOrganizationalUnitScope*, or *RecipientRelativeWriteScope* parameters, and any configured OU or predefined scope on the role assignment is overwritten. To remove a scope, specify a value of `$null`.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to

			specify a value with this parameter.
RecipientOrganizationalUnitScope	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientOrganizationalUnitScope* parameter specifies the OU to scope the new role assignment to. If the OU name contains spaces, enclose the domain and OU in quotation marks ("). If you use the *RecipientOrganizationalUnitScope* parameter, you can't use the *CustomRecipientWriteScope*, *ExclusiveRecipientWriteScope*, or *RecipientRelativeWriteScope* parameters, and any predefined scopes or custom scopes on the role assignment are overwritten. To specify an OU, use the syntax: *domain/ou*. To remove an OU, specify a value of `$null`.
RecipientRelativeWrite	Optional	Microsoft.Exchange.Dat	The *RecipientRelativeWriteS*

Scope		a.Directory.SystemConfiguration.RecipientWriteScopeType	*cope* parameter specifies the type of restriction to apply to a recipient scope. If you use the *RecipientRelativeWriteScope* parameter, you can't use the *CustomRecipientWriteScope*, *ExclusiveRecipientWriteScope*, or *RecipientOrganizationalUnitScope* parameters. The available types are: `None`, `Organization`, `MyGAL`, `Self`, and `MyDistributionGroups`. If you specify a predefined scope, any custom scope or configured OU on the role assignment is overwritten. **Note:** Even though the `NotApplicable`, `OU`, `MyDirectReports`, `CustomRecipientScope`, `MyExecutive`, `MailboxICanDelegate`, and `ExclusiveRecipientScope` values appear in the syntax block for this parameter, they can't be

			used directly on the command line. They're used internally by the cmdlet.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-ManagementRoleEntry

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Add-ManagementRoleEntry** cmdlet to add management role entries to an existing management role.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-ManagementRoleEntry -Identity <RoleEntryIdParameter> [-Parameters
<String[]>] [-PSSnapinName <String>] [-SkipScriptExistenceCheck
<SwitchParameter>] [-Type <Cmdlet | Script | ApplicationPermission |
WebService | All>] [-UnScopedTopLevel <SwitchParameter>] <COMMON
PARAMETERS>

Add-ManagementRoleEntry -ParentRoleEntry <RoleEntryIdParameter> -Role
<RoleIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-Overwrite <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds a new role entry for the **Get-Mailbox** cmdlet to the Recipient Administrators management role. The role entry for the **Get-Mailbox** cmdlet is added exactly as it's configured in the Recipient Administrators parent role.

```
Add-ManagementRoleEntry "Recipient Administrators\Get-
Mailbox"
```

EXAMPLE 2

This example adds a new role entry for the **Get-Mailbox** cmdlet to the Recipient Administrators role. Only the *Identity*, *Anr*, *Server*, and *Filter* parameters are added to the new role entry.

```
Add-ManagementRoleEntry "Recipient Administrators\Get-
Mailbox" -Parameters Identity, Anr, Server, Filter
```

EXAMPLE 3

This example uses the **Get-ManagementRoleEntry** cmdlet to retrieve a list of all the role entries that exist on the Mail Recipients management role that contain the string "Mailbox" in the cmdlet name, and then adds them to the Mailbox Administrators role using the **Add-ManagementRoleEntry** cmdlet. The role entries are added to the child role exactly as they're configured on the parent role.

```
Get-ManagementRoleEntry "Mail Recipients\*Mailbox*" | Add-
ManagementRoleEntry -Role "Mailbox Administrators"
```

EXAMPLE 4

This example adds the `MailboxAudit` script with the *Department* and *Location* parameters to the IT Scripts unscoped top-level role.

```
Add-ManagementRoleEntry "IT Scripts\MailboxAudit" -
Parameters Department, Location -UnScopedTopLevel
```

Detailed Description

The cmdlet and its parameters that you add to a role entry must exist in the parent role. You can't add role entries to built-in roles.

Important:
You can only add a role entry to a management role if the role entry exists in the role's parent role. For example, if you try to add the **Search-Mailbox** role entry to a role that's a child of the Mail Recipients role, you'll receive an error. This error occurs because the **Search-Mailbox** role entry doesn't exist in the Mail Recipients role. To add the **Search-Mailbox** role entry to a role, you need to create a role that's a child of the Mailbox Import Export role, which contains the **Search-Mailbox** role entry. Then you can use the **Add-ManagementRoleEntry** cmdlet to add the **Search-Mailbox** role entry to the new child role.

For more information about management role entries, see Understanding management roles.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management role entries" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleEntryIdParameter	The *Identity* parameter specifies the role entry to add. You must specify the value of the *Identity* parameter in the format: *<management role>**<role entry name>*, for example, *ExampleRole**Set-*

			Mailbox. For more information about how management role entries work, see Understanding management roles. The role entry you want to add must exist in the parent role. If the role entry name contains spaces, you must enclose the name in quotation marks (").
ParentRoleEntry	Required	Microsoft.Exchange.Configuration.Tasks.RoleEntryIdParameter	The *ParentRoleEntry* parameter specifies the role entry in the parent role to add to the role specified with the *Role* parameter. This parameter generally isn't used directly, but exists to enable the piping of role entries from the **Get-ManagementRoleEntry** cmdlet. If you use the *ParentRoleEntry* parameter, you can't use the *UnScopedTopLevel* switch.

Role	Required	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter	The *Role* parameter specifies the role to which the new role entry, specified by the *ParentRoleEntry* parameter, is added.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchPara	This parameter is reserved for internal

		meter	Microsoft use.
Overwrite	Optional	System.Management.Automation.SwitchParameter	The *Overwrite* parameter causes existing role entries to be overwritten by the role entries being added.
Parameters	Optional	System.String[]	The *Parameters* parameter specifies the parameters to be included in the role being added. The parameters specified must exist on the cmdlet associated with the role entry. You can specify multiple parameters, separated with commas.
PSSnapinName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *PSSnapinName* parameter specifies the Windows PowerShell snap-in that contains the cmdlet associated with the role being added. Use the **Get-PSSnapin** cmdlet to

			retrieve a list of available Windows PowerShell snap-ins.
SkipScriptExistenceCheck	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Type	Optional	Microsoft.Exchange.Data.Directory.Management.ManagementRoleEntryType	The *Type* parameter specifies the type of role entry being added. The valid values are `Cmdlet`, `Script`, and `ApplicationPermission`.
UnScopedTopLevel	Optional	System.Management.Automation.SwitchParameter	The *UnScopedTopLevel* switch specifies that you're adding a custom script or non-Exchange cmdlet to an unscoped top-level management role. You can only use the *UnScopedTopLevel* switch when you add a role entry to an unscoped top-level role. If you use the *UnScopedTopLevel* switch, you can't use the *ParentRoleEntry* parameter.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ManagementRoleEntry

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ManagementRoleEntry** cmdlet to retrieve management role entries that have been configured on management roles.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ManagementRoleEntry -Identity <RoleEntryIdParameter> [-
DomainController <Fqdn>] [-Parameters <String[]>] [-PSSnapinName <String>]
```

```
[-Type <ManagementRoleEntryType[]>]
```

Examples

EXAMPLE 1

This example retrieves a list of all the role entries that exist on the Transport Rules management role.

```
Get-ManagementRoleEntry "Transport Rules\*"
```

EXAMPLE 2

This example retrieves a list of all the role entries that contain the **Get-Recipient** cmdlet.

```
Get-ManagementRoleEntry *\Get-Recipient
```

EXAMPLE 3

This example retrieves the Tier 2 Help Desk\Set-Mailbox role entry and pipes the output of the **Get-ManagementRoleEntry** cmdlet to the **Format-List** cmdlet. The **Format-List** cmdlet then outputs only the *Name*, *Parameters*, *Role*, and *Type* properties from the role entry.

```
Get-ManagementRoleEntry "Tier 2 Help Desk\Set-Mailbox" |
Format-List Name, Parameters, Role, Type
```

Detailed Description

The **Get-ManagementRoleEntry** cmdlet retrieves role entries that have been configured on roles. You can retrieve specific role entries that match specific criteria such as role name, cmdlet name, parameter name, or a combination of each, or role entry type or the associated Windows PowerShell snap-in.

For more information about management role entries, see Understanding management roles.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management role entries" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.RoleEntryIdParameter	specifies the role entry to retrieve. You must specify the value of the *Identity* parameter in the format, *<management role>\<role entry name>*, for example, *ExampleRole\Set-Mailbox*. For more information about how management role entries work, see Understanding management roles. You can use the wildcard character (*) instead of the role, cmdlet name, or both. If the role entry name contains spaces, enclose the name in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that retrieves data from Active Directory.
Parameters	Optional	System.String[]	The *Parameters* parameter includes only the role entries that contain the parameters specified. You can specify multiple parameters, separated by commas. You can use the wildcard character (*) with partial parameter names to retrieve all parameters that match the value you specify. This parameter is useful when you use the wildcard character (*) with the value you specify in the *Identity* parameter.
PSSnapinName	Optional	System.String	The *PSSnapinName* parameter specifies the Windows PowerShell snap-in that contains the role entry to return. Use the **Get-PSSnapin** cmdlet to retrieve a list of available Windows

			PowerShell snap-ins.
Type	Optional	Microsoft.Exchange.Data.Directory.Management.ManagementRoleEntryType[]	The *Type* parameter specifies the type of role entry to return. The valid values for the *Type* parameter are any combination of the following parameters, separated by commas: `Cmdlet`, `Script`, and `ApplicationPermission`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ManagementRoleEntry

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ManagementRoleEntry** cmdlet to remove existing management role entries.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ManagementRoleEntry -Identity <RoleEntryIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
```

```
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the **New-Mailbox** role entry from the Tier 1 Help Desk role.

```
Remove-ManagementRoleEntry "Tier 1 Help Desk\New-Mailbox"
```

EXAMPLE 2

This example removes all the role entries that have the verb `New` on the Tier 1 Help Desk role by piping the output of the **Get-ManagementRoleEntry** cmdlet to the **Remove-ManagementRoleEntry** cmdlet. Because the *WhatIf* switch has been specified along with the **Remove-ManagementRoleEntry** cmdlet, the cmdlet lists what changes would have been made but doesn't commit any changes.

```
Get-ManagementRoleEntry "Tier 1 Help Desk\New-*" | Remove-ManagementRoleEntry -WhatIf
```

After you verify that the correct role entries will be removed, run the same command without the *WhatIf* switch to remove the role entries.

```
Get-ManagementRoleEntry "Tier 1 Help Desk\New-*" | Remove-ManagementRoleEntry
```

Detailed Description

The **Remove-ManagementRoleEntry** cmdlet removes existing role entries. However, you can't remove role entries from built-in management roles.

For more information about management role entries, see Understanding management roles.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management role entries" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleE	The *Identity* parameter specifies the role entry

		ntryIdParameter	to remove. You must specify the value of the *Identity* parameter in the format, *<management role>\<role entry name>*, for example, *ExampleRole\Set-Mailbox*. For more information about how management role entries work, see Understanding management roles. If the role entry name contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Dat	This parameter is available only in on-

		a.Fqdn	premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on

			the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ManagementRoleEntry

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ManagementRoleEntry** cmdlet to change the available parameters on an existing management role entry.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ManagementRoleEntry -Identity <RoleEntryIdParameter> [-AddParameter
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-Parameters <String[]>] [-
RemoveParameter <SwitchParameter>] [-SkipScriptExistenceCheck
<SwitchParameter>] [-UnScopedTopLevel <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the *Anr* and *Database* parameters from the **Get-Mailbox** role entry on the Help Desk Personnel role.

```
Set-ManagementRoleEntry "Help Desk Personnel\Get-Mailbox" -
Parameters Anr, Database -RemoveParameter
```

EXAMPLE 2

This example retrieves a list of role entries on the Help Desk Personnel role and adds the *WhatIf* switch to each role entry using the **Set-ManagementRoleEntry** cmdlet.

```
Get-ManagementRoleEntry "Help Desk Personnel\*" | Set-
ManagementRoleEntry -Parameters WhatIf -AddParameter
```

EXAMPLE 3

This example adds the *DisplayName* and *ForwardingAddress* parameters to the **Set-Mailbox** role entry on the Tier 1 Help Desk role and removes all other parameters from the role entry.

```
Set-ManagementRoleEntry "Tier 1 Help Desk\Set-Mailbox" -
Parameters DisplayName, ForwardingAddress
```

EXAMPLE 4

This example adds the *Location* parameter to the `MailboxAudit` custom script on the IT Scripts unscoped top level role.

```
Set-ManagementRoleEntry "IT Scripts\MailboxAudit" -
Parameters Location -AddParameter -UnScopedTopLevel
```

Detailed Description

The **Set-ManagementRoleEntry** cmdlet changes the available parameters on an existing role entry. If you want to add parameters to a role entry, the parameters must exist in the role entry in the parent management role. If you want to remove parameters from a role entry, there can be no role entries in child roles that inherit those parameters from the role entry you want to change. You can't change role entries associated with built-in roles.

For more information about management role entries, see Understanding management roles.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management role entries" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleEntryIdParameter	The *Identity* parameter specifies the role entry to change. You must specify the value of the *Identity* parameter in the format, *<management role>**<role entry name>*, for example, ExampleRole\Set-Mailbox. For more information about how management role entries work, see Understanding management roles. If the role entry name contains spaces, enclose it in quotation marks (").
AddParameter	Optional	System.Management.Automation.SwitchParameter	The *AddParameter* parameter adds the specified parameters to the specified role entry. Use the *Parameters* parameter to specify the parameters to add. You can't use the *AddParameter* parameter

			in the same command as the *RemoveParameter* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for

			administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
Parameters	Optional	System.String[]	The *Parameters* parameter specifies the parameters to be added to or removed from the role entry. The *Parameters* parameter has the following modes: • When used with the *AddParameter* parameter, the parameters you specify are added to the role entry. • When used with the *RemoveParameter* parameter, the parameters you specify are removed from the role entry. • When neither the *AddParameter* nor *RemoveParameter* parameters are used,

			only the parameters you specify are included in the role entry. If you specify a value of `$Null` and neither the *AddParameter* nor *RemoveParameter* parameters are used, all of the parameters on the role entry are removed. You can specify multiple parameters, separated with commas.
RemoveParameter	Optional	System.Management.Automation.SwitchParameter	The *RemoveParameter* parameter removes the specified parameters from the specified role entry. Use the *Parameters* parameter to specify the parameters to remove. You can't use the *RemoveParameter* parameter in the same command as the *AddParameter* parameter.
SkipScriptExistenceCheck	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
UnScopedTopLevel	Optional	System.Management.Automation.SwitchPar	The *UnScopedTopLevel* switch must be used when

		ameter	you want to modify a role entry on an unscoped top level role.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ManagementScope

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ManagementScope** cmdlet to return a list of management scopes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ManagementScope [-Identity <ManagementScopeIdParameter>] [-
DomainController <Fqdn>] [-Exclusive <$true | $false>] [-Organization
<OrganizationIdParameter>] [-Orphan <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves all the management scopes that start with the string Redmond.

```
Get-ManagementScope Redmond*
```

EXAMPLE 2

This example retrieves the Redmond Servers Scope using the **Get-ManagementScope** cmdlet and pipes the output to the **Format-List** cmdlet. For more information about the **Format-List** cmdlet, see Working with command output.

```
Get-ManagementScope "Redmond Servers Scope" | Format-List
```

EXAMPLE 3

This example retrieves a list of management scopes that aren't associated with any role assignments.

```
Get-ManagementScope -Orphan
```

EXAMPLE 4

This example retrieves a list of exclusive scopes.

```
Get-ManagementScope -Exclusive $True
```

Detailed Description

You can retrieve one scope or many, retrieve only scopes that aren't associated with management role assignments, or retrieve scopes that are exclusive or regular scopes.

For more information about regular and exclusive scopes, see Understanding management role scopes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the

"Management scopes" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Exclusive	Optional	System.Boolean	The *Exclusive* parameter specifies whether exclusive scopes should be returned. If the *Exclusive* parameter isn't specified, regular scopes and exclusive scopes are returned. If the *Exclusive* parameter is set to `$True`, only exclusive scopes are returned. If the *Exclusive* parameter is set to `$False`, only regular scopes are returned. The valid

			values are `$True` and `$False`.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *Identity* parameter specifies the name of the management scope to return. If the management scope name contains spaces, enclose it in quotation marks (").
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Orphan	Optional	System.Management.Automation.SwitchParameter	The *Orphan* parameter returns only the management scopes that aren't associated with role assignments.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ManagementScope

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-ManagementScope** cmdlet to create a regular or exclusive management scope.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ManagementScope -RecipientRestrictionFilter <String> [-Exclusive
<SwitchParameter>] [-Force <SwitchParameter>] [-RecipientRoot
<OrganizationalUnitIdParameter>] <COMMON PARAMETERS>

New-ManagementScope -ServerRestrictionFilter <String> [-Exclusive
<SwitchParameter>] [-Force <SwitchParameter>] <COMMON PARAMETERS>

New-ManagementScope -ServerList <ServerIdParameter[]> [-Exclusive
<SwitchParameter>] [-Force <SwitchParameter>] <COMMON PARAMETERS>

New-ManagementScope -DatabaseList <DatabaseIdParameter[]> [-Exclusive
<SwitchParameter>] [-Force <SwitchParameter>] <COMMON PARAMETERS>

New-ManagementScope -DatabaseRestrictionFilter <String> [-Exclusive
<SwitchParameter>] [-Force <SwitchParameter>] <COMMON PARAMETERS>

New-ManagementScope -PartnerDelegatedTenantRestrictionFilter <String>
<COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a scope that includes only the servers MailboxServer1, MailboxServer2, and MailboxServer3. Users assigned roles using management role assignments that have the scope in this example can only perform against the servers included in the scope.

```
New-ManagementScope -Name "Mailbox Servers 1 through 3" -
ServerList MailboxServer1, MailboxServer2, MailboxServer3
```

EXAMPLE 2

This example creates the Redmond Site Scope scope and sets a server restriction filter that matches only the servers located in the "CN=Redmond,CN=Sites,CN=Configuration,DC=contoso,DC=com" Active Directory Domain Services (AD DS) site.

```
New-ManagementScope -Name "Redmond Site Scope" -
ServerRestrictionFilter {ServerSite -eq
"CN=Redmond,CN=Sites,CN=Configuration,DC=contoso,DC=com"}
```

EXAMPLE 3

This example creates the Executive Mailboxes scope. Only mailboxes located within the Executives OU in the contoso.com domain match the recipient restriction filter.

```
New-ManagementScope -Name "Executive Mailboxes" -
RecipientRoot "contoso.com/Executives" -
RecipientRestrictionFilter {RecipientType -eq
"UserMailbox"}
```

EXAMPLE 4

This example creates the Protected Exec Users exclusive scope. Users that contain the string "VP" in their title match the recipient filter for the scope. When the exclusive scope is created, all users are immediately blocked from modifying the recipients that match the exclusive scope until the scope is associated with a management role assignment. If other role assignments are associated with other exclusive scopes that match the same recipients, those assignments can still modify the recipients.

```
New-ManagementScope -Name "Protected Exec Users" -
RecipientRestrictionFilter { Title -Like "*VP*" } -
Exclusive
```

The exclusive scope is then associated with a management role assignment that assigns the Mail Recipients management role to the Executive Administrators role group. This role group contains administrators who are allowed to modify the mailboxes of high-profile executives. Only the administrators of the Executive Administrators role group can modify users with the string "VP" in their title.

```
New-ManagementRoleAssignment -SecurityGroup "Executive
Administrators" -Role "Mail Recipients" -
CustomRecipientWriteScope "Protected Exec Users"
```

EXAMPLE 5

This example creates the Seattle Databases scope and sets a database restriction filter that matches only the databases that begin with the string "SEA".

```
New-ManagementScope -Name "Seattle Databases" -
DatabaseRestrictionFilter {Name -Like "SEA*" }
```

Detailed Description

After you create a regular or exclusive scope, you need to associate the scope with a management role assignment. To associate a scope with a role assignment, use the New-ManagementRoleAssignment cmdlet. For more information about adding new management scopes, see Create a regular or exclusive scope.

Important:
Database scopes are only enforced on servers running Microsoft Exchange Server 2010 Service Pack 1 (SP1) and Exchange Server 2013. If a user connects to a server running the release to manufacturing (RTM) version of Exchange 2010, management role assignments associated with database scopes aren't applied. Also, database scopes aren't visible to the **Get-ManagementScope** cmdlet when it's run on an Exchange 2010 RTM server.

For more information about regular and exclusive scopes, see Understanding management role scopes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management scopes" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
DatabaseList	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter[]	This parameter is available only in on-premises Exchange 2013. The *DatabaseList* parameter specifies a list of databases to which the scope should be applied. Multiple databases can be specified, separated by commas. If you use the *DatabaseList* parameter, you can't use the *DatabaseRestrictionFilter*, *ServerList*,

			RecipientRestrictionFilter, *RecipientRoot*, or *ServerRestrictionFilter* parameters.
DatabaseRestrictionFilter	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *DatabaseRestrictionFilter* parameter specifies the filter to apply to database objects. Only database objects that match the filter are included in the scope. If you use the *DatabaseRestrictionFilter* parameter, you can't use the *RecipientRestrictionFilter*, *ServerRestrictionFilter*, *RecipientRoot*, *DatabaseList*, or *ServerList* parameters. For a list of filterable database properties, see Understanding management role scopes.
Name	Required	System.String	The *Name* parameter specifies the name of the management scope. The name can be up to 64 characters. If the name

			contains spaces, enclose the name in quotation marks (").
PartnerDelegatedTenantRestrictionFilter	Required	System.String	This parameter is reserved for internal Microsoft use.
RecipientRestrictionFilter	Required	System.String	The *RecipientRestrictionFilter* parameter specifies the filter to apply to recipient objects. Only recipient objects that match the filter are included in the scope. If you use the *RecipientRestrictionFilter* parameter, you can't use the *DatabaseRestrictionFilter*, *DatabaseList*, *ServerList*, or *ServerRestrictionFilter* parameters.
ServerList	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter[]	This parameter is available only in on-premises Exchange 2013. The *ServerList* parameter specifies a list of servers to which the scope should be applied. Multiple servers can be specified, separated by commas. If you use the

			ServerList parameter, you can't use the *RecipientRestrictionFilter*, *RecipientRoot*, *DatabaseRestrictionFilter*, *DatabaseList*, or *ServerRestrictionFilter* parameters.
ServerRestrictionFilter	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *ServerRestrictionFilter* parameter specifies the filter to apply to server objects. Only server objects that match the filter are included in the scope. If you use the *ServerRestrictionFilter* parameter, you can't use the *RecipientRestrictionFilter*, *RecipientRoot*, *DatabaseRestrictionFilter*, *DatabaseList*, or *ServerList* parameters. For a list of filterable server properties, see Understanding management role scopes.
Confirm	Optional	System.Management.	The *Confirm* switch

		Automation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Exclusive	Optional	System.Management.Automation.SwitchParameter	The *Exclusive* switch specifies that the role should be an exclusive scope. **Caution:** When you create exclusive management scopes, only users or universal security groups (USG) assigned exclusive scopes that contain objects to be modified can access those objects. Users or USGs that aren't assigned an exclusive

			scope that contains the objects immediately lose access to those objects.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies that an exclusive scope should be created without showing the warning that the exclusive scope takes effect immediately.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RecipientRoot	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientRoot* parameter specifies the organizational unit (OU) under which the filter specified with the *RecipientRestrictionFilter* parameter should be applied. If you use the *RecipientRoot* parameter, you can't use the *DatabaseRestrictionFilter*, *DatabaseList*, *ServerList*, or *ServerRestrictionFilter* parameters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ManagementScope

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ManagementScope** cmdlet to remove an existing management scope.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ManagementScope -Identity <ManagementScopeIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Redmond Servers scope.

```
Remove-ManagementScope "Redmond Servers"
```

EXAMPLE 2

This example retrieves a list of all the orphaned scopes using the **Get-ManagementScope** cmdlet and pipes the output to the **Remove-ManagementScope** cmdlet. Because the *WhatIf* switch is used with the **Remove-ManagementScope** cmdlet, the cmdlet only displays the scopes that would have been removed but doesn't commit any changes.

```
Get-ManagementScope -Orphan | Remove-ManagementScope -
WhatIf
```

After you verify that the scopes to be removed are correct, run the command again without the *WhatIf* switch.

```
Get-ManagementScope -Orphan | Remove-ManagementScope
```

Detailed Description

You can't remove a management scope if it's associated with a management role assignment. Use the **Get-ManagementScope** cmdlet to retrieve a list of orphaned scopes. For more information about regular and exclusive scopes, see Understanding management role scopes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management scopes" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *Identity* parameter specifies the scope to remove. You can't remove a scope if it's in use by a management role assignment.
Confirm	Optional	System.Management.Automation.SwitchPara	The *Confirm* switch causes the command to

		meter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't

			provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ManagementScope

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ManagementScope** cmdlet to change an existing management scope.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ManagementScope [-RecipientRestrictionFilter <String>] [-RecipientRoot
<OrganizationalUnitIdParameter>] <COMMON PARAMETERS>

Set-ManagementScope -ServerRestrictionFilter <String> <COMMON PARAMETERS>

Set-ManagementScope -DatabaseRestrictionFilter <String> <COMMON
PARAMETERS>

Set-ManagementScope -PartnerDelegatedTenantRestrictionFilter <String>
<COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <ManagementScopeIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the recipient restriction filter on the Seattle Mailboxes management scope to match all mailboxes that have Seattle in the **City** mailbox property.

