Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
CurrentOrganization	Optional	System.Management.	The *CurrentOrganization*

		Automation.SwitchParameter	switch specifies that the provision cache is reset for this organization.
Organizations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Organizations* parameter specifies the organizations that the provisioning cache will be reset. This parameter is used in multi-tenant deployments.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Reset-ProvisioningCache

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

The **Reset-ProvisioningCache** cmdlet clears the Windows PowerShell provisioning cache of frequently used Active Directory objects. This cmdlet is only used for diagnostic purposes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Reset-ProvisioningCache -Application <String> -GlobalCache
<SwitchParameter> -Server <Fqdn> <COMMON PARAMETERS>

Reset-ProvisioningCache -Application <String> -Server <Fqdn> [-
CurrentOrganization <SwitchParameter>] [-Organizations
<MultiValuedProperty>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-CacheKeys <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resets the provisioning cache for Windows PowerShell running on the server EXSRV1.contoso.com in an on-premises Exchange organization and specifies that all cache keys are cleared.

```
Reset-ProvisioningCache -Server EXSRV1.contoso.com -
Application Powershell -GlobalCache
```

EXAMPLE 2

This example runs in a multi-tenant deployment by a data center administrator to reset the provisioning cache for Windows PowerShell for the adatum.com tenant and clear all cache keys.

```
Reset-ProvisioningCache -Application Powershell-Proxy -
Server datacenter1.adatum.com -GlobalCache
```

Detailed Description

The **Reset-ProvisioningCache** cmdlet is for diagnostic purposes only and is rarely used. Exchange

administrators need to run this cmdlet only if incorrect links or properties are stamped on newly provisioned recipients, which can be caused by stale data in the provisioning cache. This is a rare occurrence because the provisioning cache has invalidation notification logic.

The **Reset-ProvisioningCache** cmdlet clears the Windows PowerShell provisioning cache of frequently used Active Directory objects. To reduce Active Directory requests, a provisioning cache is initialized in each Windows PowerShell runspace and is used to cache common objects that are frequently used by cmdlets and provisioning handlers. During Exchange cmdlet execution, the provisioning cache loads configuration objects from Active Directory to help run a cmdlet. For example, when you create a mailbox, the **New-Mailbox** cmdlet obtains properties from Active Directory. When running cmdlets, configuration objects such as database containers, administrative role groups, and LegacyDNs are retrieved from Active Directory. Because these types of objects are stable and don't change for months or years after they're created, they're stored in the provisioning cache used by Windows PowerShell. This increases provisioning efficiency and significantly improves cmdlet performance.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange server configuration settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Application	Required	System.String	The *Application* parameter specifies the specific administrative application to reset the provisioning cache for. You can use the following values: • `Powershell` • `Powershell-LiveId` • `Powershell-Proxy` • `PowershellLiveId-Proxy` • `Ecp` • `Psws`
GlobalCache	Required	System.Management.Automation.SwitchParameter	The *GlobalCache* switch specifies that all cache keys are cleared.

Server	Required	Microsoft.Exchange.Data.Fqdn	The *Server* parameter specifies the fully qualified domain name (FQDN) of the server that the application you want to reset is running on.
CacheKeys	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *CacheKeys* parameter specifies the value for the cache key that you want to clear. The format for the values should contain 32 digits separated by four dashes: `xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx` Use the **Dump-ProvisioningCache** cmdlet to return a list of cache keys.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
CurrentOrganization	Optional	System.Management.Automation.SwitchParameter	The *CurrentOrganization* switch specifies that the provision cache is reset

			for this organization.
Organizations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Organizations* parameter specifies the organizations that the provisioning cache will be reset. This parameter is used in multi-tenant deployments.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-Trust

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-Trust** cmdlet to return external and forest trusts.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-Trust [-DomainName <Fqdn>]
```

Examples

EXAMPLE 1

This example enumerates all trusts for the domain Contoso.com.

```
Get-Trust -DomainName Contoso.com
```

Detailed Description

The **Get-Trust** cmdlet is used by the Exchange Administration Center in Microsoft Exchange Server 2013 to populate fields that display recipient information.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Active Directory Domain Services server settings" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainName	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainName* parameter specifies that trusts returned are restricted to the domain name specified.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-UserPrincipalNamesSuffix

Exchange Management Shell > Exchange 2013 cmdlets > Active Directory cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-UserPrincipalNamesSuffix** cmdlet to view the user principal name (UPN) suffixes in the Active Directory forest. The UPN suffixes are created in Active Directory Domains and Trusts.

```
Get-UserPrincipalNamesSuffix <COMMON PARAMETERS>

Get-UserPrincipalNamesSuffix [-Identity
<ExtendedOrganizationalUnitIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<ExtendedOrganizationalUnitIdParameter>]
```

Examples

EXAMPLE 1

This example returns all UPN suffixes for the Active Directory forest.

```
Get-UserPrincipalNamesSuffix
```

Detailed Description

UPN suffixes assigned to an organizational unit are stored in the **upnSuffixes** attribute in the **Organizational Unit** object.

The default UPN is contained in the **Canonical Name** attribute on the **Partitions container** object in the configuration naming context. The default UPN suffix identifies the domain in which the user

account is contained. When you create a user account in Active Directory, the default UPN suffix is the DNS name of the first domain in your domain tree.

If you create user accounts by using Active Directory Users and Computers, every user must have a UPN.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient provisioning permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ExtendedOrganizationalUnitIdParameter	The *Identity* parameter specifies the OU to retrieve. If the OU name contains spaces, enclose the value in quotation marks (").
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.ExtendedOrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the container where you search for all available

			UPN suffixes.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AgentLog** cmdlet to parse log files that you specify as parameters and collect raw statistics from the filtering that anti-spam agents apply during a time period that you specify.

```
Get-AgentLog [-EndDate <DateTime>] [-Location <LocalLongFullPath>] [-
StartDate <DateTime>] [-TransportService <Hub | Edge | FrontEnd |
MailboxSubmission | MailboxDelivery>]
```

Examples

EXAMPLE 1

This example returns a report that has statistics collected between 09:00 (9 A.M.), January 4, 2010 and 18:00 (6 P.M.), January 8, 2010 in the Front End Transport service on a Client Access server.

```
Get-AgentLog -StartDate "01/04/2010 9:00:00 AM" -EndDate
"01/08/2010 6:00:00 PM" -TransportService FrontEnd
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
EndDate	Optional	System.DateTime	The *EndDate* parameter specifies the date and time that you want to stop collecting statistics. The default time is the current time. When you enter a specific date, use the short date format defined in the **Regional Options** settings configured on the local computer. For example, if your computer is configured to use the short date format *mm/dd/yyyy*, enter 03/01/2010 to specify March 1, 2010. You can enter the date only, for example, `10/05/2010`. Or you can enter the date and time of day. If you enter a time of day and date, you must enclose the argument in quotation marks ("), for example, `"10/05/2010 5:00:00 PM"`.

Location	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *Location* parameter specifies the directory that contains the log files that you can use to build usage reports. The default path is `%ExchangeInstallPath%TransportRoles\Logs\AgentLog`. You must enclose the file path in quotation marks (").
StartDate	Optional	System.DateTime	The *StartDate* parameter specifies the date and time that the collection of statistics starts. The default time is the current time. When you enter a specific date, use the short date format defined in the **Regional Options** settings configured on the local computer. For example, if your computer is configured to use the short date format *mm/dd/yyyy*, enter 03/01/2010 to specify March 1, 2010. You can enter the date only, for example, `10/05/2010`, or you can enter the date and time of day. If you enter a time of day and date, you must

			enclose the argument in quotation marks ("), for example, `"10/05/2010 5:00:00 PM"`.
TransportService	Optional	Microsoft.Exchange.Data.TransportService	The *TransportService* parameter specifies the transport service that you want to view or modify. Valid values for this parameter are: • `Hub` for the Transport service on Mailbox servers. • `MailboxSubmission` for the Mailbox Transport Submission service on Mailbox servers. • `MailboxDelivery` for the Mailbox Transport Delivery service on Mailbox servers. • `FrontEnd` for the Front End Transport service on Client Access servers. • `Edge` on Edge Transport servers.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-AttachmentFilterEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Add-AttachmentFilterEntry** cmdlet to add an entry to the attachment filter list that's used by the Attachment Filtering agent on Edge Transport servers.

```
Add-Attachmentfilterentry -Name <String> -Type <ContentType | FileName> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds an attachment filter entry based on a file name. After running this command, the Attachment Filtering agent filters all attachments that have a .txt extension.

```
Add-AttachmentFilterEntry -Name *.txt -Type FileName
```

EXAMPLE 2

This example adds an attachment filter entry based on the MIME content type `image/jpeg`, which is a JPEG image binary file. After running this command, the Attachment Filtering agent filters all attachments of the MIME content type `image/jpeg`.

```
Add-AttachmentFilterEntry -Name image/jpeg -Type
ContentType
```

Detailed Description

On Edge Transport servers, the Attachment Filtering agent blocks attachments in messages based on the content type and the file name of the attachment. The configuration of the Attachment Filtering agent determines how messages that contain the specified attachments are processed. For more information about how to configure the Attachment Filtering agent, see Set-AttachmentFilterListConfig.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the MIME content type or file name of the attachment. If the *Type* parameter is set to `FileName`, the *Name* parameter can take any exact file name, such as `BadFile.exe`, or file name extension, such as `*.exe`. If the *Type* parameter is set to `ContentType`, the *Name* parameter can take any valid MIME content type.
Type	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.AttachmentType	The *Type* parameter specifies what type of attachment the attachment filter entry blocks. Valid values are `ContentType` and `FileName`: • `ContentType` This value matches the attachment filter entry against the MIME content type specified in the *Name* parameter.

			• `FileName` This value matches the attachment filter entry against the simple file name specified in the *Name* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AttachmentFilterEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-AttachmentFilterEntry** cmdlet to view the list of attachment filter entries that are used by the Attachment Filtering agent on Edge Transport servers.

```
Get-Attachmentfilterentry [-DomainController <Fqdn>] [-Identity <String>]
```

Examples

EXAMPLE 1

This example returns all attachment filter entries.

```
Get-AttachmentFilterEntry
```

EXAMPLE 2

This example returns only the attachment filter entries that filter file names with a .txt extension.

```
Get-AttachmentFilterEntry FileName:*.txt
```

EXAMPLE 3

This example returns only the attachment filter entries that filter attachments that have the MIME content type `image/jpeg`.

```
Get-AttachmentFilterEntry ContentType:image/jpeg
```

Detailed Description

On Edge Transport servers, the Attachment Filtering agent blocks attachments in messages based on the content type and the file name of the attachment. The configuration of the Attachment Filtering agent determines how messages that contain the specified attachments are processed. For more information about how to configure the Attachment Filtering agent, see Set-AttachmentFilterListConfig.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	System.String	The *Identity* parameter specifies which attachment filter entry the command retrieves. The *Identity* parameter accepts values in the format `Type:Name`, where `Type` is one of the following values: • `ContentType` This value matches the attachment filter entry against the MIME content type. • `FileName` This value matches the attachment filter entry against the simple file name.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AttachmentFilterEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Remove-AttachmentFilterEntry** cmdlet to remove an entry from the attachment filter list that's used by the Attachment Filtering agent on Edge Transport servers.

```
Remove-Attachmentfilterentry -Identity <String> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the attachment filter entry that filters file names with a .txt extension.

```
Remove-AttachmentFilterEntry -Identity FileName:*.txt
```

EXAMPLE 2

This example removes the attachment filter entry that filters attachments that have the MIME content type image/jpeg.

```
Remove-AttachmentFilterEntry -Identity ContentType:image/
jpeg
```

Detailed Description

On Edge Transport servers, the Attachment Filtering agent blocks attachments in messages based on the content type and the file name of the attachment. The configuration of the Attachment

Filtering agent determines how messages that contain the specified attachments are processed. For more information about how to configure the Attachment Filtering agent, see Set-AttachmentFilterListConfig.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	System.String	The *Identity* parameter specifies the type of attachment that this filter entry removes. The *Identity* parameter accepts values in the format `Type:Name`, where `Type` is one of the following two values: • `ContentType` This value matches the attachment filter entry against the MIME content type. • `FileName` This value matches the attachment filter entry against the simple file name. In `Type:Name`, `Name` can be either the file name of the attachment filter entry to be removed, or the content type of the attachment filter entry to be removed.
Confirm	Optional	System.Management.	The *Confirm* switch can be

		Automation.SwitchParameter	used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AttachmentFilterListConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-AttachmentFilterListConfig** cmdlet to view the configuration of the Attachment Filtering agent on Edge Transport servers.

```
Get-Attachmentfilterlistconfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the Attachment Filtering agent configuration for

the computer on which the command is run.

```
Get-AttachmentFilterListConfig | Format-List
```

Detailed Description

On Edge Transport servers, the Attachment Filtering agent blocks attachments in messages based on the content type or the file name of the attachment. The configuration of the Attachment Filtering agent determines how messages that contain the specified attachments are processed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AttachmentFilterListConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-AttachmentFilterListConfig** cmdlet to modify the configuration of the Attachment Filtering agent on Edge Transport servers.

```
Set-Attachmentfilterlistconfig [-Action <Reject | Strip | SilentDelete>]
[-AdminMessage <String>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-ExceptionConnectors <MultiValuedProperty>] [-RejectResponse
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the action that the Attachment Filtering agent takes on an attachment that matches an entry on the attachment filter list so that both the email message and attachment aren't delivered to the recipient, and an NDR is sent to the sender.

```
Set-AttachmentFilterListConfig -Action Reject
```

Detailed Description

On Edge Transport servers, the Attachment Filtering agent blocks attachments in messages based

on the content type or the file name of the attachment. The configuration of the Attachment Filtering agent determines how messages that contain the specified attachments are processed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Action	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.FilterActions	The *Action* parameter specifies how the Attachment Filtering agent handles an attachment that matches an entry on the attachment filter list. The default value is `Reject`. You can use one of the following values: • `Reject` This value prevents both the email message and attachment from being delivered to the recipient and issues a non-delivery report (NDR) to the sender. • `Strip` This value removes the offending attachment from the email message and allows the message and other attachments that don't match an entry on the attachment filter list through. A notification that the attachment was removed is added to the

			email message. • `SilentDelete` This value prevents both the email message and the attachment from being delivered to the recipient. No notification that the email message and attachment were blocked is sent to the sender.
AdminMessage	Optional	System.String	The *AdminMessage* parameter specifies the content of a text file that replaces attachments removed by the Attachment Filtering agent. The *AdminMessage* parameter only appears when the Attachment Filtering agent is configured to remove an attachment that's been identified as bad.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExceptionConnectors	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptionConnectors* parameter specifies a list of connectors that should be excluded from attachment filtering. Attachment filters aren't applied to email messages received through these connectors. You must use the connector GUID to specify the *ExceptionConnectors* parameter value.
RejectResponse	Optional	System.String	The *RejectResponse*

			parameter specifies the message body that you want delivered in the NDR to senders whose messages contain an attachment that's blocked. The *RejectResponse* parameter is required only if you set the *Action* parameter to `Reject`. Don't exceed 240 characters in the parameter argument. When you pass an argument, you must enclose the *RejectResponse* parameter value in quotation marks (") if the phrase contains spaces, for example: "`Message rejected`". The default setting is `Message rejected due to unacceptable attachments`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ContentFilterConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ContentFilterConfig** cmdlet to view the content filter configuration for the computer on which the cmdlet is run.

```
Get-ContentFilterConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the content filter configuration for the computer on which the command is run.

```
Get-ContentFilterConfig | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ContentFilterConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ContentFilterConfig** cmdlet to modify the content filter configuration on a Mailbox server or an Edge Transport server.

```
Set-ContentFilterConfig [-BypassedRecipients <MultiValuedProperty>] [-
BypassedSenderDomains <MultiValuedProperty>] [-BypassedSenders
<MultiValuedProperty>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Enabled <$true | $false>] [-ExternalMailEnabled <$true |
$false>] [-InternalMailEnabled <$true | $false>] [-
OutlookEmailPostmarkValidationEnabled <$true | $false>] [-
QuarantineMailbox <SmtpAddress>] [-RejectionResponse <AsciiString>] [-
SCLDeleteEnabled <$true | $false>] [-SCLDeleteThreshold <Int32>] [-
SCLQuarantineEnabled <$true | $false>] [-SCLQuarantineThreshold <Int32>]
[-SCLRejectEnabled <$true | $false>] [-SCLRejectThreshold <Int32>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example specifies the sender domain woodgrovebank.com as a bypassed domain. Messages received from that domain bypass the Content Filter agent.

```
Set-ContentFilterConfig -BypassedSenderDomains
woodgrovebank.com
```

EXAMPLE 2

This example makes the following modifications to the Content Filter agent configuration:

- It enables and configures the SCL threshold functionalities that quarantine, reject, and delete messages to 5, 6, and 8 respectively.
- It specifies SpamQuarantineMailbox@contoso.com as the spam quarantine mailbox.
- It defines two users for whom the Content Filter won't process messages.

```
Set-ContentFilterConfig -SCLQuarantineEnabled $true -
```

```
SCLRejectEnabled $true -SCLDeleteEnabled $true -
SCLQuarantineThreshold 5 -SCLRejectThreshold 6 -
SCLDeleteThreshold 8 -QuarantineMailbox
SpamQuarantineMailbox@contoso.com -RejectionResponse
"Message rejected due to content restrictions" -
BypassedRecipients user1@contoso.com,user2@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
BypassedRecipients	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassedRecipients* parameter specifies the SMTP address values of recipients in your organization. The Content Filter agent doesn't process any content filtering for messages bound to the addresses listed on this parameter. To enter multiple SMTP addresses, separate the addresses by using a comma, for example: `recipient1@contoso.com,recipient2@contoso.com`. The maximum number of recipients you can input is 100.

BypassedSenderDomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassedSenderDomains* parameter specifies domain name values of sending domains. The Content Filter agent doesn't process any content filtering for messages received from the domains listed on this parameter. To enter multiple domains, separate the addresses by using a comma, for example: `contoso.com,example.com`. A wildcard character (*) can be used to specify all subdomains, for example: `*.contoso.com`. The maximum number of domains you can input is 100.
BypassedSenders	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassedSenders* parameter specifies the SMTP address values of senders. The Content Filter agent doesn't process any content filtering for messages

			received from the addresses listed on this parameter. To enter multiple SMTP addresses, separate the addresses by using a comma, for example: `sender1@contoso.com, sender2@example.com`. The maximum number of SMTP addresses you can input is 100.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController*

			parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disables the Content Filter agent on the computer on which you're running the command. Valid input for the *Enabled* parameter is `$true` or `$false`. The default setting is `$true`.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter specifies whether all messages from unauthenticated connections from sources external to your Exchange organization are passed through the Content Filter agent for processing. Valid input for the

			ExternalMailEnabled parameter is `$true` or `$false`. The default setting is `$true`. When the *ExternalMailEnabled* parameter is set to `$true`, all messages from unauthenticated connections are passed through the Content Filter agent for processing.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter specifies whether all messages from authenticated connections and from authoritative domains in your enterprise are passed through the Content Filter agent for processing. Valid input for the *InternalMailEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *InternalMailEnabled* parameter is set to

			`$true`, all messages from authenticated connections and from authoritative domains in your enterprise are passed through the Content Filter agent for processing.
OutlookEmailPostmarkValidationEnabled	Optional	System.Boolean	The *OutlookEmailPostmarkValidationEnabled* parameter specifies whether the Content Filter agent sends a computational puzzle to the sender's e-mail system for processing. Valid input for the *OutlookEmailPostmarkValidationEnabled* parameter is `$true` or `$false`. When the *OutlookEmailPostmarkValidationEnabled* parameter is set to `$true`, the Content Filter agent sends a computational puzzle to the sender's e-mail system for processing. The results of the puzzle validation are

			factored into the overall spam confidence level (SCL). This functionality is exposed to the Microsoft Outlook user as Office Outlook 2007 E-mail Postmark validation. The default setting is `$false`.
QuarantineMailbox	Optional	Microsoft.Exchange.Data.SmtpAddress	The *QuarantineMailbox* parameter specifies an SMTP address to be used as a spam quarantine mailbox. A spam quarantine mailbox is required when you set the *SCLQuarantineEnabled* parameter to `$true`. All messages that exceed the value set in the *SCLQuarantineThreshold* parameter are sent to the SMTP address that you set in this parameter.
RejectionResponse	Optional	Microsoft.Exchange.Data.AsciiString	The *RejectionResponse* parameter specifies the message body that you want delivered in the non-delivery report

			(NDR) to senders whose messages meet or exceed the *SCLRejectThreshold* value. The *RejectionResponse* parameter is required if you set the *SCLRejectEnabled* parameter to `$true`. The *RejectionResponse* parameter takes a string. Don't exceed 240 characters in the argument. When you pass an argument, you must enclose the *RejectionResponse* parameter in quotation marks (") if the phrase contains spaces, for example: `"Message rejected"`. The default setting is `Message rejected due to content restrictions`.
SCLDeleteEnabled	Optional	System.Boolean	The *SCLDeleteEnabled* parameter specifies whether all messages that exceed the value set in the *SCLDeleteThreshold* parameter are deleted.

			Valid input for the *SCLDeleteEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *SCLDeleteEnabled* parameter is set to `$true`, all messages that exceed the value set in the *SCLDeleteThreshold* parameter are deleted.
SCLDeleteThreshold	Optional	System.Int32	The *SCLDeleteThreshold* parameter specifies an integer value from 1 through 9. This value represents the SCL rating that a particular message must exceed for the Content Filter agent to delete the message and not send an NDR. To enable this functionality, you must set the *SCLDeleteEnabled* parameter to `$true`. The default setting is 9.
SCLQuarantineEnabled	Optional	System.Boolean	The *SCLQuarantineEnabled* parameter specifies

			whether all messages that exceed the value set in the *SCLQuarantineThreshold* parameter are sent to the spam quarantine mailbox specified in the *QuarantineMailbox* parameter. Valid input for the *SCLQuarantineEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *SCLQuarantineEnabled* parameter is set to `$true`, all messages that exceed the value set in the *SCLQuarantineThreshold* parameter are sent to the spam quarantine mailbox specified in the *QuarantineMailbox* parameter.
SCLQuarantineThreshold	Optional	System.Int32	The *SCLQuarantineThreshold* parameter specifies an integer value from 1 through 9. This value represents the SCL

			rating that a particular message must exceed for the Content Filter agent to quarantine the message. To enable quarantine functionality, you must set the *SCLQuarantineEnabled* parameter to `$true`, and provide a valid SMTP address in the *QuarantineMailbox* parameter. The default setting is 9.
SCLRejectEnabled	Optional	System.Boolean	The *SCLRejectEnabled* parameter specifies whether all messages that exceed the value set in the *SCLRejectThreshold* parameter are rejected, and an NDR is sent to the sender. Valid input for the *SCLRejectEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When *SCLRejectEnabled* parameter is set to

			`$true`, all messages that exceed the value set in the *SCLRejectThreshold* parameter are rejected, and an NDR is sent to the sender.
SCLRejectThreshold	Optional	System.Int32	The *SCLRejectThreshold* parameter specifies an integer value from 1 through 9. This value represents the SCL rating that a particular message must exceed for the Content Filter agent to reject the message and send an NDR to the sender. To enable the delete functionality, you must set the *SCLDeleteEnabled* parameter to `$true`. Also, you can revise the default NDR message by editing the *RejectionResponse* parameter. The default setting is 9.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-ContentFilterPhrase

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-ContentFilterPhrase** cmdlet to define custom words for the Content Filter agent. A *custom word* is a word or phrase that the administrator sets for the Content Filter agent to evaluate the content of an e-mail message and apply appropriate filter processing.

```
Add-ContentFilterPhrase -Influence <GoodWord | BadWord> -Phrase <String>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the phrase `Free credit report` to the Block phrase list. Any messages that contain this phrase will be marked as spam by the Content Filtering agent.

```
Add-ContentFilterPhrase -Phrase "Free credit report" -
Influence BadWord
```

Detailed Description

The **Add-ContentFilterPhrase** cmdlet adds phrases to the Allow or Block phrases list.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Influence	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.Influence	The *Influence* parameter specifies whether the phrase being added will cause the messages that contain the phrase to be allowed or blocked. Valid values are `GoodWord` and `BadWord`. A message that contains a custom word or phrase that has an *Influence* value of `GoodWord` is automatically assigned

			a spam confidence level (SCL) rating of `0` and therefore bypasses downstream spam processing. A message that contains a custom word or phrase that has an *Influence* value of `BadWord` is automatically assigned an SCL rating of `9` and therefore is treated as spam.
Phrase	Required	System.String	The *Phrase* parameter specifies a custom word or phrase for the Content Filter agent. When you pass an argument, you must enclose the *Phrase* parameter in quotation marks (") if the phrase contains spaces, for example: `"This is a bad phrase"`. Custom phrases must be less than 257 characters in length.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ContentFilterPhrase

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ContentFilterPhrase** cmdlet to view one or all custom words that the Content Filter agent processes.

```
Get-ContentFilterPhrase [-Phrase <ContentFilterPhraseIdParameter>] <COMMON
PARAMETERS>

Get-ContentFilterPhrase [-Identity <ContentFilterPhraseIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns all custom words stored on the computer where the command is being run.

```
Get-ContentFilterPhrase
```

EXAMPLE 2

This example returns a specific custom word specified by the *Phrase* parameter. In this example, the custom word is the phrase `Free credit report`.

```
Get-ContentFilterPhrase -Phrase "Free credit report"
```

EXAMPLE 3

This example returns all custom words and phrases that contain the words `free offer`.

```
Get-ContentFilterPhrase | Where {$_.Phrase -like '*free offer*'}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An

			Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ContentFilterPhraseIdParameter	The *Identity* parameter specifies a custom word or phrase to display. You must enclose the value of the *Identity* parameter in quotation marks ("). **Note:** The *Identity* and *Phrase* parameters are interchangeable.
Phrase	Optional	Microsoft.Exchange.Configuration.Tasks.ContentFilterPhraseIdParameter	The *Phrase* parameter specifies a custom word or phrase to display. You must enclose the value of the *Phrase* parameter in quotation marks ("). **Note:** The *Phrase* and *Identity* parameters are interchangeable.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ContentFilterPhrase

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ContentFilterPhrase** cmdlet to remove one or all custom words that the Content Filter agent processes.

```
Remove-ContentFilterPhrase [-Phrase <ContentFilterPhraseIdParameter>]
<COMMON PARAMETERS>

Remove-ContentFilterPhrase -Identity <ContentFilterPhraseIdParameter>
<COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the custom phrase Free credit report from the list of phrases that are filtered.

```
Remove-ContentFilterPhrase -Identity "Free credit report"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ContentFilterPhraseIdParameter	The *Identity* parameter specifies a custom word or phrase to remove. You must enclose the value of the *Identity* parameter in quotation marks ("). **Note:** For this command, the *Identity* parameter performs the same actions as the *Phrase* parameter. The *Identity* and *Phrase* parameters are interchangeable. You can't use the *Phrase* parameter if the *Identity* parameter is used.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Phrase	Optional	Microsoft.Exchange.Configuration.Tasks.ContentFilterPhraseIdParameter	The *Phrase* parameter specifies a custom word or phrase to remove. You must enclose the value of the *Phrase* parameter in quotation marks ("). **Note:** For this command, the *Phrase* parameter performs the same actions as the *Identity* parameter. The *Phrase* and *Identity* parameters are interchangeable. You can't use the *Identity* parameter if the *Phrase* parameter is used.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPAllowListConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPAllowListConfig** cmdlet to view the configuration information for the IP Allow list that's used by the Connection Filtering agent on Edge Transport servers.

```
Get-IPAllowListConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the IP Allow list configuration on the local Edge Transport server.

```
Get-IPAllowListConfig | Format-List
```

Detailed Description

On Edge Transport servers, the Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory

			Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IPAllowListConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-IPAllowListConfig** cmdlet to modify the IP Allow list configuration that's used by the Connection Filtering agent on Edge Transport servers.

```
Set-IPAllowListConfig [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Enabled <$true | $false>] [-ExternalMailEnabled <$true |
$false>] [-InternalMailEnabled <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures connection filtering to use the IP Allow list on messages that come from internal connections.

```
Set-IPAllowListConfig -InternalMailEnabled $true
```

Detailed Description

On Edge Transport servers, the Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge

			Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the IP Allow list is used for content filtering. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, the IP Allow list is used for content filtering.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter specifies whether messages from connections outside of the Exchange organization are evaluated by the IP Allow list. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, messages from external

			connections are evaluated by the IP Allow list.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter specifies whether messages from connections inside the Exchange organization are evaluated by the IP Allow list. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, messages from internal connections are not evaluated by the IP Allow list. Authenticated partner messages aren't considered internal mail.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-IPAllowListEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-12*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Add-IPAllowListEntry** cmdlet to add IP Allow list entries to the IP Allow list that's used by the Connection Filtering agent on Edge Transport servers.

```
Add-IPAllowListEntry -IPRange <IPRange> <COMMON PARAMETERS>

Add-IPAllowListEntry -IPAddress <IPAddress> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Comment <String>] [-Confirm [<SwitchParameter>]] [-
ExpirationTime <DateTime>] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the IP address 192.168.0.100 to the list of allowed IP addresses.

```
Add-IPAllowListEntry -IPAddress 192.168.0.100
```

EXAMPLE 2

This example adds the IP address range 192.168.0.1/24 to the list of allowed IP addresses and configures the IP Allow list entry to expire at 23:59 on January 3, 2013.

```
Add-IPAllowListEntry -IPRange 192.168.0.1/24 -
ExpirationTime "1/3/2013 23:59"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies a single IP address to add to the IP Allow list, for example, `192.168.0.1`.
IPRange	Required	Microsoft.Exchange.Data.IPRange	The *IPRange* parameter specifies a range of IP addresses to add to the IP Allow list. You can use the following formats: • **CIDR IP** `192.168.0.1/24` • **IP address range** `192.168.0.1-192.168.0.254`.
Comment	Optional	System.String	The *Comment* parameter

			specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: "`This is an admin note`".
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ExpirationTime	Optional	System.DateTime	The *ExpirationTime* parameter specifies a day and time when the IP Allow list entry that you're creating will expire. If you specify a time only, and you don't specify a date, the current day is assumed. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer

			is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPAllowListEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPAllowListEntry** cmdlet to view the IP address entries in the IP Allow list that's used by the Connection Filtering agent on Edge Transport servers.

```
Get-IPAllowListEntry -IPAddress <IPAddress> <COMMON PARAMETERS>
```

```
Get-IPAllowListEntry [-Identity <IPListEntryIdentity>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-ResultSize <Unlimited>] [-Server <ServerIdParameter>]
```

Examples

EXAMPLE 1

This example returns all entries in the IP Allow list on the local Edge Transport server.

```
Get-IPAllowListEntry
```

EXAMPLE 2

This example returns an IP Allow list entry in which the specified IP address is included.

```
Get-IPAllowListEntry -IPAddress 192.168.0.1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies an IP address to view in the IP Allow list entry or entries. For example, if you have an IP Allow list entry that specifies a range of IP addresses from 192.168.0.1 through 192.168.0.20, enter any IP address in the IP Allow list

			IP address range to return the IP Allow list entry.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.IPListEntryIdentity	The *Identity* parameter specifies the identity integer value of the IP Allow list entry that you want to view. When you add an entry to the IP Allow list, the *Identity* value is automatically assigned.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN

			If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-IPAllowListEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Remove-IPAllowListEntry** cmdlet to remove IP address entries from the IP Allow list that's used by the Connection Filtering agent on Edge Transport servers.

```
Remove-IPAllowListEntry -Identity <IPListEntryIdentity> [-Confirm
[<SwitchParameter>]] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the IP address 192.168.0.100 from the IP Allow list.

```
Get-IPAllowListEntry | Where {$_.IPRange -eq
'192.168.0.100'} | Remove-IPAllowListEntry
```

EXAMPLE 2

This example removes the IP address range 192.168.0.0/24 from the IP Allow list.

```
Get-IPAllowListEntry | Where {$_.IPRange -eq
'192.168.0.0/24'} | Remove-IPAllowListEntry
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPListEntryIdentity	The *Identity* parameter specifies the integer value of the IP Allow list entry that you want to remove. When you add an entry to the IP Allow list, the *Identity* value is automatically assigned. To find the *Identity* value of an IP Allow list entry, use the **Get-IPAllowListEntry** cmdlet.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that

			appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-IPAllowListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Add-IPAllowListProvider** cmdlet to create IP Allow list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Add-IPAllowListProvider -LookupDomain <SmtpDomain> -Name <String> [-
AnyMatch <$true | $false>] [-BitmaskMatch <IPAddress>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-IPAddressesMatch <MultiValuedProperty>] [-Priority <Int32>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds a new IP Allow list provider and configures connection filtering to treat any IP address status code returned from the IP Allow list provider as a match and allow the connection. You get the value for the *LookupDomain* parameter from the allow list provider.

```
Add-IPAllowListProvider -Name "Contoso.com Allow List" -
LookupDomain allowlist.contoso.com -AnyMatch $true
```

EXAMPLE 2

This example adds an IP Allow list provider and configures a bitmask return value from the provider. You get the values for the *LookupDomain* and *BitmaskMatch* parameters from the allow list provider.

```
Add-IPAllowListProvider -Name "Fabrikam.com Allow List" -
LookupDomain allowlist.fabrikam.com -BitmaskMatch 127.1.0.1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
LookupDomain	Required	Microsoft.Exchange.Data.SmtpDomain	The *LookupDomain* parameter specifies the host name that's required to use the allow list provider. Connection filtering sends the IP address of the connecting SMTP server to the host name value that you specify. An example value is

			`allowlist.spamservice.com`. The actual value you need to use is provided by the allow list provider.
Name	Required	System.String	The *Name* parameter specifies a descriptive name for the IP Allow list provider.
AnyMatch	Optional	System.Boolean	The *AnyMatch* parameter specifies whether any response by the allow list provider is treated as a match. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When this parameter is set to `$true`, and connection filtering sends the IP address of the connecting SMTP server to the allow list provider, any response code returned by the allow list provider causes connection filtering to allow messages from that source.
BitmaskMatch	Optional	System.Net.IPAddress	The *BitmaskMatch*

			parameter specifies the bit mask status code that's returned by the allow list provider. Use this parameter if the allow list provider returns bitmask responses. Valid input for this parameter is a single IP address in the format `127.0.0.1`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't

			supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the connection filtering uses this IP Allow List provider. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, connection filtering uses new IP Allow List providers that you create.
IPAddressesMatch	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *IPAddressesMatch* parameter specifies the IP address status codes that are returned by the allow list provider. Use this parameter if the allow list provider returns IP address or A record responses. Valid input for this parameter one or more IP addresses in the

			format `127.0.0.1`. You can enter multiple IP addresses separated by commas.
Priority	Optional	System.Int32	The *Priority* parameter specifies the order that the Connection Filtering agent queries the IP Allow list providers that you have configured. A lower priority integer value indicates a higher priority. By default, every time that you add a new IP Allow list provider, the entry is assigned a priority of *N* +1, where *N* is the number of IP Allow list providers that you have configured. If you set the *Priority* parameter to a value that's the same as another IP Allow list provider, the priority of the IP Allow list provider that you add first is incremented by 1.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPAllowListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPAllowListProvider** cmdlet to view IP Allow list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Get-IPAllowListProvider [-Identity <IPAllowListProviderIdParameter>] [-
```

```
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns a summary list of all IP Allow list providers.

```
Get-IPAllowListProvider
```

EXAMPLE 2

This example returns detailed information for the IP Allow list provider named Contoso.com.

```
Get-IPAllowListProvider Contoso.com | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active

			Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.IPAllowListProviderIdParameter	The *Identity* parameter specifies the IP Allow list provider that you want to view. You can use any value that uniquely identifies the IP Allow list provider. For example: • Name • Distinguished name (DN) • GUID

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-IPAllowListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Remove-IPAllowListProvider** cmdlet to remove IP Allow list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Remove-IPAllowListProvider -Identity <IPAllowListProviderIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the IP Allow list provider named Contoso.com.

```
Remove-IPAllowListProvider Contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPAllowListProviderIdParameter	The *Identity* parameter specifies the IP Allow list provider that you want to remove. You can use any value that uniquely identifies the IP Allow list provider. For example: • Name • Distinguished name (DN) • GUID
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that

			appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IPAllowListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-IPAllowListProvider** cmdlet to modify IP Allow list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Set-IPAllowListProvider -Identity <IPAllowListProviderIdParameter> [-
AnyMatch <$true | $false>] [-BitmaskMatch <IPAddress>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-IPAddressesMatch <MultiValuedProperty>] [-LookupDomain
<SmtpDomain>] [-Name <String>] [-Priority <Int32>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the IP Allow list provider named Contoso.com to allow connections from

an IP address if any IP address status codes are returned.

```
Set-IPAllowListProvider Contoso.com -AnyMatch $true
```

EXAMPLE 2

This example sets the priority to 1 for the existing IP Allow list provider named Contoso.com.

```
Set-IPAllowListProvider Contoso.com -Priority 1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPAllowListProviderIdParameter	The *Identity* parameter specifies the IP Allow list provider that you want to modify. You can use any value that uniquely identifies the IP Allow list provider. For example: • Name • Distinguished name (DN) • GUID
AnyMatch	Optional	System.Boolean	The *AnyMatch* parameter specifies whether any response by the allow list provider is treated as a match. Valid input for this parameter is `$true` or

			`$false`. The default value is `$false`. When this parameter is set to `$true`, and connection filtering sends the IP address of the connecting SMTP server to the allow list provider, any response code returned by the allow list provider causes connection filtering to allow messages from that source.
BitmaskMatch	Optional	System.Net.IPAddress	The *BitmaskMatch* parameter specifies the bit mask status code that's returned by the allow list provider. Use this parameter if the allow list provider returns bitmask responses. Valid input for this parameter is a single IP address in the format `127.0.0.1`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the Connection Filtering agent queries the IP Allow list provider according to the priority set for this IP Allow list provider configuration. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, the Connection

			Filtering agent queries the IP Allow list provider according to the priority set for this IP Allow list provider configuration.
IPAddressesMatch	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *IPAddressesMatch* parameter specifies the IP address status codes that are returned by the allow list provider. Use this parameter if the allow list provider returns IP address or A record responses. Valid input for this parameter one or more IP addresses in the format `127.0.0.1`. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing

			entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
LookupDomain	Optional	Microsoft.Exchange.Data.SmtpDomain	The *LookupDomain* parameter specifies the host name that's required to use the allow list provider. Connection filtering sends the IP address of the connecting SMTP server to the host name value that you specify. An example value is `allowlist.spamservice.com`. The actual value you need to use is provided by the allow list provider.
Name	Optional	System.String	The *Name* parameter specifies a descriptive name for the IP Allow list provider.
Priority	Optional	System.Int32	The *Priority* parameter specifies the order that the Connection Filtering agent queries the IP Allow list providers that you've configured. By default, every time that you add a new IP Allow list provider,

			the entry is assigned a priority of *N*+1, where *N* is the number of IP Allow list providers you've configured. If you set the *Priority* parameter to a value that's the same as another IP Allow list provider, the priority of the IP Allow list provider that you added first is incremented by 1.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-IPAllowListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Test-IPAllowListProvider** cmdlet to test IP Allow list providers on Edge Transport servers.

```
Test-IPAllowListProvider -Identity <IPAllowListProviderIdParameter> -
IPAddress <IPAddress> [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Server <ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the existing IP Allow list provider named Contoso,com by sending a lookup request to that provider for the IP address 192.168.0.1.

```
Test-IPAllowListProvider Contoso.com -IPAddress 192.168.0.1
```

Detailed Description

On Edge Transport servers, the **Test-IPAllowListProvider** cmdlet checks connectivity to the specified allow list provider and then issues a lookup request to the allow list provider.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPAllowListProviderIdPara	The *Identity* parameter specifies the IP Allow list provider that you want to

		meter	test. You can use any value that uniquely identifies the IP Allow list provider. For example: • Name • Distinguished name (DN) • GUID
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies an IP address to be used in testing the IP Allow list provider. You need to use a known allowed IP address.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

			The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPAllowListProvidersConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPAllowListProvidersConfig** cmdlet to view the settings that that affect all IP Allow list providers that are configured on an Edge Transport server.

```
Get-IPAllowListProvidersConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the IP Allow list providers configuration on the local Edge Transport server.

```
Get-IPAllowListProvidersConfig | Format-List
```

Detailed Description

On Edge Transport servers, IP Allow list providers are used by the Connection Filtering agent. The Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to

			read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IPAllowListProvidersConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-IPAllowListProvidersConfig** cmdlet to modify the settings that that affect all IP Allow list providers that are configured on an Edge Transport server.

```
Set-IPAllowListProvidersConfig [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-ExternalMailEnabled
<$true | $false>] [-InternalMailEnabled <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures connection filtering to use IP Allow list providers on messages that come from internal connections.

```
Set-IPAllowListProvidersConfig -InternalMailEnabled $true
```

Detailed Description

On Edge Transport servers, IP Allow list providers are used by the Connection Filtering agent. The Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An

			Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether IP Allow list providers are used for content filtering. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. The default value is `$true`. By default, IP Allow list providers are used for content filtering.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter specifies whether messages from connections outside of the Exchange organization are evaluated by IP Allow list providers. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, messages from

			external connections are evaluated by IP Allow list providers.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter specifies whether messages from connections inside the Exchange organization are evaluated by IP Allow list providers. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, messages from internal connections are not evaluated by IP Allow list providers. Authenticated partner messages aren't considered internal mail.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPBlockListConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPBlockListConfig** cmdlet to view the IP Block list configuration information that's used by the Connection Filtering agent on Edge Transport servers.

```
Get-IPBlockListConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the IP Block list configuration on the local Edge Transport server.

```
Get-IPBlockListConfig | Format-List
```

Detailed Description

On Edge Transport servers, the Connection Filtering agent acts on the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

Set-IPBlockListConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-IPBlockListConfig** cmdlet to modify the IP Block list configuration that's used by the Connection Filtering agent on Edge Transport servers.

```
Set-IPBlockListConfig [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Enabled <$true | $false>] [-ExternalMailEnabled <$true |
$false>] [-InternalMailEnabled <$true | $false>] [-
MachineEntryRejectionResponse <AsciiString>] [-
StaticEntryRejectionResponse <AsciiString>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures connection filtering to use the IP Block list on messages that come from internal connections.

```
Set-IPBlockListConfig -InternalMailEnabled $true
```

Detailed Description

On Edge Transport servers, the Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the IP Block list is used for content filtering. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, the IP Block list is used for content filtering.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter specifies whether messages from connections outside of the Exchange organization are evaluated by the IP Block list. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, messages from external connections are evaluated by the IP Block list.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter specifies whether messages

			from connections inside the Exchange organization are evaluated by the IP Block list. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, messages from internal connections are not evaluated by the IP Block list. Authenticated partner messages aren't considered internal mail.
MachineEntryRejectionResponse	Optional	Microsoft.Exchange.Data.AsciiString	The *MachineEntryRejectionResponse* parameter specifies customized text in the non-delivery report (NDR) for messages that are blocked by connection filtering due to IP addresses in the IP Block list that were added by sender reputation. The value can't exceed 240 characters. If the value contains spaces,

			enclose the value in double quotation marks (").
StaticEntryRejectionResponse	Optional	Microsoft.Exchange.Data.AsciiString	The *StaticEntryRejectionResponse* parameter specifies a customized text in the NDR for messages that are blocked by connection filtering due to IP addresses in the IP Block list. The value can't exceed 240 characters. If the value contains spaces, enclose the value in double quotation marks (").
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-IPBlockListEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-12*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Add-IPBlockListEntry** cmdlet to add IP Block list entries to the IP Block list that's used by the Connection Filtering agent on Edge Transport servers.

```
Add-IPBlockListEntry -IPRange <IPRange> <COMMON PARAMETERS>

Add-IPBlockListEntry -IPAddress <IPAddress> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Comment <String>] [-Confirm [<SwitchParameter>]] [-
ExpirationTime <DateTime>] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the IP address 192.168.0.100 to the list of blocked IP addresses.

```
Add-IPBlockListEntry -IPAddress 192.168.0.100
```

EXAMPLE 2

This example adds the IP address range 192.168.0.1/24 to the list of blocked IP addresses and

configures the IP Block list entry to expire at 23:59 on January 3, 2013.

```
Add-IPBlockListEntry -IPRange 192.168.0.1/24 -
ExpirationTime "1/3/2013 23:59"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies a single IP address to add to the IP Block list, for example, `192.168.0.1`.
IPRange	Required	Microsoft.Exchange.Data.IPRange	The *IPRange* parameter specifies a range of IP addresses to add to the IP Block list. You can use the following formats: • **CIDR IP** `192.168.0.1/24` • **IP address range** `192.168.0.1-192.168.0.254`.
Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for

			example: "`This is an admin note`".
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ExpirationTime	Optional	System.DateTime	The *ExpirationTime* parameter specifies a day and time when the IP Block list entry that you're creating will expire. If you specify a time only, and you don't specify a date, the current day is assumed. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date

			only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPBlockListEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-12*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPBlockListEntry** cmdlet to view the IP Block list entries that are used by the Connection Filtering agent on Edge Transport servers.

```
Get-IPBlockListEntry -IPAddress <IPAddress> <COMMON PARAMETERS>

Get-IPBlockListEntry [-Identity <IPListEntryIdentity>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-ResultSize <Unlimited>] [-Server <ServerIdParameter>]
```

Examples

EXAMPLE 1

This example returns a list of all IP address entries in the IP Block list.

```
Get-IPBlockListEntry
```

EXAMPLE 2

This example returns machine-generated entries in the IP Block list that are inserted by sender reputation.

```
Get-IPBlockListEntry | where {$_.IsMachineGenerated}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies an IP address to view in the IP Block list entry or entries. For example, if you have an IP Block list entry that specifies a range of IP addresses from 192.168.0.1 through 192.168.0.20, enter any IP address in the IP Block list IP address range to return the IP Block list entry.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.IPListEntryIdentity	The *Identity* parameter specifies the identity integer value of the IP Block list entry that you want to view. When you add an entry to the IP Block list, the *Identity* value is automatically assigned.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command

			is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-IPBlockListEntry

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-01-12*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Remove-IPBlockListEntry** cmdlet to remove IP block list entries that are used by the Connection Filtering agent on Edge Transport servers.

```
Remove-IPBlocklistEntry -Identity <IPListEntryIdentity> [-Confirm
[<SwitchParameter>]] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the IP address 192.168.0.100 from the IP Block list.

```
Get-IPBlockListEntry | Where {$_.IPRange -eq
'192.168.0.100'} | Remove-IPBlockListEntry
```

EXAMPLE 2

This example removes the IP address range 192.168.0.0/24 from the IP Block list.

```
Get-IPBlockListEntry | Where {$_.IPRange -eq
'192.168.0.0/24'} | Remove-IPBlockListEntry
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPListEntryIdentity	The *Identity* parameter specifies the integer value of the IP Block list entry that you want to remove. When you add an entry to the IP Block list, the *Identity* value is automatically assigned. To find the *Identity* value of an IP Block list entry, use the **Get-IPBlockListEntry** cmdlet.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To

			suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can't use this command to configure other Edge Transport servers remotely.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-IPBlockListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Add-IPBlockListProvider** cmdlet to create IP Block list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Add-IPBlockListProvider -LookupDomain <SmtpDomain> -Name <String> [-
AnyMatch <$true | $false>] [-BitmaskMatch <IPAddress>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-IPAddressesMatch <MultiValuedProperty>] [-Priority <Int32>] [-
RejectionResponse <AsciiString>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds an IP Block list provider and sets a rejection response. You get the value for the *LookupDomain* parameter from the block list provider.

```
Add-IPBlockListProvider -Name "Contoso.com Block List" -
LookupDomain blocklist.contoso.com -RejectionResponse
"Source IP address is listed at the Contoso.com block list
provider"
```

EXAMPLE 2

This example adds an IP Block list provider and configures a bitmask return value from the provider. You get the values for the *LookupDomain* and *BitmaskMatch* parameters from the block list provider.

```
Add-IPBlockListProvider -Name "Fabrikam.com Block List" -
LookupDomain blocklist.fabrikam.com -BitmaskMatch 127.1.0.1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
LookupDomain	Required	Microsoft.Exchange.Data.SmtpDomain	The *LookupDomain* parameter specifies the host name that's required to use the block list provider. Connection filtering sends the IP address of the connecting SMTP server to the host name value that you specify. An example value is `blocklist.spamservice.com`. The actual value you need to use is

			provided by the block list provider.
Name	Required	System.String	The *Name* parameter specifies a descriptive name for the IP Block list provider.
AnyMatch	Optional	System.Boolean	The *AnyMatch* parameter specifies whether any response by the block list provider is treated as a match. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When this parameter is set to `$true`, and connection filtering sends the IP address of the connecting SMTP server to the block list provider, any response code returned by the block list provider causes connection filtering to block messages from that source.
BitmaskMatch	Optional	System.Net.IPAddress	The *BitmaskMatch* parameter specifies the bit mask status code

			that's returned by the block list provider. Use this parameter if the block list provider returns bitmask responses. Valid input for this parameter is a single IP address in the format `127.0.0.1`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An

			Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the connection filtering uses this IP Block list provider. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, connection filtering uses new IP Block List providers that you create.
IPAddressesMatch	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *IPAddressesMatch* parameter specifies the IP address status codes that are returned by the block list provider. Use this parameter if the block list provider returns IP address or A record responses. Valid input for this parameter one or more IP addresses in the format `127.0.0.1`. You can enter multiple IP

			addresses separated by commas.
Priority	Optional	System.Int32	The *Priority* parameter specifies the order that the Connection Filtering agent queries the IP Block list providers. A lower priority integer value indicates a higher priority. By default, every time that you add a new IP Block list provider, the entry is assigned a priority of *N* +1, where *N* is the number of IP Block list provider services that you have configured. If you set the *Priority* parameter to a value that's the same as another IP Block list provider service, the priority of the IP Block list provider that you add first is incremented by 1.
RejectionResponse	Optional	Microsoft.Exchange.Data.AsciiString	The *RejectionResponse* parameter specifies the text that you want to include in the SMTP

			rejection response when messages are blocked by connection filtering. The argument can't exceed 240 characters. If the value contains spaces, enclose the value in quotation marks ("). You should always specify the block list provider in the response so that legitimate senders can contact the block list provider for removal instructions. For example, `"Source IP address is listed at the Contoso.com block list provider"`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPBlockListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPBlockListProvider** cmdlet to view IP Block list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Get-IPBlockListProvider [-Identity <IPBlockListProviderIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns a summary list of all IP Block list providers configured on the local Edge Transport server.

```
Get-IPBlockListProvider
```

EXAMPLE 2

This example returns detailed information for the existing IP Block list provider named Contoso.com.

```
Get-IPBlockListProvider -Identity Contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.IPBlockListProviderIdParameter	The *Identity* parameter specifies the IP Block list provider that you want to view. You can use any value that uniquely

			identifies the IP Block list provider. For example: • Name • Distinguished name (DN) • GUID

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-IPBlockListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Remove-IPBlockListProvider** cmdlet to remove IP Block list providers that are used by the Connection Filtering agent on Edge Transport server.

```
Remove-IPBlockListProvider -Identity <IPBlockListProviderIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the IP Block list provider named Contoso.com.

```
Remove-IPBlockListProvider Contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPBlockListProviderIdParameter	The *Identity* parameter specifies the IP Block list provider that you want to remove. You can use any value that uniquely identifies the IP Block list provider. For example: • Name • Distinguished name (DN) • GUID
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Da	The *DomainController* parameter specifies the

		ta.Fqdn	fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IPBlockListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-IPBlockListProvider** cmdlet to modify IP Block list providers that are used by the Connection Filtering agent on Edge Transport servers.

```
Set-IPBlockListProvider -Identity <IPBlockListProviderIdParameter> [-
AnyMatch <$true | $false>] [-BitmaskMatch <IPAddress>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-IPAddressesMatch <MultiValuedProperty>] [-LookupDomain
<SmtpDomain>] [-Name <String>] [-Priority <Int32>] [-RejectionResponse
<AsciiString>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures connection filtering to block an IP address if any IP address status codes are returned by the IP Block list provider named Contoso.com.

```
Set-IPBlockListProvider Contoso.com -AnyMatch $true
```

EXAMPLE 2

This example sets the priority value to 1 for the IP Block list provider named Contoso.com.

```
Set-IPBlockListProvider Contoso.com -Priority 1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPBlockListProviderIdParameter	The *Identity* parameter specifies the IP Block list provider that you want to modify. You can use any value that uniquely identifies the IP Block list provider. For example: • Name • Distinguished name (DN) • GUID
AnyMatch	Optional	System.Boolean	The *AnyMatch* parameter specifies whether any response by the block list provider is treated as a match. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When this parameter is set to `$true`, and connection filtering sends the IP address of the connecting SMTP server to the block list provider, any response code returned by the block list provider causes

			connection filtering to block messages from that source.
BitmaskMatch	Optional	System.Net.IPAddress	The *BitmaskMatch* parameter specifies the bit mask status code that's returned by the block list provider. Use this parameter if the block list provider returns bitmask responses. Valid input for this parameter is a single IP address in the format `127.0.0.1`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

			The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the connection filtering uses this IP Block list provider. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, connection filtering uses new IP Block list providers that you create.
IPAddressesMatch	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *IPAddressesMatch* parameter specifies the IP address status codes that are returned by the block list provider. Use this parameter if the block list provider returns IP address or A record responses. Valid input for this parameter one or more IP addresses in the

			format `127.0.0.1`. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
LookupDomain	Optional	Microsoft.Exchange.Data.SmtpDomain	The *LookupDomain* parameter specifies the host name that's required to use the block list provider. Connection filtering sends the IP address of the connecting SMTP server to the host name value that you specify. An example value is `blocklist.spamservice.`

			com. The actual value you need to use is provided by the block list provider.
Name	Optional	System.String	The *Name* parameter specifies a descriptive name for the IP Block list provider.
Priority	Optional	System.Int32	The *Priority* parameter specifies the order that the Connection Filtering agent queries the IP Block list providers. A lower priority integer value indicates a higher priority. By default, every time that you add a new IP Block list provider, the entry is assigned a priority of *N* +1, where *N* is the number of IP Block list provider services that you have configured. If you set the *Priority* parameter to a value that's the same as another IP Block list provider service, the priority of the IP Block list provider that you add first is incremented by 1.
RejectionResponse	Optional	Microsoft.Exchange.Da	The *RejectionResponse*

		ta.AsciiString	parameter specifies the text that you want to include in the SMTP rejection response when messages are blocked by connection filtering. The argument can't exceed 240 characters. If the value contains spaces, enclose the value in quotation marks ("). You should always specify the block list provider in the response so that legitimate senders can contact the block list provider for removal instructions. For example, `"Source IP address is listed at the Contoso.com block list provider"`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-IPBlockListProvider

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Test-IPBlockListProvider** cmdlet to test IP Block list providers on Edge Transport servers.

```
Test-IPBlockListProvider -Identity <IPBlockListProviderIdParameter> -
IPAddress <IPAddress> [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Server <ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the existing IP Block list provider named Contoso,com by sending a lookup request to that provider for the IP address 192.168.0.1.

```
Test-IPBlockListProvider Contoso.com -IPAddress 192.168.0.1
```

Detailed Description

On Edge Transport servers, the **Test-IPBlockListProvider** cmdlet checks connectivity to the specified block list provider and then issues a lookup request to the block list provider.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IPBlockListProviderIdParameter	The *Identity* parameter specifies the IP Block list provider that you want to test. You can use any value that uniquely identifies the IP Block list provider. For example: • Name • Distinguished name (DN) • GUID
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies an IP address to be used in testing the IP Block list provider. You need to use a known blocked IP address.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command

			is run on the local server. You can't use this parameter to configure other Edge Transport servers remotely.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IPBlockListProvidersConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-IPBlockListProvidersConfig** cmdlet to view the settings that that affect all IP Block list providers that are configured on an Edge Transport server.

```
Get-IPBlockListProvidersConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the IP Block list providers on the local Edge Transport server.

```
Get-IPBlockListProvidersConfig | Format-List
```

Detailed Description

On Edge Transport servers, IP Block list providers are used by the Connection Filtering agent. The Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController*

			parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IPBlockListProvidersConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-IPBlockListProvidersConfig** cmdlet to modify the settings that affect all IP Block list providers that are configured on an Edge Transport server.

```
Set-IPBlockListProvidersConfig [-BypassedRecipients <MultiValuedProperty>]
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true
| $false>] [-ExternalMailEnabled <$true | $false>] [-InternalMailEnabled
<$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures connection filtering to use IP Block list providers on messages that come from internal connections, but bypasses filtering for email messages sent to kweku@contoso.com.

```
Set-IPBlockListProvidersConfig -InternalMailEnabled $true -
BypassedRecipients kweku@contoso.com
```

EXAMPLE 2

This example makes the following changes to the list of bypassed recipients:

- Adds the values chris@contoso.com and michelle@contoso.com
- Removes the values laura@contoso.com and julia@contoso.com

```
Set-IPBlockListProvidersConfig -BypassedRecipients
@{Add="chris@contoso.com","michelle@contoso.com";
Remove="laura@contoso.com","julia@contoso.com"}
```

Detailed Description

On Edge Transport servers, IP Block list providers are used by the Connection Filtering agent. The Connection Filtering agent acts on the IP address of the incoming SMTP connection to determine what action, if any, to take on an incoming message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features - Edge Transport" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
BypassedRecipients	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassedRecipients* parameter specifies the email addresses of internal recipients that are exempted from filtering by IP Block list

			providers. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...` If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether IP Block list providers are used for content filtering. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. The default value is `$true`. By default, IP Block list providers are used for content filtering.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled*

			parameter specifies whether messages from connections outside of the Exchange organization are evaluated by IP Block list providers. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, messages from external connections are evaluated by IP Bock list providers.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter specifies whether messages from connections inside the Exchange organization are evaluated by IP Block list providers. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, messages from internal connections are not evaluated by IP Block list providers.

			Authenticated partner messages aren't considered internal mail.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxJunkEmailConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MaillboxJunkEmailConfiguration** cmdlet to view the junk email rule configuration for specific mailboxes.

```
Get-MailboxJunkEmailConfiguration -Identity <MailboxIdParameter> [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example displays the junk email rule configuration for the user named David Pelton.

```
Get-MailboxJunkEmailConfiguration "David Pelton"
```

EXAMPLE 2

This example displays the junk email rule configuration for all mailboxes in your organization that have the junk email rule enabled.

```
Get-MailboxJunkEmailConfiguration -Identity * | Where
{$_.Enabled -eq $true}
```

Detailed Description

The junk email rule helps Microsoft Outlook and Outlook Web App users to automatically remove any spam that gets past anti-spam filters and reaches their mailboxes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox junk email configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. This parameter accepts

			the following values: • Alias Example: JPhillips • Canonical DN Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • Display Name Example: Jeff Phillips • Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • Domain\Account Example: Atlanta\JPhillips • GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com You can use the wildcard character (*) to view the junk email rule

			configuration for multiple mailboxes.
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* switch specifies that information should be read from a domain controller in the user's domain. If you run the

			command `Set-AdServerSettings -ViewEntireForest $true` to include all objects in the forest and you don't use the *ReadFromDomainController* switch, it's possible that information will be read from a global catalog that has outdated information. When you use the *ReadFromDomainController* switch, multiple reads might be necessary to get the information. You don't have to specify a value with this switch. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxJunkEmailConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxJunkEmailConfiguration** cmdlet to configure the junk email rule for specific mailboxes.

```
Set-MailboxJunkEmailConfiguration -Identity <MailboxIdParameter> [-
BlockedSendersAndDomains <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-ContactsTrusted <$true | $false>] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-IgnoreDefaultScope
<SwitchParameter>] [-TrustedListsOnly <$true | $false>] [-
TrustedSendersAndDomains <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the junk email rule configuration for the user named David Pelton.

```
Set-MailboxJunkEmailConfiguration "David Pelton" -Enabled
$false
```

EXAMPLE 2

This example makes the following configuration changes to the junk email rule for the user named

Michele Martin:

- Adds `contoso.com` and `fabrikam.com` as trusted domains without affecting any existing trusted domain entries.
- Adds `jane@fourthcoffee.com` as a blocked sender without affecting any existing blocked sender entries.

```
Set-MailboxJunkEmailConfiguration "Michele Martin" -
TrustedSendersAndDomains
@{Add="contoso.com","fabrikam.com"} -
BlockedSendersAndDomains @{Add="jane@fourthcoffee.com"}
```

EXAMPLE 3

This example identifies any mailboxes for which the junk email rule is configured to treat contacts as trusted senders and then changes the junk email configuration to not treat contacts as trusted senders.

```
Get-MailboxJunkEmailConfiguration * | Where
{$_.ContactsTrusted -eq $true} | Set-
MailboxJunkEmailConfiguration -ContactsTrusted $false
```

Detailed Description

The junk email rule helps Microsoft Outlook and Outlook Web App users to automatically remove any spam that gets past anti-spam filters and reaches the users' mailboxes. With this cmdlet, users and administrators can make changes to the junk email rule that's configured for a specific mailbox.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox junk email configuration" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter identifies the mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips

			• Canonical DN Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • Display Name Example: Jeff Phillips • Distinguished Name (DN) Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • Domain\Account Example: Atlanta\JPhillips • GUID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • Immutable ID Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • Legacy Exchange DN Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • SMTP Address Example: Jeff.Phillips@contoso.com • User Principal Name Example: JPhillips@contoso.com
BlockedSendersAndDomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedSendersAndDomains* parameter specifies a list of the individual senders and domains that are blocked by the junk

			email rule. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContactsTrusted	Optional	System.Boolean	The *ContactsTrusted*

			parameter specifies whether the contacts in the Contacts folder are treated as trusted senders. Valid input for this parameter is `$true` or `$false`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disables the junk email rule on this mailbox. Valid input for this parameter is `$true` or `$false`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire

			forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
TrustedListsOnly	Optional	System.Boolean	The *TrustedListsOnly* parameter specifies that only messages from trusted senders and domains are allowed to be sent to the mailbox. All other messages are considered spam by the junk email rule. Valid input for this parameter is `$true` or `$false`.

TrustedSendersAndDomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *TrustedSendersAndDomains* parameter specifies a list of the individual senders and domains that are considered trusted senders. Messages from these senders and domains aren't processed by the junk email rule. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it

			would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MalwareFilteringServer

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MalwareFilteringServer** cmdlet to view the Malware agent settings in the Transport service on a Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MalwareFilteringServer [-Identity <MalwareFilteringServerIdParameter>]
[-DomainController <Fqdn>]
```

Examples

Example 1

This example displays a summary of the Exchange Malware agent settings on all Mailbox servers in your organization.

```
Get-MalwareFilteringServer
```

Example 2

This example returns the detailed Exchange Malware agent settings on a Mailbox server named Mailbox01.

```
Get-MalwareFilteringServer Mailbox01 | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight

			Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MalwareFilteringServerIdParameter	The *Identity* parameter specifies the server where you want to view the anti-malware settings. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MalwareFilteringServer

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MalwareFilteringServer** cmdlet to configure the Malware agent settings in the Transport service on a Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MalwareFilteringServer -Identity <MalwareFilteringServerIdParameter>
[-BypassFiltering <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DeferAttempts <Int32>] [-DeferWaitTime <Int32>] [-DomainController <Fqdn>]
[-ForceRescan <$true | $false>] [-MinimumSuccessfulEngineScans <Int32>] [-
PrimaryUpdatePath <String>] [-ScanErrorAction <Block | Allow>] [-
ScanTimeout <Int32>] [-SecondaryUpdatePath <String>] [-UpdateFrequency
<Int32>] [-UpdateTimeout <Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example sets the following Malware agent settings on the Mailbox server named Mailbox01:

- Sets the update frequency interval to 2 hours
- Sets the time to wait between resubmit attempts to 10 minutes

```
Set-MalwareFilteringServer Mailbox01 -UpdateFrequency 120 -
DeferWaitTime 10
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MalwareFilteringServerIdParameter	The *Identity* parameter specifies the server where you want to configure the anti-malware settings. You can use any value that uniquely identifies the server. For example: • Name • FQDN

			• Distinguished name (DN) • Exchange Legacy DN
BypassFiltering	Optional	System.Boolean	The *BypassFiltering* parameter temporarily bypasses malware filtering without disabling the Malware agent on the server. The Malware agent is still active, and the agent is still called for every message, but no malware filtering is actually performed. This allows you to temporarily disable and then enable malware filtering on the server without disrupting mail flow by restarting the Microsoft Exchange Transport service. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
DeferAttempts	Optional	System.Int32	The *DeferAttempts* parameter specifies the maximum number of times to defer a message that can't be scanned by the Malware agent. Valid input for this parameter is an integer between 1 and 5. The default value is 3. After the maximum number of deferrals is reached, the action taken by the Malware agent depends on the error. For scan timeouts and engine errors, the action is to fail the message and return a non-delivery report (NDR) to the sender immediately after the last defer attempt. For all other errors, the message is retried for up to 48 hours, with each retry attempt taking place one hour longer than the last one. For example, starting after the last defer attempt, the first retry attempt will occur in 1 hour, the next

			retry attempt will occur 2 hours after that, the next retry attempt will occur 3 hours after the second retry attempt, and so on for up to 48 hours. After 48 hours have elapsed, the action is to fail the message and return a non-delivery report (NDR) to the sender.
DeferWaitTime	Optional	System.Int32	The *DeferWaitTime* parameter specifies the time period in minutes to increase the interval to resubmit messages for malware filtering in an effort to reduce the workload on the server. For example, the first retry after the original failed scan occurs after the interval specified by the *DeferWaitTime* parameter. The second retry after the first retry occurs after two times the value of the *DeferWaitTime* parameter. The third retry after the second retry occurs after three times

			the value of the *DeferWaitTime* parameter, and so on. The maximum number of retries is controlled by the *DeferAttempts* parameter. Valid input for this parameter is an integer between 0 and 15. The default value is 5. This means the first resubmit occurs 5 minutes after the original failed scan, the second retry occurs 10 minutes after the first retry, the third retry occurs 15 minutes after the second retry, and so on. The value 0 means messages are resubmitted for malware filtering after any failed scanning attempts without any delay.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ForceRescan	Optional	System.Boolean	The *ForceRescan* parameter specifies that messages should be scanned by the malware agent, even if the message was already scanned by Exchange Online Protection. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
MinimumSuccessfulEngineScans	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
PrimaryUpdatePath	Optional	System.String	The *PrimaryUpdatePath* parameter specifies where to download malware scanning engine updates. The default value is http://forefrontdl.microsoft.com/server/scanengineupdate.

			The location specified by the *PrimaryUpdatePath* parameter is always tried first.
ScanErrorAction	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MalwareScanErrorAction	The *ScanErrorAction* parameter specifies the action to take when a message can't be scanned by the malware filter. Valid values for this parameter are `Block` or `Allow`. The default value is `Block`.
ScanTimeout	Optional	System.Int32	The *ScanTimeout* parameter specifies the timeout interval in seconds for messages that can't be scanned by the malware filter. Valid input for this parameter is an integer between 10 and 900. The default value is 300 (5 minutes).
SecondaryUpdatePath	Optional	System.String	The *SecondaryUpdatePath* parameter specifies an alternate download location for malware scanning engine updates. The default values is blank ($null). This means no alternate download

			location is specified. The alternate download location is used when the location specified by the *PrimaryUpdatePath* parameter is unavailable for the time period specified by the *UpdateTimeout* parameter. On the next malware scanning engine update, the location specified by the *PrimaryUpdate* path parameter is tried first.
UpdateFrequency	Optional	System.Int32	The *UpdateFrequency* parameter specifies the frequency interval in minutes to check for malware scanning engine updates. Valid input for this parameter is an integer between 1 and 38880 (27 days). The default value is 60 (one hour). The locations to check for updates are specified by the *PrimaryUpdatePath* and *SecondaryUpdatePath* parameters.
UpdateTimeout	Optional	System.Int32	The *UpdateTimeout*

			parameter specifies the timeout interval in seconds to use when checking for malware scanning engine updates. Valid input for this parameter is an integer between 60 and 300. The default value is 150 seconds (2.5 minutes). If the location specified by the *PrimaryUpdatePath* parameter is unavailable for the time period specified by the *UpdateTimeout* parameter value, the location specified by the *SecondaryUpdatePath* parameter is used.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MalwareFilterPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the *Get-MalwareFilterPolicy* cmdlet to view the malware filter policies in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MalwareFilterPolicy [-Identity <MalwareFilterPolicyIdParameter>] [-
DomainController <Fqdn>] [-IgnoreDehydratedFlag <SwitchParameter>] [-
IncludeInvalidPolicies <SwitchParameter>] [-Organization
<OrganizationIdParameter>]
```

Examples

Example 1

This example retrieves a summary list of all malware filter policies in your organization.

```
Get-MalwareFilterPolicy
```

Example 2

This example retrieves detailed configuration information for the malware filter policy named Default.

```
Get-MalwareFilterPolicy Default | Format-List
```

Detailed Description

Malware filter policies contain the malware settings and a list of domains to which those settings apply. A domain can't belong to more than one malware filter policy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MalwareFilterPolicyIdParameter	The *Identity* parameter specifies the malware filter policy that you want to view. You can use any value that uniquely identifies the policy. For example, you can use the name, GUID or distinguished name (DN) of the malware filter policy.

IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
IncludeInvalidPolicies	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MalwareFilterPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the *New-MalwareFilterPolicy* cmdlet to create malware filter policies in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MalwareFilterPolicy -Name <String> [-Action <DeleteMessage |
DeleteAttachmentAndUseDefaultAlertText |
DeleteAttachmentAndUseCustomAlertText>] [-AdminDisplayName <String>] [-
```

```
BypassInboundMessages <$true | $false>] [-BypassOutboundMessages <$true |
$false>] [-Confirm [<SwitchParameter>]] [-CustomAlertText <String>] [-
CustomExternalBody <String>] [-CustomExternalSubject <String>] [-
CustomFromAddress <SmtpAddress>] [-CustomFromName <String>] [-
CustomInternalBody <String>] [-CustomInternalSubject <String>] [-
CustomNotifications <$true | $false>] [-DomainController <Fqdn>] [-
EnableExternalSenderAdminNotifications <$true | $false>] [-
EnableExternalSenderNotifications <$true | $false>] [-
EnableInternalSenderAdminNotifications <$true | $false>] [-
EnableInternalSenderNotifications <$true | $false>] [-
ExternalSenderAdminAddress <SmtpAddress>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-InternalSenderAdminAddress <SmtpAddress>] [-
Organization <OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a new malware filter policy named Contoso Malware Filter Policy with the following settings:

- Block messages that contain malware.
- Don't notify the message sender when malware is detected in the message.
- Notify the administrator admin@contoso.com when malware is detected in a message from an internal sender.

```
New-MalwareFilterPolicy -Name "Contoso Malware Filter
Policy" -EnableInternalSenderAdminNotifications $true -
InternalSenderAdminAddress admin@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies a name for the malware filter policy. If the value contains spaces, enclose the value in quotation marks (").

Action	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MalwareFilteringAction	The *Action* parameter specifies the action to take when malware is detected in a message. Valid values for this parameter are: • `BlockMessage`: blocks the message when malware is detected. • `ReplaceWithDefaultAlert`: delivers the message, but replaces the message contents with the default alert text when malware is detected. • `ReplaceWithCustomAlert`: delivers the message, but replaces the message contents with the custom alert text specified by the *AlertText* parameter when malware is detected. The default value is `BlockMessage`.
AdminDisplayName	Optional	System.String	The *AdminDisplayName* parameter specifies a description for the malware filter policy. If the value contains spaces, enclose the value in quotation marks (").
BypassInboundMessages	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013.

			The *BypassInboundMessages* parameter skips or enforces malware scanning on incoming messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. This means malware scanning occurs on incoming messages by default.
BypassOutboundMessages	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *BypassOutboundMessages* parameter skips or enforces malware scanning on outgoing messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. This means malware scanning occurs on outgoing messages by default.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CustomAlertText	Optional	System.String	The *CustomAlertText* parameter specifies the custom alert text to insert in the message when malware is detected and the value of the *Action* parameter is set to `ReplaceWithCustomAlert`. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomExternalBody	Optional	System.String	The *CustomExternalBody* parameter specifies the body of the custom notification message that's sent to an external sender when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomExternalSubject	Optional	System.String	The *CustomExternalSubject* parameter specifies the

			subject of the custom notification message that's sent to an external sender when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomFromAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *CustomFromAddress* parameter specifies the From address of the custom notification message that's sent to an internal or external sender when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomFromName	Optional	System.String	The *CustomExternalFromName* parameter specifies the From name of the custom notification message that's sent to internal or external senders when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.

CustomInternalBody	Optional	System.String	The *CustomInternalBody* parameter specifies the body of the custom notification message that's sent to an internal sender when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomInternalSubject	Optional	System.String	The *CustomInternalSubject* parameter specifies the subject of the custom notification message that's sent to an internal sender when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomNotifications	Optional	System.Boolean	The *CustomNotifications* parameter enables or disables the custom notification message to the sender when the message contains malware. Valid input for this parameter is `$true` or `$false`. The default value

			is `$false`. If you enable custom notification messages by setting this parameter to `$true`, you specify the details of the custom notification message using the *CustomFromAddress* ,*CustomFromName*, *CustomExternalSubject*, *CustomExternalBody*, *CustomInternalSubject*, and *CustomInternalBody* parameters.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnableExternalSenderAdminNotifications	Optional	System.Boolean	The *EnableExternalSenderAdminNotifications* parameter enables or disables sending notification messages to

			an administrator when malware is detected in messages from external senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. Specify the administrator to receive the notification messages by using the *ExternalSenderAdminAddress* parameter.
EnableExternalSenderNotifications	Optional	System.Boolean	The *EnableExternalSenderNotifications* parameter enables or disables sending notification messages to senders when malware is detected in messages from external senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
EnableInternalSenderAdminNotifications	Optional	System.Boolean	The *EnableExternalSenderAdminNotifications* parameter enables or disables sending notification messages to an administrator when malware is detected in

			messages from internal senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. Specify the administrator to receive the notification messages by using the *InternalSenderAdminAddress* parameter.
EnableInternalSenderNotifications	Optional	System.Boolean	The *EnableExternalSenderAdminNotifications* parameter enables or disables sending notification messages to senders when malware is detected in messages from internal senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
ExternalSenderAdminAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *ExternalSenderAdminAddress* parameter specifies the email address of the administrator who will receive notifications messages when messages from external senders contain malware.

			Notification messages are sent to the specified email address only if the *EnableExternalSenderAdminNotifications* parameter is set to `$true`.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
InternalSenderAdminAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *InternalSenderAdminAddress* parameter specifies the email address of the administrator who will receive notifications messages when messages from external senders contain malware. Notification messages are sent to the specified email address only if the *EnableInternalSenderAdminNotifications* parameter is set to `$true`.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MalwareFilterPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-19*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MalwareFilterPolicy** cmdlet to remove malware filter policies from your organization.

Note:
When a policy is removed and there are rules associated with it, the rules are not removed when the policy is removed. This is by design. If you want to remove the associated rules, you need to do this separately via the Remove-MalwareFilterRule cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MalwareFilterPolicy -Identity <MalwareFilterPolicyIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example removes the malware filter policy named Contoso Malware Filter Policy

```
Remove-MalwareFilterPolicy "Contoso Malware Filter Policy"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MalwareFilterPolicyIdParameter	The *Identity* parameter specifies the malware filter policy you want to remove. You can use any value that uniquely identifies the policy. For example, you can use the name, GUID, or distinguished name (DN) of the malware filter policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run.

			To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for

			administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MalwareFilterPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MalwareFilterPolicy** cmdlet to modify malware filter policies in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MalwareFilterPolicy -Identity <MalwareFilterPolicyIdParameter> [-
Action <DeleteMessage | DeleteAttachmentAndUseDefaultAlertText |
DeleteAttachmentAndUseCustomAlertText>] [-AdminDisplayName <String>] [-
BypassInboundMessages <$true | $false>] [-BypassOutboundMessages <$true |
$false>] [-Confirm [<SwitchParameter>]] [-CustomAlertText <String>] [-
CustomExternalBody <String>] [-CustomExternalSubject <String>] [-
CustomFromAddress <SmtpAddress>] [-CustomFromName <String>] [-
CustomInternalBody <String>] [-CustomInternalSubject <String>] [-
CustomNotifications <$true | $false>] [-DomainController <Fqdn>] [-
EnableExternalSenderAdminNotifications <$true | $false>] [-
EnableExternalSenderNotifications <$true | $false>] [-
EnableInternalSenderAdminNotifications <$true | $false>] [-
EnableInternalSenderNotifications <$true | $false>] [-
ExternalSenderAdminAddress <SmtpAddress>] [-IgnoreDehydratedFlag
<SwitchParameter>] [-InternalSenderAdminAddress <SmtpAddress>] [-
MakeDefault <SwitchParameter>] [-Name <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example modifies the malware filter policy named Contoso Malware Filter Policy with the following settings:

- Delete messages that contain malware.
- Don't notify the message sender when malware is detected in the message.
- Notify the administrator admin@contoso.com when malware is detected in a message from an internal sender.

```
Set-MalwareFilterPolicy -Identity "Contoso Malware Filter
Policy" -Action DeleteMessage -
EnableInternalSenderAdminNotifications $true -
InternalSenderAdminAddress admin@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MalwareFilterPolicyIdParameter	The *Identity* parameter specifies the malware filter policy you want to modify. You can use any value that uniquely identifies the policy. For example, you can use the name, GUID or distinguished name (DN) of the malware filter policy.
Action	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MalwareFilteringAction	The *Action* parameter specifies the action to take when malware is detected in a message. Valid values for this parameter are: • `DeleteMessage`: deletes the message when malware is detected. • `ReplaceWithDefaultAlert`: delivers the message, but replaces the message contents with the default alert text when malware is detected. • `ReplaceWithCustomAlert`: delivers the message, but replaces the message contents with the custom alert text specified by the *AlertText* parameter when malware is detected. The default value is

			`DeleteMessage`.
AdminDisplayName	Optional	System.String	The *AdminDisplayName* parameter specifies a description for the malware filter policy. If the value contains spaces, enclose the value in quotation marks (").
BypassInboundMessages	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *BypassInboundMessages* parameter skips or enforces malware scanning on incoming messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. This means malware scanning occurs on incoming messages by default.
BypassOutboundMessages	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *BypassOutboundMessages* parameter skips or enforces malware scanning on outgoing

			messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. This means malware scanning occurs on outgoing messages by default.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CustomAlertText	Optional	System.String	The *CustomAlertText* parameter specifies the custom alert text to insert in the message when malware is detected and the value of the *Action* parameter is set to `ReplaceWithCustomAlert`. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomExternalBody	Optional	System.String	The *CustomExternalBody* parameter specifies the body of the custom

			notification message that's sent to an external sender when a message contains malware. This parameter is required when any of the following parameters are set to `$true`: • *CustomNotifications* • *EnableExternalSenderAdminNotifications* • *EnableExternalSenderNotifications*
CustomExternalSubject	Optional	System.String	The *CustomExternalSubject* parameter specifies the subject of the custom notification message that's sent to an external sender when a message contains malware. This parameter is required when any of the following parameters are set to `$true`: • *CustomNotifications* • *EnableExternalSenderAdminNotifications* • *EnableExternalSenderNotifications*
CustomFromAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *CustomFromAddress* parameter specifies the

			From address of the custom notification message that's sent to an internal or external sender when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomFromName	Optional	System.String	The *CustomFromName* parameter specifies the From name of the custom notification message that's sent to internal or external senders when a message contains malware. This parameter is required when the *CustomNotifications* parameter is set to `$true`.
CustomInternalBody	Optional	System.String	The *CustomInternalBody* parameter specifies the body of the custom notification message that's sent to an internal sender when a message contains malware. This parameter is required when any of the following parameters are set to `$true`: • *CustomNotifications*

			• *EnableExternalSenderAdminNotifications* • *EnableExternalSenderNotifications*
CustomInternalSubject	Optional	System.String	The *CustomInternalSubject* parameter specifies the subject of the custom notification message that's sent to an internal sender when a message contains malware. This parameter is required when any of the following parameters are set to `$true`: • *CustomNotifications* • *EnableExternalSenderAdminNotifications* • *EnableExternalSenderNotifications*
CustomNotifications	Optional	System.Boolean	The *CustomNotifications* parameter enables or disables the custom notification message to the sender when the message contains malware. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you enable custom

			notification messages by setting this parameter to `$true`, you specify the details of the custom notification message using the *CustomFromAddress* ,*CustomFromName*, *CustomExternalSubject*, *CustomExternalBody*, *CustomInternalSubject*, and *CustomInternalBody* parameters.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnableExternalSenderAdminNotifications	Optional	System.Boolean	The *EnableExternalSenderAdminNotifications* parameter enables or disables sending notification messages to an administrator when malware is detected in

			messages from external senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. Specify the administrator to receive the notification messages by using the *ExternalSenderAdminAddress* parameter.
EnableExternalSenderNotifications	Optional	System.Boolean	The *EnableExternalSenderNotifications* parameter enables or disables sending notification messages to senders when malware is detected in messages from external senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
EnableInternalSenderAdminNotifications	Optional	System.Boolean	The *EnableExternalSenderAdminNotifications* parameter enables or disables sending notification messages to an administrator when malware is detected in messages from internal senders. Valid input for

			this parameter is `$true` or `$false`. The default value is `$false`. Specify the administrator to receive the notification messages by using the *InternalSenderAdminAddress* parameter.
EnableInternalSenderNotifications	Optional	System.Boolean	The *EnableExternalSenderAdminNotifications* parameter enables or disables sending notification messages to senders when malware is detected in messages from internal senders. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
ExternalSenderAdminAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *ExternalSenderAdminAddress* parameter specifies the email address of the administrator who will receive notifications messages when messages from external senders contain malware. Notification messages are sent to the specified email

			address only if the *EnableExternalSenderAdminNotifications* parameter is set to `$true`.
IgnoreDehydratedFlag	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
InternalSenderAdminAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *InternalSenderAdminAddress* parameter specifies the email address of the administrator who will receive notifications messages when messages from external senders contain malware. Notification messages are sent to the specified email address only if the *EnableInternalSenderAdminNotifications* parameter is set to `$true`.
MakeDefault	Optional	System.Management.Automation.SwitchParameter	The *MakeDefault* switch makes this the default malware filter policy. You don't have to specify a value with this switch.
Name	Optional	System.String	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.	The *WhatIf* switch

		Automation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-MalwareFilterRule

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Disable-MalwareFilterRule** cmdlet to disable malware filter rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-MalwareFilterRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example disables the enabled malware filter rule named Contoso Recipients.

```
Disable-MalwareFilterRule "Contoso Recipients"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the malware filter rule that you want to disable. You can use any value that uniquely identifies the rule. For example, you can use the name, GUID, or distinguished name (DN) of the malware filter rule.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do

			before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-MalwareFilterRule

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-MalwareFilterRule** cmdlet to enable malware filter rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-MalwareFilterRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example enables the disabled malware filter rule named Contoso Recipients.

```
Enable-MalwareFilterRule "Contoso Recipients"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the malware filter rule that you want to enable. You can use any value that uniquely identifies the rule. For example, you can use the name, GUID or distinguished name (DN) of the malware filter rule.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MalwareFilterRule

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Enable-MalwareFilterRule** cmdlet to view malware filter rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MalwareFilterRule [-Identity <RuleIdParameter>] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-State <Enabled |
Disabled>]
```

Examples

Example 1

This example retrieves a summary list of all malware filter rules in your organization.

```
Get-MalwareFilterRule
```

Example 2

This example retrieves detailed configuration information for the malware filter rule named Contoso Recipients.