```
Set-ManagementScope "Seattle Mailboxes" -
RecipientRestrictionFilter { City -Eq "Seattle" -And
RecipientType -Eq "UserMailbox" }
```

EXAMPLE 2

This example changes the recipient root for the Sales Recipients management scope to match only recipient objects contained under the contoso.com/Sales OU.

```
Set-ManagementScope "Sales Recipients" -RecipientRoot
contoso.com/Sales
```

EXAMPLE 3

This example changes the Active Directory Domain Services (AD DS) site used in the server restriction filter for the Vancouver Servers management scope to "NA-CDN-

Vancouver,CN=Sites,CN=Configuration,DC=contoso,DC=com".

```
Set-ManagementScope "Vancouver Servers" -
ServerRestrictionFilter { ServerSite -Eq "NA-CDN-
Vancouver,CN=Sites,CN=Configuration,DC=contoso,DC=com" }
```

Detailed Description

If you change a scope that has been associated with management role assignments using the **New-ManagementRoleAssignment** cmdlet, the updated scope applies to all the associated role assignments. For more information about changing scopes, see Change a role scope.

Important:
Database scopes are only enforced on servers running Microsoft Exchange Server 2010 Service Pack 1 and Exchange Server 2013. If a user connects to a server running the release to manufacturing (RTM) version of Exchange 2010, management role assignments associated with database scopes won't be applied. Also, database scopes won't be visible to the **Get-ManagementScope** cmdlet when it's run on an Exchange 2010 RTM server.

For more information about regular and exclusive scopes, see Understanding management role scopes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Management scopes" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
DatabaseRestrictionFilter	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *DatabaseRestrictionFilter* parameter specifies the filter to apply to database objects. When the

			DatabaseRestrictionFilter parameter is specified, only database objects that match the filter are included in the scope. If you use the *DatabaseRestrictionFilter* parameter, you can't use the *ServerRestrictionFilter*, *RecipientRestrictionFilter* or *RecipientRoot* parameters. For a list of filterable database properties, see Understanding management role scopes.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *Identity* parameter specifies the name of the management scope to modify. If the name contains spaces, enclose it in quotation marks (").
PartnerDelegatedTenantRestrictionFilter	Required	System.String	This parameter is reserved for internal Microsoft use.
ServerRestrictionFilter	Required	System.String	This parameter is available only in on-premises Exchange 2013.

			The *ServerRestrictionFilter* parameter specifies the filter to apply to server objects. When the *ServerRestrictionFilter* parameter is specified, only recipient objects that match the filter are included in the scope. If you use the *ServerRestrictionFilter* parameter, you can't use the *DatabaseRestrictionFilter*, *RecipientRestrictionFilter*, or *RecipientRoot* parameters. For a list of filterable server properties, see Understanding management role scopes.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this

			parameter.
Name	Optional	System.String	The *Name* parameter specifies the name of the management scope. The management scope name can be a maximum of 64 characters. If the name contains spaces, enclose it in quotation marks (").
RecipientRestrictionFilter	Optional	System.String	The *RecipientRestrictionFilter* parameter specifies the filter to apply to recipient objects. When the *RecipientRestrictionFilter* parameter is specified, only server objects that match the filter are included in the scope. If you use the *RecipientRestrictionFilter* parameter, you can't use the *DatabaseRestrictionFilter* or *ServerRestrictionFilter* parameters.

RecipientRoot	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientRoot* parameter specifies the organizational unit (OU) under which the filter specified with the *RecipientRestrictionFilter* parameter should be applied. If you use the *RecipientRoot* parameter, you can't use the *ServerRestrictionFilter* or *DatabaseRestrictionFilter* parameters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RoleAssignmentPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RoleAssignmentPolicy** cmdlet to view an existing management role assignment policy on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RoleAssignmentPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns a list of all the existing role assignment policies.

```
Get-RoleAssignmentPolicy
```

EXAMPLE 2

This example returns the details of the specified assignment policy. The output of the **Get-RoleAssignmentPolicy** cmdlet is piped to the **Format-List** cmdlet.

```
Get-RoleAssignmentPolicy "End User Policy" | Format-List
```

For more information about pipelining and the **Format-List** cmdlet, see Pipelining and Working with command output.

EXAMPLE 3

This example returns the default assignment policy.

The output of the **Get-RoleAssignmentPolicy** cmdlet is piped to the **Where** cmdlet. The **Where** cmdlet filters out all of the policies except the policy that has the *IsDefault* property set to `$True`.

```
Get-RoleAssignmentPolicy | Where { $_.IsDefault -eq $True }
```

For more information about pipelining and the **Format-List** cmdlet, see Pipelining and Working with command output.

Detailed Description

For more information about assignment policies, see Understanding management role assignment policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Assignment policies" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server

			uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the name of the assignment policy to view. If the name contains spaces, enclose the name in quotation marks (").
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-RoleAssignmentPolicy

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-RoleAssignmentPolicy** cmdlet to create a management role assignment policy on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-RoleAssignmentPolicy -Name <String> [-Confirm [<SwitchParameter>]] [-
Description <String>] [-DomainController <Fqdn>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-IsDefault <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-Roles <RoleIdParameter[]>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an assignment policy.

```
New-RoleAssignmentPolicy -Name "End User Policy"
```

After the assignment policy is created, you can assign the assignment policy to a mailbox using the **Set-Mailbox** cmdlet.

```
Set-Mailbox Joe -RoleAssignmentPolicy "End User Policy"
```

EXAMPLE 2

This example creates an assignment policy using the *IsDefault* switch.

```
New-RoleAssignmentPolicy -Name "Default End User Policy" -
IsDefault
```

EXAMPLE 3

This example creates an assignment policy that enables users to modify their personal information, manage their distribution group membership, and manage their voice mail. The new assignment policy is created as the new default assignment policy. Then, all existing mailboxes are configured to use the new assignment policy.

First, the new assignment policy is created and set as the new default assignment policy.

```
New-RoleAssignmentPolicy -Name "Limited End User Policy" -
Roles "MyPersonalInformation",
```

```
"MyDistributionGroupMembership", "MyVoiceMail" -IsDefault
```

Because setting the new role assignment as default applies only to new mailboxes or mailboxes moved to an Exchange 2013 server, the **Set-Mailbox** cmdlet is used to configure the new assignment policy on all existing mailboxes.

```
Get-Mailbox -ResultSize Unlimited | Set-Mailbox -
RoleAssignmentPolicy "Limited End User Policy"
```

Detailed Description

When you create an assignment policy, you can assign it to users using the **New-Mailbox**, **Set-Mailbox**, or **Enable-Mailbox** cmdlets. If you make the new assignment policy the default assignment policy, it's assigned to all new mailboxes that don't have an explicit assignment policy assigned to them.

You can add management roles to the new assignment policy when you create it, or you can create the assignment policy and add roles later. You must assign at least one management role to the new assignment policy for it to apply permissions to a mailbox. Without any roles assigned to the new assignment policy, users assigned to it won't be able to manage their mailbox configuration. To assign a management role after the assignment policy has been created, use the **New-ManagementRoleAssignment** cmdlet. For more information, see Manage role assignment policies.

For more information about assignment policies, see Understanding management role assignment policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Assignment policies" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the new assignment policy. If the assignment policy name contains spaces, enclose the name in quotation

			marks ("). The maximum length of the name is 64 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies the description that's displayed when the role assignment policy is viewed using the **Get-RoleAssignmentPolicy** cmdlet. Enclose the description in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefault	Optional	System.Management.Automation.SwitchParameter	The *IsDefault* switch specifies whether the new assignment policy should become the default assignment policy. New mailboxes or mailboxes moved to an Exchange 2013 server are assigned the default assignment policy when an explicit assignment policy isn't provided. You don't have to specify a value with this switch.

			Note: Setting an assignment policy as default doesn't change the role assignment on existing mailboxes. To change the assignment policies on existing mailboxes, use the **Set-Mailbox** cmdlet.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Roles	Optional	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter[]	The *Roles* parameter specifies the management roles to assign to the role assignment policy when it's created. If a role name contains spaces, enclose the name in quotation marks ("). If you want to assign more that one role, separate the role names with commas. For a list of built-in management roles that you can assign to a role group, see Built-in management roles.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RoleAssignmentPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-RoleAssignmentPolicy** cmdlet to remove an existing management role assignment policy from a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-RoleAssignmentPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
```

```
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the assignment policy End User Policy. First, find all the mailboxes assigned the assignment policy.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "End User Policy"}
```

Next, use the list you gathered to assign each mailbox a new assignment policy. You may want to assign all the mailboxes the same new assignment policy, such as Seattle End User Policy.

```
Get-Mailbox | Where {$_.RoleAssignmentPolicy -Eq "End User Policy"} | Set-Mailbox -RoleAssignmentPolicy "Seattle End User Policy"
```

Then, remove all the management role assignments assigned to the previous assignment policy End User Policy.

```
Get-ManagementRoleAssignment -RoleAssignee "End User Policy" | Remove-ManagementRoleAssignment
```

Finally, remove the assignment policy.

```
Remove-RoleAssignmentPolicy "End User Policy"
```

For more information about the **Where** cmdlet and pipelining, see Working with command output and Pipelining.

Detailed Description

The assignment policy you want to remove can't be assigned to any mailboxes or management roles. Also, if you want to remove the default assignment policy, it must be the last assignment policy. Do the following before you attempt to remove an assignment policy:

- Use the **Set-Mailbox** cmdlet to change the assignment policy for any mailbox assigned the assignment policy you want to remove.
- If the assignment policy is the default assignment policy, use the **Set-RoleAssignmentPolicy** cmdlet to select a new default assignment policy. You don't need to do this if you're removing the last assignment policy.
- Use the **Remove-ManagementRoleAssignment** cmdlet to remove any management role assignments assigned to the policy.

For more information about assignment policies, see Understanding management role assignment policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Assignment policies" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the assignment policy to remove. If the assignment policy name has spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RoleAssignmentPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-RoleAssignmentPolicy** cmdlet to modify an existing management role assignment policy on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-RoleAssignmentPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DomainController <Fqdn>] [-
IsDefault <SwitchParameter>] [-Name <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the default assignment policy. New mailboxes or mailboxes moved to an Exchange 2013 server are assigned the default assignment policy when an explicit assignment policy isn't provided. You don't have to specify a value with the *IsDefault* switch.

```
Set-RoleAssignmentPolicy "End User Policy" -IsDefault
```

Detailed Description

You can use the **Set-RoleAssignmentPolicy** cmdlet to change the name of an assignment policy or

to set the assignment policy as the default assignment policy.

For more information about assignment policies, see Understanding management role assignment policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Assignment policies" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the name of the assignment policy to modify. If the name contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies the description that's displayed when the

			role assignment policy is viewed using the **Get-RoleAssignmentPolicy** cmdlet. Enclose the description in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IsDefault	Optional	System.Management.Automation.SwitchPara	The *IsDefault* switch makes the assignment

		meter	policy the default assignment policy. New mailboxes or mailboxes moved to an Exchange 2013 server are assigned the default assignment policy when an explicit assignment policy isn't provided. You don't have to specify a value with this switch.
Name	Optional	System.String	The *Name* parameter specifies the new name of the assignment policy. If the assignment policy name contains spaces, enclose the name in quotation marks ("). The maximum length of the name is 64 characters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RoleGroup

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RoleGroup** cmdlet to retrieve a list of management role groups.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RoleGroup [-Identity <RoleGroupIdParameter>] [-AccountPartition
<AccountPartitionIdParameter>] [-DomainController <Fqdn>] [-Filter
<String>] [-Organization <OrganizationIdParameter>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>] [-
ShowPartnerLinked <SwitchParameter>] [-SortBy <String>] [-
UsnForReconciliationSearch <Int64>]
```

Examples

EXAMPLE 1

This example retrieves a list of role groups.

```
Get-RoleGroup
```

EXAMPLE 2

This example retrieves the details for the Recipient Administrators role group.

```
Get-RoleGroup "Recipient Administrators" | Format-List
```

For more information about the **Format-List** cmdlet and pipelining, see Working with command output and Pipelining.

EXAMPLE 3

This example retrieves a list of role groups as seen by the domain controller closest to the user.

```
Get-RoleGroup -ReadFromDomainController
```

EXAMPLE 4

This example retrieves a list of all linked role groups and the Active Directory security identifier (SID) of the foreign universal security groups (USG) that are linked to each of them. You can then use the SIDs to find the USGs so you can modify their members.

```
Get-RoleGroup -Filter { RoleGroupType -Eq "Linked" } |
Format-Table Name, LinkedGroup
```

Detailed Description

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange

			2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter specifies the property to be used to filter the role groups. Only the role groups that match the criteria you specify are returned. You can filter on the `LinkedGroup`, `ManagedBy`, `Members`, `Name`, `RoleGroupType`, and `DisplayName` properties. If you create a filter using the `RoleGroupType` property, the only values you can use in the filter are `Standard` and `Linked`.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RoleGroupIdParameter	The *Identity* parameter specifies the role group to retrieve. If the name of the role group contains spaces,

			enclose the name in quotation marks ("). If the *Identity* parameter isn't specified, all role groups are returned.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* switch specifies that the role group information should be read from a domain controller in the user's domain. If you use the **Set-AdServerSettings** cmdlet to include scope commands to the entire forest and don't use this switch, it's possible that the role group information is read from a global catalog with outdated

			information.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all the role groups, use `Unlimited` for the value of this parameter. The default value is `1000`.
ShowPartnerLinked	Optional	System.Management.Automation.SwitchParameter	This *ShowPartnerLinked* switch specifies whether to return built-in role groups that are of type `PartnerRoleGroup`. Role groups of this type are used in the cloud-based services to allow partner service providers to manage their customer organizations. These role groups can't be edited and are therefore not shown by default. This parameter is available only in the cloud-based service.

SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. You can sort by the **Name** attribute. The results are sorted in ascending order.
UsnForReconciliationSearch	Optional	System.Int64	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-RoleGroup

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-RoleGroup** cmdlet to create a management role group on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-RoleGroup <COMMON PARAMETERS>

New-RoleGroup -LinkedPartnerGroupId <String> -LinkedPartnerOrganizationId
<String> <COMMON PARAMETERS>

New-RoleGroup -LinkedDomainController <String> -LinkedForeignGroup
<UniversalSecurityGroupIdParameter> [-LinkedCredential <PSCredential>]
<COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
CustomConfigWriteScope <ManagementScopeIdParameter>] [-
CustomRecipientWriteScope <ManagementScopeIdParameter>] [-Description
<String>] [-DisplayName <String>] [-DomainController <Fqdn>] [-
ExternalDirectoryObjectId <String>] [-Force <SwitchParameter>] [-ManagedBy
<MultiValuedProperty>] [-Members <MultiValuedProperty>] [-Organization
<OrganizationIdParameter>] [-PartnerManaged <SwitchParameter>] [-
RecipientOrganizationalUnitScope <OrganizationalUnitIdParameter>] [-Roles
<RoleIdParameter[]>] [-SamAccountName <String>] [-ValidationOrganization
<String>] [-WellKnownObjectGuid <Guid>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a role group. The Mail Recipients and Mail Enabled Public Folders roles are assigned to the role group, and the users Kim and Martin are added as members. Because no scopes were provided, Kim and Martin can manage any recipient and reset passwords for any users in the organization.

```
New-RoleGroup -Name "Limited Recipient Management" -Roles
"Mail Recipients", "Mail Enabled Public Folders" -Members
Kim, Martin
```

EXAMPLE 2

This example creates a role group with a custom recipient scope. The custom recipient scope, Seattle Recipients, limits the scope of the roles assigned to the role group to recipients who have their **City** property set to Seattle. The Mail Recipients and Mail Enabled Public Folders roles are assigned to the role group, and the users John and Carol are added as members.

```
New-RoleGroup -Name "Seattle Limited Recipient Management"
-Roles "Mail Recipients", "Mail Enabled Public Folders" -
Members John, Carol -CustomRecipientWriteScope "Seattle
Recipients"
```

EXAMPLE 3

This example creates a role group and enables Isabel to add or remove members to or from the role group by adding her to the **ManagedBy** property. The Transport Rules role is assigned to the role group, and the Compliance Group USG is added as a member.

```
New-RoleGroup -Name "Transport Rules Management" -Roles
"Transport Rules" -Members "Compliance Group" -ManagedBy
Isabel
```

EXAMPLE 4

This example creates a linked role group that enables the members of the Toronto Administrators USG in the Contoso user forest to manage recipients located in the Toronto office. The custom recipient scope, Toronto Recipients, limits the scope of the roles assigned to the role group to recipients who have their **City** property set to Toronto. The Mail Recipients role is assigned to the role group.

First, the credentials for the user forest need to be stored in a variable so they can be used with the **New-RoleGroup** cmdlet. The following command retrieves the credentials using the **Get-Credential** cmdlet and stores them in the `$Credentials` variable.

```
$Credentials = Get-Credential
```

Then the linked role group is created using the following command.

```
New-RoleGroup -Name "ContosoUsers: Toronto Recipient
Admins" -LinkedDomainController
dc02.contosousers.contoso.com -LinkedCredential
$Credentials -LinkedForeignGroup "Toronto Administrators" -
CustomRecipientWriteScope "Toronto Recipients" -Roles "Mail
Recipients"
```

EXAMPLE 5

This example takes an existing role group and copies the roles from that role group into a new custom role group. This can be useful if you want to create a role group similar to an existing role group but don't want to manually create all the role assignments. For example, you might want to create a role group that has most, but not all, of the management roles assigned to the Recipient Management role group.

First, store the existing role group in a variable using the following command.

```
$RoleGroup = Get-RoleGroup "Recipient Management"
```

Then, create the custom role group using the following command.

```
New-RoleGroup "Limited Recipient Management" -Roles
$RoleGroup.Roles
```

The new Limited Recipient Management role group now has the same roles as Recipient

Management. Remove the role assignments you don't want using the **Remove-ManagementRoleAssignment** cmdlet. For example, you might not want members of the Limited Recipient Management role group to manage distribution groups. Use the following command to remove the role assignment between the Distribution Groups management role and the Limited Recipient Management role group.

```
Remove-ManagementRoleAssignment "Distribution Groups-Limited Recipient Management"
```

This example uses variables to store information. For more information about variables, see User-defined variables.

Detailed Description

You don't have to add members or assign management roles to the role group when you create it. However, until you add members or assign roles to the role group, the role group grants no permissions to users. You can also specify custom configuration or recipient scopes when you create a role group. These scopes are applied to the management role assignments created when the role group is created.

When you create a role group, you can create the group and add members to it directly, or you can create a linked role group. A linked role group links the role group to a universal security group (USG) in another forest. Creating a linked role group is useful if your servers running Exchange reside in a resource forest and your users and administrators reside in a separate user forest. If you create a linked role group, you can't add members directly to it. You must add the members to the USG in the foreign forest.

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
LinkedDomainController	Required	System.String	This parameter is available only in on-premises Exchange 2013. The

			LinkedDomainController parameter specifies the fully qualified domain name (FQDN) or IP address of the domain controller in the forest where the foreign USG resides. The domain controller you specify is used to get security information for the foreign USG specified by the *LinkedForeignGroup* parameter. If you use the *LinkedDomainController* parameter, you must specify a foreign USG with the *LinkedForeignGroup* parameter, and you can't use the *Members* parameter.
LinkedForeignGroup	Required	Microsoft.Exchange.Configuration.Tasks.UniversalSecurityGroupIdParameter	This parameter is available only in on-premises Exchange 2013. The *LinkedForeignGroup* parameter specifies the name of the foreign

			USG you want to link this role group to. If the foreign USG name contains spaces, enclose the name in quotation marks ("). If you use the *LinkedForeignGroup* parameter, you must specify a domain controller in the *LinkedDomainController* parameter, and you can't use the *Members* parameter.
LinkedPartnerGroupId	Required	System.String	This parameter is reserved for internal Microsoft use.
LinkedPartnerOrganizationId	Required	System.String	This parameter is reserved for internal Microsoft use.
Name	Required	System.String	The *Name* parameter specifies the name of the new role group. The name can have a maximum of 64 characters. If the name contains spaces, enclose the name in quotation marks ("). **Note:**

			If you create a linked role group, we recommend that you include the name of the foreign forest in the name of the role group so that you can more easily associate the linked role group and the associated foreign forest. This is especially important if you have multiple forests.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CustomConfigWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	This parameter is available only in on-premises Exchange 2013. The *CustomConfigWriteScope* parameter specifies the existing configuration-based management scope to associate with management role assignments created

			with this role group. If the management scope name contains spaces, enclose the name in quotation marks ("). Use the Get-ManagementScope cmdlet to retrieve a list of existing management scopes.
CustomRecipientWriteScope	Optional	Microsoft.Exchange.Configuration.Tasks.ManagementScopeIdParameter	The *CustomRecipientWriteScope* parameter specifies the existing recipient-based management scope to associate with management role assignments created with this role group. If the management scope name contains spaces, enclose the name in quotation marks ("). Use the Get-ManagementScope cmdlet to retrieve a list of existing management scopes. If you use the *CustomRecipientWriteScope* parameter, you can't use the

			RecipientOrganizationalUnitScope parameter.
Description	Optional	System.String	The *Description* parameter specifies the description that's displayed when the role group is viewed using the **Get-RoleGroup** cmdlet. Enclose the description in quotation marks (").
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the friendly name of the role group. If the name contains spaces, enclose the name in quotation marks ("). This parameter can have a maximum length of 256 characters.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
ExternalDirectoryObjectId	Optional	System.String	This parameter is reserved for internal Microsoft use.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
LinkedCredential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *LinkedCredential* parameter specifies credentials to use to access the domain

			controller specified by the *LinkedDomainController* parameter. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
ManagedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ManagedBy* parameter specifies the users or USGs who can modify the configuration of a role group or add and remove members to or from a role group. You can use the name, distinguished name (DN), or primary SMTP address of the user or USG that you want to add. If the name of the user or USG contains spaces, enclose the name in quotation marks ("). If you want to add more than one user or USG,

			separate them using commas.
Members	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Members* parameter specifies the mailboxes or USGs to add as a member of the role group. You can use the name, DN, or primary SMTP address of the user or USG you want to add. If the name of the user or USG contains spaces, enclose the name in quotation marks ("). If you want to add more than one user or USG, separate them using commas. If you use the *Members* parameter, you can't use the *LinkedForeignGroup*, *LinkedDomainController*, or *LinkedCredential* parameters.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
PartnerManaged	Optional	System.Management.Automation.SwitchPara	This parameter is reserved for internal

		meter	Microsoft use.
RecipientOrganizationalUnitScope	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	This parameter is available only in on-premises Exchange 2013. The *RecipientOrganizationalUnitScope* parameter specifies the organizational unit (OU) scope added to the role assignments created when the role group is created. If you use the *RecipientOrganizationalUnitScope* parameter, you can't use the *CustomRecipientWriteScope* parameter. To specify an OU, use the syntax: *domain/ou*. If the OU name contains spaces, enclose the domain and OU in quotation marks (").
Roles	Optional	Microsoft.Exchange.Configuration.Tasks.RoleIdParameter[]	The *Roles* parameter specifies the management roles to assign to the role group when it's created. If a role name contains spaces, enclose the

			name in quotation marks ("). If you want to assign more that one role, separate the role names with commas. For a list of built-in management roles that you can assign to a role group, see Built-in management roles.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies the logon name used to support clients and servers running older versions of the operating system, such as Microsoft Windows NT 4.0, Windows 98, Windows 95, and LAN Manager. This attribute must contain fewer than 20 characters. If you don't specify this parameter, Active Directory creates a value for the *SamAccountName*

			parameter automatically, based on the user principal name (UPN).
ValidationOrganization	Optional	System.String	This parameter is reserved for internal Microsoft use.
WellKnownObjectGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RoleGroup

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-RoleGroup** cmdlet to remove a management role group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-RoleGroup -Identity <RoleGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-ForReconciliation <SwitchParameter>] [-RemoveWellKnownObjectGuid
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Training Administrators role group.

```
Remove-RoleGroup "Training Administrators"
```

EXAMPLE 2

This example removes the Vancouver Recipient Administrators role group. Because the user running the command wasn't added to the **ManagedBy** property of the role group, the *BypassSecurityGroupManagerCheck* switch must be used. The user is assigned the Role Management role, which enables the user to bypass the security group manager check.

```
Remove-RoleGroup "Vancouver Recipient Administrators" -
BypassSecurityGroupManagerCheck
```

Detailed Description

When you remove a role group, all the management role assignments assigned management roles to the role group are also removed. The management roles aren't removed. Members of a removed role group can no longer manage a feature if the role group was the only means by which they were granted access to the feature.

You can't remove built-in role groups.

If the **ManagedBy** property has been populated with role group managers, the user removing the role group must be a role group manager. Alternately, if the user is a member of the Organization Management role group or is directly or indirectly assigned the Role Management role, the *BypassSecurityGroupManagerCheck* switch can be used to override the security group management check.

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleGroupIdParameter	The *Identity* parameter specifies the role group to remove. If the role group name contains spaces, enclose the name in quotation marks (").
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* switch enables a user who hasn't been added to the `ManagedBy` property to remove a role group. The user must be a member of the Organization Management role group or be assigned, either directly or indirectly, the Role

			Management role.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and

			prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
ForReconciliation	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
RemoveWellKnownObjectGuid	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RoleGroup

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-RoleGroup** cmdlet to modify who can add or remove members to or from management role groups or change the name of the role group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-RoleGroup <COMMON PARAMETERS>

Set-RoleGroup -LinkedForeignGroupSid <SecurityIdentifier> <COMMON
PARAMETERS>

Set-RoleGroup -LinkedDomainController <String> -LinkedForeignGroup
<UniversalSecurityGroupIdParameter> [-LinkedCredential <PSCredential>]
<COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <RoleGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DisplayName <String>] [-
DomainController <Fqdn>] [-ExternalDirectoryObjectId <Guid>] [-Force
<SwitchParameter>] [-ManagedBy <MultiValuedProperty>] [-Name <String>] [-
WellKnownObjectGuid <Guid>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the role group managers list to David and Christine on the London Recipient

Administrators role group.

```
Set-RoleGroup "London Recipient Administrators" -ManagedBy
"David", "Christine"
```

EXAMPLE 2

This example sets the role group managers list to the Seattle Role Administrators USG on the Seattle Administrators role group. Because the user running the command wasn't added to the **ManagedBy** property of the role group, the *BypassSecurityGroupManagerCheck* switch must be used. The user is assigned the Role Management role, which enables the user to bypass the security group manager check.

```
Set-RoleGroup "Seattle Administrators" -ManagedBy "Seattle
Role Administrators" -BypassSecurityGroupManagerCheck
```

EXAMPLE 3

This example modifies the linked foreign USG on the existing linked role group ContosoUsers: Toronto Recipient Admins. The foreign USG that should be linked is Toronto Tier 2 Administrators.

First, the credentials for the user forest need to be stored in a variable so they can be used with the **Set-RoleGroup** cmdlet. The following command retrieves the credentials using the **Get-Credential** cmdlet and stores them in the `$Credentials` variable.

```
$Credentials = Get-Credential
```

Then, the foreign USG on the ContosoUsers: Toronto Recipient Admins linked role group is modified using the following command.

```
Set-RoleGroup "ContosoUsers: Toronto Recipient Admins" -
LinkedDomainController dc02.contosousers.contoso.com -
LinkedCredential $Credentials -LinkedForeignGroup "Toronto
Tier 2 Administrators"
```

Detailed Description

If you want to add or remove members to or from an existing role group, use the **Add-RoleGroupMember** or **Remove-RoleGroupMember** cmdlets. If you want to add or remove management role assignments to or from a role group, use the **New-ManagementRoleAssignment** or **Remove-ManagementRoleAssignment** cmdlets. If you want to add or remove members to or from a linked role group, you must add or remove the members to or from the foreign universal security group (USG) in the foreign forest. To find the foreign USG, use the **Get-RoleGroup** cmdlet.

If the **ManagedBy** property is populated with role group managers, the user configuring a role group must be a role group manager. Alternately, if the user is a member of the Organization Management role group or is directly or indirectly assigned the Role Management role, the *BypassSecurityGroupManagerCheck* switch can be used to override the security group management check.

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleGroupIdParameter	The *Identity* parameter specifies the name of the role group to modify. If the name contains spaces, enclose the name in quotation marks (").
LinkedDomainController	Required	System.String	This parameter is available only in on-premises Exchange 2013. The *LinkedDomainController* parameter specifies the fully qualified domain name (FQDN) or IP address of the domain controller in the forest where the foreign USG resides. The domain controller

			you specify is used to get security information for the foreign USG specified by the *LinkedForeignGroup* parameter. You can only use the *LinkedDomainController* parameter with a linked role group.
LinkedForeignGroup	Required	Microsoft.Exchange.Configuration.Tasks.UniversalSecurityGroupIdParameter	This parameter is available only in on-premises Exchange 2013. The *LinkedForeignGroup* parameter specifies the name of the foreign USG you want to link this role group to. If the foreign USG name contains spaces, enclose the name in quotation marks ("). You can only use the *LinkedForeignGroup* parameter to change the foreign USG linked to an existing linked role group. You can't change a standard role

			group to a linked role group by using the **Set-RoleGroup** cmdlet. You must create a role group using the **New-RoleGroup** cmdlet. If you use the *LinkedForeignGroup* parameter, you must specify a domain controller in the *LinkedDomainController* parameter.
LinkedForeignGroupSid	Required	System.Security.Principal.SecurityIdentifier	This parameter is reserved for internal Microsoft use.
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* switch enables a user who hasn't been added to the **ManagedBy** property to modify a role group. The user must be a member of the Organization Management role group or be assigned, either directly or indirectly, the Role Management role.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies the description displayed when the role group is viewed using the **Get-RoleGroup** cmdlet. Enclose the description in quotation marks (').
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the friendly name of the role group. If the name contains spaces, enclose the name in quotation marks ('). This parameter can have a maximum length of 256 characters.
DomainController	Optional	Microsoft.Exchange.Dat	This parameter is available only in on-

		a.Fqdn	premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalDirectoryObjectId	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.

LinkedCredential	Optional	System.Management.Automation.PSCredential	This parameter is available only in on-premises Exchange 2013. The *LinkedCredential* parameter specifies credentials to use to access the domain controller specified by the *LinkedDomainController* parameter. You can only use the *LinkedCredential* parameter with a linked role group. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
ManagedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ManagedBy* parameter specifies the users or USG who can modify the configuration of a role group or add or

			remove members to or from a role group. The list you specify with this parameter overwrites the existing `ManagedBy` list. To add or remove individual role group managers, and for more information about modifying multivalued properties, see Modifying multivalued properties. You can use the name, distinguished name (DN), or primary SMTP address of the user or USG you want to add. If the name of the user or USG contains spaces, enclose the name in quotation marks ("). If you want to add more than one user or USG, separate them using commas.
Name	Optional	System.String	The *Name* parameter specifies the name of the role group. The name can contain up to 64 characters. If the

			name contains spaces, enclose the name in quotation marks (").
WellKnownObjectGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-RoleGroupMember

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Add-RoleGroupMember** cmdlet to add members to a management role group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-RoleGroupMember -Identity <RoleGroupIdParameter> -Member
<SecurityPrincipalIdParameter> [-BypassSecurityGroupManagerCheck
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-IncludeSoftDeletedObjects <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the user David to the role group Recipient Management.

```
Add-RoleGroupMember "Recipient Management" -Member David
```

EXAMPLE 2

This example finds all the mailboxes that are part of the Sales department and adds them to the Sales and Marketing Group role group.

```
Get-User -Filter { Department -Eq "Sales" -And
RecipientType -Eq "UserMailbox" } | Get-Mailbox | Add-
RoleGroupMember "Sales and Marketing Group"
```

If you want to verify that the correct members will be added before committing changes, use the *WhatIf* parameter.

```
Get-User -Filter { Department -Eq "Sales" -And
RecipientType -Eq "UserMailbox" } | Get-Mailbox | Add-
RoleGroupMember "Sales and Marketing Group" -WhatIf
```

For more information about pipelining, and the *WhatIf* parameter, see the following topics:

- Pipelining
- WhatIf, Confirm, and ValidateOnly switches

EXAMPLE 3

This example adds the Training Assistants USG to the Training Administrators role group. Because the user running the command wasn't added to the **ManagedBy** property of the role group, the

BypassSecurityGroupManagerCheck switch must be used. The user is assigned the Role Management role, which enables the user to bypass the security group manager check.

```
Add-RoleGroupMember "Training Administrators" -Member
"Training Assistants" -BypassSecurityGroupManagerCheck
```

Detailed Description

When you add a member to a role group, that mailbox, universal security group (USG), or computer is given the effective permissions provided by the management roles assigned to the role group.

If the **ManagedBy** property has been populated with role group managers, the user adding a role group member must be a role group manager. Alternately, if the user is a member of the Organization Management role group or is directly or indirectly assigned the Role Management role, the *BypassSecurityGroupManagerCheck* switch can be used to override the security group management check.

If the role group is a linked role group, you can't use the **Add-RoleGroupMember** cmdlet to add members to the role group. Instead, you need to add members to the foreign USG that's linked to the linked role group. To find the foreign USG that's linked to a role group, use the **Get-RoleGroup** cmdlet.

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleGroupIdParameter	The *Identity* parameter specifies the role group to add a member to. If the role group name contains spaces, enclose the name in quotation marks (").
Member	Required	Microsoft.Exchange.Configuration.Tasks.Secur	The *Member* parameter specifies the mailbox,

		ityPrincipalIdParameter	USG, or computer to add to a role group. You can only specify one member at a time. If the member name contains spaces, enclose the name in quotation marks (").
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* switch enables a user who hasn't been added to the **ManagedBy** property to add a member to a role group. The user must be a member of the Organization Management role group or be assigned, either directly or indirectly, the Role Management role.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RoleGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RoleGroupMember** cmdlet to retrieve a list of members of a management role group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RoleGroupMember -Identity <RoleGroupMemberIdParameter> [-
DomainController <Fqdn>] [-IncludeSoftDeletedObjects <SwitchParameter>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example retrieves a list of all the members of the Recipient Administrators role group.

```
Get-RoleGroupMember "Recipient Administrators"
```

EXAMPLE 2

This example retrieves a list of all the members of the Organization Administrators role group as seen by the domain controller closest to the user running the command.

```
Get-RoleGroupMember "Organization Administrators" -
ReadFromDomainController
```

Detailed Description

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleGroupMemberIdParameter	The *Identity* parameter specifies the role group for which member information should be retrieved. If the role group name contains spaces, enclose the name in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchPara	This parameter is reserved for internal

		meter	Microsoft use.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* switch specifies that the role group information should be read from a domain controller in the user's domain. If you use the **Set-AdServerSettings** cmdlet to include all role groups in the forest and don't use this parameter, it's possible that the role group information is read from a global catalog with outdated information.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all the members of a role group, use `Unlimited` for the value of this parameter. The default

			value is 1,000.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RoleGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-RoleGroupMember** cmdlet to remove a member of a management role group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-RoleGroupMember -Identity <RoleGroupIdParameter> -Member
<SecurityPrincipalIdParameter> [-BypassSecurityGroupManagerCheck
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-IncludeSoftDeletedObjects <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the user David from the role group Recipient Management.

```
Remove-RoleGroupMember "Recipient Management" -Member David
```

EXAMPLE 2

This example finds all the mailboxes that are part of the Sales department and removes them from the Sales and Marketing Group role group.

```
Get-User -Filter { Department -Eq "Sales" -And -
RecipientType -Eq "UserMailbox" } | Get-Mailbox | Remove-
RoleGroupMember "Sales and Marketing Group"
```

If you want to verify that the correct members will be removed before committing changes, use the *WhatIf* parameter.

```
Get-User -Filter { Department -Eq "Sales" -And -
RecipientType -Eq "UserMailbox" } | Get-Mailbox | Remove-
RoleGroupMember "Sales and Marketing Group" -WhatIf
```

For more information about pipelining, and the **WhatIf** parameter, see the following topics:

- Pipelining
- WhatIf, Confirm, and ValidateOnly switches

EXAMPLE 3

This example removes the Training Assistants USG from the Training Administrators role group. Because the user running the command wasn't added to the **ManagedBy** property of the role group, the *BypassSecurityGroupManagerCheck* switch must be used. The user is assigned the Role Management role, which enables the user to bypass the security group manager check.

```
Remove-RoleGroupMember "Training Administrators" -Member
"Training Assistants" -BypassSecurityGroupManagerCheck
```

Detailed Description

When you remove a member from a role group, that member can no longer manage the features made available by the role group if the role group is the only means by which the member is granted access to the feature.

If the **ManagedBy** property has been populated with role group managers, the user removing a role group member must be a role group manager. Alternately, if the user is a member of the Organization Management role group or is directly or indirectly assigned the Role Management role, the *BypassSecurityGroupManagerCheck* switch can be used to override the security group management check.

If the role group is a linked role group, you can't use the **Remove-RoleGroupMember** cmdlet to remove members from the role group. Instead, you need to remove members from the foreign universal security group (USG) linked to the linked role group. To find the foreign USG linked to a role group, use the **Get-RoleGroup** cmdlet.

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleGroupIdParameter	The *Identity* parameter specifies the role group that you want to remove a member from. If the role group name contains spaces, enclose the name in quotation marks (").
Member	Required	Microsoft.Exchange.Configuration.Tasks.SecurityPrincipalIdParameter	The *Member* parameter specifies the mailbox or USG to remove from a role group. You can only specify one member at a time. If the member name contains spaces, enclose the name in quotation marks (").
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* switch enables a user who hasn't been added to the **ManagedBy** property to remove a member from a role

			group. The user must be a member of the Organization Management role group or be assigned, either directly or indirectly, the Role Management role.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-RoleGroupMember

Exchange Management Shell > Exchange 2013 cmdlets > Permissions cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Update-RoleGroupMember** cmdlet to modify the members of a management role group.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-RoleGroupMember -Identity <RoleGroupIdParameter> [-
BypassSecurityGroupManagerCheck <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-
IncludeSoftDeletedObjects <SwitchParameter>] [-Members
<MultiValuedProperty>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the Recipient Administrators role group membership list to Mark, Jane, Mary, and Fred.

```
Update-RoleGroupMember "Recipient Administrators" -Members
"Mark", "Jane", "Mary", "Fred"
```

EXAMPLE 2

This example sets the Recipient Administrators role group membership list to Mark, Jane, Mary, and Fred. Because the user running the command wasn't added to the **ManagedBy** property of the role group, the *BypassSecurityGroupManagerCheck* switch must be used. The user is assigned the Role Management role, which enables the user to bypass the security group manager check.

```
Update-RoleGroupMember "Recipient Administrators" -Members
"Mark", "Jane", "Mary", "Fred" -
BypassSecurityGroupManagerCheck
```

EXAMPLE 3

This example adds multiple members to, and removes multiple members from, a role group without replacing all the existing members on the role group. This example makes use of multivalued property syntax that's described in the topic Modifying multivalued properties. When you use this multivalued property syntax, you must manually retrieve the *Identity* of the mailbox or security group that you want to add to or remove from the role group. Use the syntax that matches the type of object you want to add or remove:

- **Mailbox** If you want to add or remove a mailbox, use the syntax `(Get-Mailbox "<Alias or Name>").Identity`
- **Security Group** If you want to add or remove a security group, use the syntax `(Get-Group "<Name>").Identity`

```
Update-RoleGroupMember "Organization Management" -Members
@{Add=(Get-Mailbox David).Identity, (Get-Group "Help Desk
```

```
Managers").Identity; Remove=(Get-Mailbox
"Christine").Identity, (Get-Mailbox "Isabel").Identity}
```

Detailed Description

The **Update-RoleGroupMember** cmdlet enables you to replace the entire membership list for a role group or perform programmatic addition or removal of multiple members at a single time. The membership list that you specify with the *Members* parameter on this cmdlet replaces the membership list for the specific role group. For this reason, take care when using this cmdlet so you don't mistakenly overwrite role group membership.

The **Add-RoleGroupMember** and **Remove-RoleGroupMember** cmdlets can be used to add or remove role group members. You can combine these cmdlets with other cmdlets, such as **Get-Mailbox**, to add or remove multiple members without overwriting the entire membership list at once.

If the **ManagedBy** property has been populated with role group managers, the user updating role group membership must be a role group manager. Alternately, if the user is a member of the Organization Management role group or is directly or indirectly assigned the Role Management role, the *BypassSecurityGroupManagerCheck* switch can be used to override the security group management check.

If the role group is a linked role group, you can't use the **Update-RoleGroupMember** cmdlet to modify members on the role group. Instead, you need to modify members on the foreign universal security group (USG) that's linked to the linked role group. To find the foreign USG that's linked to a role group, use the **Get-RoleGroup** cmdlet.

For more information about role groups, see Understanding management role groups.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Role groups" entry in the Role management permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RoleGroupIdParameter	The *Identity* parameter specifies the role group whose membership you want to modify. If the name of the role group contains spaces, enclose

			the name in quotation marks (").
BypassSecurityGroupManagerCheck	Optional	System.Management.Automation.SwitchParameter	The *BypassSecurityGroupManagerCheck* switch enables a user who hasn't been added to the **ManagedBy** property to modify a role group's membership. The user must be a member of the Organization Management role group or be assigned, either directly or indirectly, the Role Management role.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IncludeSoftDeletedObjects	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Members	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Members* parameter specifies the mailboxes or USG that should be members of a security group. If the member name contains spaces, enclose the name in quotation marks ("). Separate multiple members using commas. **Caution:** The list that you specify using the *Members* parameter overwrites the existing membership list of the role group. If you want to add or remove individual members to or from a role group, use the **Add-RoleGroupMember** or **Remove-RoleGroupMember** cmdlets. If you want to add or remove multiple

			members without replacing the entire membership list, see the Examples section.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Search-AdminAuditLog

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Search-AdminAuditLog** cmdlet to search the contents of the administrator audit log.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Search-AdminAuditLog [-Cmdlets <MultiValuedProperty>] [-EndDate
<ExDateTime>] [-ExternalAccess <$true | $false>] [-Identity
<OrganizationIdParameter>] [-IsSuccess <$true | $false>] [-ObjectIds
<MultiValuedProperty>] [-Parameters <MultiValuedProperty>] [-ResultSize
<Int32>] [-StartDate <ExDateTime>] [-StartIndex <Int32>] [-UserIds
<MultiValuedProperty>] [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example finds all the administrator audit log entries that contain either the **New-RoleGroup** or the **New-ManagementRoleAssignment** cmdlet.

```
Search-AdminAuditLog -Cmdlets New-RoleGroup, New-
ManagementRoleAssignment
```

EXAMPLE 2

This example finds all the administrator audit log entries that match the following criteria:

- *Cmdlets* **Set-Mailbox**
- *Parameters* *UseDatabaseQuotaDefaults*, *ProhibitSendReceiveQuota*, *ProhibitSendQuota*
- *StartDate* 01/24/2012
- *EndDate* 02/12/2012
- The command completed successfully

```
Search-AdminAuditLog -Cmdlets Set-Mailbox -Parameters
UseDatabaseQuotaDefaults, ProhibitSendReceiveQuota,
ProhibitSendQuota -StartDate 01/24/2012 -EndDate 02/12/2012
-IsSuccess $true
```

EXAMPLE 3

This example displays all the comments written to the administrator audit log by the **Write-AdminAuditLog** cmdlet.

First, store the audit log entries in a temporary variable using the following command.

```
$LogEntries = Search-AdminAuditLog -Cmdlets Write-
AdminAuditLog
```

Then, iterate through all the audit log entries returned and display the **Parameters** property using the following command.

```
$LogEntries | ForEach { $_.CmdletParameters }
```

EXAMPLE 4

This example returns entries in the administrator audit log of an Exchange Online organization for cmdlets run by Microsoft datacenter administrators between September 17, 2013 and October 2, 2013.

```
Search-AdminAuditLog -ExternalAccess $true -StartDate
09/17/2013 -EndDate 10/02/2013
```

Detailed Description

If you run the **Search-AdminAuditLog** cmdlet without any parameters, up to 1,000 log entries are returned by default.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "View-only administrator audit logging" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Cmdlets	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Cmdlets* parameter specifies the cmdlets you want to search for in the administrator audit log. Only the log entries that contain the cmdlets you specify are returned. If you want to specify more than one cmdlet, separate each cmdlet with a comma.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
EndDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *EndDate* parameter specifies the scope of the administrator audit log results to log

			entries that occurred on or before the specified date. Specify the day, month, and year in the format specified in your regional settings.
ExternalAccess	Optional	System.Boolean	The *ExternalAccess* parameter returns only audit log entries for cmdlets that were run by a user outside of your organization. In Exchange Online, use this parameter to return audit log entries for cmdlets run by Microsoft datacenter administrators.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
IsSuccess	Optional	System.Boolean	The *IsSuccess* parameter specifies whether only administrator audit log entries that indicated a success or failure should be returned. Valid values are `$true` and `$false`.

ObjectIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ObjectIds* parameter specifies that only administrator audit log entries that contain the specified changed objects should be returned. This parameter accepts a variety of objects, such as mailbox aliases, Send connector names, and so on. If you want to specify more than one object ID, separate each ID with a comma.
Parameters	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Parameters* parameter specifies the parameters you want to search for in the administrator audit log. Only the log entries that contain the parameters you specify are returned. You can only use this parameter if you use the *Cmdlets* parameter. If you want to specify more than one parameter, separate each parameter with a

			comma.
ResultSize	Optional	System.Int32	The *ResultSize* parameter specifies the maximum number of administrator audit log entries to return. The minimum value is 1 and the maximum value is 250000. The default value is 1000.
StartDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies the scope of the administrator audit log results to log entries that occurred on or after the specified date. Specify the day, month, and year in the format specified in your regional settings.
StartIndex	Optional	System.Int32	The *StartIndex* parameter specifies the position in the result set where the displayed results start.
UserIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UserIds* parameter specifies that only the administrator audit log entries that contain the specified ID of the user

			who ran the cmdlet should be returned. If you want to specify more than one user ID, separate each ID with a comma.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Write-AdminAuditLog

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Write-AdminAuditLog** cmdlet to write a comment to the administrator audit log.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Write-AdminAuditLog -Comment <String> [-Identity
<OrganizationIdParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds a comment to the administrator audit log.

```
Write-AdminAuditLog -Comment "Ran custom script."
```

Detailed Description

When the **Write-AdminAuditLog** cmdlet runs, the value provided in the *Comment* parameter is included in the log entry.

For the **Write-AdminAuditLog** cmdlet to write to the audit log, it must be included in the list of cmdlets being logged by administrator audit logging.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Write to audit log" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Comment	Required	System.String	The *Comment* parameter specifies the comment to add to the administrator audit log. The maximum length is 500 characters. If the comment you specify contains spaces, enclose the comment in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AdminAuditLogConfig

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-06*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AdminAuditLogConfig** cmdlet to view the administrator audit logging configuration settings.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AdminAuditLogConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>]
```

Examples

EXAMPLE 1

This example displays the administrator audit logging settings. The output of the **Get-AdminAuditLogConfig** cmdlet is piped to the **Format-List** cmdlet. For more information about piping and the **Format-List** cmdlet, see the following topics:

- Pipelining
- Working with command output

```
Get-AdminAuditLogConfig | Format-List
```

Detailed Description

When audit logging is enabled, a log entry is created for each cmdlet that's run, excluding **Get** cmdlets.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Administrator audit logging" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AdminAuditLogConfig

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AdminAuditLogConfig** cmdlet to configure the administrator audit logging configuration settings.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AdminAuditLogConfig [-Identity <OrganizationIdParameter>] [-
AdminAuditLogAgeLimit <EnhancedTimeSpan>] [-AdminAuditLogCmdlets
<MultiValuedProperty>] [-AdminAuditLogEnabled <$true | $false>] [-
AdminAuditLogExcludedCmdlets <MultiValuedProperty>] [-
AdminAuditLogParameters <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-IgnoreDehydratedFlag <SwitchParameter>] [-LogLevel <None | Verbose>] [-
Name <String>] [-TestCmdletLoggingEnabled <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables administrator audit logging for every cmdlet and every parameter in the organization, with the exception of **Get** cmdlets.

```
Set-AdminAuditLogConfig -AdminAuditLogEnabled $true -
AdminAuditLogCmdlets * -AdminAuditLogParameters *
```

EXAMPLE 2

This example enables administrator audit logging for specific cmdlets run in the organization. Any parameter used on the specified cmdlets is logged. Every time a specified cmdlet is run, a log entry is added to the audit log.

```
Set-AdminAuditLogConfig -AdminAuditLogEnabled $true -
AdminAuditLogCmdlets *Mailbox, *Management*,
*TransportRule* -AdminAuditLogParameters *
```

EXAMPLE 3

This example enables administrator audit logging only for specific parameters that are specified when running specific cmdlets. The parameter name and the cmdlet name must match the strings

specified with the *AdminAuditLogCmdlets* and *AdminAuditLogParameters* parameters. For example, a log entry is generated only when a parameter with the string "Address" in the name is run on a cmdlet with the string "Mailbox" in its name.

```
Set-AdminAuditLogConfig -AdminAuditLogEnabled $true -
AdminAuditLogCmdlets *Mailbox* -AdminAuditLogParameters
*Address*
```

Detailed Description

When audit logging is enabled, a log entry is created for each cmdlet run, excluding **Get** cmdlets. In Microsoft Exchange Server 2013, log entries are stored in a hidden mailbox and accessed using the **Search-AdminAuditLog** or **New-AdminAuditLogSearch** cmdlets.

Important:
The **Set-AdminAuditLogConfig**, **Enable-CmdletExtensionAgent**, and **Disable-CmdletExtensionAgent** cmdlets are logged when they're run regardless of whether administrator audit logging is enabled or disabled. Administrator audit logging relies on Active Directory replication to replicate the configuration settings you specify to the domain controllers in your organization. Depending on your replication settings, the changes you make may not be immediately applied to all computers running Exchange 2013 in your organization. Changes to the audit log configuration may take up to 60 minutes to be applied on computers that have the Exchange Management Shell open at the time a configuration change is made. If you want to apply the changes immediately, close and reopen the Shell on each computer.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Administrator audit logging" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
AdminAuditLogAgeLimit	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AdminAuditLogAgeLimit* parameter specifies how long each log entry should be kept before it's deleted. The default age limit is 90 days.