```
Get-MalwareFilterRule "Contoso Recipients" | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the malware filter rule that you want to view. You can use any value that uniquely identifies the rule. For example, you can use the name, GUID or distinguished name (DN) of the malware filter rule.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
State	Optional	Microsoft.Exchange.MessagingPolicies.Rules.RuleState	The *State* parameter filters the results by enabled or disabled malware filter rules. Valid input for this parameter is `Enabled` or `Disabled`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MalwareFilterRule

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MalwareFilterRule** cmdlet to create malware filter rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MalwareFilterRule -MalwareFilterPolicy
<MalwareFilterPolicyIdParameter> -Name <String> [-Comments <String>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-ExceptIfRecipientDomainIs <Word[]>] [-ExceptIfSentTo
<RecipientIdParameter[]>] [-ExceptIfSentToMemberOf <RecipientIdParameter[]
>] [-Organization <OrganizationIdParameter>] [-Priority <Int32>] [-
RecipientDomainIs <Word[]>] [-SentTo <RecipientIdParameter[]>] [-
SentToMemberOf <RecipientIdParameter[]>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates a new malware filter rule named Contoso Recipients with the following settings: If the recipient is in the domain contoso.com, apply the malware filter policy named Contoso Malware Filter Policy.

```
New-MalwareFilterRule -Name "Contoso Recipients" -
MalwareFilterPolicy "Contoso Malware Filter Policy" -
RecipientDomainIs contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
MalwareFilterPolicy	Required	Microsoft.Exchange.Configuration.Tasks.MalwareFilterPolicyIdParameter	The *MalwareFilterPolicy* parameter specifies the malware filter policy to apply to messages that match the conditions defined by this malware filter rule. You can use any value that uniquely identifies the policy. For example, you can specify the name, GUID, or distinguished name (DN) of the content filter policy. **Note:** You can't specify the default malware filter policy. And, you can't specify a malware filter policy that's already associated with another malware filter rule.
Name	Required	System.String	The *Name* parameter specifies a unique name for the malware filter rule.

Comments	Optional	System.String	The *Comments* parameter specifies informative comments for the rule, such as what the rule is used for or how it has changed over time. The length of the comment can't exceed 1024 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disables the malware filter rule. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ExceptIfRecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientDomainIs* parameter specifies the recipient's domain. The rule isn't applied to messages sent to recipients whose email addresses are in the specified domain.
ExceptIfSentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentTo* parameter specifies a recipient. The rule isn't applied to messages sent to the specified recipient.
ExceptIfSentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentToMemberOf* parameter specifies a distribution group. The rule isn't applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is removed after

			creation of the rule, no exception is made.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
Priority	Optional	System.Int32	The *Priority* parameter specifies the priority for this rule. Rules with a lower priority value are processed first. If you modify the priority of the rule, the position of the rule in the rule list changes to match the priority that you specified. The value of this parameter must be greater than or equal to 0, and must be one less than the total number of rules in your organization. For example, if you configured 8 rules, you can set this parameter to any value from 0 through 7.
RecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientDomainIs* parameter specifies the recipient's domain. The

			rule is applied to messages sent to recipients whose email addresses are in the specified domain. This parameter is used to define a rule condition.
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies a recipient. The rule is applied to messages sent to the specified recipient. This parameter is used to define a rule condition.
SentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentToMemberOf* parameter specifies a distribution group. The rule is applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is removed after creation of the rule, no action is taken. This parameter is used to define a rule condition.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MalwareFilterRule

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MalwareFilterRule** cmdlet to remove malware filter rules from your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MalwareFilterRule -Identity <RuleIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the malware filter rule named Contoso Recipients.

```
Remove-MalwareFilterRule "Contoso Recipients"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the malware filter rule that you want to remove. You can use any value that uniquely identifies the rule. For example, you can use the name, GUID or distinguished name (DN) of the malware filter rule.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default

			when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MalwareFilterRule

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MalwareFilterRule** cmdlet to modify malware filter rules in your organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MalwareFilterRule -Identity <RuleIdParameter> [-Comments <String>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
ExceptIfRecipientDomainIs <Word[]>] [-ExceptIfSentTo
<RecipientIdParameter[]>] [-ExceptIfSentToMemberOf <RecipientIdParameter[]
>] [-MalwareFilterPolicy <MalwareFilterPolicyIdParameter>] [-Name
<String>] [-Priority <Int32>] [-RecipientDomainIs <Word[]>] [-SentTo
<RecipientIdParameter[]>] [-SentToMemberOf <RecipientIdParameter[]>] [-
WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example adds an exception to the malware filter rule named Contoso Recipients for members of the distribution group named Contoso Human Resources.

```
Set-MalwareFilterRule "Contoso Recipients" -
ExceptIfSentToMemberOf "Contoso Human Resources"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-malware" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.MessagingPolicies.Rules.Tasks.RuleIdParameter	The *Identity* parameter specifies the malware filter rule that you want to view. You can use any value that uniquely identifies the rule. For example, you can use the name, GUID, or distinguished name (DN) of the malware filter rule.
Comments	Optional	System.String	The *Comments* parameter specifies informative comments for the rule, such as what the rule is used for or how it has changed over time. The length of the comment can't exceed 1024 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExceptIfRecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *ExceptIfRecipientDomainIs* parameter specifies the recipient's domain. The rule isn't applied to messages sent to recipients whose email addresses are in the specified domain.
ExceptIfSentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentTo* parameter specifies a recipient. The rule isn't

			applied to messages sent to the specified recipient.
ExceptIfSentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *ExceptIfSentToMemberOf* parameter specifies a distribution group. The rule isn't applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is removed after creation of the rule, no exception is made.
MalwareFilterPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MalwareFilterPolicyIdParameter	The *MalwareFilterPolicy* parameter specifies the malware filter policy to apply to messages that match the conditions defined by this malware filter rule. You can use any value that uniquely identifies the policy. For example, you can specify the name, GUID, or distinguished name (DN) of the content filter policy. **Note:** You can't specify the

			default malware filter policy. And, you can't specify a malware filter policy that's already associated with another malware filter rule.
Name	Optional	System.String	The *Name* parameter specifies a unique name for the malware filter rule.
Priority	Optional	System.Int32	The *Priority* parameter specifies the priority for this rule. Rules with a lower priority value are processed first. If you modify the priority of the rule, the position of the rule in the rule list changes to match the priority that you specified. The value of this parameter must be greater than or equal to 0, and must be one less than the total number of rules in your organization. For example, if you configured 8 rules, you can set this parameter to any value from 0 through 7.

RecipientDomainIs	Optional	Microsoft.Exchange.Data.Word[]	The *RecipientDomainIs* parameter specifies the recipient's domain. The rule is applied to messages sent to recipients whose email addresses are in the specified domain. This parameter is used to define a rule condition.
SentTo	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentTo* parameter specifies a recipient. The rule is applied to messages sent to the specified recipient. This parameter is used to define a rule condition.
SentToMemberOf	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter[]	The *SentToMemberOf* parameter specifies a distribution group. The rule is applied to messages where any recipient is a member of the specified group. **Note:** If the distribution group is removed after creation of the rule, no action is taken. This parameter is used

			to define a rule condition.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RecipientFilterConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-RecipientFilterConfig** cmdlet to view the recipient filter configuration information for the computer on which the command is run.

```
Get-RecipientFilterConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the recipient filter configuration for the computer on which the command is run.

```
Get-RecipientFilterConfig | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance

			of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RecipientFilterConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-RecipientFilterConfig** cmdlet to enable and configure the Recipient Filter agent.

```
Set-RecipientFilterConfig [-BlockedRecipients <MultiValuedProperty>] [-
BlockListEnabled <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-ExternalMailEnabled
<$true | $false>] [-InternalMailEnabled <$true | $false>] [-
RecipientValidationEnabled <$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the Recipient Filter agent configuration so that recipient validation is enabled.

```
Set-RecipientFilterConfig -RecipientValidationEnabled $true
```

EXAMPLE 2

This example makes the following changes to the Recipient Filter agent configuration:

- Enables the Blocked Recipients list.
- Adds two users to the Blocked Recipients list.

```
Set-RecipientFilterConfig -BlockListEnabled $true -
BlockedRecipients user1@contoso.com,user2@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
BlockedRecipients	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedRecipients* parameter specifies one or more SMTP addresses. To enter multiple SMTP addresses, separate the addresses by using a comma. The maximum number of individual SMTP addresses that you can input is 800.
BlockListEnabled	Optional	System.Boolean	The *BlockListEnabled* parameter specifies whether the Recipient

			Filter agent blocks messages sent to recipients listed in the *BlockedRecipients* parameter. Valid input for the *BlockListEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *BlockListEnabled* parameter is set to `$true`, the Recipient Filter agent blocks messages sent to recipients listed in the *BlockedRecipients* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the Recipient Filter agent is enabled on the computer on which you're running the command. Valid input for the *Enabled* parameter is `$true` or `$false`. The default setting is `$true`. When the *Enabled* parameter is set to `$true`, the Recipient Filter agent is enabled on the computer on which you're running the

			command.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter specifies whether all messages received from unauthenticated connections by servers external to your organization are passed through the Recipient Filter agent for processing. Valid input for the *ExternalMailEnabled* parameter is `$true` or `$false`. The default setting is `$true`. When the *ExternalMailEnabled* parameter is set to `$true`, all messages received from unauthenticated connections by servers external to your organization are passed through the Recipient Filter agent for processing.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled*

			parameter specifies whether all messages from authenticated sender domains that belong to authoritative domains in the enterprise are passed through the Recipient Filter agent for processing. Valid input for the *InternalMailEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *InternalMailEnabled* parameter is set to `$true`, all messages from authenticated sender domains that belong to authoritative domains in the enterprise are passed through the Recipient Filter agent for processing.
RecipientValidationEnabled	Optional	System.Boolean	The *RecipientValidationEnabled* parameter specifies whether the Recipient Filter agent

			blocks messages addressed to recipients that don't exist in the organization. Valid input for the *RecipientValidationEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *RecipientValidationEnabled* parameter is set to `$true`, the Recipient Filter agent blocks messages addressed to recipients that don't exist in the organization.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-SafeList

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-SafeList** cmdlet to update the safelist aggregation data in Active Directory. Safelist aggregation data is used in the built-in anti-spam filtering in Microsoft Exchange. EdgeSync replicates safelist aggregation data to Edge Transport servers in the perimeter network.

```
Update-SafeList -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-EnsureJunkEmailRule
<SwitchParameter>] [-IncludeDomains <SwitchParameter>] [-Type <SafeSenders
| SafeRecipients | Both | BlockedSenders | All>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates Safe Senders List data for the single user kim@contoso.com.

```
Update-Safelist kim@contoso.com
```

EXAMPLE 2

This example updates safelist data for all user mailboxes in your Exchange organization. By default, the Exchange Management Shell is configured to retrieve or modify objects that reside in the domain in which the Exchange server resides. Therefore, to retrieve all the mailboxes in your Exchange organization, you must first set the scope of the Shell to the entire forest using the **Set-**

AdServerSettings cmdlet. For more information, see Set-AdServerSettings.

```
Set-AdServerSettings -ViewEntireForest $true
Get-Mailbox -ResultSize Unlimited -RecipientTypeDetails
UserMailbox | Update-Safelist
```

Detailed Description

The **Update-SafeList** cmdlet reads the safelist aggregation data stored on a Microsoft Outlook user mailbox and then hashes and writes the data to the corresponding user object in Active Directory. The command compares the binary attribute created to any value stored on the attribute. If the two values are identical, the command doesn't update the user attribute value with the safelist aggregation data. Safelist aggregation data contains the Outlook user's Safe Senders List and Safe Recipients List.

Be mindful of the network and replication traffic that may be generated when you run the **Update-SafeList** cmdlet. Running the command on multiple mailboxes where safelists are heavily used may generate a significant amount of traffic. We recommend that if you run the command on multiple mailboxes, you should run the command during off-peak, non-business hours.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "SafeList aggregation" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox from which you want to collect safelist aggregation data. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name`

			Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnsureJunkEmailRule	Optional	System.Management.Automation.SwitchParameter	The *EnsureJunkEmailRule* parameter specifies whether to force the junk email rule to be turned on for the mailbox if the rule isn't turned on already. **Note:** The junk email rule can only be created after the user logs on to the mailbox. If the user has never logged on to the mailbox, this parameter can't turn on the junk email rule.
IncludeDomains	Optional	System.Management.Automation.SwitchParameter	The *IncludeDomains* switch specifies whether to include the sender domains specified by users in Outlook in the safelist aggregation data. By default, domains specified by the senders aren't included.

			In most cases, we don't recommend that you include domains because users may include the domains of large Internet service providers (ISPs), which could unintentionally provide addresses that may be used or spoofed by spammers.
Type	Optional	Microsoft.Exchange.Management.RecipientTasks.UpdateType	The *Type* parameter specifies which user-generated list is updated to the user object. Valid values for this parameter are `SafeSenders`, `SafeRecipients`, and `Both`. The default value is `SafeSenders`. **Important:** The safelist aggregation feature doesn't act on Safe Recipients List data. We don't recommend running the *Type* parameter with the `SafeRecipients` or `Both` values.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SenderFilterConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-SenderFilterConfig** cmdlet to view the Sender Filter configuration information for the computer on which the command is run.

```
Get-SenderFilterConfig [-Identity <OrganizationIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the Sender Filter configuration for the computer on which the command is run.

```
Get-SenderFilterConfig | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SenderFilterConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-SenderFilterConfig** cmdlet to modify the Sender Filter agent configuration.

```
Set-SenderFilterConfig [-Action <StampStatus | Reject>] [-
BlankSenderBlockingEnabled <$true | $false>] [-BlockedDomains
<MultiValuedProperty>] [-BlockedDomainsAndSubdomains
<MultiValuedProperty>] [-BlockedSenders <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-ExternalMailEnabled <$true | $false>] [-InternalMailEnabled
<$true | $false>] [-RecipientBlockedSenderAction <Reject | Delete>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example makes the following modifications to the Sender Filter agent configuration:

- It enables blocking of blank senders.
- It blocks messages from lucernepublishing.com and all subdomains.
- It adds user1@contoso.com and user2@contoso.com to the blocked senders list without affecting any existing entries.

```
Set-SenderFilterConfig -BlankSenderBlockingEnabled $true -
BlockedDomainsAndSubdomains lucernepublishing.com -
BlockedSenders
@{Add="user1@contoso.com","user2@contoso.com"}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Action	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.BlockedSenderAction	The *Action* parameter specifies the action that the Sender Filter agent takes on messages from blocked senders or domains. Valid input for this parameter is `StampStatus` or `Reject`. The default value is `Reject`.
BlankSenderBlockingEnabled	Optional	System.Boolean	The *BlankSenderBlockingEnabled* parameter blocks or allows messages that don't contain a sender value in the SMTP command **MAIL FROM**. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
BlockedDomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedDomains* parameter specifies the

			domain names to block. When the Sender Filter agent encounters a message from a domain on this list, the Sender Filter agent takes the action specified by the *Action* parameter. Valid input for this parameter is one or more domains or subdomains. Wildcard characters aren't permitted. For example, if you specify the values contoso.com and marketing.contoso.com, only messages from those domains are blocked by the Sender Filter agent. Messages from sales.contoso.com aren't blocked by the Sender Filter agent. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise

			require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. The maximum number of entries for this parameter is 800.
BlockedDomainsAndSubdomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedDomainsAndSubdomains* parameter specifies the domain names to block. When the Sender Filter agent encounters a message from a domain on this list, or from any of the domain's subdomains, the Sender Filter agent takes the action specified by the *Action* parameter. Valid input for this parameter is one or more domains.

			Wildcard characters aren't permitted. For example, if you specify the value contoso.com, messages from contoso.com, sales.contoso.com, and all other subdomains of contoso.com are blocked by the Sender Filter agent. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. The maximum number of entries for this

			parameter is 800.
BlockedSenders	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedSenders* parameter specifies one or more SMTP email addresses to block. When the Sender Filter agent encounters a message from a sender on this list, the Sender Filter agent takes the action specified by the *Action* parameter. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.

			The maximum number of entries for this parameter is 800.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disables sender filtering on your Exchange server. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter enables or disables sender filtering on unauthenticated connections from external messaging servers. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter enables or disables sender filtering on authenticated connections from authoritative domains in your organization. Valid input for this parameter is `$true` or `$false`. The default

			value is `$false`.
RecipientBlockedSenderAction	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RecipientBlockedSenderAction	The *RecipientBlockedSenderAction* parameter specifies the action that the Sender Filter agent takes on messages received from blocked senders that are defined by SafeList aggregation. SafeList aggregation adds blocked senders that are defined by your users in Microsoft Outlook or Outlook Web App to the Blocked Senders list that's used by the Sender Filter agent. Valid input for this parameter is `Delete` or `Reject`. The default value is `Reject`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-SenderId

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-SenderId** cmdlet to test whether a specified IP address is the legitimate sending address for a specified SMTP address.

```
Test-SenderId -IPAddress <IPAddress> -PurportedResponsibleDomain
<SmtpDomain> [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
HelloDomain <String>] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example checks whether the IP address 192.168.0.1 is the legitimate sender address for the domain contoso.com.

```
Test-SenderId -IPAddress 192.168.0.1 -
PurportedResponsibleDomain contoso.com
```

Detailed Description

The **Test-SenderId** cmdlet provides the results of a Sender ID check for the IP address and the corresponding domain name that you specify.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
IPAddress	Required	System.Net.IPAddress	The *IPAddress* parameter specifies the originating IP address of the sending server.
PurportedResponsibleDomain	Required	Microsoft.Exchange.Data.SmtpDomain	The *PurportedResponsibleDomain* parameter specifies the domain name that you want to verify with Sender ID.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
HelloDomain	Optional	System.String	The *HelloDomain* parameter specifies the domain address displayed in the HELO or EHLO SMTP commands from this sender.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example:

			• Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SenderIdConfig

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-SenderIdConfig** cmdlet to view the Sender ID configuration information for the computer on which the command is run.

```
Get-SenderIdConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the Sender ID configuration for the computer on which the command is run.

```
Get-SenderIdConfig | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't

			supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SenderIdConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-SenderIdConfig** cmdlet to modify the configuration of the Sender ID agent.

```
Set-SenderIdConfig [-BypassedRecipients <MultiValuedProperty>] [-
BypassedSenderDomains <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-ExternalMailEnabled <$true | $false>] [-InternalMailEnabled
<$true | $false>] [-SpoofedDomainAction <StampStatus | Reject | Delete>]
[-TempErrorAction <StampStatus | Reject | Delete>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example makes the following modifications to the Sender ID configuration:

- It sets the Sender ID agent to delete all messages sent from spoofed domains.
- It specifies two recipients for the Sender ID agent to exclude when it processes messages.

```
Set-SenderIdConfig -SpoofedDomainAction Delete -
BypassedRecipients user1@contoso.com,user2@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
BypassedRecipients	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassedRecipients* parameter specifies one or more SMTP email addresses. Messages bound for the email addresses listed in this parameter are excluded from processing by the Sender ID agent. You can specify multiple values separated by commas. You can enter a maximum of 100 email addresses.
BypassedSenderDomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassedSenderDomai*

			ns parameter specifies one or more domain names. Messages that originate from the domains listed in this parameter are excluded from processing by the Sender ID agent. You can specify multiple values separated by commas. You can enter a maximum of 100 domain names.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

			The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the Sender ID agent is enabled on the computer on which you're running the command. Valid input for the *Enabled* parameter is `$true` or `$false`. The default setting is `$true`. When the *Enabled* parameter is set to `$true`, the Sender ID agent is enabled on the computer on which you're running the command.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter specifies whether all messages

			from unauthenticated connections external to your organization are passed through the Sender ID agent for processing. Valid input for the *ExternalMailEnabled* parameter is `$true` or `$false`. The default setting is `$true`. When the *ExternalMailEnabled* parameter is set to `$true`, all messages from unauthenticated connections external to your organization are passed through the Sender ID agent for processing.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter specifies whether all messages from authenticated sender domains that belong to authoritative domains in your enterprise are passed through the Sender ID agent for processing.

			Valid input for the *InternalMailEnabled* parameter is `$true` or `$false`. The default setting is `$false`. When the *InternalMailEnabled* parameter is set to `$true`, all messages from authenticated sender domains that belong to authoritative domains in your enterprise are passed through the Sender ID agent for processing.
SpoofedDomainAction	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SenderIdAction	The *SpoofedDomainAction* parameter specifies the action that the Sender ID agent takes on the message when the sender domain shows evidence of being spoofed. The *SpoofedDomainAction* parameter takes the following values: `StampStatus`, `Reject`, or `Delete`. The default value is `StampStatus`.
TempErrorAction	Optional	Microsoft.Exchange.Dat	The *TempErrorAction*

		a.Directory.SystemConfiguration.SenderIdAction	parameter specifies the action that the Sender ID agent takes on the message when a Sender ID status of TempError is returned. The *TempErrorAction* parameter takes the following values: `StampStatus`, `Reject`, or `Delete`. The default value is `StampStatus`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SenderReputationConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-SenderReputationConfig** cmdlet to view the configuration information for sender reputation on the computer on which the command is run.

```
Get-SenderReputationConfig [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the sender reputation configuration for the computer on which the command is run.

```
Get-SenderReputationConfig | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SenderReputationConfig

Exchange Management Shell > Exchange 2013 cmdlets > Anti-spam and anti-malware cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-SenderReputationConfig** cmdlet to modify the sender reputation configuration on a Mailbox server or an Edge Transport server.

```
Set-SenderReputationConfig [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Enabled <$true | $false>] [-ExternalMailEnabled
<$true | $false>] [-InternalMailEnabled <$true | $false>] [-
OpenProxyDetectionEnabled <$true | $false>] [-ProxyServerName <String>] [-
ProxyServerPort <Int32>] [-ProxyServerType <None | Socks4 | Socks5 |
HttpConnect | HttpPost | Telnet | Cisco | Wingate>] [-
SenderBlockingEnabled <$true | $false>] [-SenderBlockingPeriod <Int32>] [-
SrlBlockThreshold <Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example makes the following modifications to the sender reputation configuration:

- It sets the sender reputation action to block all senders whose sender reputation level (SRL) rating exceeds the SRL threshold.
- It sets the SRL blocking threshold to 6.
- It sets the number of hours that senders are put on the blocked senders list to 36 hours.

```
Set-SenderReputationConfig -SenderBlockingEnabled $true -
SrlBlockThreshold 6 -SenderBlockingPeriod 36
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Anti-spam features" entry in the Anti-spam and anti-malware permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disables sender reputation on your Exchange server. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ExternalMailEnabled	Optional	System.Boolean	The *ExternalMailEnabled* parameter allows or prevents sender

			reputation from processing all messages from unauthenticated connections that are external to your Exchange organization. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
InternalMailEnabled	Optional	System.Boolean	The *InternalMailEnabled* parameter allows or prevents sender reputation from processing all messages from authenticated sender domains that are authoritative domains in your Exchange organization. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
OpenProxyDetectionEnabled	Optional	System.Boolean	The *OpenProxyDetectionEnabled* parameter allows or prevents sender reputation from

			connecting to the source IP address to determine if the sender is an open proxy. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. The values of the *OpenProxyDetectionEnabled* and *SenderBlockingEnabled* parameters can both be set to `$true`, but they both can't be set to `$false`. If one value is `$true` and the other is `$false`, and you change the `$true` value to `$false`, the parameter that was previously `$false` will automatically change to `$true`.
ProxyServerName	Optional	System.String	The *ProxyServerName* parameter specifies the name of your organization's proxy server. Sender reputation uses this parameter to connect to the Internet.

ProxyServerPort	Optional	System.Int32	The *ProxyServerPort* parameter specifies the port number that's used by your organization's proxy server. Sender reputation uses this parameter to connect to the Internet.
ProxyServerType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ProxyType	The *ProxyServerType* parameter classifies your organization's proxy server. Sender reputation uses this parameter to connect to the Internet. Valid input for this parameter is `None`, `Socks4`, `Socks5`, `HttpConnect`, `HttpPost`, `Telnet`, `Cisco`, or `Wingate`. The default value is `None`.
SenderBlockingEnabled	Optional	System.Boolean	The *SenderBlockingEnabled* parameter allows or prevents sender reputation from blocking senders when the source server fails an open proxy test. Valid input for this

			parameter is `$true` or `$false`. The default value is `$true`. You can temporarily block senders for up to 48 hours when you use the *SenderBlockingPeriod* parameter. The values of the *OpenProxyDetectionEnabled* and *SenderBlockingEnabled* parameters can both be set to `$true`, but they both can't be set to `$false`. If one value is `$true` and the other is `$false`, and you change the `$true` value to `$false`, the parameter that was previously `$false` will automatically change to `$true`.
SenderBlockingPeriod	Optional	System.Int32	The *SenderBlockingPeriod* parameter specifies the number of hours that a sender remains on the blocked senders list when their source IP

			address fails the open proxy test. Valid input for this parameter is an integer from 0 through 48. The default value is 24.
SrlBlockThreshold	Optional	System.Int32	The *SrlBlockThreshold* specifies the sender reputation level (SRL) rating that must be exceeded for sender reputation to block a sender. Valid input for this parameter is an integer value from 0 through 9. The default value is 7.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ActiveSyncConnectivity

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-ActiveSyncConnectivity** cmdlet to perform a full synchronization against a specified mailbox to test the configuration of Microsoft Exchange ActiveSync.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-ActiveSyncConnectivity [-AllowUnsecureAccess <SwitchParameter>] [-
ClientAccessServer <ServerIdParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-LightMode <SwitchParameter>] [-
MailboxCredential <PSCredential>] [-MailboxServer <ServerIdParameter>] [-
MonitoringContext <SwitchParameter>] [-MonitoringInstance <String>] [-
ResetTestAccountCredentials <SwitchParameter>] [-Timeout <UInt32>] [-
TrustAnySSLCertificate <SwitchParameter>] [-URL <String>] [-
UseAutodiscoverForClientAccessServer <SwitchParameter>] [-UserType <LEGACY
| EDU | BPOS>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the Exchange ActiveSync connectivity for the mailbox PaulS on the Client Access server computer CAS01.

```
Test-ActiveSyncConnectivity -ClientAccessServer contoso
\CAS01 -URL "http://contoso.com/mail" -MailboxCredential
"PaulS"
```

EXAMPLE 2

This example tests the Exchange ActiveSync connectivity for the mailbox PaulS using the Autodiscover URL.

```
Test-ActiveSyncConnectivity -
UseAutodiscoverForClientAccessServer $true -URL "http://
contoso.com/mail" -MailboxCredential "pauls@contoso.com"
```

EXAMPLE 3

This example tests the Exchange ActiveSync connectivity for the mailbox PaulS.

```
Test-ActiveSyncConnectivity -AllowUnsecureAccess $true -URL
"http://contoso.com/mail" -MailboxCredential "contoso
\pauls"
```

Detailed Description

The **Test-ActiveSyncConnectivity** cmdlet performs a full synchronization between a mobile device and a specified mailbox to test the functionality of Exchange ActiveSync. If the synchronization fails, a message is displayed in the Exchange Management Shell.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync server settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AllowUnsecureAccess	Optional	System.Management.Automation.SwitchParameter	The *AllowUnsecureAccess* parameter allows the test to continue over an unsecured channel that doesn't require Secure Sockets Layer (SSL).
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *ClientAccessServer* parameter specifies the Client Access server computer that the device uses to synchronize.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
LightMode	Optional	System.Management.Automation.SwitchParameter	The *LightMode* parameter instructs the command to perform only a subset of the connectivity tests. The tests performed are the **Options** and **FolderSync** commands.
MailboxCredential	Optional	System.Management.Automation.PSCredential	The *MailboxCredential* parameter specifies the mailbox that the device synchronizes with.
MailboxServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the Mailbox server computer that contains the associated mailbox.
MonitoringContext	Optional	System.Management.Automation.SwitchPara	The *MonitoringContext* switch includes the

		meter	associated monitoring events and performance counters in the results. You don't need to specify a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
MonitoringInstance	Optional	System.String	The *MonitoringInstance* parameter specifies whether the task is to be run against the mailbox of the user currently running the task. It's only used when this task is run from System Center Operations Manager 2007 or Operations Manager.
ResetTestAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *ResetTestAccountCredentials* switch resets the

			password for the test account that's used to run this command. The password for the test account is typically reset every seven days. Use this switch to force a password reset any time it's required for security reasons.
Timeout	Optional	System.UInt32	The *Timeout* parameter specifies the amount of time (in seconds) to wait for a response from the command.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* parameter specifies whether the test uses any available SSL certificate to run the test.
URL	Optional	System.String	The *URL* parameter specifies the external URL for Exchange ActiveSync.
UseAutodiscoverForClientAccessServer	Optional	System.Management.Automation.SwitchParameter	The *UseAutodiscoverForClientAccessServer* parameter specifies whether the test should

			use the Autodiscover service to locate the Client Access server.
UserType	Optional	Microsoft.Exchange.Monitoring.DatacenterUserType	The *UserType* parameter specifies whether the user is an on-premise or online user.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Clear-ActiveSyncDevice

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Clear-ActiveSyncDevice** cmdlet to delete all data from a mobile phone.

For information about the parameter sets in the Syntax section below, see Syntax.

⚠**Warning:**
The **Clear-ActiveSyncDevice** cmdlet will be removed in a future version of Exchange. Use the **Clear-MobileDevice** cmdlet instead. If you have any scripts that use the **Clear-ActiveSyncDevice** cmdlet, update them to use the **Clear-MobileDevice** cmdlet.

```
Clear-ActiveSyncDevice -Identity <MobileDeviceIdParameter> [-Cancel
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-NotificationEmailAddresses <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example clears all data from the mobile device with the identity WM_JeffHay.

```
Clear-ActiveSyncDevice -Identity WM_JeffHay
```

EXAMPLE 2

This example clears all data from the mobile device for Tony Smith and sends a confirmation email message to tony@contoso.com.

```
Clear-ActiveSyncDevice -Identity WM_TonySmith -
NotificationEmailAddresses "tony@contoso.com"
```

EXAMPLE 3

This example cancels a previously sent **Clear-ActiveSyncDevice** command request for Tony Smith's mobile device.

```
Clear-ActiveSyncDevice -Identity WM_TonySmith -Cancel $true
```

Detailed Description

The **Clear-ActiveSyncDevice** cmdlet deletes all user data from a mobile device the next time the device receives data from the server running Microsoft Exchange Server 2013. This cmdlet sets the *DeviceWipeStatus* parameter to `$true`. The mobile device acknowledges the cmdlet and records the time stamp in the *DeviceWipeAckTime* parameter.

After you run this cmdlet, you receive a warning that states: "This command will force all the data on the device to be permanently deleted. Do you want to continue?" You must respond to the warning for the cmdlet to run on the mobile phone.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MobileDeviceIdParameter	The *Identity* parameter specifies the identity of the device that you want to reset.
Cancel	Optional	System.Management.Automation.SwitchParameter	The *Cancel* switch specifies whether the command should be canceled. If you use the *Cancel* switch, a cancellation request is issued for the remote device wipe.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
NotificationEmailAddresses	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmailAddresses* parameter specifies the notification email address for the remote device wipe confirmation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncDevice

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ActiveSyncDevice** cmdlet to retrieve the list of devices in your organization that have active Microsoft Exchange ActiveSync partnerships.

Warning:
The **Get-ActiveSyncDevice** cmdlet will be removed in a future version of Exchange. Use the **Get-MobileDevice** cmdlet instead. If you have any scripts that use the **Get-ActiveSyncDevice** cmdlet, update them to use the **Get-MobileDevice** cmdlet.

```
Get-ActiveSyncDevice [-Identity <ActiveSyncDeviceIdParameter>] <COMMON
PARAMETERS>

Get-ActiveSyncDevice -Mailbox <MailboxIdParameter> <COMMON PARAMETERS>
```

```
COMMON PARAMETERS: [-DomainController <Fqdn>] [-Filter <String>] [-
Monitoring <SwitchParameter>] [-Organization <OrganizationIdParameter>] [-
OrganizationalUnit <OrganizationalUnitIdParameter>] [-ResultSize
<Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example returns all the Exchange ActiveSync mobile devices that Tony Smith has used that are associated with his mailbox.

```
Get-ActiveSyncDevice -Identity "TonySmith"
```

EXAMPLE 2

This example returns all the Exchange ActiveSync mobile devices that Tony Smith has used that are associated with his mailbox.

```
Get-ActiveSyncDevice -Mailbox "Redmond\TonySmith"
```

Detailed Description

The **Get-ActiveSyncDevice** cmdlet returns identification, configuration, and status information for each device.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile devices user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the user whose mobile devices you want to retrieve.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter specifies a set of attributes used to filter the list of returned mobile devices.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceIdParameter	The *Identity* parameter specifies the device to retrieve. One of the following values is used to identify a mobile device in Active Directory: • `GUID` • `DeviceIdentity` • `Multi-TenantID`
Monitoring	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Monitoring* parameter specifies whether mobile devices created by monitoring accounts are included in the **Get-ActiveSyncDevice** cmdlet output. The default value is *$false*.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the organizational unit (OU) where the task is run.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute to sort by.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ActiveSyncDevice

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ActiveSyncDevice** cmdlet to remove the mobile device partnership information

that you specify from a user's mobile device list stored in a mailbox on a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ActiveSyncDevice -Identity <MobileDeviceIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mobile device partnership for the device WM_JeffHay.

```
Remove-ActiveSyncDevice -Identity WM_JeffHay
```

EXAMPLE 2

This example removes the mobile device partnership for the device iPhone_TonySmith after displaying the confirm prompt.

```
Remove-ActiveSyncDevice -Identity iPhone_TonySmith -Confirm
$true
```

EXAMPLE 3

This example removes the mobile device partnership for the device Tablet_JeffHay after displaying the confirm prompt.

```
Remove-ActiveSyncDevice -Identity Tablet_JeffHay -Confirm
$true
```

Detailed Description

The **Remove-ActiveSyncDevice** cmdlet is useful for removing mobile devices that no longer synchronize successfully with the server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MobileDeviceIdParameter	The *Identity* parameter uniquely identifies the specific device partnership to be removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncDeviceAccessRule

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ActiveSyncDeviceAccessRule** cmdlet to retrieve an access group of Exchange mobile devices along with their access level.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ActiveSyncDeviceAccessRule [-Identity
<ActiveSyncDeviceAccessRuleIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example lists all the rules currently blocking mobile phones.

```
Get-ActiveSyncDeviceAccessRule | where {$_.AccessLevel -eq
'Block'}
```

EXAMPLE 2

This example lists all device access rules set up on the server.

```
Get-ActiveSyncDeviceAccessRule | Format-List
Characteristic, QueryString, AccessLevel
```

Detailed Description

You can create multiple groups of devices: allowed devices, blocked devices, and quarantined devices with the **New-ActiveSyncDeviceAccessRule** cmdlet. The **Get-ActiveSyncDeviceAccessRule** cmdlet retrieves the settings for any existing group.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceAccessRuleIdParameter	The *Identity* parameter specifies the unique identifier for the device access rule.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ActiveSyncDeviceAccessRule

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-ActiveSyncDeviceAccessRule** cmdlet to define an access group of Exchange mobile devices along with their access level.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ActiveSyncDeviceAccessRule -AccessLevel <Allow | Block | Quarantine> -
Characteristic <DeviceType | DeviceModel | DeviceOS | UserAgent> -
```

```
QueryString <String> [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a device access rule that applies to devices defined with the *QueryString* parameter set to iPhone for the device model and blocks those devices.

```
New-ActiveSyncDeviceAccessRule -QueryString iPhone -
Characteristic DeviceModel -AccessLevel Block
```

EXAMPLE 2

This example creates a device access rule that applies to devices defined with the *QueryString* parameter set to `NokiaE521/2.00()MailforExchange` for the user agent and allows those devices.

```
New-ActiveSyncDeviceAccessRule -QueryString
NokiaE521/2.00()MailforExchange -Characteristic UserAgent -
AccessLevel Allow
```

Detailed Description

You can create multiple groups of devices: Allowed devices, blocked devices, and quarantined devices.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AccessLevel	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.DeviceAccessLevel	The *AccessLevel* parameter specifies the state of all devices.
Characteristic	Required	Microsoft.Exchange.Data.Directory.SystemConf	The *Characteristic* parameter specifies the

		iguration.DeviceAccessCharacteristic	device characteristic that the query string is to be compared to.
QueryString	Required	System.String	The *QueryString* parameter specifies which devices this rule applies to.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Co	This parameter is

		nfiguration.Tasks.OrganizationIdParameter	reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ActiveSyncDeviceAccessRule

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ActiveSyncDeviceAccessRule** cmdlet to remove any existing device access rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ActiveSyncDeviceAccessRule -Identity
<ActiveSyncDeviceAccessRuleIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes all device access rules.

```
Get-ActiveSyncDeviceAccessRule | Remove-
ActiveSyncDeviceAccessRule
```

EXAMPLE 2

This example removes all device access rules that have a name that starts with Contoso.

```
Get-ActiveSyncDeviceAccessRule | where {$_.Name -like
'Contoso*'} | Remove-ActiveSyncDeviceAccessRule
```

Detailed Description

If you've created device access rules for groups of devices, you can use the **Remove-ActiveSyncDeviceAccessRule** cmdlet to remove any access rule.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceAccessRuleIdParameter	The *Identity* parameter specifies the identity of the device access rule.
Confirm	Optional	System.Management.A	The *Confirm* switch

		utomation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ActiveSyncDeviceAccessRule

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ActiveSyncDeviceAccessRule** cmdlet to set the level of access for the rule.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ActiveSyncDeviceAccessRule -Identity
<ActiveSyncDeviceAccessRuleIdParameter> [-AccessLevel <Allow | Block |
Quarantine>] [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the access level granted to phones covered by the rule ContosoPhone (DeviceModel) to Quarantine.

```
Set-ActiveSyncDeviceAccessRule 'ContosoPhone(DeviceModel)'
-AccessLevel Quarantine
```

EXAMPLE 2

This example changes the organization's device access rule so that all devices explicitly allowed to access Microsoft Exchange ActiveSync are quarantined.

```
Get-ActiveSyncDeviceAccessRule | Where {$_.AccessLevel -eq 'Allow'} | Set-ActiveSyncDeviceAccessRule -AccessLevel Quarantine
```

Detailed Description

Your rule can define multiple groups of devices: allowed devices, blocked devices, and quarantined devices.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceAccessRuleIdParameter	The *Identity* parameter specifies the identity of the device access rule.
AccessLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DeviceAccessLevel	The *AccessLevel* parameter specifies whether the devices are allowed, blocked, or quarantined.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do

			before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncDeviceAutoblockThreshold

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ActiveSyncDeviceAutoblockThreshold** cmdlet to obtain the Autoblock settings for Microsoft Exchange ActiveSync mobile devices..

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ActiveSyncDeviceAutoblockThreshold [-Identity
<ActiveSyncDeviceAutoblockThresholdIdParameter>] [-DomainController
<Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the threshold settings for the Autoblock threshold rule for UserAgentChanges.

```
Get-ActiveSyncDeviceAutoblockThreshold -Identity
"UserAgentChanges"
```

Detailed Description

Microsoft Exchange and Exchange ActiveSync have the capability to block Exchange ActiveSync mobile devices if these devices display any of a defined list of behaviors that have the capability to cause issues with the server. The **Get-ActiveSyncDeviceAutoblockThreshold** cmdlet returns the

settings for the requested threshold rule.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync Autoblock settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceAutoblockThresholdIdParameter	The *Identity* parameter specifies the name of the Autoblock threshold rule.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ActiveSyncDeviceAutoblockThreshold

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ActiveSyncDeviceAutoblockThreshold** cmdlet to change settings for autoblocking mobile devices.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ActiveSyncDeviceAutoblockThreshold -Identity
<ActiveSyncDeviceAutoblockThresholdIdParameter> [-AdminEmailInsert
<String>] [-BehaviorTypeIncidenceDuration <EnhancedTimeSpan>] [-
BehaviorTypeIncidenceLimit <Int32>] [-Confirm [<SwitchParameter>]] [-
DeviceBlockDuration <EnhancedTimeSpan>] [-DomainController <Fqdn>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the autoblock threshold rule UserAgentChanges with several settings. It limits the number of accepted UserAgent changes to 2, specifies that the incidence duration is 1440 minutes, and blocks the mobile device for 1440 minutes. Lastly, it inserts a message into the administrative email message sent to the user.

```
Set-ActiveSyncDeviceAutoblockThreshold -Identity
"UserAgentChanges" BehaviorTypeIncidenceLimit 2 -
BehaviorTypeIncidenceDuration 1440 -DeviceBlockDuration
1440 -AdminEmailInsert "<B>Your device has been blocked.</
B> "]
```

EXAMPLE 2

This example sets the autoblock threshold rule RecentCommands with several settings. It limits the number of accepted RecentCommands changes to 5, specifies that the incidence duration is 720 minutes, and blocks the mobile device for 720 minutes. Lastly, it inserts a message into the administrative email message sent to the user.

```
Set-ActiveSyncDeviceAutoblockThreshold -Identity
"RecentCommands" BehaviorTypeIncidenceLimit 5 -
BehaviorTypeIncidenceDuration 720 -DeviceBlockDuration 720
-AdminEmailInsert "<B>Your device has been blocked.</B> "]
```

Detailed Description

Microsoft Exchange and Microsoft Exchange ActiveSync can block Exchange ActiveSync mobile devices if these devices display any of a defined list of behaviors that can potentially cause issues with the server. The **Set-ActiveSyncDeviceAutoblockThreshold** cmdlet can modify an existing autoblock threshold rule and change a variety of settings including the duration of blocking.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync Autoblock settings" entry in the <Clients and mobile devices permissions> topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceAutoblockThresholdIdParameter	The *Identity* parameter specifies the name of the autoblock threshold rule.
AdminEmailInsert	Optional	System.String	The *AdminEmailInsert* parameter specifies the text to include in the email sent to the user when a mobile device triggers an autoblock threshold rule.
BehaviorTypeIncidenceDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *BehaviorTypeIncidenceDuration* parameter specifies the interval (in minutes) within which the BehaviorType must occur to trigger the autoblock rule.

BehaviorTypeIncidenceLimit	Optional	System.Int32	The *BehaviorTypeIncidenceLimit* parameter specifies the number of occurrences of the behavior type needed to trigger blocking.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeviceBlockDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DeviceBlockDuration* parameter specifies the length of time (in minutes) that the mobile device is blocked.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncDeviceClass

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ActiveSyncDeviceClass** cmdlet to retrieve a list of mobile devices that have connected to the servers running Microsoft Exchange Server 2013 in an organization. The cmdlet returns the mobile device type and model information.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ActiveSyncDeviceClass [-Identity <ActiveSyncDeviceClassIdParameter>]
[-DomainController <Fqdn>] [-Filter <String>] [-Organization
<OrganizationIdParameter>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example returns a list of all devices with the **DeviceType** of PocketPC.

```
Get-ActiveSyncDeviceClass -Filter {DeviceType -eq
"PocketPC"}
```

EXAMPLE 2

This example lists all device types within the organization along with a count of the number of devices of each type present.

```
Get-ActiveSyncDeviceClass | group-object -property
DeviceType
```

Detailed Description

You can use this cmdlet to view a list of mobile phones or devices by type. For example, you can return a list of all Android mobile digital devices in the organization or all Windows Phone devices in the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013.

			The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter specifies the attribute by which to filter the data. The following attributes are supported: • **DeviceType** • **DeviceModel**
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceClassIdParameter	The *Identity* parameter specifies the group of devices on which to scope the task.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. You can sort by the following attributes: • **DeviceType** • **DeviceModel** The results are sorted in

			ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ActiveSyncDeviceClass

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ActiveSyncDeviceClass** cmdlet to clean up the list of mobile devices synchronizing with Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ActiveSyncDeviceClass -Identity <ActiveSyncDeviceClassIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example retrieves the list of devices connecting to Exchange 2013, and then removes all inactive mobile devices from the list.

```
Get-ActiveSyncDeviceClass | RemoveActiveSyncDeviceClass
```

Detailed Description

The **Remove-ActiveSyncDeviceClass** cmdlet cleans up the list of devices associated with the

Exchange 2013 organization. Mobile phones and devices that are inactive or have been remote wiped are removed from the list, and the Microsoft Exchange ActiveSync process regenerates the list with the current mobile phones and devices that are connecting to Exchange 2013.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceClassIdParameter	The *Identity* parameter specifies the group of devices on which to scope the task.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncDeviceStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ActiveSyncDeviceStatistics** cmdlet to retrieve the list of mobile devices configured to synchronize with a specified user's mailbox and return a list of statistics about the mobile devices.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ActiveSyncDeviceStatistics -Mailbox <MailboxIdParameter> <COMMON
PARAMETERS>

Get-ActiveSyncDeviceStatistics -Identity <ActiveSyncDeviceIdParameter>
<COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-GetMailboxLog
<SwitchParameter>] [-NotificationEmailAddresses <MultiValuedProperty>] [-
ShowRecoveryPassword <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves the statistics for the mobile phone configured to synchronize with the mailbox that belongs to the user Tony Smith.

```
Get-ActiveSyncDeviceStatistics -Identity TonySmith
```

EXAMPLE 2

This example uses the **Get-CASMailbox** cmdlet to determine who in the organization has a Microsoft Exchange ActiveSync mobile device. For each mobile device, the Exchange ActiveSync device statistics are retrieved.

```
$UserList = Get-CASMailbox -Filter
{hasactivesyncdevicepartnership -eq $true -and -not
displayname -like "CAS_{*"} | Get-Mailbox
$UserList | foreach { Get-ActiveSyncDeviceStatistics -
Mailbox $_}
```

EXAMPLE 3

This example retrieves the statistics for the mobile phone configured to synchronize with the mailbox that belongs to the user Tony Smith. It also outputs the Exchange ActiveSync log file and sends it to the System Administrator at admin@contoso.com.

```
Get-ActiveSyncDeviceStatistics -Mailbox TonySmith -
GetMailboxLog $true -NotificationEmailAddresses
"admin@contoso.com"
```

Detailed Description

The **Get-ActiveSyncDeviceStatistics** cmdlet returns a list of statistics about each mobile device. Additionally, it allows you to retrieve logs and send those logs to a recipient for troubleshooting purposes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ActiveSyncDeviceIdParameter	The *Identity* parameter specifies the user's device ID. If the *Mailbox* parameter is specified, the *Identity* parameter is disabled.
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the user mailbox for which you want to retrieve the mobile phone statistics.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
GetMailboxLog	Optional	System.Management.Automation.SwitchParameter	The *GetMailboxLog* parameter specifies whether to send the

			mailbox logs via email to the administrator running the task. If the parameter is set to `$true`, the command sends the mailbox logs via email to the administrator running the task. The default value of this parameter is `$false`.
NotificationEmailAddresses	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmailAddresses* parameter specifies an optional list of comma-separated aliases or email addresses where the mailbox logs are sent. If the *GetMailboxLog* parameter is set to `$false`, this parameter is ignored.
ShowRecoveryPassword	Optional	System.Management.Automation.SwitchParameter	The *ShowRecoveryPassword* parameter specifies whether to return the recovery password for the mobile phone as one of the displayed statistics. If this

			parameter is set to `$true`, the command returns the recovery password for the mobile phone as one of the displayed statistics.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-ActiveSyncLog

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Export-ActiveSyncLog** cmdlet to parse the Internet Information Services (IIS) logs and return information about Microsoft Exchange ActiveSync usage, either on the screen or in an output file.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-ActiveSyncLog -Filename <String> [-Confirm [<SwitchParameter>]] [-
EndDate <DateTime>] [-Force <SwitchParameter>] [-OutputPath <String>] [-
OutputPrefix <String>] [-StartDate <DateTime>] [-UseGMT <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports the Exchange ActiveSync log for the date range 06/08/12 to 06/09/12. The times on the report are in Coordinated Universal Time (UTC), and the report is saved in c:\exreports\easreports.

```
Export-ActiveSyncLog -Filename:"c:\Windows\System32\LogFiles\W2SVC1\ex060812.log" -StartDate:"06/08/12" -EndDate:"06/09/12" -UseGMT:$true -OutputPath:"c:\exreports\easreports"
```

EXAMPLE 2

This example exports the Exchange ActiveSync log for the date range 06/20/12 to 07/20/12 by reading all log files in the D:\logs directory. All prompts are suppressed while running the report, and a confirmation message is displayed. The times on the report are in UTC, and the report is saved in c:\exreports\easreports.

```
Dir D:\Logs\*.log | Export-ActiveSyncLog -Filename:"c:\Windows\System32\LogFiles\W2SVC1\ex072012.log" -StartDate:"06/20/12" -EndDate:"07/20/12" -UseGMT:$true -Force $true -Confirm -OutputPath:"c:\exreports\easreports"
```

EXAMPLE 3

This example exports the Exchange ActiveSync log for the date range 02/01/12 to 02/09/12. The times on the report are in UTC, and the report is saved in c:\exreports\easreports.

```
Export-ActiveSyncLog -Filename: "c:\Windows\System32\LogFiles\W2SVC1\ex020912.log" -StartDate:"02/01/12" -EndDate:"02/09/12" -UseGMT:$true -OutputPath:"c:\exreports\easreports"
```

Detailed Description

The **Export-ActiveSyncLog** cmdlet parses the IIS log files and returns information about Exchange ActiveSync usage. This cmdlet can export the output to a file or display it in the Exchange Management Shell.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync server settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Filename	Required	System.String	The *Filename* parameter specifies the name of the input file.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
EndDate	Optional	System.DateTime	The *EndDate* parameter specifies the end date of the date range of the report.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't

			provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
OutputPath	Optional	System.String	The *OutputPath* parameter specifies the name and location for the output file.
OutputPrefix	Optional	System.String	The *OutputPrefix* parameter specifies a prefix to append to the name of the output file.
StartDate	Optional	System.DateTime	The *StartDate* parameter specifies the start date of the date range for the report.
UseGMT	Optional	System.Management.Automation.SwitchParameter	The *UseGMT* switch specifies that Coordinated Universal Time (Greenwich Mean Time) is used for the time in the report output. By default, if this parameter isn't specified, local time is used.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ActiveSyncMailboxPolicy** cmdlet to retrieve the Mobile Device mailbox policy settings for a specific Mobile Device mailbox policy.

For information about the parameter sets in the Syntax section below, see Syntax.

Warning:

The **Get-ActiveSyncMailboxPolicy** cmdlet will be removed in a future version of Microsoft Exchange. Use the **Get-MobileDeviceMailboxPolicy** cmdlet instead. If you have any scripts that use the **Get-ActiveSyncMailboxPolicy** cmdlet, update them to use the **Get-MobileDeviceMailboxPolicy** cmdlet.

```
Get-ActiveSyncMailboxPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns the policy settings for the Mobile Device mailbox policy named SalesPolicy.

```
Get-ActiveSyncMailboxPolicy -Identity "SalesPolicy"
```

EXAMPLE 2

This example returns the policy settings for the Mobile Device mailbox policy named Default.

```
Get-ActiveSyncMailboxPolicy -Identity "Default"
```

EXAMPLE 3

This example returns the policy settings for the Mobile Device mailbox policy named Management.

```
Get-ActiveSyncMailboxPolicy -Identity "Management"
```

Detailed Description

A Mobile Device mailbox policy is a group of settings that specifies how mobile devices enabled for Microsoft Exchange ActiveSync connect to the computer running Exchange. Exchange supports multiple Mobile Device mailbox policies. The **Get-ActiveSyncMailboxPolicy** cmdlet displays all the policy settings for the specified policy. These settings include password settings, file access settings, and attachment settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the policy name.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ActiveSyncMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-ActiveSyncMailboxPolicy** cmdlet to create a Microsoft Mobile Device mailbox policy object.

Warning:
The **New-ActiveSyncMailboxPolicy** cmdlet will be removed in a future version of Microsoft Exchange. Use the **New-MobileMailboxPolicy** cmdlet instead. If you have any scripts that use the **New-ActiveSyncMailboxPolicy** cmdlet, update them to use the **New-MobileMailboxPolicy** cmdlet.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ActiveSyncMailboxPolicy -Name <String> [-AllowApplePushNotifications
<$true | $false>] [-AllowBluetooth <Disable | HandsfreeOnly | Allow>] [-
AllowBrowser <$true | $false>] [-AllowCamera <$true | $false>] [-
AllowConsumerEmail <$true | $false>] [-AllowDesktopSync <$true | $false>]
[-AllowExternalDeviceManagement <$true | $false>] [-AllowHTMLEmail <$true
| $false>] [-AllowInternetSharing <$true | $false>] [-AllowIrDA <$true |
$false>] [-AllowMobileOTAUpdate <$true | $false>] [-
AllowNonProvisionableDevices <$true | $false>] [-AllowPOPIMAPEmail <$true
| $false>] [-AllowRemoteDesktop <$true | $false>] [-
AllowSimpleDevicePassword <$true | $false>] [-
AllowSMIMEEncryptionAlgorithmNegotiation <BlockNegotiation |
OnlyStrongAlgorithmNegotiation | AllowAnyAlgorithmNegotiation>] [-
AllowSMIMESoftCerts <$true | $false>] [-AllowStorageCard <$true | $false>]
[-AllowTextMessaging <$true | $false>] [-AllowUnsignedApplications <$true
| $false>] [-AllowUnsignedInstallationPackages <$true | $false>] [-
AllowWiFi <$true | $false>] [-AlphanumericDevicePasswordRequired <$true |
$false>] [-ApprovedApplicationList <ApprovedApplicationCollection>] [-
AttachmentsEnabled <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DeviceEncryptionEnabled <$true | $false>] [-DevicePasswordEnabled <$true |
$false>] [-DevicePasswordExpiration <Unlimited>] [-DevicePasswordHistory
<Int32>] [-DevicePolicyRefreshInterval <Unlimited>] [-DomainController
<Fqdn>] [-IrmEnabled <$true | $false>] [-IsDefault <$true | $false>] [-
IsDefaultPolicy <$true | $false>] [-MaxAttachmentSize <Unlimited>] [-
MaxCalendarAgeFilter <All | TwoWeeks | OneMonth | ThreeMonths |
SixMonths>] [-MaxDevicePasswordFailedAttempts <Unlimited>] [-
MaxEmailAgeFilter <All | OneDay | ThreeDays | OneWeek | TwoWeeks |
OneMonth>] [-MaxEmailBodyTruncationSize <Unlimited>] [-
MaxEmailHTMLBodyTruncationSize <Unlimited>] [-MaxInactivityTimeDeviceLock
<Unlimited>] [-MinDevicePasswordComplexCharacters <Int32>] [-
MinDevicePasswordLength <Int32>] [-MobileOTAUpdateMode
<MajorVersionUpdates | MinorVersionUpdates | BetaVersionUpdates>] [-
Organization <OrganizationIdParameter>] [-PasswordRecoveryEnabled <$true |
$false>] [-RequireDeviceEncryption <$true | $false>] [-
RequireEncryptedSMIMEMessages <$true | $false>] [-
RequireEncryptionSMIMEAlgorithm <TripleDES | DES | RC2128bit | RC264bit |
RC240bit>] [-RequireManualSyncWhenRoaming <$true | $false>] [-
RequireSignedSMIMEAlgorithm <SHA1 | MD5>] [-RequireSignedSMIMEMessages
<$true | $false>] [-RequireStorageCardEncryption <$true | $false>] [-
UnapprovedInROMApplicationList <MultiValuedProperty>] [-UNCAccessEnabled
<$true | $false>] [-WhatIf [<SwitchParameter>]] [-WSSAccessEnabled <$true
| $false>]
```

Examples

EXAMPLE 1

This example creates the Mobile Device mailbox policy SalesPolicy that has several preconfigured values.

```
New-ActiveSyncMailboxPolicy -Name:"SalesPolicy" -
DevicePasswordEnabled:$true -
AlphanumericDevicePasswordRequired:$true -
PasswordRecoveryEnabled:$true -IsDefault:$false -
AttachmentsEnabled:$false -AllowStorageCard:$true
```

EXAMPLE 2

This example creates the Mobile Device mailbox policy Management that has several preconfigured values. Users assigned to this policy should have an Enterprise client access license (CAL) to use many of these features.

```
New-ActiveSyncMailboxPolicy -Name:"Management" -
AllowBluetooth:Allow -AllowBrowser:$true -AllowCamera:$true
-AllowPOPIMAPEmail:$false -DevicePasswordEnabled:$true -
AlphanumericDevicePasswordRequired:$true -
PasswordRecoveryEnabled:$true -MaxEmailAgeFilter:OneWeek -
AllowWiFi:$true -AllowStorageCard:$true
```

EXAMPLE 3

This example creates the Mobile Device mailbox policy Contoso that has several preconfigured values. This policy is configured to be the default policy for the organization. The default policy will be assigned to all new users.

```
New-ActiveSyncMailboxPolicy -Name:"Contoso" -
DevicePasswordEnabled:$true -
AlphanumericDevicePasswordRequired:$true -
PasswordRecoveryEnabled:$true -
MinDevicePasswordComplexCharacters:3 -IsDefault:$true -
DevicePasswordHistory:10
```

Detailed Description

The **New-ActiveSyncMailboxPolicy** cmdlet creates a Mobile Device mailbox policy for mailboxes accessed by mobile devices.

Note:
Some Mobile Device mailbox policy settings require the mobile device to have certain built-in features that enforce these security and device management settings. If your organization allows all devices, you must set the *AllowNonProvisionableDevices* parameter to `$true`. This allows devices that can't enforce all policy settings to synchronize with your server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the policy.
AllowApplePushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowApplePushNotifications* parameter specifies whether push notifications are allowed for Apple mobile devices. The default value is `$true`.
AllowBluetooth	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.BluetoothType	The *AllowBluetooth* parameter specifies whether the Bluetooth capabilities of the mobile phone are allowed. The available options are `Disable`, `HandsfreeOnly`, and `Allow`. The default value is `Allow`.
AllowBrowser	Optional	System.Boolean	The *AllowBrowser* parameter specifies whether Microsoft Pocket

			Internet Explorer is allowed on the mobile phone. The default value is `$true`. This parameter doesn't affect third-party browsers.
AllowCamera	Optional	System.Boolean	The *AllowCamera* parameter specifies whether the mobile phone's camera is allowed. The default value is `$true`.
AllowConsumerEmail	Optional	System.Boolean	The *AllowConsumerEmail* parameter specifies whether the mobile phone user can configure a personal email account on the device. The default value is `$true`.
AllowDesktopSync	Optional	System.Boolean	The *AllowDesktopSync* parameter specifies whether the mobile phone can synchronize with a desktop computer through a cable. The default value is `$true`.
AllowExternalDeviceManagement	Optional	System.Boolean	The *AllowExternalDeviceManagement* parameter specifies whether an external device

			management program is allowed to manage the device.
AllowHTMLEmail	Optional	System.Boolean	The *AllowHTMLEmail* parameter specifies whether HTML email is enabled on the device. The default value is `$true`.
AllowInternetSharing	Optional	System.Boolean	The *AllowInternetSharing* parameter specifies whether the mobile phone can be used as a modem to connect a computer to the Internet. The default value is `$true`.
AllowIrDA	Optional	System.Boolean	The *AllowIrDA* parameter specifies whether infrared connections are allowed to the mobile phone. The default value is `$true`.
AllowMobileOTAUpdate	Optional	System.Boolean	The *AllowMobileOTAUpdate* parameter specifies whether certain updates are seen by devices that implemented support for this restricting functionality. Further control can be specified via the *MobileOTAUpdateMode*

			parameter.
AllowNonProvisionableDevices	Optional	System.Boolean	When set to `$true`, the *AllowNonProvisionableDevices* parameter enables all devices to synchronize with the computer running Exchange, regardless of whether the device can enforce all the specific settings established in the Mobile Device mailbox policy. This also includes devices managed by a separate device management system. When set to `$false`, this parameter blocks these devices that aren't provisioned from synchronizing with the server running Exchange. The default value is `$false`.
AllowPOPIMAPEmail	Optional	System.Boolean	The *AllowPOPIMAPEmail* parameter specifies whether the user can configure a POP3 or IMAP4 email account on the device. The default value is `$true`.
AllowRemoteDesktop	Optional	System.Boolean	The *AllowRemoteDesktop*

			parameter specifies whether the mobile phone can initiate a remote desktop connection. The default value is `$true`.
AllowSimpleDevicePassword	Optional	System.Boolean	The *AllowSimpleDevicePassword* parameter specifies whether a simple device password is allowed. A simple device password is a password that has a specific pattern, such as 1111 or 1234. The default value is `$true`.
AllowSMIMEEncryptionAlgorithmNegotiation	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SMIMEEncryptionAlgorithmNegotiationType	The *AllowSMIMEEncryptionAlgorithmNegotiation* parameter specifies whether the messaging application on the device can negotiate the encryption algorithm in case a recipient's certificate doesn't support the specified encryption algorithm.
AllowSMIMESoftCerts	Optional	System.Boolean	The *AllowSMIMESoftCerts* parameter specifies whether S/MIME software certificates are allowed.

			The default value is `$true`.
AllowStorageCard	Optional	System.Boolean	The *AllowStorageCard* parameter specifies whether the device can access information stored on a storage card. The default value is `$true`.
AllowTextMessaging	Optional	System.Boolean	The *AllowTextMessaging* parameter specifies whether text messaging is allowed from the device. The default value is `$true`.
AllowUnsignedApplications	Optional	System.Boolean	The *AllowUnsignedApplications* parameter specifies whether unsigned applications can be installed on the device. The default value is `$true`.
AllowUnsignedInstallationPackages	Optional	System.Boolean	The *AllowUnsignedInstallationPackages* parameter specifies whether unsigned installation packages can be run on the device. The default value is `$true`.
AllowWiFi	Optional	System.Boolean	The *AllowWiFi* parameter specifies whether wireless Internet access is allowed

			on the device. The default value is `$true`.
AlphanumericDevicePasswordRequired	Optional	System.Boolean	The *AlphanumericDevicePasswordRequired* parameter specifies whether the device password must be alphanumeric. The default value is `$false`.
ApprovedApplicationList	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ApprovedApplicationCollection	The *ApprovedApplicationList* parameter specifies a list of approved applications for the device.
AttachmentsEnabled	Optional	System.Boolean	The *AttachmentsEnabled* parameter specifies whether the user can download attachments. When set to `$false`, the user is blocked from downloading attachments. The default value is `$true`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DeviceEncryptionEnabled	Optional	System.Boolean	The *DeviceEncryptionEnabled* parameter, when set to `$true`, enables device encryption on the mobile phone. The default value is `$false`. Currently, only the storage card can be encrypted on devices running Windows Mobile 6.0 or later. We recommend that you don't use this setting and use the *RequireStorageCardEncryption* parameter instead.
DevicePasswordEnabled	Optional	System.Boolean	When set to `$true`, the *DevicePasswordEnabled* parameter specifies that the user set a password for the device. The default value is `$false`.
DevicePasswordExpiration	Optional	Microsoft.Exchange.Data.Unlimited	The *DevicePasswordExpiration* parameter specifies the length of time, in days, that a password can be used. After this length of time, a new password must be created. The

			format of the parameter is *dd.hh.mm:ss*, for example, 24.00:00 = 24 hours.
DevicePasswordHistory	Optional	System.Int32	The *DevicePasswordHistory* parameter specifies the number of previously used passwords to store. When a user creates a password, the user can't reuse a stored password that was previously used.
DevicePolicyRefreshInterval	Optional	Microsoft.Exchange.Data.Unlimited	The *DevicePolicyRefreshInterval* parameter specifies how often the policy is sent from the server to the mobile phone
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IrmEnabled	Optional	System.Boolean	The *IrmEnabled*

			parameter specifies whether Information Rights Management (IRM) is enabled for the mailbox policy.
IsDefault	Optional	System.Boolean	The *IsDefault* parameter specifies whether this policy is the default Mobile Device mailbox policy. The default value is `$false`. If another policy is currently set as the default, setting this parameter replaces the old default policy with this policy.
IsDefaultPolicy	Optional	System.Boolean	The *IsDefault* parameter specifies whether this policy is the default Mobile Device mailbox policy. The default value is `$false`. If another policy is currently set as the default, setting this parameter replaces the old default policy with this policy.
MaxAttachmentSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxAttachmentSize* parameter specifies the maximum size of attachments that can be downloaded to the mobile

			phone. The default value is `Unlimited`.
MaxCalendarAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CalendarAgeFilterType	The *MaxCalendarAgeFilter* parameter specifies the maximum range of calendar days that can be synchronized to the device. Possible values are: • `All` • `TwoWeeks` • `OneMonth` • `ThreeMonths` • `SixMonths`
MaxDevicePasswordFailedAttempts	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxDevicePasswordFailedAttempts* parameter specifies the number of attempts a user can make to enter the correct password for the device. You can enter any number from 4 through 16. The default value is 8.
MaxEmailAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EmailAgeFilterType	The *MaxEmailAgeFilter* parameter specifies the maximum number of days of email items to synchronize to the device. Possible values are: • `All` • `OneDay` • `ThreeDays` • `OneWeek` • `TwoWeeks`

			• `OneMonth` • `ThreeMonths` • `SixMonths`
MaxEmailBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailBodyTruncationSize* parameter specifies the maximum size at which email messages are truncated when synchronized to the device. The value is specified in kilobytes (KB).
MaxEmailHTMLBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailHTMLBodyTruncationSize* parameter specifies the maximum size at which HTML-formatted email messages are synchronized to the device. The value is specified in KB.
MaxInactivityTimeDeviceLock	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInactivityTimeDeviceLock* parameter specifies the length of time that the device can be inactive before the password is required to reactivate the device. You can enter any interval between 30 seconds and 1 hour. The default value is 15 minutes. The format of the

			parameter is *hh.mm:ss*, for example, 15:00 = 15 minutes.
MinDevicePasswordComplexCharacters	Optional	System.Int32	The *MinDevicePasswordComplexCharacters* parameter specifies the minimum number of complex characters required in a device password. A complex character isn't a letter.
MinDevicePasswordLength	Optional	System.Int32	The *MinDevicePasswordLength* parameter specifies the minimum number of characters in the device password. You can enter any number from 1 through 16. The maximum length a password can be is 16 characters. The default value is 4.
MobileOTAUpdateMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MobileOTAUpdateModeType	The *MobileOTAUpdateMode* parameter specifies which updates can be seen by the devices that implemented support for this restricting

			functionality. It must be used in conjunction with the *AllowMobileOTAUpdate* parameter to function properly.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter specifies the organization in which you'll perform this action. This parameter doesn't accept wildcard characters, and you must use the exact name of the organization.
PasswordRecoveryEnabled	Optional	System.Boolean	The *PasswordRecoveryEnabled* parameter specifies whether you can store the recovery password for the device on an Exchange server. When set to `$true`, you can store the recovery password for the device on an Exchange server. The default value is `$false`. The recovery password can be viewed from either Microsoft Office Outlook Web App or the Exchange Administration Center.

RequireDeviceEncryption	Optional	System.Boolean	The *RequireDeviceEncryption* parameter specifies whether encryption is required on the device. The default value is `$false`.
RequireEncryptedSMIMEMessages	Optional	System.Boolean	The *RequireEncryptedSMIMEMessages* parameter specifies whether you must encrypt S/MIME messages. The default value is `$false`.
RequireEncryptionSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EncryptionSMIMEAlgorithmType	The *RequireEncryptionSMIMEAlgorithm* parameter specifies what required algorithm must be used when encrypting a message.
RequireManualSyncWhenRoaming	Optional	System.Boolean	The *RequireManualSyncWhenRoaming* parameter specifies whether the device must synchronize manually while roaming. The default value is `$false`.
RequireSignedSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemCo	The *RequireSignedSMIMEAlgo*

		nfiguration.SignedSMIMEAlgorithmType	*rithm* parameter specifies what required algorithm must be used when signing a message.
RequireSignedSMIMEMessages	Optional	System.Boolean	The *RequireSignedSMIMEMessages* parameter specifies whether the device must send signed S/MIME messages.
RequireStorageCardEncryption	Optional	System.Boolean	The *RequireStorageCardEncryption* parameter specifies whether encryption of a storage card is required. The default value is `$true`.
UnapprovedInROMApplicationList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnapprovedInROMApplicationList* parameter specifies a list of applications that can't be run in ROM.
UNCAccessEnabled	Optional	System.Boolean	The *UNCAccessEnabled* parameter specifies whether access to Microsoft Windows file shares is enabled. Access to specific shares is configured on the Microsoft Exchange ActiveSync virtual

			directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WSSAccessEnabled	Optional	System.Boolean	The *WSSAccessEnabled* parameter specifies whether access to Microsoft Windows SharePoint Services is enabled. Access to specific shares is configured on the Exchange ActiveSync virtual directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn’t accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn’t return data.

Remove-ActiveSyncMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-ActiveSyncMailboxPolicy** cmdlet to remove a specific Microsoft Mobile Device mailbox policy from a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ActiveSyncMailboxPolicy -Identity <MailboxPolicyIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Mobile Device mailbox policy SalesPolicy.

```
Remove-ActiveSyncMailboxPolicy -Identity "SalesPolicy"
```

EXAMPLE 2

This example removes the Mobile Device mailbox policy Default after confirmation is given.

```
Remove-ActiveSyncMailboxPolicy -Identity "Default" -Confirm
$true
```

EXAMPLE 3

This example removes the Mobile Device mailbox policy Management and bypasses any confirmation prompts.

```
Remove-ActiveSyncMailboxPolicy -Identity "Management" -
Force $true
```

Detailed Description

A Mobile Device mailbox policy is a group of settings that specifies how mobile phones connect to

Exchange. Exchange supports multiple Mobile Device mailbox policies. The **Remove-ActiveSyncMailboxPolicy** cmdlet enables you to remove a specific Mobile Device mailbox policy. If any users are assigned to the policy when you remove it, the **Remove-ActiveSyncMailboxPolicy** cmdlet fails.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the policy name.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies that the command should run immediately and bypass confirmation prompts.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ActiveSyncMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ActiveSyncMailboxPolicy** cmdlet to apply a variety of Mobile Device mailbox policy settings to a server. You can set any of the parameters by using one command.

For information about the parameter sets in the Syntax section below, see Syntax.

⚠Warning:

The **Set-ActiveSyncMailboxPolicy** cmdlet will be removed in a future version of Exchange. Use the **Set-MobileMailboxPolicy** cmdlet instead. If you have any scripts that use the **Set-ActiveSyncMailboxPolicy** cmdlet, update them to use the **Set-MobileMailboxPolicy** cmdlet.

```
Set-ActiveSyncMailboxPolicy -Identity <MailboxPolicyIdParameter> [-
AllowApplePushNotifications <$true | $false>] [-AllowBluetooth <Disable |
HandsfreeOnly | Allow>] [-AllowBrowser <$true | $false>] [-AllowCamera
<$true | $false>] [-AllowConsumerEmail <$true | $false>] [-
AllowDesktopSync <$true | $false>] [-AllowExternalDeviceManagement <$true
| $false>] [-AllowHTMLEmail <$true | $false>] [-AllowInternetSharing
<$true | $false>] [-AllowIrDA <$true | $false>] [-AllowMobileOTAUpdate
<$true | $false>] [-AllowNonProvisionableDevices <$true | $false>] [-
AllowPOPIMAPEmail <$true | $false>] [-AllowRemoteDesktop <$true | $false>]
[-AllowSimpleDevicePassword <$true | $false>] [-
AllowSMIMEEncryptionAlgorithmNegotiation <BlockNegotiation |
OnlyStrongAlgorithmNegotiation | AllowAnyAlgorithmNegotiation>] [-
AllowSMIMESoftCerts <$true | $false>] [-AllowStorageCard <$true | $false>]
[-AllowTextMessaging <$true | $false>] [-AllowUnsignedApplications <$true
| $false>] [-AllowUnsignedInstallationPackages <$true | $false>] [-
AllowWiFi <$true | $false>] [-AlphanumericDevicePasswordRequired <$true |
$false>] [-ApprovedApplicationList <ApprovedApplicationCollection>] [-
AttachmentsEnabled <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DeviceEncryptionEnabled <$true | $false>] [-DevicePasswordEnabled <$true |
$false>] [-DevicePasswordExpiration <Unlimited>] [-DevicePasswordHistory
<Int32>] [-DevicePolicyRefreshInterval <Unlimited>] [-DomainController
<Fqdn>] [-IrmEnabled <$true | $false>] [-IsDefault <$true | $false>] [-
IsDefaultPolicy <$true | $false>] [-MaxAttachmentSize <Unlimited>] [-
MaxCalendarAgeFilter <All | TwoWeeks | OneMonth | ThreeMonths |
SixMonths>] [-MaxDevicePasswordFailedAttempts <Unlimited>] [-
MaxEmailAgeFilter <All | OneDay | ThreeDays | OneWeek | TwoWeeks |
OneMonth>] [-MaxEmailBodyTruncationSize <Unlimited>] [-
MaxEmailHTMLBodyTruncationSize <Unlimited>] [-MaxInactivityTimeDeviceLock
<Unlimited>] [-MinDevicePasswordComplexCharacters <Int32>] [-
MinDevicePasswordLength <Int32>] [-MobileOTAUpdateMode
<MajorVersionUpdates | MinorVersionUpdates | BetaVersionUpdates>] [-Name
<String>] [-PasswordRecoveryEnabled <$true | $false>] [-
RequireDeviceEncryption <$true | $false>] [-RequireEncryptedSMIMEMessages
<$true | $false>] [-RequireEncryptionSMIMEAlgorithm <TripleDES | DES |
RC2128bit | RC264bit | RC240bit>] [-RequireManualSyncWhenRoaming <$true |
$false>] [-RequireSignedSMIMEAlgorithm <SHA1 | MD5>] [-
RequireSignedSMIMEMessages <$true | $false>] [-
RequireStorageCardEncryption <$true | $false>] [-
UnapprovedInROMApplicationList <MultiValuedProperty>] [-UNCAccessEnabled
<$true | $false>] [-WhatIf [<SwitchParameter>]] [-WSSAccessEnabled <$true
| $false>]
```

Examples

EXAMPLE 1

This example sets several policy settings for the Mobile Device mailbox policy SalesPolicy.

```
Set-ActiveSyncMailboxPolicy -Identity:SalesPolicy -
DevicePasswordEnabled:$true -
AlphanumericDevicePasswordRequired:$true -
PasswordRecoveryEnabled:$true -AttachmentsEnabled:$true -
MaxInactivityTimeDeviceLock:15:00 -IsDefault:$false
```

EXAMPLE 2

This example sets several policy settings for the Mobile Device mailbox policy Management.

```
Set-ActiveSyncMailboxPolicy -Identity:Management -
DevicePasswordEnabled:$true -
AlphanumericDevicePasswordRequired:$true -
PasswordRecoveryEnabled:$true -AllowCamera:$true  -
AllowWiFi:$false -AllowStorageCard:$true -
AllowPOPIMAPEmail:$false
```

EXAMPLE 3

This example sets several policy settings for the Mobile Device mailbox policy Default and requires confirmation before applying the settings.

```
Set-ActiveSyncMailboxPolicy -Identity:Default -
DevicePasswordEnabled:$true -
AlphanumericDevicePasswordRequired:$true -
PasswordRecoveryEnabled:$true -MaxEmailAgeFilter:ThreeDays
-AllowWiFi:$false -AllowStorageCard:$true -
AllowPOPIMAPEmail:$false -IsDefault:$true -
AllowTextMessaging:$true -Confirm:$true
```

Detailed Description

With the **Set-ActiveSyncMailboxPolicy** cmdlet, you can set each parameter in a mailbox policy.

Note:
Some Microsoft Mobile Device mailbox policy settings require the mobile device to have

specific built-in features that enforce these security and device management settings. If your organization allows all devices, you must set the *AllowNonProvisionableDevices* parameter to `$true`. This applies to devices that can't enforce all policy settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the Mobile Device mailbox policy.
AllowApplePushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowApplePushNotifications* parameter specifies whether push notifications are allowed to Apple mobile devices.
AllowBluetooth	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.BluetoothType	The *AllowBluetooth* parameter specifies whether the Bluetooth capabilities are allowed on the mobile phone. The available options are `Disable`, `HandsfreeOnly`, and `Allow`. The default value is `Allow`.
AllowBrowser	Optional	System.Boolean	The *AllowBrowser*

			parameter indicates whether Microsoft Pocket Internet Explorer is allowed on the mobile phone. The default value is `$true`. This parameter doesn't affect third-party browsers.
AllowCamera	Optional	System.Boolean	The *AllowCamera* parameter specifies whether the mobile phone's camera is allowed. The default value is `$true`.
AllowConsumerEmail	Optional	System.Boolean	The *AllowConsumerEmail* parameter specifies whether the mobile phone user can configure a personal email account on the mobile phone. The default value is `$true`. This parameter doesn't control access to emails using third-party mobile phone email programs.
AllowDesktopSync	Optional	System.Boolean	The *AllowDesktopSync* parameter specifies whether the mobile phone can synchronize with a desktop computer through a cable. The

			default value is `$true`.
AllowExternalDeviceManagement	Optional	System.Boolean	The *AllowExternalDeviceManagement* parameter specifies whether an external device management program is allowed to manage the mobile phone.
AllowHTMLEmail	Optional	System.Boolean	The *AllowHTMLEmail* parameter specifies whether HTML email is enabled on the mobile phone. The default value is `$true`. If set to `$false`, all email is converted to plain text before synchronization occurs.
AllowInternetSharing	Optional	System.Boolean	The *AllowInternetSharing* parameter specifies whether the mobile phone can be used as a modem to connect a computer to the Internet. The default value is `$true`.
AllowIrDA	Optional	System.Boolean	The *AllowIrDA* parameter specifies whether infrared connections are allowed to the mobile phone. The default value is `$true`.

AllowMobileOTAUpdate	Optional	System.Boolean	The *AllowMobileOTAUpdate* parameter specifies whether the Exchange ActiveSync mailbox policy can be sent to the mobile phone over a cellular data connection.
AllowNonProvisionableDevices	Optional	System.Boolean	The *AllowNonProvisionableDevices* parameter specifies whether all mobile phones can synchronize with the server running Exchange. When set to `$true`, the *AllowNonProvisionableDevices* parameter enables all mobile phones to synchronize with the Exchange server, regardless of whether the phone can enforce all the specific settings established in the Mobile Device mailbox policy. This also includes mobile phones managed by a separate device management system. When set to `$false`, this parameter blocks mobile

			phones that aren't provisioned from synchronizing with the Exchange server. The default value is `$false`.
AllowPOPIMAPEmail	Optional	System.Boolean	The *AllowPOPIMAPEmail* parameter specifies whether the user can configure a POP3 or IMAP4 email account on the mobile phone. The default value is `$true`. This parameter doesn't control access by third-party email programs.
AllowRemoteDesktop	Optional	System.Boolean	The *AllowRemoteDesktop* parameter specifies whether the mobile phone can initiate a remote desktop connection. The default value is `$true`.
AllowSimpleDevicePassword	Optional	System.Boolean	The *AllowSimpleDevicePassword* parameter specifies whether a simple device password is allowed. A simple device password is a password that has a specific pattern, such as 1111 or 1234. The default value is `$true`.

AllowSMIMEEncryptionAlgorithmNegotiation	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SMIMEEncryptionAlgorithmNegotiationType	The *AllowSMIMEEncryptionAlgorithmNegotiation* parameter specifies whether the messaging application on the mobile phone can negotiate the encryption algorithm if a recipient's certificate doesn't support the specified encryption algorithm.
AllowSMIMESoftCerts	Optional	System.Boolean	The *AllowSMIMESoftCerts* parameter specifies whether S/MIME software certificates are allowed. The default value is `$true`.
AllowStorageCard	Optional	System.Boolean	The *AllowStorageCard* parameter specifies whether the mobile phone can access information stored on a storage card. The default value is `$true`.
AllowTextMessaging	Optional	System.Boolean	The *AllowTextMessaging* parameter specifies whether text messaging is allowed from the mobile phone. The default value is `$true`.
AllowUnsignedApplications	Optional	System.Boolean	The *AllowUnsignedApplication*

			s parameter specifies whether unsigned applications can be installed on the mobile phone. The default value is `$true`.
AllowUnsignedInstallationPackages	Optional	System.Boolean	The *AllowUnsignedInstallationPackages* parameter specifies whether unsigned installation packages can be executed on the mobile phone. The default value is `$true`.
AllowWiFi	Optional	System.Boolean	The *AllowWiFi* parameter specifies whether wireless Internet access is allowed on the mobile phone. The default value is `$true`.
AlphanumericDevicePasswordRequired	Optional	System.Boolean	The *AlphanumericDevicePasswordRequired* parameter specifies whether the password for the mobile phone must be alphanumeric. The default value is `$false`.
ApprovedApplicationList	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ApprovedApplicationCollection	The *ApprovedApplicationList* parameter specifies a list of approved applications

			for the mobile phone.
AttachmentsEnabled	Optional	System.Boolean	The *AttachmentsEnabled* parameter specifies whether attachments can be downloaded. When set to `$false`, the *AttachmentsEnabled* parameter blocks the user from downloading attachments. The default value is `$true`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeviceEncryptionEnabled	Optional	System.Boolean	The *DeviceEncryptionEnabled* parameter specifies whether encryption is enabled. The *DeviceEncryptionEnabled* parameter, when set to `$true`, enables device encryption on the mobile phone. The default value

			is `$false`.
DevicePasswordEnabled	Optional	System.Boolean	The *DevicePasswordEnabled* parameter specifies whether a password is required. When set to `$true`, the *DevicePasswordEnabled* parameter requires that the user set a password for the mobile phone. The default value is `$false`.
DevicePasswordExpiration	Optional	Microsoft.Exchange.Data.Unlimited	The *DevicePasswordExpiration* parameter specifies the length of time, in days, that a password can be used. After this length of time, a new password must be created. The format of the parameter is *dd.hh.mm*:*ss*, for example, 24.00:00 = 24 hours.
DevicePasswordHistory	Optional	System.Int32	The *DevicePasswordHistory* parameter specifies the number of previously used passwords to store. When a user creates a password, the user can't

			reuse a stored password that was previously used.
DevicePolicyRefreshInterval	Optional	Microsoft.Exchange.Data.Unlimited	The *DevicePolicyRefreshInterval* parameter specifies how often the policy is sent from the server to the mobile phone.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IrmEnabled	Optional	System.Boolean	The *IrmEnabled* parameter specifies whether Information Rights Management (IRM) is enabled for the mailbox policy.
IsDefault	Optional	System.Boolean	The *IsDefault* parameter specifies whether this policy is the default Mobile Device mailbox policy. The default value is `$false`. If another policy

			is currently set as the default, setting this parameter replaces the old default policy with this policy.
IsDefaultPolicy	Optional	System.Boolean	The *IsDefault* parameter specifies whether this policy is the default Mobile Device mailbox policy. The default value is `$false`. If another policy is currently set as the default, setting this parameter replaces the old default policy with this policy.
MaxAttachmentSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxAttachmentSize* parameter specifies the maximum size of attachments that can be downloaded to the mobile phone. The default value is `Unlimited`.
MaxCalendarAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CalendarAgeFilterType	The *MaxCalendarAgeFilter* parameter specifies the maximum range of calendar days that can be synchronized to the device. The value is specified by entering one of the following values:

			• `All` • `OneDay` • `ThreeDays` • `OneWeek` • `TwoWeeks` • `OneMonth`
MaxDevicePasswordFailedAttempts	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxDevicePasswordFailedAttempts* parameter specifies the number of attempts a user can make to enter the correct password for the mobile phone. You can enter any number from 4 through 16. The default value is `8`.
MaxEmailAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EmailAgeFilterType	The *MaxEmailAgeFilter* parameter specifies the maximum number of days of email items to synchronize to the mobile phone. The value is specified by entering one of the following values. • `All` • `OneDay` • `ThreeDays` • `OneWeek` • `TwoWeeks` • `OneMonth`
MaxEmailBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailBodyTruncationSize* parameter specifies the maximum size at which email messages are truncated when synchronized to the

			mobile phone. The value is specified in kilobytes (KB).
MaxEmailHTMLBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailHTMLBodyTruncationSize* parameter specifies the maximum size at which HTML-formatted email messages are synchronized to the mobile phone. The value is specified in KB.
MaxInactivityTimeDeviceLock	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInactivityTimeDeviceLock* parameter specifies the length of time that the mobile phone can be inactive before the password is required to reactivate it. You can enter any interval between 30 seconds and 1 hour. The default value is 15 minutes. The format of the parameter is *hh.mm:ss*, for example, 15:00 = 15 minutes.
MinDevicePasswordComplexCharacters	Optional	System.Int32	The *MinDevicePasswordComplexCharacters* parameter specifies the minimum

			number of complex characters required in a mobile phone password. A complex character isn't a letter.
MinDevicePasswordLength	Optional	System.Int32	The *MinDevicePasswordLength* parameter specifies the minimum number of characters in the device password. You can enter any number from 1 through 16. The maximum length a password can be is 16 characters. The default value is 4.
MobileOTAUpdateMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MobileOTAUpdateModeType	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	The *Name* parameter specifies the friendly name of the Mobile Device mailbox policy.
PasswordRecoveryEnabled	Optional	System.Boolean	The *PasswordRecoveryEnabled* parameter specifies whether the recovery password for the mobile phone is stored on an

			Exchange server. When set to `$true`, the *PasswordRecoveryEnabled* parameter enables you to store the recovery password for the mobile phone on an Exchange server. The default value is `$false`. The recovery password can be viewed from either Microsoft Office Outlook Web App or the Exchange Administration Center.
RequireDeviceEncryption	Optional	System.Boolean	The *RequireDeviceEncryption* parameter specifies whether encryption is required on the device. The default value is `$false`.
RequireEncryptedSMIMEMessages	Optional	System.Boolean	The *RequireEncryptedSMIMEMessages* parameter specifies whether you must encrypt S/MIME messages. The default value is `$false`.
RequireEncryptionSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.Encryption	The *RequireEncryptionSMIMEAlgorithm* parameter

		SMIMEAlgorithmType	specifies what required algorithm must be used when encrypting a message.
RequireManualSyncWhenRoaming	Optional	System.Boolean	The *RequireManualSyncWhenRoaming* parameter specifies whether the mobile phone must synchronize manually while roaming. The default value is `$false`.
RequireSignedSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SignedSMIMEAlgorithmType	The *RequireSignedSMIMEAlgorithm* parameter specifies what required algorithm must be used when signing a message.
RequireSignedSMIMEMessages	Optional	System.Boolean	The *RequireSignedSMIMEMessages* parameter specifies whether the mobile phone must send signed S/MIME messages.
RequireStorageCardEncryption	Optional	System.Boolean	The *RequireStorageCardEncryption* parameter specifies whether storage card encryption is enabled for the mailbox policy. Setting this parameter to `$true`

			also sets the *DeviceEncryptionEnabled* parameter to `$true`.
UnapprovedInROMApplicationList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnapprovedInROMApplicationList* parameter contains a list of applications that can't be run in ROM.
UNCAccessEnabled	Optional	System.Boolean	The *UNCAccessEnabled* parameter specifies whether access to Microsoft Windows file shares is enabled. Access to specific shares is configured on the Exchange ActiveSync virtual directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WSSAccessEnabled	Optional	System.Boolean	The *WSSAccessEnabled*

			parameter specifies whether access to Microsoft Windows SharePoint Services is enabled. Access to specific shares is configured on the Exchange ActiveSync virtual directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncOrganizationSettings

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-ActiveSyncOrganizationSettings** cmdlet to retrieve the Microsoft Exchange ActiveSync settings for your Microsoft Exchange Server 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ActiveSyncOrganizationSettings [-Identity
<ActiveSyncOrganizationSettingsIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the Exchange ActiveSync organization settings for the domain Contoso.com.