			To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to set the audit log age limit to 120 days, use the syntax `120.00:00:00`. **Caution:** Setting the age limit to a value less than the current limit causes log entries older than the new limit to be deleted. Setting the age limit to `0` purges the audit log of all entries.
AdminAuditLogCmdlets	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AdminAuditLogCmdlets* parameter specifies which cmdlets should be audited. You can specify one or more cmdlets, separated by commas. You can also use the wildcard character (*) to match multiple cmdlets in one or more of the entries in the cmdlet list. To audit all cmdlets, specify only the wildcard character (*).
AdminAuditLogEnable	Optional	System.Boolean	The

d			*AdminAuditLogEnabled* parameter specifies whether administrator audit logging is enabled. The default value is `$false`. The valid values are `$true` and `$false`. You must specify an administrator audit log mailbox before you enable logging. **Note:** Changes to the administrator audit log configuration are always logged, regardless of whether audit logging is enabled or disabled.
AdminAuditLogExcludedCmdlets	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AdminAuditLogExcludedCmdlets* parameter specifies which cmdlets should be excluded from auditing. Use this parameter if you want to exclude specific cmdlets you don't want to audit even if they match a wildcard string specified in the *AdminAuditLogCmdlets* parameter. You can specify one or more cmdlets, separated

			by commas. You can also use the wildcard character (*) to match multiple cmdlets in one or more of the entries in the cmdlet list. You can't specify only the wildcard character (*). If you want to clear the list, specify a value of `$null`.
AdminAuditLogParameters	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AdminAuditLogParameters* parameter specifies which parameters should be audited on the cmdlets you specified using the *AdminAuditLogCmdlets* parameter. You can specify one or more parameters, separated by commas. You can also use the wildcard character (*) to match multiple parameters in one or more of the entries in the parameters list. To audit all parameters, specify only the wildcard character (*).
Confirm	Optional	System.Management.Automation.SwitchPar	The *Confirm* switch causes the command to

		ameter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
LogLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuditLogLevel	The *LogLevel* parameter specifies whether additional properties should be included in the log entries. Valid values are `None` and `Verbose`. By default, the `CmdletName`, `ObjectName`, `Parameters` (values), and the `Caller`, `Succeeded`, and `RunDate` properties are included in log entries. When the `Verbose` value is used, the `ModifiedProperties` (old and new) and `ModifiedObjectResolvedName` properties are included in the log entries.
Name	Optional	System.String	The *Name* parameter specifies the name of the **AdminAuditLogConfig** object. **Note:** You don't need to specify

			this parameter when configuring administrator audit logging. It doesn't affect your configuration or how administrator audit logging works.
TestCmdletLoggingEnabled	Optional	System.Boolean	The *TestCmdletLoggingEnabled* parameter specifies whether the execution of test cmdlets should be logged. Test cmdlets begin with the verb **Test**. Valid values are `$true` and `$false`. The default value is `$false`. **Important:** Test cmdlets can produce a large amount of information. As such, you should only enable logging of test cmdlets for a short period of time.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AdminAuditLogSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-AdminAuditLogSearch** cmdlet to search the contents of the administrator audit log and send the results to one or more mailboxes that you specify.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-AdminAuditLogSearch -EndDate <ExDateTime> -StartDate <ExDateTime> -
StatusMailRecipients <MultiValuedProperty> [-Organization
<OrganizationIdParameter>] [-Cmdlets <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExternalAccess <$true |
$false>] [-Name <String>] [-ObjectIds <MultiValuedProperty>] [-Parameters
<MultiValuedProperty>] [-UserIds <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example finds all the administrator audit log entries that match the following criteria and sends the results to the david@contoso.com and chris@contoso.com SMTP addresses:

- **Cmdlets** **Set-Mailbox**
- **Parameters** *UseDatabaseQuotaDefaults*, *ProhibitSendReceiveQuota*, *ProhibitSendQuota*
- **StartDate** 01/24/2012
- **EndDate** 02/12/2012

```
New-AdminAuditLogSearch -Name "Mailbox Quota Change Audit"
-Cmdlets Set-Mailbox -Parameters UseDatabaseQuotaDefaults,
ProhibitSendReceiveQuota, ProhibitSendQuota -StartDate
01/24/2012 -EndDate 02/12/2012 -StatusMailRecipients
david@contoso.com, chris@contoso.com
```

EXAMPLE 2

This example returns entries in the administrator audit log of an Exchange Online organization for cmdlets run by Microsoft datacenter administrators between September 25, 2013 and October 24, 2013. The search results are sent to the admin@contoso.com and pilarp@contoso.com SMTP addresses and the text "Datacenter admin audit log" is added to the subject line of the message.

```
New-AdminAuditLogSearch -ExternalAccess $true -StartDate
07/25/2013 -EndDate 10/24/2013 -StatusMailRecipients
admin@contoso.com,pilarp@contoso.com -Name "Datacenter
admin audit log"
```

Detailed Description

After the **New-AdminAuditLogSearch** cmdlet is run, the report is delivered to the mailboxes you specify within 15 minutes. The log is included as an XML attachment on the report email message. The maximum size of the log that can be generated is 10 megabytes (MB).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "View-only administrator audit logging" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
EndDate	Required	Microsoft.Exchange.Exchange System.ExDateTime	The *EndDate* parameter specifies the scope of the administrator audit log results to log entries that occurred on or before the specified date. Specify the day, month,

			and year in the format specified in your regional settings.
StartDate	Required	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies the scope of the administrator audit log results to log entries that occurred on or after the specified date. Specify the day, month, and year in the format specified in your regional settings.
StatusMailRecipients	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *StatusMailRecipients* parameter specifies the recipients that should receive the administrator audit log report. The recipient must be a valid SMTP address. If you want to specify more than one recipient, separate each SMTP address with a comma.
Cmdlets	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Cmdlets* parameter specifies the cmdlets you want to search for

			in the administrator audit log. Only the log entries that contain the cmdlets you specify are returned. If you want to specify more than one cmdlet, separate each cmdlet with a comma.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

ExternalAccess	Optional	System.Boolean	The *ExternalAccess* parameter returns only audit log entries for cmdlets that were run by a user outside of your organization. In Exchange Online, use this parameter to return audit log entries for cmdlets run by Microsoft datacenter administrators.
Name	Optional	System.String	The *Name* parameter specifies the name of the administrator audit log search. The name is shown in the subject line of the audit log report email message. If the name of the report contains spaces, enclose the name in quotation marks (").
ObjectIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ObjectIds* parameter specifies that only administrator audit log entries that contain the specified changed objects should be returned. This parameter accepts a variety of objects, such

			as mailboxes, aliases, Send connector names, and so on. If you want to specify more than one object ID, separate each ID with a comma.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Parameters	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Parameters* parameter specifies the parameters you want to search for in the administrator audit log. Only the log entries that contain the parameters you specify are returned. You can only use this parameter if you use the *Cmdlets* parameter. If you want to specify more than one parameter, separate each parameter with a comma.
UserIds	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UserIds* parameter specifies that only the administrator audit log

			entries that contain the specified ID of the user who ran the cmdlet should be returned. If you want to specify more than one user ID, separate each ID with a comma.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ArchiveConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-ArchiveConnectivity** cmdlet to verify archive functionality for a mailbox user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-ArchiveConnectivity -UserSmtp <SmtpAddress> [-Confirm
[<SwitchParameter>]] [-IncludeArchiveMRMConfiguration <SwitchParameter>]
[-MessageId <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests archive connectivity to Gurinder Singh's archive.

```
Test-ArchiveConnectivity -UserSmtp gsingh@contoso.com
```

EXAMPLE 2

This command retrieves mailboxes that have a cloud-based archive provisioned and tests archive connectivity for each mailbox.

```
Get-Mailbox -Filter {ArchiveGuid -ne $null -and
ArchiveDomain -ne $null} -ResultSize Unlimited | Test-
ArchiveConnectivity
```

Detailed Description

Running the **Test-ArchiveConnectivity** cmdlet validates connectivity to a user's archive mailbox. End-to-end verification includes testing whether an on-premises or cloud-based archive is provisioned for the on-premises mailbox user and whether it's enabled and logging on to the archive mailbox on behalf of the user. Successful completion of the command indicates that processes such as the Managed Folder Assistant and Microsoft Office Outlook Web App are able to successfully access the archive mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "In-Place Archive – Test connectivity" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
UserSmtp	Required	Microsoft.Exchange.Data.SmtpAddress	The *UserSmtp* parameter specifies the SMTP address of the mailbox.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
IncludeArchiveMRMConfiguration	Optional	System.Management.Automation.SwitchParameter	The *IncludeArchiveMRMConfiguration* switch retrieves retention tags provisioned in the user's archive mailbox and the last time the archive was processed by the Managed Folder Assistant.
MessageId	Optional	System.String	This parameter is

			reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AuditLogSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-07*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AuditLogSearch** cmdlet to return a list of current audit log searches that were created with the **New-AdminAuditLogSearch** or **New-MailboxAuditLogSearch** cmdlets. The **Get-AuditLogSearch** cmdlet also returns audit log searches that are initiated whenever an administrator uses the Exchange Admin Center (EAC) to export audit logs.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AuditLogSearch [-CreatedAfter <ExDateTime>] [-CreatedBefore
<ExDateTime>] [-Identity <AuditLogSearchIdParameter>] [-Organization
<OrganizationIdParameter>] [-ResultSize <Int32>] [-Type <String>]
```

Examples

Example 1

This example displays detailed information for all current audit log searches.

```
Get-AuditLogSearch | FL
```

Example 2

This example returns a list of current administrator audit log searches.

```
Get-AuditLogSearch -Type admin
```

Detailed Description

Run the **Get-AuditLogSearch** cmdlet to return a list of pending audit log searches. If an audit log search has been completed, it won't be displayed in the list of audit log searches.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "View-only administrator audit logging" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
CreatedAfter	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *CreatedAfter* parameter filters the results to audit log searches that were created after the specified date.

			Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
CreatedBefore	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *CreatedBefore* parameter filters the results to audit log searches that were created before the specified date. Use the short date format defined in the **Regional Options** settings for the

			computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AuditLogSearchIdParameter	The *Identity* parameter specifies the GUID for an audit log search. You can run the command `Get-AuditLogSearch | Format-List Identity` to display the GUIDs for all current audit log searches.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
ResultSize	Optional	System.Int32	The *ResultSize*

			parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Type	Optional	System.String	The *Type* parameter specifies the type of audit log searches to return. Use the value `Admin` to return administrator audit log searches or use `mailbox` to return mailbox audit log searches. If the *Type* parameter isn't used, the cmdlet returns both administrator and mailbox audit log searches.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ClassificationRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ClassificationRuleCollection** cmdlet to view the classification rule collections in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ClassificationRuleCollection [-Identity
<ClassificationRuleCollectionIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>]
```

Examples

Example 1

This example returns a summary list of all classification rule collections.

```
Get-ClassificationRuleCollection
```

Example 2

This example returns detailed information about the classification rule collection named Microsoft Rule Pack. The command is piped to the **Format-List** cmdlet to display the detailed configuration of the specified classification rule collection.

```
Get-ClassificationRuleCollection "Microsoft Rule Pack" |
Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Management.ClassificationDefinitions.ClassificationRuleCollectionIdParameter	The *Identity* parameter specifies the classification rule collection you want to view. You can use any value that uniquely identifies the classification rule collection. For example, you can specify the name, rule collection name or distinguished name (DN) of the classification rule collection.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ClassificationRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-ClassificationRuleCollection** cmdlet to import new classification rule collections into your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ClassificationRuleCollection -FileData <Byte[]> [-OutOfBoxCollection
<SwitchParameter>] <COMMON PARAMETERS>

New-ClassificationRuleCollection -InstallDefaultCollection
<SwitchParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example imports the classification rule collection file C:\My Documents\External Classification Rule Collection.xml.

```
New-ClassificationRuleCollection -FileData ([Byte[]]$(Get-
Content -Path "C:\My Documents\External Classification Rule
```

```
Collection.xml" -Encoding Byte -ReadCount 0))
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the classification rule collection file you want to import. For more information about the syntax required to use this parameter, see Syntax.
InstallDefaultCollection	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OutOfBoxCollection	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ClassificationRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ClassificationRuleCollection** to remove classification rule collections from your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ClassificationRuleCollection -Identity
<ClassificationRuleCollectionIdParameter> [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example removes the classification rule collection named External Classification Rule Collection from your organization.

```
Remove-ClassificationRuleCollection "External
Classification Rule Collection"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.ClassificationDefinitions.ClassificationRuleCollectionIdParameter	The *Identity* parameter specifies the classification rule collection you want to remove. You can use any value that uniquely identifies the classification rule collection. For example, you can specify the name, rule collection name or distinguished name (DN) of the classification rule collection.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You

			must include a colon (：) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ClassificationRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ClassificationRuleCollection** cmdlet to update existing classification rule collections in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ClassificationRuleCollection -FileData <Byte[]> [-OutOfBoxCollection
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Name <String>] [-Organization <OrganizationIdParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example imports the classification rule collection file C:\My Documents\External Classification Rule Collection.xml.

```
Set-ClassificationRuleCollection -FileData ([Byte[]]$(Get-
Content -Path "C:\My Documents\External Classification Rule
Collection.xml" -Encoding Byte -ReadCount 0))
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the classification rule collection file you want to import. For more information about the syntax required to use this parameter, see Syntax.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
Name	Optional	System.String	The *Name* parameter specifies a unique name for the classification rule collection. If the value contains spaces, enclose the value in quotation marks (").
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OutOfBoxCollection	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DataClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-DataClassification** cmdlet to view the data classification rules in your organization. This cmdlet shows built-in data classification rules, and rules that you created that use document fingerprints.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DataClassification [-ClassificationRuleCollectionIdentity
<ClassificationRuleCollectionIdParameter>] <COMMON PARAMETERS>

Get-DataClassification [-Identity <DataClassificationIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>]
```

Examples

Example 1

This example returns a summary list of all data classification rules in the organization.

```
Get-DataClassification
```

Example 2

This example returns a summary list of all new data classification rules based on document fingerprints that you created.

```
Get-DataClassification -
ClassificationRuleCollectionIdentity "Fingerprint
Classification Collection"
```

Example 3

This example returns details of the built-in data classification rule named SWIFT Code.

```
Get-DataClassification "SWIFT Code" | Format-List
```

Detailed Description

Classification rule packages are used by data loss prevention (DLP) to detect sensitive content in messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
ClassificationRuleCollectionIdentity	Optional	Microsoft.Exchange.Management.ClassificationDefinitions.ClassificationRuleCollectionIdParameter	The *ClassificationRuleCollectionIdentity* parameter filters the results by the name of the data classification rule collection. The data classification rule collection that contains the built-in data classification rules is named `Microsoft Rule Package`. The data classification that contains

			new data classification rules that you create that use document fingerprints is named `Fingerprint Classification Collection`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Management.ClassificationDefinitions.DataClassificationIdParameter	The *Identity* parameter specifies the data classification rule that you want to view. You can use any value that uniquely identifies the data classification rule. For example: • Name • **LocalizedName** • **Identity** GUID value
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-DataClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-DataClassification** cmdlet to create data classification rules that use document fingerprints.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-DataClassification -Description <String> -Fingerprints
<MultiValuedProperty> -Name <String> [-
ClassificationRuleCollectionIdentity
<ClassificationRuleCollectionIdParameter>] [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-Locale <CultureInfo>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates a new data classification rule named "Contoso Employee-Customer Confidential" that uses the document fingerprints of the files C:\My Documents\Contoso Employee Template.docx and D:\Data\Contoso Customer Template.docx.

```
$Employee_Template = Get-Content "C:\My Documents\Contoso
Employee Template.docx" -Encoding byte
$Employee_Fingerprint = New-Fingerprint -FileData
$Employee_Template -Description "Contoso Employee Template"
$Customer_Template = Get-Content "D:\Data\Contoso Customer
Template.docx" -Encoding byte
```

```
$Customer_Fingerprint = New-Fingerprint -FileData
$Customer_Template -Description "Contoso Customer Template"
New-DataClassification -Name "Contoso Employee-Customer
Confidential" -Fingerprints
$Employee_Fingerprint,$Customer_Fingerprint -Description
"Message contains Contoso employee or customer
information."
```

Detailed Description

Classification rule packages are used by data loss prevention (DLP) to detect sensitive content in messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Description	Required	System.String	The *Description* parameter specifies a description for the data classification rule.
Fingerprints	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Fingerprints* parameter specifies the byte-encoded files to use as document fingerprints. You can use multiple document fingerprints separated by commas. For instructions on how to import documents to use as templates for fingerprints, see New-

			Fingerprint or the Examples section.
Name	Required	System.String	The *Name* parameter specifies a name for the data classification rule. The value must be less than 256 characters. The value of this parameter is used in the Policy Tip that's presented to users in Outlook Web App.
ClassificationRuleCollectionIdentity	Optional	Microsoft.Exchange.Management.ClassificationDefinitions.ClassificationRuleCollectionIdParameter	The *ClassificationRuleCollectionIdentity* parameter is reserved for future use. New data classification rules that you create are automatically added to the classification rule collection named Fingerprint Classification Collection.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Locale	Optional	System.Globalization.CultureInfo	The *Locale* parameter specifies the language that's associated with the data classification rule. Valid input for this parameter is a Microsoft .NET Framework **CultureInfo** class culture code value. For example, `en` for English or `fr` for French. If you don't specify a value for the *Locale*

			parameter, the default language of your Exchange organization is used when you create the data classification rule. You can add additional language translations to the data classification rule by using the **Set-DataClassification** cmdlet.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DataClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-DataClassification** cmdlet to remove data classification rules that use document fingerprints. You can't use this cmdlet to remove built-in data classification rules.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DataClassification -Identity <DataClassificationIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the data classification rule named "Contoso Confidential".

```
Remove-DataClassification "Contoso Confidential"
```

Detailed Description

Classification rule packages are used by data loss prevention (DLP) to detect sensitive content in messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss

prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.ClassificationDefinitions.DataClassificationIdParameter	The *Identity* parameter specifies the data classification rule that you want to remove. You can use any value that uniquely identifies the data classification rule. For example: • Name • **LocalizedName** • **Identity** GUID value
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DataClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Set-DataClassification** cmdlet to modify data classification rules that use document fingerprints.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DataClassification -Identity <DataClassificationIdParameter> [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DomainController <Fqdn>] [-
Fingerprints <MultiValuedProperty>] [-IsDefault <SwitchParameter>] [-
Locale <CultureInfo>] [-Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example adds a French translation to the existing data classification rule named "Contoso Confidential", and sets this French translation as the default.

```
Set-DataClassification "Contoso Confidential" -Locale fr -
Name "Contoso Confidentiel" -Description "Ce message
contient des informations confidentielles." -IsDefault
```

Example 2

This example removes the existing Spanish translation from the data classification rule named "Contoso Confidential".

```
Set-DataClassification "Contoso Confidential" -Locale es -
Name $null -Description $null
```

Example 3

This example modifies the existing data classification rule named "Contoso Confidential" by adding a new document fingerprint for the file C:\My Documents\Contoso Benefits Template.docx without affecting any existing document fingerprints that are already defined.

```
$Benefits_Template = Get-Content "C:\My Documents\Contoso
Benefits Template.docx" -Encoding byte
$Benefits_Fingerprint = New-Fingerprint -FileData
$Benefits_Template -Description "Contoso Benefits Template"
$Contoso_Confidential = Get-DataClassification "Contoso
Confidential"
$Array = [System.Collections.ArrayList]
($Contoso_Confidential.Fingerprints)
$Array.Add($Benefits_FingerPrint)
```

```
Set-DataClassification $Contoso_Confidential.Identity -
FingerPrints $Array
```

Example 4

This example modifies the data classification rule named "Contoso Confidential" by removing an existing document fingerprint without affecting other document fingerprints that are already defined.

First, you need to see the list of document fingerprints in the data classification rule by running the following commands:

```
$cc = Get-DataClassification "Contoso Confidential"
$a = [System.Collections.ArrayList]($cc.Fingerprints)
$a
```

The first document fingerprint in the list has the index number 0, the second has the index number 1, and so on. You use the index number to specify the document fingerprint that you want to remove.

To remove the first document fingerprint that's displayed in the list, run the following commands:

```
$a.RemoveAt(0)
Set-DataClassification $cc.Identity -FingerPrints $Array
```

Detailed Description

Classification rule packages are used by data loss prevention (DLP) to detect sensitive content in messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.ClassificationDefinitions.DataClassificationIdParameter	The *Identity* parameter specifies the data classification rule that you want to modify. You can use any value that

			uniquely identifies the data classification rule. For example: • Name • **LocalizedName** • **Identity** GUID value
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies a description for the data classification rule. You use the *Description* parameter with the *Locale* and *Name* parameters to specify descriptions for the data classification rule in different languages. The localized values of *Description* appear in the **AllLocalizedDescriptions** property of the data classification rule.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-

			premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Fingerprints	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Fingerprints* parameter specifies the byte-encoded document files that are used as fingerprints by the data classification rule. For instructions on how to import documents to use as templates for fingerprints, see New-Fingerprint or the Examples section. For instructions on how to add and remove document fingerprints from an existing data classification rule, see the Examples section.
IsDefault	Optional	System.Management.Automation.SwitchParameter	The *IsDefault* switch is used with the *Locale* parameter to specify the default language for the data classification rule.

			The default *Locale* value is stored in the **DefaultCulture** property. When you change the default *Locale* value, the *Name* value of the data classification rule changes to match the *Name* value that's associated with the new default locale. The original *Name* value when the rule was created is permanently stored the **LocalizedName** property.
Locale	Optional	System.Globalization.CultureInfo	The *Locale* parameter adds or removes languages that are associated with the data classification rule. Valid input for this parameter is a Microsoft .NET Framework **CultureInfo** class culture code value. For example, `en` for English or `fr` for French. Typically, you use the *Locale* parameter with the *Name* and *Description* parameters to add or remove translated names and descriptions for the

			data classification rule. You can also use the *Locale* parameter with the *IsDefault* switch to designate an existing translated name and description as the default. Before you can remove the default translation, you need to set another translation as the default.
Name	Optional	System.String	The *Name* parameter specifies a name for the data classification rule. The value must be less than 256 characters. You use the *Name* parameter with the *Locale* and *Description* parameters to specify names for the data classification rule in different languages. The localized values of *Name* appear in the **AllLocalizedNames** property of the data classification rule. The value of the *Name* parameter is used in the Policy Tip that's presented to users in Outlook Web

			App. When a translated value of the *Name* parameter matches the client's language, the Policy Tip is displayed in the client's language. If no translated values of the *Name* parameter match the client's language, the default translation that's specified by the *IsDefault* parameter is used for the Policy Tip.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DlpPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-DlpPolicy** cmdlet to view information about existing data loss prevention (DLP) policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DlpPolicy [-Identity <DlpPolicyIdParameter>] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

Example 1

This example returns a summary list of all DLP policies.

```
Get-DlpPolicy
```

Example 2

This example returns detailed information about the DLP policy named Employee Numbers. The command is piped to the **Format-List** cmdlet to display the detailed configuration of the specified DLP policy.

```
Get-DlpPolicy "Employee Numbers" | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the DLP policy you want to remove. You can use any value that uniquely identifies the DLP policy. For example, you can specify the name, GUID, or distinguished name (DN) of the DLP policy.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-DlpPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-24*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-DlpPolicy** cmdlet to create data loss prevention (DLP) policies in your Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-DlpPolicy [-Confirm [<SwitchParameter>]] [-Description <String>] [-
DomainController <Fqdn>] [-Mode <Audit | AuditAndNotify | Enforce>] [-Name
<String>] [-Organization <OrganizationIdParameter>] [-Parameters
<Hashtable>] [-State <Enabled | Disabled>] [-Template <String>] [-
TemplateData <Byte[]>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a new DLP policy named Contoso PII with the following values:

- The DLP policy is enabled and set to audit only.
- The DLP policy is based on the existing "U.S. Personally Identifiable Information (PII) Data" DLP policy template.

```
New-DlpPolicy -Name "Contoso PII" -Template "U.S.
Personally Identifiable Information (PII) Data"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies an optional description for the DLP policy.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

Mode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleMode	The *Mode* parameter specifies the action and notification level of the DLP policy. Valid values for this parameter are: • `Audit`: The actions specified by the DLP policy aren't enforced when a message matches the conditions specified by the policy, and the Policy Tip isn't displayed to the user. • `AuditAndNotify`: The actions specified by the DLP policy aren't enforced when a message matches the conditions specified by the policy, but the Policy Tip is displayed to the user in a supported email client. • `Enforce`: The actions specified by the DLP policy are enforced when a message matches the conditions specified by the policy, and the Policy Tip is displayed to the user in a supported email client. By default, the value of this parameter is set to `Audit` when you create a new DLP policy. If the *State* parameter is set to `Disabled`, the value of the *Mode* parameter is

			irrelevant.
Name	Optional	System.String	The *Name* parameter specifies a descriptive name for the DLP policy.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Parameters	Optional	System.Collections.Hashtable	The *Parameters* parameter specifies the parameter values that are required by the DLP policy template that you specify using the *Template* or *TemplateData* parameters. DLP policy templates may contain parameters that need to be populated with values from your organization. For example, a DLP policy template may include an exception group that defines users who are exempt from the DLP policy. Valid input for this parameter is in the format: @{*<parameter1>="<value1>";<parameter2>="<value2>"...*}.

State	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleState	The *State* parameter enables or disables the DLP policy. Valid input for this parameter is `Enabled` or `Disabled`. By default, a new DLP policy that you create is enabled. If you want to create a disabled DLP policy, specify the value `Disabled` for this parameter.
Template	Optional	System.String	The *Template* parameter specifies the existing DLP policy template from which you can create a new DLP policy. You can't use the *Template* and *TemplateData* parameters in the same command.
TemplateData	Optional	System.Byte[]	The *TemplateData* parameter specifies an external DLP policy template file from which you can create a new DLP policy. You can't use the *TemplateData* and *Template* parameters in the same command. For more information about the syntax required to use this parameter, see Syntax.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DlpPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-DlpPolicy** cmdlet to remove an existing data loss prevention (DLP) policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DlpPolicy -Identity <DlpPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
```

```
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the existing DLP policy named Contoso PII.

```
Remove-DlpPolicy "Contoso PII"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the DLP policy you want to remove. You can use any value that uniquely identifies the DLP policy. For example, you can specify the name, GUID, or distinguished name (DN) of the DLP policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt,

			use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DlpPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-DlpPolicy** cmdlet to modify data loss prevention (DLP) policies in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DlpPolicy -Identity <DlpPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DomainController <Fqdn>] [-
Mode <Audit | AuditAndNotify | Enforce>] [-Name <String>] [-State <Enabled
| Disabled>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example disables the DLP policy named Employee Numbers.

```
Set-DlpPolicy "Employee Numbers" -State Disabled
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the DLP policy you want to modify. You can use any value that uniquely identifies the DLP policy. For example, you can specify the name, GUID, or distinguished name (DN) of the DLP policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies an optional description for the DLP policy.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Mode	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleMode	The *Mode* parameter specifies the action and notification level of the DLP policy. Valid values for this parameter are: • `Audit`: When a message matches the conditions specified by the DLP policy, the actions specified by the policy aren't enforced, and no notification emails are sent. • `AuditAndNotify`: When a message matches the conditions specified by the DLP policy, the actions specified by the policy aren't enforced, but notification emails are sent. • `Enforce`: When a message matches the conditions specified by the DLP policy, the actions specified by the policy are enforced, and notification emails are sent. If the *State* parameter is set to `Disabled`, the value

			of the *Mode* parameter is irrelevant.
Name	Optional	System.String	The *Name* parameter specifies a unique name for the DLP policy.
State	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleState	The *State* parameter enables or disables the DLP policy. Valid input for this parameter is `Enabled` or `Disabled`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-DlpPolicyCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Export-DlpPolicyCollection** cmdlet to export data loss prevention (DLP) policy collections from your organization to a file.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-DlpPolicyCollection [-Identity <DlpPolicyIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example exports all the elements of the existing DLP policies to the file C:\My Documents \Contoso PII.xml.

```
$file = Export-DlpPolicyCollection

Set-Content -Path "C:\My Documents\Contoso PII.xml" -Value
$file.FileData -Encoding Byte
```

Detailed Description

The **Export-DlpPolicyCollection** cmdlet exports the settings of the DLP policies and the associated transport rules. You use the **Import-DlpPolicyCollection** to import the DLP policy collection into your organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the DLP policy you want to export. You can use any value that uniquely identifies the DLP policy. For example, you can specify the name, GUID, or distinguished name

			(DN) of the DLP policy.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-DlpPolicyCollection

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Import-DlpPolicyCollection** cmdlet to import data loss prevention (DLP) policy collections into your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-DlpPolicyCollection -FileData <Byte[]> [-Identity
<DlpPolicyIdParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Force <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example imports the DLP policy collection in the file C:\My Documents\DLP Backup.xml.

```
Import-DlpPolicyCollection -FileData ([Byte[]]$(Get-Content
-Path " C:\My Documents\DLP Backup.xml " -Encoding Byte -
ReadCount 0))
```

Detailed Description

The **Import-DlpPolicyCollection** cmdlet imports all the settings of the DLP policies and the associated transport rules. You use the **Export-DlpPolicyCollection** cmdlet to export the DLP policy collection.

Caution:
Importing a DLP policy collection from an XML file removes or overwrites all pre-existing DLP policies that were defined in your organization. Make sure that you have a backup of your current DLP policy collection before you import and overwrite your current DLP policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter

			specifies the DLP policy collection file you want to import. For more information about the syntax required to use this parameter, see Syntax.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.A	The *Force* switch

		utomation.SwitchParameter	specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the name of the DLP policy you want to import. The DLP policy must exist in the XML file you specify with the *FileData* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DlpPolicyTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-DlpPolicyTemplate** cmdlet to view existing data loss prevention (DLP) policy templates in your Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DlpPolicyTemplate [-Identity <DlpPolicyIdParameter>] [-
DomainController <Fqdn>]
```

Examples

Example 1

This example returns a summary list of all DLP policy templates.

```
Get-DlpPolicyTemplate
```

Example 2

This example returns detailed information about the DLP policy template named GLBA. The command is piped to the **Format-List** cmdlet to display the detailed configuration of the specified DLP policy template.

```
Get-DlpPolicyTemplate GLBA | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Identity	Optional	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the DLP policy template you want to view. You can use any value that uniquely identifies the DLP policy template. For example, you can specify the name, GUID, or distinguished name (DN) of the DLP policy template.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-DlpPolicyTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Import-DlpPolicyTemplate** cmdlet to import a data loss prevention (DLP) policy template file into your Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-DlpPolicyTemplate -FileData <Byte[]> [-Confirm [<SwitchParameter>]]
[-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example imports the DLP policy template file C:\My Documents\External DLP Policy Template.xml.

```
Import-DlpPolicyTemplate -FileData ([Byte[]]$(Get-Content -
Path "C:\My Documents\External DLP Policy Template.xml" -
Encoding Byte -ReadCount 0))
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the DLP policy template file you want to import. For more information about the syntax required to use this parameter, see Syntax.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing

			continues. You don't have to specify a value with the *Confirm* switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DlpPolicyTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-DlpPolicyTemplate** cmdlet to remove a data loss prevention (DLP) policy template from your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DlpPolicyTemplate [-Identity <DlpPolicyIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the DLP policy template named External DLP Policy Template.

```
Remove-DlpPolicyTemplate "External DLP Policy Template"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.CompliancePrograms.Tasks.DlpPolicyIdParameter	The *Identity* parameter specifies the DLP policy template you want to remove. You can use any value that uniquely identifies the DLP policy template. For example, you can specify the name, GUID, or distinguished name (DN) of the DLP policy template.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-Fingerprint

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-09*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-Fingerprint** cmdlet to create document fingerprints that are used with data classification rules. Because the results of **New-Fingerprint** are not stored outside of the data classification rule, you always run **New-Fingerprint** and **New-DataClassification** or **Set-Dataclassification** in the same PowerShell session.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-Fingerprint -Description <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-FileData <Byte[]>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates a new document fingerprint based on the file C:\My Documents\Contoso Patent Template.docx. You store the new fingerprint as a variable so you can use it with the **New-DataClassification** cmdlet in the same PowerShell session.

```
$Patent_Template = Get-Content "C:\My Documents\Contoso
```

```
Patent Template.docx" -Encoding byte
$Patent_Fingerprint = New-Fingerprint -FileData
$Patent_Template -Description "Contoso Patent Template"
```

Detailed Description

Classification rule packages are used by data loss prevention (DLP) to detect sensitive content in messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Description	Required	System.String	The *Description* parameter specifies a description for the document fingerprint.
FileData	Required	System.Byte[]	The *FileData* parameter specifies the file to use as a document fingerprint. You need to read the file to a byte-encoded object using the **Get-Content** cmdlet. For details, see the Examples section.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IRMConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-IRMConfiguration** cmdlet to view the Information Rights Management (IRM) configuration in a Microsoft Exchange Server 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-IRMConfiguration [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the IRM configuration in an Exchange 2013 organization.

```
Get-IRMConfiguration
```

Detailed Description

The **Get-IRMConfiguration** cmdlet provides details about the current IRM configuration, including whether individual IRM features are enabled or disabled, and provides the URLs used for ServiceLocation, PublishingLocation, and LicensingLocation.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IRMConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-IRMConfiguration** cmdlet to configure Information Rights Management (IRM) features.

For information about the parameter sets in the Syntax section below, see Syntax.

Important:
Configuring and using IRM features in an on-premises Microsoft Exchange Server 2013 deployment requires Active Directory Rights Management Services (AD RMS).

```
Set-IRMConfiguration [-Identity <OrganizationIdParameter>] [-
ClientAccessServerEnabled <$true | $false>] [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-EDiscoverySuperUserEnabled <$true | $false>]
[-ExternalLicensingEnabled <$true | $false>] [-Force <SwitchParameter>] [-
InternalLicensingEnabled <$true | $false>] [-
JournalReportDecryptionEnabled <$true | $false>] [-LicensingLocation
<MultiValuedProperty>] [-PublishingLocation <Uri>] [-
RefreshServerCertificates <SwitchParameter>] [-RMSOnlineKeySharingLocation
<Uri>] [-SearchEnabled <$true | $false>] [-ServiceLocation <Uri>] [-
TransportDecryptionSetting <Disabled | Optional | Mandatory>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables journal report decryption.

```
Set-IRMConfiguration -JournalReportDecryptionEnabled $true
```

EXAMPLE 2

This example enables transport decryption and enforces decryption. When decryption is enforced, messages that can't be decrypted are rejected, and an NDR is returned.

```
Set-IRMConfiguration -TransportDecryptionSetting Mandatory
```

EXAMPLE 3

This example enables licensing for external messages.

```
Set-IRMConfiguration -ExternalLicensingEnabled $true
```

Detailed Description

IRM requires the use of an on-premises AD RMS server or the ILS service. IRM features can be selectively enabled or disabled.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServerEnabled	Optional	System.Boolean	The *ClientAccessServerEnabled* parameter specifies whether to enable IRM in Microsoft Office Outlook Web App and in Microsoft Exchange ActiveSync. Both of these features are enabled by default. To disable them, set the parameter to `$false`. **Important:** Enabling IRM in Outlook Web App requires additional configuration on AD RMS servers. For more information, see Information Rights Management in Outlook Web App.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EDiscoverySuperUserEnabled	Optional	System.Boolean	The *EDiscoverySuperUserEnabled* parameter specifies whether members of the Discovery Management role group can access IRM-protected messages that were returned by a discovery search and are residing in a discovery mailbox. To enable IRM-

			protected message access to the Discovery Management role group, set the value to `$true`. For more information about In-Place eDiscovery and IRM-protected messages, see In-Place eDiscovery.
ExternalLicensingEnabled	Optional	System.Boolean	The *ExternalLicensingEnabled* parameter specifies whether to enable IRM features for messages sent to external recipients. In on-premises deployments, licensing is disabled for external messages by default. To enable licensing, set the value to `$true`.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt that appears when you modify the *InternalLicensingEnabled* parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter is reserved for internal Microsoft use.
InternalLicensingEnabl	Optional	System.Boolean	The

ed			*InternalLicensingEnabled* parameter specifies whether to enable IRM features for messages sent to internal recipients. In on-premises deployments, licensing is disabled for internal messages by default. To enable licensing, set the value to `$true`. **Note:** If the *InternalLicensingEnabled* parameter is set to `$false`, no AD RMS templates are returned when you use the **Get-RMSTemplate** cmdlet.
JournalReportDecryptionEnabled	Optional	System.Boolean	The *JournalReportDecryptionEnabled* parameter specifies whether to enable journal report decryption. When enabled, journal report decryption attaches a decrypted copy of an IRM-protected message to the journal report. Journal report decryption is enabled by default. To disable journal report decryption, set the value to `$false`.

			Important: Enabling journal report decryption requires additional configuration on AD RMS servers. For more information, see Journal report decryption.
LicensingLocation	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is available only in on-premises Exchange 2013. The *LicensingLocation* parameter specifies one or more additional AD RMS licensing URLs in on-premises deployments. It isn't required to populate this parameter if the organization doesn't have cross-forest deployment of licensing servers.
PublishingLocation	Optional	System.Uri	This parameter is available only in the cloud-based service. The *PublishingLocation* parameter specifies one or more AD RMS publishing URLs.
RefreshServerCertificates	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *RefreshServerCertificates* switch clears all Rights

			Account Certificates (RACs), Computer Licensor Certificates (CLCs), and cached AD RMS templates from all Microsoft Exchange Server 2010 or Exchange Server 2013 servers in the organization. Clearing RACs, CLCs, and cached templates may be required during troubleshooting or in the event of a change of keys on the AD RMS cluster in your organization. For more information about RACs and CLCs, see Understanding AD RMS Certificates.
RMSOnlineKeySharingLocation	Optional	System.Uri	This parameter is available only in the cloud-based service. The *RMSOnlineKeySharingLocation* parameter specifies the RMS Online URL to obtain the trusted publishing domain (TPD) for the Microsoft Exchange Online organization.

SearchEnabled	Optional	System.Boolean	The *SearchEnabled* parameter specifies whether to enable searching of IRM-encrypted messages in Outlook Web App. Valid values include: • `$true` (default) Enables search of IRM-encrypted messages in Outlook Web App. • `$false` Disables search of IRM-encrypted messages in Outlook Web App.
ServiceLocation	Optional	System.Uri	This parameter is available only in the cloud-based service. The *ServiceLocation* parameter specifies the AD RMS service URL.
TransportDecryptionSetting	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.TransportDecryptionSetting	The *TransportDecryptionSetting* parameter specifies the transport decryption configuration. Valid values include one of the following: • `Disabled` Transport decryption is disabled for internal and external messages. • `Mandatory` Messages that can't be decrypted are rejected, and a non-delivery report (NDR) is

			returned. • `Optional` A best effort approach to decryption is provided. Messages are decrypted if possible, but delivered even if decryption fails.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-IRMConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Test-IRMConfiguration** cmdlet to test Information Rights Management (IRM) configuration and functionality.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-IRMConfiguration [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Recipient <SmtpAddress[]
>] [-RMSOnline <SwitchParameter>] [-RMSOnlineAuthCertSubjectNameOverride
<String>] [-RMSOnlineOrgOverride <Guid>] [-Sender <SmtpAddress>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the IRM configuration for messages sent from the sender adams@contoso.com.

```
Test-IRMConfiguration -Sender adams@contoso.com
```

Detailed Description

The **Test-IRMConfiguration** cmdlet performs a series of steps to test IRM configuration and functionality, including availability of an Active Directory Rights Management Services (AD RMS) server, prelicensing, and journal report decryption. In Exchange Online organizations, it checks connectivity to RMS Online and obtains and validates the organization's Trusted Publishing Domain (TPD).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is available only in on-premises Exchange 2013. The *Identity* parameter is reserved for internal Microsoft use.
Recipient	Optional	Microsoft.Exchange.Data.SmtpAddress[]	The *Recipient* parameter specifies the SMTP address of one or more recipients. The cmdlet tests prelicensing for the specified recipients.

			You can specify multiple recipient addresses separated by commas. If no recipient is specified, the sender address is used as the recipient.
RMSOnline	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *RMSOnline* switch specifies whether to test connectivity from Exchange Online to RMS Online, obtain your Exchange Online organization's TPD, and test its validity.
RMSOnlineAuthCertSubjectNameOverride	Optional	System.String	This parameter is reserved for internal Microsoft use.
RMSOnlineOrgOverride	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
Sender	Optional	Microsoft.Exchange.Data.SmtpAddress	The *Sender* parameter specifies the SMTP address of the sender to be tested. The cmdlet tests prelicensing and

			journal report decryption for the sender.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-JournalRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Disable-JournalRule** cmdlet to disable a journal rule on a Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-Journalrule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LawfulInterception
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the journal rule Brokerage Communications.

```
Disable-JournalRule "Brokerage Communications"
```

EXAMPLE 2

This example disables all journal rules. The Get-JournalRule cmdlet is used to add all journal rules to the pipeline. The results are piped to the **Disable-JournalRule** cmdlet.

```
Get-JournalRule | Disable-JournalRule
```

Detailed Description

You can enable or disable specific journal rules in your organization at any time using the **Disable-JournalRule** and Enable-JournalRule cmdlets.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the journal rule you want to disable. Enter either the name or the GUID of the journal rule. You

			can omit this parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
LawfulInterception	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-JournalRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-JournalRule** cmdlet to enable an existing journal rule on a Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-Journalrule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LawfulInterception
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the existing journal rule Brokerage Communications.

```
Enable-JournalRule "Brokerage Communications"
```

Detailed Description

You can enable or disable specific journal rules in your organization at any time using the **Enable-JournalRule** and Disable-JournalRule cmdlets. To learn more about journaling in Microsoft Exchange Server 2013, see Journaling.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the journal rule you want to enable. Enter either the name or GUID of the journal rule. You can omit this parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing

			continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
LawfulInterception	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-JournalRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-JournalRule** cmdlet to view the journal rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-JournalRule [-Identity <RuleIdParameter>] [-DomainController <Fqdn>]
[-LawfulInterception <SwitchParameter>] [-Organization
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves all journal rules configured in your organization.

```
Get-JournalRule
```

EXAMPLE 2

This example retrieves the specific journal rule Brokerage Communications and pipes the output to the **Format-List** cmdlet to view all the parameters of the rule.

```
Get-JournalRule "Brokerage Communications" | Format-List
```

Detailed Description

The **Get-JournalRule** cmdlet displays journal rules configured in your organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the rule you want to view. Enter either the name or the GUID of the journal rule. You can omit the parameter label.
LawfulInterception	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-JournalRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-JournalRule** cmdlet to create a journal rule in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-Journalrule -JournalEmailAddress <RecipientIdParameter> -Name <String>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true
| $false>] [-ExpiryDate <DateTime>] [-FullReport <$true | $false>] [-
LawfulInterception <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-Recipient <SmtpAddress>] [-Scope <Internal |
External | Global>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates and enables a journal rule. The rule applies to all email messages that pass through the Transport service and contain at least one recipient or sender who is a member of the brokers@contoso.com distribution list.

```
New-JournalRule -Name "Brokerage Communications" -
JournalEmailAddress "Brokers Journal Mailbox" -Scope Global
-Recipient brokers@contoso.com -Enabled $true
```

Detailed Description

The **New-JournalRule** cmdlet creates a journal rule in your organization.

By default, new journal rules are disabled unless the *Enabled* parameter is set to `$true`. For more information about how to enable a new journal rule that was created in a disabled state, see Enable-JournalRule.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
JournalEmailAddress	Required	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *JournalEmailAddress* parameter specifies a recipient object to which journal reports are sent.
Name	Required	System.String	The *Name* parameter specifies the name of the journal rule. The name of the rule can be up to 64 characters long.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the journal rule is enabled or disabled. If the rule is disabled, it isn't applied to any email messages. The default value is `$false`.
ExpiryDate	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
FullReport	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LawfulInterception	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Recipient	Optional	Microsoft.Exchange.Data.SmtpAddress	The *Recipient* parameter specifies the SMTP

			address of a mailbox, contact, or distribution group to journal. If you specify a distribution group, all recipients in that distribution group are journaled. All messages sent to or from a recipient are journaled.
Scope	Optional	Microsoft.Exchange.MessagingPolicies.Journaling.JournalRuleScope	The *Scope* parameter specifies the scope of email messages to which the journal rule is applied. Valid values for this parameter are as follows: • `Global` Global rules process all email messages that pass through a Transport service. This includes email messages that were already processed by the external and internal rules. The default value is `Global`. • `Internal` Internal rules process email messages sent and received by recipients in your organization. • `External` External rules process email messages sent to recipients or from senders outside your organization.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-JournalRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-JournalRule** cmdlet to remove an existing journal rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-Journalrule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LawfulInterception
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the journal rule Brokerage Communications that's no longer needed.

```
Remove-JournalRule "Brokerage Communications"
```

Detailed Description

The **Remove-JournalRule** cmdlet removes the specified journal rule from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the rule you want to remove. Enter either name or the GUID of the journal rule. You can omit the parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
LawfulInterception	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-JournalRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-JournalRule** cmdlet to modify an existing journal rule in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-JournalRule -Identity <RuleIdParameter> [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-ExpiryDate <DateTime>] [-FullReport <$true |
$false>] [-JournalEmailAddress <RecipientIdParameter>] [-
LawfulInterception <SwitchParameter>] [-Name <String>] [-Recipient
<SmtpAddress>] [-Scope <Internal | External | Global>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the journal email address to which journal reports are sent by the existing journal rule Consolidated Messenger.

```
Set-JournalRule "Consolidated Messenger" -
JournalEmailAddress "ArchiveMailbox@contoso.com"
```

EXAMPLE 2

This example modifies the journal email address for all journal rules. The **Get-JournalRule** cmdlet is used to retrieve all journal rules. The results are piped to the **Set-JournalRule** cmdlet to modify

the journal recipient.

```
Get-JournalRule | Set-JournalRule -JournalEmailAddress
"Archive Mailbox"
```

Detailed Description

The **Set-JournalRule** cmdlet modifies an existing journal rule used in your organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the name or GUID of the rule you want to modify. The *Identity* parameter is a positional parameter. When using positional parameters in a command, you can omit the parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExpiryDate	Optional	System.DateTime	This parameter is reserved for internal Microsoft use.
FullReport	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
JournalEmailAddress	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *JournalEmailAddress* parameter specifies a journal recipient. Journal reports for the specified rule are sent to the journal recipient.
LawfulInterception	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	The *Name* parameter specifies the name of the journal rule. The name of the rule can be up to 64 characters.

Recipient	Optional	Microsoft.Exchange.Data.SmtpAddress	The *Recipient* parameter specifies the SMTP address of a mailbox, contact, or distribution group to journal. If you specify a distribution group, all recipients in that distribution group are journaled. All messages sent to or received from a recipient are journaled.
Scope	Optional	Microsoft.Exchange.MessagingPolicies.Journaling.JournalRuleScope	The *Scope* parameter specifies the scope of email messages to which the journal rule is applied. You can use the following values: • `Global` Global rules process all email messages that pass through a Transport service. This includes email messages that were already processed by the external and internal rules. • `Internal` Internal rules process email messages sent to and received by recipients in your organization. • `External` External rules process email messages sent to recipients or from senders outside your organization.
WhatIf	Optional	System.Management.	The *WhatIf* switch

		Automation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-JournalRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-20*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Export-JournalRuleCollection** cmdlet to export the journal rules in your organization to an XML file.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-JournalRuleCollection [-Identity <RuleIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports journal rules in a two-step process. In the first step, the **Export-JournalRuleCollection** cmdlet exports journal rules to the variable `$file`. In the second step, the **Set-Content** cmdlet saves the exported data to the XML file JournalRules.xml.

```
$file = Export-JournalRuleCollection
Set-Content -Path "C:\MyDocs\JournalRules.xml" -Value
$file.FileData -Encoding Byte
```

Detailed Description

You can use the **Export-JournalRuleCollection** cmdlet to export journal rules in your organization to create a backup copy of your rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Dat	The *DomainController*

		a.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the name of a journal rule.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Import-JournalRuleCollection

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Import-JournalRuleCollection** cmdlet to import journal rules from an XML file. You can import a journal rule collection you previously exported as a backup, or import rules you exported from an older version of Exchange.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Import-JournalRuleCollection -FileData <Byte[]> [-Identity
<RuleIdParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example imports journal rules from the XML file ExportedJournalRules.xml in a two-step process.

The first step retrieves journal rules from the previously exported XML file ExportedJournalRules.xml using the **Get-Content** cmdlet, and then stores the results in the variable *$Data*. The second step retrieves data from the variable *$Data* and imports journal rules to your organization, overwriting existing journal rules.

```
[Byte[]]$Data = Get-Content -Path "C:\JournalRules
\ExportedJournalRules.xml" -Encoding Byte -ReadCount 0
Import-JournalRuleCollection -FileData $Data
```

Detailed Description

The **Import-JournalRuleCollection** cmdlet imports a journal rule collection you previously

exported.

Caution:
Importing a journal rule collection from an XML file removes or overwrites all pre-existing journal rules in your organization. Make sure that you have a backup of your current journal rule collection before you import and overwrite your current journal rules.

Importing file data is a two-step process. First you must load the data to a variable using the **Get-Content** cmdlet, and then use that variable to transmit the data to the cmdlet.

For more information about how to export a journal rule collection to an XML file, see Export-JournalRuleCollection.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Journaling" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
FileData	Required	System.Byte[]	The *FileData* parameter specifies the variable name that contains the content of the XML file. The content is retrieved using the **Get-Content** cmdlet in the first step of the two-step process used to import file content.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -

			`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the name of a journal rule to be imported.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxAuditBypassAssociation

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxAuditBypassAssociation** cmdlet to retrieve user or computer accounts configured to bypass mailbox audit logging.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxAuditBypassAssociation [-Identity
<MailboxAuditBypassAssociationIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example retrieves all user or computer accounts configured for mailbox audit logging bypass.

```
Get-MailboxAuditBypassAssociation -ResultSize unlimited
```

EXAMPLE 2

This example retrieves the mailbox audit bypass association for the Svc-MyApplication account.

```
Get-MailboxAuditBypassAssociation -Identity "Svc-
MyApplication"
```

Detailed Description

When you configure a user or computer account to bypass mailbox audit logging, access or actions taken by the user or computer account to any mailbox isn't logged. By bypassing trusted user or computer accounts that need to access mailboxes frequently, you can reduce the noise in mailbox audit logs.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxAuditBypassAssociationIdParameter	The *Identity* parameter specifies a user or computer account to retrieve audit logging bypass association for.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all mailboxes that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxAuditBypassAssociation

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxAuditBypassAssociation** cmdlet to configure mailbox audit logging bypass for user or computer accounts such as service accounts for applications that access mailboxes

frequently.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxAuditBypassAssociation -Identity
<MailboxAuditBypassAssociationIdParameter> -AuditBypassEnabled <$true |
$false> [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example bypasses the Svc-MyApplication account from mailbox audit logging.

```
Set-MailboxAuditBypassAssociation -Identity "Svc-
MyApplication" -AuditBypassEnabled $true
```

EXAMPLE 2

This example removes the bypass association for the Svc-MyApplication account.

```
Set-MailboxAuditBypassAssociation -Identity "Svc-
MyApplication" -AuditBypassEnabled $false
```

Detailed Description

When you configure a user or computer account to bypass mailbox audit logging, access or actions taken by the user or computer account to any mailbox isn't logged. By bypassing trusted user or computer accounts that need to access mailboxes frequently, you can reduce the noise in mailbox audit logs.