```
Get-ActiveSyncOrganizationSettings -Identity "Contoso.com"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ActiveSyncOrganizationSettingsIdParameter	The *Identity* parameter specifies the unique identifier for the Exchange organization.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ActiveSyncOrganizationSettings

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-ActiveSyncOrganizationSettings** cmdlet to set the Microsoft Exchange ActiveSync settings for the organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ActiveSyncOrganizationSettings [-Identity
<ActiveSyncOrganizationSettingsIdParameter>] [-AdminMailRecipients
<MultiValuedProperty>] [-AllowAccessForUnSupportedPlatform <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DefaultAccessLevel <Allow |
Block | Quarantine>] [-DomainController <Fqdn>] [-
OtaNotificationMailInsert <String>] [-UserMailInsert <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the default access level to quarantine and sets two administrative email addresses.

```
Set-ActiveSyncOrganizationSettings -DefaultAccessLevel
Quarantine -AdminMailRecipients
will@contoso.com,roger@contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AdminMailRecipients	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AdminMailRecipients* parameter specifies the email addresses of the administrators for reporting purposes. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...;`

			`Remove="<value1>","<value2>"...}`.
AllowAccessForUnSupportedPlatform	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DefaultAccessLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DeviceAccessLevel	The *DefaultAccessLevel* parameter specifies the access level for new devices. Valid values are `Allow`, `Block` or `Quarantine`. The default value is `Allow`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ActiveSyncOrganizationSettingsIdParameter	The *Identity* parameter specifies the ActiveSync organization settings object. The default name of this object is `Mobile Mailbox Settings`.
OtaNotificationMailInsert	Optional	System.String	The *OtaNotificationMailInsert* parameter specifies a string of information to be stored and included within an email message to users with Windows Mobile 6.1 devices in the event that the devices need to update their Microsoft Outlook Mobile software to use the new Exchange ActiveSync features in Microsoft Exchange Server 2013.
UserMailInsert	Optional	System.String	The *UserMailInsert* parameter specifies an informational footer that's added to the

			email message sent to users when their mobile device isn't synchronized because the device is quarantined.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ActiveSyncVirtualDirectory

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ActiveSyncVirtualDirectory** cmdlet to retrieve the Microsoft Exchange ActiveSync settings configured on the Exchange ActiveSync website.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ActiveSyncVirtualDirectory -Server <ServerIdParameter> <COMMON
PARAMETERS>

Get-ActiveSyncVirtualDirectory [-Identity <VirtualDirectoryIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the settings for the Exchange ActiveSync virtual directory on the server CAS-01.

```
Get-ActiveSyncVirtualDirectory -Server "CAS-01"
```

EXAMPLE 2

This example returns the settings for a specific Exchange ActiveSync virtual directory on the server CAS-01.

```
Get-ActiveSyncVirtualDirectory -Server "CAS-01" -Identity
"Microsoft-Server-ActiveSync"
```

EXAMPLE 3

This example returns the settings for the Exchange ActiveSync virtual directory on the server CAS-01, for the domain controller DOM-01.

```
Get-ActiveSyncVirtualDirectory -Server "CAS-01" -
DomainController "DOM-01"
```

Detailed Description

Microsoft Exchange Server 2013 contains a default virtual directory that Exchange ActiveSync

mobile devices use to synchronize with the server. You can create multiple virtual directories and assign different devices to different directories. The **Get-ActiveSyncVirtualDirectory** cmdlet retrieves a variety of settings for the virtual directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter uniquely identifies a physical server. When this parameter is set, the command returns information configured on all virtual directories available on that server.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter uniquely identifies an Exchange ActiveSync virtual directory on a physical server. If this value isn't set, this command returns information configured on all Exchange ActiveSync websites available across all Client Access servers in the Exchange organization.
ShowBackEndVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowBackEndVirtualDirectories* parameter controls whether the virtual directories on the Mailbox server are shown in the Exchange Administration Center.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* parameter controls whether the virtual directories on the Mailbox server are

			shown in the Exchange Administration Center.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ActiveSyncVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-ActiveSyncVirtualDirectory** cmdlet to create Microsoft Exchange ActiveSync virtual directories on your specified websites.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-ActiveSyncVirtualDirectory [-ApplicationRoot <String>] [-AppPoolId
<String>] [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
ExtendedProtectionFlags <MultiValuedProperty>] [-ExtendedProtectionSPNList
<MultiValuedProperty>] [-ExtendedProtectionTokenChecking <None | Allow |
Require>] [-ExternalAuthenticationMethods <MultiValuedProperty>] [-
ExternalUrl <Uri>] [-InstallProxySubDirectory <$true | $false>] [-
InternalAuthenticationMethods <MultiValuedProperty>] [-InternalUrl <Uri>]
[-Path <String>] [-Role <ClientAccess | Mailbox>] [-Server
<ServerIdParameter>] [-WebSiteName <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an Exchange ActiveSync virtual directory and specifies the external URL used to connect to the virtual directory.

```
New-ActiveSyncVirtualDirectory -WebSiteName "Default Web
```

```
Site" -ExternalUrl http://www.contoso.com/Microsoft-Server-
ActiveSync
```

EXAMPLE 2

This example creates an Exchange ActiveSync virtual directory and specifies the external and internal URLs used to connect to the virtual directory.

```
New-ActiveSyncVirtualDirectory -WebSiteName "Default Web
Site" -ExternalUrl http://www.contoso.com/mail -InternalUrl
http://contoso/mail
```

EXAMPLE 3

This example creates an Exchange ActiveSync virtual directory for the company Fourth Coffee.

```
New-ActiveSyncVirtualDirectory -WebSiteName "Default Web
Site" -ExternalUrl "http://www.fourthcoffee.com/Microsoft-
Server-ActiveSync"
```

Detailed Description

The **New-ActiveSyncVirtualDirectory** cmdlet creates an Exchange ActiveSync virtual directory on the specified server under the specified website. The Exchange ActiveSync virtual directory created is named Microsoft-Server-ActiveSync. Only one Exchange ActiveSync virtual directory can exist in each Exchange ActiveSync website.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationRoot	Optional	System.String	The *ApplicationRoot* parameter specifies the metabase path of the virtual directory. By default, this path is the same as the website in which the virtual

			directory is created.
AppPoolId	Optional	System.String	The *AppPoolId* parameter specifies the pool of programs that can be used with the virtual directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a

			proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was

			established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an

			FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN` value. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this

			virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for

			Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalAuthenticationMethods* parameter specifies the authentication methods supported by the server that contains the virtual directory when access is requested from outside the network's firewall. If this

			parameter isn't set, all authentication methods can be used.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the URL used to connect to the virtual directory from outside the network's firewall.
InstallProxySubDirectory	Optional	System.Boolean	The *InstallProxySubDirectory* parameter controls the creation of the new Exchange ActiveSync subdirectory used for proxying between Microsoft Exchange Server 2013 and previous versions of Exchange.
InternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalAuthenticationMethods* parameter specifies the authentication methods supported by the server that contains the virtual directory when access is requested from inside the network's firewall. If this parameter isn't set, all authentication methods can be used.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter

			specifies the URL used to connect to the virtual directory from inside the network's firewall.
Path	Optional	System.String	The *Path* parameter sets the directory that contains the virtual directory's system files.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter specifies the configuration that should be used when the virtual directory is created. The following are the values that can be used with this parameter: 1. **FrontEnd** configure the virtual directory for use on a Client Access server 2. **BackEnd** Configure the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to create the virtual directory. You can use any value that uniquely identifies the server, for example: 1. Name 2. FQDN 3. Distinguished name

			(DN) 4. Exchange Legacy DN If you don't use the *Server* parameter, the virtual directory will be created on the server where the Remote PowerShell session is established This will always be a Mailbox server. If you want to create the virtual directory on a Client Access server or another Mailbox server, you must use the *Server* parameter.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the name of the Exchange ActiveSync website in which to create the virtual directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ActiveSyncVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ActiveSyncVirtualDirectory** cmdlet to delete an existing Microsoft Exchange ActiveSync virtual directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ActiveSyncVirtualDirectory -Identity <VirtualDirectoryIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the default Exchange ActiveSync virtual directory from the server Contoso.

```
Remove-ActiveSyncVirtualDirectory contoso\Microsoft-Server-
ActiveSync
```

EXAMPLE 2

This example removes the default Exchange ActiveSync virtual directory from the server Contoso after confirmation is given.

```
Remove-ActiveSyncVirtualDirectory contoso\Microsoft-Server-
```

```
ActiveSync -Confirm $true
```

EXAMPLE 3

This example removes a custom Exchange ActiveSync virtual directory from the server Contoso.

```
Remove-ActiveSyncVirtualDirectory contoso\EAS
```

Detailed Description

When the Exchange ActiveSync virtual directory is removed from a specified server and website, the virtual directory is also removed from Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter uniquely identifies the Exchange ActiveSync virtual directory to be deleted.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ActiveSyncVirtualDirectory

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ActiveSyncVirtualDirectory** cmdlet to configure the Microsoft Exchange ActiveSync settings on a specified virtual directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ActiveSyncVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
ActiveSyncServer <String>] [-BadItemReportingEnabled <$true | $false>] [-
BasicAuthEnabled <$true | $false>] [-ClientCertAuth <Ignore | Accepted |
Required>] [-CompressionEnabled <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExtendedProtectionFlags
<MultiValuedProperty>] [-ExtendedProtectionSPNList <MultiValuedProperty>]
[-ExtendedProtectionTokenChecking <None | Allow | Require>] [-
ExternalAuthenticationMethods <MultiValuedProperty>] [-ExternalUrl <Uri>]
[-InstallIsapiFilter <$true | $false>] [-InternalAuthenticationMethods
<MultiValuedProperty>] [-InternalUrl <Uri>] [-
MobileClientCertificateAuthorityURL <String>] [-
MobileClientCertificateProvisioningEnabled <$true | $false>] [-
MobileClientCertTemplateName <String>] [-Name <String>] [-
RemoteDocumentsActionForUnknownServers <Allow | Block>] [-
RemoteDocumentsAllowedServers <MultiValuedProperty>] [-
RemoteDocumentsBlockedServers <MultiValuedProperty>] [-
RemoteDocumentsInternalDomainSuffixList <MultiValuedProperty>] [-
SendWatsonReport <$true | $false>] [-WhatIf [<SwitchParameter>]] [-
WindowsAuthEnabled <$true | $false>]
```

Examples

EXAMPLE 1

This example disables Basic authentication on the default Exchange ActiveSync virtual directory on the server Contoso.

```
Set-ActiveSyncVirtualDirectory -Identity "contoso
\Microsoft-Server-ActiveSync" -BasicAuthEnabled:$false
```

EXAMPLE 2

This example enables bad item reporting and turns on the option to send Watson reports for errors on the server Contoso.

```
Set-ActiveSyncVirtualDirectory -Identity "contoso
\Microsoft-Server-ActiveSync" -
BadItemReportingEnabled:$true -SendWatsonReport:$true
```

EXAMPLE 3

This example configures the external URL on the default Exchange ActiveSync virtual directory on

the server Contoso.

```
Set-ActiveSyncVirtualDirectory -Identity "contoso
\Microsoft-Server-ActiveSync" -ExternalUrl "http://
contoso.com/mail"
```

Detailed Description

The **Set-ActiveSyncVirtualDirectory** cmdlet configures a variety of settings on the virtual directory used for Exchange ActiveSync including security, authentication, and internal and external URL settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter uniquely identifies the Exchange ActiveSync virtual directory to be configured. This value must be *website* \Microsoft-Server-ActiveSync.
ActiveSyncServer	Optional	System.String	The *ActiveSyncServer* parameter specifies the URL of the Client Access server. This value is in the following format: https://*servername*/Microsoft-Server-ActiveSync.
BadItemReportingEna	Optional	System.Boolean	The

bled			*BadItemReportingEnabled* parameter specifies whether items that can't be synchronized should be reported to the user. If set to `$true`, the user receives a notification when an item can't be synchronized to the mobile phone.
BasicAuthEnabled	Optional	System.Boolean	The *BasicAuthEnabled* parameter enables or disables Basic authentication. The default setting is `$true`.
ClientCertAuth	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ClientCertAuthTypes	The *ClientCertAuth* parameter specifies the status of client certificate authentication. By default, client certificate authentication is disabled. The default setting is `Ignore`.
CompressionEnabled	Optional	System.Boolean	The *CompressionEnabled* parameter is a Boolean value that identifies the compression applied to the specified Exchange ActiveSync virtual directory. The default setting is `$true`.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in

			the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a

			secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example,

			ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is

			the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for

			Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalAuthenticationMethods* parameter specifies the authentication methods supported by the server that contains the virtual directory when access is requested from

			outside the network firewall. If this parameter isn't set, all authentication methods can be used.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the URL used to connect to the virtual directory from outside the network firewall.
InstallIsapiFilter	Optional	System.Boolean	The *InstallIsapiFilter* parameter specifies whether the Internet Server API (ISAPI) filter is installed.
InternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalAuthenticationMethods* parameter specifies the authentication methods supported by the server that contains the virtual directory when access is requested from inside the network firewall. If this parameter isn't set, all authentication methods can be used.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter is used for the Client Access server HTTP Proxy feature. If it's set, the Client Access server

			receiving the incoming client connections proxies the requests to this URL. This can be an Internet-facing FQDN URL or an internal host name.
MobileClientCertificateAuthorityURL	Optional	System.String	The *MobileClientCertificateAuthorityURL* parameter specifies the URL for the certification authority (CA) used by the mobile phone.
MobileClientCertificateProvisioningEnabled	Optional	System.Boolean	The *MobileClientCertificateProvisioningEnabled* parameter specifies whether the Autodiscover service returns the Certificate Services server URL in the XML file.
MobileClientCertTemplateName	Optional	System.String	The *MobileClientCertTemplateName* parameter specifies the template name for the client certificate.
Name	Optional	System.String	The *Name* parameter specifies the name of the Exchange ActiveSync virtual directory.
RemoteDocumentsAct	Optional	Microsoft.Exchange.Da	The

ionForUnknownServers		ta.Directory.SystemConfiguration.RemoteDocumentsActions	*RemoteDocumentsActionForUnknownServers* parameter specifies the action that occurs when a Microsoft Windows SharePoint Services or Microsoft Windows file share request comes in via Exchange ActiveSync. When a request arrives, Exchange ActiveSync looks for the requested host name in the Allow and Block lists. If the host name isn't found in either list, the action specified in this parameter, either `Block` or `Allow`, is performed.
RemoteDocumentsAllowedServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RemoteDocumentsAllowedServers* parameter is a multivalued property that lists all the allowed servers for remote document access.
RemoteDocumentsBlockedServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RemoteDocumentsBlockedServers* parameter is a multivalued property that lists all the blocked servers for remote

			document access.
RemoteDocumentsInternalDomainSuffixList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RemoteDocumentsInternalDomainSuffixList* parameter is used in organizations that don't run Windows Internet Name Service (WINS) in their network. In these environments, you can specify one or more FQDNs that Exchange ActiveSync treats as internal when a request for remote file access is received.
SendWatsonReport	Optional	System.Boolean	The *SendWatsonReport* parameter specifies whether a Watson report is sent for errors and events.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.
WindowsAuthEnabled	Optional	System.Boolean	The *WindowsAuthEnabled* parameter specifies whether Integrated Windows authentication is enabled. The default value is `$false`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AuthRedirect

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AuthRedirect** cmdlet to view OAuth redirection settings for Microsoft Exchange 2010 Client Access servers in your Microsoft Exchange 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AuthRedirect [-Identity <AuthRedirectIdParameter>] [-DomainController
<Fqdn>]
```

Examples

Example 1

This example shows a summary list of all the OAuth redirection objects.

```
Get-AuthRedirect
```

Example 2

This example retrieves details about the OAuth redirection object named `AuthRedirect-Bearer-C0B7AC3F-FE64-4B4B-A907-9226F8027CCE`

```
Get-AuthRedirect AuthRedirect-Bearer-C0B7AC3F-FE64-4B4B-A907-9226F8027CCE | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "OAuth authentication redirection settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AuthRedirectIdParameter	The *Identity* parameter specifies the existing OAuth redirection object that you want to view. The object name uses the syntax `AuthRedirect-Bearer-<GUID>`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AuthRedirect

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-AuthRedirect** cmdlet to create OAuth redirection settings for Microsoft Exchange 2010 Client Access servers in your Microsoft Exchange 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-AuthRedirect -AuthScheme <Unknown | Bearer> -TargetUrl <String> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example creates an OAuth redirection object with the following settings:

- **AuthScheme** Bearer
- **TargetURL** http://cas.contoso.com

```
New-AuthRedirect -AuthScheme Bearer -TargetURL http://
cas.contoso.com
```

Detailed Description

Exchange 2010 Client Access servers don't support OAuth authentication requests. Use this cmdlet

to redirect OAuth authentication requests to an Exchange 2013 Client Access server. This cmdlet is only useful if your organization has Exchange 2010 Client Access servers.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "OAuth authentication redirection settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AuthScheme	Required	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthScheme	The *AuthScheme* parameter specifies the authentication scheme that's used by the authentication redirection object. Typically, this value is `Bearer`.
TargetUrl	Required	System.String	The *TargetUrl* parameter specifies the FQDN of the Exchange 2013 Client Access server that will process the Oauth request.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value

			with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AuthRedirect

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-AuthRedirect** cmdlet to remove OAuth redirection settings for Microsoft Exchange 2010 Client Access servers in your Microsoft Exchange 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-AuthRedirect -Identity <AuthRedirectIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the existing OAuth redirection object named `AuthRedirect-Bearer-C0B7AC3F-FE64-4B4B-A907-9226F8027CCE`.

```
Remove-AuthRedirect AuthRedirect-Bearer-C0B7AC3F-FE64-4B4B-A907-9226F8027CCE
```

Example 2

This example is the same as the first example. However, if you have only one authentication redirection object in your organization, you can use **Get-AuthRedirect** to pipe the *Identity* value to the **Remove-AuthRedirect** cmdlet.

```
Get-AuthRedirect | Remove-AuthRedirect
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "OAuth authentication redirection settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AuthRedirectIdParameter	The *Identity* parameter specifies the existing OAuth redirection object that you want to remove. The object name uses the syntax `AuthRedirect-Bearer-<GUID>`. The easiest way to find the name of the OAuth redirection object is to run **Get-AuthRedirect**.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AuthRedirect

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AuthRedirect** cmdlet to modify the existing OAuth redirection settings for Microsoft Exchange 2010 Client Access servers in your Microsoft Exchange 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AuthRedirect -Identity <AuthRedirectIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-TargetUrl <String>] [-
WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example sets the *TargetURL* value to http://cas01.contoso.com for the existing OAuth redirection object named `AuthRedirect-Bearer-C0B7AC3F-FE64-4B4B-A907-9226F8027CCE`.

```
Set-AuthRedirect AuthRedirect-Bearer-C0B7AC3F-FE64-4B4B-
A907-9226F8027CCE -TargetUrl http://cas01.contoso.com
```

Example 2

This example is the same as the first example. However, if you have only one authentication redirection object in your organization, you can use **Get-AuthRedirect** to pipe the *Identity* value to the **Set-AuthRedirect** cmdlet.

```
Get-AuthRedirect | Set-AuthRedirect -TargetUrl http://
cas01.contoso.com
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "OAuth authentication redirection settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AuthRedirectIdParameter	The *Identity* parameter specifies the existing OAuth redirection object that you want to modify. The object name uses the syntax `AuthRedirect-Bearer-<GUID>`. The easiest way to find the name of the

			OAuth redirection object is to run **Get-AuthRedirect**.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
TargetUrl	Optional	System.String	The *TargetUrl* parameter specifies the FQDN of the Exchange 2013 Client Access server that will process the Oauth request.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-AutoDiscoverConfig

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Export-AutoDiscoverConfig** cmdlet to create or update a service connection point for an Autodiscover service pointer in a target Exchange forest on a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Export-AutoDiscoverConfig -TargetForestDomainController <String> [-Confirm
[<SwitchParameter>]] [-DeleteConfig <$true | $false>] [-DomainController
<Fqdn>] [-MultipleExchangeDeployments <$true | $false>] [-
PreferredSourceFqdn <Fqdn>] [-SourceForestCredential <PSCredential>] [-
TargetForestCredential <PSCredential>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a service connection point object to connect to another Active Directory forest so that Outlook 2010 or Outlook 2007 clients can automatically connect to their mailbox without having to set up a profile.

```
Export-AutoDiscoverConfig -TargetForestDomainController
targetForestName
```

EXAMPLE 2

This example specifies that Exchange 2013 is deployed in more than one Active Directory forest while establishing an Autodiscover service connection point to the target domain controller in another Active Directory forest.

```
Export-AutoDiscoverConfig -TargetForestDomainController
targetForestName -MultipleExchangeDeployments $true
```

Detailed Description

The Autodiscover service connection point pointer resides in Active Directory and contains the names of the Exchange Web Services URLs.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
TargetForestDomainController	Required	System.String	The *TargetForestDomainController* parameter specifies the domain controller that you want to export the

			Autodiscover configuration to.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeleteConfig	Optional	System.Boolean	The *DeleteConfig* parameter causes the command to delete your configuration settings on the service connection point object.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
MultipleExchangeDeployments	Optional	System.Boolean	The *MultipleExchangeDeployments* parameter

			specifies whether multiple Exchange deployments exist. This setting should be set to `$true` only if Exchange 2013 is deployed in more than one Active Directory forest, and the forests are connected. If set to `$true`, the list of authoritative accepted domains for the source forest is written to the Autodiscover service connection point object. Microsoft Outlook 2010 and Office Outlook 2007 clients use this object to select the most appropriate forest to search for the Autodiscover service.
PreferredSourceFqdn	Optional	Microsoft.Exchange.Data.Fqdn	The *PreferredSourceFqdn* parameter specifies the FQDN of the Active Directory domain for the Autodiscover pointer service connection point

			object.
SourceForestCredential	Optional	System.Management.Automation.PSCredential	The *SourceForestCredential* parameter specifies the credentials to use when connecting to the source forest.
TargetForestCredential	Optional	System.Management.Automation.PSCredential	The *TargetForestCredential* parameter specifies the credentials to use to connect to the target forest.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AutodiscoverVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AutodiscoverVirtualDirectory** cmdlet to retrieve the settings for the Autodiscover virtual directory on a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AutodiscoverVirtualDirectory -Server <ServerIdParameter> <COMMON
PARAMETERS>

Get-AutodiscoverVirtualDirectory [-Identity <VirtualDirectoryIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns settings for the Autodiscover virtual directory under the default website in IIS on the Client Access server CAS01 for the autodiscover.contoso.com site.

```
Get-AutodiscoverVirtualDirectory -Server CAS01 -Identity
"CAS01\autodiscover(autodiscover.contoso.com)"
```

EXAMPLE 2

This example returns settings for the Autodiscover virtual directory located on the Client Access server CAS01 by querying Active Directory using the domain controller specified.

```
Get-AutodiscoverVirtualDirectory -DomainController Exch1 -
```

```
Server CAS01
```

Detailed Description

You can run the **Get-AutodiscoverVirtualDirectory** cmdlet on a local server or run it remotely if the server name is specified in the *Identity* or *Server* parameters. You can also run this cmdlet without parameters to retrieve the configuration settings from all Autodiscover virtual directories on all Internet Information Services (IIS) websites located on the Client Access servers in the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name or GUID of the Client Access server that hosts the virtual directories that you want to display.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the virtual directory and website for the Autodiscover virtual directory.
ShowBackendVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowBackendVirtualDirectories* switch specifies whether to list the virtual directories located on the Mailbox servers within the organization.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch specifies whether to list the virtual directories located on the Mailbox servers within the organization.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input

Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AutodiscoverVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-AutodiscoverVirtualDirectory** cmdlet to create an Autodiscover virtual directory on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-AutodiscoverVirtualDirectory [-ApplicationRoot <String>] [-AppPoolId
<String>] [-BasicAuthentication <$true | $false>] [-Confirm
[<SwitchParameter>]] [-DigestAuthentication <$true | $false>] [-
DomainController <Fqdn>] [-ExtendedProtectionFlags <MultiValuedProperty>]
[-ExtendedProtectionSPNList <MultiValuedProperty>] [-
ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-InternalUrl <Uri>] [-OAuthAuthentication <$true | $false>] [-Path
<String>] [-Role <ClientAccess | Mailbox>] [-Server <ServerIdParameter>]
[-WebSiteName <String>] [-WhatIf [<SwitchParameter>]] [-
WindowsAuthentication <$true | $false>] [-WSSecurityAuthentication <$true
| $false>]
```

Examples

EXAMPLE 1

This example creates the virtual directory autodiscover under the website autodiscover.contoso.com and requires that the user connect using Integrated Windows authentication or Digest authentication.

```
New-AutodiscoverVirtualDirectory -WebSiteName
"autodiscover.contoso.com" -WindowsAuthentication $true -
DigestAuthentication $true
```

Detailed Description

If your organization has multiple email domains and each requires its own Autodiscover site and corresponding virtual directory, use the **New-AutodiscoverVirtualDirectory** cmdlet to create an Autodiscover virtual directory under a new website.

Note:
When you're creating an Autodiscover virtual directory, we recommend that you enable Secure Sockets Layer (SSL) for the Autodiscover service.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationRoot	Optional	System.String	The *ApplicationRoot* parameter specifies the metabase path of the virtual directory. By default, this path is the same as the website in which the virtual directory is created.
AppPoolId	Optional	System.String	The *AppPoolId* parameter specifies the pool of programs that can be used with the virtual directory.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies whether Basic authentication is enabled on the Autodiscover virtual directory.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DigestAuthentication	Optional	System.Boolean	The *DigestAuthentication* parameter specifies whether Digest authentication is enabled on the Autodiscover virtual directory.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are:

			• **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless

			certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully

			qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN` `value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be

			used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you

			must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter

			specifies the URL used to connect to the virtual directory from outside the network firewall.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the URL used to connect to the virtual directory from inside the network firewall.
OAuthAuthentication	Optional	System.Boolean	The *OAuthAuthentication* parameter specifies whether OAuth authentication is enabled.
Path	Optional	System.String	The *Path* parameter specifies the directory that contains the system files for the virtual directory.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter specifies the configuration that should be used when the virtual directory is created. The following are the values that can be used with this parameter: • `Client Access` Configures the virtual directory for use on a Client Access server. • `Mailbox` Configures the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Co	The *Server* parameter specifies the Exchange

		nfiguration.Tasks.ServerIdParameter	server on which you want to create the virtual directory. You can use any value that uniquely identifies the server, for example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the virtual directory will be created on the server where the Remote PowerShell session is established This will always be a Mailbox server. If you want to create the virtual directory on a Client Access server or another Mailbox server, you must use the *Server* parameter.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the name of the Internet Information Services (IIS) website under which to create the virtual directory.
WhatIf	Optional	System.Management.	The *WhatIf* switch

		Automation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is enabled on the Autodiscover virtual directory.
WSSecurityAuthentication	Optional	System.Boolean	The *WSSecurityAuthentication* parameter enables or disables the Web Services Security (WS-Security) endpoint element in the Autodiscover Web.config file. The value can be set to `$true` or `$false`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AutodiscoverVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-AutodiscoverVirtualDirectory** cmdlet to remove the Autodiscover virtual directory associated with the Autodiscover service on a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-AutodiscoverVirtualDirectory -Identity
<VirtualDirectoryIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Autodiscover virtual directory from the site autodiscover.contoso.com on the Client Access server CAS01.

```
Remove-AutodiscoverVirtualDirectory -Identity "CAS01
\autodiscover(autodiscover.contoso.com)"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an Autodiscover virtual directory. The *Identity* parameter is represented as: *ServerName\VirtualDirectoryName (WebsiteName)*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AutodiscoverVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AutodiscoverVirtualDirectory** cmdlet to configure settings on the Autodiscover virtual directory on a server running Microsoft Exchange Server 2013. You can run this cmdlet on the local Client Access server or from another Exchange 2013 server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AutodiscoverVirtualDirectory -Identity <VirtualDirectoryIdParameter>
[-BasicAuthentication <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DigestAuthentication <$true | $false>] [-DomainController <Fqdn>] [-
ExtendedProtectionFlags <MultiValuedProperty>] [-ExtendedProtectionSPNList
<MultiValuedProperty>] [-ExtendedProtectionTokenChecking <None | Allow |
Require>] [-ExternalUrl <Uri>] [-InternalUrl <Uri>] [-
LiveIdBasicAuthentication <$true | $false>] [-
LiveIdNegotiateAuthentication <$true | $false>] [-OAuthAuthentication
<$true | $false>] [-WhatIf [<SwitchParameter>]] [-WindowsAuthentication
<$true | $false>] [-WSSecurityAuthentication <$true | $false>]
```

Examples

EXAMPLE 1

This example sets the authentication method to Digest authentication for the Autodiscover virtual directory.

```
Set-AutodiscoverVirtualDirectory -Identity
'autodiscover(default Web Site)' -WindowsAuthentication
$false -BasicAuthentication $false -DigestAuthentication
$true
```

EXAMPLE 2

This example sets Integrated Windows authentication for the Autodiscover virtual directory.

```
Set-AutodiscoverVirtualDirectory -Identity 'autodiscover
(default Web Site)' -WindowsAuthentication $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name of the virtual directory and the website. This parameter

			can also be used to specify the Client Access server if it's being run from another Exchange 2013 server.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies Basic authentication on the Autodiscover virtual directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DigestAuthentication	Optional	System.Boolean	The *DigestAuthentication* parameter specifies Digest authentication on the Autodiscover virtual directory.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the

			fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal

			Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedP	The *ExtendedProtectionTokenChecking* parameter

		rotectionTokenCheckingMode	defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for

			Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNL*

			ist parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
InternalUrl	Optional	System.Uri	This parameter is reserved for internal Microsoft use.
LiveIdBasicAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LiveIdNegotiateAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OAuthAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies Integrated Windows authentication on the Autodiscover virtual directory.
WSSecurityAuthentication	Optional	System.Boolean	The *WSSecurityAuthentication* parameter specifies whether to enable the WS-Security (Web Services Security) endpoint element in the Autodiscover Web.config file. The value can be set to `$true` or `$false`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-CalendarConnectivity

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-25*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-CalendarConnectivity** cmdlet to verify that anonymous calendar sharing is enabled and working properly. The Calendar virtual directory is a subdirectory of the Microsoft Office Outlook Web App virtual directory. When you run this command without any parameters, the command tests against all Outlook Web App calendar virtual directories.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-CalendarConnectivity [-ClientAccessServer <ServerIdParameter>] [-
TestType <Internal | External>] [-VirtualDirectoryName <String>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LightMode
<SwitchParameter>] [-MailboxServer <ServerIdParameter>] [-
MonitoringContext <SwitchParameter>] [-ResetTestAccountCredentials
<SwitchParameter>] [-Timeout <UInt32>] [-TrustAnySSLCertificate
<SwitchParameter>] [-UserType <LEGACY | EDU | BPOS>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the connectivity for the Client Access server CAS01.

```
Test-CalendarConnectivity -ClientAccessServer CAS01
```

Detailed Description

To test virtual directories on a Client Access server, there must be a test Active Directory account. There must also be a test mailbox in each Active Directory site that hosts mailboxes that can be accessed through the virtual directories being tested. You can create the test account by running the New-TestCasConnectivityUser.ps1 script. The default location for this file is: \\Program Files \Microsoft\Exchange Server\V15\Scripts.

If the test environment wasn't created during the Mailbox server setup, you're prompted to run the script that creates the test mailboxes and test users when you run this command.

If the server hosting the test mailbox isn't available, the command returns an error that might not clearly identify the problem. To avoid this, use the **Test-MapiConnectivity** cmdlet to verify that the server that hosts the test mailbox is running and that the mailbox is available before you run this command.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook

Web App virtual directories" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *ClientAccessServer* parameter specifies the name of the Client Access server to test. If this parameter is included, all Outlook Web App calendar virtual directories on the Client Access server are tested against all Exchange Mailbox servers in the local Active Directory site.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
LightMode	Optional	System.Management.Automation.SwitchParameter	The *LightMode* parameter isn't implemented for this diagnostic command. Using this parameter doesn't change the behavior of the command. **Note:** This parameter is implemented for other Exchange diagnostic commands where it's used to run a less intensive version of a command.
MailboxServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server to test. If not specified, all Mailbox servers in the local Active Directory site are tested.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify a value with this

			switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
ResetTestAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *ResetTestAccountCredentials* switch resets the password for the test account that's used to run this command. The password for the test account is typically reset every seven days. Use this switch to force a password reset any time it's required for security reasons.
TestType	Optional	Microsoft.Exchange.Monitoring.OwaConnectivityTestType	The *TestType* parameter specifies whether the command tests internal or external URLs. Values are `Internal` and `External`. If you don't specify this parameter, the default is

			`TestType:Internal`.
Timeout	Optional	System.UInt32	The *Timeout* parameter isn't implemented for this diagnostic command. Using this parameter doesn't change the behavior of the command. **Note:** This parameter is implemented for other Exchange diagnostic commands where it's used to run a less intensive version of a command.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* parameter isn't implemented for this diagnostic command. Using this parameter doesn't change the behavior of the command. **Note:** This parameter is implemented for other Exchange diagnostic commands where it's used to run a less intensive version of a command.
UserType	Optional	Microsoft.Exchange.Monitoring.DatacenterUse	This parameter is reserved for internal

		rType	Microsoft use.
VirtualDirectoryName	Optional	System.String	The *VirtualDirectoryName* parameter specifies the name of the virtual directory to test on a particular Client Access server. If this parameter isn't included, all Outlook Web App calendar virtual directories that support calendar sharing are tested.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-CASMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-CASMailbox** cmdlet to view the client access settings that are configured on a mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-CASMailbox [-Identity <MailboxIdParameter>] <COMMON PARAMETERS>

Get-CASMailbox [-Anr <String>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-AccountPartition <AccountPartitionIdParameter>] [-
ActiveSyncDebugLogging <SwitchParameter>] [-Credential <PSCredential>] [-
DomainController <Fqdn>] [-Filter <String>] [-GetImapProtocolLog
<SwitchParameter>] [-GetPopProtocolLog <SwitchParameter>] [-
IgnoreDefaultScope <SwitchParameter>] [-Monitoring <SwitchParameter>] [-
Organization <OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-ProtocolSettings <SwitchParameter>] [-
ReadFromDomainController <SwitchParameter>] [-
RecalculateHasActiveSyncDevicePartnership <SwitchParameter>] [-ResultSize
<Unlimited>] [-SendLogsTo <MultiValuedProperty>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example returns the values of the following client access settings for the user named Jeff Hay.

- *ActiveSyncEnabled*
- *OWAEnabled*

```
Get-CASMailbox "Jeff Hay"
```

EXAMPLE 2

This example returns all IMAP4 settings for the user tony@contoso.com.

```
Get-CASMailbox tony@contoso.com | Format-List Imap*
```

EXAMPLE 3

This example returns all Exchange Web Services settings for the user chris@contoso.com.

```
Get-CASMailbox chris@contoso.com | Format-List Ews*
```

Detailed Description

This cmdlet returns a variety of client access settings for one or more mailboxes. These settings include options for Microsoft Outlook Web App, Microsoft Exchange ActiveSync, POP3, and IMAP4.

The **Get-CASMailbox** cmdlet can run only on a Mailbox server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
ActiveSyncDebugLogging	Optional	System.Management.Automation.SwitchParameter	The *ActiveSyncDebugLogging* switch shows the actual value of the **ActiveSyncDebugLogging** property for the mailbox. If you don't use this switch, the value always appears as `$false`.

			To see this value, you need to use a formatting cmdlet. For example, `Get-CasMailbox laura@contoso.com -ActiveSyncDebugLogging | Format-List`.
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)** • **DisplayName** • **FirstName** • **LastName** • **Alias**
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password that's used to run this command. Typically, you use this parameter in scripts or when you need to provide different credentials that have the required permissions. This parameter requires

			the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
GetImapProtocolLog	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
GetPopProtocolLog	Optional	System.Management.Automation.SwitchPar	This parameter is reserved for internal Microsoft use.

		ameter	
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox that you want to view. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com

			• `User Principal Name` Example: JPhillips@contoso.com
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted. • You can't use the *OrganizationalUnit* and

			Identity parameters together. • You can't use the *Credential* parameter.
Monitoring	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Monitoring* switch includes mailboxes that were created by monitoring accounts in the results. By default, these mailboxes aren't included in the results. You don't have to specify a value with this switch.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter limits the search to the specified organizational unit (OU). You can use any value that uniquely identifies the OU. For example: • Distinguished name (DN) Example: `OU=Users,DC=contoso,DC=com` • Canonical name (CN) Example: `contoso.com/`

			`Users` • GUID Example: `8d3d920d-fe9c-4432-8b94-d84027f5d627`
ProtocolSettings	Optional	System.Management.Automation.SwitchParameter	The *ProtocolSettings* switch returns the server names, TCP ports and encryption methods for the following settings: • *ExternalImapSettings* • *InternalImapSettings* • *ExternalPopSettings* • *InternalPopSettings* • *ExternalSmtpSettings* • *InternalSmtpSettings* To see these values, you need to use a formatting cmdlet. For example, `Get-CasMailbox laura@contoso.com -ProtocolSettings | Format-List`.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ReadFromDomainController* switch specifies that information should be read from a domain controller in the user's domain. If you run the command `Set-AdServerSettings -ViewEntireForest $true`

			to include all objects in the forest and you don't use the *ReadFromDomainController* switch, it's possible that information will be read from a global catalog that has outdated information. When you use the *ReadFromDomainController* switch, multiple reads might be necessary to get the information. You don't have to specify a value with this switch. **Note:** By default, the recipient scope is set to the domain that hosts your Exchange servers.
RecalculateHasActiveSyncDevicePartnership	Optional	System.Management.Automation.SwitchParameter	The *RecalculateHasActiveSyncDevicePartnership* switch recalculates the value of the **HasActiveSyncDevicePartnership** property on the mailbox. The value is automatically updated if it's found to be incorrect. You don't have to specify a value with this switch.

ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
SendLogsTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. The results are sorted in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-CASMailbox

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-CASMailbox** cmdlet to configure client access settings on a mailbox. For example, you can configure settings for Microsoft Exchange ActiveSync, Microsoft Outlook Web App, POP3, and IMAP4.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-CASMailbox -Identity <MailboxIdParameter> [-ActiveSyncAllowedDeviceIDs
<MultiValuedProperty>] [-ActiveSyncBlockedDeviceIDs <MultiValuedProperty>]
[-ActiveSyncDebugLogging <$true | $false>] [-ActiveSyncEnabled <$true |
$false>] [-ActiveSyncMailboxPolicy <MailboxPolicyIdParameter>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
ECPEnabled <$true | $false>] [-EmailAddresses <ProxyAddressCollection>] [-
EwsAllowEntourage <$true | $false>] [-EwsAllowList <MultiValuedProperty>]
[-EwsAllowMacOutlook <$true | $false>] [-EwsAllowOutlook <$true | $false>]
[-EwsApplicationAccessPolicy <EnforceAllowList | EnforceBlockList>] [-
EwsBlockList <MultiValuedProperty>] [-EwsEnabled <$true | $false>] [-
IgnoreDefaultScope <SwitchParameter>] [-ImapEnabled <$true | $false>] [-
ImapEnableExactRFC822Size <$true | $false>] [-
ImapForceICalForCalendarRetrievalOption <$true | $false>] [-

SamAccountName <String>] [-ShowGalAsDefaultView <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables Outlook Web App and POP3 access for the user adam@contoso.com.

```
Set-CASMailbox adam@contoso.com -OWAEnabled $false -
PopEnabled $false
```

EXAMPLE 2

This example enables Exchange ActiveSync debug logging and specifies the Exchange ActiveSync mailbox policy named Management for the user adam@contoso.com.

```
Set-CASMailbox adam@contoso.com -ActiveSyncDebugLogging
$true -ActiveSyncMailboxPolicy Management
```

EXAMPLE 3

This example sets the display name and disables Outlook Anywhere access for the user tony@contoso.com.

```
Set-CASMailbox tony@contoso.com -DisplayName "Tony Smith" -
MAPIBlockOutlookRpcHttp $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client protocol settings" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox that you want to configure. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account`

			Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
ActiveSyncAllowedDeviceIDs	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ActiveSyncAllowedDeviceIDs* parameter specifies one or more Exchange ActiveSync device IDs that are allowed to synchronize with the mailbox. A device ID is a text string that uniquely identifies the device. Use the **Get-MobileDevice** cmdlet to see the devices that have Exchange ActiveSync partnerships with the mailbox.

			To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. To clear the list of device IDs, use the value `$null` for this parameter.
ActiveSyncBlockedDeviceIDs	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ActiveSyncBlockedDeviceIDs* parameter specifies one or more Exchange ActiveSync device IDs that aren't allowed to synchronize with the mailbox. A device ID is a text string that uniquely identifies the device. Use

			the **Get-MobileDevice** cmdlet to see the devices that have Exchange ActiveSync partnerships with the mailbox. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. To clear the list of device IDs, use the value `$null` for this parameter.
ActiveSyncDebugLogging	Optional	System.Boolean	The *ActiveSyncDebugLogging* parameter enables or disables Exchange

			ActiveSync debug logging for the mailbox. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
ActiveSyncEnabled	Optional	System.Boolean	The *ActiveSyncEnabled* parameter enables or disables Exchange ActiveSync for the mailbox. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. Note that when you set this parameter to `$false`, the other Exchange ActiveSync settings in this cmdlet are ignored.
ActiveSyncMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *ActiveSyncMailboxPolicy* parameter specifies the Exchange ActiveSync mailbox policy for the mailbox. You can use any value that uniquely identifies the Exchange ActiveSync mailbox policy. For example: • Name • Distinguished name (DN) • GUID

			The name of the default Exchange ActiveSync mailbox policy is `Default`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *DisplayName* parameter specifies the display name for the mailbox.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

ECPEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *ECPEnabled* parameter enables or disables access to the Exchange admin center (EAC) for the specified user. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	This parameter is available only in on-premises Exchange 2013. The *EmailAddresses* parameter specifies all the proxy addresses of the recipient. It includes the primary SMTP address as one of the proxy addresses. Typically, the primary SMTP address and other proxy address are set by email address policies. However, you can use this parameter to configure other proxy addresses for the recipient. For more information, see Email address policies.

			Valid syntax for this parameter is `[<Type>]:<emailaddress1>, [<Type>]:<emailaddress2>...`. The optional *<Type>* value indicates the type of email address. Some examples of valid type values include: • `SMTP` The primary SMTP address • `smtp` Other SMTP email addresses • `X400` X.400 addresses • `X500` X.500 addresses If you don't include a *<Type>* value for an email address, the value `smtp` is assumed. To specify the primary SMTP email address, you can use any of the following methods: • Use the *<Type>* value `SMTP`. • The first email address when you don't use the *<Type>* value `SMTP`, and when you don't use any *<Type>* values, or when there are multiple *<Type>* values of `smtp` • Use the *PrimarySmtpAddress*

			parameter instead. You can't use the *EmailAddresses* parameter and the *PrimarySmtpAddress* parameter in the same command. When you specify one or more proxy address by using the *EmailAddresses* parameter, those values replace any exiting proxy addresses that are configured for the recipient. To add or remove specify proxy addresses without affecting other values, use the following syntax: `@{Add="[<Type>]:<emailaddress1>","[<Type>]:<emailaddress2>"...; Remove="[<Type>]:<emailaddress2>","[<Type>]:<emailaddress2>"...}` **Important:** Exchange doesn't validate custom address types (including X.400 addresses) for proper formatting. You need to ensure that any custom addresses comply with the format requirements for that address type.
EwsAllowEntourage	Optional	System.Boolean	The *EwsAllowEntourage* parameter enables or disables access to the

			mailbox by Microsoft Entourage clients that use Exchange Web Services (for example, Entourage 2008 for Mac, Web Services Edition). Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
EwsAllowList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *EwsAllowList* parameter specifies the Exchange Web Services applications (user agent strings) that are allowed to access the mailbox. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following

			syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. This parameter is meaningful only when the *EwsEnabled* parameter is set to `$true`, and the *EwsApplicationAccessPolicy* parameter is set to `EnforceAllowList`.
EwsAllowMacOutlook	Optional	System.Boolean	The *EwsAllowMacOutlook* parameter enables or disables access to the mailbox by Microsoft Outlook for Mac clients that use Exchange Web Services (for example, Outlook for Mac 2011). Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
EwsAllowOutlook	Optional	System.Boolean	The *EwsAllowOutlook* parameter enables or disables access to the mailbox by Microsoft Outlook clients that use Exchange Web Services. Outlook uses Exchange Web Services for free/

			busy, out-of-office settings, and calendar sharing.
EwsApplicationAccessPolicy	Optional	Microsoft.Exchange.Data.Directory.EwsApplicationAccessPolicy	The *EwsApplicationAccessPolicy* parameter controls access to the mailbox by using Exchange Web Services applications. Valid values for this parameter are: • `EnforceAllowList` Only applications specified in the *EwsAllowList* parameter are allowed to access the mailbox. • `EnforceBlockList` Applications specified in the *EwsBlockList* parameter aren't allowed to access the mailbox, but any other applications can access the mailbox. This parameter doesn't affect access to the mailbox by using Entourage, Outlook for Mac, and Outlook. Access to the mailbox by using these clients is controlled by the *EwsAllowEntourage*, *EwsAllowMacOutlook* and

			EwsAllowOutlook parameters.
EwsBlockList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *EwsBlockList* parameter specifies the Exchange Web Services applications (user agent strings) that aren't allowed to access the mailbox by using Exchange Web Services. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. This parameter is meaningful only when

			the *EwsEnabled* parameter is set to `$true`, and the *EwsApplicationAccessPolicy* parameter is set to `EnforceBlockList`.
EwsEnabled	Optional	System.Boolean	The *EwsEnabled* parameter enables or disables access to the mailbox by using Exchange Web Services clients. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. Note that when you set this parameter to `$false`, the other Exchange Web Services settings in this cmdlet are ignored.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This

			allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
ImapEnabled	Optional	System.Boolean	The *ImapEnabled* parameter enables or disables access to the mailbox by using IMAP4 clients. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. Note that when you set this parameter to `$false`, the other IMAP4

			settings in this cmdlet are ignored.
ImapEnableExactRFC822Size	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *ImapEnableExactRFC822Size* parameter specifies how message sizes are presented to IMAP4 clients that access the mailbox. Valid values for this parameter are: • `$true` Calculate the exact message size. • `$false` Use an estimated message size. The default value is `$false`. We don't recommend changing this value unless you determine that the default setting causes problems for IMAP4 clients. To change the value of this parameter, you also need to set the value of the *ImapUseProtocolDefaults* parameter to `$false`.
ImapForceICalForCale	Optional	System.Boolean	The

ndarRetrievalOption			*ImapForceICalForCalendarRetrievalOption* parameter specifies how meeting requests are presented to IMAP4 clients that access the mailbox. Valid values for this parameter are: • `$true` All meeting requests are in the iCal format. • `$false` All meeting requests appear as Outlook Web App links. The default value is `$false`. To change the value of this parameter, you also need to set the value of the *ImapUseProtocolDefaults* parameter to `$false`.
ImapMessagesRetrievalMimeFormat	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MimeTextFormat	The *ImapMessagesRetrievalMimeFormat* parameter specifies the message format for IMAP4 clients that access the mailbox. You can use an integer or a text value. Valid values are: • 0: `TextOnly`

			• 1: `HtmlOnly` • 2: `HtmlAndTextAlternative` • 3: `TextEnrichedOnly` • 4: `TextEnrichedAndTextAlternative` • 5: `BestBodyFormat` • 6: `Tnef` The default value is `BestBodyFormat`. To change the value of this parameter, you also need to set the value of the *ImapUseProtocolDefaults* parameter to `$false`.
ImapSuppressReadReceipt	Optional	System.Boolean	The *ImapSuppressReadReceipt* parameter controls the behavior of read receipts for IMAP4 clients that access the mailbox. Valid values for this parameter are: • `$true` The user receives a read receipt when the recipient opens the message. • `$false` The user receives two read receipts: one when the message is downloaded and another when the message is opened.

			The default value is `$false`. To change the value of this parameter, you also need to set the value of the *ImapUseProtocolDefaults* parameter to `$false`.
ImapUseProtocolDefaults	Optional	System.Boolean	The *ImapUseProtocolDefaults* parameter specifies whether to use the IMAP4 protocol defaults for the mailbox. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. You need to set the *ImapUseProtocolDefaults* parameter to `$false` when you use any of the following IMAP4 parameters: • *ImapEnableExactRFC822Size* • *ImapForceICalForCalendarRetrievalOption* • *ImapMessagesRetrievalMimeFormat* • *ImapSuppressReadReceipt*
MAPIBlockOutlookNo	Optional	System.Boolean	This parameter is

nCachedMode			available only in on-premises Exchange 2013. The *MAPIBlockOutlookNonCachedMode* parameter controls access to the mailbox by using Microsoft Outlook in online or offline mode. Valid values for this parameter are: • `$true` Only Outlook clients that are configured to use Cached Exchange Mode (offline mode) are allowed to access the mailbox. • `$false` The state of the Cached Exchange Mode setting isn't checked before Outlook clients are allowed to access the mailbox (online mode and offline mode are allowed). The default value is `$false`.
MAPIBlockOutlookRpcHttp	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MAPIBlockOutlookRpcHttp* parameter enables or disables access to the

			mailbox by using Outlook Anywhere (RPC over HTTP) in Microsoft Outlook. Valid values for this parameter are: • `$true` Only Outlook clients that aren't configured to use Outlook Anywhere (RPC over HTTP) are allowed to access the mailbox. By default, Outlook 2013 is configured to use Outlook Anywhere. • `$false` Outlook clients that are configured to use Outlook Anywhere (RPC over HTTP) are allowed to access the mailbox. The default value is `$false`.
MAPIBlockOutlookVersions	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *MAPIBlockOutlookVersions* parameter blocks access to the mailbox for specific versions of Outlook. For example, if you specify the value `15.0.4569.1503`, only Outlook 2013 Service Pack 1 (SP1) or

			later clients are allowed to access the mailbox. Earlier versions of Outlook are blocked.
MAPIEnabled	Optional	System.Boolean	The *MAPIEnabled* parameter enables or disables access to the mailbox by using MAPI clients (for example, Microsoft Outlook). Valid input for this parameter is `$true` or `$false`. The default value is `$true`. Note that when you set this parameter to `$false`, the other MAPI settings in this cmdlet are ignored.
Name	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Name* parameter specifies the name of the mailbox.
OWAEnabled	Optional	System.Boolean	The *OWAEnabled* parameter enables or disables access to the mailbox by using Outlook Web App. Valid input for this parameter is `$true` or

			`$false`. The default value is `$true`. Note that when you set this parameter to `$false`, the other Outlook Web App settings in this cmdlet are ignored.
OWAforDevicesEnabled	Optional	System.Boolean	The *OWAforDevicesEnabled* parameter enables or disables access to the mailbox by using OWA for Devices. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
OwaMailboxPolicy	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *OwaMailboxPolicy* parameter specifies the Outlook Web App mailbox policy for the mailbox. You can use any value that uniquely identifies the Outlook Web App mailbox policy. For example: • Name • Distinguished name (DN) • GUID The name of the default Outlook Web App mailbox

			policy is `Default`.
PopEnabled	Optional	System.Boolean	The *PopEnabled* parameter enables or disables access to the mailbox by using POP3 clients. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. Note that when you set this parameter to `$false`, the other POP3 settings in this cmdlet are ignored.
PopEnableExactRFC822Size	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *PopEnableExactRFC822Size* parameter specifies how message sizes are presented to POP3 clients that access the mailbox. Valid values for this parameter are: • `$true` Calculate the exact message size. • `$false` Use an estimated message size. The default value is `$false`. We don't recommend

			changing this value unless you determine that the default setting causes problems for POP3 clients. To change the value of this parameter, you also need to set the value of the *PopUseProtocolDefaults* parameter to `$false`.
PopForceICalForCalendarRetrievalOption	Optional	System.Boolean	The *PopForceICalForCalendarRetrievalOption* parameter specifies how meeting requests are presented to POP3 clients that access the mailbox. Valid values for this parameter are: • `$true` All meeting requests are in the iCal format. • `$false` All meeting requests appear as Outlook Web App links. The default value is `$false`. To change the value of this parameter, you also need to set the value of the *PopUseProtocolDefaults* parameter to `$false`.

PopMessagesRetrievalMimeFormat	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MimeTextFormat	The *PopMessagesRetrievalMimeFormat* parameter specifies the message format for POP3 clients that access the mailbox. You can use an integer or a text value. Valid values are: • 0: `TextOnly` • 1: `HtmlOnly` • 2: `HtmlAndTextAlternative` • 3: `TextEnrichedOnly` • 4: `TextEnrichedAndTextAlternative` • 5: `BestBodyFormat` • 6: `Tnef` The default value is `BestBodyFormat`. To change the value of this parameter, you also need to set the value of the *PopUseProtocolDefaults* parameter to `$false`.
PopSuppressReadReceipt	Optional	System.Boolean	The *PopSuppressReadReceipt* parameter controls the behavior of read receipts for POP3 clients that access the mailbox.

			Valid values for this parameter are: • `$true` The user receives a read receipt when the recipient opens the message. • `$false` The user receives two read receipts: one when the message is downloaded and another when the message is opened. The default value is `$false`. To change the value of this parameter, you also need to set the value of the *PopUseProtocolDefaults* parameter to `$false`.
PopUseProtocolDefaults	Optional	System.Boolean	The *PopUseProtocolDefaults* parameter specifies whether to use the POP3 protocol defaults for the mailbox. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. You need to set the *PopUseProtocolDefaults* parameter to `$false` when you use any of

			following parameters: • *PopEnableExactRFC822Size* • *PopForceICalForCalendarRetrievalOption* • *PopMessagesRetrievalMimeFormat* • *PopSuppressReadReceipt*
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is available only in on-premises Exchange 2013. The *PrimarySmtpAddress* parameter specifies the primary SMTP email address for the mailbox. This is the From address that external recipients see when they receive a message from this mailbox. You can't use the *PrimarySmtpAddress* parameter and the *EmailAddresses* parameter in the same command.
ResetAutoBlockedDevices	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *ResetAutoBlockedDevices*

			switch resets the status of blocked mobile devices that have exceeded the limits defined by the **Set-ActiveSyncDeviceAutoblockThreshold** cmdlet.
SamAccountName	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *SamAccountName* parameter specifies an account identifier that's compatible with older operating systems. The value of this parameter must be less than 20 characters, and can contain letters, numbers, and the following characters: • ! • # • $ • % • ^ • & • - • . • _ • { • } • |

			• ~
ShowGalAsDefaultView	Optional	System.Boolean	The *ShowGalAsDefaultView* parameter shows the global address list (GAL) as the default recipient picker for messages. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ClientAccessArray

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ClientAccessArray** cmdlet to return an object that represents a load-balanced array of Client Access servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ClientAccessArray [-Identity <ClientAccessArrayIdParameter>] [-
DomainController <Fqdn>] [-Site <AdSiteIdParameter>]
```

Examples

EXAMPLE 1

This example returns the array of Client Access servers with the unique identifier CASArray01 in the current Active Directory site.

```
Get-ClientAccessArray -Identity "CASArray01"
```

EXAMPLE 2

This example returns the array of Client Access servers with the unique identifier CASArray01 in the Active Directory site eur.contoso.com.

```
Get-ClientAccessArray -Identity "CASArray01" -Site
"eur.contoso.com"
```

EXAMPLE 3

This example returns the array of Client Access servers with the unique identifier Array12032 in the current Active Directory site.

```
Get-ClientAccessArray -Identity "Array12032"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Client Access server array settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ClientAccessArrayIdParameter	The *Identity* parameter specifies a unique identifier for the array of Client Access servers.
Site	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *Site* parameter specifies the Active Directory site that contains the specified array of Client Access servers.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ClientAccessServer

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ClientAccessServer** cmdlet to return information for the Client Access server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ClientAccessServer [-Identity <ClientAccessServerIdParameter>] [-
DomainController <Fqdn>] [-
IncludeAlternateServiceAccountCredentialPassword <SwitchParameter>] [-
IncludeAlternateServiceAccountCredentialStatus <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns information about the Exchange Client Access server with the FQDN of mail.contoso.com.

```
Get-ClientAccessServer -Identity "mail.contoso.com"
```

EXAMPLE 2

This example returns information about all computers running Exchange that have the Client Access server role installed.

```
Get-ClientAccessServer
```

EXAMPLE 3

This example returns information about the Exchange Client Access server with the FQDN of email.fourthcoffee.com.

```
Get-ClientAccessServer -Identity "email.fourthcoffee.com"
```

Detailed Description

The Client Access server is one of two server types that can be installed with Microsoft Exchange Server 2013. The **Get-ClientAccessServer** cmdlet returns information about all Client Access servers in the organization.

The **ExchangeVersion** attribute returned is the minimum version of Exchange that you can use to manage the returned object.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access server settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ClientAccessServerIdParameter	The *Identity* parameter specifies the name of the Exchange Client Access server.
IncludeAlternateServiceAccountCredentialPassword	Optional	System.Management.Automation.SwitchParameter	The *IncludeAlternateServiceAccountCredentialPassword* parameter specifies whether the credential password should be included with the request.
IncludeAlternateServiceAccountCredentialStatus	Optional	System.Management.Automation.SwitchParameter	The *IncludeAlternateServiceAccountCredentialStatus* parameter specifies

			whether the status of the service account credential should be included with the request.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ClientAccessServer

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ClientAccessServer** cmdlet to set properties on specified Client Access server objects.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ClientAccessServer [-Array <ClientAccessArrayIdParameter>] [-
AutoDiscoverServiceInternalUri <Uri>] [-AutoDiscoverSiteScope
<MultiValuedProperty>] <COMMON PARAMETERS>

Set-ClientAccessServer [-AlternateServiceAccountCredential <PSCredential[]
>] [-CleanUpInvalidAlternateServiceAccountCredentials <SwitchParameter>]
[-RemoveAlternateServiceAccountCredentials <SwitchParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: -Identity <ClientAccessServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IsOutOfService <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets two properties on the Client Access server CAS-01.

```
Set-ClientAccessServer -Identity "CAS-01" -
AutoDiscoverServiceInternalUri "https://cas01.contoso.com/
autodiscover/autodiscover.xml" -AutoDiscoverSiteScope
"Mail"
```

EXAMPLE 2

This example sets two properties on the Client Access server CASMail.

```
Set-ClientAccessServer -Identity "CASMail" -
AutoDiscoverServiceInternalUri "https://
casmail.contoso.com/autodiscover/autodiscover.xml" -
AutoDiscoverSiteScope "Mail"
```

EXAMPLE 3

This example sets two properties on the Client Access server WebMail.

```
Set-ClientAccessServer -Identity "WebMail" -
AutoDiscoverServiceInternalUri "https://
webmail.contoso.com/autodiscover/autodiscover.xml" -
AutoDiscoverSiteScope "Mail"
```

Detailed Description

You can run the **Set-ClientAccessServer** cmdlet for a single Client Access server or for all Client Access servers in your Exchange organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access server settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.Client	The *Identity* parameter specifies an individual

		AccessServerIdParameter	Client Access server.
AlternateServiceAccountCredential	Optional	System.Management.Automation.PSCredential[]	The *AlternateServiceAccountCredential* parameter specifies a credential (consisting of a user name and password) to distribute to all Client Access servers in an organization.
Array	Optional	Microsoft.Exchange.Configuration.Tasks.ClientAccessArrayIdParameter	This parameter is reserved for internal Microsoft use.
AutoDiscoverServiceInternalUri	Optional	System.Uri	The *AutoDiscoverServiceInternalUri* parameter specifies the internal URL of the Autodiscover service.
AutoDiscoverSiteScope	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AutoDiscoverSiteScope* parameter specifies the site for which the Autodiscover service is authoritative. Clients that connect to the Autodiscover service by using the internal URL must belong to a listed

			site.
CleanUpInvalidAlternateServiceAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *CleanUpInvalidAlternateServiceAccountCredentials* parameter specifies whether to remove a previously set alternate service account credential that's no longer valid.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IsOutOfService	Optional	System.Boolean	This parameter is reserved for internal

			Microsoft use.
RemoveAlternateServiceAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *RemoveAlternateServiceAccountCredentials* parameter specifies whether to remove a previously distributed alternate service account credential.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-EcpConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-EcpConnectivity** cmdlet to verify that the Exchange Administration Center is running as expected.

Warning:
The Exchange Control Panel (ECP) is the web-based user interface developed for Microsoft Exchange Server 2010. The Exchange Server 2013 Exchange Administration Center cmdlets for virtual directory still use ECP in the name, and the ECP cmdlets can be used to manage Exchange 2010 and Exchange 2013 ECP virtual directories.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-EcpConnectivity [-ClientAccessServer <ServerIdParameter>] [-
RSTEndpoint <String>] [-TestType <Internal | External>] [-
VirtualDirectoryName <String>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-LightMode <SwitchParameter>] [-MailboxServer
<ServerIdParameter>] [-MonitoringContext <SwitchParameter>] [-
ResetTestAccountCredentials <SwitchParameter>] [-Timeout <UInt32>] [-
TrustAnySSLCertificate <SwitchParameter>] [-UserType <LEGACY | EDU |
BPOS>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests user connectivity to the Exchange Administration Center on Server01.

```
Test-EcpConnectivity -ClientAccessServer Server01
```

Detailed Description

The **Test-EcpConnectivity** cmdlet can be used to test Exchange Administration Center connectivity for all ECP virtual directories on a specified Client Access server for all mailboxes on servers running Exchange in the same Active Directory site. The **Test-EcpConnectivity** cmdlet can also be used to test the connectivity for an individual Exchange Administration Center URL.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange

Administration Center connectivity" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *ClientAccessServer* parameter specifies the name of the Client Access server to test. If this parameter is included, all Exchange ECP virtual directories on the Client Access server are tested against all Exchange Mailbox servers in the local Active Directory site. Mailboxes that aren't on Exchange Mailbox servers are tested.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that retrieves data from Active Directory.
LightMode	Optional	System.Management.Automation.SwitchParameter	The *LightMode* parameter isn't implemented for this diagnostic command. Using this parameter doesn't change the behavior of the command. **Note:** This parameter is implemented for other Exchange diagnostic commands where it's used to run a less intensive version of a command.
MailboxServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server to test. If not specified, all Mailbox servers in the local Active Directory site are tested.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results.

			You don't need to specify a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
ResetTestAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *ResetTestAccountCredentials* parameter resets the password for the test account used to run this command. The password for the test account is usually reset every 7 days. Use this parameter to force a password reset any time that a password reset is required for security reasons.
RSTEndpoint	Optional	System.String	This parameter is reserved for internal Microsoft use.
TestType	Optional	Microsoft.Exchange.Mo	The *TestType* parameter

		nitoring.OwaConnectivityTestType	determines whether the command tests internal or external URLs. Values are `Internal` and `External`.
Timeout	Optional	System.UInt32	The *Timeout* parameter specifies the amount of time, in seconds, to wait for the test operation to finish. The default value for the *Timeout* parameter is 30 seconds. You must specify a time-out value greater than 0 seconds and less than 1 hour (3,600 seconds). We recommend that you always configure this parameter with a value of 5 seconds or more.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* parameter specifies whether Secure Sockets Layer (SSL) certificate validation failures are reported. If the *TrustAnySSLCertificate* parameter is used, SSL certificate validation failures aren't reported.

			This is useful for testing internal URLs because Internet Information Services (IIS) doesn't support assigning multiple certificates for a single virtual directory. If a directory has different URLs for internal and external access and has a certificate, that certificate is usually for the external URL. This parameter lets the task check an internal URL without generating an error when the certificate doesn't match the URL.
UserType	Optional	Microsoft.Exchange.Monitoring.DatacenterUserType	This parameter is reserved for internal Microsoft use.
VirtualDirectoryName	Optional	System.String	The *VirtualDirectoryName* parameter specifies the name of the virtual directory to test on a particular Client Access server. If this parameter isn't included, all Exchange Control Panel

			virtual directories that support Exchange mailboxes are tested.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-EcpVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-EcpVirtualDirectory** cmdlet to retrieve all configuration data for Exchange Control Panel (ECP) virtual directories. The ECP virtual directory manages the Exchange Administration Center.

For information about the parameter sets in the Syntax section below, see Syntax.

Note:
The ECP is the web-based user interface developed for Microsoft Exchange Server 2010. The Exchange Server 2013 Exchange Administration Center cmdlets for virtual directory still use ECP in the name, and the ECP cmdlets can be used to manage Exchange 2010 and Exchange 2013 ECP virtual directories.

```
Get-EcpVirtualDirectory -Server <ServerIdParameter> <COMMON PARAMETERS>

Get-EcpVirtualDirectory [-Identity <VirtualDirectoryIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example displays the configuration data for the Exchange Control Panel virtual directory on Server01.

```
Get-EcpVirtualDirectory -Server Server01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Administration Center connectivity" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name or GUID of the server that hosts the ECP virtual

			directories that you want to display. If you don't specify a value for the *Server* parameter, all ECP virtual directories are returned.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an ECP virtual directory. The *Identity* parameter is represented as:

			ServerName\ECP (*WebsiteName*). If you don't specify a server name, the command returns the ECP virtual directory on the local server.
ShowBackEndVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowBackEndVirtualDirectories* switch specifies whether to return virtual directories on Client Access servers when used in a query. If you don't use this parameter, only virtual directories on Mailbox servers are returned.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch specifies whether to return the ECP virtual directories that are located on servers running the Mailbox server role. This switch should only be used with the direction of Microsoft support.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-EcpVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-EcpVirtualDirectory** cmdlet to create an Exchange Control Panel (ECP) virtual directory. This is a command that Microsoft Exchange Server Setup runs when you install Exchange in your organization. The ECP virtual directory manages the Exchange admin center.

Warning:
The ECP is the web-based user interface developed for Microsoft Exchange Server 2010. The Exchange Server 2013 Exchange Admin center cmdlets for virtual directory still use ECP in the name, and the ECP cmdlets can be used to manage Exchange 2010 and Exchange 2013 ECP virtual directories.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-EcpVirtualDirectory [-AppPoolId <String>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExtendedProtectionFlags
<MultiValuedProperty>] [-ExtendedProtectionSPNList <MultiValuedProperty>]
[-ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-InternalUrl <Uri>] [-Path <String>] [-Role <ClientAccess |
Mailbox>] [-Server <ServerIdParameter>] [-WebSiteName <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the Exchange Control Panel virtual directory on the Exchange server Server01.

```
New-EcpVirtualDirectory -Server SERVER01 -ExternalURL
https://mail.contoso.com/ecp -InternalURL https://
mail.contoso.com/ecp
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Administration Center connectivity" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
AppPoolId	Optional	System.String	The *AppPoolId* parameter sets the Internet Information Services (IIS) application pool in which the Exchange Control Panel virtual directory runs. We recommend that you leave this parameter at its default setting.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	The *DomainController*

		ta.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the

			Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.

ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/

			mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for

			Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail.

			If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the host name used to connect to the server running Exchange from outside the firewall. This setting is important when Secure Sockets Layer (SSL) is used. This parameter must be set to allow the Autodiscover service to return the URL for the Exchange Control Panel virtual directory.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the host name used to connect to the server running Exchange from inside the firewall.

			This setting is important when SSL is used. This parameter must be set to allow the Autodiscover service to return the URL for the Exchange Control Panel virtual directory.
Path	Optional	System.String	The *Path* parameter sets the file system path of the Exchange Control Panel virtual directory. This parameter should be used with care and only when you must use a different file system path than the default.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter specifies the configuration that should be used when the virtual directory is created. The following are the values that can be used with this parameter: • `ClientAccess` Configure the virtual directory for use on a Client Access server. • `Mailbox` Configure the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name or GUID of the server that

			hosts the Exchange Control Panel virtual directories that you want to create. You can't create an Exchange Control Panel virtual directory remotely. You can only create an Exchange Control Panel virtual directory on the local computer.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the name of the IIS website under which the Exchange Control Panel virtual directory is created.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-EcpVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-EcpVirtualDirectory** cmdlet to remove Exchange Control Panel (ECP) virtual directories located in the Internet Information Services (IIS) website on a server running Exchange. The ECP virtual directory manages the Exchange Administration Center.

⚠**Warning:**
The ECP is the web-based user interface developed for Microsoft Exchange Server 2010. The Exchange Server 2013 Exchange Administration Center cmdlets for virtual directory still use ECP in the name, and the ECP cmdlets can be used to manage Exchange 2010 and Exchange 2013 ECP virtual directories.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-EcpVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the ECP virtual directory ecp located on the default IIS website on the Exchange server Server01.

```
Remove-EcpVirtualDirectory -Identity "Server01\ecp (default
Web site)"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Administration Center connectivity" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an ECP virtual directory. The *Identity* parameter is represented as: *ServerName*\ECP (*WebsiteName*). Remote removal of an ECP virtual directory isn't supported. You must run this command from the local computer.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-EcpVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-EcpVirtualDirectory** cmdlet to modify the properties of an Exchange Control Panel (ECP) virtual directory. The ECP virtual directory manages the Exchange Administration Center (EAC).

⚠**Warning:**
The ECP is the web-based user interface developed for Microsoft Exchange Server 2010. The Exchange Server 2013 Exchange Administration Center cmdlets for virtual directory still use ECP in the name, and the ECP cmdlets can be used to manage Exchange 2010 and Exchange 2013 ECP virtual directories.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-EcpVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
AdfsAuthentication <$true | $false>] [-AdminEnabled <$true | $false>] [-
BasicAuthentication <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DigestAuthentication <$true | $false>] [-DomainController <Fqdn>] [-
ExtendedProtectionFlags <MultiValuedProperty>] [-ExtendedProtectionSPNList
<MultiValuedProperty>] [-ExtendedProtectionTokenChecking <None | Allow |
Require>] [-ExternalAuthenticationMethods <MultiValuedProperty>] [-
ExternalUrl <Uri>] [-FormsAuthentication <$true | $false>] [-GzipLevel
<Off | Low | High | Error>] [-InternalUrl <Uri>] [-LiveIdAuthentication
<$true | $false>] [-OwaOptionsEnabled <$true | $false>] [-WhatIf
[<SwitchParameter>]] [-WindowsAuthentication <$true | $false>]
```

Examples

EXAMPLE 1

This example disables Basic authentication on the default ECP virtual directory on the server Server01.

```
Set-EcpVirtualDirectory -Identity "Server01\ecp (default
Web site)" -BasicAuthentication:$false
```

EXAMPLE 2

This example turns off the Internet access to the EAC on server CAS01.

```
Set-EcpVirtualDirectory -Identity "CAS01\ecp (default Web
site)" -AdminEnabled $false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Administration Center connectivity" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an ECP virtual directory. The *Identity* parameter is represented as: *ServerName*\ECP (*WebsiteName*). To manage the first ECP virtual directory created in an Exchange organization, you must run the **Set-EcpVirtualDirectory** cmdlet on the computer that includes the first ECP virtual directory. If you create additional ECP virtual directories, you can manage those remotely.
AdfsAuthentication	Optional	System.Boolean	The *AdfsAuthentication* parameter specifies that the ECP virtual directory allows users to authenticate through Active Directory

			Federation Services (AD FS) authentication. This parameter accepts `$true` or `$false`. The default value is `$false`. The ADFS authentication settings for **Set-OwaVirtualDirectory** and **Set-EcpVirtualDirectory** are related. You need to set the *AdfsAuthentication* parameter on **Set-EcpVirtualDirectory** to `$true` before you can set the *AdfsAuthentication* parameter on **Set-OwaVirtualDirectory** to `$true`. Likewise, you need to set the *AdfsAuthentication* parameter on **Set-OwaVirtualDirectory** to `$false` before you can set the *AdfsAuthentication* parameter on **Set-EcpVirtualDirectory** to `$false`.
AdminEnabled	Optional	System.Boolean	The *AdminEnabled* parameter specifies that the EAC isn't able to be accessed through the

			Internet. For more information, see Turn off access to the Exchange admin center. This parameter accepts `$true` or `$false`.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies whether Basic authentication is enabled on the ECP virtual directory. This parameter can be used with the *FormsAuthentication* parameter or with the *DigestAuthentication* and *WindowsAuthentication* parameters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DigestAuthentication	Optional	System.Boolean	The *DigestAuthentication* parameter specifies whether Digest

			authentication is enabled on the ECP virtual directory.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic

			may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended

			Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN` value. You specify the

			domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and

			Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or

			server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalAuthenticationMethods* parameter specifies the authentication methods supported on the Exchange server from outside the firewall.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the host name used to connect to the Exchange server from outside the firewall. This setting is also important

			when Secure Sockets Layer (SSL) is used. This parameter must be set to allow the Autodiscover service to return the URL for the ECP virtual directory.
FormsAuthentication	Optional	System.Boolean	The *FormsAuthentication* parameter specifies whether forms-based authentication is enabled on the ECP virtual directory. If the *FormsAuthentication* parameter is set to `$true`, the *BasicAuthentication* parameter is set to `$true`, and the *DigestAuthentication* and *WindowsAuthentication* parameters are set to `$false`.
GzipLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.GzipLevel	The *GzipLevel* parameter sets Gzip configuration information for the ECP virtual directory.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the host name of the Exchange server for connections from inside

			the firewall. This setting is also important when SSL is used. This parameter must be set to allow the Autodiscover service to return the URL for the ECP virtual directory.
LiveIdAuthentication	Optional	System.Boolean	The *LiveIdAuthentication* parameter specifies whether Microsoft account (formerly known as Windows Live ID) authentication is enabled for the ECP virtual directory.
OwaOptionsEnabled	Optional	System.Boolean	The *OwaOptionsEnabled* parameter specifies that Outlook Web Access Options is enabled for end users. If this parameter is set to `$false`, users aren't able to access Outlook Web Access Options. You may want to disable access if your organization uses third-party provider tools. This parameter accepts `$true` or `$false`.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthenticati on	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is permitted on the ECP virtual directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ImapConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-ImapConnectivity** cmdlet to verify that the IMAP4 service is running as expected. The **Test-ImapConnectivity** cmdlet can be used to test the IMAP4 functionality for a specified Client Access server for all mailboxes on servers running Microsoft Exchange Server 2013 in the same Active Directory site.

```
Test-ImapConnectivity [-ClientAccessServer <ServerIdParameter>] [-
ConnectionType <Plaintext | Tls | Ssl>] [-MailboxCredential
<PSCredential>] [-PerConnectionTimeout <Int32>] [-PortClientAccessServer
<Int32>] [-TrustAnySSLCertificate <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LightMode
<SwitchParameter>] [-MailboxServer <ServerIdParameter>] [-
MonitoringContext <SwitchParameter>] [-ResetTestAccountCredentials
<SwitchParameter>] [-Timeout <UInt32>] [-UserType <LEGACY | EDU | BPOS>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the IMAP4 connectivity for the Client Access server Contoso12 by using the credentials for the user contoso\kweku.

```
Test-ImapConnectivity -ClientAccessServer:Contoso12 -
MailboxCredential:(Get-Credential contoso\kweku)
```

EXAMPLE 2

This example tests the IMAP4 connectivity of the specific Client Access server Contoso12 and tests all Exchange mailboxes.

```
Test-ImapConnectivity -ClientAccessServer:Contoso12
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test IMAP4 settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.Serve	The *ClientAccessServer* parameter specifies the

		rIdParameter	name of the Client Access server to test.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectionType	Optional	Microsoft.Exchange.Monitoring.ProtocolConnectionType	The *ConnectionType* parameter specifies the type of connection used to connect to the Client Access server. This setting can be set to `Plaintext`, `Tls`, or `Ssl`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
LightMode	Optional	System.Management.Automation.SwitchParameter	The *LightMode* parameter instructs the command to perform

			only a test logon to the server using the IMAP4 protocol. If you don't use this parameter, the test also tests the sending and receiving of a message using the IMAP4 protocol.
MailboxCredential	Optional	System.Management.Automation.PSCredential	The *MailboxCredential* parameter specifies the mailbox credential for a single mailbox test.
MailboxServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server to test. If not specified, all Mailbox servers in the local Active Directory site are tested.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify a value with this switch. Typically, you include the monitoring events and performance

			counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
PerConnectionTimeout	Optional	System.Int32	The *PerConnectionTimeout* parameter specifies the amount of time, in seconds, to wait per connection for the test operation to finish. The default value for the *PerConnectionTimeout* parameter is 120 seconds. You must specify a time-out value greater than 0 seconds and less than 120 seconds. We recommend that you configure this parameter with a value of 5 seconds or more.
PortClientAccessServer	Optional	System.Int32	The *PortClientAccessServer* parameter specifies the port to use to connect to the Client Access

			server. The default port is 143 for IMAP4. The valid range is from 0 through 65,535.
ResetTestAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *ResetTestAccountCredentials* switch resets the password for the test account that's used to run this command. The password for the test account is typically reset every seven days. Use this switch to force a password reset any time it's required for security reasons.
Timeout	Optional	System.UInt32	The *Timeout* parameter specifies the amount of time, in seconds, to wait for the test operation to finish. The default value for the *Timeout* parameter is 180 seconds. You must specify a time-out value greater than 0 seconds and less than 1 hour (3,600 seconds). We recommend that you configure this parameter with a value

			of 5 seconds or more.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* parameter specifies whether Secure Sockets Layer (SSL) certificate validation failures are reported. This parameter instructs the command to check the IMAP4 service without generating an error when the certificate doesn't match the URL of the Client Access server.
UserType	Optional	Microsoft.Exchange.Monitoring.DatacenterUserType	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IMAPSettings

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-IMAPSettings** cmdlet to display the properties of a single server running Microsoft Exchange Server 2013 that has the Client Access server role installed and is running the IMAP4 service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ImapSettings [-DomainController <Fqdn>] [-Server <ServerIdParameter>]
```

Examples

EXAMPLE 1

This example displays the parameters and values for the Client Access server CAS01 running the IMAP4 service.

```
Get-IMAPSettings -Server CAS01
```

Detailed Description

With the **Get-IMAPSettings** cmdlet, you can view the settings for the IMAP4 service running on an Exchange Client Access server. Information can only be returned about servers located in the Exchange organization from which the cmdlet is being run.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "IMAP4 settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies whether the command returns the properties of an individual Client Access server in your organization for which you're viewing IMAP4 settings.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ImapSettings

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ImapSettings** cmdlet to set specific IMAP4 settings for the server running Microsoft Exchange Server 2013 that has the Client Access server role installed and that's running the Microsoft Exchange IMAP4 service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ImapSettings [-AuthenticatedConnectionTimeout <EnhancedTimeSpan>] [-
Banner <String>] [-CalendarItemRetrievalOption <iCalendar | intranetUrl |
InternetUrl | Custom>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-EnableExactRFC822Size <$true | $false>] [-
EnableGSSAPIAndNTLMAuth <$true | $false>] [-EnforceCertificateErrors
<$true | $false>] [-ExtendedProtectionPolicy <None | Allow | Require>] [-
ExternalConnectionSettings <MultiValuedProperty>] [-
InternalConnectionSettings <MultiValuedProperty>] [-
LiveIdBasicAuthReplacement <$true | $false>] [-LogFileLocation <String>]
[-LogFileRollOverSettings <Hourly | Daily | Weekly | Monthly>] [-LoginType
<PlainTextLogin | PlainTextAuthentication | SecureLogin>] [-
LogPerFileSizeQuota <Unlimited>] [-MaxCommandSize <Int32>] [-
MaxConnectionFromSingleIP <Int32>] [-MaxConnections <Int32>] [-
MaxConnectionsPerUser <Int32>] [-MessageRetrievalMimeFormat <TextOnly |
HtmlOnly | HtmlAndTextAlternative | TextEnrichedOnly |
TextEnrichedAndTextAlternative | BestBodyFormat | Tnef>] [-OwaServerUrl
<Uri>] [-PreAuthenticatedConnectionTimeout <EnhancedTimeSpan>] [-
ProtocolLogEnabled <$true | $false>] [-ProxyTargetPort <Int32>] [-Server
<ServerIdParameter>] [-ShowHiddenFoldersEnabled <$true | $false>] [-
SSLBindings <MultiValuedProperty>] [-SuppressReadReceipt <$true | $false>]
[-UnencryptedOrTLSBindings <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]] [-X509CertificateName <String>]
```

Examples

EXAMPLE 1

This example sets the plain text or TLS connection to the Client Access server CAS01. In this example, the connection uses an IP address of 10.0.0.0 and a port number of 995.

```
Set-ImapSettings -Server "CAS01" -UnencryptedOrTLSBindings
10.0.0.0:995
```

EXAMPLE 2

This example turns on IMAP4 protocol logging. It also changes the IMAP4 protocol logging directory to C:\Imap4Logging.

```
Set-ImapSettings -ProtocolLogEnabled $true -LogFileLocation
"C:\Imap4Logging"
```

EXAMPLE 3

This example changes the IMAP4 protocol logging to create a new log file when a log file reaches 2 megabytes (MB).

```
Set-ImapSettings -LogPerFileSizeQuota 2000000
```

EXAMPLE 4

This example changes the IMAP4 protocol logging to create a new log file every hour.