Caution:
If you use mailbox audit logging to audit mailbox access and actions, you must monitor mailbox audit bypass associations at regular intervals. If a mailbox audit bypass association is added for an account, the account can access any mailbox in the organization to which it has been assigned access permissions, without any mailbox audit logging entries being generated for such access, or any actions taken such as message deletions.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description

AuditBypassEnabled	Required	System.Boolean	The *AuditBypassEnabled* parameter specifies whether audit bypass is enabled for the user or computer. Valid values include the following: • `$true` Enables mailbox audit logging bypass • `$false` Disables mailbox audit logging bypass
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxAuditBypassAssociationIdParameter	The *Identity* parameter specifies a user or computer account to be bypassed from mailbox audit logging.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Search-MailboxAuditLog

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Search-MailboxAuditLog** cmdlet to search mailbox audit log entries matching the specified search terms.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Search-MailboxAuditLog [-EndDate <ExDateTime>] [-ExternalAccess <$true |
$false>] [-LogonTypes <MultiValuedProperty>] [-Mailboxes
<MultiValuedProperty>] [-ResultSize <Int32>] [-StartDate <ExDateTime>]
<COMMON PARAMETERS>

Search-MailboxAuditLog [-EndDate <ExDateTime>] [-ExternalAccess <$true |
$false>] [-Identity <MailboxIdParameter>] [-LogonTypes
<MultiValuedProperty>] [-Organization <OrganizationIdParameter>] [-
ResultSize <Int32>] [-ShowDetails <SwitchParameter>] [-StartDate
<ExDateTime>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves mailbox audit log entries for Ken Kwok's mailbox for actions performed by `Admin` and `Delegate` logon types between 1/1/2012 and 12/31/2012. A maximum of 2,000 log entries are returned.

```
Search-MailboxAuditLog -Identity kwok -LogonTypes
Admin,Delegate -StartDate 1/1/2012 -EndDate 12/31/2012 -
ResultSize 2000
```

EXAMPLE 2

This example retrieves mailbox audit log entries for Ken Kwok and Ben Smith's mailboxes for actions performed by `Admin` and `Delegate` logon types between 1/1/2012 and 12/31/2012. A maximum of 2,000 log entries are returned.

```
Search-MailboxAuditLog -Mailboxes kwok,bsmith -LogonTypes
Admin,Delegate -StartDate 1/1/2012 -EndDate 12/31/2012 -
ResultSize 2000
```

EXAMPLE 3

This example retrieves mailbox audit log entries for Ken Kwok's mailbox for actions performed by the mailbox owner between 1/1/2012 and 3/1/2012. The results are piped to the **Where-Object** cmdlet and filtered to return only entries with the **HardDelete** action.

```
Search-MailboxAuditLog -Identity kwok -LogonTypes Owner -
```

```
ShowDetails -StartDate 1/1/2012 -EndDate 3/1/2012 | Where-
Object {$_.Operation -eq "HardDelete"}
```

Detailed Description

The **Search-MailboxAuditLog** cmdlet performs a synchronous search of mailbox audit logs for one or more specified mailboxes and displays search results in the Exchange Management Shell window. To search mailbox audit logs for multiple mailboxes and have the results sent by email to specified recipients, use the **New-MailboxAuditLogSearch** cmdlet instead. To learn more about mailbox audit logging, see Mailbox audit logging.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
EndDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *EndDate* parameter specifies the end date of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the

			command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
ExternalAccess	Optional	System.Boolean	The *ExternalAccess* parameter returns only mailbox audit log entries for mailbox access by users outside of your organization. In Exchange Online, use this parameter to return audit log entries for mailbox access by Microsoft datacenter administrators.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox for which to retrieve mailbox audit log entries. You can use this parameter to search a single mailbox.

LogonTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *LogonTypes* parameter specifies the type of logons. Valid values include: • `Admin` Audit log entries for mailbox access by administrator logons are returned. • `Delegate` Audit log entries for mailbox access by delegates are returned, including access by users with Full Mailbox Access permission. • `External` For Exchange Online mailboxes, audit log entries for mailbox access by Microsoft datacenter administrators are returned. • `Owner` Audit log entries for mailbox access by the primary mailbox owner are returned. If you specify the `Owner` logon type, you must use the *ShowDetails* switch.
Mailboxes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Mailboxes* parameter specifies the mailboxes for which to retrieve mailbox audit log entries. You can use this parameter to search audit logs for multiple mailboxes. You can't use the *ShowDetails*

			switch with the *Mailboxes* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ResultSize	Optional	System.Int32	The *ResultSize* parameter specifies the maximum number of mailbox audit log entries to return. Valid values include an integer from 1 through 250000. By default, 1000 entries are returned.
ShowDetails	Optional	System.Management.Automation.SwitchParameter	The *ShowDetails* switch specifies that details of each log entry be retrieved. By default, all fields for each returned log entry are displayed in a list view. You can't use the *Mailboxes* parameter with the *ShowDetails* switch.
StartDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies the start date of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the

			command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxAuditLogSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MailboxAuditLogSearch** cmdlet to search mailbox audit logs and have search results sent via email to specified recipients.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxAuditLogSearch -EndDate <ExDateTime> -StartDate <ExDateTime> -
StatusMailRecipients <MultiValuedProperty> [-Organization
<OrganizationIdParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-ExternalAccess <$true | $false>] [-LogonTypes
<MultiValuedProperty>] [-Mailboxes <MultiValuedProperty>] [-Name <String>]
[-ShowDetails <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a mailbox audit log search to search Ken Kwok and April Stewart's mailboxes for administrator and delegate logons from 1/1/2011 to 12/31/2011. Search results are sent to auditors@contoso.com by email.

```
New-MailboxAuditLogSearch "Admin and Delegate Access" -
Mailboxes "Ken Kwok","April Stewart" -LogonTypes
Admin,Delegate -StartDate 1/1/2011 -EndDate 12/31/2011 -
StatusMailRecipients auditors@contoso.com
```

EXAMPLE 2

This example returns entries from the mailbox audit logs of all users in organization for any mailbox access by Microsoft datacenter administrators between September 1, 2013 and October 24, 2013. The search results are sent to admin@contoso.com.

```
New-MailboxAuditLogSearch -ExternalAccess $true -StartDate
09/01/2013 -EndDate 10/24/2013 -StatusMailRecipients
admin@contoso.com
```

Detailed Description

The **New-MailboxAuditLogSearch** cmdlet performs an asynchronous search of mailbox audit logs for the specified mailboxes and sends the search results by email to the specified recipients. The body of the email message contains search metadata such as search parameters and the time when the search request was submitted. The results are attached in an .xml file.

To search mailbox audit logs for a single mailbox and have the results displayed in the Exchange Management Shell window, use the Search-MailboxAuditLog cmdlet instead. To learn more about mailbox audit logging, see Mailbox audit logging.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox audit logging" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
EndDate	Required	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *EndDate* parameter specifies the end date of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
StartDate	Required	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies the start date of the date range. Use the short date format

			defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
StatusMailRecipients	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *StatusMailRecipients* parameter specifies the email address of one or more recipients to whom search results are sent by email.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalAccess	Optional	System.Boolean	The *ExternalAccess* parameter returns only audit log entries for mailbox access by a user outside of your organization. In Exchange Online, use this parameter to return audit log entries for access to a mailbox by Microsoft datacenter administrators.
LogonTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *LogonTypes* parameter specifies the type of logons. Valid values include: • `Admin` Audit log entries for mailbox access by administrator logons are returned. • `Delegate` Audit log

			entries for mailbox access by delegates are returned, including access by users with Full Mailbox Access permission. • `External` For cloud-based mailboxes, audit log entries for mailbox access by administrators of the cloud-based service are returned. • `Owner` Audit log entries for mailbox access by the primary mailbox owner are returned. If you specify the `Owner` logon type, you must use the *ShowDetails* switch. You can specify multiple values separated by a comma.
Mailboxes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Mailboxes* parameter specifies one or more mailboxes for which to retrieve mailbox audit log entries. If you don't specify a value, mailbox audit logs for all mailboxes on Microsoft Exchange Server 2013 or Exchange Server 2010 in the Exchange organization are returned.
Name	Optional	System.String	The *Name* parameter specifies a name for the

			search.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ShowDetails	Optional	System.Management.Automation.SwitchParameter	The *ShowDetails* switch specifies that details of each log entry be retrieved.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-08-22*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxSearch** cmdlet to view mailbox searches that are in progress, complete, or stopped.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxSearch -InPlaceHoldIdentity <String> <COMMON PARAMETERS>

Get-MailboxSearch [-Identity <EwsStoreObjectIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-ResultSize <Unlimited>] [-
ShowDeletionInProgressSearches <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves a list of all mailbox searches.

```
Get-MailboxSearch -ResultSize "unlimited"
```

EXAMPLE 2

This example retrieves all properties for the mailbox search Project Hamilton.

```
Get-MailboxSearch "Project Hamilton" | FL
```

Note:
The *Identity* parameter is a positional parameter. Positional parameters can be used without the label (Identity). For more information about positional parameters, see Parameters.

EXAMPLE 3

This example retrieves the In-Place Holds that a user is placed on. The following command outputs GUIDs of In-Place Holds.

```
(Get-Mailbox Mark).InPlaceHolds
```

The following command retrieves a mailbox search based on the GUID of the In-Place Hold that the user is placed on.

```
Get-MailboxSearch -InPlaceHoldIdentity
9953d0f0fd03415e949d4b41c5a28cbb
```

Detailed Description

In Microsoft Exchange Server 2013 and Exchange Online, a mailbox search is used to perform an In-Place eDiscovery or to place users on an In-Place Hold. Use the **Get-MailboxSearch** cmdlet to retrieve details of either type of mailbox search.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
InPlaceHoldIdentity	Required	System.String	The *InPlaceHoldIdentity* parameter specifies the GUID of an In-Place Hold. Use this parameter to search for an In-Place Hold that a user is placed on. GUIDs of all In-Place Holds that a user is placed on are added to the user's **InPlaceHolds** property. You can retrieve the property by using the **Get-Mailbox** cmdlet.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.EwsStoreObjectIdParameter	The *Identity* parameter specifies the name of the search query. If a name isn't provided, all mailbox search queries are returned. To improve the performance of this cmdlet in Exchange Online, some mailbox search properties aren't returned if you don't specify the name of a mailbox search. These properties are: • SourceMailboxes • Sources • SearchQuery • ResultsLink • PreviewResultsLink • Errors To view these properties, you have to provide the name of a mailbox search.

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. The default result size is 1000. Use unlimited to return all mailbox searches.
ShowDeletionInProgressSearches	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MailboxSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-23*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MailboxSearch** cmdlet to create a mailbox search and either get an estimate of search results, place search results on In-Place Hold or copy them to a Discovery mailbox. You can

also place all contents in a mailbox on hold by not specifying a search query, which accomplishes similar results as litigation hold in Microsoft Exchange Server 2010.

Caution:

Mailbox searches are performed across all mailboxes on Microsoft Exchange Server 2013 servers in an Exchange organization, unless the search is constrained to fewer mailboxes by using the *SourceMailboxes* parameter.

Important:

When you create a mailbox search using this cmdlet on an Exchange 2013 server, mailboxes on previous versions of Exchange aren't searched. You must search mailboxes on Exchange Server 2010 by running the command on an Exchange 2010 server.

For more information, see In-Place eDiscovery and In-Place Hold.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MailboxSearch -Name <String> [-AllPublicFolderSources <$true |
$false>] [-AllSourceMailboxes <$true | $false>] [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DomainController <Fqdn>] [-
EndDate <ExDateTime>] [-EstimateOnly <SwitchParameter>] [-
ExcludeDuplicateMessages <$true | $false>] [-Force <SwitchParameter>] [-
IncludeKeywordStatistics <SwitchParameter>] [-IncludeUnsearchableItems
<SwitchParameter>] [-InPlaceHoldEnabled <$true | $false>] [-
InPlaceHoldIdentity <String>] [-ItemHoldPeriod <Unlimited>] [-Language
<CultureInfo>] [-LogLevel <Suppress | Basic | Full>] [-MessageTypes
<KindKeyword[]>] [-PublicFolderSources <PublicFolderIdParameter[]>] [-
Recipients <String[]>] [-SearchQuery <String>] [-Senders <String[]>] [-
SourceMailboxes <RecipientIdParameter[]>] [-StartDate <ExDateTime>] [-
StatusMailRecipients <RecipientIdParameter[]>] [-TargetMailbox
<MailboxIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the mailbox search Legal-ProjectX. The search uses several parameters to restrict the query:

- *SourceMailboxes* This parameter restricts the search to members of the DG-Marketing and DG-Executives distribution groups.
- *Recipients* This parameter specifies that the search includes all mail sent to the domain contoso.com.
- *SearchQuery* This parameter specifies a KQL query for messages with either the words project or report and for messages with attachments.
- *StartDate* and *EndDate* These parameters specify the start date of January 1, 2011, and end date of December 31, 2011, for the search.
- *TargetMailbox* This parameter specifies that search results should be copied to the discovery mailbox LegalDiscovery.
- *StatusMailRecipeints* This parameter specifies that the distribution group DG-DiscoveryTeam is to receive a notification when the search is complete.

```
New-MailboxSearch -Name "Legal-ProjectX" -SourceMailboxes
DG-Marketing,DG-Executives -TargetMailbox
LegalDiscovery@contoso.com -StartDate "01/01/2011" -EndDate
"12/31/2011" -Recipients "*@contoso.com" -SearchQuery
"project report hasattachments:true" -StatusMailRecipients
"DG-DiscoveryTeam"
```

EXAMPLE 2

This example creates an In-Place Hold Hold-ProjectX and places all members of the distribution group DG-Finance on hold. Because the search doesn't specify the *SearchQuery* and *ItemHoldPeriod* parameters, all messages in mailboxes returned are placed on indefinite In-Place Hold.

```
New-MailboxSearch -Name "Hold-ProjectX" -SourceMailboxes
DG-Finance -InPlaceHoldEnabled $true
```

EXAMPLE 3

This example creates an In-Place Hold Hold-tailspintoys and places all members of the distribution group DG-Research on hold. Because the search specifies the *SearchQuery* parameter, only messages that match the search query are placed on indefinite In-Place Hold.

```
New-MailboxSearch -Name "Hold-tailspintoys" -
SourceMailboxes DG-Research -SearchQuery "'Patent' AND
'Project tailspintoys'" -InPlaceHoldEnabled $true
```

Detailed Description

The **New-MailboxSearch** cmdlet creates an In-Place eDiscovery search or an In-Place Hold. Unless specified, mailboxes on all Exchange 2013 servers in an organization are searched. You can stop, start, modify, or remove the search.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" and "In-Place Hold" entries in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies a friendly name

			for the search. Search results are copied to a folder in the mailbox specified by the *TargetMailbox* parameter. The folder name is the same as the search name.
AllPublicFolderSources	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AllSourceMailboxes	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies a description for the search. The description isn't displayed to users.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EndDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *EndDate* parameter specifies an end date and time for the search. Messages dated on or before the end date will be searched. The default time is the current time. When you enter a specific date, use the short date format, mm/dd/yyyy, even if the Regional Options settings on the local computer are configured with a different format, such as dd/mm/yyyy. For example, use **03/01/2012** to specify March 1, 2012. You can enter the date only, for example, **10/05/2011**. Or you can enter the date and time of day. If you enter a time of day and date, you must enclose the argument in

			quotation marks ("), for example, **"10/05/2011 5:00:00 PM"**.
EstimateOnly	Optional	System.Management.Automation.SwitchParameter	The *EstimateOnly* switch specifies that only an estimate of the number of items that will be returned is provided. If not specified, messages are copied to the target mailbox.
ExcludeDuplicateMessages	Optional	System.Boolean	The *ExcludeDuplicateMessages* parameter eliminates duplication of messages in search results. Set the parameter to `$true` to copy a single instance of a message if the same message exists in multiple folders or mailboxes.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter creates the search, overwriting any existing searches with the same name.
IncludeKeywordStatistics	Optional	System.Management.Automation.SwitchParameter	The *IncludeKeywordStatistics* switch returns keyword statistics (number of instances for each

			keyword) in search results.
IncludeUnsearchableItems	Optional	System.Management.Automation.SwitchParameter	The *IncludeUnsearchableItems* switch specifies whether items that couldn't be indexed by Exchange Search should be included in the search results. The *IncludeUnsearchableItems* parameter doesn't require a value. **Important:** In Exchange 2013, specifying this switch doesn't result in unsearchable items being placed on hold. To place unsearchable items on hold, create a search without specifying search parameters, which accomplishes the same results as litigation hold in Exchange 2010.
InPlaceHoldEnabled	Optional	System.Boolean	The *InPlaceHoldEnabled* parameter specifies whether an In-Place Hold has been placed on items matching the search query. Set the parameter to `$true` to enable In-Place Hold. If the *ItemHoldPeriod* parameter isn't specified,

			items are held until the hold is removed by deleting the search or removing a mailbox from the search. You can add or remove mailboxes from a mailbox search by modifying the *SourceMailboxes* parameter. If you don't specify a search query, all items in the specified mailboxes are placed on hold.
InPlaceHoldIdentity	Optional	System.String	This parameter is reserved for internal Microsoft use.
ItemHoldPeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *ItemHoldPeriod* parameter specifies the number of days for which to hold mailbox items matching the search query. The duration is calculated from the time the item is received or created in the mailbox.
Language	Optional	System.Globalization.CultureInfo	The *Language* parameter specifies a locale for the search.
LogLevel	Optional	Microsoft.Exchange.Data.Storage.Infoworker.MailboxSearch.Loggin	The *LogLevel* parameter specifies the logging level for the search. It can have

		gLevel	one of the following values: • `Suppress` No logs are kept. • `Basic` Basic information about the query and who ran it is kept. • `Full` In addition to the information kept by the `Basic` log level, the `Full` log level adds a complete list of search results.
MessageTypes	Optional	Microsoft.Exchange.Data.Search.AqsParser.KindKeyword[]	The *MessageTypes* parameter specifies the message types to include in the search. Valid values can be one or more of the following: • `Email` • `Meetings` • `Tasks` • `Notes` • `Docs` • `Journals` • `Contacts` • `IM` If not specified, all message types are included.
PublicFolderSources	Optional	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter[]	This parameter is reserved for internal Microsoft use.
Recipients	Optional	System.String[]	The *Recipients* parameter specifies one or more recipients. Messages that have the recipients in the

			To, **Cc**, and **Bcc** fields are returned.
SearchQuery	Optional	System.String	The *SearchQuery* parameter specifies a search string or a query formatted using Keyword Query Language (KQL). If this parameter is empty, all messages from all mailboxes specified in the *SourceMailboxes* parameter are returned.
Senders	Optional	System.String[]	The *Senders* parameter specifies the SMTP address of one or more senders.
SourceMailboxes	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SourceMailboxes* parameter specifies the identity of one or more mailboxes to be searched. **Note:** If not specified, all mailboxes in the Exchange 2013 organization are searched. To enable In-Place Hold, you must specify the *SourceMailboxes* parameter.
StartDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies a start date and time for the search.

			For valid date and time formatting options, refer to the description of the *EndDate* parameter.
StatusMailRecipients	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *StatusMailRecipients* parameter specifies one or more recipients to receive a status email message upon completion of the search.
TargetMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *TargetMailbox* parameter specifies the identity of the destination mailbox where search results are copied. You can use the following values: • Alias • Display name • *Domain\Account* • SMTP address • Distinguished name (DN) • Object GUID • User principal name (UPN) • LegacyExchangeDN
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MailboxSearch** cmdlet to remove a mailbox search.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxSearch -Identity <EwsStoreObjectIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mailbox search Project Contoso.

```
Remove-MailboxSearch -Identity "Project Contoso"
```

Detailed Description

In Microsoft Exchange Server 2013, mailbox searches are used for In-Place eDiscovery and In-Place Hold. You can't remove an In-Place Hold without first disabling the hold.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EwsStoreObjectIdParameter	The *Identity* parameter specifies the name of the mailbox search.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxSearch

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-23*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxSearch** cmdlet to modify an existing mailbox search.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxSearch -Identity <EwsStoreObjectIdParameter> [-
AllPublicFolderSources <$true | $false>] [-AllSourceMailboxes <$true |
$false>] [-Confirm [<SwitchParameter>]] [-Description <String>] [-
DomainController <Fqdn>] [-EndDate <ExDateTime>] [-EstimateOnly <$true |
$false>] [-ExcludeDuplicateMessages <$true | $false>] [-Force
<SwitchParameter>] [-IncludeKeywordStatistics <SwitchParameter>] [-
IncludeUnsearchableItems <$true | $false>] [-InPlaceHoldEnabled <$true |
$false>] [-ItemHoldPeriod <Unlimited>] [-Language <String>] [-LogLevel
<Suppress | Basic | Full>] [-MessageTypes <KindKeyword[]>] [-Name
<String>] [-PublicFolderSources <PublicFolderIdParameter[]>] [-Recipients
<String[]>] [-SearchQuery <String>] [-Senders <String[]>] [-
SourceMailboxes <RecipientIdParameter[]>] [-StartDate <ExDateTime>] [-
StatisticsStartIndex <Int32>] [-StatusMailRecipients
<RecipientIdParameter[]>] [-TargetMailbox <MailboxIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the start date of a mailbox search.

```
Set-MailboxSearch -Identity "Legal-ProjectX" -StartDate
"01/01/2010"
```

Detailed Description

In Microsoft Exchange Server 2013, mailbox searches are used for In-Place eDiscovery and In-Place Hold. For In-Place eDiscovery, unless specified, mailboxes on all Exchange 2013 Mailbox servers in an organization are searched. To create an In-Place Hold, you must specify the mailboxes to place on hold using the *SourceMailboxes* parameter. The search can be stopped, started, modified, and removed.

Important:

When you create a mailbox search using this cmdlet on an Exchange 2013 server, mailboxes on previous versions of Exchange aren't searched. You must search mailboxes on Exchange Server 2010 by running the command on an Exchange 2010 server.

Caution:

Mailbox searches are performed across all Exchange 2013 servers in an Exchange organization, unless the search is constrained to fewer mailboxes by using the *SourceMailboxes* parameter.

If the In-Place eDiscovery search you want to modify is running, stop it before using the **Set-MailboxSearch** cmdlet. When restarting a search, any previous search results are removed from the target mailbox.

For more information, see In-Place eDiscovery and In-Place Hold.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" and "In-Place Hold" entries in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EwsStoreObjectIdParameter	The *Identity* parameter specifies the name of the mailbox search.
AllPublicFolderSources	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AllSourceMailboxes	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies a description for the search.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EndDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *EndDate* parameter specifies an end date for the search.
EstimateOnly	Optional	System.Boolean	The *EstimateOnly* parameter specifies that only an estimate of the number of items that will be returned is provided. Messages aren't copied to the target mailbox.
ExcludeDuplicateMessages	Optional	System.Boolean	The *ExcludeDuplicateMessages* parameter eliminates duplication of messages across mailboxes in an In-Place eDiscovery search.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch suppresses the confirmation prompt displayed before

			modifying a search. When modifying a search, previous search results are removed from the target mailbox, and the search is restarted after modification. The *Force* switch doesn't require a value.
IncludeKeywordStatistics	Optional	System.Management.Automation.SwitchParameter	The *IncludeKeywordStatistics* switch specifies that the command generates and returns keyword statistics for the search.
IncludeUnsearchableItems	Optional	System.Boolean	The *IncludeUnsearchableItems* parameter specifies whether unsearchable items are included in search results. If set to `$true`, unsearchable items are included in the search results. **Caution:** In Exchange 2013, unsearchable items aren't placed on hold for a query-based In-Place Hold. If you need to place unsearchable items on hold, you must create an indefinite hold (a hold without specifying any search parameters, which

			provides functionality similar to litigation hold in Exchange 2010).
InPlaceHoldEnabled	Optional	System.Boolean	The *InPlaceHoldEnabled* parameter specifies whether an In-Place Hold should be placed on items matching the search query. Set the parameter to `$true` to enable In-Place Hold. If the *ItemHoldPeriod* parameter isn't specified, items are held until the hold is removed by deleting the search or removing a mailbox from the search. You can add or remove mailboxes from a mailbox search by modifying the *SourceMailboxes* parameter. If you don't specify a search query, all specified mailboxes are placed on hold. **Important:** If you attempt to place a hold but don't specify mailboxes using the *SourceMailboxes* parameter, the command may succeed but the mailboxes are not placed on In-Place Hold.

ItemHoldPeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *ItemHoldPeriod* parameter specifies the number of days for which to hold mailbox items matching the search query. The duration is calculated from the time the item is received or created in the mailbox.
Language	Optional	System.String	The *Language* parameter specifies a locale for the mailbox search.
LogLevel	Optional	Microsoft.Exchange.Data.Storage.Infoworker.MailboxSearch.LoggingLevel	The *LogLevel* parameter specifies a logging level for the mailbox search. Valid values are: • `Basic` Basic details of the search are kept. • `Full` In addition to details in the Basic logging level, a full list of all messages returned is included. • `Suppress` Logging is suppressed. No logs are kept.
MessageTypes	Optional	Microsoft.Exchange.Data.Search.AqsParser.KindKeyword[]	The *MessageTypes* parameter specifies the message types that should be included in the mailbox search. Valid values include: • `Email` • `Meetings` • `Tasks` • `Notes`

			• `Docs` • `Journals` • `Contacts` • `IM`
Name	Optional	System.String	The *Name* parameter specifies a name for the search. The top-level folder created in the target mailbox, where items returned by the search are copied, is also named after the search name.
PublicFolderSources	Optional	Microsoft.Exchange.Configuration.Tasks.PublicFolderIdParameter[]	This parameter is reserved for internal Microsoft use.
Recipients	Optional	System.String[]	The *Recipients* parameter specifies one or more recipients and is a part of the mailbox search query. Messages addressed to any recipient specified in the *Recipients* parameter are returned.
SearchQuery	Optional	System.String	The *SearchQuery* parameter specifies a search query using Keyword Query Language (KQL). If a query isn't specified, the entire mailbox is copied to the target mailbox. If other search parameters

			such as *Senders*, *Recipients*, *StartDate*, and *EndDate* are specified, these are combined by using the **AND** operator with the *SearchQuery* parameter.
Senders	Optional	System.String[]	The *Senders* parameter specifies one or more senders. Messages sent by the specified senders are returned by the search. Senders can include users, distribution groups, SMTP addresses, or domains. If distribution groups are specified, messages sent by distribution group members are returned in the search results.
SourceMailboxes	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SourceMailboxes* parameter specifies the mailboxes to be searched. If no mailboxes are explicitly specified by using the *SourceMailboxes* parameter, all mailboxes located on Exchange 2013 servers across the entire organization are searched.

StartDate	Optional	Microsoft.Exchange.ExchangeSystem.ExDateTime	The *StartDate* parameter specifies a start date for the mailbox search. Messages dated on or after the start date are returned by the search.
StatisticsStartIndex	Optional	System.Int32	The *StatisticsStartIndex* parameter is used by the Exchange Administration Center (EAC) to retrieve keyword statistics in a paged operation.
StatusMailRecipients	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *StatusMailRecipients* parameter specifies one or more recipients to receive a status email message upon completion of the search.
TargetMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *TargetMailbox* parameter specifies the mailbox to which items returned by the search are copied.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Start-MailboxSearch

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Start-MailboxSearch** cmdlet to restart or resume a mailbox search that's been stopped.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Start-MailboxSearch -Identity <EwsStoreObjectIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-Resume <SwitchParameter>] [-StatisticsStartIndex <Int32>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example starts the mailbox search ProjectContoso.

```
Start-MailboxSearch -Identity "ProjectContoso"
```

Detailed Description

You can use In-Place eDiscovery to search one or more specified mailboxes or all mailboxes across the Microsoft Exchange Server 2013 organization. A search is created by using the Exchange Administration Center (EAC) or the **New-MailboxSearch** cmdlet.

Caution:
When restarting a search, any previous results returned by the same search and copied to a Discovery mailbox are removed. To preserve previous search results and resume the search from the point it was stopped, use the *Resume* switch.

In Exchange 2013, mailbox searches are also used for In-Place Hold. However, you can't start or stop In-Place Hold using the **Start-MailboxSearch** and **Stop-MailboxSearch** cmdlets.

For more details, see In-Place Hold and In-Place eDiscovery.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EwsStoreObjectIdParameter	The *Identity* parameter specifies the name of the search. The name is referenced when starting, stopping, or removing the search.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch suppresses the confirmation prompt displayed before the command is executed.
Resume	Optional	System.Management.Automation.SwitchParameter	The *Resume* switch resumes a stopped, failed, or partially succeeded search from the point it stopped. If you use the *Resume* switch to resume a search, previous search results aren't removed from the target mailbox.
StatisticsStartIndex	Optional	System.Int32	The *StatisticsStartIndex*

			parameter is used by the Exchange Administration Center (EAC) to retrieve keyword statistics in a paged operation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Stop-MailboxSearch

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Stop-MailboxSearch** cmdlet to stop a mailbox search that's in progress.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Stop-MailboxSearch -Identity <EwsStoreObjectIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example stops the mailbox search Project Contoso.

```
Stop-MailboxSearch -Identity "Project Contoso"
```

Detailed Description

In Microsoft Exchange Server 2013, mailbox searches are used for In-Place eDiscovery and In-Place Hold. You can start and stop a mailbox search. For more information, see In-Place eDiscovery.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "In-Place eDiscovery" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EwsStoreObjectIdParameter	The *Identity* parameter specifies the name of the mailbox search.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Start-ManagedFolderAssistant

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Start-ManagedFolderAssistant** cmdlet to immediately start messaging records management (MRM) processing of mailboxes that you specify.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Start-ManagedFolderAssistant -Identity <MailboxOrMailUserIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
EHAHiddenFolderCleanup <SwitchParameter>] [-HoldCleanup <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example processes the mailbox for a user with the alias Chris.

```
Start-ManagedFolderAssistant -Identity "Chris"
```

EXAMPLE 2

This example uses the **Get-Mailbox** command to retrieve all the mailboxes that resolve from the ambiguous name resolution (ANR) search on the string "Chr" in the domain DC01 (for example, users such as Chris Ashton, Christian Hess, and Christa Geller), and the results are piped to the **Start-ManagedFolderAssistant** cmdlet for processing.

```
Get-Mailbox -Anr Chr -DomainController DC01 | Start-
ManagedFolderAssistant
```

Detailed Description

The Managed Folder Assistant uses the retention policy settings of users' mailboxes to process retention of items. This mailbox processing occurs automatically. You can use the **Start-ManagedFolderAssistant** cmdlet to immediately start processing the specified mailbox.

Important:
In the Microsoft Exchange Server 2010 release to manufacturing (RTM) and Exchange Server 2007 versions, the *Identity* parameter specifies the Mailbox server to start the assistant and process all mailboxes on that server, and the *Mailbox* parameter specifies the mailbox to process. In Exchange 2010 Service Pack 1 (SP1) and later, the *Mailbox* parameter has been removed, and the *Identity* parameter accepts the mailbox or mail user to process. If you use these parameters in scheduled commands or scripts, we recommend that you review them and make any necessary changes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxOrMailUserIdParameter	The *Identity* parameter specifies the mailbox to be processed. In cross-premises deployments, you can also specify a mail user who has a mailbox in the cloud.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EHAHiddenFolderCleanup	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
HoldCleanup	Optional	System.Management.Automation.SwitchParameter	The *HoldCleanup* switch instructs the Managed Folder Assistant to clean up duplicate versions of items in the Recoverable Items folder that may have been created when a mailbox is on In-Place

			Hold, litigation hold, or has Single Item Recovery enabled. Removing duplicate items from the Recoverable Items folder reduces the folder size and may help prevent reaching Recoverable Items quota limits. For more details about Recoverable Items quota limits, see Recoverable Items folder.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Stop-ManagedFolderAssistant

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Stop-ManagedFolderAssistant** cmdlet to immediately stop messaging records management (MRM) from processing users' mailboxes on the specified servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Stop-ManagedFolderAssistant [-Identity <ServerIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example executes the **Stop-ManagedFolderAssistant** command without parameters. The Managed Folder Assistant is stopped as soon as processing of the current mailbox is completed on the current server.

```
Stop-ManagedFolderAssistant
```

EXAMPLE 2

This example stops the Managed Folder Assistant on the servers ExchSrvr1 and Exchsrvr2.

```
Stop-ManagedFolderAssistant -Identity ExchSrvr1, Exchsrvr2
```

Detailed Description

The Managed Folder Assistant uses the managed folder mailbox policy settings of users to process

mailbox items for retention and journaling as needed. Use the **Stop-ManagedFolderAssistant** cmdlet to stop the Managed Folder Assistant as soon as processing of the current mailbox is completed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the names of servers on which the Managed Folder

			Assistant is to be stopped. If a server isn't specified, the Managed Folder Assistant on the local server is stopped.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MessageClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MessageClassification** cmdlet to view existing message classifications in your organization.

```
Get-MessageClassification [-Identity <MessageClassificationIdParameter>]
[-DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
IncludeLocales <SwitchParameter>] [-Organization
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example lists all message classifications in your organization.

```
Get-MessageClassification
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message classifications" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

			The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter	The *Identity* parameter specifies the name of the message classification instance that you want to view. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, `"Administrative Name"`.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IncludeLocales	Optional	System.Management.Automation.SwitchParameter	The *IncludeLocales* switch specifies whether the command output includes the message classification locale data. When you

			use the *IncludeLocales* switch, the output includes the message classification locale data.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MessageClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MessageClassification** cmdlet to create a message classification instance in your organization.

```
New-MessageClassification [-ClassificationID <Guid>] [-DisplayPrecedence
<Highest | Higher | High | MediumHigh | Medium | MediumLow | Low | Lower |
Lowest>] [-PermissionMenuVisible <$true | $false>] [-
RetainClassificationEnabled <$true | $false>] <COMMON PARAMETERS>

New-MessageClassification -Locale <CultureInfo> <COMMON PARAMETERS>
```

```
COMMON PARAMETERS: -DisplayName <String> -Name <String> -SenderDescription
<String> [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
IgnoreDehydratedFlag <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-RecipientDescription <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the message classification named `MyMessageClassification` with the following properties:

- The display name is `New Message Classification`.
- The sender description is "`This is the description text`".

```
New-MessageClassification -Name MyMessageClassification -
DisplayName "New Message Classification" -SenderDescription
"This is the description text"
```

EXAMPLE 2

This example creates a locale-specific (Spanish - Spain) version of an existing message classification `MyMessageClassification`.

```
New-MessageClassification MyMessageClassification -Locale
es-ES -DisplayName "España Example" -SenderDescription
"Este es el texto de la descripción"
```

Detailed Description

After you create a new message classification, you can specify the message classification as a transport rule predicate. Before Microsoft Outlook and Outlook Web App users can apply the message classification to messages, you must update the end-user systems with the message classification XML file created by the `Export-OutlookClassification.ps1` script file. The `Export-OutlookClassification.ps1` script file is located in the `%ExchangeInstallPath%Scripts` directory.

When you create a message classification, it has no locale. By default, the new message classification is used for all locales. After a default message classification is defined, you can add new locales of the classification by running the **New-MessageClassification** cmdlet and by specifying the default message classification identity that you want to localize.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message classifications" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DisplayName	Required	System.String	The *DisplayName* parameter specifies the display name for the message classification instance. The display name is used by Outlook users to select the appropriate message classification before they send a message. **Note:** The message classification XML file must be present on the sender's computer for the display name to be displayed. If the *UserDisplayEnabled* parameter is set to `$true`, the display name is displayed for the recipient, even if no message classification XML file is installed. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for

			example, `"Display Name"`. The *DisplayName* parameter can contain a maximum of 64 characters.
Locale	Required	System.Globalization.CultureInfo	The *Locale* parameter specifies a locale-specific version of the message classification. You must also pass the *Identity* parameter of the default existing message classification when you create a new locale-specific version. Valid input for the *Locale* parameter is the string names listed in the *Culture Name* column in the Microsoft .NET Class Library class reference available at CultureInfo Class.
Name	Required	System.String	The *Name* parameter specifies the administrative name for the message classification instance. The name is used to administer the message classification instance.

			When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, `"Adminstrative Name"`. The *Name* parameter can contain a maximum of 256 characters.
SenderDescription	Required	System.String	The *SenderDescription* parameter specifies the purpose of the message classification to the sender. The value of this parameter is used by Outlook users to select the appropriate message classification before they send a message. Enclose the value in quotation marks ("), for example, `"This is the sender description that explains when to use this message classification"`. The *SenderDescription* parameter can contain a maximum of 1,024 characters.
ClassificationID	Optional	System.Guid	The *ClassificationID* parameter specifies a

			classification ID of an existing message classification that you want to import and use in your Exchange organization. Use this parameter if you're configuring message classifications that span two Exchange forests in the same enterprise.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayPrecedence	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ClassificationDisplayPrecedenceLevel	The *DisplayPrecedence* parameter specifies the relative precedence of the message classification to other message classifications that may be applied to a specified message. Although Outlook only lets a user specify a single classification per

			message, transport rules may apply other classifications to a message. The classification with the highest precedence is shown first, and the subsequent classifications, which are those with lesser precedence as defined by this parameter, are appended in the appropriate order thereafter. Valid input for the *DisplayPrecedence* parameter is `Highest`, `Higher`, `High`, `MediumHigh`, `Medium`, `MediumLow`, `Low`, `Lower`, and `Lowest`. The default value is `Medium`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
PermissionMenuVisible	Optional	System.Boolean	The *PermissionMenuVisible* parameter specifies whether the values that you entered for the *DisplayName* and *RecipientDescription* parameters are displayed in Outlook as the user composes a

			message. If you set the *PermissionMenuVisible* parameter to `$false`, users won't be able to assign this message classification to the messages they are composing. However, messages received with this message classification still display the classification information. The default value is `$true`.
RecipientDescription	Optional	System.String	The *RecipientDescription* parameter specifies the purpose of the message classification to the recipient. The value of this parameter is shown to Outlook users when they receive a message that has this message classification. Enclose the value in quotation marks ("), for example, `"This is the recipient description that explains how to treat the message that has been`

			`classified"`. The *RecipientDescription* parameter can contain a maximum of 1,024 characters. If you don't enter a value for this parameter, the description that you enter for the *SenderDescription* parameter is used.
RetainClassificationEnabled	Optional	System.Boolean	The *RetainClassificationEnabled* parameter specifies whether the message classification should persist with the message if the message is forwarded or replied to. The default value is `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MessageClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MessageClassification** cmdlet to delete an existing message classification instance from your organization.

```
Remove-MessageClassification -Identity <MessageClassificationIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the message classification named MyMessageClassification.

```
Remove-MessageClassification MyMessageClassification
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message classifications" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter	The *Identity* parameter specifies the name of the message classification instance that you want to remove. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, `"Administrative Name"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MessageClassification

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MessageClassification** cmdlet to configure an existing message classification instance in your organization.

```
Set-MessageClassification -Identity <MessageClassificationIdParameter> [-
ClassificationID <Guid>] [-Confirm [<SwitchParameter>]] [-DisplayName
<String>] [-DisplayPrecedence <Highest | Higher | High | MediumHigh |
Medium | MediumLow | Low | Lower | Lowest>] [-DomainController <Fqdn>] [-
Name <String>] [-PermissionMenuVisible <$true | $false>] [-
RecipientDescription <String>] [-RetainClassificationEnabled <$true |
$false>] [-SenderDescription <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example makes the following configuration changes to the message classification named MyMessageClassification:

- Changes the display precedence to Low.
- Specifies that the message classification shouldn't persist with the message if the message is

forwarded or replied to.

```
Set-MessageClassification MyMessageClassification -
DisplayPrecedence Low -RetainClassificationEnabled $false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message classifications" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MessageClassificationIdParameter	The *Identity* parameter specifies the name or GUID of the message classification you want to modify.
ClassificationID	Optional	System.Guid	The *ClassificationID* parameter specifies the GUID of an existing message classification that you want to use in your Exchange organization. Use this parameter if you're configuring message classifications to span two Exchange forests in the same organization.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name for the message classification instance. The display name appears in the Microsoft Office and is used by Outlook users to select the appropriate message classification before they send a message. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, `"Display Name"`. The *DisplayName* parameter can contain a maximum of 64 characters.
DisplayPrecedence	Optional	Microsoft.Exchange.Dat	The *DisplayPrecedence*

		a.Directory.SystemConfiguration.ClassificationDisplayPrecedenceLevel	parameter specifies the relative precedence of the message classification to other message classifications that may be applied to a specified message. Although Outlook only lets a user specify a single classification for each message, transport rules may apply other classifications to a message. The classification with the highest precedence is shown first, and the subsequent classifications, which are those with lesser precedence as defined by this parameter, are appended in the appropriate order thereafter. Valid input for the *DisplayPrecedence* parameter is `Highest`, `Higher`, `High`, `MediumHigh`, `Medium`, `MediumLow`, `Low`, `Lower`, and `Lowest`.

			The default value is `Medium`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Name	Optional	System.String	The *Name* parameter specifies the administrative name for the message classification instance. The name is used to administer the

			message classification instance. When you specify a name that includes spaces, you must enclose the name in quotation marks ("), for example, `"Administrative Name"`. The *Name* parameter can contain a maximum of 256 characters.
PermissionMenuVisible	Optional	System.Boolean	The *PermissionMenuVisible* parameter specifies whether the values that you entered for the *DisplayName* and *RecipientDescription* parameters are displayed in Outlook as the user composes a message. If you set the *PermissionMenuVisible* parameter to `$false`, users won't be able to assign this message classification to the messages they're composing. However, messages received with this message

			classification still display the classification information. The default value is `$true`.
RecipientDescription	Optional	System.String	The *RecipientDescription* parameter specifies the purpose of the message classification to the recipient. The value of this parameter is shown to Outlook users when they receive a message that has this message classification. Enclose the value in quotation marks ("), for example, `"This is the recipient description that explains how to treat the message that has been classified"`. The *RecipientDescription* parameter can contain a maximum of 1,024 characters. If you don't enter a value for this parameter, the

			description that you enter for *SenderDescription* is used.
RetainClassificationEnabled	Optional	System.Boolean	The *RetainClassificationEnabled* parameter specifies whether the message classification should persist with the message if the message is forwarded or replied to. The default value is `$true`.
SenderDescription	Optional	System.String	The *SenderDescription* parameter specifies the purpose of the message classification to the sender. The value of this parameter is used by Outlook users to select the appropriate message classification before they send a message. Enclose the value in quotation marks ("), for example, `"This is the sender description that explains when to use this message classification"`. The

			SenderDescription parameter can contain a maximum of 1,024 characters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-OutlookProtectionRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-OutlookProtectionRule** cmdlet to disable an existing Microsoft Outlook protection rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-OutlookProtectionRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the Outlook protection rule Project Contoso.

```
Disable-OutlookProtectionRule -Identity "Project Contoso"
```

Detailed Description

Outlook protection rules are administrator-created rules applied before a user sends a message using Outlook. Outlook protection rules are used to automatically Information Rights Management (IRM)-protect email messages using a Rights Management Services (RMS) template before the message is sent. However, Outlook protection rules don't inspect message content. To rights-protect messages based on message content, use transport protection rules.

For more information, see Outlook protection rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the name of the rule being disabled.
Confirm	Optional	System.Management.A	The *Confirm* switch

		utomation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-OutlookProtectionRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-OutlookProtectionRule** cmdlet to enable an existing Outlook protection rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-OutlookProtectionRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the Outlook protection rule Project Contoso.

```
Enable-OutlookProtectionRule -Identity "Project Contoso"
```

Detailed Description

Outlook protection rules are used to automatically Information Rights Management (IRM)-protect messages using a Rights Management Services (RMS) template before the message is sent. However, Outlook protection rules don't inspect message content. To rights-protect messages based on message content, use transport protection rules. For more information, see Outlook protection rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the name of the rule being enabled.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OutlookProtectionRule

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-OutlookProtectionRule** cmdlet to retrieve Microsoft Outlook protection rules configured in an organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OutlookProtectionRule [-Identity <RuleIdParameter>] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example gets details of all Outlook protection rules configured in the organization.

```
Get-OutlookProtectionRule
```

EXAMPLE 2

This example gets all properties of the Outlook protection rule ProjectContoso.

```
Get-OutlookProtectionRule ProjectContoso | Format-List
```

Note:

The *Identity* parameter is positional. When used after the cmdlet name, the parameter value can be specified without providing the parameter label.

Detailed Description

Outlook protection rules are used to automatically Information Rights Management (IRM)-protect email messages using a Rights Management Services (RMS) template before the message is sent. However, Outlook protection rules don't inspect message content. To IRM-protect messages based on message content, use transport protection rules. For more information, see Outlook protection rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter identifies an Outlook protection rule.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OutlookProtectionRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-OutlookProtectionRule** cmdlet to create a Microsoft Outlook protection rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OutlookProtectionRule -ApplyRightsProtectionTemplate
<RmsTemplateIdParameter> -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-Force
<SwitchParameter>] [-FromDepartment <String[]>] [-Organization
<OrganizationIdParameter>] [-Priority <Int32>] [-SentTo
<RecipientIdParameter[]>] [-SentToScope <All | InOrganization>] [-
UserCanOverride <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example applies the AD RMS template `Template-Contoso` to messages sent to the SMTP address Joe@contoso.com.

```
New-OutlookProtectionRule -Name "Project Contoso" -SentTo
Joe@contoso.com -ApplyRightsProtectionTemplate "Template-
Contoso"
```

Detailed Description

Outlook protection rules are administrator-created rules applied before a user sends a message using Outlook. Outlook inspects message content and protects messages by applying Active Directory Rights Management Services (AD RMS) rights templates.

For more information, see Outlook protection rules.

Caution:
Outlook protection rules created without a condition apply to all messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the

"Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
ApplyRightsProtectionTemplate	Required	Microsoft.Exchange.Configuration.Tasks.RmsTemplateIdParameter	The *ApplyRightsProtectionTemplate* parameter specifies the AD RMS template to apply to the message. An AD RMS template can be specified using the template name. Use the **Get-RMSTemplate** cmdlet to retrieve templates from your AD RMS server.
Name	Required	System.String	The *Name* parameter specifies a name for the rule.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	This parameter is available only in on-

		ta.Fqdn	premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the Outlook protection rules are enabled. New Outlook protection rules are enabled by default. To create a rule without enabling it, set the *Enabled* parameter to `$false`.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt used to warn the administrator when rules are created without any conditions. Rules without any conditions specified apply to all messages. The *Force* switch doesn't require a value.
FromDepartment	Optional	System.String[]	The *FromDepartment*

			parameter specifies the sender's department as a condition. The user's department property is compared with the value specified.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Priority	Optional	System.Int32	The *Priority* parameter specifies whether to set the order of processing of Outlook protection rules. Rules with a lower priority value are executed first.
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies one or more recipients as a rule condition. The identity of recipients in the organization or the SMTP address of external recipients can be specified. The *SentTo* parameter doesn't accept wildcard characters. When multiple recipients are specified, messages sent to any of the specified recipients are considered a match.

SentToScope	Optional	Microsoft.Exchange.Management.OutlookProtectionRules.ToUserScope	The *SentToScope* parameter specifies the message scope as a condition. You can use one of the following values: • `InOrganization` This value is for messages sent to recipients within the organization. • `All` This value is for messages sent to all recipients.
UserCanOverride	Optional	System.Boolean	The *UserCanOverride* parameter specifies whether users can override actions taken by Outlook protection rules. By default, users can override actions taken by Outlook protection rules. When set to `$false`, the *UserCanOverride* parameter prevents the user from overriding the rule when sending the message.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OutlookProtectionRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-OutlookProtectionRule** cmdlet to remove an Outlook protection rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OutlookProtectionRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Outlook protection rule Project Contoso.

```
Remove-OutlookProtectionRule -Identity "Project Contoso"
```

EXAMPLE 2

This example removes all Outlook protection rules in the organization. The **Get-OutlookProtectionRule** cmdlet is used to retrieve all Outlook protection rules in the Microsoft Exchange Server 2013 organization, and the results are pipelined to the **Remove-OutlookProtectionRule** cmdlet to remove them.

```
Get-OutlookProtectionRule | Remove-OutlookProtectionRule
```

Detailed Description

Outlook protection rules use an Active Directory Rights Management Services (AD RMS) rights template to automatically apply Information Rights Management (IRM) protection to messages before they're sent. For more information, see Outlook protection rules.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the name of the rule being removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OutlookProtectionRule

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-OutlookProtectionRule** cmdlet to modify an existing Microsoft Outlook protection rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OutlookProtectionRule -Identity <RuleIdParameter> [-
ApplyRightsProtectionTemplate <RmsTemplateIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-FromDepartment <String[]>] [-Name <String>] [-Priority <Int32>] [-SentTo
<MultiValuedProperty>] [-SentToScope <All | InOrganization>] [-
UserCanOverride <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the Outlook protection rule `OPR-DG-Finance` to apply to messages sent to the DG-Finance distribution group.

```
Set-OutlookProtectionRule -Identity "OPR-DG-Finance" -
SentTo "DG-Finance"
```

EXAMPLE 2

This example sets the priority of the Outlook protection rule `OPR-DG-Finance` to 2.