```
Set-ImapSettings -LogPerFileSizeQuota 0 -
LogFileRollOverSettings Hourly
```

Detailed Description

You can run the **Set-ImapSettings** cmdlet for a single Client Access server that has the Microsoft Exchange IMAP4 service installed, or for all Exchange Client Access servers that have the Microsoft Exchange IMAP4 service installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "IMAP4 settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AuthenticatedConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AuthenticatedConnectionTimeout* parameter specifies the period of time to wait before closing an idle authenticated connection.

			To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is `00:00:30` to `1:00:00`. The default setting is `00:30:00` or 30 minutes.
Banner	Optional	System.String	The *Banner* parameter specifies the banner string displayed after a connection to a Client Access server has been established.
CalendarItemRetrievalOption	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CalendarItemRetrievalOptions	The *CalendarItemRetrievalOption* parameter specifies the type of calendar item returned when the calendar is accessed by using IMAP4. The default value is `iCalendar`. You can specify the value for this parameter by using a numerical value or text string. The following values are available: • `0` or `iCalendar` • `1` or `intranetUrl` • `2` or `InternetUrl` • `3` or `Custom`

			If you're using `3` or `custom`, you must specify the *OwaServerUrl* parameter setting.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnableExactRFC822Size	Optional	System.Boolean	The *EnableExactRFC822Size* parameter calculates the exact size of each MIME message that can be retrieved from the server. When you set this parameter to `$true`, the exact size of MIME messages stored on the

			Exchange server is available to POP3 or IMAP4 client programs that rely on knowing the exact size of each MIME message. **Note:** This parameter is set to `$false` by default. If you don't set this option to `$true`, the size of each MIME message that the Exchange server returns to POP3 and IMAP4 client programs may be slightly different than the exact size of the message. Because setting this option to `$true` can negatively affect performance, you should only use this option if many of your users are using a client that requires knowing the exact size of MIME messages.
EnableGSSAPIAndNTLMAuth	Optional	System.Boolean	The *EnableGSSAPIAndNTLMAuth* parameter specifies whether connections can use Integrated Windows authentication (NTLM) using the Generic Security Services application programming interface (GSSAPI). This setting applies to connections

			where Transport Layer Security (TLS) is disabled. This parameter is set to `$true` by default. You can disable NTLM for IMAP4 connections by setting the parameter value to `$false`. NTLM authentication isn't supported for IMAP4 connections in Microsoft Exchange Server 2010 release to manufacturing (RTM). Support for NTLM authentication for IMAP4 connections was brought back in Exchange 2010 Service Pack 1 (SP1).
EnforceCertificateErrors	Optional	System.Boolean	The *EnforceCertificateErrors* parameter specifies whether to enforce valid Secure Sockets Layer (SSL) certificates. To use this parameter, specify the destination Client Access server for which you want to enforce valid SSL certificates. If the *EnforceCertificateErrors* parameter is set to `$true` and the proxy's target certificate isn't valid, the

			proxy logon attempt fails. The default setting is `$false`.
ExtendedProtectionPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionPolicy* parameter specifies how you want to use Extended Protection for Authentication for IMAP4 connections. By default, this parameter is set to `None`. The possible values are: • `None` Extended Protection for Authentication won't be used. • `Allow` Extended Protection for Authentication will be used only if the connecting IMAP4 connection supports it. Otherwise, the connections will be established without Extended Protection for Authentication. • `Require` Extended Protection for Authentication will be required for all IMAP4 connections. If the connecting host doesn't support Extended Protection for Authentication, the connection will be rejected.

			Extended Protection for Authentication enhances the protection and handling of credentials when authenticating network connections using Integrated Windows authentication. Integrated Windows authentication is also known as NTLM. We strongly recommend that you use Extended Protection for Authentication if you're using Integrated Windows authentication. To use Extended Protection for Authentication, the client and server computers must meet specific requirements. These include operating system requirements and security update requirements. In addition, the IMAP4 client program must support the use of Extended Protection for Authentication.
ExternalConnectionSettings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalConnectionSettings* parameter specifies the host name, port, and

			encryption type that Exchange uses when IMAP4 clients connect to their email from outside the corporate network. Enter a value using the format: *<HostName>:<Port>:<Encryption Type>*. The *<Encryption Type>* part of the multivalued value is optional. Valid values for *<Encryption Type>* are either TLS (Transport Layer Security) or SSL.
InternalConnectionSettings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalConnectionSettings* parameter specifies the host name, port, and encryption type used when IMAP4 clients connect to their email from inside the corporate network. This setting is also used to specify the host name, port, and encryption type used when a user connection is forwarded to another Client Access server. Enter a value using the format:

			<HostName>:*<Port>*:*<Encryption Type>*. The *<Encryption Type>* part of the multivalued value is optional. Valid values for *<Encryption Type>* are either TLS or SSL. If the server name is Server01 and the domain is Contoso.com, the default value is `Server01.Contoso.com:993:SSL, Server01.Contoso.com:143:TLS`.
LiveIdBasicAuthReplacement	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LogFileLocation	Optional	System.String	The *LogFileLocation* parameter specifies the location for the IMAP4 protocol log files. By default, IMAP4 protocol log files are located in the C:\Program Files\Microsoft\Exchange Server\V15\Logging\Imap4 directory.
LogFileRollOverSettings	Optional	Microsoft.Exchange.Diagnostics.LogFileRollOver	The *LogFileRollOverSettings* parameter specifies how frequently IMAP4 protocol logging creates a new log file. By default, a new log

			file is created daily. You can specify the value for this parameter by using a numerical value or text string. The possible values are: • 1 or Hourly • 2 or Daily • 3 or Weekly • 4 or Monthly This setting only applies when the value for the *LogPerFileSizeQuota* parameter is set to 0.
LoginType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.LoginOptions	The *LoginType* parameter specifies the authentication setting used for the Client Access server running the Microsoft Exchange IMAP4 service. The default value is SecureLogin. You can specify the value for this parameter by using a numerical value or text string. The possible values are: • 1 or PlainTextLogin • 2 or PlainTextAuthentication • 3 or SecureLogin
LogPerFileSizeQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *LogPerFileSizeQuota* parameter specifies the maximum size of an

			IMAP4 protocol log file in bytes. By default, this value is set to 0. When this value is set to 0, a new protocol log file is created at the frequency specified by the *LogFileRollOverSettings* parameter.
MaxCommandSize	Optional	System.Int32	The *MaxCommandSize* parameter specifies the maximum size of a single command. The default size is 10240 bytes. The possible values are from 1024 through 16384 bytes.
MaxConnectionFromSingleIP	Optional	System.Int32	The *MaxConnectionFromSingleIP* parameter specifies the number of connections that the specified server accepts from a single IP address. The default value is 2147483647. The possible values are from 1 through 2147483647.
MaxConnections	Optional	System.Int32	The *MaxConnections* parameter specifies the total number of

			connections that the specified server accepts. This includes authenticated and unauthenticated connections. The default value is 2147483647. The possible values are from 1 through 2147483647.
MaxConnectionsPerUser	Optional	System.Int32	The *MaxConnectionsPerUser* parameter specifies the maximum number of connections that the Client Access server accepts from a particular user. The default value is 16. The possible values are from 1 through 2147483647.
MessageRetrievalMimeFormat	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MimeTextFormat	The *MessageRetrievalMimeFormat* parameter specifies the format of the messages retrieved from the server. The default value is `BestBodyFormat`. You can specify the value for this parameter by using a numerical value or text string. The possible values are:

			• 0 or `TextOnly` • 1 or `HtmlOnly` • 2 or `HtmlAndTextAlternative` • 3 or `TextEnrichedOnly` • 4 or `TextEnrichedAndTextAlternative` • 5 or `BestBodyFormat` • 6 or `Tnef` For more information, see Configure POP3 and IMAP4 message retrieval format options.
OwaServerUrl	Optional	System.Uri	The *OwaServerUrl* parameter specifies the Client Access server from which to retrieve calendar information for instances of custom Microsoft Office Outlook Web App calendar items.
PreAuthenticatedConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *PreAuthenticatedConnectionTimeout* parameter specifies the period of time to wait before closing an idle connection that isn't authenticated. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			Valid input for this parameter is `00:00:30` to `1:00:00`.The default value is `00:01:00` or one minute.
ProtocolLogEnabled	Optional	System.Boolean	The *ProtocolLogEnabled* parameter specifies whether to enable protocol logging. For more information, see Configure protocol logging for POP3 and IMAP4.
ProxyTargetPort	Optional	System.Int32	The *ProxyTargetPort* parameter specifies the port on the Exchange Server 2003 back-end server to which the Microsoft Exchange IMAP4 service on a Client Access server relays commands. The default port is 9933.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies an individual Client Access server in your organization for which you're specifying IMAP4 settings.
ShowHiddenFoldersEnabled	Optional	System.Boolean	The *ShowHiddenFoldersEnabl*

			ed parameter specifies whether hidden folders are visible. If the value is set to `$true`, hidden folders are visible. The default value is `$false`.
SSLBindings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SSLBindings* parameter specifies whether the command sets the IP address and port number to use for communication for an SSL session. This is a multivalued property. Enter a value using the format: <*IP address*>:<*Port number*>. The default value is `0.0.0.0:993`.
SuppressReadReceipt	Optional	System.Boolean	The *SuppressReadReceipt* parameter specifies whether to stop duplicate read receipts from being sent to IMAP4 senders that are using the **Send read receipts for messages I send** option in their IMAP4 email program. By default, this option is set to `$false`. By default, IMAP4 senders that use the **Send read**

			receipts for messages I send option receive a read receipt in both of the following circumstances: • When messages they send are downloaded by the recipient. • When the recipient opens the message. The following are valid values and descriptions for this parameter: • `$false` IMAP4 users are sent a read receipt each time a recipient downloads a message. IMAP4 users are also sent a read receipt when the user opens the message. • `$true` IMAP4 users that use the **Send read receipts for messages I send** option in their email client programs only receive a read receipt when the recipient opens the message.
UnencryptedOrTLSBindings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnencryptedOrTLSBindings* parameter specifies the IP address and port number for communication over the TLS-encrypted connection

			or the connection that isn't encrypted. This is a multivalued property. Enter a value using the format: *<IP address>*:*<Port number>*. The default value is `0.0.0.0:143`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
X509CertificateName	Optional	System.String	The *X509CertificateName* parameter specifies the host name in the SSL certificate from the **Associated Subject** field. This is a multivalued property that contains both the IP address and the port setting. Enter a value using the format: *<IP address>*:*<Port number>*.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxCalendarConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxCalendarConfiguration** cmdlet to show the calendar settings for a specified mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxCalendarConfiguration -Identity <MailboxIdParameter> [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves all the calendar settings for Kai's mailbox where the *Identity* parameter is specified in the alias format.

```
Get-MailboxCalendarConfiguration -Identity kai | Format-
List
```

EXAMPLE 2

This example uses the *Identity* parameter specified in the *domain\account* format and returns the calendar settings for Tony's mailbox.

```
Get-MailboxCalendarConfiguration -Identity contoso\tony
```

EXAMPLE 3

This example requests that the domain controller DC1 retrieves calendar settings for Kai's mailbox from Active Directory.

```
Get-MailboxCalendarConfiguration -Identity kai -
DomainController DC1
```

Detailed Description

The **Get-MailboxCalendarConfiguration** cmdlet returns settings for the calendar of the specified mailbox, including the following:

- **Workdays** Days that appear in the calendar as work days in Microsoft Office Outlook Web App
- **WorkingHoursStartTime** Time that the calendar work day starts
- **WorkingHoursEndTime** Time that the calendar work day ends
- **WorkingHoursTimeZone** Time zone set on the mailbox for the working hours start and end times
- **WeekStartDay** First day of the calendar work week
- **ShowWeekNumbers** Number for each week ranging from 1 through 52 for the calendar while in month view in Outlook Web App
- **TimeIncrement** Increments in minutes in which the calendar displays the time in Outlook Web App
- **RemindersEnabled** Whether Outlook Web App provides a visual cue when a calendar reminder is due
- **ReminderSoundEnabled** Whether a sound is played when a calendar reminder is due
- **DefaultReminderTime** Length of time before each meeting or appointment that the calendar in Outlook Web App shows the reminder

To see all of the settings returned, pipeline the command to the **Format-List** command. To view a code sample, see "EXAMPLE 1."

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.Mail	The *Identity* parameter specifies a unique

		boxIdParameter	identifier for the mailbox. You can use the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxCalendarConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxCalendarConfiguration** cmdlet to apply calendar settings for users using Microsoft Office Outlook Web App calendars. This affects how the user's calendar looks and how reminders work in Outlook Web App. This also affects settings that define how meeting invitations, responses, and notifications are sent to the user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxCalendarConfiguration -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DefaultReminderTime <TimeSpan>] [-DomainController
<Fqdn>] [-FirstWeekOfYear <LegacyNotSet | FirstDay | FirstFourDayWeek |
FirstFullWeek>] [-RemindersEnabled <$true | $false>] [-
ReminderSoundEnabled <$true | $false>] [-ShowWeekNumbers <$true | $false>]
[-TimeIncrement <FifteenMinutes | ThirtyMinutes>] [-WeekStartDay <Sunday |
Monday | Tuesday | Wednesday | Thursday | Friday | Saturday>] [-WhatIf
[<SwitchParameter>]] [-WorkDays <None | Sunday | Monday | Tuesday |
Wednesday | Thursday | Friday | Saturday | Weekdays | WeekendDays |
AllDays>] [-WorkingHoursEndTime <TimeSpan>] [-WorkingHoursStartTime
<TimeSpan>] [-WorkingHoursTimeZone <ExTimeZoneValue>]
```

Examples

EXAMPLE 1

This example disables the calendar reminders for the user Peter.

```
Set-MailboxCalendarConfiguration -Identity Peter -
RemindersEnabled $false
```

EXAMPLE 2

This example sets the time zone of the work hours' start and end times to Pacific Standard Time for the user Peter.

```
Set-MailboxCalendarConfiguration -Identity Peter -
WorkingHoursTimeZone "Pacific Standard Time"
```

EXAMPLE 3

This example sets the working day's starting hour in Tony's calendar to the specified time.

```
Set-MailboxCalendarConfiguration -Identity tony -
WorkingHoursStartTime 07:00:00
```

Detailed Description

The **Set-MailboxCalendarConfiguration** cmdlet was created primarily to allow users to manage their calendar settings. However, administrators who have the Organization Management or Recipient Management management roles may configure the calendar settings for users by using the Exchange Management Shell.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Calendar configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the user account to be set.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DefaultReminderTime	Optional	System.TimeSpan	The *DefaultReminderTime* parameter specifies the length of time before each meeting or appointment

			that Outlook Web App should show the reminder. Values are expressed in "*DD.HH:MM:SS*" time span format within quotation marks, where *DD* refers to days, *HH* refers to hours, *MM* refers to minutes, and *SS* refers to seconds. Valid values are as follows: 00:00:00, 00:05:00, 00:10:00, 00:15:00, 00:30:00, 01:00:00, 02:00:00, 03:00:00, 04:00:00, 08:00:00, 12:00:00, 1.00:00:00, 2.00:00:00, 3.00:00:00, 7.00:00:00, 14.00:00:00
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

FirstWeekOfYear	Optional	Microsoft.Exchange.Data.Storage.Management.FirstWeekRules	The *FirstWeekOfYear* parameter specifies when the first week of the year will start when show week numbers has been turned on in Outlook Web App by the user, or by using the Shell to set the *ShowWeekNumbers* parameter to `$true`. The *FirstWeekOfYear* parameter can have the following values: • `LegacyNotSet` A null value that appears only when the mailbox has been moved from an earlier version of Exchange. It can't be set using the Shell. • `FirstDay` Causes the week numbers to start on the first day of the year. • `FirstFourDayWeek` Causes the week numbers to start on the first week that has at least four days. • `FirstFullWeek` Causes the week numbers to start on the first seven day week. **Note:** The first day of the week can be set by using the *WeekStartDay* parameter.
RemindersEnabled	Optional	System.Boolean	The *RemindersEnabled*

			parameter specifies whether Outlook Web App provides a visual indicator when a calendar reminder is due. Reminders are enabled by default (`$true`).
ReminderSoundEnabled	Optional	System.Boolean	The *ReminderSoundEnabled* parameter specifies whether a sound is played when a reminder is due. The reminder sound is enabled by default (`$true`).
ShowWeekNumbers	Optional	System.Boolean	The *ShowWeekNumbers* parameter specifies whether the date picker in the Outlook Web App calendar shows the week number.
TimeIncrement	Optional	Microsoft.Exchange.Data.Storage.Management.HourIncrement	The *TimeIncrement* parameter specifies the minutes in which the Outlook Web App calendar shows time. For example, `FifteenMinutes` is mapped to 15 minutes.
WeekStartDay	Optional	Microsoft.Exchange.Data.Storage.Management.DayOfWeek	The *WeekStartDay* parameter specifies the first day of the work week.

			The valid values for this parameter are `Sunday`, `Monday`, `Tuesday`, `Wednesday`, `Thursday`, `Friday`, and `Saturday`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WorkDays	Optional	Microsoft.Exchange.Data.DaysOfWeek	The *WorkDays* parameter specifies the work days in the calendar. Valid values for this parameter are `Weekdays`, `AllDays`, `WeekEndDays`, `Sunday`, `Monday`, `Tuesday`, `Wednesday`, `Thursday`, `Friday`, `Saturday` and `None`. The default value is `Weekdays`. You can specify multiple values separated by commas, but redundant

			values are ignored. For example, entering `weekdays,Monday` results in the value `weekdays`.
WorkingHoursEndTime	Optional	System.TimeSpan	The *WorkingHoursEndTime* parameter specifies the time in hours, minutes, and seconds (*hh:mm:ss*) that the work day ends. For example, to state the time as 5:00 P.M., use 17:00:00.
WorkingHoursStartTime	Optional	System.TimeSpan	The *WorkingHoursStartTime* parameter specifies the time in hours, minutes, and seconds (*hh:mm:ss*) that the work day starts. For example, to state the time as 8:00 A.M., use 08:00:00.
WorkingHoursTimeZone	Optional	Microsoft.Exchange.Data.Storage.Management.ExTimeZoneValue	The *WorkingHoursTimeZone* parameter specifies the time zone used by the user's working hour start and end times. Two types of formats are supported as follows: • GMT (Greenwich Mean

			Time), for example, GMT-08:00 • Time zone key name, for example, Pacific Standard Time (PST)

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxMessageConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxMessageConfiguration** cmdlet to view the Microsoft Outlook Web App settings that are applied to specific mailboxes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxMessageConfiguration -Identity <MailboxIdParameter> [-
Credential <PSCredential>] [-DomainController <Fqdn>] [-
ReadFromDomainController <SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the Outlook Web App settings for Tony's mailbox.

```
Get-MailboxMessageConfiguration tony@contoso.com
```

EXAMPLE 2

This example returns the Outlook Web App settings for Tony's mailbox, and specifies the domain controller that's used to get those settings.

```
Get-MailboxMessageConfiguration tony@contoso.com -
DomainController DC1
```

Detailed Description

The **Get-MailboxMessageConfiguration** cmdlet shows Outlook Web App settings for the specified mailbox. These settings are not used in Microsoft Outlook, Microsoft Exchange ActiveSync, or other email clients. These settings are applied in Outlook Web App only. Settings that contain the word *Mobile* are applied in Microsoft OWA for Devices only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use any value that uniquely identifies the mailbox. For example: • Alias • Distinguished name (DN) • GUID • Name • Display name • LegacyExchangeDN • Email address

Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest, and if you don't use this

			parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxMessageConfiguration

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-31*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxMessageConfiguration** cmdlet to configure the Microsoft Outlook Web App settings that are applied to specific mailboxes.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxMessageConfiguration -Identity <MailboxIdParameter> [-
AfterMoveOrDeleteBehavior <OpenPreviousItem | OpenNextItem |
ReturnToView>] [-AlwaysShowBcc <$true | $false>] [-AlwaysShowFrom <$true |
$false>] [-AutoAddSignature <$true | $false>] [-AutoAddSignatureOnMobile
<$true | $false>] [-CheckForForgottenAttachments <$true | $false>] [-
Confirm [<SwitchParameter>]] [-ConversationSortOrder <Chronological | Tree
| NewestOnTop | NewestOnBottom | ChronologicalNewestOnTop |
ChronologicalNewestOnBottom | TreeNewestOnBottom>] [-DefaultFontColor
<String>] [-DefaultFontFlags <Normal | Bold | Italic | Underline | All>]
[-DefaultFontName <String>] [-DefaultFontSize <Int32>] [-DefaultFormat
<Html | PlainText>] [-DomainController <Fqdn>] [-EmailComposeMode <Inline
| SeparateForm>] [-EmptyDeletedItemsOnLogoff <$true | $false>] [-
HideDeletedItems <$true | $false>] [-IgnoreDefaultScope <SwitchParameter>]
[-NewItemNotification <None | Sound | EMailToast | VoiceMailToast |
FaxToast | All>] [-PreviewMarkAsReadBehavior <Delayed | OnSelectionChange
| Never>] [-PreviewMarkAsReadDelaytime <Int32>] [-ReadReceiptResponse
<DoNotAutomaticallySend | AlwaysSend | NeverSend>] [-SendAddressDefault
<String>] [-ShowConversationAsTree <$true | $false>] [-SignatureHtml
<String>] [-SignatureText <String>] [-SignatureTextOnMobile <String>] [-
UseDefaultSignatureOnMobile <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets items deleted from a conversation thread to not show in the list view of the conversation in Outlook Web App for Kai's mailbox.

```
Set-MailboxMessageConfiguration kai@contoso.com -
HideDeletedItems $true
```

EXAMPLE 2

This example sets the compose email message form to always show the Bcc field in Outlook Web App for Kai's mailbox.

```
Set-MailboxMessageConfiguration kai@contoso.com -
AlwaysShowBcc $true
```

Detailed Description

The **Set-MailboxMessageConfiguration** cmdlet configures Outlook Web App settings for the specified mailbox. These settings include email signature, message format, message options, read receipts, reading pane, and conversations. These settings are not used in Microsoft Outlook, Exchange ActiveSync, or other email clients. These settings are applied in Outlook Web App only. Settings that contain the word *Mobile* are applied in Microsoft OWA for Devices only.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "User options" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use any value that uniquely identifies the mailbox. For example: • Alias • Distinguished name (DN) • GUID • Name • Display name • LegacyExchangeDN • Email address
AfterMoveOrDeleteBehavior	Optional	Microsoft.Exchange.Data.Storage.Management.AfterMoveOrDeleteBehavior	The *AfterMoveOrDeleteBehavior* parameter specifies the behavior after moving or deleting an email item in Outlook Web App. You

			can use the following values: • `OpenPreviousItem` • `OpenNextItem` • `ReturnToView` The default value is `OpenNextItem`.
AlwaysShowBcc	Optional	System.Boolean	The *AlwaysShowBcc* parameter shows or hides the blind carbon copy (**Bcc**) field when the user creates messages in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
AlwaysShowFrom	Optional	System.Boolean	The *AlwaysShowFrom* parameter shows or hides the **From** field when the user creates messages in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
AutoAddSignature	Optional	System.Boolean	The *AutoAddSignature* parameter automatically adds the email signature specified by the *SignatureText* or *SignatureHTML*

			parameters to messages when the user creates messages in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. The email signature specified by the *SignatureText* parameter is added to plain text messages. The email signature specified by the *SignatureHTML* parameter is added to HTML-formatted messages.
AutoAddSignatureOnMobile	Optional	System.Boolean	The *AutoAddSignatureOnMobile* parameter automatically adds the signature specified by the *SignatureTextOnMobile* parameter to messages when the user creates messages in OWA for Devices. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.

CheckForForgottenAttachments	Optional	System.Boolean	The *CheckForForgottenAttachments* parameter shows or hides the attachment warning prompt when the user creates messages in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. For example, the user creates a message that includes the text "Please see the attached Word document", but the user doesn't attach a file, and clicks **Send**. If this value is set to `$true`, the user gets a warning prompt so they can go back to the message and attach a file. If this value is set to `$false`, the user doesn't get the warning prompt.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You

			don't have to specify a value with the *Confirm* switch.
ConversationSortOrder	Optional	Microsoft.Exchange.Data.Storage.Management.ConversationSortOrder	The *ConversationSortOrder* parameter specifies the sorting of messages in the reading pane in **Conversation** view for the user in Outlook Web App. You can use the following values: • `Chronological` • `Tree` • `NewestOnTop` • `NewestOnBottom` • `ChronologicalNewestOnTop` • `ChronologicalNewestOnBottom` • `TreeNewestOnBottom` The default value is `ChronologicalNewestOnTop`.
DefaultFontColor	Optional	System.String	The *DefaultFontColor* parameter specifies the default text color when the user creates messages in Outlook Web App. This parameter accepts a hexadecimal color code value in the format `#xxxxxx`. The default value is `#000000`. If the string value is unrecognized, the

			browser application uses a default font color to display the text.
DefaultFontFlags	Optional	Microsoft.Exchange.Data.Storage.Management.FontFlags	The *DefaultFontFlags* parameter specifies the default text effect when the user creates messages in Outlook Web App. You can use the following values: • `Normal` • `Bold` • `Italic` • `Underline` • `All` The default value is `Normal`.
DefaultFontName	Optional	System.String	The *DefaultFontName* parameter specifies the default font when the user creates messages in Outlook Web App. The default value is `Calibri`. If the font name value is unrecognized, the browser application uses a default font to display the text.
DefaultFontSize	Optional	System.Int32	The *DefaultFontSize* parameter specifies the default text size when the user creates messages in Outlook Web App.

			Valid input for this parameter is an integer between 1 and 7. The default value is 3, which corresponds to a 12 point font size.
DefaultFormat	Optional	Microsoft.Exchange.Data.Storage.Management.MailFormat	The *DefaultFormat* parameter specifies the default message format when the user creates messages in Outlook Web App. Accepted values are `Html` and `PlainText`. The default value is `Html`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailComposeMode	Optional	Microsoft.Exchange.Data.Storage.Management.EmailComposeMode	The *EmailComposeMode* parameter specifies how the user creates messages in Outlook Web App. You can use the following values: • `Inline` New messages

			and replies are created in a new browser window. • `SeparateForm` New messages and replies are created in the preview pane. The default value is `Inline`.
EmptyDeletedItemsOnLogoff	Optional	System.Boolean	The *EmptyDeletedItemsOnLogoff* parameter specifies whether to delete items from the Deleted Items folder when the user logs out of Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
HideDeletedItems	Optional	System.Boolean	The *HideDeletedItems* parameter shows or hides deleted messages in **Conversation** view for the user in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchPar	The *IgnoreDefaultScope* parameter instructs the command to ignore the

		ameter	default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
NewItemNotification	Optional	Microsoft.Exchange.Data.Storage.Management.NewItemNotification	The *NewItemNotification* parameter specifies how to provide notification for the arrival of new items for the user in Outlook Web App. You can use the following values:

			• `Sound` • `EMailToast` • `VoiceMailToast` • `FaxToast` • `None` • `All` The default value is `All`.
PreviewMarkAsReadBehavior	Optional	Microsoft.Exchange.Data.Storage.Management.PreviewMarkAsReadBehavior	The *PreviewMarkAsReadBehavior* parameter specifies the options for marking an item as Read in the reading pane for the user in Outlook Web App. You can use the following values: • `Delayed` This value uses the delay interval specified by the *PreviewMarkAsReadDelaytime* parameter. • `OnSelectionChange` • `Never` The default value is `OnSelectionChange`.
PreviewMarkAsReadDelaytime	Optional	System.Int32	The *PreviewMarkAsReadDelaytime* parameter specifies the time in seconds to wait before marking an item as **Read** for the user in Outlook Web App. Valid input for this parameter is an integer between 0 and 30. The default value is 5 seconds.

			This parameter is meaningful only if you set the *PreviewMarkAsReadBehavior* parameter to the value `Delayed`.
ReadReceiptResponse	Optional	Microsoft.Exchange.Data.Storage.Management.ReadReceiptResponse	The *ReadReceiptResponse* parameter specifies how to respond to requests for read receipts for the user in Outlook Web App. You can use the following values: • `DoNotAutomaticallySend` • `AlwaysSend` • `NeverSend` The default value is `DoNotAutomaticallySend`.
SendAddressDefault	Optional	System.String	This parameter is available only in the cloud-based service. The *SendAddressDefault* parameter specifies the default From email address when the user has POP, IMAP, or Hotmail subscriptions configured on their mailbox. Users can override the default From address when they create an email message in Outlook Web App.

			You can use one of the following values: • Blank, which is represented by the value `$null`. This indicates no default From address is specified. • The user's primary email address. For example, bob@contoso.com. • The GUID of a POP, IMAP, or Hotmail subscription that's configured on the user's mailbox. By default, no default From address is specified on the mailbox. When no default From address is specified, the default behavior is: • The primary email address on the mailbox is used for all new messages. • The To address of the incoming message is used as the From address for all replies or forwarded messages.

			You can find the available values for *SendAddressDefault* on a mailbox by running the command **Get-SendAddress -Mailbox <mailbox>**.
ShowConversationAsTree	Optional	System.Boolean	The *ShowConversationAsTree* parameter specifies how to sort messages in the list view in an expanded conversation for the user in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
SignatureHtml	Optional	System.String	The *SignatureHtml* parameter specifies the email signature that's available to the user in HTML-formatted messages in Outlook Web App. You can use plain text or text with HTML tags. However, any JavaScript code is removed. To automatically add this email signature to HTML-

			formatted messages created by the user in Outlook Web App, the *AutoAddSignature* parameter must be set to `$true`.
SignatureText	Optional	System.String	The *SignatureText* parameter specifies the email signature that's available to the user in plain text messages in Outlook Web App. This parameter supports all Unicode characters. To automatically add the email signature to plain text messages created by the user in Outlook Web App, the *AutoAddSignature* parameter must be set to the value `$true`.
SignatureTextOnMobile	Optional	System.String	The *SignatureTextOnMobile* parameter specifies the email signature that's available in messages created by the user in OWA for Devices. This parameter supports all Unicode characters.

			To automatically add the email signature to messages created by the user in OWA for Devices, the *AutoAddSignatureOnMobile* parameter must be set to the value `$true`.
UseDefaultSignatureOnMobile	Optional	System.Boolean	The *UseDefaultSignatureOnMobile* parameter specifies whether to add the default email signature to messages created by the user in OWA for Devices. The user configures the default signature in Microsoft Outlook. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxRegionalConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxRegionalConfiguration** cmdlet to retrieve regional settings such as time zone, time format, date, and language settings for a specified mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxRegionalConfiguration -Identity <MailboxIdParameter> [-
DomainController <Fqdn>] [-VerifyDefaultFolderNameLanguage
<SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves regional settings for Tony's mailbox.

```
Get-MailboxRegionalConfiguration -Identity tony
```

EXAMPLE 2

This example retrieves regional settings for Tony's mailbox, requesting information from the

domain controller closest to Tony's mailbox.

```
Get-MailboxRegionalConfiguration -Identity tony -
DomainController "DC1"
```

EXAMPLE 3

This example, in addition to returning regional settings for Tony's mailbox, indicates whether the default folder names of the mailbox are localized in the locale selected for the mailbox.

```
Get-MailboxRegionalConfiguration -Identity tony -
VerifyDefaultFolderNameLanguage $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter identifies the mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-

			premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
VerifyDefaultFolderNameLanguage	Optional	System.Management.Automation.SwitchParameter	If the *VerifyDefaultFolderNameLanguage* parameter is set to `$true`, the **DefaultFolderNameMatchingUserLanguage** property returned by the task indicates whether the mailbox default folder names are localized with the language specified for the mailbox. If this parameter isn't specified, the property isn't returned by the task. This parameter can only be used by the mailbox owner. If a non-mailbox owner tries to run the command on the mailbox with this parameter, an error is reported. The default value is `$false`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxRegionalConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxRegionalConfiguration** cmdlet to set regional settings such as time, date, or language for the specified mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxRegionalConfiguration -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DateFormat <String>] [-DomainController <Fqdn>] [-
Language <CultureInfo>] [-LocalizeDefaultFolderName <SwitchParameter>] [-
TimeFormat <String>] [-TimeZone <ExTimeZoneValue>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets Tony's mailbox to have the language set as Brazilian Portuguese.

```
Set-MailboxRegionalConfiguration -Identity Tony -Language
pt-br
```

EXAMPLE 2

This example sets the date format for Tony's mailbox.

```
Set-MailboxRegionalConfiguration -Identity Tony -DateFormat
"d/m/yyyy"
```

EXAMPLE 3

This example sets Tony's mailbox to have the language set as Danish Denmark and the date set in the format of day/month/year.

```
Set-MailboxRegionalConfiguration -Identity Tony -Language
da-dk -DateFormat "dd-mm-yyyy"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Spelling configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
Confirm	Optional	System.Management.Automation.SwitchPar	The *Confirm* switch can be used to suppress the

		ameter	confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DateFormat	Optional	System.String	The *DateFormat* parameter specifies the format for displaying the date, for example, *m/d/yyyy*, in the mailbox for a specified region based on the *Language* selection.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Language	Optional	System.Globalization.CultureInfo	The *Language* parameter specifies the language setting such as en-us that would apply for the mailbox.

LocalizeDefaultFolderName	Optional	System.Management.Automation.SwitchParameter	The *LocalizeDefaultFolderName* parameter specifies whether the default folder names of the mailbox are localized with the current or specified language. When the parameter is set to `$true`, the default folder names of the mailbox are localized with the current or specified language. This parameter can only be used by the mailbox owner running the task. If a non-mailbox owner tries to configure this setting on the mailbox, an error is reported. By default, the value is set to `$false`.
TimeFormat	Optional	System.String	The *TimeFormat* parameter specifies the format (for example, *h:mm tt*, as in 3:45 A.M.) used by the mailbox to display time for the specified region.
TimeZone	Optional	Microsoft.Exchange.Data.Storage.Management.ExTimeZoneValue	The *TimeZone* parameter specifies the time zone, such as Pacific Standard Time, that the mailbox in

			the specified region uses. The default value is the time zone setting on the server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxSpellingConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some

parameters and settings may be exclusive to one environment or the other.

Use the **Get-MailboxSpellingConfiguration** cmdlet to retrieve the Microsoft Office Outlook Web App spelling checker settings of a specified user. For example, users can set their dictionary language and configure the spelling checker to ignore mixed digits and words in all uppercase.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxSpellingConfiguration -Identity <MailboxIdParameter> [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves the Outlook Web App options of user Tony.

```
Get-MailboxSpellingConfiguration -Identity Tony
```

EXAMPLE 2

This example returns the Outlook Web App spelling checker options for Tony's mailbox by specifying domain controller DC1 to get the information from Active Directory.

```
Get-MailboxSpellingConfiguration -Identity Tony -
DomainController DC1
```

EXAMPLE 3

This example returns the Outlook Web App spelling checker options for Tony's mailbox by specifying the identity of the mailbox in the format *domain\account*.

```
Get-MailboxSpellingConfiguration -Identity contoso\tony
```

Detailed Description

The **Get-MailboxSpellingConfiguration** cmdlet is primarily used to populate the spelling checker settings for end users in Outlook Web App. Administrators can also view users' settings by running this cmdlet in the Exchange Management Shell. The following spelling checker settings are retrieved by the cmdlet for the specified mailbox:

- **Identity** This setting specifies the mailbox identity.
- **CheckBeforeSend** This setting specifies whether Outlook Web App checks the spelling of every message when the user clicks **Send** in the new message form.
- **DictionaryLanguage** This setting specifies the dictionary language used when the spelling checker checks the spelling in messages.
- **IgnoreMixedDigits** This setting specifies whether the spelling checker ignores words that

contain numbers.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Spelling configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxSpellingConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MailboxSpellingConfiguration** cmdlet to modify Microsoft Office Outlook Web App spelling checker options for a specified user. For example, you can set the dictionary language and configure the spelling checker to ignore mixed digits or words in all uppercase.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxSpellingConfiguration -Identity <MailboxIdParameter> [-
CheckBeforeSend <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DictionaryLanguage <Spanish | Arabic | Danish | Dutch | EnglishAustralia |
EnglishCanada | EnglishUnitedKingdom | EnglishUnitedStates | Finnish |
French | GermanPostReform | GermanPreReform | Hebrew | Italian | Korean |
NorwegianBokmal | NorwegianNynorsk | PortuguesePortugal | PortugueseBrasil
| Swedish | Catalan>] [-DomainController <Fqdn>] [-IgnoreMixedDigits
<$true | $false>] [-IgnoreUppercase <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the spelling checker of user Peter to ignore words in all uppercase letters.

```
Set-MailboxSpellingConfiguration -Identity Peter -
IgnoreUppercase $true
```

EXAMPLE 2

This example sets the spelling checker to ignore words that contain only uppercase letters for messages sent from Kai's mailbox.

```
Set-MailboxSpellingConfiguration -Identity kai -
IgnoreUppercase $true
```

EXAMPLE 3

This example sets the spelling checker to ignore words containing numbers for messages sent from Kai's mailbox.

```
Set-MailboxSpellingConfiguration -IgnoreMixedDigits $true -
Identity kai
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Spelling configuration" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox. You can use the following values: • GUID • ADObjectID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
CheckBeforeSend	Optional	System.Boolean	The *CheckBeforeSend* parameter specifies

			whether Outlook Web App checks the spelling for every message when the user clicks **Send** in the new message form. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DictionaryLanguage	Optional	Microsoft.Exchange.Data.Storage.Management.SpellcheckerSupportedLanguage	The *DictionaryLanguage* parameter specifies the dictionary language to use when the spelling checker checks the spelling in messages. You can use the following values: • `Arabic` • `Catalan` • `Danish` • `Dutch` • `EnglishAustralia` • `EnglishCanada` • `EnglishUnitedKingdom` • `EnglishUnitedStates` • `Finnish` • `French` • `GermanPreReform`

			• GermanPostReform • Hebrew • Italian • Korean • NorwegianBokMal • NorwegianNyorsk • PortuguesePortugal • PortugueseBrasil • Spanish • Swedish
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreMixedDigits	Optional	System.Boolean	The *IgnoreMixedDigits* parameter specifies whether the spelling checker ignores words that contain numbers. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.
IgnoreUppercase	Optional	System.Boolean	The *IgnoreUppercase* parameter specifies whether the spelling checker ignores words that contain only uppercase letters, for

			example, acronyms. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MapiVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MapiVirtualDirectory** cmdlet to view Message Application Programming Interface (MAPI) virtual directories on Microsoft Exchange 2013 servers. A MAPI virtual directory is used by supported versions of Microsoft Outlook to connect to mailboxes by using the MAPIHTTP protocol.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MapiVirtualDirectory [-Identity <VirtualDirectoryIdParameter>] <COMMON
PARAMETERS>

Get-MapiVirtualDirectory -Server <ServerIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

Example 1

This example returns the settings of the MAPI virtual directory on the server named ContosoMail.

```
Get-MapiVirtualDirectory -Server ContosoMail
```

Example 2

These examples return the settings of the MAPI virtual directory on the local server named ContosoMail. All three commands do the same thing.

```
Get-MapiVirtualDirectory -Identity "ContosoMail\mapi
(Default Web Site)"
Get-MapiVirtualDirectory "mapi (Default Web Site)"
Get-MapiVirtualDirectory mapi*
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description

Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server that will host the virtual directory. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the virtual directory will be created on the server where the remote PowerShell session is established. This will always be a Mailbox server. If you want to create the virtual directory on a Client Access server or another Mailbox server, you need to use the *Server* parameter.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the

			Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the MAPI virtual directory that you want to view. You can use any value that uniquely identifies the virtual directory. For example: • Name or <Server>\Name • Distinguished name (DN) • GUID The **Name** value uses the syntax "`<VirtualDirectoryName>(<WebsiteName>)`" from the properties of the virtual directory. You can specify the wildcard character (*) instead of the

			default website by using the syntax `<VirtualDirectoryName>*`.
ShowBackEndVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MapiVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-MapiVirtualDirectory** cmdlet to create Messaging Application Programming Interface (MAPI) virtual directories on Microsoft Exchange 2013 servers A MAPI virtual directory is used by supported versions of Microsoft Outlook to connect to mailboxes by using the MAPIHTTP protocol.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MapiVirtualDirectory [-Confirm [<SwitchParameter>]] [-DomainController
```

```
<Fqdn>] [-ExtendedProtectionFlags <MultiValuedProperty>] [-
ExtendedProtectionSPNList <MultiValuedProperty>] [-
ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-IISAuthenticationMethods <MultiValuedProperty>] [-InternalUrl
<Uri>] [-Role <ClientAccess | Mailbox>] [-Server <ServerIdParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates a new MAPI virtual directory that has the following configuration:

- **Internal URL** https://contoso.com/mapi
- **IIS authentication methods** NTLM and Negotiate.

```
New-MapiVirtualDirectory -InternalUrl https://contoso.com/
mapi -IISAuthenticationMethods NTLM,Negotiate
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	This parameter is reserved for internal Microsoft use.
ExternalUrl	Optional	System.Uri	The *ExternalURL* parameter specifies the URL that's used to connect to the virtual directory from outside the firewall. This setting enforces the Secure Sockets Layer (SSL) protocol and uses the default SSL port. Valid input for this parameter uses the syntax `https://<Domain Name>/mapi`.

			When you use the *InternalUrl* or *ExternalUrl* parameters, you need to specify one or more authentication values by using the *IISAuthenticationMethods* parameter.
IISAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *IISAuthenticationMethods* parameter specifies the authentication methods that are enabled on the virtual directory in Internet Information Services (IIS). Valid values for this parameter are: • Basic • Negotiate • NTLM You can specify multiple values separated by commas.
InternalUrl	Optional	System.Uri	The *InternalURL* parameter specifies the URL that's used to connect to the virtual directory from inside the firewall. This setting enforces the Secure Sockets Layer (SSL) protocol and uses

			the default SSL port. Valid input for this parameter uses the syntax `https://<Domain Name>/mapi`. When you use the *InternalUrl* or *ExternalUrl* parameters, you need to specify one or more authentication values by using the *IISAuthenticationMethods* parameter.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	This parameter is reserved for internal Microsoft use.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server that will host the virtual directory. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the virtual directory will be created

			on the server where the remote PowerShell session is established. This will always be a Mailbox server. If you want to create the virtual directory on a Client Access server or another Mailbox server, you need to use the *Server* parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MapiVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MapiVirtualDirectory** cmdlet to remove Message Application Programming Interface (MAPI) virtual directories from Microsoft Exchange 2013 servers. A MAPI virtual directory is used by supported versions of Microsoft Outlook to connect to mailboxes by using the MAPIHTTP protocol.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MapiVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the MAPI virtual directory from the local server named ContosoMail. All three commands do the same thing.

```
Remove-MapiVirtualDirectory -Identity "ContosoMail\mapi
(Default Web Site)"
Remove-MapiVirtualDirectory "mapi (Default Web Site)"
Remove-MapiVirtualDirectory mapi*
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the MAPI virtual directory that you want to remove. You can use any value that uniquely identifies the virtual directory. For example: • Name or <Server>\Name • Distinguished name (DN) • GUID The **Name** value uses the syntax "<VirtualDirectoryName> (<WebsiteName>)" from the properties of the virtual directory. You can specify the wildcard character (*) instead of the default website by using the syntax <VirtualDirectoryName>*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax --

			`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MapiVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MapiVirtualDirectory** cmdlet to modify Messaging Application Programming Interface (MAPI) virtual directories on Microsoft Exchange 2013 servers. A MAPI virtual directory is used by supported versions of Microsoft Outlook to connect to mailboxes by using the MAPIHTTP protocol.

```
Set-MapiVirtualDirectory -Identity <VirtualDirectoryIdParameter> -
IISAuthenticationMethods <MultiValuedProperty> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExtendedProtectionFlags
<MultiValuedProperty>] [-ExtendedProtectionSPNList <MultiValuedProperty>]
[-ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-InternalUrl <Uri>] [-Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example makes the following configuration changes to the MAPI virtual directory on the default web site of the server named ContosoMail:

- **Internal URL** https://contoso/mapi.
- **IIS authentication methods** NTLM and Negotiate.

```
Set-MapiVirtualDirectory -Identity "ContosoMail\mapi
(Default Web Site)" -InternalUrl https://contoso.com/mapi -
IISAuthenticationMethods NTLM,Negotiate
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Client Access virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the MAPI virtual directory that you want to configure. You can use any value that uniquely identifies the virtual directory. For example: • Name or <Server>\Name • Distinguished name (DN) • GUID The **Name** value uses the syntax "`<VirtualDirectoryName>(<WebsiteName>)`" from the properties of the virtual directory. You can specify the wildcard character (*) instead of the default website by using the syntax `<VirtualDirectoryName>*`.
IISAuthenticationMethods	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *IISAuthenticationMethods* parameter specifies the authentication methods that are enabled on the virtual directory in Internet Information Services (IIS). Valid values

			for this parameter are: • Basic • Negotiate • NTLM To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	This parameter is reserved for internal Microsoft use.
ExternalUrl	Optional	System.Uri	The *ExternalURL* parameter specifies the URL that's used to connect to the virtual directory from outside the firewall. This setting enforces the Secure Sockets Layer (SSL) protocol and uses the default SSL port. Valid

			input for this parameter uses the syntax `https://<Domain Name>/mapi`. When you use the *InternalUrl* or *ExternalUrl* parameters, you need to specify one or more authentication values by using the *IISAuthenticationMethods* parameter.
InternalUrl	Optional	System.Uri	The *InternalURL* parameter specifies the URL that's used to connect to the virtual directory from inside the firewall. This setting enforces the Secure Sockets Layer (SSL) protocol and uses the default SSL port. Valid input for this parameter uses the syntax `https://<Domain Name>/mapi`. When you use the *InternalUrl* or *ExternalUrl* parameters, you need to specify one or more authentication values by using the *IISAuthenticationMethods* parameter.

Name	Optional	System.String	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Clear-MobileDevice

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Clear-MobileDevice** cmdlet to delete all data from a mobile phone.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Clear-MobileDevice -Identity <MobileDeviceIdParameter> [-Cancel
<SwitchParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-NotificationEmailAddresses <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example clears all data from the mobile device with the Identity WM_JeffHay.

```
Clear-MobileDevice -Identity WM_JeffHay
```

EXAMPLE 2

This example clears all data from the mobile device for Tony Smith and sends a confirmation email message to tony@contoso.com.

```
Clear-MobileDevice -Identity WM_TonySmith -
NotificationEmailAddresses "tony@contoso.com"
```

EXAMPLE 3

This example cancels a previously sent **Clear-MobileDevice** command request for Tony Smith's mobile device.

```
Clear-MobileDevice -Identity WM_TonySmith -Cancel $true
```

Detailed Description

The **Clear-MobileDevice** cmdlet deletes all user data from a mobile device the next time that the device receives data from the server running Microsoft Exchange Server 2013. This cmdlet sets the *DeviceWipeStatus* parameter to `$true`. The mobile device acknowledges the cmdlet and records the time stamp in the *DeviceWipeAckTime* parameter.

After you run this cmdlet, you receive a warning that states: "This command will force all the data on the device to be permanently deleted. Do you want to continue?" You must respond to the warning for the cmdlet to run on the mobile phone.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange ActiveSync user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MobileDeviceIdParameter	The *Identity* parameter specifies the identity of the device that you want to reset.
Cancel	Optional	System.Management.Automation.SwitchParameter	The *Cancel* parameter specifies whether the command should be canceled. If you use the *Cancel* parameter, a cancellation request is issued for the remote device wipe.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
NotificationEmailAddresses	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmailAddresses* parameter specifies the notification email address for the remote device wipe confirmation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MobileDevice

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MobileDevice** cmdlet to get the list of devices in your organization that have active Microsoft Exchange ActiveSync partnerships.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MobileDevice [-Identity <MobileDeviceIdParameter>] <COMMON PARAMETERS>

Get-MobileDevice -Mailbox <MailboxIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-ActiveSync <SwitchParameter>] [-DomainController
<Fqdn>] [-Filter <String>] [-Monitoring <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-OrganizationalUnit
<OrganizationalUnitIdParameter>] [-OWAforDevices <SwitchParameter>] [-
ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example returns all the Exchange ActiveSync mobile devices that Tony Smith has used that are associated with his mailbox.

```
Get-MobileDevice -Identity "TonySmith"
```

EXAMPLE 2

This example returns all the Exchange ActiveSync mobile devices that Tony Smith has used that are associated with his mailbox.

```
Get-MobileDevice -Mailbox "Redmond\TonySmith"
```

Detailed Description

The **Get-MobileDevice** cmdlet returns identification, configuration, and status information for each mobile device.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile devices user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the user whose mobile devices you want to retrieve.
ActiveSync	Optional	System.Management.Automation.SwitchParameter	The *ActiveSync* switch specifies whether to include mobile devices that synchronize with Exchange ActiveSync.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter specifies a set of attributes

			used to filter the list of returned mobile devices.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MobileDeviceIdParameter	The *Identity* parameter specifies the device to retrieve. One of the following values is used to identify a mobile device in Active Directory: • `GUID` • `DeviceIdentity` • `Multi-TenantID`
Monitoring	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in on-premises Exchange 2013. The *Monitoring* parameter specifies whether mobile devices that are created by monitoring accounts are exposed by the **Get-MobileDevice** cmdlet. The default value is *$false*.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
OrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OrganizationalUnit* parameter specifies the organizational unit (OU) where the task is run.
OWAforDevices	Optional	System.Management.Automation.SwitchParameter	The *OWAforDevices* parameter specifies whether OWA for Devices is enabled for the specific

			mobile phone or device.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute to sort by.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MobileDevice

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MobileDevice** cmdlet to remove the mobile device partnership information that you specify from a user's mobile device list stored in a mailbox on a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MobileDevice -Identity <MobileDeviceIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mobile device partnership for the device WM_JeffHay.

```
Remove-MobileDevice -Identity WM_JeffHay
```

EXAMPLE 2

This example removes the mobile device partnership for the device iPhone_TonySmith after displaying the confirm prompt.

```
Remove-MobileDevice -Identity iPhone_TonySmith -Confirm
$true
```

EXAMPLE 3

This example removes the mobile device partnership for the device Tablet_JeffHay after displaying the confirm prompt.

```
Remove-MobileDevice -Identity Tablet_JeffHay -Confirm $true
```

Detailed Description

The **Remove-MobileDevice** cmdlet is useful for removing mobile devices that no longer synchronize successfully with the server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MobileDeviceIdParameter	The *Identity* parameter uniquely identifies the specific device partnership to be removed.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MobileDeviceMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MobileDeviceMailboxPolicy** cmdlet to retrieve the Mobile Device mailbox policy settings for a specific Mobile Device mailbox policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MobileDeviceMailboxPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns the policy settings for the Mobile Device mailbox policy SalesPolicy.

```
Get-MobileDeviceMailboxPolicy -Identity "SalesPolicy"
```

EXAMPLE 2

This example returns the policy settings for the Mobile Device mailbox policy Default.

```
Get-MobileDeviceMailboxPolicy -Identity "Default"
```

Detailed Description

A Mobile Device mailbox policy is a group of settings that specifies how mobile devices enabled for Exchange ActiveSync connect to the computer running Exchange. Exchange supports multiple Mobile Device mailbox policies. The **Get-MobileDeviceMailboxPolicy** cmdlet displays all the policy settings for the specified policy. These settings include password settings, file access settings, and attachment settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the policy name.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-MobileDeviceMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-MobileDeviceMailboxPolicy** cmdlet to create Microsoft mobile device mailbox policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-MobileDeviceMailboxPolicy -Name <String> [-AllowApplePushNotifications
<$true | $false>] [-AllowBluetooth <Disable | HandsfreeOnly | Allow>] [-
AllowBrowser <$true | $false>] [-AllowCamera <$true | $false>] [-
AllowConsumerEmail <$true | $false>] [-AllowDesktopSync <$true | $false>]
[-AllowExternalDeviceManagement <$true | $false>] [-
AllowGooglePushNotifications <$true | $false>] [-AllowHTMLEmail <$true |
$false>] [-AllowInternetSharing <$true | $false>] [-AllowIrDA <$true |
$false>] [-AllowMicrosoftPushNotifications <$true | $false>] [-
AllowMobileOTAUpdate <$true | $false>] [-AllowNonProvisionableDevices
<$true | $false>] [-AllowPOPIMAPEmail <$true | $false>] [-
AllowRemoteDesktop <$true | $false>] [-AllowSimplePassword <$true |
$false>] [-AllowSMIMEEncryptionAlgorithmNegotiation <BlockNegotiation |
OnlyStrongAlgorithmNegotiation | AllowAnyAlgorithmNegotiation>] [-
AllowSMIMESoftCerts <$true | $false>] [-AllowStorageCard <$true | $false>]
[-AllowTextMessaging <$true | $false>] [-AllowUnsignedApplications <$true
| $false>] [-AllowUnsignedInstallationPackages <$true | $false>] [-
AllowWiFi <$true | $false>] [-AlphanumericPasswordRequired <$true |
$false>] [-ApprovedApplicationList <ApprovedApplicationCollection>] [-
AttachmentsEnabled <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DeviceEncryptionEnabled <$true | $false>] [-DevicePolicyRefreshInterval
<Unlimited>] [-DomainController <Fqdn>] [-IrmEnabled <$true | $false>] [-
```

```
IsDefault <$true | $false>] [-MaxAttachmentSize <Unlimited>] [-
MaxCalendarAgeFilter <All | TwoWeeks | OneMonth | ThreeMonths |
SixMonths>] [-MaxEmailAgeFilter <All | OneDay | ThreeDays | OneWeek |
TwoWeeks | OneMonth>] [-MaxEmailBodyTruncationSize <Unlimited>] [-
MaxEmailHTMLBodyTruncationSize <Unlimited>] [-MaxInactivityTimeLock
<Unlimited>] [-MaxPasswordFailedAttempts <Unlimited>] [-
MinPasswordComplexCharacters <Int32>] [-MinPasswordLength <Int32>] [-
MobileOTAUpdateMode <MajorVersionUpdates | MinorVersionUpdates |
BetaVersionUpdates>] [-Organization <OrganizationIdParameter>] [-
PasswordEnabled <$true | $false>] [-PasswordExpiration <Unlimited>] [-
PasswordHistory <Int32>] [-PasswordRecoveryEnabled <$true | $false>] [-
RequireDeviceEncryption <$true | $false>] [-RequireEncryptedSMIMEMessages
<$true | $false>] [-RequireEncryptionSMIMEAlgorithm <TripleDES | DES |
RC2128bit | RC264bit | RC240bit>] [-RequireManualSyncWhenRoaming <$true |
$false>] [-RequireSignedSMIMEAlgorithm <SHA1 | MD5>] [-
RequireSignedSMIMEMessages <$true | $false>] [-
RequireStorageCardEncryption <$true | $false>] [-
UnapprovedInROMApplicationList <MultiValuedProperty>] [-UNCAccessEnabled
<$true | $false>] [-WhatIf [<SwitchParameter>]] [-WSSAccessEnabled <$true
| $false>]
```

Examples

EXAMPLE 1

This example creates the mobile device mailbox policy Sales Policy that has several preconfigured values.

```
New-MobileDeviceMailboxPolicy -Name "Sales Policy" -
PasswordEnabled $true -AlphanumericPasswordRequired $true -
PasswordRecoveryEnabled $true -IsDefault $false -
AttachmentsEnabled $false -AllowStorageCard $true
```

EXAMPLE 2

This example creates the mobile device mailbox policy Management that has several preconfigured values. Users assigned to this policy should have an Enterprise client access license (CAL) to use many of these features.

```
New-MobileDeviceMailboxPolicy -Name Management -
AllowBluetooth $true -AllowBrowser $true -AllowCamera $true
-AllowPOPIMAPEmail $false -PasswordEnabled $true -
AlphanumericPasswordRequired $true -PasswordRecoveryEnabled
$true -MaxEmailAgeFilter TwoWeeks -AllowWiFi $true -
AllowStorageCard $true
```

EXAMPLE 3

This example creates the mobile device mailbox policy Contoso Policy that has several preconfigured values. This policy is configured to be the default policy for the organization. The default policy is assigned to all new users.

```
New-MobileDeviceMailboxPolicy -Name "Contoso Policy" -
PasswordEnabled $true -AlphanumericPasswordRequired $true -
PasswordRecoveryEnabled $true -MinPasswordComplexCharacters
3 -IsDefault $true -PasswordHistory 10
```

Detailed Description

Mobile device mailbox policies define settings for mobile devices that are used to access mailboxes in your organization. The default mobile device mailbox policy is applied to all new mailboxes that you create. You can assign a mobile device mailbox policy to existing mailboxes by using the **Set-CASMailbox** cmdlet, or by editing the mailbox properties in the Exchange admin center (EAC).

Note:

Some mobile device mailbox policy settings require the mobile device to have certain built-in features that enforce these security and device management settings. If your organization allows all devices, you need to set the *AllowNonProvisionableDevices* parameter to `$true`. This allows devices that can't enforce all policy settings to synchronize with your server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the mobile device mailbox policy. You can use any value that uniquely identifies the policy. For example: • Name • Distinguished name (DN) • GUID The name of the built-in

			mobile device mailbox policy is `Default`.
AllowApplePushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowApplePushNotifications* parameter specifies whether push notifications are allowed for Apple mobile devices. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowBluetooth	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.BluetoothType	The *AllowBluetooth* parameter specifies whether the Bluetooth capabilities of the mobile device are allowed. The available options are `Disable`, `HandsfreeOnly`, and `Allow`. The default value is `Allow`.
AllowBrowser	Optional	System.Boolean	The *AllowBrowser* parameter specifies whether Microsoft Pocket Internet Explorer is allowed on the mobile device. Valid input for this parameter is `$true` or

			`$false`. The default value is `$true`. This parameter doesn't affect third-party browsers.
AllowCamera	Optional	System.Boolean	The *AllowCamera* parameter specifies whether the mobile device's camera is allowed. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowConsumerEmail	Optional	System.Boolean	The *AllowConsumerEmail* parameter specifies whether the user can configure a personal email account on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter doesn't control access to email accounts using third-party mobile device email programs.
AllowDesktopSync	Optional	System.Boolean	The *AllowDesktopSync* parameter specifies whether the mobile device can synchronize with a desktop computer through a cable. Valid

			input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowExternalDeviceManagement	Optional	System.Boolean	The *AllowExternalDeviceManagement* parameter specifies whether an external device management program is allowed to manage the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
AllowGooglePushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowGooglePushNotifications* parameter controls whether the user can receive push notifications from Google for OWA for Devices. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowHTMLEmail	Optional	System.Boolean	The *AllowHTMLEmail* parameter specifies whether HTML-formatted email is enabled on the

			mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If set to `$false`, all email is converted to plain text before synchronization occurs.
AllowInternetSharing	Optional	System.Boolean	The *AllowInternetSharing* parameter specifies whether the mobile device can be used as a modem to connect a computer to the Internet. This process is also known as *tethering*. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowIrDA	Optional	System.Boolean	The *AllowIrDA* parameter specifies whether infrared connections are allowed to the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowMicrosoftPushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowMicrosoftPushNotific*

			ations parameter specifies whether push notifications are enabled on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowMobileOTAUpdate	Optional	System.Boolean	The *AllowMobileOTAUpdate* parameter specifies whether the policy can be sent to the mobile device over a cellular data connection. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowNonProvisionableDevices	Optional	System.Boolean	The *AllowNonProvisionableDevices* parameter specifies whether all mobile devices can synchronize with Exchange. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. When set to `$true`, this parameter enables all mobile devices to synchronize with Exchange, regardless of

			whether the device can enforce all settings that are defined by the policy. This also includes mobile devices managed by a separate device management system. When set to `$false`, this parameter blocks mobile devices that aren't provisioned from synchronizing with Exchange.
AllowPOPIMAPEmail	Optional	System.Boolean	The *AllowPOPIMAPEmail* parameter specifies whether the user can configure a POP3 or IMAP4 email account on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter doesn't control access by third-party email programs.
AllowRemoteDesktop	Optional	System.Boolean	The *AllowRemoteDesktop* parameter specifies whether the mobile device can initiate a remote desktop connection. Valid input for this parameter is `$true` or `$false`. The

			default value is `$true`.
AllowSimplePassword	Optional	System.Boolean	The *AllowSimplePassword* parameter specifies whether a simple password is allowed on the mobile device. A simple password is a password that has a specific pattern, such as 1111 or 1234. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowSMIMEEncryptionAlgorithmNegotiation	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SMIMEEncryptionAlgorithmNegotiationType	The *AllowSMIMEEncryptionAlgorithmNegotiation* parameter specifies whether the messaging application on the mobile device can negotiate the encryption algorithm if a recipient's certificate doesn't support the specified encryption algorithm. Valid values for this parameter are: • `AllowAnyAlgorithmNegotiation` • `BlockNegotiation` • `OnlyStrongAlgorithmNegotiation` The default value is `AllowAnyAlgorithmNegotiation`.

AllowSMIMESoftCerts	Optional	System.Boolean	The *AllowSMIMESoftCerts* parameter specifies whether S/MIME software certificates are allowed on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowStorageCard	Optional	System.Boolean	The *AllowStorageCard* parameter specifies whether the mobile device can access information stored on a storage card. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowTextMessaging	Optional	System.Boolean	The *AllowTextMessaging* parameter specifies whether text messaging is allowed from the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowUnsignedApplications	Optional	System.Boolean	The *AllowUnsignedApplications* parameter specifies whether unsigned applications can be installed on the mobile

			device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowUnsignedInstallationPackages	Optional	System.Boolean	The *AllowUnsignedInstallationPackages* parameter specifies whether unsigned installation packages are allowed to run on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowWiFi	Optional	System.Boolean	The *AllowWiFi* parameter specifies whether wireless Internet access is allowed on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AlphanumericPasswordRequired	Optional	System.Boolean	The *AlphanumericPasswordRequired* parameter specifies whether the password for the mobile device must be alphanumeric. Valid input for this parameter is

			`$true` or `$false`. The default value is `$false`.
ApprovedApplicationList	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ApprovedApplicationCollection	The *ApprovedApplicationList* parameter specifies a configured list of approved applications for the device.
AttachmentsEnabled	Optional	System.Boolean	The *AttachmentsEnabled* parameter specifies whether attachments can be downloaded on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. When set to `$false`, this parameter blocks the user from downloading attachments on the mobile device.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DeviceEncryptionEnabled	Optional	System.Boolean	The *DeviceEncryptionEnabled* parameter specifies whether encryption is enabled on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When this parameter is set to `$true`, device encryption is enabled on the mobile device.
DevicePolicyRefreshInterval	Optional	Microsoft.Exchange.Data.Unlimited	The *DevicePolicyRefreshInterval* parameter specifies how often the policy is sent to the mobile device. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The default value is `Unlimited`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IrmEnabled	Optional	System.Boolean	The *IrmEnabled* parameter specifies whether Information Rights Management (IRM) is enabled for the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
IsDefault	Optional	System.Boolean	The *IsDefault* parameter specifies whether this policy is the default mobile device mailbox policy. Valid input for this parameter is `$true` or `$false`. The default value for the built-in mobile device mailbox policy named `Default` is `$true`. The default value for new mobile device mailbox policies that you create is `$false`. There can be only one default policy. If another policy is currently set as the default, and you set

			this parameter to `$true`, this policy becomes the default policy. The value of this parameter on the other policy is automatically changed to `$false`, and that policy is no longer the default policy.
MaxAttachmentSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxAttachmentSize* parameter specifies the maximum size of attachments that can be downloaded to the mobile device. Valid input for this parameter is a size value between 0 and 2147482624 bytes (approximately 2 GB), or the value `Unlimited`. The default value is `Unlimited`. Unqualified values are treated as bytes. You can qualify the value with `KB` (kilobytes), `MB` (megabytes) or `GB` (gigabytes). For example, to set the limit to 4 kilobytes, enter the value `4096` or `4KB`. The maximum value is 1024 bytes (one kilobyte)

			less than two gigabytes (2*1024^3), so these are the maximum qualified values you can use with this parameter. • `2097151KB` • `2047.999024MB` • `1.999999047GB`
MaxCalendarAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CalendarAgeFilterType	The *MaxCalendarAgeFilter* parameter specifies the maximum range of calendar days that can be synchronized to the mobile device. Valid values for this parameter are: • `All` • `TwoWeeks` • `OneMonth` • `ThreeMonths` • `SixMonths` The default value is `All`.
MaxEmailAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EmailAgeFilterType	The *MaxEmailAgeFilter* parameter specifies the maximum number of days of email items to synchronize to the mobile device. Valid values for this parameter are: • `All` • `OneDay` • `ThreeDays` • `OneWeek` • `TwoWeeks` • `OneMonth` The default value is `All`.

MaxEmailBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailBodyTruncationSize* parameter specifies the maximum size at which email messages are truncated when synchronized to the mobile device. Valid input for this parameter is an integer between 0 and 2147483647 (`Int32`) or the value `Unlimited`. The default value is `Unlimited`. Unqualified values are treated as bytes. You can qualify the value with `KB` (kilobytes), `MB` (megabytes) or `GB` (gigabytes). For example, to set the limit to 4 kilobytes, enter the value `4KB` or `4096`.
MaxEmailHTMLBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailHTMLBodyTruncationSize* parameter specifies the maximum size at which HTML-formatted email messages are truncated when synchronized to the mobile device. Valid input for this parameter is an

			integer between 0 and 2147483647 (`Int32`) or the value `Unlimited`. The default value is `Unlimited`. Unqualified values are treated as bytes. You can qualify the value with `KB` (kilobytes), `MB` (megabytes) or `GB` (gigabytes). For example, to set the limit to 4 kilobytes, enter the value `4KB` or `4096`.
MaxInactivityTimeLock	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInactivityTimeLock* parameter specifies the length of time that the mobile device can be inactive before the password is required to reactivate it. This parameter accepts the following values: • Timespan *hh:mm:ss*, where *hh* = hours, *mm* = minutes and *ss*= seconds. The valid input range is `00:01:00` to `01:00:00` (one minute to one hour). • The value `Unlimited`. The default value is

			`Unlimited`.
MaxPasswordFailedAttempts	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxPasswordFailedAttempts* parameter specifies the number of attempts a user can make to enter the correct password for the mobile device. You can enter any number from 4 through 16 or the value `Unlimited`. The default value is `Unlimited`.
MinPasswordComplexCharacters	Optional	System.Int32	The *MinPasswordComplexCharacters* parameter specifies the minimum number of complex characters required in a mobile device password. A complex character isn't a letter. You can enter any number from 1 through 4. The default value is 1.
MinPasswordLength	Optional	System.Int32	The *MinPasswordLength* parameter specifies the minimum number of characters in the mobile device password. You can enter any number from 1 through 16 or the

			value `$null`. The default value is blank. The maximum password length is 16 characters.
MobileOTAUpdateMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MobileOTAUpdateModeType	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
PasswordEnabled	Optional	System.Boolean	The *PasswordEnabled* parameter specifies whether a password is required on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When set to `$true`, this parameter requires the user to set a password on the mobile device.
PasswordExpiration	Optional	Microsoft.Exchange.Data.Unlimited	The *PasswordExpiration* parameter specifies how long a password can be used on a mobile device before the user is forced to change the password. This parameter accepts the following values:

			• Timespan *ddd.hh:mm:ss*, where *ddd* = days, *hh* = hours, *mm* = minutes and *ss*= seconds. The valid input range is `1.00:00:00` to `730.00:00:00` (one day to two years). • The value `Unlimited`. The default value is `Unlimited`.
PasswordHistory	Optional	System.Int32	The *PasswordHistory* parameter specifies the number of unique new passwords that need to be created on the mobile device before an old password can be reused. You can enter any number from 0 through 50. The default value is 0.
PasswordRecoveryEnabled	Optional	System.Boolean	The *PasswordRecoveryEnabled* parameter specifies whether the recovery password for the mobile device is stored in Exchange. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.

			When set to `$true`, this parameter enables you to store the recovery password for the mobile device in Exchange. The recovery password can be viewed from Microsoft Outlook Web App or the Exchange admin center.
RequireDeviceEncryption	Optional	System.Boolean	The *RequireDeviceEncryption* parameter specifies whether encryption is required on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireEncryptedSMIMEMessages	Optional	System.Boolean	The *RequireEncryptedSMIMEMessages* parameter specifies whether the mobile device must send encrypted S/MIME messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireEncryptionSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.Encryption	The *RequireEncryptionSMIMEAlgorithm* parameter specifies the algorithm

		SMIMEAlgorithmType	that's required to encrypt S/MIME messages on a mobile device. The valid values for this parameter are: • `DES` • `TripleDES` • `RC240bit` • `RC264bit` • `RC2128bit` The default value is `TripleDES`.
RequireManualSyncWhenRoaming	Optional	System.Boolean	The *RequireManualSyncWhenRoaming* parameter specifies whether the mobile device must synchronize manually while roaming. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireSignedSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SignedSMIMEAlgorithmType	The *RequireSignedSMIMEAlgorithm* parameter specifies the algorithm that's used to sign S/MIME messages on the mobile device. Valid values for this parameter are `SHA1` or `MD5`. The default value is `SHA1`.
RequireSignedSMIME	Optional	System.Boolean	The

Messages			*RequireSignedSMIMEMessages* parameter specifies whether the mobile device must send signed S/MIME messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireStorageCardEncryption	Optional	System.Boolean	The *RequireStorageCardEncryption* parameter specifies whether storage card encryption is required on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. Setting this parameter to `$true` also sets the *DeviceEncryptionEnabled* parameter to `$true`.
UnapprovedInROMApplicationList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnapprovedInROMApplicationList* parameter specifies a list of applications that can't be run in ROM on the mobile device.
UNCAccessEnabled	Optional	System.Boolean	The *UNCAccessEnabled* parameter specifies whether access to

			Microsoft Windows file shares is enabled from the mobile device. In on-premises Exchange 2013 organizations, access to specific shares is configured on the Exchange ActiveSync virtual directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WSSAccessEnabled	Optional	System.Boolean	The *WSSAccessEnabled* parameter specifies whether access to Microsoft Windows SharePoint Services is enabled from the mobile device. In on-premises Exchange 2013 organizations, access to specific shares is configured on the

			Exchange ActiveSync virtual directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MobileDeviceMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-MobileDeviceMailboxPolicy** cmdlet to remove a specific Microsoft Mobile Device mailbox policy from a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MobileDeviceMailboxPolicy -Identity <MailboxPolicyIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Mobile Device mailbox policy SalesPolicy.

```
Remove-MobileDeviceMailboxPolicy -Identity "SalesPolicy"
```

EXAMPLE 2

This example removes the Mobile Device mailbox policy Default after confirmation is given.

```
Remove-MobileDeviceMailboxPolicy -Identity "Default" -
Confirm $true
```

EXAMPLE 3

This example removes the Mobile Device mailbox policy Management and bypasses any confirmation prompts.

```
Remove-MobileDeviceMailboxPolicy -Identity "Management" -
Force $true
```

Detailed Description

A Mobile Device mailbox policy is a group of settings that specifies how mobile phones connect to Exchange. Exchange supports multiple Mobile Device mailbox policies. The **Remove-MobileDeviceMailboxPolicy** cmdlet removes a specific Mobile Device mailbox policy. If any users are assigned to the policy when you remove it, the **Remove-MobileDeviceMailboxPolicy** cmdlet fails.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the policy name.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies that the command should run immediately and bypass confirmation prompts.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MobileDeviceMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-MobileDeviceMailboxPolicy** cmdlet to modify mobile device mailbox policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MobileDeviceMailboxPolicy -Identity <MailboxPolicyIdParameter> [-
AllowApplePushNotifications <$true | $false>] [-AllowBluetooth <Disable |
HandsfreeOnly | Allow>] [-AllowBrowser <$true | $false>] [-AllowCamera
<$true | $false>] [-AllowConsumerEmail <$true | $false>] [-
AllowDesktopSync <$true | $false>] [-AllowExternalDeviceManagement <$true
| $false>] [-AllowGooglePushNotifications <$true | $false>] [-
AllowHTMLEmail <$true | $false>] [-AllowInternetSharing <$true | $false>]
[-AllowIrDA <$true | $false>] [-AllowMicrosoftPushNotifications <$true |
$false>] [-AllowMobileOTAUpdate <$true | $false>] [-
AllowNonProvisionableDevices <$true | $false>] [-AllowPOPIMAPEmail <$true
| $false>] [-AllowRemoteDesktop <$true | $false>] [-AllowSimplePassword
<$true | $false>] [-AllowSMIMEEncryptionAlgorithmNegotiation
<BlockNegotiation | OnlyStrongAlgorithmNegotiation |
AllowAnyAlgorithmNegotiation>] [-AllowSMIMESoftCerts <$true | $false>] [-
AllowStorageCard <$true | $false>] [-AllowTextMessaging <$true | $false>]
[-AllowUnsignedApplications <$true | $false>] [-
AllowUnsignedInstallationPackages <$true | $false>] [-AllowWiFi <$true |
$false>] [-AlphanumericPasswordRequired <$true | $false>] [-
ApprovedApplicationList <ApprovedApplicationCollection>] [-
AttachmentsEnabled <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DeviceEncryptionEnabled <$true | $false>] [-DevicePolicyRefreshInterval
<Unlimited>] [-DomainController <Fqdn>] [-IrmEnabled <$true | $false>] [-
IsDefault <$true | $false>] [-MaxAttachmentSize <Unlimited>] [-
```

```
MaxCalendarAgeFilter <All | TwoWeeks | OneMonth | ThreeMonths |
SixMonths>] [-MaxEmailAgeFilter <All | OneDay | ThreeDays | OneWeek |
TwoWeeks | OneMonth>] [-MaxEmailBodyTruncationSize <Unlimited>] [-
MaxEmailHTMLBodyTruncationSize <Unlimited>] [-MaxInactivityTimeLock
<Unlimited>] [-MaxPasswordFailedAttempts <Unlimited>] [-
MinPasswordComplexCharacters <Int32>] [-MinPasswordLength <Int32>] [-
MobileOTAUpdateMode <MajorVersionUpdates | MinorVersionUpdates |
BetaVersionUpdates>] [-Name <String>] [-PasswordEnabled <$true | $false>]
[-PasswordExpiration <Unlimited>] [-PasswordHistory <Int32>] [-

RC240bit>] [-RequireManualSyncWhenRoaming <$true | $false>] [-
RequireSignedSMIMEAlgorithm <SHA1 | MD5>] [-RequireSignedSMIMEMessages
<$true | $false>] [-RequireStorageCardEncryption <$true | $false>] [-
UnapprovedInROMApplicationList <MultiValuedProperty>] [-UNCAccessEnabled
<$true | $false>] [-WhatIf [<SwitchParameter>]] [-WSSAccessEnabled <$true
| $false>]
```

Examples

EXAMPLE 1

This example sets several policy settings for the mobile device mailbox policy Sales Policy.

```
Set-MobileDeviceMailboxPolicy -Identity "Sales Policy" -
PasswordEnabled $true -AlphanumericPasswordRequired $true -
PasswordRecoveryEnabled $true -AttachmentsEnabled $true -
MaxInactivityTimeLock 15:00 -IsDefault $false
```

EXAMPLE 2

This example sets several policy settings for the mobile device mailbox policy Management.

```
Set-MobileDeviceMailboxPolicy -Identity Management -
PasswordEnabled $true -AlphanumericPasswordRequired $true -
PasswordRecoveryEnabled $true -AllowCamera $true -AllowWiFi
$false -AllowStorageCard $true -AllowPOPIMAPEmail $false
```

EXAMPLE 3

This example sets several policy settings for the mobile device mailbox policy Default and requires confirmation before applying the settings.

```
Set-MobileDeviceMailboxPolicy -Identity Default -
PasswordEnabled $true -AlphanumericPasswordRequired $true -
PasswordRecoveryEnabled $true -AllowWiFi $false -
AllowStorageCard $true -AllowPOPIMAPEmail $false -IsDefault
$true -AllowTextMessaging $true -Confirm $true
```

Detailed Description

Mobile device mailbox policies define settings for mobile devices that are used to access mailboxes in your organization. The default mobile device mailbox policy is applied to all new mailboxes that you create. You can assign a mobile device mailbox policy to existing mailboxes by using the **Set-CASMailbox** cmdlet, or by editing the mailbox properties in the Exchange admin center (EAC).

Note:

Some mobile device mailbox policy settings require the mobile device to have specific built-in features that enforce these security and device management settings. If your organization allows all devices, you must set the *AllowNonProvisionableDevices* parameter to `$true`. This applies to devices that can't enforce all policy settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile device mailbox policy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the mobile device mailbox policy. You can use any value that uniquely identifies the policy. For example: • Name • Distinguished name (DN) • GUID The name of the built-in mobile device mailbox policy is `Default`.
AllowApplePushNotifications	Optional	System.Boolean	This parameter is available only in the

			cloud-based service. The *AllowApplePushNotifications* parameter specifies whether push notifications are allowed for Apple mobile devices. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowBluetooth	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.BluetoothType	The *AllowBluetooth* parameter specifies whether the Bluetooth capabilities are allowed on the mobile device. The available options are `Disable`, `HandsfreeOnly`, and `Allow`. The default value is `Allow`.
AllowBrowser	Optional	System.Boolean	The *AllowBrowser* parameter specifies whether Microsoft Pocket Internet Explorer is allowed on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter doesn't affect third-party browsers.

AllowCamera	Optional	System.Boolean	The *AllowCamera* parameter specifies whether the mobile device's camera is allowed. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowConsumerEmail	Optional	System.Boolean	The *AllowConsumerEmail* parameter specifies whether the user can configure a personal email account on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter doesn't control access to email accounts using third-party mobile device email programs.
AllowDesktopSync	Optional	System.Boolean	The *AllowDesktopSync* parameter specifies whether the mobile device can synchronize with a desktop computer through a cable. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowExternalDeviceM	Optional	System.Boolean	The

anagement			*AllowExternalDeviceManagement* parameter specifies whether an external device management program is allowed to manage the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
AllowGooglePushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowGooglePushNotifications* parameter controls whether the user can receive push notifications from Google for OWA for Devices. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowHTMLEmail	Optional	System.Boolean	The *AllowHTMLEmail* parameter specifies whether HTML-formatted email is enabled on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If set to `$false`, all email is

			converted to plain text before synchronization occurs.
AllowInternetSharing	Optional	System.Boolean	The *AllowInternetSharing* parameter specifies whether the mobile device can be used as a modem to connect a computer to the Internet. This process is also known as *tethering*. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowIrDA	Optional	System.Boolean	The *AllowIrDA* parameter specifies whether infrared connections are allowed to the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowMicrosoftPushNotifications	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *AllowMicrosoftPushNotifications* parameter specifies whether push notifications are enabled on the mobile device. Valid input for this

			parameter is `$true` or `$false`. The default value is `$true`.
AllowMobileOTAUpdate	Optional	System.Boolean	The *AllowMobileOTAUpdate* parameter specifies whether the policy can be sent to the mobile device over a cellular data connection. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowNonProvisionableDevices	Optional	System.Boolean	The *AllowNonProvisionableDevices* parameter specifies whether all mobile devices can synchronize with Exchange. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. When set to `$true`, this parameter enables all mobile devices to synchronize with Exchange, regardless of whether the device can enforce all settings that are defined by the policy. This also includes mobile devices managed by a

			separate device management system. When set to `$false`, this parameter blocks mobile devices that aren't provisioned from synchronizing with Exchange.
AllowPOPIMAPEmail	Optional	System.Boolean	The *AllowPOPIMAPEmail* parameter specifies whether the user can configure a POP3 or IMAP4 email account on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. This parameter doesn't control access by third-party email programs.
AllowRemoteDesktop	Optional	System.Boolean	The *AllowRemoteDesktop* parameter specifies whether the mobile device can initiate a remote desktop connection. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowSimplePassword	Optional	System.Boolean	The *AllowSimplePassword* parameter specifies whether a simple

			password is allowed on the mobile device. A simple password is a password that has a specific pattern, such as 1111 or 1234. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowSMIMEEncryptionAlgorithmNegotiation	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SMIMEEncryptionAlgorithmNegotiationType	The *AllowSMIMEEncryptionAlgorithmNegotiation* parameter specifies whether the messaging application on the mobile device can negotiate the encryption algorithm if a recipient's certificate doesn't support the specified encryption algorithm. Valid values for this parameter are: • `AllowAnyAlgorithmNegotiation` • `BlockNegotiation` • `OnlyStrongAlgorithmNegotiation` The default value is `AllowAnyAlgorithmNegotiation`.
AllowSMIMESoftCerts	Optional	System.Boolean	The *AllowSMIMESoftCerts* parameter specifies whether S/MIME software certificates are allowed on

			the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowStorageCard	Optional	System.Boolean	The *AllowStorageCard* parameter specifies whether the mobile device can access information stored on a storage card. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowTextMessaging	Optional	System.Boolean	The *AllowTextMessaging* parameter specifies whether text messaging is allowed from the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowUnsignedApplications	Optional	System.Boolean	The *AllowUnsignedApplications* parameter specifies whether unsigned applications can be installed on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.

AllowUnsignedInstallationPackages	Optional	System.Boolean	The *AllowUnsignedInstallationPackages* parameter specifies whether unsigned installation packages can be executed on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowWiFi	Optional	System.Boolean	The *AllowWiFi* parameter specifies whether wireless Internet access is allowed on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AlphanumericPasswordRequired	Optional	System.Boolean	The *AlphanumericPasswordRequired* parameter specifies whether the password for the mobile device must be alphanumeric. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
ApprovedApplicationList	Optional	Microsoft.Exchange.Data.Directory.SystemCo	The *ApprovedApplicationList*

		nfiguration.Approved ApplicationCollection	parameter specifies a configured list of approved applications for the device.
AttachmentsEnabled	Optional	System.Boolean	The *AttachmentsEnabled* parameter specifies whether attachments can be downloaded on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. When set to `$false`, this parameter blocks the user from downloading attachments on the mobile device.
Confirm	Optional	System.Management. Automation.SwitchPar ameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeviceEncryptionEnab led	Optional	System.Boolean	The *DeviceEncryptionEnabled* parameter specifies whether encryption is

			enabled on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When this parameter is set to `$true`, device encryption is enabled on the mobile device.
DevicePolicyRefreshInterval	Optional	Microsoft.Exchange.Data.Unlimited	The *DevicePolicyRefreshInterval* parameter specifies how often the policy is sent to the mobile device. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The default value is `Unlimited`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
IrmEnabled	Optional	System.Boolean	The *IrmEnabled* parameter specifies whether Information Rights Management (IRM) is enabled for the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
IsDefault	Optional	System.Boolean	The *IsDefault* parameter specifies whether this policy is the default mobile device mailbox policy. Valid input for this parameter is `$true` or `$false`. The default value for the built-in mobile device mailbox policy named `Default` is `$true`. The default value for new mobile device mailbox policies that you create is `$false`. There can be only one default policy. If another policy is currently set as the default, and you set this parameter to `$true`, this policy becomes the default policy. The value of this parameter on the

			other policy is automatically changed to `$false`, and that policy is no longer the default policy.
MaxAttachmentSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxAttachmentSize* parameter specifies the maximum size of attachments that can be downloaded to the mobile device. Valid input for this parameter is a size value between 0 and 2147482624 bytes (approximately 2 GB), or the value `Unlimited`. The default value is `Unlimited`. Unqualified values are treated as bytes. You can qualify the value with `KB` (kilobytes), `MB` (megabytes) or `GB` (gigabytes). For example, to set the limit to 4 kilobytes, enter the value `4096` or `4KB`. The maximum value is 1024 bytes (one kilobyte) less than two gigabytes (2*1024^3), so these are the maximum qualified values you can use with

			this parameter. • 2097151KB • 2047.999024MB • 1.999999047GB
MaxCalendarAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CalendarAgeFilterType	The *MaxCalendarAgeFilter* parameter specifies the maximum range of calendar days that can be synchronized to the mobile device. Valid values for this parameter are: • All • TwoWeeks • OneMonth • ThreeMonths • SixMonths The default value is All.
MaxEmailAgeFilter	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EmailAgeFilterType	The *MaxEmailAgeFilter* parameter specifies the maximum number of days of email items to synchronize to the mobile device. Valid values for this parameter are: • All • OneDay • ThreeDays • OneWeek • TwoWeeks • OneMonth The default value is All.
MaxEmailBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailBodyTruncationSize* parameter specifies the maximum size at

			which email messages are truncated when synchronized to the mobile device. Valid input for this parameter is an integer between 0 and 2147483647 (`Int32`) or the value `Unlimited`. The default value is `Unlimited`. Unqualified values are treated as bytes. You can qualify the value with `KB` (kilobytes), `MB` (megabytes) or `GB` (gigabytes). For example, to set the limit to 4 kilobytes, enter the value `4KB` or `4096`.
MaxEmailHTMLBodyTruncationSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxEmailHTMLBodyTruncationSize* parameter specifies the maximum size at which HTML-formatted email messages are truncated when synchronized to the mobile device. Valid input for this parameter is an integer between 0 and 2147483647 (`Int32`) or the value `Unlimited`. The default value is `Unlimited`.

			Unqualified values are treated as bytes. You can qualify the value with KB (kilobytes), MB (megabytes) or GB (gigabytes). For example, to set the limit to 4 kilobytes, enter the value 4KB or 4096.
MaxInactivityTimeLock	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInactivityTimeLock* parameter specifies the length of time that the mobile device can be inactive before the password is required to reactivate it. This parameter accepts the following values: • Timespan *hh:mm:ss*, where *hh* = hours, *mm* = minutes and *ss*= seconds. The valid input range is 00:01:00 to 01:00:00 (one minute to one hour). • The value Unlimited. The default value is Unlimited.
MaxPasswordFailedAttempts	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxPasswordFailedAttempts* parameter specifies

			the number of attempts a user can make to enter the correct password for the mobile device. You can enter any number from 4 through 16 or the value `Unlimited`. The default value is `Unlimited`.
MinPasswordComplexCharacters	Optional	System.Int32	The *MinPasswordComplexCharacters* parameter specifies the minimum number of complex characters required in a mobile device password. A complex character isn't a letter. You can enter any number from 1 through 4. The default value is 1.
MinPasswordLength	Optional	System.Int32	The *MinPasswordLength* parameter specifies the minimum number of characters in the mobile device password. You can enter any number from 1 through 16 or the value `$null`. The default value is blank. The maximum password length is 16 characters.

MobileOTAUpdateMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MobileOTAUpdateModeType	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	The *Name* parameter specifies the friendly name of the mobile device mailbox policy.
PasswordEnabled	Optional	System.Boolean	The *PasswordEnabled* parameter specifies whether a password is required on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When set to `$true`, this parameter requires the user to set a password on the mobile device.
PasswordExpiration	Optional	Microsoft.Exchange.Data.Unlimited	The *PasswordExpiration* parameter specifies how long a password can be used on a mobile device before the user is forced to change the password. This parameter accepts the following values: • Timespan *ddd.hh:mm:ss*, where *ddd* = days, *hh* = hours,

			mm = minutes and *ss*= seconds. The valid input range is `1.00:00:00` to `730.00:00:00` (one day to two years). • The value `Unlimited`. The default value is `Unlimited`.
PasswordHistory	Optional	System.Int32	The *PasswordHistory* parameter specifies the number of unique new passwords that need to be created on the mobile device before an old password can be reused. You can enter any number from 0 through 50. The default value is 0.
PasswordRecoveryEnabled	Optional	System.Boolean	The *PasswordRecoveryEnabled* parameter specifies whether the recovery password for the mobile device is stored in Exchange. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When set to `$true`, this parameter enables you to store the recovery

			password for the mobile device in Exchange. The recovery password can be viewed from Microsoft Outlook Web App or the Exchange admin center.
RequireDeviceEncryption	Optional	System.Boolean	The *RequireDeviceEncryption* parameter specifies whether encryption is required on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireEncryptedSMIMEMessages	Optional	System.Boolean	The *RequireEncryptedSMIMEMessages* parameter specifies whether the mobile device must send encrypted S/MIME messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireEncryptionSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EncryptionSMIMEAlgorithmType	The *RequireEncryptionSMIMEAlgorithm* parameter specifies the algorithm that's required to encrypt S/MIME messages on a mobile device. The valid

			values for this parameter are: • DES • TripleDES • RC240bit • RC264bit • RC2128bit The default value is TripleDES.
RequireManualSyncWhenRoaming	Optional	System.Boolean	The *RequireManualSyncWhenRoaming* parameter specifies whether the mobile device must synchronize manually while roaming. Valid input for this parameter is $true or $false. The default value is $false.
RequireSignedSMIMEAlgorithm	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SignedSMIMEAlgorithmType	The *RequireSignedSMIMEAlgorithm* parameter specifies the algorithm that's used to sign S/MIME messages on the mobile device. Valid values for this parameter are SHA1 or MD5. The default value is SHA1.
RequireSignedSMIMEMessages	Optional	System.Boolean	The *RequireSignedSMIMEMessages* parameter specifies whether the mobile device

			must send signed S/MIME messages. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
RequireStorageCardEncryption	Optional	System.Boolean	The *RequireStorageCardEncryption* parameter specifies whether storage card encryption is required on the mobile device. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. Setting this parameter to `$true` also sets the *DeviceEncryptionEnabled* parameter to `$true`.
UnapprovedInROMApplicationList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnapprovedInROMApplicationList* parameter specifies a list of applications that can't be run in ROM on the mobile device.
UNCAccessEnabled	Optional	System.Boolean	The *UNCAccessEnabled* parameter specifies whether access to Microsoft Windows file shares is enabled from the mobile device. In on-

			premises Exchange 2013 organizations, access to specific shares is configured on the Exchange ActiveSync virtual directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WSSAccessEnabled	Optional	System.Boolean	The *WSSAccessEnabled* parameter specifies whether access to Microsoft Windows SharePoint Services is enabled from the mobile device. In on-premises Exchange 2013 organizations, access to specific shares is configured on the Exchange ActiveSync virtual directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MobileDeviceStatistics

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MobileDeviceStatistics** cmdlet to retrieve the list of mobile devices configured to synchronize with a specified user's mailbox and return a list of statistics about the mobile devices.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MobileDeviceStatistics -Identity <MobileDeviceIdParameter> <COMMON
PARAMETERS>

Get-MobileDeviceStatistics -Mailbox <MailboxIdParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: [-ActiveSync <SwitchParameter>] [-DomainController
<Fqdn>] [-GetMailboxLog <SwitchParameter>] [-NotificationEmailAddresses
<MultiValuedProperty>] [-OWAforDevices <SwitchParameter>] [-
ShowRecoveryPassword <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves the statistics for the mobile phone configured to synchronize with the mailbox that belongs to the user Tony Smith.

```
Get-MobileDeviceStatistics -Identity TonySmith
```

EXAMPLE 2

This example uses the **Get-CASMailbox** cmdlet to determine who in the organization has a Microsoft Exchange ActiveSync mobile device. For each mobile device, the Exchange ActiveSync device statistics are retrieved.

```
$UserList = Get-CASMailbox -Filter
{hasactivesyncdevicepartnership -eq $true -and -not
displayname -like "CAS_{*"} | Get-Mailbox
$UserList | foreach { Get-MobileDeviceStatistics -Mailbox
$_}
```

EXAMPLE 3

This example retrieves the statistics for the mobile phone configured to synchronize with the mailbox that belongs to the user Tony Smith. It also outputs the Exchange ActiveSync log file and sends it to the System Administrator at admin@contoso.com.

```
Get-MobileDeviceStatistics -Mailbox TonySmith -
GetMailboxLog $true -NotificationEmailAddresses
"admin@contoso.com"
```

Detailed Description

The **Get-MobileDeviceStatistics** cmdlet returns a list of statistics about each mobile device. Additionally, it allows you to retrieve logs and send those logs to a recipient for troubleshooting purposes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mobile Device user settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MobileDeviceIdParameter	The *Identity* parameter specifies the user's device ID. If the *Mailbox* parameter is specified, the *Identity* parameter

			is disabled.
Mailbox	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Mailbox* parameter specifies the user mailbox for which you want to retrieve the mobile phone statistics.
ActiveSync	Optional	System.Management.Automation.SwitchParameter	The *ActiveSync* switch specifies whether to return statistics for Microsoft Exchange ActiveSync or other mobile device synchronization.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
GetMailboxLog	Optional	System.Management.Automation.SwitchParameter	The *GetMailboxLog* parameter specifies whether to send the mailbox logs via email to the administrator running the task. If the parameter is set to

			`$true`, the command sends the mailbox logs via email to the administrator running the task. The default value of this parameter is `$false`.
NotificationEmailAddresses	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *NotificationEmailAddresses* parameter specifies an optional list of comma-separated aliases or email addresses where the mailbox logs are sent. If the *GetMailboxLog* parameter is set to `$false`, this parameter is ignored.
OWAforDevices	Optional	System.Management.Automation.SwitchParameter	The *OWAforDevices* parameter specifies whether Outlook Web App for Mobile Devices is enabled for the mobile device.
ShowRecoveryPassword	Optional	System.Management.Automation.SwitchParameter	The *ShowRecoveryPassword* parameter specifies whether to return the recovery password for

			the mobile phone as one of the displayed statistics. If this parameter is set to `$true`, the command returns the recovery password for the mobile phone as one of the displayed statistics.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OutlookAnywhere

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-OutlookAnywhere** cmdlet to retrieve all Outlook Anywhere settings on a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OutlookAnywhere -Server <ServerIdParameter> <COMMON PARAMETERS>

Get-OutlookAnywhere [-Identity <VirtualDirectoryIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowMailboxVirtualDirectories
```

```
<SwitchParameter>]
```

Examples

EXAMPLE 1

This example uses the *Server* and *Identity* parameters to retrieve all Outlook Anywhere settings on the server CAS01.

```
Get-OutlookAnywhere -Server CAS01
```

EXAMPLE 2

This example displays all Outlook Anywhere settings for the server EXCH01.

```
Get-OutlookAnywhere -Identity "EXCH01\rpc (Default Web
Site)"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Anywhere configuration (enable, disable, change, view)" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name or GUID of the server for which you want to display the settings. This parameter is required if you aren't running the **Get-OutlookAnywhere** cmdlet on a server that

			has the Client Access server role installed.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of the virtual directory. It's represented as: *ServerName\VirtualDirectoryName (WebsiteName)*.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch returns

			virtual directories on Client Access servers when used in a query. If you don't use this parameter, only virtual directories on Mailbox servers are returned.
ShowBackendVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowBackendVirtualDirectories* switch specifies whether to list the virtual directories located on the Mailbox servers within the organization.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OutlookAnywhere

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-06-26*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-OutlookAnywhere** cmdlet to modify the properties on a computer running Microsoft

Exchange Server 2013 enabled for Microsoft Outlook Anywhere.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OutlookAnywhere -Identity <VirtualDirectoryIdParameter> [-Confirm
[<SwitchParameter>]] [-DefaultAuthenticationMethod <Basic | Digest | Ntlm
| Fba | WindowsIntegrated | LiveIdFba | LiveIdBasic | WSSecurity |
Certificate | NegoEx | OAuth | Adfs | Kerberos | Negotiate |
LiveIdNegotiate | Misconfigured>] [-DomainController <Fqdn>] [-
ExtendedProtectionFlags <MultiValuedProperty>] [-ExtendedProtectionSPNList
<MultiValuedProperty>] [-ExtendedProtectionTokenChecking <None | Allow |
Require>] [-ExternalClientAuthenticationMethod <Basic | Digest | Ntlm |
Fba | WindowsIntegrated | LiveIdFba | LiveIdBasic | WSSecurity |
Certificate | NegoEx | OAuth | Adfs | Kerberos | Negotiate |
LiveIdNegotiate | Misconfigured>] [-ExternalClientsRequireSsl <$true |
$false>] [-ExternalHostname <String>] [-IISAuthenticationMethods
<MultiValuedProperty>] [-InternalClientAuthenticationMethod <Basic |
Digest | Ntlm | Fba | WindowsIntegrated | LiveIdFba | LiveIdBasic |
WSSecurity | Certificate | NegoEx | OAuth | Adfs | Kerberos | Negotiate |
LiveIdNegotiate | Misconfigured>] [-InternalClientsRequireSsl <$true |
$false>] [-InternalHostname <String>] [-Name <String>] [-SSLOffloading
<$true | $false>] [-WhatIf [<SwitchParameter>]] [-XropUrl <Uri>]
```

Examples

EXAMPLE 1

This example sets the client authentication method to NTLM for the /rpc virtual directory on the Client Access server CAS01.

```
Set-OutlookAnywhere -Identity: "CAS01\rpc (Default Web
Site)" -ExternalClientAuthenticationMethod NTLM
```

EXAMPLE 2

This example sets SSL offloading for the /rpc virtual directory to false, which means that SSL isn't used for securing client connections to the Client Access server EXCH1.

```
Set-OutlookAnywhere -Identity "EXCH1\rpc (Default Web
Site)" -SSLOffloading $false
```

EXAMPLE 3

This example sets the authentication method for the /rpc virtual directory setting in IIS to NTLM.

```
Set-OutlookAnywhere -Identity "EXCH1\rpc (Default Web
Site)" -IISAuthenticationMethods NTLM
```

EXAMPLE 4

This example sets the available authentication methods for the /rpc virtual directory setting in IIS to use both Basic and NTLM authentication. After you set this value, you can use the IIS virtual directory to handle authentication for multiple applications that require different authentication

methods.

```
Set-OutlookAnywhere -Identity "EXCH1\rpc (Default Web
Site)" -IISAuthenticationMethods Basic,NTLM
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Anywhere configuration (enable, disable, change, view)" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of the virtual directory. It's represented as: *ServerName**VirtualDirectoryName* (*WebsiteName*).
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DefaultAuthenticationMethod	Optional	Microsoft.Exchange.Data.Directory.SystemCo	The *DefaultAuthenticationMet*

		nfiguration.Authentica tionMethod	*hod* parameter can be specified to set the *ExternalClientAuthenticati onMethod*, *InternalClientAuthenticati onMethod*, and *IISAuthenticationMethods* parameters to the same authentication value. This authentication method can be set to one of these values: • `Basic` • `Ntlm` • `Negotiate` **Note:** If the *DefaultAuthenticationMet hod* parameter is specified, *InternalClientAuthenticati onMethod*, *ExternalClientAuthenticati onMethod* and *IISAuthenticationMethods* parameters cannot be used.
DomainController	Optional	Microsoft.Exchange.Da ta.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFla	Optional	Microsoft.Exchange.Da	The *ExtendedProtectionFlags*

gs		ta.MultiValuedProperty	parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You

			specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory.

			The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual

			directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection

			using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and

			the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalClientAuthenticationMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	The *ExternalClientAuthenticationMethod* parameter specifies the authentication method used for external client authentication. Possible values include: • `Basic` • `Ntlm` • `Negotiate`
ExternalClientsRequireSsl	Optional	System.Boolean	The *ExternalClientsRequireSsl* parameter specifies whether clients connecting via Outlook Anywhere from outside the network must use Secure Sockets Layer (SSL). The default value is `$true`.
ExternalHostname	Optional	System.String	The *ExternalHostname* parameter specifies the external host name to use in the Microsoft Outlook profiles for users enabled for Outlook Anywhere.

IISAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *IISAuthenticationMethods* parameter specifies the authentication method enabled on the /rpc virtual directory in Internet Information Services (IIS). You can set the virtual directory to allow Basic authentication or NTLM authentication. Alternatively, you can also set the virtual directory to allow both Basic and NTLM authentication. All other authentication methods are disabled. You may want to enable both Basic and NTLM authentication if you're using the IIS virtual directory with multiple applications that require different authentication methods. **Note:** When you configure this setting using the IIS interface, you can enable as many authentication methods as you want. For more information about configuring this parameter with multiple

			values, see the example later in this topic.
InternalClientAuthenticationMethod	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthenticationMethod	The *InternalClientAuthenticationMethod* parameter specifies the authentication method used for internal client authentication. Possible values include: • `Basic` • `Ntlm` • `Negotiate`
InternalClientsRequireSsl	Optional	System.Boolean	The *InternalClientsRequireSsl* parameter specifies whether clients connecting via Outlook Anywhere from inside the network require SSL. The default value is `$true`.
InternalHostname	Optional	System.String	The *InternalHostname* parameter specifies the internal hostname for the Outlook Anywhere virtual directory.
Name	Optional	System.String	The *Name* parameter specifies the name of the server being modified.
SSLOffloading	Optional	System.Boolean	The *SSLOffloading* parameter specifies whether the Client Access

			server requires SSL. This value should be set only to `$true` when an SSL hardware solution is running in front of the Client Access server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
XropUrl	Optional	System.Uri	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-OutlookConnectivity

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-OutlookConnectivity** cmdlet to test end-to-end Microsoft Outlook client connectivity in the Microsoft Exchange Server 2013 organization. This includes testing for Outlook Anywhere (RPC/HTTP) connections.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-OutlookConnectivity -ProbeIdentity <String> [-Credential
<PSCredential>] [-Hostname <String>] [-MailboxId <MailboxIdParameter>] [-
RunFromServerId <ServerIdParameter>] [-TimeOutSeconds <String>]
```

Examples

EXAMPLE 1

This example runs a protocol test from the Mailbox server.

```
Test-OutlookConnectivity -ProbeIdentity
"OutlookSelfTestProbe"
```

EXAMPLE 2

This example runs a logon test from a Client Access server for the mailbox administrator@contoso.com.

```
Test-OutlookConnectivity -ProbeIdentity
"OutlookRpcCTPProbe" -MailboxID administrator@contoso.com
```

Detailed Description

Running the **Test-OutlookConnectivity** cmdlet validates a user's Outlook connection. The command has been simplified in Exchange Server 2013 to only support ad hoc validation of a single mailbox. If the cmdlet fails, the output notes the step that failed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test Outlook connectivity" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ProbeIdentity	Required	System.String	The *ProbeIdentity* parameter specifies the type of probe to call.
Credential	Optional	System.Management.Automation.PSCredential	The Credential parameter specifies the credential used by the probe. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
Hostname	Optional	System.String	The *Hostname* parameter specifies the protocol endpoint target of the probe.
MailboxId	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *MailboxID* parameter specifies the mailbox that is the target of the probe.
RunFromServerId	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *RunFromServerID* parameter specifies the server on which the probe should be

			executed.
TimeOutSeconds	Optional	System.String	The *TimeOutSeconds* parameter specifies the timeout period in seconds before the probe is abandoned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OutlookProvider

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-OutlookProvider** cmdlet to obtain the global settings from the **AutoDiscoverConfig** object under the **Global Settings** object in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OutlookProvider [-Identity <OutlookProviderIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example obtains the protocol settings for the web protocol named WEB and pipes the output to display each setting on a separate line.

```
Get-OutlookProvider -Identity WEB | Format-List
```

Detailed Description

The **Get-OutlookProvider** cmdlet gets the global settings from the **AutoDiscoverConfig** object in Active Directory and returns an **OutlookProvider** object to be managed in the Exchange Administration Center.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OutlookProviderIdParameter	The *Identity* parameter specifies the `ADIDParameter` value of the MAPI protocol for which you want to obtain global settings.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OutlookProvider

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-OutlookProvider** cmdlet to create the **AutoDiscoverConfig** object, and then populate the object with relevant settings.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OutlookProvider -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the **AutoDiscoverConfig** object MyOABUrl.

```
New-OutlookProvider -Name MyOABUrl
```

EXAMPLE 2

This example creates the **AutoDiscoverConfig** object Autodiscover1, and the specified domain controller writes the change to Active Directory.

```
New-OutlookProvider -DomainController DC1 -Name
Autodiscover1
```

Detailed Description

The **New-OutlookProvider** cmdlet creates the **AutoDiscoverConfig** object under the **Global Settings** object in Active Directory and sets the attributes specified.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter provides the common name of the **AutoDiscoverConfig** object. This can be a user-friendly name for identification.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OutlookProvider

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-OutlookProvider** cmdlet to delete the **AutoDiscoverConfig** object from Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OutlookProvider -Identity <OutlookProviderIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the **AutoDiscoverConfig** object named Test Object from Active Directory.

```
Remove-OutlookProvider -Identity "Test Object"
```

Detailed Description

The **Remove-OutlookProvider** cmdlet deletes the **AutoDiscoverConfig** object under the **Global Settings** object in Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OutlookProviderIdParameter	The *Identity* parameter specifies the **AutoDiscoverConfig**

			object to remove from Active Directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OutlookProvider

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-OutlookProvider** cmdlet to set specific global settings using the **msExchOutlookProvider** attribute on the **msExchAutoDiscoverConfig** object in Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OutlookProvider -Identity <OutlookProviderIdParameter> [-
CertPrincipalName <String>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Name <String>] [-OutlookProviderFlags <None |
ServerExclusiveConnect>] [-RequiredClientVersions <String[]>] [-Server
<String>] [-TTL <Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the duration that the Autodiscover service settings are valid for the Microsoft Outlook provider **msExchAutoDiscoverConfig**.

```
Set-OutlookProvider -Identity msExchAutoDiscoverConfig -TTL
```

Detailed Description

The **Set-OutlookProvider** cmdlet creates the global settings for the Autodiscover service. It sets the **AutoDiscoverConfig** object under the **Global Settings** object in Active Directory and sets the attributes specified in the parameters listed in the Parameters section.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Autodiscover service configuration settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OutlookProviderIdParameter	The *Identity* parameter specifies the ADIDParameter value of the MAPI protocol for which you want to set global settings.
CertPrincipalName	Optional	System.String	The *CertPrincipalName* parameter specifies the Secure Sockets Layer (SSL) certificate principal name required for connecting to Exchange from an external location. This parameter is only used for Outlook Anywhere clients.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Name	Optional	System.String	The *Name* parameter specifies a common name for the **Outlook Provider Configuration** object. This can be a user-friendly name for identification.
OutlookProviderFlags	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.OutlookProviderFlags	The *OutlookProviderFlags* parameter specifies how Outlook clients should connect to the Exchange server. The value can be set to `ServerExclusiveConnect`, `ExternalClientsRequireSSL`, `InternalClientsRequireSSL`, or to `None` to clear the flags. The recommended value is `None`, which is also the default setting.
RequiredClientVersions	Optional	System.String[]	The *RequiredClientVersions* parameter specifies the minimum version of Microsoft Outlook that's allowed to connect to the Exchange server. This information is in the Autodiscover response to the client connection request. Valid input for this parameter is "<*MinimumVersion*>, <*ExpirationDate*>".

			<*MinimumVersion*> is the version of Outlook in the format *xx.x.xxxx.xxxx*. For example, to specify Outlook 2010 Service Pack 2 (SP2), use the value `14.0.7012.1000`. <*ExpirationDate*> is the UTC date-time when connections by older versions of Outlook will be blocked. The UTC date-time is represented in the ISO 8601 date-time format: *yyyy-mm-dd*T*hh:mm:ss.fff*Z, where *yyyy* = year, *mm* = month, *dd* = day, T indicates the beginning of the time component, *hh* = hour, *mm* = minute, *ss* = second, *fff* = fractions of a second, and Z signifies Zulu, which is another way to denote UTC. An example of a valid value for this parameter is `"14.0.7012.1000, 2014-01-01T12:00:00Z"`.
Server	Optional	System.String	The *Server* parameter specifies the Mailbox server to use for Outlook Anywhere clients.
TTL	Optional	System.Int32	The *TTL* parameter specifies the duration (in hours) that the specified settings are valid. If a value is specified, the settings are rediscovered via the Autodiscover service after the duration specified with this parameter. A value of 0 indicates that no rediscovery is

			required. The default value is 1 hour.	
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.	

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OwaMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-OwaMailboxPolicy** cmdlet to retrieve all Microsoft Office Outlook Web App mailbox policies in a Microsoft Exchange Server 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OwaMailboxPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the properties of all mailbox policies for the organization Contoso.

```
Get-OwaMailboxPolicy -Organization Contoso
```

EXAMPLE 2

This example retrieves the properties of the Outlook Web App mailbox policy Executives in the organization Fabrikam.

```
Get-OwaMailboxPolicy -Identity Fabrikam\Executives
```

EXAMPLE 3

This example retrieves the information for the Outlook Web App mailbox policy Corporate for the tenant Contoso in the organization Proseware.

```
Get-OwaMailboxPolicy -Identity Proseware\Contoso\Corporate
```

Detailed Description

The **Get-OwaMailboxPolicy** cmdlet retrieves information about existing Outlook Web App mailbox policies.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App mailbox policies" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the name of the policy or path to the policy including the name, for example, *<Organization>**<ResellerA>**<Reseller...n>**<Tenant>**<Object Name>*.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OwaMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-OwaMailboxPolicy** cmdlet to create Microsoft Outlook Web App mailbox policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OwaMailboxPolicy -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-IsDefault <SwitchParameter>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the Outlook Web App mailbox policy Corporate for the default organization.

```
New-OwaMailboxPolicy -Name Corporate
```

Detailed Description

Use the Set-OwaMailboxPolicy cmdlet to configure the new policy.

Note:

Changes to Outlook Web App mailbox polices may take up to 60 minutes to take effect. In on-premises Exchange 2013, you can force an update by running the command `IISRESET /noforce`.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App mailbox policies" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies a name for the new policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IsDefault	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *IsDefault*

			parameter specifies whether this policy is the default policy. The default value is `$false`. If another policy is currently set as the default, setting this parameter replaces the old default policy with this policy.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OwaMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-05-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-OwaMailboxPolicy** cmdlet to remove Microsoft Outlook Web App mailbox policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OwaMailboxPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mailbox policy Executives.

```
Remove-OwaMailboxPolicy -Identity Executives
```

EXAMPLE 2

This example removes the mailbox policy Employees for the organization Fabrikam.

```
Remove-OwaMailboxPolicy -Identity Fabrikam\Employees
```

EXAMPLE 3

This example removes the mailbox policy Corporate for the tenant Contoso in the organization Litware.

```
Remove-OwaMailboxPolicy -Identity Litware\Contoso\Corporate
```

Detailed Description

The **Remove-OwaMailboxPolicy** cmdlet removes an existing Outlook Web App mailbox policy.

Note:

Changes to Outlook Web App mailbox polices may take up to 60 minutes to take effect. In on-premises Exchange 2013, you can force an update by running the command `IISRESET /noforce`.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App mailbox policies" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the name of the policy or the path to the policy including the name, for example, *<Organization>**<ResellerA>**<Reseller...n>**<Tenant>**<Object Name>*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* parameter specifies whether to suppress the warning or confirmation messages that appear during specific configuration changes.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OwaMailboxPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-07-17*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-OwaMailboxPolicy** cmdlet to configure existing Microsoft Outlook Web App mailbox policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OwaMailboxPolicy -Identity <MailboxPolicyIdParameter> [-
ActionForUnknownFileAndMIMETypes <Allow | ForceSave | Block>] [-

```

Examples

EXAMPLE 1

This example disables access to the calendar for the mailbox policy `Corporate` for the tenant Contoso in the organization EMEA.

```
Set-OwaMailboxPolicy -Identity EMEA\Contoso\Corporate -
CalendarEnabled $false
```

EXAMPLE 2

This example disables access to the Tasks folder for the default mailbox policy.

```
Set-OwaMailboxPolicy -Identity Default -TasksEnabled $false
```

EXAMPLE 3

This example sets the allowed file type extensions to .doc and .pdf for the default mailbox policy, allowing users to save files with those extensions locally or view them from a web browser.

```
Set-OwaMailboxPolicy -Identity Default -AllowedFileTypes
'.doc', '.pdf'
```

Detailed Description

By default, an Outlook Web App mailbox policy named Default is created in the organization. The **Set-OwaMailboxPolicy** cmdlet configures an existing Outlook Web App mailbox policy.

Note:

Changes to Outlook Web App mailbox polices may take up to 60 minutes to take effect. In on-premises Exchange 2013, you can force an update by running the command `IISRESET /noforce`.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App mailbox policies" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the name of the policy or the path to the policy including the name, for example, *<Organization>**<ResellerA>**<Reseller...n>**<Tenant>**<Object Name>*.
ActionForUnknownFileAndMIMETypes	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AttachmentBlockingActions	The *ActionForUnknownFileAndMIMETypes* parameter specifies how to handle files that aren't included in other File Access Management lists. The following values are valid for this parameter: • `Allow` • `ForceSave` • `Block`

ActiveSyncIntegrationEnabled	Optional	System.Boolean	The *ActiveSyncIntegrationEnabled* parameter specifies whether to disable Microsoft Exchange ActiveSync on the Outlook Web App **Options** page.
AllAddressListsEnabled	Optional	System.Boolean	The *AllAddressListsEnabled* parameter specifies which address lists are available to the user. You can use either `$true` or `$false` as follows: • If set to `$true`, users can view all address lists. • If set to `$false`, users can view only the global address list.
AllowCopyContactsToDeviceAddressBook	Optional	System.Boolean	The *AllowCopyContactsToDeviceAddressBook* parameter specifies if users can copy the contents of their Contacts folder to a mobile device's native address book when using OWA for Devices.
AllowedFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedFileTypes* parameter specifies the extensions of file types

			that the user can save locally and view from a web browser. If the same extensions are in multiple settings lists, the most secure setting overrides the less secure settings.
AllowedMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedMimeTypes* parameter creates extensions of MIME attachments that users can save locally and view from a web browser. If the same extensions are in multiple settings lists, the most secure setting overrides the less secure settings.
AllowOfflineOn	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AllowOfflineOnEnum	The *AllowOfflineOn* parameter specifies which computers can use Outlook Web App in offline mode. The possible values are `PrivateComputersOnly`, `NoComputers`, or `AllComputers`. The value is set to `AllComputers` by default. If you set the value to `PrivateComputersOnly`, only users who log into

			Outlook Web App using the **Private** option are able to use Outlook Web App in offline mode. If the feature is enabled, and if users are using a supported browser, they can use Outlook Web App in offline mode. Users can turn the feature on or off in Outlook Web App. To turn the feature on, users click the gear icon, and then select **Stop using offline**. To turn the feature off, users click the gear icon, and then select **Use mail offline**. The supported browsers for this feature in Microsoft Exchange Server 2013 are Microsoft Internet Explorer 10, Safari 4, or Chrome 16. For more information, see Using Outlook Web App offline.
BlockedFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedFileTypes* parameter specifies a list of extensions of attachments that are blocked. Attachments that contain these blocked

			extensions can't be saved locally or viewed from a web browser.
BlockedMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedMimeTypes* parameter specifies a list of MIME extensions of attachments that are blocked. Attachments that contain these blocked MIME extensions can't be saved locally or viewed from a web browser.
CalendarEnabled	Optional	System.Boolean	The *CalendarEnabled* parameter specifies whether to enable or disable the calendar for users.
ChangePasswordEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *ChangePasswordEnabled* parameter specifies whether users can change their passwords from inside Outlook Web App.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContactsEnabled	Optional	System.Boolean	The *ContactsEnabled* parameter specifies whether Contacts are enabled for users.
DefaultClientLanguage	Optional	System.Int32	This parameter has been deprecated and is no longer used.
DefaultTheme	Optional	System.String	The *DefaultTheme* parameter specifies the default theme used by Outlook Web App when the user hasn't selected a theme.
DelegateAccessEnabled	Optional	System.Boolean	The *DelegateAccessEnabled* parameter specifies whether delegates can use Outlook Web App to open folders they have delegate access to through this virtual directory.
DirectFileAccessOnPrivateComputersEnabled	Optional	System.Boolean	The *DirectFileAccessOnPrivateComputersEnabled* parameter specifies the

			left-click options on attachments when the user has chosen to log on using the **Private** option. If this parameter is set to `$true`, **Open** is an available option. If it's set to `$false`, the **Open** option is disabled.
DirectFileAccessOnPublicComputersEnabled	Optional	System.Boolean	The *DirectFileAccessOnPublicComputersEnabled* parameter specifies the left-click options on attachments when the user has chosen to log on using the **Public** option. If this parameter is set to `$true`, **Open** is an available option. If it's set to `$false`, the **Open** option is disabled.
DisableFacebook	Optional	System.Management.Automation.SwitchParameter	This parameter is available only in the cloud-based service. The *DisableFacebook* switch disables Facebook integration with Outlook Web App.
DisplayPhotosEnabled	Optional	System.Boolean	The *DisplayPhotosEnabled* parameter specifies

			whether users see sender photos in Outlook Web App. The possible values for this parameter are `$true` or `$false`. The default value is `$false`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExplicitLogonEnabled	Optional	System.Boolean	The *ExplicitLogonEnabled* parameter specifies whether to allow a user to open someone else's mailbox in Outlook Web App. If this parameter is set to `$true`, it allows a user to open someone else's mailbox in Outlook Web App.
FacebookEnabled	Optional	System.Boolean	The *FacebookEnabled* parameter specifies whether users can synchronize their

			Facebook contacts to their Contacts folder. The possible values for this parameter are `$true` or `$false`. The default value is `$true`.
ForceSaveAttachmentFilteringEnabled	Optional	System.Boolean	The *ForceSaveAttachmentFilteringEnabled* parameter specifies whether files which are included in the list of extensions created by the *ForceSaveFileTypes* parameter are filtered before the user can save them.
ForceSaveFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ForceSaveFileTypes* parameter creates a list of extensions of attachments that can be opened only after the file is saved locally on the user's computer.
ForceSaveMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ForceSaveMimeTypes* parameter specifies the MIME types of attachments that can be opened only after the file is saved locally on the user's computer.
ForceWacViewingFirst	Optional	System.Boolean	The

OnPrivateComputers			*ForceWacViewingFirstOnPrivateComputers* parameter specifies whether a user who has logged on using the **Private** option can open an Office file directly without first viewing it as a web page.
ForceWacViewingFirstOnPublicComputers	Optional	System.Boolean	The *ForceWacViewingFirstOnPublicComputers* parameter specifies whether a user who has logged on using the **Public** option can open an Office file directly without first viewing it as a web page.
ForceWebReadyDocumentViewingFirstOnPrivateComputers	Optional	System.Boolean	The *ForceWebReadyDocumentViewingFirstOnPrivateComputers* parameter specifies whether a user who has logged on using the **Private** option can open a document directly without first viewing it as a web page.
ForceWebReadyDocumentViewingFirstOnP	Optional	System.Boolean	The *ForceWebReadyDocumen*

ublicComputers			*tViewingFirstOnPublicComputers* parameter specifies whether a user who has logged on using the **Public** option can open a document directly without first viewing it as a web page.
GlobalAddressListEnabled	Optional	System.Boolean	The *GlobalAddressListEnabled* parameter specifies whether to show the global address list in Outlook Web App.
GroupCreationEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
InstantMessagingEnabled	Optional	System.Boolean	The *InstantMessagingEnabled* parameter specifies whether to enable instant messaging in Outlook Web App.
InstantMessagingType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.InstantMessagingTypeOptions	The *InstantMessagingType* parameter specifies the type of instant messaging provider to be used. Set this parameter to `None` for no provider and `Ocs` for Microsoft Office Communication Server. The `Msn` value is no longer

			used and will be deprecated.
IRMEnabled	Optional	System.Boolean	The *IRMEnabled* parameter specifies whether the Information Rights Management (IRM) feature is enabled.
IsDefault	Optional	System.Management.Automation.SwitchParameter	The *IsDefault* parameter specifies whether this policy is the default policy. The default value is `$false`. If another policy is currently set as the default, setting this parameter replaces the old default policy with this policy.
JournalEnabled	Optional	System.Boolean	The *JournalEnabled* parameter specifies whether the Journal folder is visible.
JunkEmailEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *JunkEmailEnabled* parameter specifies whether the Junk Email management tools are enabled.
LinkedInEnabled	Optional	System.Boolean	This parameter is

			available only in the cloud-based service. The *LinkedInEnabled* parameter specifies whether users can synchronize their LinkedIn contacts to their Contacts folder. The possible values for this parameter are `$true` or `$false`. The default value is `$true`.
LogonAndErrorLanguage	Optional	System.Int32	The *LogonAndErrorLanguage* parameter specifies which language Outlook Web App uses for forms-based authentication and for error messages that occur when a user's current language setting can't be read. When this parameter has a value of 0, the language selection is undefined.
Name	Optional	System.String	The *Name* parameter specifies a name for the policy.
NotesEnabled	Optional	System.Boolean	The *NotesEnabled* parameter specifies whether the Notes folder is visible in Outlook Web

			App.
OrganizationEnabled	Optional	System.Boolean	When the *OrganizationEnabled* parameter is set to `$false`, the **Automatic Reply** option doesn't include external and internal options, the address book doesn't show the organization hierarchy, and the **Resources** tab in Calendar forms is disabled.
OutboundCharset	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.OutboundCharsetOptions	The *OutboundCharset* parameter specifies the character set used for messages sent by users on a specific Outlook Web App virtual directory.
OWALightEnabled	Optional	System.Boolean	The *OWALightEnabled* parameter, when set to `$false`, removes the option to use the light version of Outlook Web App from the logon page and removes the **Accessibility** check box from the **General Options** tab. This parameter doesn't apply

			to Outlook Web App.
PhoneticSupportEnabled	Optional	System.Boolean	The *PhoneticSupportEnabled* parameter specifies phonetically spelled entries in the address book. This parameter is available for use in Japan.
PlacesEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
PredictedActionsEnabled	Optional	System.Boolean	The *PredictedActionsEnabled* parameter specifies whether you want Outlook Web App to customize the user experience by making predictions about the action that a user should take on a particular item. This value is set to `$false` by default. If this value is set to `$true`, Outlook Web App tries to make suggestions for the user. The following are examples: • The user interface may change the order of items in an options list based on the context the user is in.

			• Outlook Web App may highlight an icon or other user interface element that's the next logical step in the completion of a task. • Upon initiating a move email item operation, the user interface may suggest the folder that you want to move email items based on previous actions of the user.
PremiumClientEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
PublicFoldersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
RecoverDeletedItemsEnabled	Optional	System.Boolean	The *RecoverDeletedItemsEnabled* parameter specifies whether a user can use Outlook Web App to view, recover, or delete permanently items that have been deleted from the Deleted Items folder. By default, the *RecoverDeletedItemsEnabled* parameter is set to `$true`. If the

			RecoverDeletedItemsEnabled parameter is set to `$false`, the items deleted from the Deleted Items folder are retained. However, users can't view, recover, or permanently delete them using Outlook Web App.
RemindersAndNotificationsEnabled	Optional	System.Boolean	The *RemindersAndNotificationsEnabled* parameter specifies whether notifications and reminders are enabled in Outlook Web App. This parameter doesn't apply to the light version of Outlook Web App.
ReportJunkEmailEnabled	Optional	System.Boolean	The *ReportJunkEmailEnabled* parameter specifies whether users can report messages as junk to Microsoft in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If you set this parameter to `$false`, the **Report mail as junk** window

			doesn't appear after users select **Mark as junk**. This parameter is meaningful only when the *JunkEmailEnabled* parameter is set to `$true`.
RulesEnabled	Optional	System.Boolean	The *RulesEnabled* parameter specifies whether a user can view, create, or modify server-side rules using Outlook Web App. By default, the *RulesEnabled* parameter is set to `$true`. If the *RulesEnabled* parameter is set to `$false`, users must use Microsoft Outlook to view, create, and modify server-side rules.
SearchFoldersEnabled	Optional	System.Boolean	The *SearchFoldersEnabled* parameter specifies whether Search Folders are available in Outlook Web App.
SetPhotoEnabled	Optional	System.Boolean	The *SetPhotoEnabled* parameter specifies whether users can add, change, and remove their sender photo in Outlook Web App. The possible values for this parameter

			are `$true` or `$false`. The default value is `$false`. When this value is set to `$true`, users can manage their sender photo using two methods. They can click their name in the upper-right corner of Outlook Web App, click **Change**, and then browse to the photo they want to use. Alternatively, users can manage their photo by clicking the gear icon in the upper-right corner of Outlook Web App, and then clicking **Options** > **Account** > **My account** > **Edit** > **Change**.
SetPhotoURL	Optional	System.String	The *SetPhotoURL* parameter specifies the location of the user photos. This value isn't set by default.
SignaturesEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
SilverlightEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
SkipCreateUnifiedGro	Optional	System.Boolean	The

upCustomSharepointClassification			*SkipCreateUnifiedGroupCustomSharepointClassification* parameter causes the custom Sharepoint page during unified group creation to be skipped.
SMimeEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used. To configure the S/MIME settings in Outlook Web App, use the **Get-SmimeConfig** and **Set-SmimeConfig** cmdlets. For more information, see S/MIME for message signing and encryption.
SpellCheckerEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
TasksEnabled	Optional	System.Boolean	The *TasksEnabled* parameter specifies whether a user can use the Tasks feature in Outlook Web App. This parameter doesn't apply to the light version of Outlook Web App.
TextMessagingEnabled	Optional	System.Boolean	The *TextMessagingEnabled* parameter specifies

			whether users can send and receive text messages. This parameter doesn't apply to the light version of Outlook Web App.
ThemeSelectionEnabled	Optional	System.Boolean	The *ThemeSelectionEnabled* parameter specifies whether users can select a theme in Outlook Web App.
UMIntegrationEnabled	Optional	System.Boolean	The *UMIntegrationEnabled* parameter specifies whether Unified Messaging is enabled in Outlook Web App. This setting applies only if Unified Messaging has been enabled for a user using the **Enable-UMMailbox** cmdlet. This parameter doesn't apply to the light version of Outlook Web App.
UNCAccessOnPrivateComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
UNCAccessOnPublicComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.

UseGB18030	Optional	System.Boolean	The *UseGB18030* parameter specifies when to use the character set GB18030. This parameter is a character-handling registry key that works in coordination with the *OutboundCharset* registry key. When the *UseGB18030* parameter is set to `$true`, the character set GB18030 is used wherever GB2312 would have been used.
UseISO885915	Optional	System.Boolean	The *UseISO885915* parameter specifies when to use the character set ISO8859-15. This parameter is a character-handling registry key that works in coordination with the *OutboundCharset* registry key. When the *UseISO885915* parameter is set to `$true`, the character set ISO8859-15 is used wherever ISO8859-1 would have been used.
UserDiagnosticEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

WacExternalServicesEnabled	Optional	System.Boolean	The *WacExternalServicesEnabled* parameter enables or disables external services that may be used by Web Access Companion (WAC). The default value is `$true`.
WacOMEXEnabled	Optional	System.Boolean	The *WacOMEXEnabled* parameter enables or disables apps for Outlook. The default value is `$false`.
WacViewingOnPrivateComputersEnabled	Optional	System.Boolean	The *WacViewingOnPrivateComputersEnabled* parameter specifies whether a user who has logged into Outlook Web App using the **Private** option can view supported Office files using Outlook Web App.
WacViewingOnPublicComputersEnabled	Optional	System.Boolean	The *WacViewingOnPublicComputersEnabled* parameter specifies whether a user who has logged into Outlook Web App using the **Public** option can view supported Office files using Outlook Web

			App.
WeatherEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WebPartsFrameOptionsType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.WebPartsFrameOptions	The *WebPartsFrameOptionsType* parameter specifies what sources can access Outlook Web App web parts in IFRAME or FRAME elements. This parameter can have the following values: • `None` This indicates that there are no restrictions on displaying Outlook Web App content in a frame. • `SameOrigin` This is the default value and the recommended value. This allows display of Outlook Web App content only in a frame that has the same origin as the content. • `Deny` This blocks display of Outlook Web App content in a frame regardless of the origin of the site attempting to access it. • `AllowFrom` This isn't yet available. It will be implemented in a later release.
WebReadyDocumentViewingForAllSupport	Optional	System.Boolean	The *WebReadyDocumentView*

edTypes			*ingForAllSupportedTypes* parameter enables WebReady Document Viewing for all supported file and MIME types. If this parameter is set to `$false`, use the *WebReadyFileTypes* and *WebReadyMimeTypes* parameters to set which file and MIME types to convert.
WebReadyDocumentViewingOnPrivateComputersEnabled	Optional	System.Boolean	The *WebReadyDocumentViewingOnPrivateComputersEnabled* parameter specifies whether WebReady Document Viewing is enabled when the user selects the **This is a private computer** option on the Outlook Web App logon page.
WebReadyDocumentViewingOnPublicComputersEnabled	Optional	System.Boolean	The *WebReadyDocumentViewingOnPublicComputersEnabled* parameter specifies whether WebReady Document Viewing is enabled when the user selects the **This is a public or shared**

			computer option on the Outlook Web App logon page.
WebReadyDocumentViewingSupportedFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The read-only *WebReadyDocumentViewingSupportedFileTypes* parameter lists the file types supported by the conversion engine.
WebReadyDocumentViewingSupportedMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The read-only *WebReadyDocumentViewingSupportedMimeTypes* parameter lists the MIME types supported by the conversion engine
WebReadyFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *WebReadyFileTypes* parameter creates a list of file types on which WebReady Document Viewing is performed.
WebReadyMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *WebReadyMimeTypes* parameter creates a list of MIME types on which WebReady Document Viewing is performed.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf*

			switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WSSAccessOnPrivateComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
WSSAccessOnPublicComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OwaVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-OwaVirtualDirectory** cmdlet to retrieve all Microsoft Office Outlook Web App virtual directories on a computer running Microsoft Exchange Server 2013 that has the Client Access server role installed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OwaVirtualDirectory -Server <ServerIdParameter> <COMMON PARAMETERS>

Get-OwaVirtualDirectory [-Identity <VirtualDirectoryIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example uses the *Server* parameter to retrieve all Outlook Web App virtual directories on the server Contoso.

```
Get-OwaVirtualDirectory -Server Contoso
```

EXAMPLE 2

This example uses the *Identity* parameter to retrieve the configuration settings on the Outlook Web App virtual directory owa (default Web site) on the server Contoso.

```
Get-OwaVirtualDirectory -Identity "Contoso\owa (default Web
site)"
```

Detailed Description

The **Get-OwaVirtualDirectory** cmdlet retrieves and displays the configuration settings currently set on Outlook Web App virtual directories on Exchange. The **Get-OwaVirtualDirectory** cmdlet can also retrieve and display the configuration settings on a specific Outlook Web App virtual directory.

The **Get-OwaVirtualDirectory** cmdlet can be run on a local server or run remotely if the server name is specified in the *Identity* or *Server* parameters. This cmdlet can also be run without parameters to retrieve the configuration settings from all Outlook Web App virtual directories on all Internet Information Services (IIS) websites located on the Client Access servers in the organization.

The **Get-OwaVirtualDirectory** cmdlet can be run on any server that has the Exchange Server administration tools installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App virtual directories" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name or GUID of the server that hosts the Outlook Web App virtual directories that you want to display. It's required if you aren't running the command on a server that has the Client Access server role installed.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from

			Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an Outlook Web App virtual directory. It's represented as: *ServerName\VirtualDirectoryName (WebsiteName)*.
ShowBackEndVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowBackEndVirtualDirectories* switch is no longer used and will be deprecated.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch specifies whether the virtual directories on the Mailbox server role within the organization are shown.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OwaVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-OwaVirtualDirectory** cmdlet to create a Microsoft Office Outlook Web App virtual directory in an existing Internet Information Services (IIS) website on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OwaVirtualDirectory [-ApplicationRoot <String>] [-AppPoolId <String>]
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
ExtendedProtectionFlags <MultiValuedProperty>] [-ExtendedProtectionSPNList
<MultiValuedProperty>] [-ExtendedProtectionTokenChecking <None | Allow |
Require>] [-ExternalAuthenticationMethods <MultiValuedProperty>] [-
ExternalUrl <Uri>] [-InternalUrl <Uri>] [-Path <String>] [-Role
<ClientAccess | Mailbox>] [-Server <ServerIdParameter>] [-WebSiteName
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the Outlook Web App virtual directory in an IIS website on the local Exchange server, which isn't a default website.

```
New-OwaVirtualDirectory -WebSiteName "Contoso.com"
```

Detailed Description

By default, when Exchange is installed, the Outlook Web App virtual directory owa is created in the default IIS website on the local server running Exchange. The **New-OwaVirtualDirectory** cmdlet must be run on the Exchange server hosting the Client Access server role on which you want to host the new virtual directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App virtual directories" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationRoot	Optional	System.String	The *ApplicationRoot* parameter sets the path of the virtual directory in the metabase. **Note:** This parameter hasn't been implemented.
AppPoolId	Optional	System.String	The *AppPoolId* parameter sets the IIS application pool in which Outlook Web App runs. We recommend that you leave this parameter at its default setting.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain

			name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're

			using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenChecki	The *ExtendedProtectionTokenChecking* parameter defines how you want to

		ngMode	use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the

			client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter.

			Note: If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalAuthenticationMethods* parameter, a Services Discovery property setting, specifies the authentication methods supported on the Exchange server from outside the firewall. **Note:** This parameter hasn't been implemented; however, it can be set by using the **Set-OwaVirtualDirectory** cmdlet.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the host name to be used to connect to the Exchange server from outside the firewall. This setting is important when Secure Sockets Layer (SSL) is used. **Note:**

			You can only configure this setting on Exchange virtual directories. The default Exchange virtual directory is /owa.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the host name to be used to connect to the Exchange server from inside the firewall. This setting is important when SSL is used. **Note:** You can only configure this setting on Exchange virtual directories. The default Exchange virtual directory is /owa.
Path	Optional	System.String	The *Path* parameter sets the file system path of the virtual directory. This parameter should be used with care and only when you must use a different file system path than the default.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter specifies the configuration that should be used when the virtual directory is created. The following are the values that can be used with this parameter: • `ClientAccess` Configures the virtual

			directory for use on a Client Access server. • `Mailbox` Configures the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to create the virtual directory. You can use any value that uniquely identifies the server, for example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the virtual directory will be created on the server where the Remote PowerShell session is established This will always be a Mailbox server. If you want to create the virtual directory on a Client Access server or another Mailbox server, you must use the *Server* parameter.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the

			name of the IIS website under which the Outlook Web App virtual directory is created.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OwaVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-OwaVirtualDirectory** cmdlet to remove Microsoft Office Outlook Web App virtual directories located in the Internet Information Services (IIS) website on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OwaVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the specified Outlook Web App virtual directory owa located on the default IIS website on the Exchange server Contoso.

```
Remove-OwaVirtualDirectory -Identity "Contoso\owa (default
Web site)"
```

Detailed Description

To run the **Remove-OwaVirtualDirectory** cmdlet, you must specify the name of the Outlook Web App virtual directory that you want to remove. You might be required to use the **Remove-OwaVirtualDirectory** cmdlet in the following situations:

- The **Get-OwaVirtualDirectory** cmdlet detects an Outlook Web App virtual directory deleted in IIS but not deleted in Active Directory. These abandoned Outlook Web App virtual directory objects are known as Active Directory orphans. We recommend that you remove this kind of Outlook Web App virtual directory in Active Directory by using the **Remove-OwaVirtualDirectory** cmdlet.
- You are troubleshooting an Outlook Web App configuration issue that requires you to delete the existing Outlook Web App virtual directory and then re-create the Outlook Web App virtual directory.

Caution:

The **Remove-OwaVirtualDirectory** cmdlet permanently removes an Outlook Web App virtual directory or directories. When you use the **Remove-OwaVirtualDirectory** cmdlet, make sure that you don't accidentally delete the default Outlook Web App virtual directory. There are no default values for the **Remove-OwaVirtualDirectory** cmdlet.

Note:

The **Remove-OwaVirtualDirectory** cmdlet supports the **Confirm** flag.

The **Remove-OwaVirtualDirectory** cmdlet can be run on any server that has the Exchange Server administration tools installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App virtual directories" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an Outlook Web App virtual directory. It's represented as: *ServerName**VirtualDirectoryName (WebsiteName)*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OwaVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-09*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-OwaVirtualDirectory** cmdlet to modify the properties of Microsoft Outlook Web App virtual directories on a server running Microsoft Exchange Server 2013 that has the Client Access server role installed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OwaVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-

```

Examples

EXAMPLE 1

This example sets the *DirectFileAccessOnPublicComputersEnabled* parameter to `$false` on the Outlook Web App virtual directory owa on the default Internet Information Services (IIS) website on the Exchange server Contoso.

```
Set-OwaVirtualDirectory -Identity "Contoso\owa (default Web
site)" -DirectFileAccessOnPublicComputersEnabled $false
```

EXAMPLE 2

This example sets the *ActionForUnknownFileAndMIMETypes* parameter to `Block` on the default Outlook Web App virtual directory owa on the server Contoso.

```
Set-OwaVirtualDirectory -Identity "Contoso\owa (default Web
site)" -ActionForUnknownFileAndMIMETypes Block
```

Detailed Description

Before you run the **Set-OwaVirtualDirectory** cmdlet, consider the following items:

- You must have Write access to virtual directory objects in Active Directory. If you don't have the necessary permissions and you try to run the **Set-OwaVirtualDirectory** cmdlet on the Active Directory virtual directory object, the cmdlet fails.
- You must have Write access to virtual directory objects in the metabase for some properties, such as **Authentication** and **GZip**. If you don't have the necessary permissions to run the **Set-OwaVirtualDirectory** cmdlet on a metabase virtual directory object or on a parameter that writes to the metabase, the cmdlet fails.
- Verify that the data source can be read. Depending on the properties that you want to set on an Outlook Web App virtual directory, you may want to run the cmdlet in a test environment on the Outlook Web App virtual directory object in Active Directory, the metabase, or both.
- You can run the **Set-OwaVirtualDirectory** cmdlet on any server that has the Exchange Server administration tools installed.
- Several parameters for the **Set-OwaVirtualDirectory** cmdlet can contain more than one value. These are known as multivalued properties. Make sure that you modify multivalued properties

correctly. For information, see Modifying multivalued properties.

- Many of the Outlook Web App virtual directory settings require you to run the **IISReset /noforce** command before the change takes effect. For example, when you enable or disable forms-based authentication, or when you enable or disable the **Private computer** option on the sign-in page.
- To switch from forms-based authentication to Basic authentication, you must first disable forms-based authentication, and then as a separate task, enable Basic authentication. You can't disable forms-based authentication and enable Basic authentication in a single task.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Outlook Web App virtual directories" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name or GUID of an Outlook Web App virtual directory. The *Identity* parameter is represented as: *ServerName**VirtualDirectoryName (WebsiteName)*.
ActionForUnknownFileAndMIMETypes	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AttachmentBlockingActions	The *ActionForUnknownFileAndMIMETypes* parameter specifies how to handle files that aren't included in other File Access Management lists. The following values are valid for this parameter: • `Allow` • `ForceSave` • `Block`

ActiveSyncIntegrationEnabled	Optional	System.Boolean	The *ActiveSyncIntegrationEnabled* parameter disables Microsoft Exchange ActiveSync on the Outlook Web App **Options** page. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AdfsAuthentication	Optional	System.Boolean	The *AdfsAuthentication* parameter enables or disables Active Directory Federation Services (ADFS) authentication on the Outlook Web App virtual directory. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. The ADFS authentication settings for **Set-OwaVirtualDirectory** and **Set-EcpVirtualDirectory** are related. You need to set the *AdfsAuthentication* parameter on **Set-EcpVirtualDirectory** to `$true` before you can set the *AdfsAuthentication* parameter on **Set-**

			OwaVirtualDirectory to `$true`. Likewise, you need to set the *AdfsAuthentication* parameter on **Set-OwaVirtualDirectory** to `$false` before you can set the *AdfsAuthentication* parameter on **Set-EcpVirtualDirectory** to `$false`.
AllAddressListsEnabled	Optional	System.Boolean	The *AllAddressListsEnabled* parameter specifies which address lists are available to the user. You can use one of the following values: • If set to `$true`, users can view all address lists. • If set to `$false`, users can view only the global address list (GAL). The default value is `$true`.
AllowCopyContactsToDeviceAddressBook	Optional	System.Boolean	The *AllowCopyContactsToDeviceAddressBook* parameter specifies if users can copy the contents of their Contacts folder to a mobile device's native address book when using

			OWA for Devices. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
AllowedFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedFileTypes* parameter specifies the extensions of file types that the user can save locally and view from a web browser. If the same extensions are in multiple settings lists, the most secure setting overrides the less secure settings. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax:

			`@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
AllowedMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AllowedMimeTypes* parameter specifies extensions of MIME attachments that users can save locally and view from a web browser. If the same extensions are in multiple settings lists, the most secure setting overrides the less secure settings. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<va`

			`lue2>"...}`.
AllowOfflineOn	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AllowOfflineOnEnum	The *AllowOfflineOn* parameter specifies which computers can use Outlook Web App in offline mode. The possible values are: • `NoComputers` • `AllComputers` • `PrivateComputersOnly` The default value is `AllComputers`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. In order to show the **Private computer** option at sign-in, you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`. If the feature is enabled and users are using a supported browser, they can use Outlook Web App in offline mode. Users can turn the feature on or off in Outlook Web App. To turn the feature on, click the gear icon and then

			select **Stop using offline**. To turn the feature off, click the gear icon and then select **Use mail offline**. The supported browsers are Microsoft Internet Explorer 10, Safari 4, or Chrome 16. For more information, see Using Outlook Web App offline.
AnonymousFeaturesEnabled	Optional	System.Boolean	The *AnonymousFeaturesEnabled* parameter specifies whether you want to allow Outlook Web App users that are logged on anonymously to access specific features. For example, if this value is set to `$true`, users logged on using anonymous authentication can view and change meeting content. This parameter is set to `$true` by default.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter enables or disables Basic authentication on the Outlook Web App virtual directory. This parameter

			can be used with the *FormsAuthentication* parameter or with the *DigestAuthentication* and *WindowsAuthentication* parameters. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
BlockedFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedFileTypes* parameter specifies a list of extensions of attachments that are blocked. Attachments that contain these blocked extensions can't be saved locally or viewed from a web browser. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or

			more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
BlockedMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BlockedMimeTypes* parameter specifies a list of MIME extensions of attachments that are blocked. Attachments that contain these blocked MIME extensions can't be saved locally or viewed from a web browser. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax:

			`@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
CalendarEnabled	Optional	System.Boolean	The *CalendarEnabled* parameter specifies whether to enable the calendar for users. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ChangePasswordEnabled	Optional	System.Boolean	The *ChangePasswordEnabled* parameter specifies whether users can change their passwords from inside Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ClientAuthCleanupLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ClientAuthCleanupLevels	The *ClientAuthCleanupLevel* parameter specifies how much of the cache is cleared when the user logs off in Outlook Web App. This parameter doesn't apply to the light version of Outlook Web App.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContactsEnabled	Optional	System.Boolean	The *ContactsEnabled* parameter specifies whether Contacts are enabled for users. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
DefaultClientLanguage	Optional	System.Int32	This parameter has been deprecated and is no longer used.
DefaultDomain	Optional	System.String	The *DefaultDomain* parameter specifies which domain to use when the *LogonFormat* parameter is set to `UserName`.
DefaultTheme	Optional	System.String	The *DefaultTheme* parameter specifies the default theme used by Outlook Web App when the user hasn't selected a

			theme.
DelegateAccessEnabled	Optional	System.Boolean	The *DelegateAccessEnabled* parameter specifies whether delegates can use Outlook Web App to open folders, which they have delegate access to, through this virtual directory. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
DigestAuthentication	Optional	System.Boolean	The *DigestAuthentication* parameter enables or disables Digest authentication on the virtual directory. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. This parameter can't be used with the *FormsAuthentication* parameter.
DirectFileAccessOnPrivateComputersEnabled	Optional	System.Boolean	The *DirectFileAccessOnPrivateComputersEnabled* parameter specifies the

			left-click options on attachments. If this parameter is set to `$true`, **Open** is an available option. If it's set to `$false`, the **Open** option is disabled. The default value is `$true`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. In order to show the **Private computer** option at sign-in, you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`.
DirectFileAccessOnPublicComputersEnabled	Optional	System.Boolean	The *DirectFileAccessOnPublicComputersEnabled* parameter specifies the left-click options on attachments when a user logs on after unchecking the **Private computer** option. If this parameter is set to `$true`, **Open** is an available option. If it's set to `$false`, the **Open**

			option is disabled. The default value is `$true`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. Therefore, this parameter is meaningful only if you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`. This allows you to uncheck the **Private computer** option at sign-in, which indicates you are connecting from a public computer.
DisplayPhotosEnabled	Optional	System.Boolean	The *DisplayPhotosEnabled* parameter specifies whether users see sender photos in Outlook Web App. The possible values for this parameter are `$true` or `$false`. The default value is `$true`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
Exchange2003Url	Optional	System.Uri	This parameter has been deprecated and is no longer used.
ExchwebProxyDestination	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExchwebProxyDestinations	This parameter has been deprecated and is no longer used.
ExplicitLogonEnabled	Optional	System.Boolean	The *ExplicitLogonEnabled* parameter specifies whether to allow a user to open someone else's mailbox in Outlook Web App. If this parameter is set to `$true`, it allows a user to open someone else's mailbox in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are:

			• **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless

			certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing

			entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN` value. You specify the

			domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual

			directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection

			using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and

			the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalAuthenticationMethods	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalAuthenticationMethods* parameter specifies the authentication methods supported on the Exchange server from outside the firewall.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the host name used to connect to the Exchange server from outside the firewall. This setting is also important when Secure Sockets Layer (SSL) is used. **Note:** You can only configure this option on Exchange 2013 virtual directories. The default Exchange virtual directory is /owa.
FailbackUrl	Optional	System.Uri	The *FailbackUrl* parameter specifies the host name Outlook Web App uses to connect to the Client Access server after

			failback in a site resilience process and requires a separate Domain Name System (DNS) entry pointing to the original Client Access server's IP address. The *FailbackUrl* parameter must be different from the *ExternalUrl* parameter.
FilterWebBeaconsAndHtmlForms	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.WebBeaconFilterLevels	The *FilterWebBeaconsAndHtmlForms* parameter specifies how web beacons are handled. The possible values are `UserFilterChoice`, `ForceFilter`, and `DisableFilter`.
ForceSaveAttachmentFilteringEnabled	Optional	System.Boolean	The *ForceSaveAttachmentFilteringEnabled* parameter specifies whether files included in the list of extensions created by the *ForceSaveFileTypes* parameter are filtered before the user can save them. Valid input for this parameter is `$true` or `$false`. The default value

			is `$false`.
ForceSaveFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ForceSaveFileTypes* parameter specifies a list of extensions of attachments that can be opened only after the file is saved locally on the user's computer. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
ForceSaveMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ForceSaveMimeTypes* parameter specifies the MIME types of attachments that can be

			opened only after the file is saved locally on the user's computer.
ForceWacViewingFirstOnPrivateComputers	Optional	System.Boolean	The *ForceWacViewingFirstOnPrivateComputers* parameter specifies whether a user can open an Office file directly without first viewing it as a web page. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. In order to show the **Private computer** option at sign-in, you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`.
ForceWacViewingFirstOnPublicComputers	Optional	System.Boolean	The *ForceWacViewingFirstOnPublicComputers* parameter specifies whether a user who logs

			on after unchecking the **Private computer** option can open an Office file directly without first viewing it as a web page. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. Therefore, this parameter is meaningful only if you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`. This allows you to uncheck the **Private computer** option at sign-in, which indicates you are connecting from a public computer.
ForceWebReadyDocumentViewingFirstOnPrivateComputers	Optional	System.Boolean	The *ForceWebReadyDocumentViewingFirstOnPrivateComputers* parameter specifies whether a user can open a document directly without first

			viewing it as a web page. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. In order to show the **Private computer** option at sign-in, you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`.
ForceWebReadyDocumentViewingFirstOnPublicComputers	Optional	System.Boolean	The *ForceWebReadyDocumentViewingFirstOnPublicComputers* parameter specifies whether a user who logs on after unchecking the **Private computer** option can open a document directly without first viewing it as a web page. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.

			By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. Therefore, this parameter is meaningful only if you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`. This allows you to uncheck the **Private computer** option at sign-in, which indicates you are connecting from a public computer.
FormsAuthentication	Optional	System.Boolean	The *FormsAuthentication* parameter enables or disables forms-based authentication on the Outlook Web App virtual directory. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If the *FormsAuthentication* parameter is set to `$true`, the *BasicAuthentication* parameter is set to `$true`, and the

			DigestAuthentication and *WindowsAuthentication* parameters are set to `$false`.
GlobalAddressListEnabled	Optional	System.Boolean	The *GlobalAddressListEnabled* parameter specifies whether to show the global address list in Outlook Web App.
GzipLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.GzipLevel	The *GzipLevel* parameter sets Gzip configuration information for the Outlook Web App virtual directory.
InstantMessagingCertificateThumbprint	Optional	System.String	The *InstantMessagingCertificateThumbprint* parameter specifies the trusted certificate used to communicate between the instant messaging server and the Client Access server. Use the Get-ExchangeCertificate cmdlet to find the thumbprint of the certificate.
InstantMessagingEnabled	Optional	System.Boolean	The *InstantMessagingEnabled* parameter specifies

			whether to enable instant messaging in Outlook Web App.
InstantMessagingServerName	Optional	System.String	The *InstantMessagingServerName* parameter specifies the fully qualified domain name (FQDN) of the instant messaging server or set of servers behind a load balancing device.
InstantMessagingType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.InstantMessagingTypeOptions	The *InstantMessagingType* parameter specifies the type of instant messaging provider to be used. Set this parameter to `None` for no provider and `Ocs` for Microsoft Office Communications Server. The `Msn` value is no longer used and will be deprecated.
IntegratedFeaturesEnabled	Optional	System.Boolean	The *IntegratedFeaturesEnabled* parameter specifies whether to allow Outlook Web App users who are logged on using Integrated Windows authentication to access specific features. For

			example, if this value is set to `$true`, users logged on using Integrated Windows authentication can view and change meeting content. This is set to `$true` by default.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the host name of the Exchange server for connection from inside the firewall. This setting is also important when SSL is used. **Note:** You can only configure this option on Exchange 2013 virtual directories. The default Exchange virtual directory is /owa.
IRMEnabled	Optional	System.Boolean	The *IRMEnabled* parameter specifies whether the Information Rights Management (IRM) feature is enabled.
JournalEnabled	Optional	System.Boolean	The *JournalEnabled* parameter specifies whether the Journal folder is visible.
JunkEmailEnabled	Optional	System.Boolean	The *JunkEmailEnabled* parameter specifies whether the Junk Email

			management tools are enabled.
LiveIdAuthentication	Optional	System.Boolean	The *LiveIdAuthentication* parameter specifies whether to configure Outlook Web App to use logon via a Microsoft account (formerly known as Windows Live ID). Set this parameter to `$true` to configure Outlook Web App to use logon via a Microsoft account.
LogonAndErrorLanguage	Optional	System.Int32	The *LogonAndErrorLanguage* parameter specifies which language Outlook Web App uses for forms-based authentication and for error messages that occur when a user's current language setting can't be read. When this parameter has a value of `0`, the language selection is undefined.
LogonFormat	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.LogonFormats	The *LogonFormat* parameter specifies the type of logon format forms-based authentication must use on the Outlook Web App

			sign-in page. Possible attributes are **FullDomain**, **UserName**, or **PrincipalName**. If you specify the **FullDomain** attribute, the **User name** field on the Outlook Web App sign-in page requires the user name to be entered in the format *domain**user name*. If you specify the **UserName** attribute, you must also specify the *DefaultDomain* parameter. If you specify the **PrincipalName** attribute, the **User name** field on the Outlook Web App sign-in page requires a user principal name (UPN) address. This sign-in method works only for users whose UPN name is the same as their email address.
LogonPageLightSelectionEnabled	Optional	System.Boolean	The *LogonPageLightSelectionEnabled* parameter specifies whether the

			Outlook Web App sign-in page includes the option to sign in to the light version of Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
LogonPagePublicPrivateSelectionEnabled	Optional	System.Boolean	The *LogonPagePublicPrivateSelectionEnabled* parameter specifies whether the Outlook Web App sign-in page includes the **Private computer** option at sign-in. By default, Valid input for this parameter is `$true` or `$false`. The default value is `$false`. By default, Exchange 2013 assumes you are connecting from a private computer. To make the **Private computer** option available to check or uncheck, set the value of this parameter to `$true`, and then restart IIS.

NotesEnabled	Optional	System.Boolean	The *NotesEnabled* parameter specifies whether the Notes folder is visible in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
NotificationInterval	Optional	System.Int32	This parameter has been deprecated and is no longer used.
OAuthAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OrganizationEnabled	Optional	System.Boolean	When the *OrganizationEnabled* parameter is set to `$false`, the **Automatic Reply** option doesn't include external and internal options, the address book doesn't show the organization hierarchy, and the **Resources** tab in Calendar forms is disabled. The default value is `$true`.
OutboundCharset	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.Outbound	The *OutboundCharset* parameter specifies the character set used for

		CharsetOptions	messages sent by users on a specific Outlook Web App virtual directory.
OWALightEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
PlacesEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
PredictedActionsEnabled	Optional	System.Boolean	The *PredictedActionsEnabled* parameter specifies whether you want Outlook Web App to customize the user experience by making predictions about the action that a user should take on a particular item. This value is set to `$false` by default. If this value is set to `$true`, Outlook Web App tries to make suggestions for the user. For example: • The user interface may change the order of items in an options list based on the context the user is in. • Outlook Web App may highlight an icon or other user interface

			element that is the next logical step in the completion of a task. • Upon initiating a move email item operation, the user interface may suggest the folder that you want to move email items based on previous actions of the user.
PremiumClientEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
PublicFoldersEnabled	Optional	System.Boolean	The *PublicFoldersEnabled* parameter specifies whether a user can browse or read items in public folders using Outlook Web App. By default, the *PublicFoldersEnabled* parameter is set to `$true`. If the *PublicFoldersEnabled* parameter is set to `$false`, users can only access their private mailboxes in Outlook Web App.
RecoverDeletedItemsEnabled	Optional	System.Boolean	The *RecoverDeletedItemsEnabled* parameter specifies

			whether a user can use Outlook Web App to view, recover, or delete permanently items that have been deleted from the Deleted Items folder. By default, the *RecoverDeletedItemsEnabled* parameter is set to `$true`. If the *RecoverDeletedItemsEnabled* parameter is set to `$false`, the items deleted from the Deleted Items folder are retained. However, users can't view, recover, or permanently delete them using Outlook Web App.
RedirectToOptimalOWAServer	Optional	System.Boolean	The *RedirectToOptimalOWAServer* parameter, when set to `$true`, causes Outlook Web App to use service discovery to find the best Client Access server to use after a user authenticates. If redirection is disabled, Outlook Web App doesn't redirect clients to the most optimal Client Access server.

			Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
RemindersAndNotificationsEnabled	Optional	System.Boolean	The *RemindersAndNotificationsEnabled* parameter specifies whether notifications and reminders are enabled in Outlook Web App. This parameter doesn't apply to the light version of Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
RemoteDocumentsActionForUnknownServers	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.RemoteDocumentsActions	This parameter has been deprecated and is no longer used.
RemoteDocumentsAllowedServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter has been deprecated and is no longer used.
RemoteDocumentsBlockedServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter has been deprecated and is no longer used.
RemoteDocumentsInternalDomainSuffixList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter has been deprecated and is no

		y	longer used.
ReportJunkEmailEnabled	Optional	System.Boolean	The *ReportJunkEmailEnabled* parameter specifies whether users can report messages as junk to Microsoft in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. If you set this parameter to `$false`, the **Report mail as junk** window doesn't appear after users select **Mark as junk**. This parameter is meaningful only when the *JunkEmailEnabled* parameter is set to `$true`.
RulesEnabled	Optional	System.Boolean	The *RulesEnabled* parameter specifies whether a user can view, create, or modify server-side rules using Outlook Web App. By default, the *RulesEnabled* parameter is set to `$true`. If the *RulesEnabled* parameter is set to `$false`, users must use Microsoft Outlook to view, create, and modify

			server-side rules.
SearchFoldersEnabled	Optional	System.Boolean	The *SearchFoldersEnabled* parameter specifies whether Search Folders are available in Outlook Web App.
SetPhotoEnabled	Optional	System.Boolean	The *SetPhotoEnabled* parameter specifies whether users can add, change, and remove their sender photo in Outlook Web App. The possible values for this parameter are `$true` or `$false`. The default value is `$false`. When this value is set to `$true`, users can manage their sender photo using two methods. They can click their name in the upper-right corner of Outlook Web App, click **change**, and then browse to the photo they want to use. Alternatively, users can manage their photo by clicking the gear icon in the upper-right corner of Outlook Web App, and then clicking **Options** > **Account** > **My account** > **Edit** > **Change**.

SetPhotoURL	Optional	System.String	The *SetPhotoURL* parameter specifies the location of the user photos. This value isn't set by default.
SignaturesEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
SilverlightEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
SMimeEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used. To configure the S/MIME settings in Outlook Web App, use the **Get-SmimeConfig** and **Set-SmimeConfig** cmdlets. For more information, see S/MIME for message signing and encryption.
SpellCheckerEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
TasksEnabled	Optional	System.Boolean	The *TasksEnabled* parameter specifies whether a user can use the Tasks feature in Outlook Web App. This

			parameter doesn't apply to the light version of Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
TextMessagingEnabled	Optional	System.Boolean	The *TextMessagingEnabled* parameter specifies whether users can send and receive text messages. This parameter doesn't apply to the light version of Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
ThemeSelectionEnabled	Optional	System.Boolean	The *ThemeSelectionEnabled* parameter specifies whether users can select a theme in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
UMIntegrationEnabled	Optional	System.Boolean	The *UMIntegrationEnabled*

			parameter specifies whether Unified Messaging is enabled on Outlook Web App. This setting applies only if Unified Messaging has been enabled for a user using the **Enable-UMMailbox** cmdlet. This parameter doesn't apply to the light version of Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
UNCAccessOnPrivateComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
UNCAccessOnPublicComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
UseGB18030	Optional	System.Boolean	The *UseGB18030* parameter specifies when to use the character set GB18030. This parameter is a character-handling registry key that works in coordination with the *OutboundCharset* registry key. When the

			UseGB18030 parameter is set to `$true`, the character set GB18030 is used wherever GB2312 would have been used. The default value is `$false`.
UseISO885915	Optional	System.Boolean	The *UseISO885915* parameter specifies when to use the character set ISO8859-15. This parameter is a character-handling registry key that works in coordination with the *OutboundCharset* registry key. When the *UseISO885915* parameter is set to `$true`, the character set ISO8859-15 is used wherever ISO8859-1 would have been used. The default value is `$false`.
UserContextTimeout	Optional	System.Int32	The *UserContextTimeout* parameter specifies the time-out setting, in minutes, for a user context object. This parameter doesn't limit public and private forms-based authentication time-out settings.

UserDiagnosticEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
VirtualDirectoryType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.VirtualDirectoryTypes	This parameter has been deprecated and is no longer used.
WacViewingOnPrivateComputersEnabled	Optional	System.Boolean	The *WacViewingOnPrivateComputersEnabled* parameter specifies whether a user can view supported Office files using Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. In order to show the **Private computer** option at sign-in, you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`.
WacViewingOnPublicComputersEnabled	Optional	System.Boolean	The *WacViewingOnPublicCom*

			putersEnabled parameter specifies whether a user who logs on after unchecking the **Private computer** option can view supported Office files using Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. Therefore, this parameter is meaningful only if you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`. This allows you to uncheck the **Private computer** option at sign-in, which indicates you are connecting from a public computer.
WeatherEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WebPartsFrameOptio	Optional	Microsoft.Exchange.Da	The *WebPartsFrameOptionsTy*

nsType		ta.Directory.SystemConfiguration.WebPartsFrameOptions	*pe* parameter specifies what sources can access Outlook Web App web parts in IFRAME or FRAME elements. This parameter can have the following values: • `None` This indicates that there are no restrictions on displaying Outlook Web App content in a frame. • `SameOrigin` This is the default value and the recommended value. This allows display of Outlook Web App content only in a frame that has the same origin as the content. • `Deny` This blocks display of Outlook Web App content in a frame regardless of the origin of the site attempting to access it. • `AllowFrom` This isn't yet available. It will be implemented in a later release.
WebReadyDocumentViewingForAllSupportedTypes	Optional	System.Boolean	The *WebReadyDocumentViewingForAllSupportedTypes* parameter enables WebReady Document Viewing for all supported file and MIME types. If this parameter is set to

			`$false`, use the *WebReadyFileTypes* and *WebReadyMimeTypes* parameters to set which file and MIME types to convert. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
WebReadyDocumentViewingOnPrivateComputersEnabled	Optional	System.Boolean	The *WebReadyDocumentViewingOnPrivateComputersEnabled* parameter enables or disables WebReady Document Viewing. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. In order to show the **Private computer** option at sign-in, you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`.

WebReadyDocumentViewingOnPublicComputersEnabled	Optional	System.Boolean	The *WebReadyDocumentViewingOnPublicComputersEnabled* parameter enables or disables WebReady Document Viewing for a user who logs on after unchecking the **Private computer** option. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, Outlook Web App in Exchange 2013 assumes you are connecting from a private computer. Therefore, this parameter is meaningful only if you set the *LogonPagePublicPrivateSelectionEnabled* parameter to the value `$true`. This allows you to uncheck the **Private computer** option at sign-in, which indicates you are connecting from a public computer.
WebReadyDocumentViewingSupportedFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The read-only *WebReadyDocumentViewingSupportedFileTypes*

			parameter lists the file types supported by the conversion engine. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
WebReadyDocumentViewingSupportedMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The read-only *WebReadyDocumentViewingSupportedMimeTypes* parameter lists the MIME types supported by the conversion engine. To enter multiple values and overwrite any existing entries, use the following syntax:

			`<value1>,<value2>...` If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
WebReadyFileTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *WebReadyFileTypes* parameter creates a list of file types on which WebReady Document Viewing is performed. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...` If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`

			To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
WebReadyMimeTypes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *WebReadyMimeTypes* parameter creates a list of MIME types on which WebReady Document Viewing is performed. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter enables or disables Integrated Windows authentication on the Outlook Web App virtual directory. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
WSSAccessOnPrivateComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.
WSSAccessOnPublicComputersEnabled	Optional	System.Boolean	This parameter has been deprecated and is no longer used.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-PopConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-PopConnectivity** cmdlet to verify that the POP3 service is running as expected. The **Test-PopConnectivity** cmdlet can be used to test the POP3 functionality for a specified Client Access server for all mailboxes on servers running Microsoft Exchange Server 2013 in the same Active Directory site.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-PopConnectivity [-ClientAccessServer <ServerIdParameter>] [-
ConnectionType <Plaintext | Tls | Ssl>] [-MailboxCredential
<PSCredential>] [-PerConnectionTimeout <Int32>] [-PortClientAccessServer
<Int32>] [-TrustAnySSLCertificate <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-LightMode
<SwitchParameter>] [-MailboxServer <ServerIdParameter>] [-
MonitoringContext <SwitchParameter>] [-ResetTestAccountCredentials
<SwitchParameter>] [-Timeout <UInt32>] [-UserType <LEGACY | EDU | BPOS>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the POP3 connectivity for the Client Access server Contoso12 by using the credentials for the user contoso\kweku.

```
Test-PopConnectivity -ClientAccessServer:Contoso12 -
MailboxCredential:(Get-Credential contoso\kweku)
```

EXAMPLE 2

This example tests the POP3 connectivity of the specific Client Access server Contoso12 and tests all

Exchange mailboxes.

```
Test-PopConnectivity -ClientAccessServer:Contoso12
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test POP3 settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *ClientAccessServer* parameter specifies the name of the Client Access server to test.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectionType	Optional	Microsoft.Exchange.Monitoring.ProtocolConnectionType	The *ConnectionType* parameter specifies the type of connection used to connect to the Client Access server.

			This setting can be set to `Plaintext`, `Tls`, or `ssl`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
LightMode	Optional	System.Management.Automation.SwitchParameter	The *LightMode* parameter instructs the command to perform only a test logon to the server using the POP3 protocol. If you don't use this parameter, the test also tests the sending and receiving of a message using the POP3 protocol.
MailboxCredential	Optional	System.Management.Automation.PSCredential	The *MailboxCredential* parameter specifies the mailbox credential for a single mailbox test.
MailboxServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server to test. If not specified, all Mailbox servers in the local

			Active Directory site are tested.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
PerConnectionTimeout	Optional	System.Int32	The *PerConnectionTimeout* parameter specifies the amount of time, in seconds, to wait per connection for the test operation to finish. The default value for the *PerConnectionTimeout* parameter is 120 seconds. You must

			specify a time-out value greater than 0 seconds and less than 120 seconds. We recommend that you configure this parameter with a value of 5 seconds or more.
PortClientAccessServer	Optional	System.Int32	The *PortClientAccessServer* parameter specifies the port to use to connect to the Client Access server. The default port is 110 for POP3. The valid range is from 0 through 65,535.
ResetTestAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *ResetTestAccountCredentials* switch resets the password for the test account that's used to run this command. The password for the test account is typically reset every seven days. Use this switch to force a password reset any time it's required for security reasons.
Timeout	Optional	System.UInt32	The *Timeout* parameter

			specifies the amount of time, in seconds, to wait for the test operation to finish. The default value for the *Timeout* parameter is 180 seconds. You must specify a time-out value greater than 0 seconds and less than 1 hour (3,600 seconds). We recommend that you configure this parameter with a value of 5 seconds or more.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* parameter specifies whether Secure Sockets Layer (SSL) certificate validation failures are reported. This parameter instructs the command to check the POP3 service without generating an error when the certificate doesn't match the URL of the Client Access server.
UserType	Optional	Microsoft.Exchange.Mo	This parameter is

		nitoring.DatacenterUserType	reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-POPSettings

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-POPSettings** cmdlet to display the properties of a single server running Microsoft

Exchange Server 2013 that has the Client Access server role installed and is running the POP3 service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PopSettings [-DomainController <Fqdn>] [-Server <ServerIdParameter>]
```

Examples

EXAMPLE 1

This example displays the parameters and values for the Client Access server CAS01 running the POP3 service.

```
Get-POPSettings -Server CAS01
```

Detailed Description

With the **Get-POPSettings** cmdlet, you can view the settings for the POP3 service running on an Exchange Client Access server. Information can only be returned about servers located in the Exchange organization from which the cmdlet is being run.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "POP3 settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies whether the command returns the

			properties of an individual Client Access server in your organization for which you're viewing POP3 settings.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PopSettings

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-PopSettings** cmdlet to set specific POP3 settings for the server running Microsoft Exchange Server 2013 that has the Client Access server role installed and that's running the Microsoft Exchange POP3 service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PopSettings [-AuthenticatedConnectionTimeout <EnhancedTimeSpan>] [-
Banner <String>] [-CalendarItemRetrievalOption <iCalendar | intranetUrl |
InternetUrl | Custom>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-EnableExactRFC822Size <$true | $false>] [-
EnableGSSAPIAndNTLMAuth <$true | $false>] [-EnforceCertificateErrors
<$true | $false>] [-ExtendedProtectionPolicy <None | Allow | Require>] [-
ExternalConnectionSettings <MultiValuedProperty>] [-
InternalConnectionSettings <MultiValuedProperty>] [-
LiveIdBasicAuthReplacement <$true | $false>] [-LogFileLocation <String>]
[-LogFileRollOverSettings <Hourly | Daily | Weekly | Monthly>] [-LoginType
<PlainTextLogin | PlainTextAuthentication | SecureLogin>] [-
LogPerFileSizeQuota <Unlimited>] [-MaxCommandSize <Int32>] [-
MaxConnectionFromSingleIP <Int32>] [-MaxConnections <Int32>] [-
MaxConnectionsPerUser <Int32>] [-MessageRetrievalMimeFormat <TextOnly |
```

```
HtmlOnly | HtmlAndTextAlternative | TextEnrichedOnly |
TextEnrichedAndTextAlternative | BestBodyFormat | Tnef>] [-
MessageRetrievalSortOrder <Ascending | Descending>] [-OwaServerUrl <Uri>]
[-PreAuthenticatedConnectionTimeout <EnhancedTimeSpan>] [-
ProtocolLogEnabled <$true | $false>] [-ProxyTargetPort <Int32>] [-Server
<ServerIdParameter>] [-SSLBindings <MultiValuedProperty>] [-
SuppressReadReceipt <$true | $false>] [-UnencryptedOrTLSBindings
<MultiValuedProperty>] [-WhatIf [<SwitchParameter>]] [-X509CertificateName
<String>]
```

Examples

EXAMPLE 1

This example sets the plain text or TLS connection to the Client Access server CAS01. In this example, the connection uses an IP address of 10.0.0.0 and a port number of 993.

```
Set-PopSettings -Server "CAS01" -UnencryptedOrTLSBindings
10.0.0.0:993
```

EXAMPLE 2

This example turns on POP3 protocol logging. It also changes the POP3 protocol logging directory to C:\Pop3Logging.

```
Set-PopSettings -ProtocolLogEnabled $true -LogFileLocation
"C:\Pop3Logging"
```

EXAMPLE 3

This example changes the POP3 protocol logging to create a new log file when a log file reaches 2 megabytes (MB).

```
Set-PopSettings -LogPerFileSizeQuota 2000000
```

EXAMPLE 4

This example changes the POP3 protocol logging to create a new log file every hour.

```
Set-PopSettings -LogPerFileSizeQuota 0 -
LogFileRollOverSettings Hourly
```

Detailed Description

You can run the **Set-PopSettings** cmdlet for a single Client Access server that has the Microsoft Exchange POP3 service installed, or for all Exchange Client Access servers that have the Microsoft Exchange POP3 service installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "POP3 settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AuthenticatedConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AuthenticatedConnectionTimeout* parameter specifies the time to wait before closing an idle authenticated connection. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is `00:00:30` to `1:00:00`. The default setting is `00:30:00` or 30 minutes.
Banner	Optional	System.String	The *Banner* parameter specifies the banner string displayed after a connection to a Client Access server has been established.
CalendarItemRetrievalOption	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.CalendarItemRetrievalOptions	The *CalendarItemRetrievalOption* parameter specifies the type of calendar item

			returned when the calendar is accessed by using POP3. The default value is `iCalendar`. You can specify the value for this parameter by using a numerical value or text string. The following values are available: • `0` or `iCalendar` • `1` or `intranetUrl` • `2` or `InternetUrl` • `3` or `Custom` If you're using `3` or `Custom`, you must specify the *OwaServerUrl* parameter setting.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
EnableExactRFC822Size	Optional	System.Boolean	The *EnableExactRFC822Size* parameter calculates the exact size of each MIME message that can be retrieved from the server. When you set this parameter to `$true`, the exact size of MIME messages stored on the Exchange server is available to POP3 or IMAP4 client programs that rely on knowing the exact size of each MIME message. **Note:** This parameter is set to `$false` by default. If you don't set this option to `$true`, the size of each MIME message that the Exchange server returns to POP3 and IMAP4 client programs may be slightly different than the exact size of the message. Because setting this option to `$true` can negatively affect performance, you should only use this option if many of your users are using a client that requires knowing the exact size of MIME

			messages.
EnableGSSAPIAndNTLMAuth	Optional	System.Boolean	The *EnableGSSAPIAndNTLMAuth* parameter specifies whether connections can use Integrated Windows authentication (NTLM) by using the Generic Security Services application programming interface (GSSAPI). This setting applies to connections where Transport Layer Security (TLS) is disabled. By default, this parameter is set to `$true`. You can disable NTLM for POP3 connections by setting the value to `$false`. NTLM authentication isn't supported for POP3 connections in Microsoft Exchange Server 2010 release to manufacturing (RTM). Support for NTLM authentication for POP3 connections was brought back in Exchange 2010 Service Pack 1 (SP1).
EnforceCertificateErrors	Optional	System.Boolean	The *EnforceCertificateErrors* parameter specifies

			whether to enforce valid Secure Sockets Layer (SSL) certificates. To use this parameter, specify the destination Client Access server for which you want to enforce valid SSL certificates. If the *EnforceCertificateErrors* parameter is set to `$true` and the proxy's target certificate isn't valid, the proxy logon attempt fails. The default setting is `$false`.
ExtendedProtectionPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionPolicy* parameter specifies how you want to use Extended Protection for Authentication for POP3 connections. By default, this parameter is set to `None`. The possible values are: • `None` Extended Protection for Authentication won't be used. • `Allow` Extended Protection for Authentication will be used only if the connecting POP3 connection supports it.