```
Set-OutlookProtectionRule -Identity "OPR-DG-Finance" -
Priority 2
```

Detailed Description

Outlook protection rules are used to automatically rights-protect email messages using a Rights Management Services (RMS) template before the message is sent. However, Outlook protection rules don't inspect message content. To rights-protect messages based on message content, use transport protection rules. For more information, see Outlook protection rules.

Caution:
Not specifying any conditions results in an Outlook protection rule being applied to all messages.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Information Rights Management (IRM) configuration" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the rule.
ApplyRightsProtectionTemplate	Optional	Microsoft.Exchange.Configuration.Tasks.RmsTemplateIdParameter	The *ApplyRightsProtectionTemplate* parameter specifies an RMS template to be applied to messages matching the conditions.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -

			`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the confirmation prompt produced by the cmdlet when modifying a rule with no conditions, resulting in such rules being applied to all messages.
FromDepartment	Optional	System.String[]	The *FromDepartment* parameter specifies a department name. The rule is applied to messages where the sender's department attribute matches this value.

Name	Optional	System.String	The *Name* parameter specifies a name for the rule.
Priority	Optional	System.Int32	The *Priority* parameter specifies a priority for the Outlook protection rule. Rule priority values can range from 0 through *n*-1, where *n* is the total number of existing Outlook protection rules. Any existing rules with priority equal to or higher than the priority being set have their priority incremented by 1.
SentTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SentTo* parameter specifies one or more recipients. External recipients can be specified using the SMTP address. Internal recipients can be specified using any of the following values: • Alias • Distinguished name (DN) • ExchangeGUID • LegacyExchangeDN • SmtpAddress • User principal name (UPN)

SentToScope	Optional	Microsoft.Exchange.Management.OutlookProtectionRules.ToUserScope	The *SentToScope* parameter specifies the scope of messages to which the rule applies. Valid values include: • `All` Applies to all messages. • `InOrganization` Applies to messages originating from inside the Exchange organization, where all recipients are also internal. If not specified, the parameter defaults to `All`.
UserCanOverride	Optional	System.Boolean	The *UserCanOverride* parameter specifies whether the Outlook user can override the rule behavior, either by using a different RMS template, or by removing rights protection before sending the message. Valid values include: • `$true` User can override rule action. • `$false` User can't override rule action.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PolicyTipConfig

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-PolicyTipConfig** cmdlet to view the data loss prevention (DLP) Policy Tips in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PolicyTipConfig [-Action <NotifyOnly | RejectOverride | Reject | Url>]
[-Locale <CultureInfo>] [-Original <SwitchParameter>] <COMMON PARAMETERS>

Get-PolicyTipConfig [-Identity <PolicyTipConfigIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>]
```

Examples

Example 1

This example returns a summary list of the custom Policy Tips in all languages that have the action value `NotifyOnly`.

```
Get-PolicyTipConfig -Action NotifyOnly
```

Example 2

This example returns a summary list of all built-in French Policy Tips.

```
Get-PolicyTipConfig -Original -Locale fr
```

Example 3

This example returns details about the custom English Policy Tip for the action value `RejectOverride`.

```
Get-PolicyTipConfig en\RejectOverride | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Action	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.PolicyTipMessageConfigAction	The *Action* parameter filters the Policy Tips by action. Valid values for this parameter are: • NotifyOnly • RejectOverride • Reject You can't use the value

			`Url` with the *Action* parameter. Instead, use command: `Get-PolicyTipConfig Url`. You can't use the *Action* parameter with the *Identity* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Management.PolicyNudges.PolicyTipConfigIdParameter	The *Identity* parameter specifies the custom Policy Tip you want to view. You can use any value that uniquely identifies the custom Policy Tip. For example: • <*Locale*>\<*Action*>: Locale is a supported locale code. For example, `en` for English or `fr` for French. For more information about supported locales, see Supported languages

			for system messages. Action is one of the following Policy Tip actions: `NotifyOnly`, `RejectOverride` or `Reject`. • The value `Url` • GUID • Distinguished name (DN) You can't use the *Identity* parameter with the *Action*, *Locale*, or *Original* parameters.
Locale	Optional	System.Globalization.CultureInfo	The *Locale* parameter specifies a locale-specific version of the Policy Tip. Valid values for this parameter are supported locale codes. For example, `en` for English or `fr` for French. For more information about supported locales, see Supported languages for system messages. You can't use the *Locale* parameter with the *Identity* parameter.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.Orga	The *Organization* parameter is reserved for

		nizationIdParameter	internal Microsoft use.
Original	Optional	System.Management.Automation.SwitchParameter	The *Original* switch includes built-in Policy Tips in the results. You don't specify a value with the *Original* switch. You can't use the *Original* switch with the *Identity* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-PolicyTipConfig

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-PolicyTipConfig** cmdlet to create custom Policy Tips in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-PolicyTipConfig -Name <String> -Value <String> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates a custom Policy Tip with the following settings:

- Locale: English
- Action: `NotifyOnly`
- Policy Tip text: "This message contains content that is restricted by Contoso company policy."

```
New-PolicyTipConfig -Name en\NotifyOnly -Value "This
message contains content that is restricted by Contoso
company policy."
```

Example 2

This example sets the informational URL in Policy Tips to the value http://www.contoso.com/PolicyTipInformation.

```
New-PolicyTipConfig Url -Value "http://www.contoso.com/
PolicyTipInformation"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the custom Policy Tip you want to modify. Valid input for this parameter is one of the following values: • *<Locale>\<Action>*: Locale is a supported locale code. For example, `en` for English

			or `fr` for French. For more information about supported locales, see Supported languages for system messages. Action is one of the following Policy Tip actions: `NotifyOnly`, `RejectOverride` or `Reject`. • `Url` There can be only one custom Policy Tip with the value `Url` for the *Name* parameter. For the remaining Policy Tip actions, there can be only one custom Policy Tip for each combination of locale and action. For example, there can be only one custom Policy Tip with the *Name* value `en\NotifyOnly`, but you can create additional custom Policy Tips with the values `de\NotifyOnly` and `fr\NotifyOnly` for the *Name* parameter.
Value	Required	System.String	The *Value* parameter specifies the text that's displayed by the Policy Tip. If the value contains

			spaces, enclose the value in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PolicyTipConfig

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-PolicyTipConfig** cmdlet to remove custom data loss prevention (DLP) Policy Tips from your organization. You can't remove built-in Policy Tips.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PolicyTipConfig -Identity <PolicyTipConfigIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the custom English Policy Tip for the action value `NotifyOnly`.

```
Remove-PolicyTipConfig en\NotifyOnly
```

Example 2

This example removes all the custom Russian Policy Tips.

```
Get-PolicyTipConfig -Locale ru | Remove-PolicyTipConfig
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.PolicyNudges.PolicyTipConfigIdParameter	The *Identity* parameter specifies the custom Policy Tip you want to remove. You can use any value that uniquely identifies the custom Policy Tip. For example: • <*Locale*>\<*Action*>: Locale is a supported locale code. For example, `en` for English or `fr` for French. For more information about supported locales, see Supported languages for system messages. Action is one of the following Policy Tip

			actions: `NotifyOnly`, `RejectOverride` or `Reject`. The value `Url` • GUID • Distinguished name (DN)
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PolicyTipConfig

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-PolicyTipConfig** cmdlet to modify custom Policy Tips in your organization. You can't modify built-in Policy Tips.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PolicyTipConfig -Identity <PolicyTipConfigIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Name <String>] [-Value
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example modifies the custom English Policy Tip with the action value `NotifyOnly`. The text of this custom Policy Tip is changed to the following value: "This message contains content that is restricted by Contoso company policy."

```
Set-PolicyTipConfig en\NotifyOnly "This message contains content that is restricted by Contoso company policy."
```

Example 2

This example replaces the text of all custom Spanish Policy Tips with the value, "Este mensaje contiene contenido que está restringida por la política de Contoso."

```
Get-PolicyTipConfig -Locale es | Set-PolicyTipConfig -Value "Este mensaje contiene contenido que está restringida por la política de Contoso."
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Data loss prevention (DLP)" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.PolicyNudges.PolicyTipConfigIdParameter	The *Identity* parameter specifies the custom Policy Tip you want to modify. You can use any value that uniquely identifies the custom Policy Tip. For example: • *<Locale>\<Action>*: Locale is a supported locale code. For example, `en` for English

			or `fr` for French. For more information about supported locales, see Supported languages for system messages. Action is one of the following Policy Tip actions: `NotifyOnly`, `RejectOverride` or `Reject`. • The value `Url` • GUID • Distinguished name (DN)
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
Name	Optional	System.String	The *Name* parameter specifies the custom Policy Tip you want to modify. Valid input for this parameter is one of the following values: • <*Locale*>\<*Action*>: Locale is a supported locale code. For example, `en` for English or `fr` for French. For more information about supported locales, see Supported languages for system messages. Action is one of the following Policy Tip actions: `NotifyOnly`, `RejectOverride` or `Reject`. • The value `Url` There can be only one custom Policy Tip with the value `Url` for the *Name* parameter. For the remaining Policy Tip actions, there can be only one custom Policy Tip for each combination of

			locale and action. For example, there can be only one custom Policy Tip with the *Name* value `en\NotifyOnly`, but you can create additional custom Policy Tips with the values `de\NotifyOnly` and `fr\NotifyOnly` for the *Name* parameter.
Value	Optional	System.String	The *Value* parameter specifies the text that's displayed by the Policy Tip. If the value contains spaces, enclose the value in quotation marks (").
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RetentionPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RetentionPolicy** cmdlet to retrieve the settings for retention policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RetentionPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE1

This example returns all the properties of the retention policy RP Finance. The output is piped to the **Format-List** cmdlet to format the results as a list of properties.

```
Get-RetentionPolicy -Identity "RP Finance" | Format-List
```

Detailed Description

A retention policy is associated with a group of retention policy tags that specify retention settings for items in a mailbox. A policy may contain one default policy tag to move items to an archive mailbox, one default policy tag to delete all items, one default policy tag to delete voicemail items, and multiple personal tags to move or delete items. A mailbox can have only one retention policy applied to it. The **Get-RetentionPolicy** cmdlet displays all policy settings associated with the specified policy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the policy name.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-RetentionPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-25*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-RetentionPolicy** cmdlet to create a retention policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-RetentionPolicy -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
IsDefault <SwitchParameter>] [-IsDefaultArbitrationMailbox
<SwitchParameter>] [-Organization <OrganizationIdParameter>] [-RetentionId
<Guid>] [-RetentionPolicyTagLinks <RetentionPolicyTagIdParameter[]>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the retention policy Business General without associating any retention policy tags.

```
New-RetentionPolicy "Business General"
```

EXAMPLE 2

This example creates the retention policy Business General and uses the *RetentionPolicyTagLinks* parameter to associate two retention policy tags with this policy. You can enter multiple retention policy tags, separated by commas. If a tag name includes a space, enclose the name in quotation marks.

```
New-RetentionPolicy "Business General" -
RetentionPolicyTagLinks "General Business","Legal"
```

Note:
The second retention tag, which is named Legal, is also enclosed in quotation marks for consistency. Values that don't include a space can be enclosed in quotation marks without any change to how the command is interpreted.

Detailed Description

Retention policy tags are associated with a retention policy. When a retention policy is applied to a mailbox, tags associated with the policy are available to the mailbox user.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the policy name.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefault	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use. **Note:** This parameter isn't available in on-premises deployments.
IsDefaultArbitrationMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *IsDefaultArbitrationMailbox* switch configures this policy as the default retention policy for arbitration mailboxes in your Exchange Online organization. **Note:** This parameter isn't available in on-premises deployments.

Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RetentionId	Optional	System.Guid	The *RetentionId* parameter specifies the identity of the retention policy to ensure mailboxes moved from an on-premises Exchange deployment to the cloud continue to have the same retention policy applied to them. The *RetentionId* parameter is used in cross-premises deployments. You don't need to specify this parameter in on-premises-only deployments.
RetentionPolicyTagLinks	Optional	Microsoft.Exchange.Configuration.Tasks.RetentionPolicyTagIdParameter[]	The *RetentionPolicyTagLinks* parameter specifies the names of retention policy tags to be associated with this policy.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RetentionPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-RetentionPolicy** cmdlet to remove a retention policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-RetentionPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the retention policy Business Critical.

```
Remove-RetentionPolicy -Identity "Business Critical"
```

EXAMPLE 2

This example removes the retention policy Business Critical and suppresses the confirmation prompt.

```
Remove-RetentionPolicy -Identity "Business Critical" -
Confirm:$false
```

EXAMPLE 3

This example removes the retention policy Business Critical, which is assigned to users, and suppresses the confirmation prompt.

```
Remove-RetentionPolicy -Identity "Business Critical" -
Confirm:$false -Force
```

Detailed Description

Retention policies are used to apply message retention settings to folders and items in a mailbox. The **Remove-RetentionPolicy** cmdlet removes an existing retention policy.

Caution:

If you remove a retention policy that's assigned to users and they don't have another retention policy assigned, messages in those mailboxes may never expire. This may be a violation of the organization's messaging retention policies. When you attempt to remove a policy that's assigned to users, Microsoft Exchange displays a confirmation message indicating that the policy is assigned to users. Note that this message is in addition to the confirmation prompt displayed when removing a retention policy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the retention policy name.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to override the confirmation prompt

			that appears when removing a retention policy that's assigned to users. Removing a policy that's assigned to users results in those users not having any retention policy. You don't have to specify a value with the *Force* switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RetentionPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-RetentionPolicy** cmdlet to change the properties of an existing retention policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-RetentionPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-IgnoreDehydratedFlag <SwitchParameter>] [-IsDefault <SwitchParameter>]
[-IsDefaultArbitrationMailbox <SwitchParameter>] [-Name <String>] [-
RetentionId <Guid>] [-RetentionPolicyTagLinks
<RetentionPolicyTagIdParameter[]>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the policy MyPolicy to link the retention policy tag MyRetentionPolicyTag with it.

```
Set-RetentionPolicy "MyPolicy" -RetentionPolicyTagLinks
"MyRetentionPolicyTag"
```

Note:
The *Identity* parameter is a positional parameter. Positional parameters can be used without the label (Identity). For more information about positional parameters, see Parameters.

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the name, distinguished name (DN), or GUID of the retention policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch overrides the confirmation prompt displayed by the cmdlet

			when you use the *RetentionId* parameter.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefault	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *IsDefault* switch configures this policy as the default retention policy in your Microsoft Exchange Online organization. The default retention policy is applied to users who don't have a retention policy explicitly applied (including `$null`). After the user has a retention policy applied or set to `$null`, the default retention policy is no longer applied. **Note:** This parameter isn't available in on-premises deployments.
IsDefaultArbitrationMailbox	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The

			IsDefaultArbitrationMailbox switch configures this policy as the default retention policy for arbitration mailboxes in your Exchange Online organization. **Note:** This parameter isn't available in on-premises deployments.
Name	Optional	System.String	The *Name* parameter specifies a unique name for the retention policy.
RetentionId	Optional	System.Guid	The *RetentionId* parameter specifies the identity of the retention policy to make sure mailboxes moved between two Exchange organizations continue to have the same retention policy applied to them. For example, in a cross-forest deployment or in a cross-premises deployment, when a mailbox is moved from an on-premises Exchange server to the cloud, or a cloud-based mailbox is moved to an

			on-premises Exchange server, this parameter is used to make sure the same retention policy is applied to the mailbox. **Important:** It's not normally required to specify or modify the *RetentionId* parameter for a retention tag. The parameter is populated automatically when importing retention tags using the Import-RetentionTags.ps1 script.
RetentionPolicyTagLinks	Optional	Microsoft.Exchange.Configuration.Tasks.RetentionPolicyTagIdParameter[]	The *RetentionPolicyTagLinks* parameter specifies the identity of retention policy tags to associate with the retention policy. Mailboxes that get a retention policy applied have retention tags linked with that retention policy.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RetentionPolicyTag

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RetentionPolicyTag** cmdlet to retrieve settings for a retention tag.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RetentionPolicyTag [-Mailbox <MailboxIdParameter>] [-OptionalInMailbox
<SwitchParameter>] <COMMON PARAMETERS>

Get-RetentionPolicyTag [-Identity <RetentionPolicyTagIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-IncludeSystemTags <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-Types <ElcFolderType[]>]
```

Examples

EXAMPLE 1

This example returns all retention tags.

```
Get-RetentionPolicyTag
```

EXAMPLE 2

This example returns system tags in addition to personal and default tags.

```
Get-RetentionPolicyTag -IncludeSystemTags
```

EXAMPLE 3

This example returns the settings for the tag Consolidated Messenger.

```
Get-RetentionPolicyTag "Consolidated Messenger"
```

EXAMPLE 4

This example returns all retention tags of `Inbox` and `All` types and pipes the results to the **Format-Table** command to display the **Name**, **Type**, **RetentionEnabled**, **AgeLimitForRetention**, and **RetentionAction** properties.

```
Get-RetentionPolicyTag -Types Inbox,All | Format-Table
Name,Type,RetentionEnabled,AgeLimitForRetention,RetentionAc
tion -AutoSize
```

Detailed Description

Retention tags are used to apply message retention settings to messages or folders. There are three types of retention tags:

- Retention policy tags
- Default policy tags
- Personal tags

Retention policy tags are applied to default folders such as Inbox and Deleted Items. Personal tags are available to users to tag items and folders. The default policy tag is applied to all items that don't have a tag applied by the user or aren't inherited from the folder they're located in. The **Get-RetentionPolicyTag** cmdlet displays all the settings for the specified tag.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RetentionPolicyTagIdParameter	The *Identity* parameter specifies the name of the tag.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IncludeSystemTags	Optional	System.Management.Automation.SwitchParameter	The *IncludeSystemTags* switch specifies whether to return any system tags.
Mailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter isn't available in this release.
OptionalInMailbox	Optional	System.Management.Automation.SwitchParameter	The *OptionalInMailbox* parameter isn't available in this release.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.
Types	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ElcFolderType[]	The *Types* parameter specifies the type of retention tag to return. Valid values include: • `Calendar` • `Contacts` • `DeletedItems` • `Drafts` • `Inbox` • `JunkEmail` • `Journal` • `Notes` • `Outbox` • `SentItems` • `Tasks` • `All` • `RssSubscriptions` • `ConversationHistory` • `Personal` The parameter accepts multiple values separated by a comma.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-RetentionPolicyTag

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-RetentionPolicyTag** cmdlet to create a retention tag.

For more information about retention tags, see Retention tags and retention policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-RetentionPolicyTag [-AddressForJournaling <RecipientIdParameter>] [-
AgeLimitForRetention <EnhancedTimeSpan>] [-JournalingEnabled <$true |
$false>] [-LabelForJournaling <String>] [-MessageClass <String>] [-
MessageFormatForJournaling <UseMsg | UseTnef>] [-RetentionAction
<MoveToDeletedItems | MoveToFolder | DeleteAndAllowRecovery |
PermanentlyDelete | MarkAsPastRetentionLimit | MoveToArchive>] [-
RetentionEnabled <$true | $false>] [-RetentionId <Guid>] <COMMON
PARAMETERS>

New-RetentionPolicyTag [-ManagedFolderToUpgrade <ELCFolderIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Comment <String>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-IsDefaultAutoGroupPolicyTag <SwitchParameter>] [-
IsDefaultModeratedRecipientsPolicyTag <SwitchParameter>] [-
LocalizedComment <MultiValuedProperty>] [-LocalizedRetentionPolicyTagName
<MultiValuedProperty>] [-MustDisplayCommentEnabled <$true | $false>] [-
Organization <OrganizationIdParameter>] [-SystemTag <$true | $false>] [-
Type <Calendar | Contacts | DeletedItems | Drafts | Inbox | JunkEmail |
Journal | Notes | Outbox | SentItems | Tasks | All | ManagedCustomFolder |
RssSubscriptions | SyncIssues | ConversationHistory | Personal |
RecoverableItems | NonIpmRoot | LegacyArchiveJournals>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the retention policy tag Finance-DeletedItems for the Deleted Items default folder. When applied to a mailbox as a part of a retention policy, the tag permanently deletes items of all types in the Deleted Items folder in 30 days.

```
New-RetentionPolicyTag "Finance-DeletedItems" -Type
DeletedItems -RetentionEnabled $true -AgeLimitForRetention
30 -RetentionAction PermanentlyDelete
```

EXAMPLE 2

This example creates the default policy tag Finance-Default. When applied to a mailbox as part of a retention policy, the tag permanently deletes all items without a retention tag within 365 days. Items of a particular message class such as Voicemail, for which a default tag (a retention tag of type All) exists, aren't impacted.

```
New-RetentionPolicyTag "Finance-Default" -Type All -
RetentionEnabled $true -AgeLimitForRetention 365 -
RetentionAction PermanentlyDelete
```

EXAMPLE 3

This example creates the retention tag Business Critical of type Personal. When applied to mailbox items as part of a retention policy, the items are permanently deleted in approximately seven years.

```
New-RetentionPolicyTag "Business Critical" -Type Personal -
Comment "Use this tag for all business critical mail" -
RetentionEnabled $true -AgeLimitForRetention 2556 -
RetentionAction PermanentlyDelete
```

Detailed Description

Retention tags are used to apply message retention settings to folders and items in a mailbox.

Retention tags support a display of the tag name and an optional comment in localized languages. Language culture codes from the **CultureInfo** class are used for this purpose.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Messaging records management" entry in the Messaging policy and compliance permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the tag.
AddressForJournaling	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	This parameter isn't available in this release.
AgeLimitForRetention	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AgeLimitForRetention* parameter specifies the age at which retention is enforced on an item. The

			age limit corresponds to the number of days from the date the item was delivered, or the date an item was created if it wasn't delivered. If this parameter isn't present and the *RetentionEnabled* parameter is set to `$true`, an error is returned.
Comment	Optional	System.String	The *Comment* parameter specifies a comment for the tag.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefaultAutoGroupPolicyTag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IsDefaultModeratedRecipientsPolicyTag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
JournalingEnabled	Optional	System.Boolean	This parameter isn't available in this release.
LabelForJournaling	Optional	System.String	This parameter isn't available in this release.
LocalizedComment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *LocalizedComment* parameter specifies localized comments and their languages. When the user's language setting matches a language specified for this parameter, Microsoft Outlook and Microsoft Office Outlook Web App display the corresponding localized comment. Comments are specified in the form of *ISO*

			Language Code:Comment, for example, `LocalizedComment EN-US:"This is a localized comment in U.S. English"`.
LocalizedRetentionPolicyTagName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *LocalizedRetentionPolicyTagName* parameter specifies localized tag names and their languages. When the user's language setting matches a language specified for this parameter, Outlook and Outlook Web App display the corresponding localized tag name. Names are specified in the form of *ISO Language Code:Name*, for example, `LocalizedRetentionPolicyTagName EN-US:"Business Critical"`.
ManagedFolderToUpgrade	Optional	Microsoft.Exchange.Configuration.Tasks.ELCFolderIdParameter	This parameter is available only in on-premises Exchange 2013. The *ManagedFolderToUpgrade* parameter specifies the name of a managed folder to use as a template for a

			retention tag.
MessageClass	Optional	System.String	The *MessageClass* parameter specifies the message type to which the tag applies. If not specified, the default value is set to `*`. With the exception of a default policy tag (DPT) for `voicemail`, Exchange doesn't support retention tags for different message types. Only tags with a *MessageClass* of `*` are supported, and they apply to all message types. To create a DPT for voice mail messages, set the *MessageClass* parameter to `voicemail` and the *Type* parameter to `All`. **Note:** A DPT for voice mail messages applies only to Microsoft Exchange Unified Messaging voice mail messages (identified by the `PR_MESSAGE_CLASS` MAPI property value `IPM.Note.Microsoft.Voicemail*`).
MessageFormatForJournaling	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.Journaling	This parameter isn't available in this release.

		Format	
MustDisplayCommentEnabled	Optional	System.Boolean	The *MustDisplayCommentEnabled* parameter specifies whether the comment can be hidden. The default value is `$true`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RetentionAction	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RetentionActionType	The *RetentionAction* parameter specifies one of the following actions: • `MarkAsPastRetentionLimit` If you specify this action for a retention tag, messages that have the tag applied are marked as past the retention limit. • `MoveToFolder` This action isn't available for retention tags. • `MoveToDeletedItems` This action isn't available for retention tags. • `DeleteAndAllowRecovery` This action deletes a message and allows recovery from the Recoverable Items folder. • `PermanentlyDelete` This action permanently deletes a message. A message that has been

			permanently deleted can't be recovered using the Recoverable Items folder. Permanently deleted messages aren't returned in a Discovery search, unless litigation hold is enabled for the mailbox. • `MoveToArchive` This action moves a message to the user's archive mailbox. You can use this action for retention tags of type `All`, `Personal`, and `RecoverableItems`. If this parameter isn't present and the *RetentionEnabled* parameter is set to `$true`, an error is returned.
RetentionEnabled	Optional	System.Boolean	The *RetentionEnabled* parameter specifies whether the tag is enabled. When set to `$false`, the tag is disabled, and no retention action is taken on messages that have the tag applied. **Note:** Messages with a disabled tag are still considered tagged, so any default policy tags in the user's retention policy aren't applied to such messages. When you set the

			RetentionEnabled parameter to `$false`, the retention period for the tag is shown as **Never**. Users may apply this tag to items they want to indicate should never be deleted or should never be moved to the archive. Enabling the tag later may result in unintentional deletion or archiving of items. To avoid this situation, if a retention policy is disabled temporarily, it may be advisable to change the name of that tag so that users are discouraged from using it, such as `DISABLED_<Original Name>`.
RetentionId	Optional	System.Guid	The *RetentionId* parameter specifies an alternate tag ID to make sure the retention tag found on mailbox items tagged in an on-premises deployment matches the tag when the mailbox is moved to the cloud, or mailbox items tagged in the cloud match the tag

			when the mailbox is moved to an on-premises Exchange server. The parameter is used in cross-premises deployments. You don't need to specify this parameter in on-premises-only deployments.
SystemTag	Optional	System.Boolean	The *SystemTag* parameter specifies that the tag is created for internal Exchange functionality.
Type	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ElcFolderType	The *Type* parameter specifies the type of retention tag being created. Valid values include: • `Calendar` • `Contacts` • `DeletedItems` • `Drafts` • `Inbox` • `JunkEmail` • `Journal` • `Notes` • `Outbox` • `SentItems` • `Tasks` • `All` • `RecoverableItems` • `RssSubscriptions` • `SyncIssues` • `ConversationHistory` • `Personal` **Note:** To create a default policy tag (DPT), specify type `All`. For tags of type

			`RecoverableItems`, the only valid retention action is `MoveToArchive`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RetentionPolicyTag

Exchange Management Shell > Exchange 2013 cmdlets > Policy and compliance cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-RetentionPolicyTag** cmdlet to remove a retention tag.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-RetentionPolicyTag -Identity <RetentionPolicyTagIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the retention tag Finance-DeletedItems.

```
Remove-RetentionPolicyTag -Identity "Finance-DeletedItems"
```

Detailed Description