			Otherwise, the connections will be established without Extended Protection for Authentication. • `Require` Extended Protection for Authentication will be required for all POP3 connections. If the connecting host doesn't support Extended Protection for Authentication, the connection will be rejected. Extended Protection for Authentication enhances the protection and handling of credentials when authenticating network connections using Integrated Windows authentication. Integrated Windows authentication is also known as NTLM. We strongly recommend that you use Extended Protection for Authentication if you're using Integrated Windows authentication. To use Extended Protection for Authentication, the client and server computers must meet the specific requirements. These

			include operating system requirements and security update requirements. In addition, the POP3 client program must support the use of Extended Protection for Authentication.
ExternalConnectionSettings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalConnectionSettings* parameter specifies the host name, port, and encryption type that Exchange uses when POP3 clients connect to their email from outside your corporate network. Enter a value using the format: <*HostName*>:<*Port*>:<*Encryption Type*>. The <*Encryption Type*> part of the multivalued value is optional. Valid values for <*Encryption Type*> are either TLS or SSL.
InternalConnectionSettings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalConnectionSettings* parameter specifies the host name, port, and encryption type used when POP3 clients

			connect to their email from inside your corporate network. This setting is also used to specify the host name, port, and encryption type used when a user connection is forwarded to another Client Access server. Enter a value using the format: <*HostName*>:<*Port*>:<*Encryption Type*>. The <*Encryption Type*> part of the multivalued value is optional. Valid values for <*Encryption Type*> are either TLS or SSL. If your server name is Server01 and your domain is Contoso.com, the default value is `Server01.Contoso.com:995:SSL, Server01.Contoso.com:110:TLS`.
LiveIdBasicAuthReplacement	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LogFileLocation	Optional	System.String	The *LogFileLocation* parameter specifies the location for the POP3 protocol log files. By

			default, POP3 protocol log files are located in the C:\Program Files\Microsoft\Exchange Server\V15\Logging\Pop3 directory.
LogFileRollOverSettings	Optional	Microsoft.Exchange.Diagnostics.LogFileRollOver	The *LogFileRollOverSettings* parameter defines how frequently POP3 protocol logging creates a new log file. By default, a new log file is created daily. You can specify the value for this parameter by using a numerical value or text string. The possible values are: • `1` or `Hourly` • `2` or `Daily` • `3` or `Weekly` • `4` or `Monthly` This setting only applies when the value for the *LogPerFileSizeQuota* parameter is set to `0`.
LoginType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.LoginOptions	The *LoginType* parameter specifies the authentication setting used for the Client Access server running the Microsoft Exchange POP3 service. You can specify the value for this

			parameter by using a numerical value or text string. The possible values are: • `1` or `PlainTextLogin` • `2` or `PlainTextAuthentication` • `3` or `SecureLogin` The default value is `SecureLogin`.
LogPerFileSizeQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *LogPerFileSizeQuota* parameter defines the maximum size of a POP3 protocol log file in bytes. By default, this value is set to `0`. When this value is set to `0`, a new protocol log file is created at the frequency specified by the *LogFileRollOverSettings* parameter.
MaxCommandSize	Optional	System.Int32	The *MaxCommandSize* parameter specifies the maximum size of a single command. The default size is `512` bytes. The possible values are from 40 through 1024 bytes.
MaxConnectionFromSingleIP	Optional	System.Int32	The *MaxConnectionFromSingleIP* parameter specifies

			the number of connections that the specified server accepts from a single IP address. The default value is 2147483647. The possible values are from 1 through 2147483647.
MaxConnections	Optional	System.Int32	The *MaxConnections* parameter specifies the total number of connections that the specified server accepts. This includes authenticated and unauthenticated connections. The default value is 2147483647. The possible values are from 1 through 2147483647.
MaxConnectionsPerUser	Optional	System.Int32	The *MaxConnectionsPerUser* parameter specifies the maximum number of connections that the Client Access server accepts from a particular user. The default value is 16. The possible values are from 1 through 2147483647.

MessageRetrievalMimeFormat	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MimeTextFormat	The *MessageRetrievalMimeFormat* parameter specifies the format of the messages retrieved from the server. The default value is `BestBodyFormat`. You can specify the value for this parameter by using a numerical value or text string. The possible values are: • 0 or `TextOnly` • 1 or `HtmlOnly` • 2 or `HtmlAndTextAlternative` • 3 or `TextEnrichedOnly` • 4 or `TextEnrichedAndTextAlternative` • 5 or `BestBodyFormat` • 6 or `Tnef`
MessageRetrievalSortOrder	Optional	Microsoft.Exchange.Data.SortOrder	The *MessageRetrievalSortOrder* parameter specifies the order in which the retrieved messages are sorted. This value can be either 0 (Ascending) or 1 (Descending). The default value is `Ascending`.
OwaServerUrl	Optional	System.Uri	The *OwaServerUrl* parameter specifies the Client Access server from which to retrieve calendar

			information for instances of custom Microsoft Office Outlook Web App calendar items.
PreAuthenticatedConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *PreAuthenticatedConnectionTimeout* parameter specifies the time to wait before closing an idle connection that isn't authenticated. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Valid input for this parameter is `00:00:30` to `1:00:00`.The default value is `00:1:00` or one minute.
ProtocolLogEnabled	Optional	System.Boolean	The *ProtocolLogEnabled* parameter specifies whether to enable protocol logging. The default setting is `$false`. For more information, see Configure protocol logging for POP3 and IMAP4.
ProxyTargetPort	Optional	System.Int32	The *ProxyTargetPort* parameter specifies the

			port on the Exchange Server 2003 back-end server to which the Microsoft Exchange POP3 service on a Client Access server relays commands. The default port is `9955`.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies an individual Client Access server in your organization for which you're specifying POP3 settings.
SSLBindings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SSLBindings* parameter specifies whether the command sets the IP address and port number to use for an SSL session. This is a multivalued property. Enter a value using the format: <*IP address*>:<*Port number*>. The default value is `0.0.0.0:995`.
SuppressReadReceipt	Optional	System.Boolean	The *SuppressReadReceipt* parameter specifies whether to stop duplicate read receipts from being sent to POP3 senders that are using the **Send read**

			receipts for messages I send option in their POP3 email program. By default, this option is set to `$false`. By default, POP3 senders that use the **Send read receipts for messages I send** option receive a read receipt in both of the following circumstances: • When messages they send are downloaded by the recipient. • When the recipient opens the message. The valid values and descriptions for this parameter are: • `$false` POP3 users are sent a read receipt each time a recipient downloads a message. POP3 users are also sent a read receipt when the user opens the message. • `$true` POP3 users that use the **Send read receipts for messages I send** option in their email client programs only receive a read receipt when the recipient opens the message.

UnencryptedOrTLSBindings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnencryptedOrTLSBindings* parameter specifies the IP address and port number for communication over the TLS–encrypted connection or the connection that isn't encrypted. This is a multivalued property. Enter a value using the format: <*IP address*>:<*Port number*>. The default value is `0.0.0.0:110`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
X509CertificateName	Optional	System.String	The *X509CertificateName* parameter specifies the host name in the SSL certificate from the **Associated Subject** field.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-PowerShellConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-28*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-PowerShellConnectivity** cmdlet to test whether Windows PowerShell remoting on the target Client Access server is functioning correctly.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-PowerShellConnectivity -ConnectionUri <Uri> -TestCredential
<PSCredential> <COMMON PARAMETERS>

Test-PowerShellConnectivity [-ClientAccessServer <ServerIdParameter>] [-
TestType <Internal | External>] [-VirtualDirectoryName <String>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Authentication <Default | Basic | Negotiate |
NegotiateWithImplicitCredential | Credssp | Digest | Kerberos>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-MailboxServer
<ServerIdParameter>] [-MonitoringContext <SwitchParameter>] [-
ResetTestAccountCredentials <SwitchParameter>] [-TrustAnySSLCertificate
<SwitchParameter>] [-UserType <LEGACY | EDU | BPOS>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the PowerShell (Default Web Site) virtual directory on the CAS2 server. The *TrustAnySSLCertificate* switch is used to skip the certificate check during connection. You might need to use the New-TestCasConnectivityUser.ps1 script to create a test user that the command can use

to test the Windows PowerShell virtual directory.

```
Test-PowerShellConnectivity -ClientAccessServer CAS2 -
VirtualDirectoryName "PowerShell (Default Web Site)" -
TrustAnySSLCertificate
```

EXAMPLE 2

This example tests the remote Windows PowerShell virtual directory at the URI https://contoso.com/powershell. Because the SSL certificate should be valid, the *TrustAnySSLCertificate* switch isn't used. The remote server uses Basic authentication so the *Authentication* parameter is used with a value of `Basic`.

Before running the test, the credentials to be used to connect to the remote Windows PowerShell virtual directory need to be retrieved. The following command retrieves the credentials from the person running the test using the **Get-Credential** cmdlet and stores them in the *$UserCredentials* variable.

```
$UserCredentials = Get-Credential
```

The test is then run using the **Test-PowerShellConnectivity** cmdlet with the options previously described.

```
Test-PowerShellConnectivity -ConnectionUri https://
contoso.com/powershell -TestCredential $UserCredentials -
Authentication Basic
```

Detailed Description

The **Test-PowerShellConnectivity** cmdlet connects to a Client Access server to test whether Windows PowerShell remoting on that server is working correctly and whether the Client Access server can perform commands against a remote Mailbox server.

When you run the **Test-PowerShellConnectivity** cmdlet, you must specify either the fully qualified domain name (FQDN) of the Client Access server to connect to by using the *ClientAccessServer* parameter, or the Uniform Resource Identifier (URI) of a Client Access server by using the *ConnectionUri* parameter. You can't use both the *ClientAccessServer* and *ConnectionUri* parameters in the same command.

The first time you use the **Test-PowerShellConnectivity** cmdlet with the *ClientAccessServer* parameter, you might be required to create a test user. To create a test user, use the New-TestCasConnectivityUser.ps1 script.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "PowerShell virtual directories" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ConnectionUri	Required	System.Uri	The *ConnectionUri* parameter specifies the URI of the Client Access server to test, for example, https://contoso.com/powershell. If the *ClientAccessServer* parameter is specified, you can't use the *ConnectionUri* parameter.
TestCredential	Required	System.Management.Automation.PSCredential	The *TestCredential* parameter specifies the credentials to use when connecting to the Client Access server. This parameter can only be used when the *ConnectionUri* parameter is specified. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.

Authentication	Optional	System.Management.Automation.Runspaces.AuthenticationMechanism	The *Authentication* parameter specifies the type of authentication to use when establishing a connection. You can use one of the following values: • `Default` • `Basic` • `Negotiate` • `NegotiateWithImplicitCredential` • `Credssp` • `Digest` • `Kerberos` **Note:** The `NegotiateWithImplicitCredential` value has been deprecated and is no longer used.
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *ClientAccessServer* parameter specifies the name of the Client Access server to test. If the *ConnectionUri* parameter is specified, you can't use the *ClientAccessServer* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
MailboxServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server to test. If not specified, all Mailbox servers in the local Active Directory site are tested.
MonitoringContext	Optional	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 -

			Operations Manager.
ResetTestAccountCredentials	Optional	System.Management.Automation.SwitchParameter	The *ResetTestAccountCredentials* switch resets the password for the test account that's used to run this command. The password for the test account is typically reset every seven days. Use this switch to force a password reset any time it's required for security reasons.
TestType	Optional	Microsoft.Exchange.Monitoring.OwaConnectivityTestType	The *TestType* parameter specifies whether the command should test the internal or external URL of a virtual directory. This parameter can only be used with the *ClientAccessServer* parameter. The valid values are `Internal` and `External`. The default value is `Internal`.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* parameter specifies whether Secure Sockets Layer (SSL) certificate

			validation failures are reported. This parameter instructs the command to check Windows PowerShell connectivity without generating an error when the certificate doesn't match the URL of the Client Access server.
UserType	Optional	Microsoft.Exchange.Monitoring.DatacenterUserType	This parameter is reserved for internal Microsoft use.
VirtualDirectoryName	Optional	System.String	The *VirtualDirectoryName* parameter specifies the virtual directory on the Client Access server to test. The *VirtualDirectoryName* parameter can only be used with the *ClientAccessServer* parameter. If the *VirtualDirectoryName* parameter isn't specified, all virtual directories on the Client Access server are tested.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PowerShellVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-PowerShellVirtualDirectory** cmdlet to view an existing virtual directory in Internet Information Services (IIS).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PowerShellVirtualDirectory -Server <ServerIdParameter> <COMMON
PARAMETERS>

Get-PowerShellVirtualDirectory [-Identity <VirtualDirectoryIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves a list of all the Windows PowerShell virtual directories and uses the **Format-Table** cmdlet to display only the *Name* property and any properties that begin with `Internal`. For more information about the **Format-Table** cmdlet, see Working with command output.

```
Get-PowerShellVirtualDirectory | Format-Table Name,
Internal* -Wrap
```

EXAMPLE 2

This example retrieves a list of all the Windows PowerShell virtual directories that exist on the server Server01.

```
Get-PowerShellVirtualDirectory -Server Server01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "PowerShell virtual directories" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies which server to query when returning a list of Windows PowerShell virtual directories. You can't use the *Server* parameter with the *Identity* parameter.
ADPropertiesOnly	Optional	System.Management.A	The *ADPropertiesOnly*

		utomation.SwitchParameter	switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name of the Windows PowerShell virtual directory to retrieve. If the virtual directory contains spaces, enclose the name in quotation marks ("). You can't use the *Identity* parameter with the *Server* parameter.
ShowBackEndVirtualDirectories	Optional	System.Management.Automation.SwitchPara	This parameter is reserved for internal

		meter	Microsoft use.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch instructs the command to return the Windows PowerShell virtual directories that are located on servers running the Mailbox server role. This switch should only be used with the direction of Microsoft Support.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-PowerShellVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-PowerShellVirtualDirectory** cmdlet to create a Windows PowerShell virtual directory in Internet Information Services (IIS).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-PowerShellVirtualDirectory -Name <String> [-AppPoolId <String>] [-
BasicAuthentication <$true | $false>] [-CertificateAuthentication <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
ExternalUrl <Uri>] [-InternalUrl <Uri>] [-LimitMaximumMemory <$true |
$false>] [-Path <String>] [-RequireSSL <$true | $false>] [-Role
<ClientAccess | Mailbox>] [-Server <ServerIdParameter>] [-WebSiteName
<String>] [-WhatIf [<SwitchParameter>]] [-WindowsAuthentication <$true |
$false>]
```

Examples

EXAMPLE 1

This example creates a Windows PowerShell virtual directory and configures it to accept only certificate authentication.

```
New-PowerShellVirtualDirectory -Name "Contoso Certificates
Required" -BasicAuthentication $false -
WindowsAuthentication $false -CertificateAuthentication
$true
```

Detailed Description

Although it's possible to create a Windows PowerShell virtual directory, we recommend that you only do so at the request of Microsoft Customer Service and Support.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "PowerShell virtual directories" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the new Windows PowerShell virtual directory. The name you provide will have the name of the website it's created under

			appended to it. If the name you provide contains spaces, enclose the name in quotation marks (").
AppPoolId	Optional	System.String	The *AppPoolId* parameter specifies the pool of programs that can be used with the Windows PowerShell virtual directory.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies whether Basic authentication is enabled on the Windows PowerShell virtual directory. The valid values are `$true` and `$false`. The default value is `$true`.
CertificateAuthentication	Optional	System.Boolean	The *CertificateAuthentication* parameter specifies whether certificate authentication is enabled on the Windows PowerShell virtual directory. The valid values are `$true` and `$false`. The default value is `$false`.
Confirm	Optional	System.Management.	The *Confirm* switch

		Automation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the external URL that the Windows PowerShell virtual directory points to.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the internal URL that the Windows PowerShell virtual directory points to.
LimitMaximumMemory	Optional	System.Boolean	The *LimitMaximumMemory* parameter specifies whether to limit the

			amount of memory used by the application pool in the Windows PowerShell virtual directory. If this parameter is set to `$true`, the amount of memory made available to the application pool is limited to 70 percent of the total physical memory in the server. If this parameter is set to `$false`, the amount of memory isn't limited. The default value is `$false`.
Path	Optional	System.String	The *Path* parameter specifies the directory that contains the system files for the Windows PowerShell virtual directory.
RequireSSL	Optional	System.Boolean	The *RequireSSL* parameter specifies whether the Windows PowerShell virtual directory should require that the client connection be made using Secure Sockets Layer (SSL). The valid values are `$true` and `$false`. The default value is `$true`.

Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter species the configuration that should be used when the virtual directory is created. The following are the values that can be used with this parameter: • `FrontEnd` Configure the virtual directory for use on a Client Access server. • `BackEnd` Configure the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server name on which the new Windows PowerShell virtual directory should be created.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the name of the IIS website under which the Windows PowerShell virtual directory is created.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur

			without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is enabled on the Windows PowerShell virtual directory. The valid values are `$true` and `$false`. The default value is `$true`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-PowerShellVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-PowerShellVirtualDirectory** cmdlet to remove an existing Windows PowerShell

virtual directory from Internet Information Services (IIS).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-PowerShellVirtualDirectory -Identity <VirtualDirectoryIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a Windows PowerShell virtual directory without confirmation.

Caution:
Be careful when using the **Remove-PowerShellVirtualDirectory** cmdlet without confirmation. You won't be prompted before the virtual directory is deleted.

```
Remove-PowerShellVirtualDirectory "Internal (Default Web
Site)" -Confirm:$False
```

Detailed Description

Although it's possible to remove a Windows PowerShell virtual directory, we recommend that you only do so at the request of Microsoft Customer Service and Support.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "PowerShell virtual directories" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the Windows PowerShell virtual directory to remove. If the name contains spaces, enclose the name in quotation marks (").

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PowerShellVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-PowerShellVirtualDirectory** cmdlet to change an existing Windows PowerShell virtual directory in Internet Information Services (IIS).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PowerShellVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
BasicAuthentication <$true | $false>] [-CertificateAuthentication <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
EnableCertificateHeaderAuthModule <$true | $false>] [-
EnableDelegatedAuthModule <$true | $false>] [-
EnableSessionKeyRedirectionModule <$true | $false>] [-ExternalUrl <Uri>]
[-InternalUrl <Uri>] [-LiveIdBasicAuthentication <$true | $false>] [-
LiveIdNegotiateAuthentication <$true | $false>] [-RequireSSL <$true |
$false>] [-WhatIf [<SwitchParameter>]] [-WindowsAuthentication <$true |
$false>]
```

Examples

EXAMPLE 1

This example modifies the external URL of the Contoso Windows PowerShell virtual directory.

```
Set-PowerShellVirtualDirectory "Contoso (default Web site)"
-ExternalUrl "http://www.contoso.com/powershell"
```

Detailed Description

Although it's possible to modify a Windows PowerShell virtual directory, we recommend that you only do so at the request of Microsoft Customer Service and Support.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "PowerShell virtual directories" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name of the Windows PowerShell virtual directory that you want to modify.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies whether Basic authentication is enabled on the Windows PowerShell virtual directory. The valid values are `$true` and `$false`. The default value is `$true`.
CertificateAuthentication	Optional	System.Boolean	The *CertificateAuthentication* parameter specifies whether certificate authentication is enabled on the

			Windows PowerShell virtual directory. The valid values are `$true` and `$false`. The default value is `$false`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EnableCertificateHeaderAuthModule	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
EnableDelegatedAuthModule	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.

EnableSessionKeyRedirectionModule	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the external URL that the Windows PowerShell virtual directory points to.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the internal URL that the Windows PowerShell virtual directory points to.
LiveIdBasicAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LiveIdNegotiateAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RequireSSL	Optional	System.Boolean	The *RequireSSL* parameter specifies whether the Windows PowerShell virtual directory should require that the client connection be made using Secure Sockets Layer (SSL). The valid values are `$true` and

			`$false`. The default value is `$true`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is enabled on the Windows PowerShell virtual directory. The valid values are `$true` and `$false`. The default value is `$true`.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-PushNotificationProxy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-PushNotificationProxy** cmdlet to disable the push notification proxy that's configured between an on-premises Microsoft Exchange organization and a Microsoft Office 365 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-PushNotificationProxy [-BackOffTimeInSeconds <Int32>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
Enabled <$true | $false>] [-ExchangeMaximumVersion <Version>] [-
ExchangeMinimumVersion <Version>] [-NumberOfChannels <Int32>] [-QueueSize
<Int32>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example disables the push notification proxy in the on-premises Exchange organization.

```
Disable-PushNotificationProxy
```

Detailed Description

The push notification proxy relays event notifications (for example, new email or calendar updates) for on-premises mailboxes through Office 365 to OWA for Devices on the user's device.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Push notification proxy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
BackOffTimeInSeconds	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DisplayName	Optional	System.String	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge

			Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ExchangeMaximumVersion	Optional	System.Version	This parameter is reserved for internal Microsoft use.
ExchangeMinimumVersion	Optional	System.Version	This parameter is reserved for internal Microsoft use.
NumberOfChannels	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
QueueSize	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-PushNotificationProxy

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-PushNotificationProxy** cmdlet to enable a push notification proxy between an on-premises Microsoft Exchange organization and a Microsoft Office 365 organization.

Important:
In order for event notifications to be successfully delivered, you also need to configure OAuth authentication between your on-premises Exchange organization and your Office 365 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-PushNotificationProxy [-BackOffTimeInSeconds <Int32>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
Enabled <$true | $false>] [-ExchangeMaximumVersion <Version>] [-
ExchangeMinimumVersion <Version>] [-NumberOfChannels <Int32>] [-
Organization <String>] [-QueueSize <Int32>] [-Uri <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example displays the status of the push notification proxy in the on-premises Exchange organization.

```
Enable-PushNotificationProxy -WhatIf
```

Example 2

This example enables the push notification proxy in the on-premises Exchange organization by using the Office 365 organization contoso.com.

```
Enable-PushNotificationProxy -Organization contoso.com
```

Detailed Description

The push notification proxy relays event notifications (for example, new email or calendar updates) for on-premises mailboxes through Office 365 to OWA for Devices on the user's device.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Push notification proxy settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
BackOffTimeInSeconds	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing

			continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ExchangeMaximumVersion	Optional	System.Version	This parameter is reserved for internal Microsoft use.

ExchangeMinimumVersion	Optional	System.Version	This parameter is reserved for internal Microsoft use.
NumberOfChannels	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
Organization	Optional	System.String	The *Organization* parameter specifies the domain name of the Office 365 organization. For example, `contoso.com`.
QueueSize	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
Uri	Optional	System.String	The *Uri* parameter specifies the push notification service endpoint in Office 365. The default value is `https://outlook.office365.com/PushNotifications`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RpcClientAccess

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-RpcClientAccess** cmdlet to display the settings for the Exchange RPC Client Access service that's running on a Microsoft Exchange server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RpcClientAccess [-DomainController <Fqdn>] [-Server
<ServerIdParameter>]
```

Examples

EXAMPLE 1

This example displays the parameters and values for the Exchange server ENT01 that's running the Exchange RPC Client Access service.

```
Get-RpcClientAccess -Server ENT01
```

Detailed Description

The **Get-RpcClientAccess** cmdlet returns the Exchange RPC Client Access service configuration for Exchange servers. Information can be returned only about servers located in the Exchange organization from which the cmdlet is run.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "RPC Client Access settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RpcClientAccess

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-RpcClientAccess** cmdlet to manage the settings for the Exchange RPC Client Access service that's running on a Microsoft Exchange Server 2010 Client Access server.

```
Set-RpcClientAccess -Server <ServerIdParameter> [-BlockedClientVersions
<String>] [-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
EncryptionRequired <$true | $false>] [-MaximumConnections <Int32>] [-Name
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example restricts clients that aren't running Office Outlook 2007 from connecting to the Client Access server CAS01.

Important:
The values used with the *BlockedClientVersions* parameter are examples. You can determine the correct client software versions by parsing the RPC Client Access log files located at `%ExchangeInstallPath%Logging\RPC Client Access`.

```
Set-RpcClientAccess -Server CAS01 -BlockedClientVersions
"0.0.0-5.6535.6535;7.0.0;8.02.4-11.6535.6535"
```

Detailed Description

You can run the **Set-RpcClientAccess** cmdlet for a single Client Access server that has the Exchange RPC Client Access service installed or for all Exchange Client Access servers that have the Exchange RPC Client Access service installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "RPC Client Access settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Client Access server.
BlockedClientVersions	Optional	System.String	The *BlockedClientVersions* parameter specifies which versions of Microsoft Outlook are restricted from connecting. The Exchange RPC Client Access service rejects Outlook connections if versions are in the range specified. This setting affects MAPI and Outlook Anywhere client connections. The value must be less than 256 characters in length. Versions should be single numbers in the format *X.Y.Z* where *X* is a major version number, *Y* is the minor revision number, and *Z* specifies the build, and ranges should be delimited by semicolons (for example, 0.0.0-5.9.9;

			7.0.0-65535.65535.65535). For more information, see Configure Outlook client blocking.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EncryptionRequired	Optional	System.Boolean	The *EncryptionRequired* parameter specifies whether to require Outlook connections to be encrypted. The Exchange RPC Client Access service rejects unencrypted Outlook

			connections if this parameter is set to `$true`.
MaximumConnections	Optional	System.Int32	The *MaximumConnections* parameter specifies the maximum number of concurrent connections allowed. The Exchange RPC Client Access service reads and limits connections based on this property. This parameter has a range from 1 through 65535. **Note:** Although you can configure a non-default value for this parameter, changes to this setting aren't enforced in this version of Exchange.
Name	Optional	System.String	The *Name* parameter specifies the name of the configuration object in Active Directory. By default, this parameter is set to RpcClientAccess.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SmimeConfig

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-SmimeConfig** cmdlet to view the S/MIME configuration for Microsoft Outlook Web App.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-SmimeConfig [-Identity <OrganizationIdParameter>] [-DomainController
<Fqdn>]
```

Examples

Example 1

This example shows the S/MIME configuration that used with Outlook Web App.

```
Get-SmimeConfig
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "S/MIME configuration" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance

			of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-SmimeConfig

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-SmimeConfig** cmdlet to modify the S/MIME configuration for Microsoft Outlook Web App.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-SmimeConfig [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Name <String>] [-
OWAAllowUserChoiceOfSigningCertificate <$true | $false>] [-
OWAAlwaysEncrypt <$true | $false>] [-OWAAlwaysSign <$true | $false>] [-
OWABCCEncryptedEmailForking <UInt32>] [-OWACheckCRLOnSend <$true |
$false>] [-OWAClearSign <$true | $false>] [-OWACopyRecipientHeaders <$true
| $false>] [-OWACRLConnectionTimeout <UInt32>] [-OWACRLRetrievalTimeout
<UInt32>] [-OWADisableCRLCheck <$true | $false>] [-OWADLExpansionTimeout
<UInt32>] [-OWAEncryptionAlgorithms <String>] [-OWAEncryptTemporaryBuffers
<$true | $false>] [-OWAForceSMIMEClientUpgrade <$true | $false>] [-
```

```
OWAIncludeCertificateChainAndRootCertificate <$true | $false>] [-
OWAIncludeCertificateChainWithoutRootCertificate <$true | $false>] [-
OWAIncludeSMIMECapabilitiesInMessage <$true | $false>] [-
OWAOnlyUseSmartCard <$true | $false>] [-
OWASenderCertificateAttributesToDisplay <String>] [-
OWASignedEmailCertificateInclusion <$true | $false>] [-
OWASigningAlgorithms <String>] [-OWATripleWrapSignedEncryptedMail <$true |
$false>] [-OWAUseKeyIdentifier <$true | $false>] [-
OWAUseSecondaryProxiesWhenFindingCertificates <$true | $false>] [-
SMIMECertificateIssuingCA <Byte[]>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example sets the S/MIME configuration to allow users the choice of signing the message, limits the Certificate Revocation List (CRL) retrieval time-out to 10 seconds, and specifies the 128 bit RC2 encryption algorithm.

```
Set-SmimeConfig -OWAAllowUserChoiceOfSigningCertificate
$true -OWACRLRetrievalTimeout 10000 -
OWAEncryptionAlgorithms 6602:128
```

Detailed Description

⚠Warning:

The **Set-SmimeConfig** cmdlet can change several important parameters than can reduce the overall level of message security. Review your organization's security policy before you make any changes.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "S/MIME configuration" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is reserved for internal Microsoft use.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	This parameter is reserved for internal Microsoft use.
OWAAllowUserChoiceOfSigningCertificate	Optional	System.Boolean	The *OWAAllowUserChoiceOfSigningCertificate* parameter specifies whether to allow users to select the certificate to use when they digitally sign email messages in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
OWAAlwaysEncrypt	Optional	System.Boolean	The *OWAAlwaysEncrypt* parameter specifies whether all outgoing messages are automatically encrypted in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default

			value is `$false`.
OWAAlwaysSign	Optional	System.Boolean	The *OWAAlwaysSign* parameter specifies whether all outgoing messages are automatically signed in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
OWABCCEncryptedEmailForking	Optional	System.UInt32	The *OWABCCEncryptedEmailForking* parameter specifies how Bcc messages are encrypted in Outlook Web App. This parameter uses the following values: • 0 = One encrypted message per Bcc recipient. • 1 = One single encrypted message for all Bcc recipients. • 2 = One encrypted message without Bcc forking. The default value is 0. **Note:** This setting affects the

			security and privacy of Outlook Web App. Consult your organization's security policy before you change this setting.
OWACheckCRLOnSend	Optional	System.Boolean	The *OWACheckCRLOnSend* parameter specifies how the certificate revocation list (CRL) check is enforced when an email message is sent in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When this parameter is set to `$false` and the CRL distribution point is inaccessible, Outlook Web App allows signed or encrypted messages to be sent. When this parameter is set to `$true`, Outlook Web App displays a warning dialog box and prevents signed or encrypted messages from being sent.

OWAClearSign	Optional	System.Boolean	The *OWAClearSign* parameter specifies how email messages are signed in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default is `$true`. When this parameter is set to `$true`, digitally signed messages are clear-signed. When this parameter is set to `$false`, digitally signed messages are opaque-signed. Clear-signed messages are larger than opaque-signed messages, but clear-signed messages can be read in most email clients, including clients that don't support S/MIME.
OWACopyRecipientHeaders	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
OWACRLConnectionTimeout	Optional	System.UInt32	The *OWACRLConnectionTimeout* parameter specifies the time in

			milliseconds that Outlook Web App waits while connecting to retrieve a single CRL as part of a certificate validation operation. Valid input for this parameter is an integer between 0 and 4294967295 (`UInt32`). The default value is 60000 (60 seconds). When multiple CRLs in a certificate chain must be retrieved, the time limit that's specified by this parameter applies to each connection. For example, if a certificate requires the retrieval of three CRLs, and this parameter is set to 60000 (60 seconds), each individual CRL retrieval operation has a time limit of 60 seconds. If any one of the CRLs isn't retrieved before the time limit expires, the entire operation fails. The total time limit for all

			the retrievals is controlled by the *OWACRLRetrievalTimeout* parameter.
OWACRLRetrievalTimeout	Optional	System.UInt32	The *OWACRLRetrievalTimeout* parameter specifies the time in milliseconds that Outlook Web App waits to retrieve all CRLs when validating a certificate. Valid input for this parameter is an integer between 0 and 4294967295 (`UInt32`). The default value is 10000 (10 seconds). If all the required CRLs are not retrieved before the time limit expires, the operation fails. Suppose the retrieval of three CRLs is required, the *OWACRLConnectionTimeout* value is set to 60000 (60 seconds), and the *OWACRLRetrievalTimeout* is set to 120000 (2 minutes). In this

			example, if any individual CRL retrieval takes more than 60 seconds, the operation fails. Also, if all the CRL retrievals together take more than 120 seconds, the operation fails.
OWADisableCRLCheck	Optional	System.Boolean	The *OWADisableCRLCheck* parameter enables or disables CRL checking in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When set to `$true`, this parameter disables CRL checks when validating certificates. Disabling CRL checking can decrease the time that's required to validate the signatures of signed email messages, but it also validates email messages signed with revoked certificates.
OWADLExpansionTimeout	Optional	System.UInt32	The *OWADLExpansionTime*

			out parameter specifies the time in milliseconds that Outlook Web App waits when sending encrypted messages to members of a distribution group that requires expansion. Valid input for this parameter is an integer between 0 and 4294967295 (`UInt32`). The default value is 60000 (60 seconds). If the operation doesn't complete in the time specified by this parameter, the operation fails and the message is not sent. When sending an encrypted message to a distribution group, Exchange expands the distribution group to retrieve the encryption certificate of each recipient. While the distribution group is being expanded, the sender receives no response from Outlook Web App.

			The timeout value that's specified by this parameter is applied to the expansion of each distribution group. For example, if an encrypted message is sent to three distribution group, and the value of this parameter is 60000 (60 seconds), the entire operation can take no more than 180 seconds.
OWAEncryptionAlgorithms	Optional	System.String	The *OWAEncryptionAlgorithms* parameter specifies a list of algorithms that are used by Outlook Web App to encrypt messages. Valid input for this parameter is a semicolon-separated list of symmetric encryption algorithm identifiers. When you use an algorithm that supports multiple key lengths, you need to

			specify the key length. Note that RC2 is the only supported algorithm that that offers multiple key lengths. You can specify the object identifier (OID) of the cryptographic service provider (CSP) when using third-party CSPs. An OID must be specified together with an algorithm ID. Outlook Web App needs an algorithm ID so that it can infer how the algorithm should be used. For example, to provide a custom replacement for the 3DES algorithm, you would specify the algorithm ID of 3DES (6603) and the custom OID of the replacement algorithm by using the value `6603,<OID>`. The encryption algorithms, key length values, and algorithm IDs that you can use with this parameter are

			described in the following list: • RC2 algorithm ID `6602` (supported key lengths are 40, 56, 64, and 128) • DES (56-bit) algorithm ID `6601` • 3DES (168-bit) algorithm ID `6603` • AES128 algorithm ID `660E` • AES192 algorithm ID `660F` • AES256 algorithm ID `6610` This parameter uses the following syntax: `{Algorithm ID} |` For example, to set the encryption algorithms to 3DES, RC2-128, RC2-64, DES, and RC2-56, use the following value: `6603;6602:128;6602:64;6601;6602:56`. The algorithm specified by *OWAEncryptionAlgorithms* is always used. If the parameter is not

			specified or is not formatted correctly, Outlook Web App uses the default value `6610` (AES256). If the encryption algorithm or minimum key length is not available on a client, Outlook Web App does not allow encryption.
OWAEncryptTemporaryBuffers	Optional	System.Boolean	The *OWAEncryptTemporaryBuffers* parameter specifies whether the Outlook Web App client-side temporary message storage buffers are encrypted. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. By default, all client-side temporary buffers that store message data are encrypted using an ephemeral key and the 3DES algorithm. Setting this parameter to `$false` disables temporary

			buffer encryption. **Note:** Disabling encryption of the buffers can increase performance of the Outlook Web App client but also leaves information unencrypted in the client's buffer. Consult your organization's security policy before you disable this feature.
OWAForceSMIMEClient Upgrade	Optional	System.Boolean	The *OWAForceSMIMEClient Upgrade* parameter specifies whether or not users are forced to upgrade an S/MIME control that's older than their current version in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default is `$true`. If the parameter is set to `$true`, users need to download and install the new control before they can use S/MIME. If this parameter is set to `$false`, users receive a

			warning if the S/MIME control on their computer is not current, but they can still use S/MIME without updating the control.
OWAIncludeCertificateChainAndRootCertificate	Optional	System.Boolean	The *OWAIncludeCertificateChainAndRootCertificate* parameter specifies whether the certificate chains and root certificates of the signing or encryption certificates are included in the message in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default value is `$false`.
OWAIncludeCertificateChainWithoutRootCertificate	Optional	System.Boolean	The *OWAIncludeCertificateChainWithoutRootCertificate* parameter specifies whether the certificate chains of the signing or encryption certificates are included in messages in Outlook Web App.

			Valid input for this parameter is `$true` or `$false`. The default is `$false`. By default, Outlook Web App includes only the signing and encrypting certificates, not their corresponding certificate chains. When this parameter is set to `$true`, signed or encrypted messages include the full certificate chain, but not the root certificate.
OWAIncludeSMIMECapabilitiesInMessage	Optional	System.Boolean	The *OWAIncludeSMIMECapabilitiesInMessage* parameter specifies whether signed and encrypted messages in Outlook Web App include attributes that describe the supported encryption and signing algorithms. Valid input for this parameter is `$true` or `$false`. The default is `$false`. Enabling this option

			increases the size of messages, but may make it easier for some email clients to interact with encrypted messages in Outlook Web App.
OWAOnlyUseSmartCard	Optional	System.Boolean	The *OWAOnlyUseSmartCard* parameter specifies whether smartcard-based certificates are required for Outlook Web App message signing and decryption. Valid input for this parameter is `$true` or `$false`. The default is `$false` When this parameter is set to `$true`, the use of smartcard-based certificates for signing and decryption is required when you use Outlook Web App and the S/MIME control.
OWASenderCertificateAttributesToDisplay	Optional	System.String	The *OWASenderCertificateAttributesToDisplay* parameter controls which certificate

			attributes are displayed when signature verification proceeds despite a mismatch between the sender's email address and the email address in sender's certificate. The parameter accepts a comma-separated list of object identifiers (OIDs). This setting is blank (`$null`) by default.
OWASignedEmailCertificateInclusion	Optional	System.Boolean	The *OWASignedEmailCertificateInclusion* parameter specifies whether the sender's encryption certificate is excluded from a signed email message in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default is `$true`. By default, Outlook Web App and the S/MIME control include both signing and encrypting certificates

			with signed email messages. When this parameter is set to `$false`, the size of encrypted messages is reduced. However, recipients don't have access to the sender's encryption certificate in the message. Recipients need to retrieve the certificate from a directory, or from the sender.
OWASigningAlgorithms	Optional	System.String	The *OWASigningAlgorithms* parameter specifies the list of signing algorithms that are used by Outlook Web App to sign messages with the S/MIME control. Valid input for this parameter is a semicolon-separated list of symmetric encryption algorithm identifiers. You can specify the object identifier (OID) of the cryptographic

			service provider (CSP) when using third-party CSPs. An OID must be specified together with an algorithm ID. Outlook Web App needs an algorithm ID so that it can infer how the algorithm should be used. For example, to provide a custom replacement for the SHA1 algorithm, you would specify the algorithm ID of SHA1 (8804) and the custom OID of the replacement algorithm by using the value 8804,<OID>. This parameter supports the following algorithms. • **CALG_SHA_512** Type: 512 bit secure hashing algorithm (SHA). Algorithm ID: 800E. • **CALG_SHA_384** Type: 384 bit SHA. Algorithm ID: 800D. • **CALG_SHA_256** Type: 256 bit SHA. Algorithm ID: 800C.

			• **SHA1** Type: SHA. Algorithm ID: 8004. • **CALG_MD5** Type: MD5 hashing algorithm. Algorithm ID: 8003. This parameter uses the following syntax: {Algorithm ID} | For example, to set the signing algorithms to CALG_SHA_512, SHA1, and CALG_MD5, use the value 800E;8004;8003. The algorithm specified by *OWASigningAlgorithms* is always used. If this parameter is not specified or is not formatted correctly, Outlook Web App defaults to 8004 (SHA1).
OWATripleWrapSignedEncryptedMail	Optional	System.Boolean	The *OWATripleWrapSignedEncryptedMail* parameter specifies whether signed and encrypted email messages in Outlook

			Web App are triple-wrapped. Valid input for this parameter is `$true` or `$false`. The default is `$true`. A *triple-wrapped* message is a signed message that is encrypted, and then the encrypted message is signed (signed-encrypted-signed). When this parameter is set to `$false`, the signed message is encrypted only (there is no additional signing of the encrypted message). Triple-wrapped messages offer the highest level of security for messages under the S/MIME standard, but are larger in size.
OWAUseKeyIdentifier	Optional	System.Boolean	The *OWAUseKeyIdentifier* parameter specifies whether a certificate's key identifier is used to encode the

			asymmetrically encrypted token in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default is `$false`. By default, Outlook Web App encodes the asymmetrically encrypted token (sometimes called a lockbox) that's required to decrypt the rest of the message by indicating the issuer and serial number of each recipient's certificate. The issuer and serial number can then be used to locate the certificate and private key for decrypting the message. This parameter causes the use of a certificate's key identifier when encoding the asymmetrically encrypted token. Because a key pair can

			be reused in new certificates, using the key identifier for encrypted email messages means that users need to keep only the most recent certificate and associated private key, rather than all old certificates. Because some email clients do not support finding certificates with a key identifier, Outlook Web App uses the issuer and serial number of each recipient's certificate by default.
OWAUseSecondaryProxiesWhenFindingCertificates	Optional	System.Boolean	The *OWAUseSecondaryProxiesWhenFindingCertificates* parameter specifies whether alternative proxies are used during the certificate search in Outlook Web App. Valid input for this parameter is `$true` or `$false`. The default is `$true`.

			Outlook Web App attempts to find the correct certificate for a recipient when sending encrypted messages. The certificate subject or subject alternative name values can each contain an email address. Because a recipient can have multiple proxy addresses, the certificate's subject or subject alternative name values may not match the recipient's primary SMTP address. When this parameter is set to `$true`, and the certificate subject or subject alternative name values do not match the recipient's primary SMTP address, Outlook Web App tries to match the certificate's subject to one of the recipient's proxy addresses.
SMIMECertificateIssuingCA	Optional	System.Byte[]	The *SMIMECertificateIssuingCA* parameter specifies

			the serialized certificate store (SST) that contains the Certificate Authority (CA) signing and intermediate certificate information. You need to read the file to a byte-encoded object using the **Get-Content** cmdlet. For example: `-SMIMECertificateIssuingCA $([byte[]](Get-Content -Encoding byte -Path "C:\Temp\CACertificateSerializedStore.sst" -ReadCount 0)` Each certificate is checked, and if any certificates are expired, the operation will fail.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf*

			switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Clear-TextMessagingAccount

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Clear-TextMessagingAccount** cmdlet to remove the text messaging settings from a user's account.

```
Clear-TextMessagingAccount -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example clears the text messaging account settings and notification settings from Tony Smith's mailbox.

```
Clear-TextMessagingAccount -Identity "TonySmith"
```

EXAMPLE 2

This example clears the text messaging account settings and notification settings from Tony Smith's mailbox and displays a confirmation message.

```
Clear-TextMessagingAccount -Identity "Contoso\TonySmith" -
Confirm $true
```

EXAMPLE 3

This example clears the text messaging account settings and notification settings from Tony Smith's mailbox.

```
Clear-TextMessagingAccount -Identity "tony@contoso.com"
```

Detailed Description

The **Clear-TextMessagingAccount** cmdlet clears all of a user's text messaging settings, including communication and notification settings.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Text messaging settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the target mailbox. You can use one of the following values: • CommonName • DisplayName • FirstName • LastName • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the

			DomainController parameter. The command uses an appropriate global catalog server automatically.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-TextMessagingAccount

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-TextMessagingAccount** cmdlet to return a user's Short Message Service (SMS) settings.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-TextMessagingAccount -Identity <MailboxIdParameter> [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>]
```

Examples

EXAMPLE 1

This example returns the text messaging settings for Tony Smith's mailbox using his alias.

```
Get-TextMessagingAccount -Identity "TonySmith" -
DomainController server.contoso.com
```

EXAMPLE 2

This example returns the text messaging settings for Tony Smith's mailbox using his domain and username.

```
Get-TextMessagingAccount -Identity "contoso\tonysmith" -
DomainController DC1.contoso.com
```

EXAMPLE 3

This example returns the text messaging settings for Tony Smith's mailbox using his email address.

```
Get-TextMessagingAccount -Identity "tony@contoso.com" -
DomainController gc.contoso.com
```

Detailed Description

The **Get-TextMessagingAccount** cmdlet displays the SMS settings for a specific user. These settings include whether Microsoft Exchange ActiveSync is enabled, the user's country or region ID, mobile operator ID, service provider ID, and notification phone number.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Text

messaging settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the identity of the mailbox.
Credential	Optional	System.Management.Automation.PSCredential	This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies whether the cmdlet returns data from the domain controller.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the amount of data returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-TextMessagingAccount

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-TextMessagingAccount** cmdlet to configure text messaging notification settings for a user.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-TextMessagingAccount -Identity <MailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-CountryRegionId <RegionInfo>] [-DomainController
<Fqdn>] [-IgnoreDefaultScope <SwitchParameter>] [-MobileOperatorId
<Int32>] [-NotificationPhoneNumber <E164Number>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets the notification phone number for the text messaging account for Jeff Hay.

```
Set-TextMessagingAccount -Identity 'JeffHay' -
NotificationPhoneNumber 4255550100
```

EXAMPLE 2

This example sets the region, mobile operator, and notification phone number for the text messaging account for Jeff Hay.

```
Set-TextMessagingAccount -Identity 'JeffHay' -
CountryRegionId US -MobileOperatorId 15001 -
NotificationPhoneNumber +14255550199
```

Detailed Description

The **Set-TextMessagingAccount** cmdlet configures a user's account for text messaging notifications. You can configure several settings, including the mobile phone number and country or region ID.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Text messaging settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox identity.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CountryRegionId	Optional	System.Globalization.RegionInfo	The *CountryRegionId* parameter specifies the country or region in

			which the user's mobile operator resides.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter isn't yet implemented.
MobileOperatorId	Optional	System.Int32	The *MobileOperatorId* parameter specifies the mobile operator ID for the user.
NotificationPhoneNumber	Optional	Microsoft.Exchange.Data.Storage.Management.E164Number	The *NotificationPhoneNumber* parameter specifies the phone number to use for notifications.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Compare-TextMessagingVerificationCode

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Compare-TextMessagingVerificationCode** cmdlet to verify the text messaging verification code that the user specified.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Compare-TextMessagingVerificationCode -VerificationCode <String> [-
```

```
Identity <MailboxIdParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example compares the verification code 111555 to the code sent to Tony Smith's mobile phone.

```
Compare-TextMessagingVerificationCode -Identity TonySmith -
VerificationCode 111555
```

EXAMPLE 2

This example compares the verification code 123456 to the code sent to Tony Smith's mobile phone.

```
Compare-TextMessagingVerificationCode -Identity
tony@contoso.com -VerificationCode 123456
```

EXAMPLE 3

This example compares the verification code 111555 to the code sent to Tony Smith's mobile phone after confirmation is given.

```
Compare-TextMessagingVerificationCode -Identity TonySmith -
VerificationCode 111555 -Confirm $true
```

Detailed Description

The **Compare-TextMessagingVerificationCode** cmdlet returns true if the code matches the stored code generated by the **Send-TextMessagingVerificationCode** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Text messaging settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
VerificationCode	Required	System.String	The *VerificationCode* parameter contains the

			verification code that the user specified.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox ID for the user.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Send-TextMessagingVerificationCode

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-14*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Send-TextMessagingVerificationCode** cmdlet to send a text messaging verification code to the user's mobile phone.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Send-TextMessagingVerificationCode [-Identity <MailboxIdParameter>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sends the text messaging verification code to Tony Smith's mobile phone.

```
Send-TextMessagingVerificationCode -Identity "TonySmith"
```

EXAMPLE 2

This example sends the text messaging verification code to Tony Smith's mobile phone after confirmation is given.

```
Send-TextMessagingVerificationCode -Identity "TonySmith" -
Confirm $true
```

EXAMPLE 3

This example sends the text messaging verification code to Tony Smith's mobile phone.

```
Send-TextMessagingVerificationCode -Identity
"tony@contoso.com"
```

Detailed Description

The **Send-TextMessagingVerificationCode** cmdlet generates a verification code and sends it to a user's mobile phone.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Text messaging settings" entry in the Clients and mobile devices permissions topic.

Caution:
This cmdlet returns an error if the user requests a verification code more than three times within a 24-hour period.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox ID for the user.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-WebServicesConnectivity

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-19*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-WebServicesConnectivity** cmdlet to perform basic operations to verify the functionality of Exchange Web Services on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-WebServicesConnectivity -MonitoringContext <SwitchParameter> <COMMON
PARAMETERS>

Test-WebServicesConnectivity [-ClientAccessServer
<ClientAccessServerIdParameter>] <COMMON PARAMETERS>

Test-WebServicesConnectivity -AutoDiscoverServer
<ClientAccessServerIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-Identity
<MailboxIdParameter>] [-LightMode <SwitchParameter>] [-MailboxCredential
<PSCredential>] [-TrustAnySSLCertificate <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the connection to Exchange Web Services on the Client Access server named CAS01. The test account that was created by running the **New-TestCasConnectivityUser.ps1** script is used.

```
Test-WebServicesConnectivity -ClientAccessServer CAS01
```

Detailed Description

To use most of the features of this cmdlet, you need to create a test user by running the following command.

```
& $env:ExchangeInstallPath\Scripts\New-
TestCasConnectivityUser.ps1
```

The **Test-WebServicesConnectivity** results are displayed on-screen. The cmdlet returns the following information.

- **Source** Source server.
- **ServiceEndpoint** Destination server.
- **Scenario** The operations that are tested. Values are `Autodiscover: SOAP Provider` and `EWS: GetFolder` or `EWS: ConvertID`.
- **Result** The values returned are typically `Success` or `*FAILURE*`.
- **Latency (MS)** The time required to complete the test in milliseconds

You can write the results to a file by piping the output to **ConvertTo-Html** or **ConvertTo-Csv** and adding "> <filename>" to the command. For example:

```
Test-WebServicesConnectivity -ClientAccessServer CAS01 |
ConvertTo-Html > "C:\My Documents\EWS Test.html"
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Test Exchange Web Services" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
AutoDiscoverServer	Required	Microsoft.Exchange.Co	The *AutoDiscoverServer*

		nfiguration.Tasks.ClientAccessServerIdParameter	parameter specifies the Client Access server to use to test Autodiscover connectivity. You can use any value that uniquely identifies the server. For example: • Name Example: Exchange01 • Distinguished name (DN) Example: `CN=Exchange01,CN=Servers,CN=Exchange Administrative Group (FYDIBOHF23SPDLT),CN=Administrative Groups,CN=First Organization,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=contoso,DC=com` • Exchange Legacy DN Example: `/o=First Organization/ou=Exchange Administrative Group (FYDIBOHF23SPDLT)/cn=Configuration/cn=Servers/cn=Exchange01` • GUID Example: `bc014a0d-1509-4ecc-b569-f077eec54942`
MonitoringContext	Required	System.Management.Automation.SwitchParameter	The *MonitoringContext* switch includes the associated monitoring events and performance counters in the results. You don't need to specify

			a value with this switch. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
ClientAccessServer	Optional	Microsoft.Exchange.Configuration.Tasks.ClientAccessServerIdParameter	The *ClientAccessServer* parameter specifies the Client Access server to use when the command is run. You can use any value that uniquely identifies the server. For example: • Name Example: Exchange01 • Distinguished name (DN) Example: `CN=Exchange01,CN=Servers,CN=Exchange Administrative Group (FYDIBOHF23SPDLT),CN=Administrative Groups,CN=First Organization,CN=Microsoft Exchange,CN=Services,CN=Configuration,DC=contoso,DC=com` • Exchange Legacy DN Example: `/o=First Organization/ou=Exchange Administrative Group`

			`(FYDIBOHF23SPDLT)/cn=Configuration/cn=Servers/cn=Exchange01` • GUID Example: `bc014a0d-1509-4ecc-b569-f077eec54942`
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the mailbox to use for the test. When you use this parameter, you also need to use the *MailboxCredential* parameter. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example:

			CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
LightMode	Optional	System.Management.Automation.SwitchParameter	The *LightMode* switch instructs the command to perform only a subset of the connectivity tests. When you use this parameter, the `EWS: ConvertId` operation is tested instead of the `EWS: GetFolder` operation.
MailboxCredential	Optional	System.Management.Automation.PSCredential	The *MailboxCredential* parameter specifies the mailbox credentials to use

			when the command is run. This parameter is required when you use the *Identity* parameter. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
TrustAnySSLCertificate	Optional	System.Management.Automation.SwitchParameter	The *TrustAnySSLCertificate* switch allows the test to use any SSL certificate that's available.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-WebServicesVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-WebServicesVirtualDirectory** cmdlet to retrieve information in Active Directory for the Exchange Web Services virtual directory from a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-WebServicesVirtualDirectory -Server <ServerIdParameter> <COMMON
PARAMETERS>

Get-WebServicesVirtualDirectory [-Identity <VirtualDirectoryIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns the settings for the Exchange Web Services virtual directory EWS under the default website in IIS.

```
Get-WebServicesVirtualDirectory -Identity "EWS (Default Web
Site)"
```

EXAMPLE 2

This example uses the *Identity* parameter to retrieve all settings for the Exchange Web Services virtual directories on the server CAS01.

```
Get-WebServicesVirtualDirectory -Identity CAS01
```

Detailed Description

The **Get-WebServicesVirtualDirectory** cmdlet can be run on a local server or run remotely if the server name is specified in the *Identity* or *Server* parameters. It can also be run without parameters to retrieve the configuration settings from all Microsoft Office Outlook Web App virtual directories on all Internet Information Services (IIS) websites located on the Client Access servers in the organization.

The **Get-WebServicesVirtualDirectory** cmdlet can be run on any server that has the Exchange administration tools installed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Web Services virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name or GUID of the server that hosts the virtual directories that you want to display.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the

			Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the GUID of the server, the name of the website, or the name of the virtual directory that you want to display.
ShowBackendVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch specifies whether the virtual directories on the Mailbox servers within the organization are shown.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-WebServicesVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-WebServicesVirtualDirectory** cmdlet to create an Exchange Web Services virtual directory on a server running Microsoft Exchange Server 2013.

You can use this cmdlet to create multiple virtual directories. However, you can create only one Exchange Web Services virtual directory organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-WebServicesVirtualDirectory [-ApplicationRoot <String>] [-AppPoolId
<String>] [-AppPoolIdForManagement <String>] [-BasicAuthentication <$true
| $false>] [-Confirm [<SwitchParameter>]] [-DigestAuthentication <$true |
$false>] [-DomainController <Fqdn>] [-ExtendedProtectionFlags
<MultiValuedProperty>] [-ExtendedProtectionSPNList <MultiValuedProperty>]
[-ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-Force <SwitchParameter>] [-GzipLevel <Off | Low | High | Error>]
[-InternalNLBBypassUrl <Uri>] [-InternalUrl <Uri>] [-MRSProxyEnabled
<$true | $false>] [-OAuthAuthentication <$true | $false>] [-Path <String>]
[-Role <ClientAccess | Mailbox>] [-Server <ServerIdParameter>] [-
WebSiteName <String>] [-WhatIf [<SwitchParameter>]] [-
WindowsAuthentication <$true | $false>] [-WSSecurityAuthentication <$true
| $false>]
```

Examples

EXAMPLE 1

This example creates a virtual directory under the non-default website www.contoso.com. It also sets the external URL to https://www.contoso.com/webservices.aspx.

```
New-WebServicesVirtualDirectory -WebSiteName
"www.contoso.com" -ExternalUrl "https://www.contoso.com/
```

```
webservices.aspx"
```

Detailed Description

You can create multiple virtual directories by using this cmdlet. However, you can only create one Exchange Web Services virtual directory for each website.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Web Services virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationRoot	Optional	System.String	The *ApplicationRoot* parameter sets the metabase path of the virtual directory. By default, this path is the same as the website in which the virtual directory is created.
AppPoolId	Optional	System.String	The *AppPoolId* parameter sets the pool of programs that can be used with the virtual directory.
AppPoolIdForManagement	Optional	System.String	The *AppPoolIdForManagement* parameter specifies the pool of programs that manages the virtual directory.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies

			whether Basic authentication is enabled on the Exchange Web Services virtual directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DigestAuthentication	Optional	System.Boolean	The *DigestAuthentication* parameter specifies whether Digest authentication is enabled on the virtual directory.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you

			use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the

			ExtendedProtectionSPNList parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default

			value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN` value. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't

			enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication.

			Note: If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one

			or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the host name used to connect to the Exchange server from outside the firewall. This setting is also important when Secure Sockets Layer (SSL) is used.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress the warning or confirmation messages that appear during specific configuration changes.
GzipLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.GzipLevel	The *GzipLevel* parameter sets Gzip configuration information for the Exchange Web Services virtual directory. This parameter can be set to the following values: • `Off` This value results in no compression. • `Low` This value results in static compression only. Don't use this setting for Exchange Web Services because Exchange Web Services content is dynamic. You'll get a warning if

			you set the *GzipLevel* parameter to this value. If you use this setting, it behaves the same as the `Off` setting. • `High` This value results in static and dynamic compression. Content from Exchange Web Services is compressed if clients have indicated support for Gzip compression in their requests. • `Error` This value identifies errors in the Gzip compression configuration.
InternalNLBBypassUrl	Optional	System.Uri	The *InternalNLBBypassUrl* parameter specifies the URL of the Client Access server, regardless of whether it's behind a Network Load Balancing (NLB) array. Although the *InternalUrl* parameter is set to the URL of the NLB array, the *InternalNLBBypassUrl* parameter should always be set to the URL of the Client Access server.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the host name of the Exchange server for a connection from inside the firewall. This setting is

			also important when SSL is used.
MRSProxyEnabled	Optional	System.Boolean	The *MRSProxyEnabled* parameter specifies whether to enable MRSProxy for the Client Access server. MRSProxy is a service that runs on Client Access servers in a remote forest and helps to proxy a mailbox move. For more information, see Mailbox moves in Exchange 2013.
OAuthAuthentication	Optional	System.Boolean	The *OAuthAuthentication* parameter specifies whether OAuth authentication is enabled.
Path	Optional	System.String	The *Path* parameter sets the path of the virtual directory in the metabase.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter specifies the configuration that should be used when the virtual directory is created. The following are the values that can be used with this parameter: • `FrontEnd` Configures the virtual directory for use on a Client Access server.

			• `BackEnd` Configures the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to create the virtual directory. You can use any value that uniquely identifies the server, for example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the virtual directory is created on the server where the Remote PowerShell session is established This will always be a Mailbox server. If you want to create the virtual directory on a Client Access server or another Mailbox server, you must use the *Server* parameter.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the name of the website under which to create the

			virtual directory. This parameter shouldn't be used when you're creating a virtual directory under the default website.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is permitted on the new Exchange Web Services virtual directory.
WSSecurityAuthentication	Optional	System.Boolean	The *WSSecurityAuthentication* parameter specifies whether Web Services Security authentication is enabled on the Exchange

			Web Services virtual directory. This parameter can be used with the *BasicAuthentication*, *DigestAuthentication*, and *WindowsAuthentication* parameters.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-WebServicesVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-WebServicesVirtualDirectory** cmdlet to remove an existing virtual directory from a computer running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-WebServicesVirtualDirectory -Identity <VirtualDirectoryIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the virtual directory Sales from the server CAS01.

```
Remove-WebServicesVirtualDirectory -Identity CAS01\Sales
```

Detailed Description

You can remove the default Exchange Web Services virtual directory or another Exchange Web Services virtual directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Web Services virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies a virtual directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to force the command to execute without asking for user confirmation. If set to `$true`, this parameter forces the command to execute without asking for user confirmation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-WebServicesVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Client Access cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-10*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-WebServicesVirtualDirectory** cmdlet to modify an existing Exchange Web Services virtual directory on a server running Microsoft Exchange Server 2013.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-WebServicesVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
BasicAuthentication <$true | $false>] [-CertificateAuthentication <$true |
$false>] [-Confirm [<SwitchParameter>]] [-DigestAuthentication <$true |
$false>] [-DomainController <Fqdn>] [-ExtendedProtectionFlags
<MultiValuedProperty>] [-ExtendedProtectionSPNList <MultiValuedProperty>]
[-ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-Force <SwitchParameter>] [-GzipLevel <Off | Low | High | Error>]
[-InternalNLBBypassUrl <Uri>] [-InternalUrl <Uri>] [-
LiveIdBasicAuthentication <$true | $false>] [-
LiveIdNegotiateAuthentication <$true | $false>] [-MRSProxyEnabled <$true |
$false>] [-OAuthAuthentication <$true | $false>] [-WhatIf
[<SwitchParameter>]] [-WindowsAuthentication <$true | $false>] [-
WSSecurityAuthentication <$true | $false>]
```

Examples

EXAMPLE 1

This example sets the authentication method to Basic authentication for the virtual directory EWS on the server Contoso. This example also sets the external and internal URLs for this virtual directory.

```
Set-WebServicesVirtualDirectory -Identity Contoso
\EWS(Default Web Site)-ExternalUrl https://www.contoso.com/
EWS/exchange.asmx -BasicAuthentication $true -InternalUrl
https://contoso.internal.com/EWS/exchange.asmx
```

EXAMPLE 2

This example uses a wildcard character instead of "Default Web site" as was used in Example 1.

```
Set-WebServicesVirtualDirectory -Identity Contoso\EWS* -
ExternalUrl https://www.contoso.com/EWS/exchange.asmx
```

EXAMPLE 3

This example enables MRSProxy on the EWS default website. MRSProxy is the service responsible for assisting in remote mailbox moves.

```
Set-WebServicesVirtualDirectory -Identity "EWS (Default Web
Site)" -MRSProxyEnabled $true
```

Detailed Description

If you have a load balanced set of Client Access servers, you need to specify the name of each Client Access server when you run the command.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Exchange Web Services virtual directory settings" entry in the Clients and mobile devices permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the name of the virtual directory. You can also specify a wildcard character instead of the default website.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies whether Basic authentication is enabled on the Exchange Web Services virtual directory. This parameter can be used with the

			DigestAuthentication, *WindowsAuthentication*, and *WSSecurityAuthentication* parameters.
CertificateAuthentication	Optional	System.Boolean	The *CertificateAuthentication* parameter specifies whether certificate authentication is enabled. This parameter affects the <*Servername*>/ews/management/ virtual directory. It doesn't affect the <*Servername*>/ews/ virtual directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DigestAuthentication	Optional	System.Boolean	The *DigestAuthentication* parameter specifies whether Digest authentication is enabled on the virtual directory.

			This parameter can be used with the *BasicAuthentication*, *WindowsAuthentication*, and *WSSecurityAuthentication* parameters.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy

			mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN

			list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionToke*

			nChecking parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is <*protocol*>/<*FQDN*>. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for

			Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and

			Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the host name used to connect to the Exchange server from outside the firewall. This setting is also important when Secure Sockets Layer (SSL) is used.
Force	Optional	System.Management.Automation.SwitchPar	The *Force* switch specifies whether to suppress the

		ameter	warning or confirmation messages that appear during specific configuration changes.
GzipLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.GzipLevel	The *GzipLevel* parameter sets Gzip configuration information for the Exchange Web Services virtual directory. This parameter can be set to the following values: • `Off` This value results in no compression. • `Low` This value results in static compression only. Don't use this setting for Exchange Web Services because Exchange Web Services content is dynamic. You get a warning if you set the *GzipLevel* parameter to this value. If you use this setting, it behaves the same as the `Off` setting. • `High` This value results in static and dynamic compression. Content from Exchange Web Services is compressed if clients have indicated support for Gzip compression in their requests. • `Error` This value identifies errors in the Gzip compression configuration.

InternalNLBBypassUrl	Optional	System.Uri	The *InternalNLBBypassUrl* parameter specifies the URL of the Client Access server, regardless of whether it's behind a Network Load Balancing (NLB) array. Although the *InternalUrl* parameter is set to the URL of the NLB array, the *InternalNLBBypassUrl* parameter should always be set to the URL of the Client Access server.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the host name of the Exchange server for a connection from inside the firewall. This setting is also important when SSL is used.
LiveIdBasicAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LiveIdNegotiateAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
MRSProxyEnabled	Optional	System.Boolean	The *MRSProxyEnabled* parameter specifies whether to enable MRSProxy for the Client Access server. MRSProxy is a service that runs on

			Client Access servers in a remote forest and helps to proxy a mailbox move.
OAuthAuthentication	Optional	System.Boolean	The *OAuthAuthentication* parameter specifies whether OAuth authentication is enabled.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is permitted on the Exchange Web Services virtual directory. This parameter can be used with the *BasicAuthentication*, *DigestAuthentication*, and

			WSSecurityAuthentication parameters.
WSSecurityAuthentication	Optional	System.Boolean	The *WSSecurityAuthentication* parameter specifies whether Web Services Security authentication is enabled on the Exchange Web Services virtual directory. This parameter can be used with *BasicAuthentication*, *DigestAuthentication*, and *WindowsAuthentication* parameters.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-CmdletExtensionAgent

Exchange Management Shell > Exchange 2013 cmdlets > Cmdlet extension agent cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-CmdletExtensionAgent** cmdlet on a server running Microsoft Exchange Server 2013 to disable an existing cmdlet extension agent.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-CmdletExtensionAgent -Identity <CmdletExtensionAgentIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables a specific cmdlet extension agent.

```
Disable-CmdletExtensionAgent "Scripting Agent"
```

Detailed Description

Run the **Disable-CmdletExtensionAgent** cmdlet on an Exchange 2013 server to disable an existing cmdlet extension agent. When you disable a cmdlet extension agent, the agent is disabled for the entire organization. When an agent is disabled, it's not made available to cmdlets. Cmdlets can no longer use the agent to perform additional operations.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Cmdlet extension agents" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.CmdletExtensionAgentIdParameter	The *Identity* parameter specifies the name of the cmdlet extension agent to disable. If the name contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-CmdletExtensionAgent

Exchange Management Shell > Exchange 2013 cmdlets > Cmdlet extension agent cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-CmdletExtensionAgent** cmdlet on a server running Microsoft Exchange Server 2013 to enable a cmdlet extension agent.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-CmdletExtensionAgent -Identity <CmdletExtensionAgentIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the Scripting Agent cmdlet extension agent. Before you enable the Scripting Agent, you need to make sure that you've first deployed the ScriptingAgentConfig.xml configuration file to all the servers in your organization. If you don't deploy the configuration file first and you enable the Scripting Agent, all non-**Get** cmdlets fail when they're run.

```
Enable-CmdletExtensionAgent "Scripting Agent"
```

Detailed Description

When you enable a cmdlet extension agent, the agent is run on every Exchange 2013 server in the organization. When an agent is enabled, it's made available to cmdlets that can then use the agent to perform additional operations.

Caution:
Before you enable agents, be sure that you're aware of how the agent works and what impact the agent will have on your organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Cmdlet extension agents" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.CmdletExtensionAgentIdParameter	The *Identity* parameter specifies the name of the cmdlet extension agent to enable. If the name contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do

			before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-CmdletExtensionAgent

Exchange Management Shell > Exchange 2013 cmdlets > Cmdlet extension agent cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-CmdletExtensionAgent** cmdlet on a server running Microsoft Exchange Server 2013 to display a list of cmdlet extension agents in the organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-CmdletExtensionAgent [-Assembly <String>] [-Enabled <$true | $false>]
<COMMON PARAMETERS>

Get-CmdletExtensionAgent [-Identity <CmdletExtensionAgentIdParameter>]
<COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays the details about a specific cmdlet extension agent.

```
Get-CmdletExtensionAgent "Mailbox Permissions Agent"
```

EXAMPLE 2

This example displays a list of all the cmdlet extension agents in the organization. The **Name**, **Enabled**, and **Priority** properties of each agent are displayed in a table. This is done by piping the results of the **Get-CmdletExtensionAgent** cmdlet to the **Format-Table** cmdlet.

For more information about pipelining and the **Format-Table** cmdlet, see the following topics:

- Pipelining
- Working with command output

```
Get-CmdletExtensionAgent | Format-Table Name, Enabled,
Priority
```

Detailed Description

Run the **Get-CmdletExtensionAgent** cmdlet on an Exchange 2013 server to display a list of cmdlet extension agents in the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Cmdlet extension agents" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Assembly	Optional	System.String	The *Assembly* parameter specifies that only the agents that match the assembly name provided should be listed.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the cmdlet should return a list of enabled agents only, or a list of disabled agents only. Valid values are `$true`

			and `$false`.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.CmdletExtensionAgentIdParameter	The *Identity* parameter specifies the name of the cmdlet extension agent to view. If the name contains spaces, enclose the name in quotation marks (").

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-CmdletExtensionAgent

Exchange Management Shell > Exchange 2013 cmdlets > Cmdlet extension agent cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-CmdletExtensionAgent** cmdlet on a server running Microsoft Exchange Server 2013 to modify a cmdlet extension agent.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-CmdletExtensionAgent -Identity <CmdletExtensionAgentIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-IsSystem <$true
| $false>] [-Name <String>] [-Priority <Byte>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the priority of the fictitious "Validation Agent" cmdlet extension agent to 9.

```
Set-CmdletExtensionAgent "Validation Agent" -Priority 9
```

Detailed Description

The changes applied to an agent are applied to every Exchange 2013 server in the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Cmdlet extension agents" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.CmdletExtensionAgentIdParameter	The *Identity* parameter specifies the name of the cmdlet extension agent to modify. If the name contains spaces, enclose the name in quotation marks (").
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IsSystem	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Name	Optional	System.String	The *Name* parameter specifies the name of the cmdlet extension agent. The maximum length of the agent name is 64 characters. If the name contains spaces, enclose the name in quotation marks (").
Priority	Optional	System.Byte	The *Priority* parameter specifies where in the priority order of the cmdlet extension agent list the agent should be placed. The priority must be between 0 and the maximum number of agents. Agents with a priority closest to 0

			have a higher priority and are run first.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AddressBookPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-12*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AddressBookPolicy** cmdlet to return address book policies that match the specified conditions.

```
Get-AddressBookPolicy [-Identity <MailboxPolicyIdParameter>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns detailed information about all address book policies in your organization by pipelining the **Format-List** cmdlet.

```
Get-AddressBookPolicy | Format-List
```

EXAMPLE 2

This example returns default information about the address book policy All Fabrikam

```
Get-AddressBookPolicy -Identity "All Fabrikam"
```

EXAMPLE 3

This example returns information about all address book policies for which the offline address book (OAB) that the address book policy uses is named Fabrikam All OAB.

```
Get-AddressBookPolicy | where {$_.OfflineAddressBook eq
"\Fabrikam All OAB"}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address book policies" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identity of the address book policy.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AddressBookPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-AddressBookPolicy** cmdlet to create an address book policy. Address book policies define the global address list (GAL), offline address book (OAB), room list, and address lists that will be displayed to mailbox users who are assigned the policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-AddressBookPolicy -AddressLists <AddressListIdParameter[]> -
GlobalAddressList <GlobalAddressListIdParameter> -Name <String> -
OfflineAddressBook <OfflineAddressBookIdParameter> -RoomList
<AddressListIdParameter> [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an address book policy with the following settings:

- Name: All Fabrikam ABP
- Included address lists: All Fabrikam, All Fabrikam Mailboxes, All Fabrikam DLs, All Fabrikam Contacts
- Included room list: All Fabrikam-Rooms
- Included OAB: Fabrikam-All-OAB
- Included GAL: All Fabrikam

```
New-AddressBookPolicy -Name "All Fabrikam ABP" -
AddressLists "\All Fabrikam","\All Fabrikam
Mailboxes","\All Fabrikam DLs","\All Fabrikam Contacts" -
RoomList "\All Fabrikam-Rooms" -OfflineAddressBook
"\Fabrikam-All-OAB" -GlobalAddressList "\All Fabrikam"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address book policies" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
AddressLists	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter[]	The *AddressLists* parameter specifies the address lists that will be used by mailbox users who are assigned this address book policy. This parameter

			accepts multiple values, which should be separated by a comma. For example, `"\Mr. Munson's Class","Mrs. McKay's Class","Mrs. Count's Class"`.
GlobalAddressList	Required	Microsoft.Exchange.Configuration.Tasks.GlobalAddressListIdParameter	The *GlobalAddressList* parameter specifies the identity of the GAL that will be used by mailbox users who are assigned this address book policy. You can specify only one GAL for each address book policy.
Name	Required	System.String	The *Name* parameter specifies the name of the address book policy.
OfflineAddressBook	Required	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *OfflineAddressBook* parameter specifies the identity of the OAB that will be used by mailbox users who are assigned this address book policy. You can specify only one OAB for each address book policy.
RoomList	Required	Microsoft.Exchange.Co	The *RoomList*

		nfiguration.Tasks.AddressListIdParameter	parameter specifies the room address list that will be used by mailbox users who are assigned this address book policy. You can specify only one room list for each address book policy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft

			use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AddressBookPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-AddressBookPolicy** cmdlet to delete an address book policy. You can't remove

the address book policy if it's still assigned to a user's mailbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-AddressBookPolicy -Identity <MailboxPolicyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the address book policy Murchison's Class.

```
Remove-AddressBookPolicy -Identity "Murchison's Class"
```

Detailed Description

You can't delete an address book policy if it's assigned to a user. To determine if an address book policy is assigned to a user, run the following command:

```
Get-Mailbox | where $._AddressBookPolicy -eq "Murchison's
Class"}
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address book policies" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identity of the address book policy that you want to remove.
Confirm	Optional	System.Management.A	The *Confirm* switch can

		utomation.SwitchParameter	be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AddressBookPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-09*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AddressBookPolicy** cmdlet to change the settings of an address book policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AddressBookPolicy -Identity <MailboxPolicyIdParameter> [-AddressLists
<AddressListIdParameter[]>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-GlobalAddressList
<GlobalAddressListIdParameter>] [-Name <String>] [-OfflineAddressBook
<OfflineAddressBookIdParameter>] [-RoomList <AddressListIdParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the OAB that the address book policy All Fabrikam ABP uses to Fabrikam-OAB-2.

```
Set-AddressBookPolicy -Identity "All Fabrikam ABP" -
OfflineAddressBook \Fabrikam-OAB-2 -GlobalAddressList "\All
Fabrikam GAL"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address book policies" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxPolicyIdParameter	The *Identity* parameter specifies the identity of the address book policy that you want to modify.
AddressLists	Optional	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter[]	The *AddressLists* parameter specifies the address lists that will be used by mailbox users who are assigned this address book policy. This parameter accepts multiple values, which should be separated by a comma.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -

			`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
GlobalAddressList	Optional	Microsoft.Exchange.Configuration.Tasks.GlobalAddressListIdParameter	The *GlobalAddressList* parameter specifies the identity of the global address list (GAL) that will be used by mailbox users who are assigned this address book policy. You can specify only one GAL for each address book policy.
Name	Optional	System.String	The *Name* parameter specifies the name that you want this address book policy to be called. Use this parameter to change the name of the address book policy.
OfflineAddressBook	Optional	Microsoft.Exchange.Configuration.Tasks.Offlin	The *OfflineAddressBook*

		eAddressBookIdParameter	parameter specifies the identity of the offline address book (OAB) that will be used by mailbox users who are assigned this address book policy. You can specify only one OAB for each address book policy.
RoomList	Optional	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *RoomList* parameter specifies the name of the room address list.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-AddressList** cmdlet to retrieve all attributes of an address list.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-AddressList -Container <AddressListIdParameter> <COMMON PARAMETERS>

Get-AddressList [-SearchText <String>] <COMMON PARAMETERS>

Get-AddressList [-Identity <AddressListIdParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the attributes of all the address lists under the All Address Lists container.

```
Get-AddressList
```

EXAMPLE 2

This example retrieves the attributes of the address list building4, located under the All Users\Sales\ address list, using the domain controller DomainController01.

```
Get-AddressList -Identity "All Users\Sales\building4" -
DomainController DomainController01
```

Detailed Description

You can pipe the output from the **Get-AddressList** cmdlet to the **Remove-AddressList**, **Set-AddressList**, **Update-Addresslist**, and **Move-AddressList** cmdlets instead of using the *Identity* parameter with each of those cmdlets.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Container	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Container* parameter specifies the identity of the parent address list of the address list or lists that you want to view. If no parent address list is specified, the command gets all address lists under the root All Address Lists.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or address list name that represents a specific address list. You can also include the path using the format *Path\AddressListName*. You can omit the parameter label so that only the address list name or GUID is supplied.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter specifies the organization in which you'll perform this action. This parameter doesn't accept wildcard characters, and you must use the exact name of the organization.
SearchText	Optional	System.String	The *SearchText* parameter specifies that you can search the names of all organizational units (OUs) in your organization for the

			specified string. Only the OUs that match the string you specify are returned. If the string you specify contains spaces, enclose it in quotation marks ("). This parameter can't be used with the Identity parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Move-AddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Move-AddressList** cmdlet to move an existing address list to a new container under the root address list.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Move-AddressList -Identity <AddressListIdParameter> -Target
<AddressListIdParameter> [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example moves the address list with GUID c3fffd8e-026b-41b9-88c4-8c21697ac8ac to a new location under the parent address list \All Users\Sales\building4.

```
Move-AddressList -Identity c3fffd8e-026b-41b9-88c4-
8c21697ac8ac -Target "\All Users\Sales\building4"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or address list name that represents a specific address list. You can also include the path by using the format *Path**AddressListName*. You can omit the parameter label so that only the address list

			name or GUID is supplied.
Target	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Target* parameter specifies the path to the parent address list where you want to move this address list.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-AddressList** cmdlet to create an address list and apply it to recipients.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-AddressList [-RecipientFilter <String>] <COMMON PARAMETERS>

New-AddressList [-ConditionalCompany <MultiValuedProperty>] [-
ConditionalCustomAttribute1 <MultiValuedProperty>] [-
ConditionalCustomAttribute10 <MultiValuedProperty>] [-
ConditionalCustomAttribute11 <MultiValuedProperty>] [-
ConditionalCustomAttribute12 <MultiValuedProperty>] [-
ConditionalCustomAttribute13 <MultiValuedProperty>] [-
ConditionalCustomAttribute14 <MultiValuedProperty>] [-
ConditionalCustomAttribute15 <MultiValuedProperty>] [-
ConditionalCustomAttribute2 <MultiValuedProperty>] [-
```

```
ConditionalCustomAttribute3 <MultiValuedProperty>] [-
ConditionalCustomAttribute4 <MultiValuedProperty>] [-
ConditionalCustomAttribute5 <MultiValuedProperty>] [-
ConditionalCustomAttribute6 <MultiValuedProperty>] [-
ConditionalCustomAttribute7 <MultiValuedProperty>] [-
ConditionalCustomAttribute8 <MultiValuedProperty>] [-
ConditionalCustomAttribute9 <MultiValuedProperty>] [-ConditionalDepartment
<MultiValuedProperty>] [-ConditionalStateOrProvince <MultiValuedProperty>]
[-IncludedRecipients <None | MailboxUsers | Resources | MailContacts |
MailGroups | MailUsers | AllRecipients>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
Container <AddressListIdParameter>] [-DisplayName <String>] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
RecipientContainer <OrganizationalUnitIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the address list MyAddressList. The address list includes recipients that are mailbox users and have the **StateOrProvince** property set to Washington or Oregon.

```
New-AddressList -Name MyAddressList -RecipientFilter
{((RecipientType -eq 'MailboxUser') -and ((StateOrProvince
-eq 'Washington') -or (StateOrProvince -eq 'Oregon')))}
```

EXAMPLE 2

This example creates the address list MyAddressList2 that includes mailboxes that have the *ConditionalStateOrProvince* parameter set to Washington.

```
New-AddressList -Name MyAddressList2 -
ConditionalStateOrProvince Washington -IncludedRecipients
MailboxUsers
```

EXAMPLE 3

This example creates the address list AL_AgencyB that includes mailboxes that have the value of the *CustomAttribute15* parameter contains AgencyB.

```
New-AddressList -Name "AL_AgencyB" -RecipientFilter
{((RecipientType -eq 'MailboxUser') -and (CustomAttribute15
-like *AgencyB*))}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name for the new address list. The name can't exceed 64 characters, and it can't include a carriage return or a backslash (\).
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter is a filter to specify a company. All recipients with a company attribute that matches the value that you input for this parameter are included in the address list. You can use multiple values as a comma-delimited list. You can't use this parameter if you use the *RecipientFilter* parameter. You must use either the *RecipientFilter* parameter or one of these filter parameters: • *ConditionalCompany*

			• *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients*
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the

			ConditionalCustomAttribute1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.

ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is

			`Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribu*

			te15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a

			Conditional parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the

			ConditionalCustomAttribute1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.

ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is

			`Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribu*

			te15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter is a filter to specify a department. All recipients with a department attribute that matches the value that you input for this parameter are included in the address list. You can use multiple values as a comma-delimited list. You can't use this parameter if you use the *RecipientFilter* parameter. You must use either the *RecipientFilter* parameter or one of these

			filter parameters: • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients*
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter is a filter to specify a state or province. All recipients with a *ConditionalStateOrProvince* attribute that matches the value that you input for this parameter are included in the address list. You can use multiple values as a comma-delimited list. You can't use this parameter if you use the *RecipientFilter* parameter. You must use either the *RecipientFilter* parameter or one of these filter parameters: • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients*
Confirm	Optional	System.Management.Automation.SwitchPar	The *Confirm* switch causes the command to

		ameter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Container	Optional	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Container* parameter specifies the identity of the parent address list where this new address list is created. If no parent address list is specified, the address list is created under the root All Address Lists.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name of the address list. If no display name is provided, the name of the address list is also the display name.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
IncludedRecipients	Optional	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter is a filter to specify the type of recipient to include in the address list. You can use one or more of the following types: • `None` • `MailboxUsers` • `MailUsers` • `Resources` • `MailGroups` • `MailContacts` • `AllRecipients` You can't use this parameter if you use the *RecipientFilter* parameter. You must use either the *RecipientFilter* parameter or one of these filter parameters: • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients*
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the dynamic distribution

			group based on their location in Active Directory. The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If a value for *RecipientContainer* isn't specified, the default search filter is the location of the dynamic distribution group in Active Directory.
RecipientFilter	Optional	System.String	The *RecipientFilter* parameter specifies a filter for recipients to include in the address list. You can't use this parameter if you use any of the following filter parameters: • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients* You must use either this parameter or one of the preceding filter parameters.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-AddressList** cmdlet to remove an existing address list.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-AddressList -Identity <AddressListIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Recursive
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the address list Address_List_1 and all of its child address lists.

```
Remove-AddressList -Identity "Address_List_1" -Recursive
```

Detailed Description

The **Remove-AddressList** cmdlet can be used in conjunction with the **Get-AddressList** cmdlet as follows:

- Use the **Get-AddressList** cmdlet to get address list information, and then pipe the output to the **Format-List** cmdlet to get the GUID, distinguished name (DN), or path and name of an existing address list.
- Use the **Get-AddressList** cmdlet to get a specific existing address list, and then pipe the output directly to the **Remove-AddressList** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or address list name that represents a specific address list. You can also include the path by using the format *Path\AddressListName*.

			You can omit the parameter label so that only the address list name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Recursive	Optional	System.Management.Automation.SwitchParameter	The *Recursive* switch specifies whether the command removes all child address lists of the address list specified by the *Identity* parameter. If you don't

			specify this parameter and the address list to remove has child address lists, the command fails.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AddressList

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-AddressList** cmdlet to modify an existing address list.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-AddressList -Identity <AddressListIdParameter> [-ConditionalCompany
<MultiValuedProperty>] [-ConditionalCustomAttribute1
<MultiValuedProperty>] [-ConditionalCustomAttribute10
<MultiValuedProperty>] [-ConditionalCustomAttribute11
<MultiValuedProperty>] [-ConditionalCustomAttribute12
<MultiValuedProperty>] [-ConditionalCustomAttribute13
<MultiValuedProperty>] [-ConditionalCustomAttribute14
<MultiValuedProperty>] [-ConditionalCustomAttribute15
<MultiValuedProperty>] [-ConditionalCustomAttribute2
<MultiValuedProperty>] [-ConditionalCustomAttribute3
<MultiValuedProperty>] [-ConditionalCustomAttribute4
<MultiValuedProperty>] [-ConditionalCustomAttribute5
<MultiValuedProperty>] [-ConditionalCustomAttribute6
<MultiValuedProperty>] [-ConditionalCustomAttribute7
<MultiValuedProperty>] [-ConditionalCustomAttribute8
<MultiValuedProperty>] [-ConditionalCustomAttribute9
<MultiValuedProperty>] [-ConditionalDepartment <MultiValuedProperty>] [-
ConditionalStateOrProvince <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
ForceUpgrade <SwitchParameter>] [-IncludedRecipients <None | MailboxUsers
| Resources | MailContacts | MailGroups | MailUsers | AllRecipients>] [-
Name <String>] [-RecipientContainer <OrganizationalUnitIdParameter>] [-
RecipientFilter <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the name of an existing address list.

```
Set-AddressList -Identity "All Users\Sales\building4" -Name
building9
```

EXAMPLE 2

This example modifies the type of recipients and the department of the recipients included in the existing address list identified by its GUID.

```
Set-Addresslist -Identity c3fffd8e-026b-41b9-88c4-
8c21697ac8ac -IncludedRecipients MailboxUsers -
ConditionalDepartment Sales
```

Detailed Description

Use the **Get-AddressList** cmdlet, piped to **Format-List**, to get the GUID, distinguished name (DN), or path and name of an existing address list. Or, use **Get-AddressList** to get a specific existing

address list, and then pipe the output directly to the **Set-AddressList** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Identity* parameter specifies the GUID, DN, or address list name that represents a specific address list. You can also include the path using the format *Path**AddressListName*. You can omit the parameter label *Identity* so that only the address list name or GUID is supplied.
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter is a filter to specify a company. All recipients with a company attribute that matches the value that you input for this parameter are included in the address list that you're modifying.

			You can use multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to

			ConditionalCustomAttribute15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients*

			parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For

			example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the

			RecipientFilter parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose

			CustomAttribute1 value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to

			ConditionalCustomAttribute15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients*

			parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For

			example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the

			RecipientFilter parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter is a filter to specify a department. All recipients with a department attribute that matches the value that you input for this parameter are included in the address list. You can use multiple values as a

			comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter is a filter to specify a state or province. All recipients with a *ConditionalStateOrProvince* attribute that matches the value that you input for this parameter are included in the address list. You can use multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the desired display name of the address list.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* switch suppresses the following confirmation: "To save changes on object, the object must be upgraded to the current Exchange version. After upgrade, this object can't be managed by a previous version of Exchange System Manager. Do you want to continue to upgrade and save the object?"

IncludedRecipients	Optional	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter filters the recipient types used to build the global address list (GAL). The following are the available values for the *IncludedRecipients* parameter: • `None` • `MailboxUsers` • `Resources` • `MailContacts` • `MailGroups` • `MailUsers` • `AllRecipients` The `AllRecipients` value can be used only by itself. When multiple values of the *IncludedRecipients* parameter are separated by commas, the **OR** Boolean operator is applied. You must use this parameter if you're using any of the *Conditional* parameters. You can't use this parameter if you use the *RecipientFilter* parameter.
Name	Optional	System.String	The *Name* parameter specifies a new name for the address list. The name can't exceed 64 characters, and it can't

			include a carriage return or a backslash (\).
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the dynamic distribution group based on their location in Active Directory. The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If a value for the *RecipientContainer* parameter isn't specified, the default search filter is the location of the dynamic distribution group in Active Directory.
RecipientFilter	Optional	System.String	The *RecipientFilter* parameter specifies a filter for recipients to include in the address list. You can't use this parameter if you use any of the following filter parameters: • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients*

			• *RecipientContainer*
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-AddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-AddressList** cmdlet to update the recipients included in the address list that you specify.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-AddressList -Identity <AddressListIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the recipients of the address list building4 and under the container All Users \Sales.

```
Update-AddressList -Identity "All Users\Sales\building4"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or address list name that represents a specific address list. You can also include the path by using the format *Path\AddressListName*. You can omit the parameter label so that

			only the address list name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of

			those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-AddressListPaging

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-AddressListPaging** cmdlet to disable Active Directory virtual list view for address lists. Virtual list view displays address lists in your organization as pages instead of loading and viewing the entire directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-AddressListPaging [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables virtual list view for address lists in your organization.

`Disable-AddressListPaging`

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the identity of the tenant organization.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-AddressListPaging

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-AddressListPaging** cmdlet to enable Active Directory virtual list view for address lists. Virtual list view allows you to display the address lists in your organization as pages instead of loading and viewing the entire directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-AddressListPaging [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-DoNotUpdateRecipients
<SwitchParameter>] [-ForceUpdateOfRecipients <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables virtual list view for your organization.

```
Enable-AddressListPaging
```

Detailed Description

The **Enable-AddressListPaging** cmdlet creates the **Address List** container in Active Directory. Recipient cmdlets, such as **Get-Recipient**, use the information written to the container to quickly retrieve recipient data.

Note:
Microsoft Exchange Server 2007 can't read the **Address List** container and will clear its contents while managing address lists. As a result, the Exchange Server 2010 or later recipient cmdlets won't return any recipient data. If you're in a coexistence deployment with Exchange 2007, and you use Exchange 2007 servers to manage address lists, don't enable address list paging. If you've already enabled address list paging, you can disable it by running the Disable-AddressListPaging cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn’t assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the “Add a role to a role assignment policy” section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DoNotUpdateRecipients	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ForceUpdateOfRecipients	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchPara	The *WhatIf* switch instructs the command

		meter	to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DetailsTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-DetailsTemplate** cmdlet to retrieve the attributes for details templates.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DetailsTemplate [-Identity <DetailsTemplateIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example retrieves all attributes for the User details template for the English language.

```
Get-DetailsTemplate -Identity en-us\User
```

EXAMPLE 2

This example retrieves all attributes for all details template types in all languages.

```
Get-DetailsTemplate -Identity *\*
```

EXAMPLE 3

This example retrieves all attributes for all User details template types in all languages.

```
Get-DetailsTemplate -Identity *\User
```

Detailed Description

The **Get-DetailsTemplate** cmdlet retrieves the attributes for one or more details templates. Wildcard characters can be used when specifying the type and language of the details templates.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Details templates" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a

			value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DetailsTemplateIdParameter	The *Identity* parameter specifies the GUID of the details template or specifies the details template type and language separated by a backslash, for example, en-us\User. Details template types are: • User • Group • PublicFolder • SearchDialog • MailboxAgent • Contact
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Restore-DetailsTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Restore-DetailsTemplate** cmdlet to restore the specified template to its default state.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Restore-DetailsTemplate -Identity <DetailsTemplateIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example restores the default attributes to the User details template for the English language.

```
Restore-DetailsTemplate -Identity en-us\User
```

Detailed Description

Details templates can't be created or deleted, but this task restores the specified template to its default state. All user changes are lost.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Details templates" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DetailsTemplateIdParameter	The *Identity* parameter specifies the GUID or specifies the details template type and language separated by a backslash, for example, en-us\User. Details template types include: • User • Group • PublicFolder • SearchDialog • MailboxAgent • Contact
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You

			must include a colon (:) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DetailsTemplate

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-DetailsTemplate** cmdlet to modify the attributes of a details template. To make changes to the details template format and layout, you need to use the Details Templates Editor in the Exchange Toolbox.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DetailsTemplate -Identity <DetailsTemplateIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Pages
<MultiValuedProperty>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example sets attributes for the User details template for the U.S. English language.

```
Set-DetailsTemplate -Identity en-us\User
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Details templates" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DetailsTemplateIdParameter	The *Identity* parameter specifies the details template using a GUID or specifies a template type

			and language separated by a slash. The following is an example of the user template type and U.S. English language: en-us \User. Details template types include: • User • Group • PublicFolder • SearchDialog • MailboxAgent • Contact
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Pages	Optional	Microsoft.Exchange.Da	This parameter is reserved

		ta.MultiValuedProperty	for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-EmailAddressPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-EmailAddressPolicy** cmdlet to return all of the attributes on a policy or set of policies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-EmailAddressPolicy [-Identity <EmailAddressPolicyIdParameter>] [-
DomainController <Fqdn>] [-IncludeMailboxSettingOnlyPolicy
<SwitchParameter>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example retrieves the attributes for Email Address Policy 1.

```
Get-EmailAddressPolicy -Identity "Email Address Policy 1"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.EmailAddressPolicyIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or email address policy name that represents a specific email address policy. You can also include

			the path using the format *Path**EmailAddressPolicy*. You can omit the parameter label *Identity* so that only the GUID, DN, or email address policy name is supplied.
IncludeMailboxSettingOnlyPolicy	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-EmailAddressPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-EmailAddressPolicy** cmdlet to create an email address policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-EmailAddressPolicy -EnabledEmailAddressTemplates
<ProxyAddressTemplateCollection> -RecipientFilter <String> [-
DisabledEmailAddressTemplates <ProxyAddressTemplateCollection>] <COMMON
PARAMETERS>

New-EmailAddressPolicy -EnabledPrimarySMTPAddressTemplate <String> -

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
Priority <EmailAddressPolicyPriority>] [-RecipientContainer
<OrganizationalUnitIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an email address policy that includes mailbox users in the southeast offices who have email addresses that include their last name combined with the first two letters of their first name.

```
New-EmailAddressPolicy -Name "southeast offices" -
IncludedRecipients UserMailbox -ConditionalStateOrProvince
"Georgia","Alabama","Louisiana" -
EnabledEmailAddressTemplates "SMTP:%s%
2g@southeast.contoso.com"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
EnabledEmailAddressTemplates	Required	Microsoft.Exchange.Data.ProxyAddressTemplateCollection	The *EnabledEmailAddressTemplates* parameter specifies the proxy addresses included in an email address policy and are enabled. Separate multiple values with commas. The domain part of each proxy address needs to match an existing accepted domain.
EnabledPrimarySMTPAddressTemplate	Required	System.String	The *EnabledPrimarySMTPAddressTemplate* parameter

			specifies the proxy address enabled and included in an email address policy. The domain part of each proxy address needs to match an existing accepted domain.
IncludedRecipients	Required	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter specifies how to filter recipients used to set the email address policy. The AllRecipients value can be used only by itself. When multiple values of the *IncludedRecipients* parameter are separated by commas, the **OR** Boolean operator is applied.
Name	Required	System.String	The *Name* parameter specifies the name of the email address policy.
RecipientFilter	Required	System.String	The *RecipientFilter* parameter specifies a filter for recipients to include in the email address policy. You can't use this parameter if you use any of the following filter parameters:

			• *ConditionalCompany* • *ConditionalDepartment* • *IncludedRecipients* • *ConditionalStateOrProvince*
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter specifies a filter by company. It takes multiple values as a comma-delimited list.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ConditionalCustomAttribu*

		y	*te1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use

			the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients'

			custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this

			parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all

			included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ConditionalCustomAttribu*

		y	*te1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use

			the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients'

			custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this

			parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter specifies a filter by department. It takes multiple values as a comma-delimited list.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter specifies a

			filter by state or province. It takes multiple values as a comma-delimited list.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisabledEmailAddressTemplates	Optional	Microsoft.Exchange.Data.ProxyAddressTemplateCollection	The *DisabledEmailAddressTemplates* parameter specifies the proxy addresses included in an email address policy and are disabled. It takes multiple values as a comma-delimited list.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Organization	Optional	Microsoft.Exchange.Co	The *Organization*

		nfiguration.Tasks.OrganizationIdParameter	parameter is reserved for internal Microsoft use.
Priority	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EmailAddressPolicyPriority	The *Priority* parameter specifies that the current priority is higher than the priority specified as an argument for this parameter.
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter specifies how to filter the recipients used to build the email address policies based on their location in Active Directory Domain Services (AD DS). The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If you don't specify a value for the *RecipientContainer* parameter, the default search filter is the location of the dynamic distribution group in AD DS.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-EmailAddressPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-EmailAddressPolicy** cmdlet to remove an existing email address policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-EmailAddressPolicy -Identity <EmailAddressPolicyIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the email address policy Email_Address_Policy_1.

```
Remove-EmailAddressPolicy -Identity Email_Address_Policy_1
```

Detailed Description

The **Remove-EmailAddressPolicy** cmdlet removes an existing email address policy and updates the recipients.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EmailAddressPolicyIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or email address policy name that represents a specific email address policy. You can also include the path by using the format *Path**EmailAddressPolicy*. You can omit the parameter label *Identity* so that only the email address policy name or GUID is

			supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-EmailAddressPolicy

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-EmailAddressPolicy** cmdlet to set Active Directory attributes for an email address policy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-EmailAddressPolicy -Identity <EmailAddressPolicyIdParameter> [-
ConditionalCompany <MultiValuedProperty>] [-ConditionalCustomAttribute1
<MultiValuedProperty>] [-ConditionalCustomAttribute10
<MultiValuedProperty>] [-ConditionalCustomAttribute11
<MultiValuedProperty>] [-ConditionalCustomAttribute12
<MultiValuedProperty>] [-ConditionalCustomAttribute13
<MultiValuedProperty>] [-ConditionalCustomAttribute14
<MultiValuedProperty>] [-ConditionalCustomAttribute15
<MultiValuedProperty>] [-ConditionalCustomAttribute2
<MultiValuedProperty>] [-ConditionalCustomAttribute3
<MultiValuedProperty>] [-ConditionalCustomAttribute4
<MultiValuedProperty>] [-ConditionalCustomAttribute5
<MultiValuedProperty>] [-ConditionalCustomAttribute6
<MultiValuedProperty>] [-ConditionalCustomAttribute7
<MultiValuedProperty>] [-ConditionalCustomAttribute8
<MultiValuedProperty>] [-ConditionalCustomAttribute9
<MultiValuedProperty>] [-ConditionalDepartment <MultiValuedProperty>] [-
ConditionalStateOrProvince <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DisabledEmailAddressTemplates
<ProxyAddressTemplateCollection>] [-DomainController <Fqdn>] [-
EnabledEmailAddressTemplates <ProxyAddressTemplateCollection>] [-
EnabledPrimarySMTPAddressTemplate <String>] [-ForceUpgrade
<SwitchParameter>] [-IncludedRecipients <None | MailboxUsers | Resources |
```

```
MailContacts | MailGroups | MailUsers | AllRecipients>] [-Name <String>]
[-Priority <EmailAddressPolicyPriority>] [-RecipientContainer
<OrganizationalUnitIdParameter>] [-RecipientFilter <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the email address policy's name from EMAIL_ADDRESS_POLICY01 to EMAILADDRESSPOLICY02.

```
Set-EmailAddressPolicy -Identity EMAIL_ADDRESS_POLICY01 -
Name EMAILADDRESSPOLICY02
```

EXAMPLE 2

This example edits the South East Offices email address policy that currently includes recipients in Georgia, Alabama, and Louisiana to also include recipients in Texas.

```
Set-EmailAddressPolicy -Identity "South East Offices" -
ConditionalStateorProvince
"Georgia","Alabama","Louisiana","Texas"
```

Note:
Although the email address policy is already applied to recipients in Georgia, Alabama, and Louisiana, you must include them in the parameter because the parameter overwrites values; it doesn't append new values to existing values.

Detailed Description

The **Set-EmailAddressPolicy** cmdlet doesn't apply the changes to the email address policy. Use the **Update-EmailAddressPolicy** cmdlet following a **Set-EmailAddressPolicy** cmdlet for the changes to be applied.

For more information about the **Update-EmailAddressPolicy** cmdlet, see Update-EmailAddressPolicy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.EmailAddressPolicyIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or email address policy name that represents a specific email address policy. You can also include the path using the format *Path\EmailAddressPolicy*. You can omit the parameter label so that only the email address policy name or GUID is supplied.
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter specifies the company for the email address policy. It takes multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribu*

			te15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a

			Conditional parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the

			ConditionalCustomAttribute1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.

ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is

			`Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribu*

			te15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a

			Conditional parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the

			ConditionalCustomAttribute1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.

ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is

			`Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter specifies the department for the email address policy. It takes multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter specifies the state or province for the email address policy. It takes multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a

			Conditional parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisabledEmailAddressTemplates	Optional	Microsoft.Exchange.Data.ProxyAddressTemplateCollection	The *DisabledEmailAddressTemplates* parameter specifies the proxy addresses included in an email address policy that are disabled. It takes multiple values as a comma-delimited list.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

EnabledEmailAddressTemplates	Optional	Microsoft.Exchange.Data.ProxyAddressTemplateCollection	The *EnabledEmailAddressTemplates* parameter specifies the proxy addresses included in an email address policy that are enabled. It takes multiple values as a comma-delimited list.
EnabledPrimarySMTPAddressTemplate	Optional	System.String	The *EnabledPrimarySMTPAddressTemplate* parameter specifies the proxy addresses included in an email address policy that are enabled. It takes multiple values as a comma-delimited list.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* switch specifies whether to suppress the following confirmation: "To save changes on object, the object must be upgraded to the current Exchange version. After upgrade, this object cannot be managed by a previous version of Exchange System Manager. Do you want to continue to upgrade and save the

			object?"
IncludedRecipients	Optional	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter filters the recipient types used to build the global address list (GAL). The available values for the *IncludedRecipients* parameter include the following: • `None` • `MailboxUsers` • `Resources` • `MailContacts` • `MailGroups` • `MailUsers` • `AllRecipients` The `AllRecipients` value can be used only by itself. When multiple values of the *IncludedRecipients* parameter are separated by commas, the **OR** Boolean operator is applied. You must use this parameter if you're using any of the *Conditional* parameters. You can't use this parameter if you use the *RecipientFilter* parameter.
Name	Optional	System.String	The *Name* parameter specifies the new name

			for the email address policy.
Priority	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EmailAddressPolicyPriority	The *Priority* parameter specifies that the current priority is higher than the priority specified as an argument for this parameter.
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the email address policy based on their location in Active Directory Domain Services (AD DS). The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If you don't specify a value for the *RecipientContainer* parameter, the default search filter is the location of the dynamic distribution group in AD DS.
RecipientFilter	Optional	System.String	The *RecipientFilter* parameter filters the recipients contained in a particular email address

			policy. The *RecipientFilter* parameter can't be used if any of the following parameters are specified: • *ConditionalCompany* • *ConditionalDepartment* • *ConditionalStateOrProvince* • *IncludedRecipients*
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-EmailAddressPolicy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-EmailAddressPolicy** cmdlet to apply an email address policy to all recipients.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-EmailAddressPolicy -Identity <EmailAddressPolicyIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-FixMissingAlias
<SwitchParameter>] [-UpdateSecondaryAddressesOnly <SwitchParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example applies the email address policy EMAIL_ADDRESS_POLICY01 to all affected recipients.

```
Update-EmailAddressPolicy -Identity EMAIL_ADDRESS_POLICY01
```

Detailed Description

The **Update-EmailAddressPolicy** cmdlet queries for all recipients that match the specified email address policy and saves the objects to Active Directory. Use the **Update-EmailAddressPolicy** cmdlet after you use the **Set-EmailAddressPolicy** cmdlet to apply all changes. For more information about the **Set-EmailAddressPolicy** cmdlet, see Set-EmailAddressPolicy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Email address policies" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EmailAddressPolicyIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or email address policy name that

			represents a specific email address policy. You can also include the path by using the format *Path\EmailAddressPolicy*. You can omit the parameter label *Identity* so that only the email address policy name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

FixMissingAlias	Optional	System.Management.Automation.SwitchParameter	The *FixMissingAlias* switch repairs recipients that don't have an alias. The alias is generated based on the name of the recipient. You need to use the *FixMissingAlias* parameter if you receive an error message when you attempt to update an email address policy, global address list, or address list.
UpdateSecondaryAddressesOnly	Optional	System.Management.Automation.SwitchParameter	The *UpdateSecondaryAddressesOnly* switch parameter specifies to update the secondary email addresses only. If you specify this parameter, the primary proxy email address isn't updated.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-GlobalAddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-GlobalAddressList** cmdlet to return all the attributes of a global address list (GAL) or a set of GALs.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-GlobalAddressList -DefaultOnly <SwitchParameter> <COMMON PARAMETERS>

Get-GlobalAddressList [-Identity <GlobalAddressListIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example doesn't use parameters and returns all the attributes of all GALs.

```
Get-GlobalAddressList
```

EXAMPLE 2

This example uses the *DefaultOnly* parameter to return all the attributes of the default GAL only.

```
Get-GlobalAddressList -DefaultOnly
```

Detailed Description

The **Get-GlobalAddressList** cmdlet is mainly used to populate the GAL property pages in the Exchange Administration Center. This command doesn't provide a filtering capability. If filtering is required, you should use a WHERE clause with the command.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Global address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
DefaultOnly	Required	System.Management.Automation.SwitchParameter	The *DefaultOnly* parameter specifies the default GAL only.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.GlobalAddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or GAL name that represents a specific address list. You can also include the path by using the format *Path\GlobalAddressListName*. You can omit the parameter label so that only the GAL name or GUID is supplied.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-GlobalAddressList

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-GlobalAddressList** cmdlet to create a global address list (GAL).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-GlobalAddressList [-RecipientFilter <String>] <COMMON PARAMETERS>

New-GlobalAddressList [-ConditionalCompany <MultiValuedProperty>] [-
ConditionalCustomAttribute1 <MultiValuedProperty>] [-
ConditionalCustomAttribute10 <MultiValuedProperty>] [-
ConditionalCustomAttribute11 <MultiValuedProperty>] [-
ConditionalCustomAttribute12 <MultiValuedProperty>] [-
ConditionalCustomAttribute13 <MultiValuedProperty>] [-
ConditionalCustomAttribute14 <MultiValuedProperty>] [-
ConditionalCustomAttribute15 <MultiValuedProperty>] [-
ConditionalCustomAttribute2 <MultiValuedProperty>] [-
ConditionalCustomAttribute3 <MultiValuedProperty>] [-
ConditionalCustomAttribute4 <MultiValuedProperty>] [-
ConditionalCustomAttribute5 <MultiValuedProperty>] [-
ConditionalCustomAttribute6 <MultiValuedProperty>] [-
ConditionalCustomAttribute7 <MultiValuedProperty>] [-
ConditionalCustomAttribute8 <MultiValuedProperty>] [-
ConditionalCustomAttribute9 <MultiValuedProperty>] [-ConditionalDepartment
<MultiValuedProperty>] [-ConditionalStateOrProvince <MultiValuedProperty>]
[-IncludedRecipients <None | MailboxUsers | Resources | MailContacts |
MailGroups | MailUsers | AllRecipients>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Organization <OrganizationIdParameter>] [-
RecipientContainer <OrganizationalUnitIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the GAL NewGAL.

```
New-GlobalAddressList -Name NewGAL
```

EXAMPLE 2

This example creates the GAL_AgencyB GAL by using the *RecipientFilter* parameter to include all mailbox users whose custom attribute 15 equals AgencyB.

```
New-GlobalAddressList -Name GAL_AgencyB -RecipientFilter
{((RecipientType -eq "UserMailbox") -and (CustomAttribute15
-eq "AgencyB"))}
```

Detailed Description

The GAL is created under the Microsoft Exchange Organization configuration container in Active Directory.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Global address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies the name of the new GAL.
ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter specifies the company attribute on the GAL.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use

			the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients'

			custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this

			parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all

			included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ConditionalCustomAttribu*

		y	*te1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use

			the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients'

			custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this

			parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all

			included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ConditionalDepartment*

		y	parameter specifies the department attribute on the GAL.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter specifies the attribute in the GAL for the state or province. It takes multiple values as a comma-delimited list.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IncludedRecipients	Optional	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientT	The *IncludedRecipients* parameter sets the included recipients in the

		ype	GAL.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the dynamic distribution group based on their location in Active Directory. The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If a value for the *RecipientContainer* parameter isn't specified, the default search filter is the location of the dynamic distribution group in Active Directory.
RecipientFilter	Optional	System.String	The *RecipientFilter* parameter specifies the recipients contained in the GAL. The *RecipientFilter* parameter can't be used if any of the following parameters are specified: • *IncludedRecipients* • *ConditionalCompany* • *ConditionalDepartment*

			• *ConditionalStateOrProvince*
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-GlobalAddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-GlobalAddressList** cmdlet to remove an existing global address list (GAL).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-GlobalAddressList -Identity <GlobalAddressListIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the GAL OldGAL.

```
Remove-GlobalAddressList OldGAL
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GlobalAddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or GAL name that represents a specific address list. You can also include the path by using the format *Path\GlobalAddressListName*. You can omit the parameter label so that only the GAL name or

			GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-GlobalAddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-GlobalAddressList** cmdlet to modify the attributes in Active Directory for a global address list (GAL).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-GlobalAddressList -Identity <GlobalAddressListIdParameter> [-
ConditionalCompany <MultiValuedProperty>] [-ConditionalCustomAttribute1
<MultiValuedProperty>] [-ConditionalCustomAttribute10
<MultiValuedProperty>] [-ConditionalCustomAttribute11
<MultiValuedProperty>] [-ConditionalCustomAttribute12
<MultiValuedProperty>] [-ConditionalCustomAttribute13
<MultiValuedProperty>] [-ConditionalCustomAttribute14
<MultiValuedProperty>] [-ConditionalCustomAttribute15
<MultiValuedProperty>] [-ConditionalCustomAttribute2
<MultiValuedProperty>] [-ConditionalCustomAttribute3
<MultiValuedProperty>] [-ConditionalCustomAttribute4
<MultiValuedProperty>] [-ConditionalCustomAttribute5
<MultiValuedProperty>] [-ConditionalCustomAttribute6
<MultiValuedProperty>] [-ConditionalCustomAttribute7
<MultiValuedProperty>] [-ConditionalCustomAttribute8
<MultiValuedProperty>] [-ConditionalCustomAttribute9
<MultiValuedProperty>] [-ConditionalDepartment <MultiValuedProperty>] [-
ConditionalStateOrProvince <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ForceUpgrade
<SwitchParameter>] [-IncludedRecipients <None | MailboxUsers | Resources |
MailContacts | MailGroups | MailUsers | AllRecipients>] [-Name <String>]
[-RecipientContainer <OrganizationalUnitIdParameter>] [-RecipientFilter
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example assigns a new name, GALwithNewName, to the GAL with the GUID 96d0c505-eba8-4103-ad4f-577a1bf4ad7b.

```
Set-GlobalAddressList 96d0c505-eba8-4103-ad4f-577a1bf4ad7b
-Name GALwithNewName
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Global address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GlobalAddressListIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or GAL name that represents a specific GAL. You can also include the path by using the format *Path**GlobalAddressListName*. You can omit the parameter label so that only the GAL name or GUID is supplied.

ConditionalCompany	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCompany* parameter specifies a company. You can use multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.

ConditionalCustomAttribute10	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute11	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is

			`Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute12	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute13	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribu*

			te15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute14	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a

			Conditional parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute15	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the

			ConditionalCustomAttribute1 value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.

ConditionalCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is

			`Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute6	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute7	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribu*

			te15 parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute8	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a

			Conditional parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalCustomAttribute9	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalCustomAttribute1* to *ConditionalCustomAttribute15* parameters specify filters for recipients' custom attributes. For example, if you set the *ConditionalCustomAttribute1* value to `Marketing`, all included recipients whose *CustomAttribute1* value is `Marketing` are included in this filter. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalDepartment	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalDepartment* parameter specifies a department. All GALs with a department attribute that matches the value that you input for this parameter are included.

			You can use multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
ConditionalStateOrProvince	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConditionalStateOrProvince* parameter specifies the state or province for the GAL. You can use multiple values as a comma-delimited list. You must use the *IncludedRecipients* parameter if you use a *Conditional* parameter. You can't use this parameter if you use the *RecipientFilter* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* parameter suppresses the following confirmation: "To save changes on object, the object must be upgraded to the current Exchange version. After upgrade, this object cannot be managed by a previous version of Exchange System Manager. Do you want to continue to upgrade and save the object?"
IncludedRecipients	Optional	Microsoft.Exchange.Data.Directory.Recipient.WellKnownRecipientType	The *IncludedRecipients* parameter filters the recipient types that are used to build the GAL. The available values for the *IncludedRecipients* parameter are `None`, `AllRecipients`, `MailboxUsers`, `MailUsers`, `Resources`, `MailContacts`,

			and `MailGroups`. The `AllRecipients` value can be used only by itself. When multiple values of the *IncludedRecipients* parameter are separated by commas, the **OR** Boolean operator is applied. You must use this parameter if you're using any of the *Conditional* parameters. You can't use this parameter if you use the *RecipientFilter* parameter.
Name	Optional	System.String	The *Name* parameter specifies the new name of the GAL.
RecipientContainer	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *RecipientContainer* parameter filters the recipients used to build the dynamic distribution group based on their location in Active Directory. The value of the *RecipientContainer* parameter can be the canonical name of an organizational unit (OU) or a domain. If a value for

			the *RecipientContainer* parameter isn't specified, the default search filter is the location of the dynamic distribution group in Active Directory.
RecipientFilter	Optional	System.String	The *RecipientFilter* parameter specifies a filter for recipients to include in the GAL. You can't use this parameter if you use any of the following filter parameters: • *ConditionalCompany* • *ConditionalDepartment* • *IncludedRecipients* • *ConditionalStateOrProvince* You must use either this parameter or one of the previously listed filter parameters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-GlobalAddressList

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-GlobalAddressList** cmdlet to update a global address list (GAL).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-GlobalAddressList -Identity <GlobalAddressListIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the default GAL.

```
Update-GlobalAddressList -Identity "Global Address List"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address lists" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.GlobalAddressListIdParameter	The *Identity* parameter specifies a unique identifier of the GAL being updated. These unique identifiers include the common name (CN), GUID, or distinguished name (DN).
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OabVirtualDirectory

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-OabVirtualDirectory** cmdlet to return configuration information about offline address book (OAB) distribution points.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OabVirtualDirectory -Server <ServerIdParameter> <COMMON PARAMETERS>

Get-OabVirtualDirectory [-Identity <VirtualDirectoryIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-ADPropertiesOnly <SwitchParameter>] [-
DomainController <Fqdn>] [-ShowBackEndVirtualDirectories
<SwitchParameter>] [-ShowMailboxVirtualDirectories <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns all OAB virtual directory web distribution points.

```
Get-OabVirtualDirectory
```

EXAMPLE 2

This example returns all OAB virtual directory web distribution points on the server CAS-01-007.

```
Get-OabVirtualDirectory -Server CAS-01-007
```

EXAMPLE 3

This example returns OAB virtual directories on Client Access servers. By default, this cmdlet only returns virtual directories on Mailbox servers.

```
Get-OabVirtualDirectory -ShowBackEndVirtualDirectories
```

Detailed Description

The **Get-OabVirtualDirectory** cmdlet queries a distribution point by identity or by web distribution points on a specific server, or queries for all web distribution points. By default, this cmdlet only returns virtual directories on Mailbox servers. To view virtual directories on Client Access servers, use the *ShowBackEndVirtualDirectories* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address book connectivity" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which to perform the selected operation. You can't use this parameter in conjunction with the *Identity* parameter.
ADPropertiesOnly	Optional	System.Management.Automation.SwitchParameter	The *ADPropertiesOnly* switch specifies whether to return only the properties about the virtual directory stored in Active Directory. The properties stored in the Internet Information Services (IIS) metabase aren't returned.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from

			Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB virtual directory name that represents a specific OAB virtual directory. You can also include the path using the format *Server\OfflineAddressBookVirtualDirectoryName*. You can omit the parameter label so that only the OAB virtual directory name, DN, or GUID is supplied. You can't use this parameter in conjunction with the *Server* parameter.
ShowBackEndVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowBackEndVirtualDirectories* switch specifies that OAB virtual directories on Client Access servers are returned. If you don't use this switch, only virtual directories

			on Mailbox servers are returned.
ShowMailboxVirtualDirectories	Optional	System.Management.Automation.SwitchParameter	The *ShowMailboxVirtualDirectories* switch specifies whether the OAB virtual directories on Mailbox servers are returned. This switch should only be used with the direction of Microsoft support.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OabVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-OABVirtualDirectory** cmdlet to configure a server as a web distribution point for an offline address book (OAB).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OabVirtualDirectory [-AppPoolId <String>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ExtendedProtectionFlags
<MultiValuedProperty>] [-ExtendedProtectionSPNList <MultiValuedProperty>]
[-ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-InternalUrl <Uri>] [-Path <String>] [-PollInterval <Int32>] [-
Recovery <SwitchParameter>] [-RequireSSL <$true | $false>] [-Role
<ClientAccess | Mailbox>] [-Server <ServerIdParameter>] [-WebSiteName
<String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an OAB virtual directory on CASServer01 and configures the distribution service to poll the generation server every two hours.

```
New-OABVirtualDirectory -Server CASServer01 -PollInterval
120
```

Detailed Description

The **New-OABVirtualDirectory** cmdlet configures a web distribution point for an OAB and creates the OAB virtual directory.

Note:
You have to manually create the file system folder on the server that hosts the OAB files.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the " Offline address book connectivity " entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
AppPoolId	Optional	System.String	The *AppPoolId* parameter specifies the pool of programs that can be used with the OAB virtual directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy

			mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN

			list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionToke*

			nChecking parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is <*protocol*>/<*FQDN*>. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenCheckingMode	The *ExtendedProtectionTokenChecking* parameter defines how you want to use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for

			Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and

			Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the external URL that the OAB virtual directory points to.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the internal URL that the OAB virtual directory points to.
Path	Optional	System.String	The *Path* parameter specifies the path to the

			folder that hosts the OAB virtual directory.
PollInterval	Optional	System.Int32	The *PollInterval* parameter specifies the time interval (in minutes) that the distribution service should poll the generation server for new updates.
Recovery	Optional	System.Management.Automation.SwitchParameter	The *Recovery* parameter specifies whether to support Setup recovery mode and is used implicitly by Setup when recovery is performed. It's never necessary to specify this parameter.
RequireSSL	Optional	System.Boolean	The *RequireSSL* parameter specifies whether to require Secure Sockets Layer (SSL) to access the OAB virtual directory. If set to `$true`, the *RequireSSL* parameter requires SSL to access the OAB virtual directory.
Role	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.VirtualDirectoryRole	The *Role* parameter specifies the configuration that should be used when the virtual directory is created. The following are

			the values that can be used with this parameter: • `FrontEnd` Configure the virtual directory for use on a Client Access server. • `BackEnd` Configure the virtual directory for use on a Mailbox server.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the name of the server to connect. Enter the *Server* parameter as a host name or an FQDN. If this parameter isn't used, the local server is queried.
WebSiteName	Optional	System.String	The *WebSiteName* parameter specifies the name of the Internet Information Services (IIS) website under which to create the virtual directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OabVirtualDirectory

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-OabVirtualDirectory** cmdlet to remove a server from the offline address book (OAB) distribution points list.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OabVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the default OAB virtual directory from the local server.

```
Remove-OabVirtualDirectory -Identity "OAB (Default Web
Site)"
```

EXAMPLE 2

This example removes the default OAB virtual directory from Server1.

```
Remove-OabVirtualDirectory -Identity "Server1\OAB (Default
Web Site)"
```

Detailed Description

Some situations require the removal of an OAB virtual directory. For example, to uninstall a Client Access server that contains an OAB distribution points list, you must remove the OAB virtual directory and then re-create it on another Client Access server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB virtual directory name that represents a specific OAB virtual directory. You can also include the path by using the format *Server\OfflineAddressBookVirtualDirectoryName*. You can omit the parameter label so that only the OAB virtual directory name or GUID is supplied.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're

			prompted for administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OabVirtualDirectory

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-OABVirtualDirectory** cmdlet to change configuration settings for an offline address book (OAB) virtual directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OabVirtualDirectory -Identity <VirtualDirectoryIdParameter> [-
BasicAuthentication <$true | $false>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-ExtendedProtectionFlags <MultiValuedProperty>]
[-ExtendedProtectionSPNList <MultiValuedProperty>] [-
ExtendedProtectionTokenChecking <None | Allow | Require>] [-ExternalUrl
<Uri>] [-InternalUrl <Uri>] [-OAuthAuthentication <$true | $false>] [-
PollInterval <Int32>] [-RequireSSL <$true | $false>] [-WhatIf
[<SwitchParameter>]] [-WindowsAuthentication <$true | $false>]
```

Examples

EXAMPLE 1

This example changes the external URL of the OAB virtual directory OAB (Default Web Site) to https://www.contoso.com/OAB.

```
Set-OABVirtualDirectory -Identity "Server1\OAB (Default Web
Site)" -ExternalUrl "https://www.contoso.com/OAB"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address book connectivity" entry in the Email address and address book permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB virtual directory name that represents a specific OAB virtual

			directory. You can also include the path by using the format *Server\OfflineAddressBookVirtualDirectoryName*.
BasicAuthentication	Optional	System.Boolean	The *BasicAuthentication* parameter specifies whether Basic authentication is enabled on the OAB virtual directory. This parameter can be used with the *WindowsAuthentication* parameter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active

			Directory.
ExtendedProtectionFlags	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionFlags* parameter is used to customize the options you use if you're using Extended Protection for Authentication. The possible values are: • **None** Default setting. • **Proxy** Specifies that a proxy is terminating the SSL channel. A Service Principal Name (SPN) must be registered in the *ExtendedProtectionSPNList* parameter if proxy mode is configured. • **ProxyCoHosting** Specifies that both HTTP and HTTPS traffic may be accessing the Client Access server and that a proxy is located between at least some of the clients and the Client Access server. • **AllowDotlessSPN** Specifies whether you want to support valid SPNs that aren't in the fully qualified domain

			name (FQDN) format, for example ContosoMail. You specify valid SPNs with the *ExtendedProtectionSPNList* parameter. This option makes extended protection less secure because dotless certificates aren't unique, so it isn't possible to ensure that the client-to-proxy connection was established over a secure channel. • **NoServiceNameCheck** Specifies that the SPN list won't be checked to validate a channel binding token. This option makes Extended Protection for Authentication less secure. We generally don't recommend this setting.
ExtendedProtectionSPNList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtendedProtectionSPNList* parameter specifies a list of valid Service Principal Names (SPNs) if you're

			using Extended Protection for Authentication on the specified virtual directory. The possible values are: • **Null** This is the default value. • **Single SPN or comma delimited list of valid SPNs** By default, you must specify the fully qualified domain name (FQDN) (for example mail.contoso.com) for each SPN. If you want to add an SPN that's not an FQDN (for example, ContosoMail), you must also use the *ExtendedProtectionTokenChecking* parameter with the `AllowDotlessSPN value`. You specify the domain in SPN format. The SPN format is *<protocol>/<FQDN>*. For example, a valid entry could be HTTP/mail.contoso.com.
ExtendedProtectionTokenChecking	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionTokenChecki	The *ExtendedProtectionTokenChecking* parameter defines how you want to

		ngMode	use Extended Protection for Authentication on the specified Exchange virtual directory. Extended Protection for Authentication isn't enabled by default. The available settings are: • **None** Extended Protection for Authentication won't be used. Connections between the client and Exchange won't use Extended Protection for Authentication on this virtual directory. This is the default setting. • **Allow** Extended Protection for Authentication will be used for connections between the client and Exchange on this virtual directory if both the client and server support Extended Protection for Authentication. Connections that don't support Extended Protection for Authentication on the

			client and server will work, but may not be as secure as a connection using Extended Protection for Authentication. **Note:** If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more Service Principal Names (SPNs) by using the *ExtendedProtectionSPNList* parameter. • **Require** Extended Protection for Authentication will be used for all connections between clients and Exchange servers for this virtual directory. If either the client or server doesn't support Extended Protection for Authentication, the connection between the client and server will fail. If you set this option, you must also set a value for the *ExtendedProtectionSPNList* parameter.

			Note: If you have a proxy server between the client and the Client Access server that's configured to terminate the client-to-proxy SSL channel, you must also configure one or more SPNs using the parameter *ExtendedProtectionSPNList*.
ExternalUrl	Optional	System.Uri	The *ExternalUrl* parameter specifies the external URL that the OAB virtual directory points to.
InternalUrl	Optional	System.Uri	The *InternalUrl* parameter specifies the internal URL that the OAB virtual directory points to.
OAuthAuthentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
PollInterval	Optional	System.Int32	The *PollInterval* parameter specifies the time interval that the distribution service should poll the generation server for new updates (in minutes).
RequireSSL	Optional	System.Boolean	The *RequireSSL* parameter specifies whether to require Secure Sockets Layer (SSL) when accessing the OAB virtual

			directory. When set to `$true`, the *RequireSSL* parameter requires SSL when accessing the OAB virtual directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsAuthentication	Optional	System.Boolean	The *WindowsAuthentication* parameter specifies whether Integrated Windows authentication is permitted on the OAB virtual directory. This parameter can be used with the *BasicAuthentication* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-OfflineAddressBook

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-OfflineAddressBook** cmdlet to obtain the settings of one or more offline address books (OABs).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-OfflineAddressBook -Server <ServerIdParameter> <COMMON PARAMETERS>

Get-OfflineAddressBook [-Identity <OfflineAddressBookIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example uses the **Get-OfflineAddressBook** command without parameters to obtain all the configuration details of all the existing OABs.

```
Get-OfflineAddressBook | Format-List
```

Detailed Description

If a parameter isn't passed with the **Get-OfflineAddressBook** cmdlet, the command returns all of the OABs in the organization. If the *Identity* parameter is passed, the command returns the OAB for the specified identity. If the *Server* parameter is passed, the command returns the OABs for the specified server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the GUID, domain name, or fully qualified domain name (FQDN) of the server generating the OAB.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB name that represents a specific OAB. You can also include the path using the format *Server\OfflineAddressBookName*.

			You can omit the parameter label *Identity* so that only the OAB name or GUID is supplied.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-OfflineAddressBook

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-OfflineAddressBook** cmdlet to create an offline address book (OAB).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-OfflineAddressBook -AddressLists <AddressBookBaseIdParameter[]> -Name
<String> [-Confirm [<SwitchParameter>]] [-DiffRetentionPeriod <Unlimited>]
[-DomainController <Fqdn>] [-GeneratingMailbox <MailboxIdParameter>] [-
GlobalWebDistributionEnabled <$true | $false>] [-IsDefault <$true |
$false>] [-Organization <OrganizationIdParameter>] [-VirtualDirectories
<VirtualDirectoryIdParameter[]>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example uses two commands to create the OAB named OAB_AgencyB that includes all address lists where AgencyB is part of the name. With the settings shown, an OAB is generated by myserver.contoso.com on Mondays and Wednesdays from 01:00 (1:00 A.M.) to 02:00 (2:00 A.M.). The command also creates the default OAB for the organization.

```
$a = Get-AddressList | Where {$_.Name -Like "*AgencyB*"
New-OfflineAddressBook -Name "OAB_AgencyB" -AddressLists $a
-Schedule "Mon.01:00-Mon.02:00, Wed.01:00-Wed.02:00"
```

EXAMPLE 2

This example creates the OAB New OAB that uses Web-based distribution for Microsoft Office Outlook 2007 or later by using the default virtual directory.

```
New-OfflineAddressBook -Name "New OAB" -AddressLists
"\Default Global Address List" -VirtualDirectories
"SERVER01\OAB (Default Web Site)"
```

Detailed Description

The **New-OfflineAddressBook** cmdlet allows administrators to create OABs. For example, if you uninstall a Client Access server that contains an OAB, you need to re-create it on another Client Access server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
AddressLists	Required	Microsoft.Exchange.Configuration.Tasks.Addre	The *AddressLists* parameter specifies an

		ssBookBaseIdParameter[]	array of address list identities included in the OAB.
Name	Required	System.String	The *Name* parameter specifies the name that describes the OAB object in Exchange System Manager. This value can contain a maximum of 64 characters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DiffRetentionPeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *DiffRetentionPeriod* parameter specifies the length of time, in days, that the OAB difference files are retained on the OAB-generating server and the Client Access server. To retain the

			OAB difference files indefinitely, use the value `unlimited`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
GeneratingMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *GeneratingMailbox* parameter specifies the *OABGenCapability* arbitration mailbox where the offline address books will be generated. This allows on-premises admins to load balance OAB generation.
GlobalWebDistributionEnabled	Optional	System.Boolean	The *GlobalWebDistributionEnabled* parameter specifies whether distribution occurs to all virtual directories in the organization. If the value of the *GlobalWebDistributionEnabled* parameter is

			`$true`, distribution occurs to all virtual directories in the organization and the *VirtualDirectories* parameter can't be used.
IsDefault	Optional	System.Boolean	The *IsDefault* parameter specifies whether the OAB is set as the default OAB for all new mailbox databases. If the value of the *IsDefault* parameter is `$true`, the OAB is set as the default OAB for all new mailbox databases. If the value is `$false`, the OAB isn't set as the default OAB.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
VirtualDirectories	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter[]	The *VirtualDirectories* parameter specifies the array of **OABVirtualDirectory** objects. If the *VirtualDirectories* parameter is specified,

			`version4` of the OAB must be generated.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Move-OfflineAddressBook

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Move-OfflineAddressBook** cmdlet to designate a new server responsible for generating the offline address book (OAB).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Move-OfflineAddressBook -Identity <OfflineAddressBookIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Server
<ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example moves OAB generation to the server Server1.

```
Move-OfflineAddressBook -Identity "My OAB" -Server
"Server1"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB name that represents a specific OAB. You can also include the path by using the format *Server\OfflineAddressBookName*.

			You can omit the parameter label so that only the OAB name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Mailbox server on which to perform the selected operation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions

			that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-OfflineAddressBook

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-OfflineAddressBook** cmdlet to remove (delete) offline address books (OABs).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-OfflineAddressBook -Identity <OfflineAddressBookIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Force
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the OAB My OAB from Active Directory.

```
Remove-OfflineAddressBook -Identity "\My OAB"
```

Detailed Description

The **Remove-OfflineAddressBook** cmdlet removes an existing OAB. For example, to uninstall a Client Access server that contains an OAB, you have to remove the OAB and re-create it on another Client Access server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB name that represents a specific OAB. You can also include the path by using the format *Server\OfflineAddressBookName*. You can omit the parameter label so that

			only the OAB name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the

			Force switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-OfflineAddressBook

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-OfflineAddressBook** cmdlet to modify offline address book (OAB) settings.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-OfflineAddressBook -Identity <OfflineAddressBookIdParameter> [-
AddressLists <AddressBookBaseIdParameter[]>] [-ApplyMandatoryProperties
<SwitchParameter>] [-ConfiguredAttributes <MultiValuedProperty>] [-Confirm
[<SwitchParameter>]] [-DiffRetentionPeriod <Unlimited>] [-DomainController
<Fqdn>] [-GeneratingMailbox <MailboxIdParameter>] [-
GlobalWebDistributionEnabled <$true | $false>] [-IsDefault <$true |
$false>] [-MaxBinaryPropertySize <Int32>] [-
MaxMultivaluedBinaryPropertySize <Int32>] [-
MaxMultivaluedStringPropertySize <Int32>] [-MaxStringPropertySize <Int32>]
[-Name <String>] [-PublicFolderDistributionEnabled <$true | $false>] [-
Schedule <Schedule>] [-UseDefaultAttributes <SwitchParameter>] [-Versions
<MultiValuedProperty>] [-VirtualDirectories <VirtualDirectoryIdParameter[]
>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example changes the name of the OAB.

```
Set-OfflineAddressBook -Identity "\Default Offline Address
Book" -Name "My Offline Address Book"
```

Detailed Description

The **Set-OfflineAddressBook** cmdlet modifies the settings of an existing OAB. An OAB is valuable for users who spend time disconnected from the network. An OAB is a snapshot of one or more address lists, which MAPI clients can download to provide access to the address lists while offline.

The generation of an OAB doesn't stop even if more time is required than specified in the *Schedule* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn’t assigned to any role groups. To use any cmdlets that require the Address List role, you need to add the role to a role group. For details, see

the “Add a role to a role assignment policy” section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB name that represents a specific OAB. You can also include the path by using the format *Server\OfflineAddressBookName*. You can omit the parameter label so that only the OAB name or GUID is supplied.
AddressLists	Optional	Microsoft.Exchange.Configuration.Tasks.AddressBookBaseIdParameter[]	The *AddressLists* parameter specifies an array of address list identities included in the OAB.
ApplyMandatoryProperties	Optional	System.Management.Automation.SwitchParameter	The *ApplyMandatoryProperties* parameter specifies whether to modify the mandatory properties of a legacy OAB to the version in Microsoft Exchange Server 2013.

ConfiguredAttributes	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ConfiguredAttributes* parameter specifies the attributes to be displayed for the OAB.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DiffRetentionPeriod	Optional	Microsoft.Exchange.Data.Unlimited	The *DiffRetentionPeriod* parameter specifies the length of time, in days, that the OAB difference files are retained on the OAB-generating server and the Client Access server. To retain the OAB difference files indefinitely, use the value `Unlimited`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration

			change to Active Directory.
GeneratingMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *GeneratingMailbox* parameter specifies the *OABGenCapability* arbitration mailbox where the offline address books will be generated. This allows on-premises admins to load balance OAB generation.
GlobalWebDistributionEnabled	Optional	System.Boolean	The *GlobalWebDistributionEnabled* parameter specifies whether distribution occurs to all virtual directories in the organization. If the value of the *GlobalWebDistributionEnabled* parameter is `$true`, distribution occurs to all virtual directories in the organization. If you have *GlobalWebDistributionEnabled* set to `$true`, you can't add values to the *VirtualDirectories* parameter.
IsDefault	Optional	System.Boolean	The *IsDefault* parameter specifies whether this

			OAB is the default OAB for all new mailbox stores.
MaxBinaryPropertySize	Optional	System.Int32	The *MaxBinaryPropertySize* parameter specifies the maximum size for binary attributes before they're truncated.
MaxMultivaluedBinaryPropertySize	Optional	System.Int32	The *MaxMultivaluedBinaryPropertySize* parameter specifies the maximum size for multivalued binary attributes before they're truncated.
MaxMultivaluedStringPropertySize	Optional	System.Int32	The *MaxMultivaluedStringPropertySize* parameter specifies the maximum size for multivalued string attributes before they're truncated.
MaxStringPropertySize	Optional	System.Int32	The *MaxStringPropertySize* parameter specifies the maximum size for string attributes before they're truncated.
Name	Optional	System.String	The *Name* parameter specifies the new name of

			the OAB. A *Name* parameter value can include up to 64 characters.
PublicFolderDistributionEnabled	Optional	System.Boolean	The *PublicFolderDistributionEnabled* parameter specifies whether the OAB is to be distributed via public folders. Setting the *PublicFolderDistributionEnabled* parameter to a value of `$true` sets the OAB to be distributed via public folders. The default value is `$true`.
Schedule	Optional	Microsoft.Exchange.Data.Schedule	The *Schedule* parameter specifies the interval scheduled for generating the OAB. You can use the following values for the start and end days: • Full name of the day • Abbreviated name of the day • Integer from 0 through 6, where 0 = Sunday The start time and end time must be at least 15 minutes apart. Minutes will be rounded down to

			0, 15, 30, or 45. If you specify more than one interval, there must be at least 15 minutes between each interval. The following are examples: • "Sun.11:30 PM-Mon.1:30 AM" • 6.22:00-6.22:15 (The assistant will run from Saturday at 10:00 PM until Saturday at 10:15 PM.) • "Monday.4:30 AM-Monday.5:30 AM","Wednesday.4:30 AM-Wednesday.5:30 AM" (The assistant will run on Monday and Wednesday mornings from 4:30 until 5:30.) • "Sun.1:15 AM-Monday.23:00"
UseDefaultAttributes	Optional	System.Management.Automation.SwitchParameter	The *UseDefaultAttributes* parameter specifies whether to revert the OAB attributes to the default list.
Versions	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Versions* parameter specifies the OAB versions that are generated for

			client download. The available options are Version4, Version3, and Version2. Version4 is for Microsoft Outlook 2003 Service Pack 2 (SP2) or later clients. Version3 is for Outlook clients that support Unicode.
VirtualDirectories	Optional	Microsoft.Exchange.Configuration.Tasks.VirtualDirectoryIdParameter[]	The *VirtualDirectories* parameter specifies the array of OABVirtualDirectory objects. If the *VirtualDirectories* parameter is specified, Version4 of the OAB must be generated.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-OfflineAddressBook

Exchange Management Shell > Exchange 2013 cmdlets > Email address and address book cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-OfflineAddressBook** cmdlet to update the offline address books (OABs) used by Microsoft Outlook clients.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-OfflineAddressBook -Identity <OfflineAddressBookIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example updates the OAB MyOAB.

```
Update-OfflineAddressBook -Identity MyOAB
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Offline address books" entry in the Email address and address book permissions topic.

By default in Exchange Online, the Address List role isn't assigned to any role groups. To use any

cmdlets that require the Address List role, you need to add the role to a role group. For details, see the "Add a role to a role assignment policy" section of Manage role assignment policies.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.OfflineAddressBookIdParameter	The *Identity* parameter specifies the GUID, distinguished name (DN), or OAB name that represents a specific OAB. You can also include the path by using the format *Server\OfflineAddressBookName*. You can omit the parameter label *Identity* so that only the OAB name or GUID is supplied.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Dat	The *DomainController*

		a.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-FederatedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-FederatedDomain** cmdlet to configure a secondary domain with the federated organization identifier in the federation trust for the Exchange organization.

Important:
The domains being added to the federation trust must exist as accepted domains in the Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-FederatedDomain -DomainName <SmtpDomain> [-Identity
<OrganizationIdParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the domain Contoso.co.uk to the existing federation trust.

```
Add-FederatedDomain -DomainName Contoso.co.uk
```

Detailed Description

You can add any registered Internet domain to the federated organization identifier. You must prove domain ownership by creating a TXT record in the Domain Name System (DNS) zone of each domain you add.

For more details, see Federation.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainName	Required	Microsoft.Exchange.Data.SmtpDomain	The *DomainName* parameter specifies the secondary domain to be configured.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.OrganizationIdParameter	is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-FederatedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-FederatedDomain** cmdlet to remove a federated domain from the federated

organization identifier in the federation trust for the Exchange organization.

Caution:
If you remove a domain configured for federated sharing, federated sharing for that domain is disabled.

For more information, see Federation.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-FederatedDomain -DomainName <SmtpDomain> [-Identity
<OrganizationIdParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-Force <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the federated domain contoso.co.uk from the federated organization identifier.

```
Remove-FederatedDomain -DomainName contoso.co.uk
```

Detailed Description

An Exchange organization's federated organization identifier is generally created using the organization's primary domain name. Additional domain names can be added and removed. The **Remove-FederatedDomain** cmdlet removes a federated domain from the federated organization identifier.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainName	Required	Microsoft.Exchange.Data.SmtpDomain	The *DomainName* parameter specifies the federated domain name to be removed from the federated

			organization identifier.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages when removing a federated domain. This parameter can be used when the removal of the federated domain from Windows Live fails, but the

			configuration of this domain as a federated domain in Exchange should be removed regardless. The result of running this task with the *Force* switch is that the Exchange configuration is removed but the domain may not be released in Windows Live. We recommend that you not use the *Force* switch unless the release of the domain from Windows Live continues to fail.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-FederatedDomainProof

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-FederatedDomainProof** cmdlet to generate a cryptographically secure string for the domain used for federated sharing in your Microsoft Exchange Server 2013 organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-FederatedDomainProof -DomainName <SmtpDomain> [-DomainController
<Fqdn>] [-Thumbprint <String>]
```

Examples

EXAMPLE 1

This example generates a cryptographically secure string for the domain contoso.com.

```
Get-FederatedDomainProof -DomainName "contoso.com"
```

EXAMPLE 2

This example uses a specific certificate for the domain contoso.com.

```
Get-FederatedDomainProof -DomainName "contoso.com" -
Thumbprint AC00F35CBA8359953F4126E0984B5CCAFA2F4F17
```

Detailed Description

The **Get-FederatedDomainProof** cmdlet generates a cryptographically secure string for the domain used for federated sharing. The resulting string is used to manually configure a text (TXT) record in the Domain Name System (DNS) zone for the domain used by the administrator when running the cmdlet. A TXT record needs to be added to DNS for all accepted domains used for federated sharing. If the thumbprint of a certificate isn't provided, the task generates strings for all the certificates currently configured for the federation trust. Upon initial configuration of federated sharing, the proof string generated for the current certificate needs to be put into the TXT record for the federated domain in DNS. We recommend you update the TXT records whenever a new certificate is configured for the federation trust.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainName	Required	Microsoft.Exchange.Data.SmtpDomain	The *DomainName* parameter specifies the domain name for which the cryptographically secure string is generated.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Thumbprint	Optional	System.String	The *Thumbprint* parameter specifies the thumbprint of an existing certificate.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-FederatedOrganizationIdentifier

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-FederatedOrganizationIdentifier** cmdlet to retrieve the Exchange organization's federated organization identifier and related details, such as federated domains, organization contact, and status.

For more information, see Federation.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-FederatedOrganizationIdentifier [-Identity <OrganizationIdParameter>]
[-DomainController <Fqdn>] [-IncludeExtendedDomainInfo <SwitchParameter>]
```

Examples

EXAMPLE 1

This example retrieves the Exchange organization's federated organization identifier.

```
Get-FederatedOrganizationIdentifier
```

EXAMPLE 2

This example retrieves the Exchange organization's federated organization identifier. The *IncludeExtendedDomainInfo* switch is used to return the status of federated domains from the Microsoft Federation Gateway.

```
Get-FederatedOrganizationIdentifier -
IncludeExtendedDomainInfo
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the organization ID.
IncludeExtendedDomai	Optional	System.Management.A	The

nInfo		utomation.SwitchParameter	*IncludeExtendedDomainInfo* switch specifies that the command query Microsoft Federation Gateway for the status of each accepted domain that's federated. The status is returned with each domain in the **Domains** property.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-FederatedOrganizationIdentifier

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-FederatedOrganizationIdentifier** cmdlet to configure the federated organization identifier for the Exchange organization.

For more details, see Federation.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-FederatedOrganizationIdentifier [-Identity <OrganizationIdParameter>]
[-AccountNamespace <SmtpDomain>] [-Confirm [<SwitchParameter>]] [-
DefaultDomain <SmtpDomain>] [-DelegationFederationTrust
<FederationTrustIdParameter>] [-DomainController <Fqdn>] [-Enabled <$true
| $false>] [-OrganizationContact <SmtpAddress>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures a federated organization identifier for the Exchange organization.

```
Set-FederatedOrganizationIdentifier -
DelegationFederationTrust "Microsoft Federation Gateway" -
AccountNamespace "Contoso.com" -Enabled $true
```

EXAMPLE 2

This example temporarily disables federation for the Exchange organization.

```
Set-FederatedOrganizationIdentifier -Enabled $false
```

EXAMPLE 3

This example enables the organization identifier. This enables federation for the Exchange organization.

```
Set-FederatedOrganizationIdentifier -Enabled $true
```

Detailed Description

You must configure a federated organization identifier to create an account namespace for your Exchange organization with the Microsoft Federation Gateway and enable federation for the purpose of sharing calendars or contacts, accessing free/busy information across Exchange organizations, and securing cross-premises email delivery using federated delivery. When you create a federation trust, a value for the *AccountNamespace* parameter is automatically created with the Microsoft Federation Gateway. The *AccountNamespace* parameter is a combination of a pre-defined string and the domain specified. For example, if you specify the federated domain contoso.com as the domain, "FYDIBOHF25SPDLT.contoso.com" is automatically created as the value for the *AccountNamespace* parameter. You can add and remove Additional domain names later by using the **Add-FederatedDomain** and **Remove-FederatedDomain** cmdlets.

You can temporarily disable federation by disabling the organization identifier.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
AccountNamespace	Optional	Microsoft.Exchange.Data.SmtpDomain	The *AccountNamespace* parameter specifies the federated domain to be used to establish the organization identifier with the Microsoft Federation Gateway.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DefaultDomain	Optional	Microsoft.Exchange.Data.SmtpDomain	The *DefaultDomain* parameter specifies the federated domain used for delegation tokens issued by the Microsoft Federation Gateway for user accounts in the Exchange organization.

			If the *DefaultDomain* parameter isn't set, the primary SMTP domain for each user account is used in delegation tokens issued by the Microsoft Federation Gateway. Only a single domain or subdomain for the Exchange organization should be configured, and it applies to all delegation tokens issued for the Exchange organization, for example, contoso.com.
DelegationFederationTrust	Optional	Microsoft.Exchange.Configuration.Tasks.FederationTrustIdParameter	The *DelegationFederationTrust* parameter specifies the identity of the federation trust to be used by the organization identifier.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the organization identifier is enabled. Valid values include `$true` or `$false`. Setting the parameter to `$false` disables federation.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Identity* parameter specifies the federated organization identifier.
OrganizationContact	Optional	Microsoft.Exchange.Data.SmtpAddress	The *OrganizationContact* parameter specifies the SMTP address of the federation contact.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-FederationInformation

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-06*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-FederationInformation** cmdlet to get federation information, including federated domain names and target URLs, from an external Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-FederationInformation -DomainName <SmtpDomain> [-
BypassAdditionalDomainValidation <SwitchParameter>] [-Force
<SwitchParameter>] [-TrustedHostnames <MultiValuedProperty>]
```

Examples

EXAMPLE 1

This example gets federation information from the domain contoso.com.

```
Get-FederationInformation -DomainName contoso.com
```

Detailed Description

The **Get-FederationInformation** cmdlet retrieves federation information from the domain specified. Results from the cmdlet can be piped to the **New-OrganizationRelationship** cmdlet to establish an organization relationship with the Exchange organization being queried.

The domain specified should have federation enabled.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainName	Required	Microsoft.Exchange.Data.SmtpDomain	The *DomainName* parameter specifies the domain name for which federation information is to be retrieved.
BypassAdditionalDomainValidation	Optional	System.Management.Automation.SwitchParameter	The *BypassAdditionalDomainValidation* switch specifies that the command skip validation of domains from the external Exchange organization. We recommend that you only use this parameter when retrieving federation information in a hybrid deployment between

			on-premises and Exchange Online organizations that are part of a single, larger Exchange deployment. Don't use this parameter when retrieving federation information from external Exchange organizations in a cross-organization arrangement. The default value is `$false`.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies that the command overrides the prompt and fail immediately if the host name in the Autodiscover endpoint of the domain doesn't match the Secure Sockets Layer (SSL) certificate presented by the endpoint, and the host name isn't specified in the *TrustedHostnames* parameter.
TrustedHostnames	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *TrustedHostnames* parameter specifies the

			fully qualified domain name (FQDN) of federation endpoints. Federation endpoints are Client Access servers in an organization with federation enabled. Explicitly specifying the *TrustedHostnames* parameter allows the cmdlet to bypass prompting if the certificate presented by the endpoint doesn't match the domain name specified in the *DomainName* parameter.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-FederationTrust

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-FederationTrust** cmdlet to view the federation trust configured for the Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-FederationTrust [-Identity <FederationTrustIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves properties of the federation trust configured for the Exchange organization.

```
Get-FederationTrust | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.FederationTrustIdParameter	The *Identity* parameter specifies a federation trust ID. If not specified, the cmdlet returns all federation trusts configured for the Exchange organization.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-FederationTrust

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-FederationTrust** cmdlet to set up a federation trust between your Exchange organization and the Microsoft Federation Gateway.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-FederationTrust -ApplicationUri <String> -
SkipNamespaceProviderProvisioning <SwitchParameter> -Thumbprint <String>
[-AdministratorProvisioningId <String>] [-ApplicationIdentifier <String>]
[-MetadataUrl <Uri>] <COMMON PARAMETERS>

New-FederationTrust -Thumbprint <String> [-MetadataUrl <Uri>] [-
UseLegacyProvisioningService <SwitchParameter>] <COMMON PARAMETERS>
```

```
COMMON PARAMETERS: -Name <String> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the federation trust Microsoft Federation Gateway with a certificate with the thumbprint AC00F35CBA8359953F4126E0984B5CCAFA2F4F17.

```
New-FederationTrust -Name "Microsoft Federation Gateway" -
Thumbprint AC00F35CBA8359953F4126E0984B5CCAFA2F4F17
```

Detailed Description

Federation trusts are trusts created between an Exchange organization and the Microsoft Federation Gateway. A federation trust is required to configure a federated organization identifier for federated sharing.

For more information, see Federation.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationUri	Required	System.String	The *ApplicationUri* parameter specifies the primary domain used for the federated organization identifier. If you specify the *ApplicationUri* parameter, you must use the *SkipNamespaceProvide*

			rProvisioning switch and also specify the *AdministratorProvisioningId* and *ApplicationIdentifier* parameters.
Name	Required	System.String	The *Name* parameter specifies a friendly name for the federation trust.
SkipNamespaceProviderProvisioning	Required	System.Management.Automation.SwitchParameter	The *SkipNamespaceProviderProvisioning* switch specifies that the trust and federated organization identifier are provisioned externally without using federation functionality in Microsoft Exchange Server 2013. If you use this switch, you must specify the *ApplicationIdentifier*, *ApplicationUri*, and *AdministratorProvisioningId* parameters.
Thumbprint	Required	System.String	The *Thumbprint* parameter specifies the thumbprint of a

			certificate issued by a public certification authority (CA) trusted by the Microsoft Federation Gateway. For more details, see Federation.
AdministratorProvisioningId	Optional	System.String	The *AdministratorProvisioningId* parameter specifies the provisioning key returned by the Microsoft Federation Gateway when an organization has already registered a **SiteID** or **ApplicationID**. If you specify the *AdministratorProvisioningId* parameter, you must use the *SkipNamespaceProviderProvisioning* switch and also specify the *ApplicationIdentifier* and *ApplicationUri* parameters.
ApplicationIdentifier	Optional	System.String	The *ApplicationIdentifier* parameter specifies

			the **SiteID** or **ApplicationID** when an organization has already registered a **SiteID** or **ApplicationID**. If you specify the *ApplicationIdentifier* parameter, you must use the *SkipNamespaceProvider Provisioning* switch and also specify the *AdministratorProvisioningId* and *ApplicationUri* parameters.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory.
MetadataUrl	Optional	System.Uri	The *MetadataUrl* parameter specifies the URL where WS-FederationMetadata is published by the Microsoft Federation Gateway.
UseLegacyProvisioningService	Optional	System.Management.Automation.SwitchParameter	The *UseLegacyProvisioningService* parameter specifies if the legacy interface on the Microsoft Federation Gateway will be used for managing the federation trust, including federated domains, certificates, and federation metadata. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. When using a self-signed certificate for configuring a federation trust with the Microsoft

			Federation Gateway, the trust needs to be created with the parameter set to `$true`. After the federation trust is created, this behavior can't be changed and requires the deletion and re-creation of the federation trust. We recommend you always use the default value of `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-FederationTrust

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-FederationTrust** cmdlet to remove an existing federation trust from an Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-FederationTrust -Identity <FederationTrustIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the federation trust `Microsoft Federation Gateway`.

```
Remove-FederationTrust "Microsoft Federation Gateway"
```

Detailed Description

Federation trusts are set up with Microsoft Federation Gateway to enable calendar sharing and free/busy sharing with external Exchange organizations or individuals. The **Remove-FederationTrust** cmdlet removes a federation trust.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.FederationTrustIdParameter	The *Identity* parameter specifies the identity of the federation trust being removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can

			view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-FederationTrust

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-FederationTrust** cmdlet to modify an existing federation trust.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-FederationTrust -Identity <FederationTrustIdParameter> -
PublishFederationCertificate <SwitchParameter> <COMMON PARAMETERS>

Set-FederationTrust -Identity <FederationTrustIdParameter> [-MetadataUrl
<Uri>] [-RefreshMetadata <SwitchParameter>] [-Thumbprint <String>] <COMMON
PARAMETERS>

Set-FederationTrust -ApplicationUri <String> -Identity
<FederationTrustIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-Name <String>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the federation trust Microsoft Federation Gateway to use the certificate with the thumbprint AC00F35CBA8359953F4126E0984B5CCAFA2F4F17 as the next certificate.

```
Set-FederationTrust -Identity "Microsoft Federation
Gateway" -Thumbprint
AC00F35CBA8359953F4126E0984B5CCAFA2F4F17
```

EXAMPLE 2

This example configures the federation trust Microsoft Federation Gateway to use the next certificate as the current certificate.

Important:
Before you configure a federation trust to use the next certificate as the current certificate, you must use the **Test-FederationTrust** cmdlet to verify that the certificate is available on all Mailbox and Client Access servers.

```
Set-FederationTrust -Identity "Microsoft Federation
Gateway" -PublishFederationCertificate
```

Detailed Description

You can use the **Set-FederationTrust** cmdlet to manage the certificates used for the federation trust. You can also use the **Set-FederationTrust** cmdlet to refresh the metadata document from the Microsoft Federation Gateway and download its certificate.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ApplicationUri	Required	System.String	The *ApplicationUri* parameter specifies the primary domain used for the federation

			organization identifier.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.FederationTrustIdParameter	The *Identity* parameter specifies the name of the federation trust being modified.
PublishFederationCertificate	Required	System.Management.Automation.SwitchParameter	The *PublishFederationCertificate* switch specifies the next certificate as the current certificate for the federation trust and publishes it to the Microsoft Federation Gateway. The certificate is used to encrypt tokens with the Microsoft Federation Gateway. **Caution:** Before setting the next certificate to be used as the current certificate, ensure that the certificate is deployed on all Mailbox and Client Access servers. Use the **Test-FederationCertificate** cmdlet to check the deployment status of the certificate.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
MetadataUrl	Optional	System.Uri	The *MetadataUrl* parameter specifies the URL where WS-FederationMetadata is published by the Microsoft Federation Gateway.
Name	Optional	System.String	The *Name* parameter specifies a name for the federation trust.
RefreshMetadata	Optional	System.Management.Automation.SwitchParameter	The *RefreshMetadata* switch specifies that the metadata document and certificate is retrieved again from the Microsoft Federation Gateway.
Thumbprint	Optional	System.String	The *Thumbprint*

			parameter specifies the thumbprint of the X.509 certificate to be configured as the next certificate for the federation trust. After the certificate is deployed on all Mailbox and Client Access servers in the Exchange organization, you can use the *PublishFederationCertificate* switch to configure the trust to use this certificate.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-FederationTrust

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-FederationTrust** cmdlet to verify that the federation trust is properly configured and functioning as expected.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-FederationTrust [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-MonitoringContext <$true | $false>] [-UserIdentity
<RecipientIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example validates the federation trust deployed in the Exchange organization and checks whether a security token can be retrieved from the Microsoft Federation Gateway.

```
Test-FederationTrust
```

Detailed Description

You can run the **Test-FederationTrust** cmdlet from the Exchange Management Shell, or a monitoring system can run the test periodically.

The **Test-FederationTrust** cmdlet runs the following series of tests to ensure that federation is working as expected:

- A connection to the Microsoft Federation Gateway is established. This test ensures that communication between the local Exchange server and the Microsoft Federation Gateway is working correctly.
- Certificates are checked to ensure they're valid and can be used with the Microsoft Federation

Gateway.

- A security token is requested from the Microsoft Federation Gateway. This test ensures that a token can be properly retrieved and used.

You must run the **Test-FederationTrust** cmdlet from either an Exchange Mailbox or Client Access server.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated

			monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
UserIdentity	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *UserIdentity* parameter specifies a mailbox user to request a token for. If a mailbox user isn't specified, the command uses the default test mailbox. If the default test mailbox isn't present,

			the test fails. You can create the default test mailbox using the `New-TestCasConnectivityUser.ps1` script found in the Scripts folder of the Exchange installation. The test mailbox only needs to be created once.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-FederationTrustCertificate

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-FederationTrustCertificate** cmdlet to check the status of certificates used for federation on all Mailbox and Client Access servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-FederationTrustCertificate [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example reports the status of federation certificates on all Mailbox and Client Access servers.

```
Test-FederationTrustCertificate
```

Detailed Description

The certificate used to establish a federation trust is propagated to all Mailbox and Client Access servers in the Exchange organization. The **Test-FederationTrustCertificate** cmdlet reports the status of the certificate on each Mailbox and Client Access server.

The cmdlet doesn't require any parameters.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchPara	The *Confirm* switch causes the command to

		meter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-HybridConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-HybridConfiguration** cmdlet to view the hybrid configuration for the Microsoft Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-HybridConfiguration [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns detailed information about the hybrid deployment configuration.

```
Get-HybridConfiguration
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Hybrid deployment configuration" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-HybridConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-28*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-HybridConfiguration** cmdlet to create the HybridConfiguration object and set up a hybrid deployment between your on-premises Exchange organization and a Microsoft Office 365 for enterprises Exchange Online organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-HybridConfiguration [-ClientAccessServers <MultiValuedProperty>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Domains
<MultiValuedProperty>] [-EdgeTransportServers <MultiValuedProperty>] [-
ExternalIPAddresses <MultiValuedProperty>] [-Features
<MultiValuedProperty>] [-OnPremisesSmartHost <SmtpDomain>] [-
ReceivingTransportServers <MultiValuedProperty>] [-SendingTransportServers
<MultiValuedProperty>] [-ServiceInstance <Int32>] [-TlsCertificateName
<SmtpX509Identifier>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the hybrid configuration `Hybrid Configuration` with the default hybrid configuration settings.

```
New-HybridConfiguration
```

Detailed Description

A hybrid deployment offers organizations the ability to extend the feature-rich experience and administrative control they have with their existing on-premises Microsoft Exchange organization to the cloud. The **New-HybridConfiguration** cmdlet is used with the Hybrid Configuration wizard and is typically configured when the hybrid deployment is initially created by the wizard. We strongly recommend that you use the Hybrid Configuration wizard to create the HybridConfiguration object and configure your hybrid deployment with the Exchange Online organization.

For more information, see **Exchange Server 2013 Hybrid Deployments**.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Hybrid deployment configuration" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ClientAccessServers* parameter is deprecated and will be removed from Microsoft Exchange Server 2013.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Domains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Domains* parameter specifies the domain namespaces that are used in the hybrid deployment. These domains must be configured as accepted domains in either the on-premises Exchange organization or the Exchange Online service. The domains are used in configuring the organization relationships and Send and Receive connectors used by the hybrid configuration.
EdgeTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *EdgeTransportServers* parameter specifies the Exchange servers with the

		y	Exchange 2010 Service Pack 2 (SP2) Edge Transport server role installed that are configured to support the hybrid deployment features. The Edge Transport server must be externally accessible from the Internet on port 25. The accepted values for the *EdgeTransportServers* parameter are either the full or short computer name of an Edge Transport server, for example, either edge.corp.contoso.com or edge. Separate server names with a comma if defining more than one Edge Transport server. When configuring the *EdgeTransportServers* parameter, you must configure the *ReceivingTransportServers* and *SendingTransportServers* parameter values to `$null`.
ExternalIPAddresses	Optional	Microsoft.Exchange.Da	The *ExternalIPAddresses*

		ta.MultiValuedProperty	parameter is a legacy parameter that specifies the publicly accessible inbound IP address of Microsoft Exchange Server 2010 Hub Transport servers. The only configuration change that should be made with this parameter is to change or clear the legacy Exchange 2010 Hub Transport server IP address value. The IP address must be Internet Protocol version 4 (IPv4) based only.
Features	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Features* parameter specifies the features that are enabled for the hybrid configuration. One or more of the following values separated by commas can be entered. When using the Hybrid Configuration wizard, all features are enabled by default. • `OnlineArchive` Enables the Exchange Online archive for on-premises Exchange and Exchange Online organization users.

			• `FreeBusy` Enables free/busy calendar information to be shared between on-premises Exchange and Exchange Online organization users. • `MailTips` Enables MailTips information to be shared between on-premises Exchange and Exchange Online organization users. • `MessageTracking` Enables message tracking information to be shared between on-premises Exchange and Exchange Online organization users. • `OWARedirection` Enables automatic Microsoft Office Outlook Web App redirection to either the on-premises Exchange or Exchange Online organizations depending on where the user mailbox is located. • `SecureMail` Enables secure message transport via Transport Layer Security (TLS) between the on-premises Exchange and Exchange Online organizations. • `Centralized` Enables the on-premises servers to handle all message transport between the on-premises Exchange and Exchange Online

			organizations, including message delivering to the Internet for both organizations. If this value is `$false`, the on-premises server and Exchange Online organization are each responsible for their own Internet message delivery. • `Photos` Enables the sharing of user photo data between the on-premises Exchange and Exchange Online organizations. This feature works in tandem with the *PhotosEnabled* parameter in the **OrganizationRelationship** cmdlets in a hybrid deployment. If the *Photos* parameter is `$true`, the *PhotosEnabled* parameter is automatically set to `$true`. If the *Photos* parameter is `$false`, the *PhotosEnabled* parameter is automatically set to `$false`. When running the Hybrid Configuration wizard for the first time, the default value is `$true`.
OnPremisesSmartHost	Optional	Microsoft.Exchange.Data.SmtpDomain	The *OnPremisesSmartHost* parameter specifies the FQDN of the on-premises

			Mailbox server used for secure mail transport for messages sent between the on-premises Exchange and Exchange Online organizations.
ReceivingTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ReceivingTransportServers* parameter specifies the Exchange servers with the Client Access server role installed that are defined in the outbound connector configuration of the Microsoft Exchange Online Protection (EOP) service included as part of the Office 365 for enterprises tenant. The servers defined in the *ReceivingTransportServers* parameter are designated as the receiving servers for secure mail messages sent from the Exchange Online organization to the on-premises Exchange organization in a hybrid deployment. At least one Client Access server must be defined and be externally accessible from the Internet for secure

			mail to be enabled between the on-premises Exchange and Exchange Online organizations. The accepted values for the *ReceivingTransportServers* parameter are either the full or short computer name of a Client Access server, for example, either CAS.corp.contoso.com or CAS. Separate server names with a comma if defining more than one Client Access server. If configuring the *EdgeTransportServers* parameter in the hybrid deployment, the *ReceivingTransportServers* parameter value must be `$null`.
SendingTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SendingTransportServers* parameter specifies the Exchange servers with the Mailbox server role installed that are defined in the inbound connector configuration of the EOP service included as part of the Office 365 for

			enterprises tenant. The servers defined in the *SendingTransportServers* parameter are designated as the receiving servers for secure mail messages sent from the on-premises Exchange organization to the Exchange Online organization in a hybrid deployment. At least one Mailbox server must be defined and be externally accessible from the Internet for secure mail to be enabled between the on-premises Exchange and Exchange Online organizations. The accepted values for the *SendingTransportServers* parameter are either the full or short computer name of a Mailbox server, for example, either MBX.corp.contoso.com or MBX. Separate server names with a comma if defining more than one Mailbox server. If configuring the *EdgeTransportServers*

			parameter in the hybrid deployment, the *SendingTransportServers* parameter value must be `$null`.
ServiceInstance	Optional	System.Int32	The *ServiceInstance* parameter should only be used by organizations manually configuring hybrid deployments with Office 365 operated by 21Vianet in China. All other organizations should use the Hybrid Configuration wizard to configure a hybrid deployment with Office 365. The valid values for this parameter are 0 (null) or 1. The default value is 0 (null).For organizations connecting with Office 365 operated by 21Vianet in China, set this value to 1 when manually configuring your hybrid deployment.
TlsCertificateName	Optional	Microsoft.Exchange.Data.SmtpX509Identifier	The *TlsCertificateName* parameter specifies the X.509 certificate to use with TLS sessions and secure mail. Valid input

			for this parameter is `[I]`*Issuer*`[S]`*Subject*. The *Issuer* value is found in the certificate's `Issuer` field, and the *Subject* value is found in the certificate's `Subject` field. You can find these values by running the **Get-ExchangeCertificate** cmdlet.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-HybridConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-16*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-HybridConfiguration** cmdlet to delete the **HybridConfiguration** Active Directory object for your on-premises Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-HybridConfiguration [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the **HybridConfiguration** object for the hybrid deployment.

```
Remove-HybridConfiguration
```

Detailed Description

Removing a **HybridConfiguration** object should typically only be performed in circumstances where the hybrid deployment state is corrupt and under the direction of Microsoft Customer Service and Support. After removing the **HybridConfiguration** object, your existing hybrid deployment configuration settings aren't disabled or removed. However, when the Hybrid Configuration wizard is run again after removing the **HybridConfiguration** object, the wizard won't have a hybrid configuration reference point for your existing feature settings. As a result, it will automatically create a **HybridConfiguration** object and record the new hybrid deployment configuration feature values defined in the wizard. The feature settings associated with the hybrid deployment, such as organization relationship or Send and Receive connector parameters, which were configured with the **HybridConfiguration** object that's removed, aren't removed or modified until the Hybrid Configuration wizard is run again.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Hybrid deployment configuration" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can

			view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-HybridConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-28*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-HybridConfiguration** cmdlet to modify the hybrid deployment between your on-premises Microsoft Exchange organization and Exchange Online in a Microsoft Office 365 for enterprises organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-HybridConfiguration [-ClientAccessServers <MultiValuedProperty>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Domains
<MultiValuedProperty>] [-EdgeTransportServers <MultiValuedProperty>] [-
ExternalIPAddresses <MultiValuedProperty>] [-Features
<MultiValuedProperty>] [-Name <String>] [-OnPremisesSmartHost
<SmtpDomain>] [-ReceivingTransportServers <MultiValuedProperty>] [-
SendingTransportServers <MultiValuedProperty>] [-ServiceInstance <Int32>]
[-TlsCertificateName <SmtpX509Identifier>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example disables the secure mail and centralized transport hybrid deployment features, but keeps the Exchange Online Archive, MailTips, Outlook Web App redirection, free/busy, and message tracking features enabled between the on-premises Exchange and Exchange Online organizations.

```
Set-HybridConfiguration -Features
OnlineArchive,MailTips,OWARedirection,FreeBusy,MessageTrack
ing
```

EXAMPLE 2

This example specifies that the hybrid deployment uses a defined TLS certificate, referenced by the combination of the Issuer and Subject attributes of the CA issued X.509 certificate.

```
Set-HybridConfiguration -TlsCertificateName "<I>CN=A. Datum
Corporation CA-3, OU=www.adatum.com, O=A.Datum Corp,
C=US<S>CN=mail.contoso.com, O=Barbara Zighetti, L=Seattle,
S=WA, C=US"
```

Detailed Description

The **Set-HybridConfiguration** cmdlet modifies the hybrid configuration features, such as enabling secure mail, designating a specific Client Access server for hybrid functionality, or enabling or disabling free/busy information sharing and message tracking between the on-premises Exchange and Exchange Online organizations.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Hybrid deployment configuration" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
ClientAccessServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ClientAccessServers* parameter is deprecated and will be removed from

			Microsoft Exchange Server 2013.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Domains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Domains* parameter specifies the domain namespaces that will be used in the hybrid deployment. These domains must be configured as accepted domains in either the on-premises Exchange organization or the Exchange Online

			organization. The domains will be used in configuring the organization relationships and Send and Receive connectors used by the hybrid configuration.
EdgeTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *EdgeTransportServers* parameter specifies the Exchange servers with the Microsoft Exchange Server 2010 Service Pack 2 (SP2) Edge Transport server role installed that are configured to support the hybrid deployment features. The Edge Transport server must be externally accessible from the Internet on port 25. The accepted values for the *EdgeTransportServers* parameter are either the full or short computer name of an Edge Transport server, for example, either edge.corp.contoso.com or edge. Separate server names with a comma if defining more than one Edge Transport server.

			When configuring the *EdgeTransportServers* parameter, you must configure the *ReceivingTransportServers* and *SendingTransportServers* parameter values to `$null`.
ExternalIPAddresses	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalIPAddresses* parameter is a legacy parameter that specifies the publicly accessible inbound IP address of Exchange 2010 Hub Transport servers. The only configuration change that should be made with this parameter is to change or clear the legacy Exchange 2010 Hub Transport server IP address value. The IP address must be Internet Protocol version 4 (IPv4) based only.
Features	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Features* parameter specifies the features enabled for the hybrid configuration. One or more of the following values separated by

			commas can be entered. When using the Hybrid Configuration wizard, all features are enabled by default. • `Centralized` Enables transport servers to handle all message transport between the on-premises Exchange and Exchange Online organizations, including external message delivery to the Internet for both organizations. If this value is `$false`, the on-premises transport servers and Exchange Online organization are each responsible for their own Internet message delivery. • `FreeBusy` Enables free/busy calendar information to be shared between on-premises Exchange and Exchange Online organization users. • `MailTips` Enables MailTips information to be shared between on-premises Exchange and Exchange Online organization users. • `MessageTracking` Enables message tracking information to be shared between on-premises Exchange and Exchange Online organization users.

			• `OnlineArchive` Enables the Exchange Online archive feature so that Exchange Online supports hosting archive mailboxes for on-premises users. • `OWARedirection` Enables automatic Microsoft Office Outlook Web App redirection to either the on-premises Exchange or Exchange Online organizations depending on where the user mailbox is located. • `SecureMail` Enables secure message transport via Transport Layer Security (TLS) between the on-premises Exchange and Exchange Online organizations. • `Photos` Enables the sharing of user photo data between the on-premises Exchange and Exchange Online organizations. This feature works in tandem with the *PhotosEnabled* parameter in the **OrganizationRelationship** cmdlets in a hybrid deployment. If the *Photos* parameter is `$true`, the *PhotosEnabled* parameter is automatically set to `$true`. If the *Photos* parameter is `$false`,

			the *PhotosEnabled* parameter is automatically set to `$false`. When running the Hybrid Configuration wizard for the first time, the default value is `$true`.
Name	Optional	System.String	The *Name* parameter isn't used and will be deprecated from the **Set-HybridConfiguration** cmdlet in a future release. There can be only one HybridConfiguration object in an Exchange organization.
OnPremisesSmartHost	Optional	Microsoft.Exchange.Data.SmtpDomain	The *OnPremisesSmartHost* parameter specifies the FQDN of the on-premises Mailbox servers used for secure mail transport for messages sent between the on-premises Exchange and Exchange Online organizations.
ReceivingTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ReceivingTransportServers* parameter specifies the Exchange servers with the Client Access server role installed that are defined in the outbound

			connector configuration of the Microsoft Exchange Online Protection (EOP) service included as part of the Office 365 for enterprises tenant. The servers defined in the *ReceivingTransportServers* parameter are designated as the receiving servers for secure mail messages sent from the Exchange Online organization to the on-premises Exchange organization in a hybrid deployment. At least one Client Access server must be defined and be externally accessible from the Internet for secure mail to be enabled between the on-premises Exchange and Exchange Online organizations. The accepted values for the *ReceivingTransportServers* parameter are either the full or short computer name of a Client Access server, for example, either CAS.corp.contoso.com or CAS. Separate server names with a comma if

			defining more than one Client Access server. If configuring the *EdgeTransportServers* parameter in the hybrid deployment, the *ReceivingTransportServers* parameter value must be `$null`.
SendingTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SendingTransportServers* parameter specifies the Exchange servers with the Mailbox server role installed that are defined in the inbound connector configuration of the EOP service included as part of the Office 365 for enterprises tenant. The servers defined in the *SendingTransportServers* parameter are designated as the receiving servers for secure mail messages sent from the on-premise organization to the Exchange Online organization in a hybrid deployment. At least one Mailbox server must be defined and be externally

			accessible from the Internet for secure mail to be enabled between the on-premises Exchange and Exchange Online organizations. The accepted values for the *SendingTransportServers* parameter are either the full or short computer name of a Mailbox server, for example, either MBX.corp.contoso.com or MBX. Separate server names with a comma if defining more than one Mailbox server. If configuring the *EdgeTransportServers* parameter in the hybrid deployment, the *SendingTransportServers* parameter value must be `$null`.
ServiceInstance	Optional	System.Int32	The *ServiceInstance* parameter should only be used by organizations manually configuring hybrid deployments with Office 365 operated by 21Vianet in China. All other organizations

			should use the Hybrid Configuration wizard to configure a hybrid deployment with Office 365. The valid values for this parameter are 0 (null) or 1. The default value is 0 (null).For organizations connecting with Office 365 operated by 21Vianet in China, set this value to 1 when manually configuring your hybrid deployment.
TlsCertificateName	Optional	Microsoft.Exchange.Data.SmtpX509Identifier	The *TlsCertificateName* parameter specifies the X.509 certificate to use with TLS sessions and secure mail. Valid input for this parameter is `[I]`*Issuer*`[s]`*Subject*. The *Issuer* value is found in the certificate's `Issuer` field, and the *Subject* value is found in the certificate's `subject` field. You can find these values by running the **Get-ExchangeCertificate** cmdlet.
WhatIf	Optional	System.Management.Automation.SwitchPar	The *WhatIf* switch instructs the command to

		ameter	simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-HybridConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Update-HybridConfiguration** cmdlet to define the credentials used for updating the hybrid configuration object.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-HybridConfiguration -OnPremisesCredentials <PSCredential> -
TenantCredentials <PSCredential> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-ForceUpgrade <SwitchParameter>] [-
SuppressOAuthWarning <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example defines the credentials used when updating the hybrid configuration object and connecting to the Microsoft Office 365 for enterprises tenant.

Use this command to specify your on-premises credentials. For example, run this command and then enter *<domain>***\admin@contoso.com** and the associated account password in the credentials dialog box when prompted.

```
$OnPremisesCreds = Get-Credential
```

Use this command to specify your Office 365 for enterprises tenant credentials. For example, run this command and then enter admin@contoso.onmicrosoft.com and the associated account password in the credentials dialog box when prompted.

```
$TenantCreds = Get-Credential
```

Use this command to define the specified credentials that will be used when updating the hybrid configuration object and connecting to the Office 365 for enterprises tenant.

```
Update-HybridConfiguration -OnPremisesCredentials
$OnPremisesCreds -TenantCredentials $TenantCreds
```

Detailed Description

You can use the **Update-HybridConfiguration** cmdlet to designate the accounts and credentials that will be used when updating the hybrid configuration Active Directory object and connecting to the Microsoft Office 365 for enterprises tenant.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Hybrid deployment configuration" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
OnPremisesCredentials	Required	System.Management.Automation.PSCredential	The *OnPremisesCredentials* parameter specifies the

			on-premises Active Directory account and credentials that will be used to configure hybrid configuration features. This account must have the Organization Management management role group assigned.
TenantCredentials	Required	System.Management.Automation.PSCredential	The *TenantCredentials* parameter identifies the Office 365 for enterprises tenant organization account and credentials that will be used to configure hybrid configuration features. This is often the administrator account assigned when the Office 365 tenant was created. This account must have the Organization Management management role group assigned.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ForceUpgrade	Optional	System.Management.Automation.SwitchParameter	The *ForceUpgrade* parameter suppresses the prompt to confirm an upgrade of the HybridConfiguration Active Directory object. This confirmation prompt is only displayed when using the **Update-HybridConfiguration** cmdlet on a server

			running Microsoft Exchange Server 2013 and when the existing HybridConfiguration Active Directory object version is Exchange 2010.
SuppressOAuthWarning	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IntraOrganizationConfiguration

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-02*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-IntraOrganizationConfiguration** cmdlet to view the component settings of a hybrid Exchange deployment.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-IntraOrganizationConfiguration [-Organization
<OrganizationIdParameter>] [-OrganizationGuid
<OnPremisesOrganizationIdParameter>]
```

Examples

Example 1

This example returns the settings of the intra-organization configuration.

```
Get-IntraOrganizationConfiguration
```

Detailed Description

A hybrid Exchange deployment results in one logical organization made up of a number of physical Exchange instances. Hybrid Exchange environments contain more than one Exchange instance and support topologies like two on-premises Microsoft Exchange Server 2013 forests in an organization, an Exchange 2013 on-premises organization and an Exchange Online organization, or two Exchange Online organizations.

Hybrid environments are enabled by Intra-Organization connectors. The connectors can be created and managed by cmdlets like **New-IntraOrganizationConnector**, but we strongly recommend that you use the Hybrid Configuration wizard when configuring a hybrid deployment with an Exchange Online organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Intra-Organization connectors" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OrganizationGuid	Optional	Microsoft.Exchange.Configuration.Tasks.OnPremisesOrganizationIdParameter	This parameter is available only in the cloud-based service. The *OrganizationGuid* parameter specifies the on-premises organization in a hybrid deployment that has multiple on-premises organizations defined. If you don't use the *OrganizationGuid* parameter for these types of hybrid deployments, the **Get-IntraOrganizationConfiguration** cmdlet will generate errors. To view the on-premises organization GUID values that are required for this parameter, use the **Get-OnPremisesOrganiza**

			tion cmdlet.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-IntraOrganizationConnector

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-IntraOrganizationConnector** cmdlet to view the settings of Intra-Organization connectors.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-IntraOrganizationConnector [-Identity
<IntraOrganizationConnectorIdParameter>] [-DomainController <Fqdn>] [-
Organization <OrganizationIdParameter>]
```

Examples

Example 1

This example returns a summary list of all Intra-Organization connectors.

```
Get-IntraOrganizationConnector
```

Example 2

This example returns details about the Intra-Organization connector named "MainCloudConnector".

```
Get-IntraOrganizationConnector "MainCloudConnector" |
Format-List
```

Detailed Description

Intra-Organizational connectors enable features and services between divisions in your Exchange organization. It allows for the expansion of organizational boundaries for features and services across different hosts and network boundaries, such as between Active Directory forests, between on-premises and cloud-based organizations, or between tenants hosted in the same or different datacenters.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Intra-Organization connectors" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.IntraOrganizationConnectorIdParameter	The *Identity* parameter specifies the Intra-Organization connector that you want to view. You can use any value that uniquely identifies the connector. For example:

			• Name • Distinguished name (DN) • GUID
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-IntraOrganizationConnector

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-IntraOrganizationConnector** cmdlet to create an Intra-Organization connector between two on-premises Microsoft Exchange Server 2013 forests in an organization, between an Exchange 2013 on-premises organization and an Exchange Online organization, or between two Exchange Online organizations. This connector enables feature availability and service connectivity across the organizations using a common connector and connection endpoints.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-IntraOrganizationConnector -DiscoveryEndpoint <Uri> -Name <String> -
TargetAddressDomains <MultiValuedProperty> [-Confirm [<SwitchParameter>]]
[-DomainController <Fqdn>] [-Enabled <$true | $false>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example creates an Intra-Organization connector named "MainCloudConnector" between an on-premises Exchange 2013 organization and an Exchange Online organization containing two domains, Cloud1.contoso.com and Cloud2.contoso.com.

```
New-IntraorganizationConnector -DiscoveryEndpoint http://
ExternalDiscovery.Contoso.com -Name MainCloudConnector -
TargetAddressDomains Cloud1.contoso.com,Cloud2.contoso.com
```

Detailed Description

The **New-IntraOrganizationConnector** cmdlet is used to create a connection for features and services between divisions in your Exchange organization. It allows for the expansion of organizational boundaries for features and services across different hosts and network boundaries, such as between Active Directory forests, between on-premises and cloud-based organizations, or between tenants hosted in the same or different datacenters.

For hybrid deployments between on-premises Exchange 2013 and Exchange Online organizations, the **New-IntraOrganizationConnector** cmdlet is used by the Hybrid Configuration wizard. Typically, the Intra-Organization connector is configured when the hybrid deployment is initially created by the wizard. We strongly recommend that you use the Hybrid Configuration wizard to create the Intra-Organization connector when configuring a hybrid deployment with an Exchange Online organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Intra-Organization connectors" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
DiscoveryEndpoint	Required	System.Uri	The *DiscoveryEndpoint* parameter specifies the externally-accessible URL that's used for the Autodiscover service

			for the domain that's configured in the Intra-Organization connector.
Name	Required	System.String	The *Name* parameter specifies a friendly name for the Intra-Organization connector. If the value contains spaces, enclose the value in double quotation marks.
TargetAddressDomains	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *TargetAddressDomains* parameter specifies the domain namespaces that will be used in the Intra-organization connector. These domains must have valid Autodiscover endpoints defined in their organizations. The domains and their associated Autodiscover endpoints are used by the Intra-Organization connector for feature and service connectivity. You specify multiple

			domain values separated by commas.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disabled the Intra-organization connector. The valid values for this parameter are `$true` or

			`$false`. The default value is `$true`. When you set the value to `$false`, you completely stop connectivity for the specific connection.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-IntraOrganizationConnector

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-IntraOrganizationConnector** cmdlet to remove existing Intra-Organization connectors.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-IntraOrganizationConnector -Identity
<IntraOrganizationConnectorIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example removes the existing Intra-Organization connector named "Contoso On-premises-Exchange Online".

```
Remove-IntraOrganizationConnector "Contoso On-premises-Exchange Online"
```

Detailed Description

Intra-Organizational connectors enable features and services between divisions in your Exchange organization. It allows for the expansion of organizational boundaries for features and services across different hosts and network boundaries, such as between Active Directory forests, between on-premises and cloud-based organizations, or between tenants hosted in the same or different datacenters.

The **Remove-IntraOrganizationConnector** cmdlet removes the connector objects. To stop feature or service connectivity without removing the connector object, run the command `Set-IntraOrganizationConnector <ConnectorIdentity> -Enabled $false`.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Intra-Organization connectors" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.IntraOrganizationConnectorIdParameter	The *Identity* parameter specifies the Intra-Organization connector that you want to remove. You can use any value that uniquely identifies the connector. For example: • Name • Distinguished name (DN) • GUID
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-IntraOrganizationConnector

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-IntraOrganizationConnector** cmdlet to modify an existing Intra-Organization connector between two on-premises Microsoft Exchange Server 2013 forests in an organization, or between an Exchange 2013 on-premises organization and an Exchange Online organization, or between two Exchange Online organizations.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-IntraOrganizationConnector -Identity
<IntraOrganizationConnectorIdParameter> [-Confirm [<SwitchParameter>]] [-
DiscoveryEndpoint <Uri>] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-Name <String>] [-TargetAddressDomains <MultiValuedProperty>] [-
WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example disables the Intra-Organization connector named "MainCloudConnector".

```
Set-IntraOrganizationConnector "MainCloudConnector" -
Enabled $false
```

Detailed Description

Intra-Organizational connectors enable features and services between divisions in your Exchange organization. It allows for the expansion of organizational boundaries for features and services across different hosts and network boundaries, such as between Active Directory forests, between on-premises and cloud-based organizations, or between tenants hosted in the same or different datacenters.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Intra-Organization connectors" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter specifies the Intra-

		nfiguration.Tasks.IntraOrganizationConnectorIdParameter	Organization connector that you want to modify. You can use any value that uniquely identifies the connector. For example: • Name • Distinguished name (DN) • GUID
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DiscoveryEndpoint	Optional	System.Uri	The *DiscoveryEndpoint* parameter specifies the externally accessible URL used for the Autodiscover service for the domain configured in the IntraOrganization Connector. This parameter is automatically populated with the *TargetAutodiscoverEpr* value from the **Get-**

			FederationInformation cmdlet for the defined domain.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Enabled	Optional	System.Boolean	The *Enabled* parameter enables or disabled the Intra-organization connector. The valid values for this parameter are `$true` or `$false`. The default value is `$true`. When you set the value to `$false`, you completely stop connectivity for the specific connection.
Name	Optional	System.String	The *Name* parameter specifies a friendly name for the Intra-Organization connector. If the value contains spaces, enclose the value in double

			quotation marks.
TargetAddressDomains	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *TargetAddressDomains* parameter specifies the domain namespaces that will be used in the Intra-Organization connector. The domains must have valid Autodiscover endpoints defined in their organizations. The domains and their associated Autodiscover endpoints are used by the Intra-Organization connector for feature and service connectivity.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-PendingFederatedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-PendingFederatedDomain** cmdlet to display a list of pending federated domains for the federation trust for your Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-PendingFederatedDomain
```

Examples

EXAMPLE 1

This example retrieves the pending federated domain information for the federation trust for your Exchange organization.

```
Get-PendingFederatedDomain
```

Detailed Description

The **Get-PendingFederatedDomain** cmdlet is used as part of the Exchange Administration Center (EAC) functionality and shouldn't be used by administrators manually configuring a federation trust.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-PendingFederatedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-PendingFederatedDomain** cmdlet to configure pending domains with the federated organization identifier in the federation trust for the Exchange organization.

Important:
The domains being added to the federation trust must exist as accepted domains in the Exchange organization.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-PendingFederatedDomain [-Identity <OrganizationIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-PendingAccountNamespace
<SmtpDomain>] [-PendingDomains <SmtpDomain[]>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the pending domains contoso.com and sales.contoso.com to the existing federation trust.

```
Set-PendingFederatedDomain -PendingDomains
contoso.com,sales.contoso.com
```

Detailed Description

The **Set-PendingFederatedDomain** cmdlet is used as part of the Exchange Administration Center (EAC) functionality and shouldn't be used by administrators manually configuring a federation trust. This cmdlet allows the EAC to save domains selected as the *FederatedOrganizationIdentifier* or federated domains when proof of domain ownership hasn't been completed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Federation trusts" entry in the Exchange and Shell infrastructure permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Identity	Optional	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.OrganizationIdParameter	is reserved for internal Microsoft use.
PendingAccountNamespace	Optional	Microsoft.Exchange.Data.SmtpDomain	The *PendingAccountNamespace* parameter specifies the pending domain used as the account namespace for the federation trust.
PendingDomains	Optional	Microsoft.Exchange.Data.SmtpDomain[]	The *PendingDomains* parameter specifies the pending federated domains configured for the federation trust.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-Recipient

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-Recipient** cmdlet to add Microsoft Exchange attributes to recipient objects created by the global address list (GAL) synchronization management agent in Microsoft Forefront Identity Manager (FIM) 2010. The recipient objects you modify using this cmdlet must reside on a server running Microsoft Exchange Server 2010 or later.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-Recipient -Identity <RecipientIdParameter> [-Confirm
[<SwitchParameter>]] [-Credential <PSCredential>] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds Exchange attributes to the mail contact that represents John Smith's mailbox.

```
Update-Recipient -Identity "John Smith"
```

EXAMPLE 2

This example updates all contacts in a specific organizational unit (OU). This example assumes that recipients are synchronized between two forests, contoso.com and fabrikam.com, and all the synchronized recipients from the fabrikam.com domain are stored in a specific OU called fabrikam.com Users in the contoso.com domain.

```
Get-MailContact -OrganizationalUnit "contoso.com/
fabrikam.com Users" | Update-Recipient
```

Detailed Description

Because of mergers, acquisitions, or legal requirements, customers may need to deploy Exchange in a multiple Exchange forest topology. These deployments require the synchronization of recipient objects across disparate Active Directory forests.

Microsoft provides the GAL synchronization management agent for synchronizing recipient objects. The version of the GAL synchronization management agent included in Microsoft Identity Integration Server (MIIS) 2003 was designed to work with Exchange Server 2003 and relied on the Recipient Update Service. Because the Recipient Update Service is a deprecated feature and is no longer required, the new GAL synchronization management agent included in FIM 2010 is designed to function without the Recipient Update Service.

As part of the synchronization process, the FIM 2010 GAL synchronization management agent creates recipient objects in both Active Directory forests. After the recipients are created, the management agent uses the **Update-Recipient** cmdlet to add the attributes required by Microsoft Exchange to complete the provisioning of these recipients.

In Exchange, before you can run the **Update-Recipient** cmdlet to convert an Active Directory user object into an Exchange mailbox, you must stamp the user object with the following three mandatory Exchange attributes:

- **homeMDB**
- **mailNickname**
- **msExchHomeServerName**

Note:
If you're using MIIS 2003, you must run various cmdlets to complete the provisioning process of the mail contacts created by the GAL synchronization management agent. The **Update-Recipient** cmdlet provides an alternate and more efficient method to do this. You can run the **Update-Recipient** cmdlet against the recipient objects created by the MIIS 2003 GAL synchronization management agent to complete the provisioning process.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Recipient Provisioning Permissions" section in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	The *Identity* parameter specifies the recipient. This parameter accepts

			the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/ou=AdministrativeGroup/cn=Recipients/cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Disable-RemoteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Disable-RemoteMailbox** cmdlet to remove a mailbox from the cloud-based service. The associated user object in the on-premises Active Directory isn't removed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Disable-RemoteMailbox <COMMON PARAMETERS>

Disable-RemoteMailbox [-Archive <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <RemoteMailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-IgnoreLegalHold <SwitchParameter>] [-
PreventRecordingPreviousDatabase <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the mailbox in the service associated with the on-premises mail-enabled user Kim Akers. The mail-enabled user is automatically converted to a regular user. This example assumes directory synchronization has been configured.

```
Disable-RemoteMailbox "Kim Akers"
```

EXAMPLE 2

This example removes an archive mailbox in the service but keeps the mailbox in the service associated with the on-premises mail-enabled user David Strome. This example assumes directory synchronization has been configured.

```
Disable-RemoteMailbox "David Strome" -Archive
```

Detailed Description

Use the **Disable-RemoteMailbox** cmdlet if you want to remove the mailbox from the service but keep the associated on-premises mail-enabled user. You can also use it to disconnect the archive mailbox in the service from the mailbox in the service. If you want to remove both the mailbox from the service and the on-premises mail-enabled user, use the Remove-RemoteMailbox cmdlet.

Directory synchronization must be configured correctly for a mailbox to be removed from the service. Removal of the mailbox from the service isn't immediate and depends on the directory synchronization schedule.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RemoteMailboxIdParameter	The *Identity* parameter takes one of the following values: • ADObjectID • GUID

			• Distinguished name (DN) • *Domain**SamAccountName* • User principal name (UPN) • LegacyExchangeDN • Email address • User alias
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies whether to disconnect the archive mailbox in the service from the associated mailbox in the service. The on-premises mail-enabled user and its associated mailbox in the service aren't removed if you use this switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as

			alias or GUID, aren't accepted.
IgnoreLegalHold	Optional	System.Management.Automation.SwitchParameter	The *IgnoreLegalHold* switch ignores the legal hold status of the mailbox user and allows you to disable the cloud-based mailbox that's on legal hold. **Caution:** When you disable a mailbox, the mailbox is disconnected from the user account. After you disable a mailbox, you can't include it in a discovery search. Disconnected mailboxes are permanently deleted from the mailbox database after the deleted mailbox retention period expires. Check with your organization's legal or Human Resources department before disabling a mailbox that's on legal hold.
PreventRecordingPreviousDatabase	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Enable-RemoteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Enable-RemoteMailbox** cmdlet to create a mailbox in the cloud-based service for an existing user in the on-premises Active Directory.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Enable-RemoteMailbox [-RemoteRoutingAddress <ProxyAddress>] <COMMON
PARAMETERS>

Enable-RemoteMailbox -Room <SwitchParameter> [-RemoteRoutingAddress
<ProxyAddress>] <COMMON PARAMETERS>

Enable-RemoteMailbox -Equipment <SwitchParameter> [-RemoteRoutingAddress
<ProxyAddress>] <COMMON PARAMETERS>

Enable-RemoteMailbox [-RemoteRoutingAddress <ProxyAddress>] <COMMON
PARAMETERS>

Enable-RemoteMailbox [-Archive <SwitchParameter>] [-ArchiveName
```

```
<MultiValuedProperty>] <COMMON PARAMETERS>

COMMON PARAMETERS: -Identity <UserIdParameter> [-Alias <String>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
PrimarySmtpAddress <SmtpAddress>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example mail-enables an existing on-premises user and creates an associated mailbox in the service. The remote routing address doesn't need to be specified because mail flow between the on-premises organization and the service has been configured. Using this configuration, the **Enable-RemoteMailbox** cmdlet automatically calculates the SMTP address of the mailbox to be used with the *RemoteRoutingAddress* parameter. This example also assumes directory synchronization has been configured.

Note:

To mail-enable an existing user and create an associated mailbox in the service, run the New-RemoteMailbox cmdlet and specify the identity of the existing user.

```
Enable-RemoteMailbox "Kim Akers"
```

After the user is mail-enabled, directory synchronization synchronizes the mail-enabled user to the service and the associated mailbox is created.

EXAMPLE 2

This example does the following:

- Mail-enables an existing on-premises user.
- Creates the associated mailbox in the service.
- Creates an archive mailbox in the service for the mailbox.

As in Example 1, this example assumes that mail flow and directory synchronization have been properly configured.

To mail-enable an on-premises user, create the associated mailbox in the service, enable the archive mailbox in the service, and include the *Archive* switch with the **Enable-RemoteMailbox** cmdlet.

```
Enable-RemoteMailbox "Kim Akers" -Archive
```

Detailed Description

The **Enable-RemoteMailbox** cmdlet mail-enables an existing on-premises user. The mail-enabled user contains a specific attribute that indicates that an associated mailbox in the service should be

created when the user is synchronized to the service using directory synchronization.

Directory synchronization must be configured correctly for a mailbox to be created in the service. Creation of the mailbox in the service isn't immediate and depends on the directory synchronization schedule.

Important:
The policies that you apply to recipients in the on-premises Exchange organization, such as Unified Messaging or compliance policies, aren't applied to mailboxes in the service. You must configure policies in the service if you want policies to be applied to recipients in the service.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Equipment	Required	System.Management.Automation.SwitchParameter	The *Equipment* switch specifies that the mailbox in the service should be created as an equipment resource mailbox. You can't use the *Equipment* switch if you specified the *Room* switch.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.UserIdParameter	The *Identity* parameter specifies the identity of the existing on-premises user. The *Identity* parameter can have one of the following values: • ADObjectID • GUID • Distinguished name (DN) • *Domain*

			SamAccountName • User principal name (UPN) • LegacyExchangeDN • User alias
Room	Required	System.Management.Automation.SwitchParameter	The *Room* switch specifies that the mailbox in the service should be created as a room resource mailbox. You can't use the *Room* switch if you specified the *Equipment* switch.
Alias	Optional	System.String	The *Alias* parameter specifies the alias of the user and its associated mailbox in the service. An alias can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $ • % • ^ • & • * • + • - • . • /

			• = • ? • _ • { • } • | • ~
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies whether to create an archive mailbox in the service in addition to the mailbox created in the service. You don't have to specify a value with this switch.
ArchiveName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ArchiveName* parameter specifies the name of the archive mailbox. Use this parameter to change the name of the archive.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DisplayName	Optional	System.String	The *DisplayName* parameter specifies the display name for the mailbox that's created in the service.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary SMTP address for the mail user. By default, the primary SMTP address is generated based on the default email address policy. If you specify a primary SMTP address by using this parameter, the cmdlet sets the **EmailAddressPolicyEnabled** attribute of the mail user to `$false`, and the email addresses of this mail user aren't automatically updated based on email address policies.

RemoteRoutingAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *RemoteRoutingAddress* parameter specifies the SMTP address of the mailbox in the service that this user is associated with. If you've configured mail flow between the on-premises organization and the service, you don't need to specify this parameter. The remote routing address is calculated automatically.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RemoteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-RemoteMailbox** cmdlet to retrieve the mail-related attributes of one or more users in the on-premises Active Directory associated with mailboxes in the cloud-based service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-RemoteMailbox [-Anr <String>] <COMMON PARAMETERS>

Get-RemoteMailbox [-Identity <RemoteMailboxIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Archive <SwitchParameter>] [-Credential
<PSCredential>] [-DomainController <Fqdn>] [-Filter <String>] [-
IgnoreDefaultScope <SwitchParameter>] [-OnPremisesOrganizationalUnit
<OrganizationalUnitIdParameter>] [-ReadFromDomainController
<SwitchParameter>] [-ResultSize <Unlimited>] [-SortBy <String>]
```

Examples

EXAMPLE 1

This example retrieves a complete list of remote mailboxes for the entire Exchange organization.

```
Get-RemoteMailbox
```

EXAMPLE 2

This example uses alternate credentials to retrieve a list of one or more mail-enabled users with mailboxes in the service. This is useful if the account you typically use doesn't have administrative permissions. The credentials are used to access the on-premises Active Directory domain controllers.

First, run the following command to prompt you for your credentials, and then store them in a

variable.

```
$Credentials = Get-Credential
```

Then retrieve a list of remote mailboxes using the credentials you provided by using the following command.

```
Get-RemoteMailbox -Credential $Credentials
```

Detailed Description

The **Get-RemoteMailbox** cmdlet retrieves the mail-related attributes of a mail user in the on-premises Active Directory. It doesn't retrieve the attributes of the associated mailbox in the service. Most of the mail-related attributes of the on-premises mail user and the associated mailbox in the service should be the same. However, the mailbox in the service has additional attributes that you can't view by using the **Get-RemoteMailbox** cmdlet. To view the attributes of the mailbox, you must instead either view the mailbox by opening the appropriate forest in the Exchange Administration Center or connect to the service using the Exchange Management Shell and use the **Get-Mailbox** cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Anr	Optional	System.String	The *Anr* parameter specifies a string on which to perform an ambiguous name resolution (ANR) search. You can specify a partial string and search for objects with an attribute that matches that string. The default attributes searched are: • **CommonName (CN)**

			• **DisplayName** • **FirstName** • **LastName** • **Alias**
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies whether to return information about the recipient's archive mailbox.
Credential	Optional	System.Management.Automation.PSCredential	The *Credential* parameter specifies the user name and password to use to access the on-premises Active Directory. This parameter requires the creation and passing of a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information, see Get-Credential.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Filter	Optional	System.String	The *Filter* parameter indicates the OPath filter

			used to filter recipients. For more information about the filterable properties, see Filterable properties for the -Filter parameter.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RemoteMailboxIdParameter	The *Identity* parameter identifies the remote mailbox. You can use one of the following values: • GUID • Distinguished name (DN) • *Domain\Account* • User principal name (UPN) • LegacyExchangeDN • SmtpAddress • Alias
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to access Active Directory objects that aren't currently in the default scope. Using the

			IgnoreDefaultScope parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias, aren't accepted. • You can't use the *OnPremisesOrganizationalUnit* and *Identity* parameters together. • You can't use the *Credential* parameter.
OnPremisesOrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OnPremisesOrganizationalUnit* parameter specifies a container in the on-premises organization in which to limit the results. You can specify either an organizational unit (OU) or a domain. The canonical name should be specified, for example: • OU:

			westcoast.contoso.com/users • Domain: westcoast.contoso.com
ReadFromDomainController	Optional	System.Management.Automation.SwitchParameter	The *ReadFromDomainController* parameter specifies that the user information is read from a domain controller in the user's domain. If you set the recipient scope to include all recipients in the forest and don't use this parameter, it's possible that the user information is read from a global catalog with outdated information. If you use this parameter, multiple reads might be necessary to get the information. **Note:** By default, the recipient scope is set to the domain that hosts your servers that run Exchange.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all mailboxes that match the query, use `unlimited` for the value of

			this parameter. The default value is 1000.
SortBy	Optional	System.String	The *SortBy* parameter specifies the attribute by which to sort the results. You can sort by only one attribute at a time. You can sort by the following attributes: • Alias • Display name • Name The results are sorted in ascending order.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-RemoteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-08*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-RemoteMailbox** cmdlet to create a mail-enabled user in the on-premises Active Directory and also create an associated mailbox in the cloud-based service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-RemoteMailbox -Password <SecureString> -UserPrincipalName <String>
<COMMON PARAMETERS>

New-RemoteMailbox -Room <SwitchParameter> [-Password <SecureString>] [-
UserPrincipalName <String>] <COMMON PARAMETERS>

New-RemoteMailbox -Equipment <SwitchParameter> [-Password <SecureString>]
[-UserPrincipalName <String>] <COMMON PARAMETERS>

New-RemoteMailbox -AccountDisabled <SwitchParameter> [-Password
<SecureString>] [-UserPrincipalName <String>] <COMMON PARAMETERS>

New-RemoteMailbox [-Password <SecureString>] [-UserPrincipalName <String>]
<COMMON PARAMETERS>

COMMON PARAMETERS: -Name <String> [-Alias <String>] [-ArbitrationMailbox
<MailboxIdParameter>] [-Archive <SwitchParameter>] [-Confirm
[<SwitchParameter>]] [-DisplayName <String>] [-DomainController <Fqdn>] [-
FirstName <String>] [-ImmutableId <String>] [-Initials <String>] [-
Languages <MultiValuedProperty>] [-LastName <String>] [-
MailboxProvisioningConstraint <MailboxProvisioningConstraint>] [-
MailboxProvisioningPreferences <MultiValuedProperty>] [-ModeratedBy
<MultiValuedProperty>] [-ModerationEnabled <$true | $false>] [-
OnPremisesOrganizationalUnit <OrganizationalUnitIdParameter>] [-
OverrideRecipientQuotas <SwitchParameter>] [-PrimarySmtpAddress
<SmtpAddress>] [-RemotePowerShellEnabled <$true | $false>] [-
RemoteRoutingAddress <ProxyAddress>] [-ResetPasswordOnNextLogon <$true |
$false>] [-SamAccountName <String>] [-SendModerationNotifications <Never |
Internal | Always>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an on-premises mail-enabled user and its associated mailbox in the service. The remote routing address doesn't need to be specified because mail flow between the on-premises organization and the service has been configured. Using this configuration, the **New-RemoteMailbox** cmdlet automatically calculates the SMTP address of the mailbox to be used with the *RemoteRoutingAddress* parameter. This example also assumes directory synchronization has been configured.

First, store the password to use with the new remote mailbox in a variable by using the **Get-Credential** cmdlet.

```
$Credentials = Get-Credential
```

Then run the **New-RemoteMailbox** cmdlet to create the mail user.

```
New-RemoteMailbox -Name "Kim Akers" -Password
$Credentials.Password -UserPrincipalName
kim@corp.contoso.com
```

After the new mail user is created, directory synchronization synchronizes the new mail user to the service and the associated mailbox is created.

EXAMPLE 2

This example shows how to do the following:

- Creates an on-premises mail-enabled user. The mail-enabled user is placed in the contoso.com/Archive Users OU. The OU has no effect on the mailbox in the service.
- Creates the associated mailbox in the service.
- Creates an archive mailbox in the service for the mailbox.

As in Example 1, this example assumes that mail flow and directory synchronization have been properly configured.

First, store the password to use with the new remote mailbox in a variable by using the **Get-Credential** cmdlet.

```
$Credentials = Get-Credential
```

Then run the **New-RemoteMailbox** cmdlet to create the mail user.

```
New-RemoteMailbox -Name "Kim Akers" -Password
$Credentials.Password -UserPrincipalName
kim@corp.contoso.com -OnPremisesOrganizationalUnit
"corp.contoso.com/Archive Users" -Archive
```

Detailed Description

The **New-RemoteMailbox** cmdlet creates an on-premises mail-enabled user. The mail-enabled user contains a specific attribute, which indicates that an associated mailbox in the service should be created when the user is synchronized to the service using directory synchronization.

Directory synchronization must be configured correctly for a mailbox to be created in the service. Creation of the mailbox in the service isn't immediate and depends on the directory synchronization schedule.

Important:
The policies that you apply to recipients in the on-premises Exchange organization, such as Unified Messaging or compliance policies, aren't applied to mailboxes in the service. You must configure policies in the service if you want policies to be applied to recipients in the service.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
AccountDisabled	Required	System.Management.Automation.SwitchParameter	The *AccountDisabled* switch specifies whether to create the mail-enabled user in a disabled state. You don't have to specify a value with this parameter.
Equipment	Required	System.Management.Automation.SwitchParameter	The *Equipment* switch specifies that the mailbox in the service should be created as an equipment resource mailbox. You can't use the *Equipment* switch if you specified the *Room* switch.
Name	Required	System.String	The *Name* parameter specifies the common name (CN) of the on-premises mail-enabled user and its associated mailbox in the service.
Password	Required	System.Security.SecureString	The *Password* parameter specifies the password used by the mail user to secure his or her account and associated mailbox in the service.
Room	Required	System.Management.	The *Room* switch specifies

		Automation.SwitchParameter	that the mailbox in the service should be created as a room resource mailbox. You can't use the *Room* switch if you specified the *Equipment* switch.
UserPrincipalName	Required	System.String	The *UserPrincipalName* parameter specifies the logon name for the user. This is the name the user will use for authentication. The UPN can be different than the user's email address. For example. a user could have a UPN of user@corp.contoso.com, but their email address could be user@contoso.com.
Alias	Optional	System.String	The *Alias* parameter specifies the email alias of the user and its associated mailbox in the service that you're creating. The alias can be a combination of characters separated by a period with no intervening spaces. Don't use special characters in the alias.

ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *ArbitrationMailbox* parameter specifies the mailbox used to manage the moderation process.
Archive	Optional	System.Management.Automation.SwitchParameter	The *Archive* switch specifies whether to create an archive mailbox in the service in addition to the mailbox that's created in the service. You don't have to specify a value with this switch.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisplayName	Optional	System.String	The *DisplayName* parameter specifies the name displayed in Microsoft Outlook for the mail user and its associated mailbox in the service.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FirstName	Optional	System.String	The *FirstName* parameter specifies the first name of the user that you create.
ImmutableId	Optional	System.String	The *ImmutableId* parameter is used by GAL Synchronization (GALSync) and specifies a unique and immutable identifier in the form of an SMTP address for an Exchange mailbox that's used for federated delegation when requesting Security Assertion Markup Language (SAML) tokens. If federation is configured for this mailbox and you don't set this parameter when you create the mailbox, Exchange creates the value for the immutable identifier based upon the mailbox's **ExchangeGUID** and the federated account

			namespace, for example, 7a78e7c8-620e-4d85-99d3-c90d90f29699@mail.contoso.com. You must set the *ImmutableId* parameter if Active Directory Federation Services (AD FS) is deployed to allow single sign-on into an off-premises mailbox and AD FS is configured to use a different attribute than **ExchangeGUID** for sign-on token requests. Both, Exchange and AD FS must request the same token for the same user to ensure proper functionality for a cross-premise Exchange deployment scenario.
Initials	Optional	System.String	The *Initials* parameter specifies the initials of the user that you create.
Languages	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
LastName	Optional	System.String	The *LastName* parameter specifies the last name of

			the user that you create.
MailboxProvisioningConstraint	Optional	Microsoft.Exchange.Data.Directory.MailboxProvisioningConstraint	This parameter is reserved for internal Microsoft use.
MailboxProvisioningPreferences	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users responsible for moderating the messages sent to this mail user and its associated mailbox in the service. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled* parameter to `$true`.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable or disable moderation for the mail user. The two possible values for this parameter are `$true` or `$false`. To enable moderation, set this parameter to `$true`. To

			disable moderation, set this parameter to `$false`. The default value is `$false`.
OnPremisesOrganizationalUnit	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationalUnitIdParameter	The *OnPremisesOrganizationalUnit* parameter specifies the organizational unit (OU) in the on-premises organization in which the new mailbox is added (for example, redmond.contoso.com/Users). This parameter has no effect on the mailbox in the service.
OverrideRecipientQuotas	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary SMTP address for the mail user. By default, the primary SMTP address is generated based on the default email address policy. If you specify a primary SMTP address by using this parameter, the command sets the

			EmailAddressPolicyEnabled attribute of the mail user to `$false`, and the email addresses of this mail user aren't automatically updated based on email address policies.
RemotePowerShellEnabled	Optional	System.Boolean	The *RemotePowerShellEnabled* parameter specifies whether the user can use remote Windows PowerShell. Remote Windows PowerShell is required to open the Exchange Management Shell on Mailbox and Client Access servers. Access to remote Windows PowerShell is required even if you're trying to open the Shell on the local server. The valid values are `$True` and `$False`. The default value is `$True`.
RemoteRoutingAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *RemoteRoutingAddress* parameter specifies the SMTP address of the mailbox in the service that

			this user is associated with. This address is created automatically when the service is initially configured in the format of <your domain>.mail.onmicrosoft.com. If you've configured mail flow between the on-premises organization and the service, such as in a hybrid deployment, you don't need to specify this parameter. The remote routing address is calculated automatically and assigned to the email address policy for the on-premises organization by the Hybrid Configuration wizard.
ResetPasswordOnNextLogon	Optional	System.Boolean	The *ResetPasswordOnNextLogon* parameter specifies whether the password in the *Password* parameter must be reset the next time the user logs on. If set to `$true`, the *ResetPasswordOnNextLogon* parameter specifies

			that the password in the *Password* parameter must be reset the next time the user logs on.
SamAccountName	Optional	System.String	The *SamAccountName* parameter defines the logon name used to support clients and servers running older versions of the operating system. This attribute must contain fewer than 20 characters. An account name can contain letters, numbers, and the following punctuation marks and symbols: • ! • # • $ • % • ^ • & • - • . • _ • { • } • | • ~
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.	The *SendModerationNotificati*

		TransportModerationNotificationFlags	*ons* parameter specifies whether status notifications are sent to users when they send a message to the moderated distribution group. You can specify one of the following values: • `Always` • `Internal` • `Never` Set this parameter to `Always` if you want notifications to be sent to all senders. Set this parameter to `Internal` if you want notifications to be sent only to the senders who are internal to your organization. Set this parameter to `Never` to disable all status notifications. The default value is `Never`. **Note:** The sender is always notified if the message is rejected by the moderators, regardless of the value of this parameter.
WhatIf	Optional	System.Management.	The *WhatIf* switch

		Automation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RemoteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-RemoteMailbox** cmdlet to remove a mail-enabled user in the on-premises Active Directory and the associated mailbox in the cloud-based service.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-RemoteMailbox -Identity <RemoteMailboxIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-IgnoreDefaultScope
<SwitchParameter>] [-IgnoreLegalHold <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the on-premises mail-enabled user Kim Akers and the associated mailbox from the service. This example assumes directory synchronization has been configured.

```
Remove-RemoteMailbox "Kim Akers"
```

Detailed Description

With the **Remove-RemoteMailbox** cmdlet, you can remove an on-premises mail-enabled user and the mailbox from the service. If you only want to remove the mailbox from the service and keep the associated on-premises user, use the Disable-RemoteMailbox cmdlet.

Directory synchronization must be configured correctly for a mailbox to be removed from the service. Removal of the mailbox from the service isn't immediate and depends on the directory synchronization schedule.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RemoteMailboxIdParameter	The *Identity* parameter identifies the mail-enabled user and the associated mailbox in the service that you want to remove. You can use one of the following values: • ADObjectID • Distinguished name (DN) • Legacy DN • GUID

			• *Domain\Account name* • User principal name (UPN) • Email address • Alias
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to

			access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
IgnoreLegalHold	Optional	System.Management.Automation.SwitchParameter	The *IgnoreLegalHold* switch ignores the legal hold status of the mailbox user and allows you to remove the cloud-based mailbox on legal hold. **⚠Warning:** After you remove a mailbox, you can't include it in a discovery search. Depending on the command parameters you use, removed mailboxes are either purged immediately or

			when the deleted mailbox retention period expires. Check with your organization's legal or Human Resources department before disabling a mailbox that's on legal hold.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RemoteMailbox

Exchange Management Shell > Exchange 2013 cmdlets > Federation and hybrid cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-RemoteMailbox** cmdlet to modify the mail-related attributes of an existing user in Active Directory that's associated with a mailbox in the cloud-based service.

For information about the parameter sets in the Syntax section below, see Syntax.

```

Examples

EXAMPLE 1

This example configures the mailbox in the service that's associated with the specified mail-enabled user as a room resource mailbox. This example assumes that directory synchronization has been configured.

```
Set-RemoteMailbox davids -Type Room
```

EXAMPLE 2

This example configures delivery restrictions for the mailbox in the service that's associated with the specified mail-enabled user. This example assumes that directory synchronization has been configured.

```
Set-RemoteMailbox kima -AcceptMessagesOnlyFrom davids,
"Executive Team", bill@contoso.com
```

Detailed Description

The **Set-RemoteMailbox** cmdlet configures Exchange attributes for an on-premises mail-enabled user. The configuration set on the on-premises mail-enabled user is synchronized to its associated mailbox in the service.

Note:
Some attributes on mailboxes in the service can only be configured by connecting to the service and using the Set-Mailbox cmdlet.

Directory synchronization must be configured correctly for changes made to an on-premises mail-enabled user to be applied to a mailbox in the service. Changing the configuration of the mailbox in the service isn't immediate and depends on the directory synchronization schedule.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote mailboxes" entry in the Recipients Permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RemoteMailboxIdParameter	The *Identity* parameter specifies the mail-enabled user. You can use one of the following values: • ADObjectID • GUID • Distinguished name (DN)

			• *Domain \SamAccountName* • User principal name (UPN) • Legacy DN • Email address • User alias
AcceptMessagesOnlyFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFrom* parameter specifies the mailbox users and mail-enabled users that can send email messages to this mail-enabled user. You can also specify Exchange as a valid recipient for this parameter. If you configure a mail-enabled user to accept messages only from the Exchange recipient, the mail-enabled user only receives system-generated messages. You can use one of the following values for the valid senders: • DN • Canonical name • GUID • Name • Display name

			• Alias • Exchange DN • Primary SMTP email address By default, this parameter is blank, which enables the mail-enabled user to accept messages from all senders.
AcceptMessagesOnlyFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromDLMembers* parameter specifies the distribution groups whose members are allowed to send email messages to this mail-enabled user. You can use any of the following values for the allowed distribution groups: • DN • Canonical name • GUID • Name • Display name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail-enabled user to accept messages from all

			senders.
AcceptMessagesOnlyFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AcceptMessagesOnlyFromSendersOrMembers* parameter specifies the recipients who are allowed to send email messages to this mail-enabled user. You can use any of the following values for the allowed recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail-enabled user to accept messages from all senders.
AggregatedMailboxGuids	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
Alias	Optional	System.String	The *Alias* parameter specifies the alias (mail

			nickname) of the mail-enabled user. The alias can be a combination of characters separated by a period with no intervening spaces. Don't use special characters in the alias.
ArbitrationMailbox	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	This parameter is reserved for internal Microsoft use.
ArchiveGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
ArchiveName	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ArchiveName* parameter specifies the name of the archive mailbox. Use this parameter to change the name of the archive.
ArchiveQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ArchiveWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
BypassModerationFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *BypassModerationFromSendersOrMembers* parameter specifies the recipients whose messages bypass moderation when sending

			to this mail-enabled user. You can use any of the following values: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address This value makes sure that all messages are moderated when this mail-enabled user is configured for moderation. **Note:** Senders designated as moderators for this mail-enabled user are never moderated.
CalendarVersionStoreDisabled	Optional	System.Boolean	The *CalendarVersionStoreDisabled* parameter specifies whether calendar changes in a user's mailbox are logged. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`. By default, all changes to a

			calendar item are recorded in the mailbox of a user to keep older versions of meeting items.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateDTMFMap	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
CustomAttribute1	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute10	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.

CustomAttribute11	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute12	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute13	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute14	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute15	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify

			custom attributes. You can use these attributes to store additional information.
CustomAttribute2	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute3	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute4	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute5	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional

			information.
CustomAttribute6	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute7	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute8	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
CustomAttribute9	Optional	System.String	The *CustomAttribute1* to *CustomAttribute15* parameters specify custom attributes. You can use these attributes to store additional information.
DisplayName	Optional	System.String	The *DisplayName*

			parameter specifies the display name for the user account associated with this mail-enabled user.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
EmailAddresses	Optional	Microsoft.Exchange.Data.ProxyAddressCollection	The *EmailAddresses* parameter specifies the email alias of the mail-enabled user. All valid Exchange email address types may be used. You can specify multiple values for the *EmailAddresses* parameter as a comma-delimited list. **Important:** Exchange doesn't validate custom addresses for proper formatting. You must ensure that the custom address you specify complies with the format requirements for that address type. Because X.400 addresses are considered custom addresses in Exchange, they're also not validated, and you must provide the

			correct syntax when specifying an X.400 address.
EmailAddressPolicyEnabled	Optional	System.Boolean	The *EmailAddressPolicyEnabled* parameter specifies whether the email addresses for the mail-enabled user are automatically updated based on the email address policies defined. The two possible values for this parameter are `$true` or `$false`. When this parameter is set to `$true`, you can't change the *PrimarySmtpAddress* or *WindowsEmailAddress* parameters.
EndDateForRetentionHold	Optional	System.DateTime	The *EndDateForRetentionHold* parameter specifies the end date for retention hold for messaging records management (MRM). To use this parameter, the *RetentionHoldEnabled* parameter must be set to `$true`.
ExchangeGuid	Optional	System.Guid	This parameter is reserved

			for internal Microsoft use.
ExtensionCustomAttribute1	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute2	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute*

			parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute3	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute4	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *ExtensionCustomAttribute*

		y	*1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
ExtensionCustomAttribute5	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExtensionCustomAttribute 1-5* parameters specify custom attributes that store additional information. You can specify multiple values for these parameters as a comma delimited list. Each *ExtensionCustomAttribute* parameter can hold up to 1,300 values. For more information

			about custom attributes, see Custom attributes. For more information about using multivalued properties, see Modifying multivalued properties.
GrantSendOnBehalfTo	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *GrantSendOnBehalfTo* parameter specifies the DN of recipients that can send messages on behalf of this mail-enabled user.
HiddenFromAddressListsEnabled	Optional	System.Boolean	The *HiddenFromAddressListsEnabled* parameter specifies whether the mail-enabled user appears in the address list. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.
IgnoreDefaultScope	Optional	System.Management.Automation.SwitchParameter	The *IgnoreDefaultScope* parameter instructs the command to ignore the default recipient scope setting for the Exchange Management Shell session and use the entire forest as the scope. This allows the command to

			access Active Directory objects that aren't currently in the default scope. Using the *IgnoreDefaultScope* parameter introduces the following restrictions: • You can't use the *DomainController* parameter. The command uses an appropriate global catalog server automatically. • You can only use the DN for the *Identity* parameter. Other forms of identification, such as alias or GUID, aren't accepted.
ImmutableId	Optional	System.String	The *ImmutableId* parameter is used by Outlook Live Directory Sync (OLSync) and specifies a unique and immutable identifier in the form of an SMTP address for an Exchange mailbox that's used for federated delegation when requesting Security Assertion Markup Language (SAML) tokens.

			If federation is configured for this mail-enabled user and you don't set this parameter when you create the mailbox, Exchange creates the value for the immutable identifier based upon the mailbox's **ExchangeGUID** and the federated account namespace, for example, 7a78e7c8-620e-4d85-99d3-c90d90f29699@mail.contoso.com. You must set the *ImmutableId* parameter if Active Directory Federation Services (AD FS) is deployed to allow single sign-on into off-premises mailboxes and AD FS is configured to use a different attribute than **ExchangeGUID** for sign-on token requests. Both, Exchange and AD FS must request the same token for the same user to ensure proper functionality for cross-premise Exchange

			organizations.
JournalArchiveAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	This parameter is reserved for internal Microsoft use.
LitigationHoldDate	Optional	System.DateTime	The *LitigationHoldDate* parameter specifies the date when the mail-enabled user and its associated mailbox in the service are placed on litigation hold. The parameter is populated automatically when placing a mailbox on litigation hold. This can be used for informational or reporting purposes. **Note:** When using the Exchange Management Shell to place the mailbox on litigation hold, you can optionally specify any date as the *LitigationHoldDate*, but the mailbox is placed on litigation hold when the cmdlet is run.
LitigationHoldEnabled	Optional	System.Boolean	The *LitigationHoldEnabled* parameter specifies that the mail-enabled user and its associated mailbox in the service are under litigation hold and that messages can't be deleted

			from the mailbox. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`. After a mailbox is placed on litigation hold, deleted items and all versions of changed items are retained in the Recoverable Items folder. Items that are purged from the dumpster are also retained and the items are held indefinitely. If you enable litigation hold, single-item recovery quotas aren't applied.
LitigationHoldOwner	Optional	System.String	The *LitigationHoldOwner* parameter specifies the user who placed the mail-enabled user and the associated mailbox in the service on litigation hold. The parameter is populated automatically when placing a mailbox on litigation hold. This can be used for informational and reporting purposes. **Note:** When using the Shell to place a mailbox on litigation hold, you can optionally specify a string

			value for this parameter.
MailboxContainerGuid	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
MailTip	Optional	System.String	The *MailTip* parameter specifies the message displayed to senders when they start drafting an email message to this mail-enabled user. The *MailTip* parameter message must be less than or equal to 250 characters.
MailTipTranslations	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *MailTipTranslations* parameter specifies additional languages when you want to provide the *MailTip* parameter information for this recipient in multiple languages. For each language, you must provide the locale, followed by a colon and the specific *MailTip* parameter message in that language. Each *MailTip* parameter message must be less than or equal to 250 characters. Multiple languages can be

			separated by commas.
MaxReceiveSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxReceiveSize* parameter specifies the maximum size of email messages that can be received by the mail-enabled user, from 1 kilobyte (KB) through 2,097,151 KB. If not specified, there are no size restrictions.
MaxSendSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxSendSize* parameter specifies the maximum size of email messages that can be sent by the mail-enabled user, from 1 KB through 2,097,151 KB. If not specified, there are no size restrictions.
ModeratedBy	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ModeratedBy* parameter specifies the users responsible for moderating the messages sent to the mail-enabled user. To designate more than one user, separate the users with commas. This parameter is required if you set the *ModerationEnabled*

			parameter to `$true`. If you leave this parameter blank and there's a user already specified as the manager of this mail-enabled user, the *ModeratedBy* parameter is automatically set by the *ManagedBy* parameter of the distribution group. Otherwise, an error is returned.
ModerationEnabled	Optional	System.Boolean	The *ModerationEnabled* parameter specifies whether to enable moderation for the mail-enabled user. The two possible values for this parameter are `$true` or `$false`. To enable moderation, set this parameter to `$true`. To disable moderation, set this parameter to `$false`. The default value is `$false`.
Name	Optional	System.String	The *Name* parameter specifies the name of the mail-enabled user.
Password	Optional	System.Security.SecureString	This parameter is reserved for internal Microsoft use.

PrimarySmtpAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PrimarySmtpAddress* parameter specifies the primary SMTP address.
RecipientLimits	Optional	Microsoft.Exchange.Data.Unlimited	The *RecipientLimits* parameter specifies the maximum number of recipients for messages from this mail-enabled user.
RecoverableItemsQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *RecoverableItemsQuota* parameter specifies the size limit for the Recoverable Items folder for a remote mailbox or remote archive mailbox in the cloud-based service.
RecoverableItemsWarningQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *RecoverableItemsWarningQuota* parameter specifies the size of the Recoverable Item folder before Exchange sends a warning message to the mailbox owner and logs an event to the application event log.
RejectMessagesFrom	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFrom* parameter specifies the recipients from which to reject messages. You can

			use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail-enabled user to accept messages from all senders.
RejectMessagesFromDLMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromDLMembers* parameter specifies the distribution list members from which to reject messages. You can use any of the following values to specify the recipients: • DN • Alias • Canonical name • Display name • GUID • Name

			• LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail-enabled user to accept messages from all senders.
RejectMessagesFromSendersOrMembers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RejectMessagesFromSendersOrMembers* parameter specifies the recipients who aren't allowed to send email messages to this mail-enabled user. You can use any of the following values to specify the recipients: • Alias • Canonical name • Display name • DN • GUID • Name • LegacyExchangeDN • Primary SMTP email address By default, this parameter is blank, which enables the mail-enabled user to accept messages from all senders.

RemoteRoutingAddress	Optional	Microsoft.Exchange.Data.ProxyAddress	The *RemoteRoutingAddress* parameter specifies the SMTP address of the mailbox in the service that's associated with this mail-enabled user. You shouldn't have to change the remote routing address if the address was automatically configured by Exchange when the mail-enabled user and its associated mailbox in the service were created.
RemovePicture	Optional	System.Management.Automation.SwitchParameter	The *RemovePicture* parameter specifies whether to remove the picture that a user has added to a mailbox.
RemoveSpokenName	Optional	System.Management.Automation.SwitchParameter	The *RemoveSpokenName* parameter specifies whether to remove the spoken name that a user has added to a mailbox.
RequireSenderAuthenticationEnabled	Optional	System.Boolean	The *RequireSenderAuthenticationEnabled* parameter specifies whether to accept messages only

			from authenticated recipients. The two possible values for this parameter are `$true` or `$false`. The default value is `$false`.
ResetPasswordOnNextLogon	Optional	System.Boolean	The *ResetPasswordOnNextLogon* parameter specifies whether to require the mail-enabled users to change their password the next time they sign in to the cloud-based service. The two possible values for this parameter are `$true` or `$false`. If the *ResetPasswordOnNextLogon* parameter is set to `$true`, the mail-enabled users are required to change their password the next time they sign in to the cloud-based service.
RetainDeletedItemsFor	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RetainDeletedItemsFor* parameter specifies the length of time to keep deleted items. To specify a value, enter it as a time span: dd.hh:mm:ss where d =

			days, h = hours, m = minutes, and s = seconds. For example, to specify a 15-hour interval, enter 15:00:00.
RetentionComment	Optional	System.String	The *RetentionComment* parameter specifies a comment displayed in Microsoft Outlook regarding the user's retention hold status. This comment can be set only if the *RetentionHoldEnabled* parameter is set to `$true`. This comment should be localized to the user's preferred language.
RetentionHoldEnabled	Optional	System.Boolean	The *RetentionHoldEnabled* parameter specifies whether retention hold is enabled for messaging retention policies. The two possible values for this parameter are `$true` or `$false`. To set the start date for retention hold, use the *StartDateForRetentionHold* parameter.

RetentionUrl	Optional	System.String	The *RetentionUrl* parameter specifies the URL or an external web page with additional details about the organization's messaging retention policies. This URL can be used to expose details regarding retention policies in general, which is usually a customized legal or IT website for the company.
SamAccountName	Optional	System.String	The *SamAccountName* parameter specifies the logon name used to support clients and servers running older versions of the operating system, such as Microsoft Windows NT 4.0, Windows 98, Windows 95, and LAN Manager. This attribute must contain fewer than 20 characters. An account name can contain letters, numbers, and the following punctuation marks and symbols: • ! • #

			• $ • % • ^ • & • - • . • _ • { • } • | • ~
SecondaryAddress	Optional	System.String	The *SecondaryAddress* parameter specifies the secondary address used by the Unified Messaging (UM)-enabled user.
SecondaryDialPlan	Optional	Microsoft.Exchange.Configuration.Tasks.UMDialPlanIdParameter	This parameter is reserved for internal Microsoft use.
SendModerationNotifications	Optional	Microsoft.Exchange.Data.Directory.Recipient.TransportModerationNotificationFlags	The *SendModerationNotifications* parameter specifies whether status notifications are sent to users when they send a message to the moderated mail-enabled user. You can use one of the following values: • `Always` • `Internal` • `Never` If you want notifications

			to be sent to all senders, set this parameter to `Always`. If you want notifications to be sent only to the senders who are internal to your organization, set this parameter to `Internal`. To disable all status notifications, set this parameter to `Never`. **Note:** The sender is always notified if the message is rejected by the moderators, regardless of the value of this parameter. The default value is `Never`.
SimpleDisplayName	Optional	System.String	The *SimpleDisplayName* parameter is used to display an alternative description of the object when only a limited set of characters is permitted. This limited set of characters consists of ASCII characters 26 through 126, inclusively.
SingleItemRecoveryEnabled	Optional	System.Boolean	The *SingleItemRecoveryEnabled* parameter specifies

			whether to prevent the Recovery Items folder from being purged. When this parameter is set to `$true`, it prevents the Recovery Items folder from being purged. It also prevents any items from being removed that have been deleted or edited. The possible values for this parameter are `$true` or `$false`. The default value is `$false`.
StartDateForRetentionHold	Optional	System.DateTime	The *StartDateForRetentionHold* parameter specifies the start date for retention hold for MRM. To use this parameter, the *RetentionHoldEnabled* parameter must be set to `$true`.
Type	Optional	Microsoft.Exchange.Management.RecipientTasks.ConvertibleRemoteMailboxSubType	The *Type* parameter specifies the type for the mailbox in the service. You can use the following values: • `Regular` • `Room` • `Equipment`
UMDtmfMap	Optional	Microsoft.Exchange.Data.MultiValuedPropert	This parameter is reserved for internal Microsoft use.

		y	
UserCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
UserPrincipalName	Optional	System.String	The *UserPrincipalName* parameter specifies a UPN for the user.
UserSMimeCertificate	Optional	Microsoft.Exchange.Data.MultiValuedProperty	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WindowsEmailAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *WindowsEmailAddress* parameter specifies the Windows email address for this mail-enabled user. This address isn't used by Exchange.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Move-ActiveMailboxDatabase

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Move-ActiveMailboxDatabase** cmdlet to perform a database or server switchover.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Move-ActiveMailboxDatabase -Identity <DatabaseIdParameter> <COMMON
PARAMETERS>

Move-ActiveMailboxDatabase -Server <MailboxServerIdParameter> <COMMON
PARAMETERS>

COMMON PARAMETERS: [-ActivateOnServer <MailboxServerIdParameter>] [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
MountDialOverride <None | Lossless | GoodAvailability | BestAvailability |
BestEffort>] [-MoveComment <String>] [-SkipActiveCopyChecks
<SwitchParameter>] [-SkipClientExperienceChecks <SwitchParameter>] [-
SkipHealthChecks <SwitchParameter>] [-SkipLagChecks <SwitchParameter>] [-
SkipMaximumActiveDatabasesChecks <SwitchParameter>] [-TerminateOnWarning
<SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example performs a switchover of the database DB2 to the Mailbox server MBX1. When the command completes, MBX1 hosts the active copy of DB2. Because the *MountDialOverride* parameter is set to *None*, MBX1 mounts the database using its own defined database auto mount dial settings.

```
Move-ActiveMailboxDatabase DB2 -ActivateOnServer MBX1 -
MountDialOverride:None
```

EXAMPLE 2

This example performs a switchover of the database DB1 to the Mailbox server MBX3. When the command completes, MBX3 hosts the active copy of DB1. Because the *MountDialOverride* parameter is specified with a value of *Good Availability*, MBX3 mounts the database using a database auto mount dial setting of *GoodAvailability*.

```
Move-ActiveMailboxDatabase DB1 -ActivateOnServer MBX3 -
MountDialOverride:GoodAvailability
```

EXAMPLE 3

This example performs a switchover of the database DB3 to the Mailbox server MBX4. When the command completes, MBX4 hosts the active copy of DB3. Because the *MountDialOverride* parameter isn't specified, MBX4 mounts the database using a database auto mount dial setting of *Lossless*.

```
Move-ActiveMailboxDatabase DB3 -ActivateOnServer MBX4
```

EXAMPLE 4

This example performs a server switchover for the Mailbox server MBX1. All active mailbox database copies on MBX1 will be activated on one or more other Mailbox servers with healthy copies of the active databases on MBX1.

```
Move-ActiveMailboxDatabase -Server MBX1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not

included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *Identity* parameter specifies the identity of the mailbox database being activated.
Server	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *Server* parameter specifies the identity of the server from which to move all active mailbox databases.
ActivateOnServer	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *ActivateOnServer* parameter specifies the name of the Mailbox server on which the mailbox database copy should be activated.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Da	The *DomainController*

		ta.Fqdn	parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
MountDialOverride	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DatabaseMountDialOverride	The *MountDialOverride* parameter is used to override the auto database mount dial (AutoDatabaseMountDial) setting for the target server and specify an alternate setting. The following are possible values: • `None` When using this value, the currently configured auto database mount dial setting on the target server will be used. • `Lossless` This is the default value. When using this value, the database doesn't automatically mount until all log files that were generated on the original active copy have been copied to the passive copy. • `GoodAvailability` If you specify this value, the database automatically mounts immediately after a

			failover if the copy queue length is less than or equal to 6. If the copy queue length is greater than 6, the database doesn't automatically mount. When the copy queue length is less than or equal to 6, Microsoft Exchange attempts to replicate the remaining logs to the passive copy and then mounts the database. • `BestEffort` If you specify this value, the database automatically mounts regardless of the size of the copy queue length. Because the database will mount with any amount of log loss, using this value could result in a large amount of data loss. • `BestAvailability` If you specify this value, the database automatically mounts immediately after a failover if the copy queue length is less than or equal to 12. The copy queue length is the number of logs recognized by the passive copy that needs to be replicated. If the copy queue length is more than 12, the database doesn't automatically mount. When the copy queue

			length is less than or equal to 12, Exchange attempts to replicate the remaining logs to the passive copy and then mounts the database.
MoveComment	Optional	System.String	The *MoveComment* parameter specifies an optional administrative reason for the move operation. The comment is recorded in the Event log.
SkipActiveCopyChecks	Optional	System.Management.Automation.SwitchParameter	The *SkipActiveCopyChecks* parameter specifies whether to skip checking the current active copy to see if it's currently a seeding source for any passive databases. Be aware that when using this parameter, you can move a database that's currently a seeding source, which cancels the seed operation.
SkipClientExperienceChecks	Optional	System.Management.Automation.SwitchParameter	The *SkipClientExperienceChecks* parameter specifies whether to skip the search catalog (content index) state check to see if the

			search catalog is healthy and up to date. If the search catalog for the database copy you're activating is in an unhealthy or unusable state and you use this parameter to skip the search catalog health check and activate the database copy, you will need to either re-crawl or reseed the search catalog.
SkipHealthChecks	Optional	System.Management.Automation.SwitchParameter	The *SkipHealthChecks* parameter specifies whether to bypass passive copy health checks. With the *SkipHealthChecks* parameter, you can move the active copy to a database copy that's in the Failed state. This parameter should be used only if the initial attempt to move the active database has failed. This is because the *SkipHealthChecks* parameter performs additional validation to ensure that the log files are consistent, which can

			take a considerable amount of time.
SkipLagChecks	Optional	System.Management.Automation.SwitchParameter	The *SkipLagChecks* parameter specifies whether to allow a copy to be activated that has replay and copy queues outside of the configured criteria.
SkipMaximumActiveDatabasesChecks	Optional	System.Management.Automation.SwitchParameter	The *SkipMaximumActiveDatabasesChecks* is used to skip checking the value of MaximumPreferredActiveDatabases during the best copy and server selection (BCSS) process. Any configured value for MaximumActiveDatabases will still be honored during the BCSS process and by the Information Store.
TerminateOnWarning	Optional	System.Management.Automation.SwitchParameter	The *TerminateOnWarning* parameter specifies whether to terminate the task and output an error message if a warning is encountered during the switchover operation.
WhatIf	Optional	System.Management.	The *WhatIf* switch

		Automation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-DatabaseAvailabilityGroup** cmdlet to obtain a variety of configuration settings, status, and other information about a database availability group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DatabaseAvailabilityGroup [-Identity
<DatabaseAvailabilityGroupIdParameter>] [-DomainController <Fqdn>] [-
Status <SwitchParameter>]
```

Examples

EXAMPLE 1

This example displays the basic properties of the DAG DAG1. The output for the command is formatted as a list.

```
Get-DatabaseAvailabilityGroup DAG1 | Format-List
```

EXAMPLE 2

This example displays the properties of the DAG DAG2. Because it includes the *Status* parameter, the task also displays real-time status information for DAG2, such as the current list of operational servers, and the server currently holding the Primary Active Manager role. In addition, several properties of the DAG, such as the witness server and directory configuration information are also displayed. The output for the command is formatted as a list.

```
Get-DatabaseAvailabilityGroup DAG2 -Status | Format-List
```

Detailed Description

In addition to obtaining a list of DAG members, the **Get-DatabaseAvailabilityGroup** cmdlet can also be used to view real-time status information about a DAG, such as:

- **OperationalServers**
- **PrimaryActiveManager**
- **ReplicationPort**
- **NetworkNames**
- **WitnessShareInUse**

Use the *Status* parameter with the command to include the values for these listed properties. Without the *Status* parameter, the values returned for these properties are blank.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability group properties" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG to query.
Status	Optional	System.Management.Automation.SwitchParameter	The *Status* parameter instructs the command to query Active Directory for additional information, and to include real-time status information in the output.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-01*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-DatabaseAvailabilityGroup** cmdlet to create a database availability group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-DatabaseAvailabilityGroup -Name <String> [-Confirm
[<SwitchParameter>]] [-DagConfiguration
<DatabaseAvailabilityGroupConfigurationIdParameter>] [-
DatabaseAvailabilityGroupIpAddresses <IPAddress[]>] [-DomainController
<Fqdn>] [-ThirdPartyReplication <Disabled | Enabled>] [-WhatIf
[<SwitchParameter>]] [-WitnessDirectory <NonRootLocalLongFullPath>] [-
WitnessServer <FileShareWitnessServerName>]
```

Examples

EXAMPLE 1

This example creates the DAG DAG1 that's configured to use a witness server of CAS1, and a local directory of C:\DAG1. DAG1 is also configured to use DHCP for the DAG's IP addresses.

```
New-DatabaseAvailabilityGroup -Name DAG1 -WitnessServer
CAS1 -WitnessDirectory C:\DAG1
```

EXAMPLE 2

This example creates the DAG DAG2. The system automatically selects a Client Access server without the Mailbox server role in the same site as the DAG to use as the witness server. DAG2 is assigned a single static IP address because the MAPI network for DAG2 contains or will contain a single subnet (10.0.0.x).

```
New-DatabaseAvailabilityGroup -Name DAG2 -
DatabaseAvailabilityGroupIpAddresses 10.0.0.8
```

EXAMPLE 3

This example creates the DAG DAG3. DAG3 is configured to use CAS1 for the witness server, and a witness directory on CAS1 of C:\DAG3. DAG3 is assigned multiple static IP addresses because the MAPI network for the DAG contains or will contain multiple subnets (10.0.0.x and 192.168.0.x).

```
New-DatabaseAvailabilityGroup -Name DAG3 -WitnessServer
CAS1 -WitnessDirectory C:\DAG3 -
DatabaseAvailabilityGroupIpAddresses 10.0.0.8,192.168.0.8
```

EXAMPLE 4

This example creates the DAG DAG4 configured to use DHCP. In addition, the witness server is automatically selected by the system and the default witness directory is created.

```
New-DatabaseAvailabilityGroup -Name DAG4
```

EXAMPLE 5

This example creates the DAG DAG5 without a cluster administrative access point (Windows Server 2012 R2 and later DAG members only). DAG5 is configured to use CAS1 for the witness server, and a witness directory on CAS1 of C:\DAG3.

```
New-DatabaseAvailabilityGroup -Name DAG5 -WitnessServer
CAS1 -WitnessDirectory C:\DAG3 -
DatabaseAvailabilityGroupIpAddresses
([System.Net.IPAddress])::None
```

Detailed Description

When creating a DAG, you need to specify a valid computer name for the DAG no longer than 15 characters that's unique within the Active Directory forest. In addition, each DAG is configured with a witness server and witness directory. The witness server and its directory are used only for quorum purposes where there's an even number of members in the DAG. You don't need to create the witness directory in advance. Exchange automatically creates and secures the directory for you on the witness server. The directory shouldn't be used for any purpose other than for the DAG witness server.

The requirements for the witness server are as follows:

- The witness server can't be a member of the DAG.
- The witness server must be in the same Active Directory forest as the DAG.
- The witness server must be running the Windows Server 2012 R2, Windows Server 2012, Windows Server 2008 R2, Windows Server 2008, Windows Server 2003 R2, or Windows Server 2003 operating system.
- A single server can serve as a witness for multiple DAGs; however, each DAG requires its own witness directory.

We recommend that you use a Client Access server running on Microsoft Exchange Server 2013 in the Active Directory site containing the DAG. This allows the witness server and directory to remain under the control of an Exchange administrator.

The following combinations of options and behaviors are available:

- You can specify only a name for the DAG. In this scenario, the task searches for a Client Access server in the local Active Directory site that doesn't have the Mailbox server role installed, and it automatically creates the default directory and share on that server and uses that Client Access server as the witness server.
- You can specify a name for the DAG, the witness server that you want to use, and the directory you want created and shared on the witness server.
- You can specify a name for the DAG and the witness server that you want to use. In this scenario,

the task creates the default directory on the specified witness server.

- You can specify a name for the DAG and specify the directory you want created and shared on the witness server. In this scenario, the task searches for a Client Access server in the local Active Directory site that doesn't have the Mailbox server role installed, and it automatically creates the specified directory on that server, shares the directory, and uses that Client Access server as the witness server.

Important:
If the witness server you specify isn't an Exchange 2013 server, you must add the Exchange Trusted Subsystem universal security group (USG) to the local Administrators group on the witness server. If the witness server is a directory server, you must add the Exchange Trusted Subsystem USG to the Builtin\Administrators group. These security permissions are necessary to ensure that Exchange can create a directory and share on the witness server as needed.

In addition to providing a name for the DAG, one or more IP addresses must also be assigned to the DAG, unless you are creating a DAG without a cluster administrative access point, which can be done only with DAG members running Windows Server 2012 R2. You can assign static IP addresses to the DAG by using the *DatabaseAvailabilityGroupIpAddresses* parameter. If you omit this parameter or configure the parameter with a value of 0.0.0.0, the task attempts to use Dynamic Host Configuration Protocol (DHCP) to obtain the necessary IP addresses. If you configure the parameter with a value of 255.255.255.255, the task attempts to create a DAG without a cluster administrative access point.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Name	Required	System.String	The *Name* parameter specifies a unique name for the new DAG of up to 15 characters. The name you use must not conflict with any computer name in the organization.
Confirm	Optional	System.Management.Automation.SwitchPara	The *Confirm* switch causes the command to

		meter	pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DagConfiguration	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupConfigurationIdParameter	This parameter is reserved for internal Microsoft use.
DatabaseAvailabilityGroupIpAddresses	Optional	System.Net.IPAddress[]	The *DatabaseAvailabilityGroupIpAddresses* parameter specifies one or more static IPv4 addresses to the DAG when a Mailbox server is added to a DAG. If you omit the *DatabaseAvailabilityGroupIpAddresses* parameter when creating a DAG, the system attempts to lease one or more IPv4 addresses from a DHCP server in your organization to assign to the DAG. Setting the

			DatabaseAvailabilityGroupIpAddresses parameter to a value of `0.0.0.0` also configures the DAG to use DHCP. Setting the *DatabaseAvailabilityGroupIpAddresses* parameter to a value of `255.255.255.255` creates a DAG without a cluster administrative access point.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ThirdPartyReplication	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ThirdPartyReplicationMode	The *ThirdPartyReplication* parameter specifies to configure and enable a DAG to use third-party replication that leverages the Exchange Third Party Replication API instead of the built-in continuous replication. After this

			mode is enabled, it can't be changed.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WitnessDirectory	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *WitnessDirectory* parameter specifies the name of the directory on the witness server used to store file share witness data. The directory and share should be hosted on an Exchange server other than any of the Mailbox servers in the DAG. This allows an Exchange administrator to maintain operational control over the directory. The specified directory must not be

			in use by any other DAGs or used for any purpose other than for the witness server. If you omit this option, the default witness directory is used.
WitnessServer	Optional	Microsoft.Exchange.Data.FileShareWitnessServerName	The *WitnessServer* parameter specifies the name of a server used as a quorum witness when the DAG contains an even number of members. The selected server must not be a member of the DAG that's configured to use it. If you omit the *WitnessServer* parameter, the task tries to automatically select a Client Access server without the Mailbox server role in the same Active Directory site as the DAG to use as the witness server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-DatabaseAvailabilityGroup** cmdlet to delete an empty database availability group (DAG). Before you can delete a DAG, you must first remove all Mailbox servers from the DAG.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DatabaseAvailabilityGroup -Identity
<DatabaseAvailabilityGroupIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example, deletes the DAG DAG1.

```
Remove-DatabaseAvailabilityGroup -Identity DAG1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG to be removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without

			having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Restore-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Restore-DatabaseAvailabilityGroup** cmdlet as part of a datacenter switchover of a database availability group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Restore-DatabaseAvailabilityGroup -Identity
<DatabaseAvailabilityGroupIdParameter> [-ActiveDirectorySite
<AdSiteIdParameter>] [-AlternateWitnessDirectory
<NonRootLocalLongFullPath>] [-AlternateWitnessServer
<FileShareWitnessServerName>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-UsePrimaryWitnessServer <SwitchParameter>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example activates member servers in the DAG DAG1 for the Active Directory site Portland. In

this example, the values for the *AlternateWitnessServer* parameter and the *AlternateWitnessDirectory* parameter had been previously set by using the **Set-DatabaseAvailabilityGroup** cmdlet. Thus, there is no need to specify them here.

```
Restore-DatabaseAvailabilityGroup -Identity DAG1 -
ActiveDirectorySite Portland
```

EXAMPLE 2

This example activates member servers in the DAG DAG1 for the Active Directory site Redmond. In this example, the values for the *AlternateWitnessServer* parameter and the *AlternateWitnessDirectory* parameter are being set as part of the activation process.

```
Restore-DatabaseAvailabilityGroup -Identity DAG1 -
ActiveDirectorySite Redmond -AlternateWitnessServer CAS4 -
AlternateWitnessDirectory D:\DAG1
```

Detailed Description

You can also use this cmdlet for disaster recovery purposes to restore functionality to a DAG that has lost quorum due to one or more DAG members being offline for an extended period. Before running this cmdlet, you must first run the Stop-DatabaseAvailabilityGroup cmdlet.

The **Restore-DatabaseAvailabilityGroup** cmdlet can be run against a DAG only when the DAG is configured with a *DatacenterActivationMode* parameter value of `DagOnly`. For more information about the *DatacenterActivationMode* parameter, see Datacenter Activation Coordination mode.

You can use the **Set-DatabaseAvailabilityGroup** cmdlet to configure the value for the *DatacenterActivationMode* parameter.

The **Restore-DatabaseAvailabilityGroup** cmdlet performs several operations that affect the structure and membership of the DAG's cluster. This task does the following:

- Forcibly evicts the servers listed on the StoppedMailboxServers list from the DAG's cluster, thereby reestablishing quorum for the cluster enabling the surviving DAG members to start and provide service.
- Configures the DAG to use the alternate witness server if there is an even number of surviving DAG members, or a single surviving DAG member.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG being manipulated.
ActiveDirectorySite	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *ActiveDirectorySite* parameter specifies the site containing the DAG members to be restored.
AlternateWitnessDirectory	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *AlternateWitnessDirectory* parameter specifies the name of an alternate directory used to store witness data. The specified directory must not be in use by any other DAGs or used for any other purpose. This value can be populated ahead by using the **Set-DatabaseAvailabilityGroup** cmdlet.
AlternateWitnessServer	Optional	Microsoft.Exchange.Data.FileShareWitnessServerName	The *AlternateWitnessServer* parameter specifies the name of a new witness server for the DAG as part of a site activation process. This value can

			be populated ahead by using the **Set-DatabaseAvailabilityGroup** cmdlet.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
UsePrimaryWitnessServer	Optional	System.Management.Automation.SwitchParameter	The *UsePrimaryWitnessServer* parameter specifies that the DAG's currently configured witness server should be used if a witness is needed by the DAG

			members being activated.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-DatabaseAvailabilityGroup** cmdlet to configure properties of a database availability

group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DatabaseAvailabilityGroup -Identity
<DatabaseAvailabilityGroupIdParameter> [-AllowCrossSiteRpcClientAccess
<SwitchParameter>] [-AlternateWitnessDirectory <NonRootLocalLongFullPath>]
[-AlternateWitnessServer <FileShareWitnessServerName>] [-
AutoDagAllServersInstalled <$true | $false>] [-AutoDagAutoReseedEnabled
<$true | $false>] [-AutoDagBitlockerEnabled <$true | $false>] [-
AutoDagDatabaseCopiesPerDatabase <Int32>] [-AutoDagDatabaseCopiesPerVolume
<Int32>] [-AutoDagDatabasesRootFolderPath <NonRootLocalLongFullPath>] [-
AutoDagDiskReclaimerEnabled <$true | $false>] [-AutoDagFIPSCompliant
<$true | $false>] [-AutoDagTotalNumberOfDatabases <Int32>] [-
AutoDagTotalNumberOfServers <Int32>] [-AutoDagVolumesRootFolderPath
<NonRootLocalLongFullPath>] [-Confirm [<SwitchParameter>]] [-
DagConfiguration <DatabaseAvailabilityGroupConfigurationIdParameter>] [-
DatabaseAvailabilityGroupIpAddresses <IPAddress[]>] [-
DatacenterActivationMode <Off | DagOnly>] [-DiscoverNetworks
<SwitchParameter>] [-DomainController <Fqdn>] [-MailboxLoadBalanceEnabled
<$true | $false>] [-MailboxLoadBalanceMaximumEdbFileSize
<ByteQuantifiedSize>] [-MailboxLoadBalanceOverloadedThreshold <Int32>] [-
MailboxLoadBalanceRelativeLoadCapacity <Int32>] [-
MailboxLoadBalanceUnderloadedThreshold <Int32>] [-
ManualDagNetworkConfiguration <$true | $false>] [-NetworkCompression
<Disabled | Enabled | InterSubnetOnly | SeedOnly>] [-NetworkEncryption
<Disabled | Enabled | InterSubnetOnly | SeedOnly>] [-
ReplayLagManagerEnabled <$true | $false>] [-ReplicationPort <UInt16>] [-
SkipDagValidation <SwitchParameter>] [-WhatIf [<SwitchParameter>]] [-
WitnessDirectory <NonRootLocalLongFullPath>] [-WitnessServer
<FileShareWitnessServerName>]
```

Examples

EXAMPLE 1

This example sets the witness directory to C:\DAG1DIR for the DAG DAG1.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
WitnessDirectory C:\DAG1DIR
```

EXAMPLE 2

This example preconfigures an alternate witness server of CAS3 and an alternate witness directory of C:\DAGFileShareWitnesses\DAG1.contoso.com for the DAG DAG1.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
AlternateWitnessDirectory C:\DAGFileShareWitnesses
\DAG1.contoso.com -AlternateWitnessServer CAS3
```

EXAMPLE 3

This example configures the DAG DAG1 to use DHCP to obtain an IP address.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatabaseAvailabilityGroupIpAddresses 0.0.0.0
```

EXAMPLE 4

This example configures the DAG DAG1 to use a static IP address of 10.0.0.8.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatabaseAvailabilityGroupIpAddresses 10.0.0.8
```

EXAMPLE 5

This example configures the multi-subnet DAG DAG1 with multiple static IP addresses.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatabaseAvailabilityGroupIpAddresses 10.0.0.8,10.0.1.8
```

EXAMPLE 6

This example configures TCP port 63132 as the port used by replication for the DAG DAG1.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
ReplicationPort 63132
```

Note:

After changing the default replication port for a DAG, you must manually modify the Windows Firewall exceptions on each member of the DAG to allow communication to occur over the specified port.

EXAMPLE 7

This example configures the DAG DAG1 for DAC mode.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
DatacenterActivationMode DagOnly
```

EXAMPLE 8

This example configures the DAG DAG1 for AutoReseed using custom mount point paths and 4 databases per volume.

```
Set-DatabaseAvailabilityGroup -Identity DAG1 -
AutoDagVolumesRootFolderPath C:\ExchVols -
AutoDagDatabasesRootFolderPath C:\ExchDBs -
AutoDagDatabaseCopiesPerVolume 4
```

Detailed Description

The **Set-DatabaseAvailabilityGroup** cmdlet enables you to manage DAG properties that can't be

managed from the Exchange Administration Center (EAC), such as configuring network discovery, selecting the TCP port used for replication, and enabling datacenter activation coordination (DAC) mode.

DAG property values are stored in both Active Directory and the cluster database. Because some properties are stored in the cluster database, the underlying cluster for the DAG must have quorum to set the properties for:

- ReplicationPort
- NetworkCompression
- NetworkEncryption
- DiscoverNetworks

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the"Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG to be modified.
AllowCrossSiteRpcClientAccess	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
AlternateWitnessDirectory	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *AlternateWitnessDirectory* parameter specifies the name of an alternate directory that's used to store file share witness data. The specified directory must not be in use by any other DAGs or

			used for any other purpose. This parameter is used only as part of a datacenter switchover process. If the DAG is extended across multiple datacenters in a site resilience configuration, we recommend preconfiguring the alternate witness server and directory.
AlternateWitnessServer	Optional	Microsoft.Exchange.Data.FileShareWitnessServerName	The *AlternateWitnessServer* parameter specifies the name of an alternate server that's used to store file share witness data. The specified server must not be a member of the DAG that's configured to use it. This parameter is used only as part of a datacenter switchover process. If the DAG is extended across multiple datacenters in a site resilience configuration, we

			recommend preconfiguring the alternate witness server and directory.
AutoDagAllServersInstalled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AutoDagAutoReseedEnabled	Optional	System.Boolean	The *AutoDagAutoReseedEnabled* is used to enable or disable Autoreseed. The default value is True (enabled).
AutoDagBitlockerEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AutoDagDatabaseCopiesPerDatabase	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
AutoDagDatabaseCopiesPerVolume	Optional	System.Int32	The *AutoDagDatabaseCopiesPerVolume* parameter is used to specify the configured number of database copies per volume. This parameter is used only with AutoReseed.
AutoDagDatabasesRootFolderPath	Optional	Microsoft.Exchange.Data.NonRootLocalLongFu	The *AutoDagDatabasesRoo*

		llPath	*tFolderPath* parameter specifies the directory containing the database mount points when using AutoReseed. This parameter is required when using AutoReseed. AutoReseed uses a default path of C:\ExchangeDatabases.
AutoDagDiskReclaimerEnabled	Optional	System.Boolean	The *AutoDagDiskReclaimerEnabled* is used to enable or disable the volume formatting functions used by Autoreseed. The default value is True (enabled). If you set this to False, you will need to manually format the volume before the database(s) can be reseeded.
AutoDagFIPSCompliant	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AutoDagTotalNumberOfDatabases	Optional	System.Int32	This parameter is reserved for internal

			Microsoft use.
AutoDagTotalNumberOfServers	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
AutoDagVolumesRootFolderPath	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *AutoDagVolumesRootFolderPath* parameter specifies the volume containing the mount points for all disks, including spare disks, when using the AutoReseed feature of the DAG. This parameter is required when using AutoReseed. AutoReseed uses a default path of C:\ExchangeVolumes.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DagConfiguration	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupConfigurationIdParameter	This parameter is reserved for internal Microsoft use.
DatabaseAvailabilityGroupIpAddresses	Optional	System.Net.IPAddress[]	The *DatabaseAvailabilityGroupIpAddresses* parameter specifies one or more static IP addresses to the DAG when a Mailbox server is added to a DAG. If you omit the *DatabaseAvailabilityGroupIpAddresses* parameter when creating a DAG, the system attempts to lease one or more IP addresses from a Dynamic Host Configuration Protocol (DHCP) server in your organization to assign to the DAG. You must specify this parameter each time an additional IP address is added to the DAG, such as in the case of multi-subnet DAGs. You must also specify all IP addresses

			previously assigned to the DAG each time the *DatabaseAvailabilityGroupIpAddresses* parameter is used. Setting the *DatabaseAvailabilityGroupIpAddresses* parameter to a value of `0.0.0.0` automatically configures the DAG to use DHCP.
DatacenterActivationMode	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DatacenterActivationModeOption	The *DatacenterActivationMode* parameter specifies whether datacenter activation mode is disabled (`off`) or enabled for the DAG (`DagOnly`).
DiscoverNetworks	Optional	System.Management.Automation.SwitchParameter	The *DiscoverNetworks* parameter specifies whether to force a rediscovery of the network and network interfaces. By default, internal network heartbeats are sent between DAG members on the same subnet. If there's no

			response to the heartbeats, network discovery is performed automatically by the system. If you add or remove networks or change DAG network subnets, you can force rediscovery of all DAG networks by using the *DiscoverNetworks* parameter.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
MailboxLoadBalanceEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
MailboxLoadBalanceMaximumEdbFileSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	This parameter is reserved for internal Microsoft use.
MailboxLoadBalanceOverloadedThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
MailboxLoadBalanceRe	Optional	System.Int32	This parameter is

lativeLoadCapacity			reserved for internal Microsoft use.
MailboxLoadBalanceUnderloadedThreshold	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
ManualDagNetworkConfiguration	Optional	System.Boolean	The *ManualDagNetworkConfiguration* parameter specifies whether DAG networks should be automatically configured. If this parameter is set to False, DAG networks are automatically configured. If this parameter is set to True, you must manually configure DAG networks.
NetworkCompression	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DatabaseAvailabilityGroup+NetworkOption	The *NetworkCompression* parameter specifies whether network compression is disabled on all networks (`Disabled`), enabled on all networks (`Enabled`), enabled for inter-subnet communication

			only (`InterSubnetOnly`), or enabled only for seeding (`SeedOnly`).
NetworkEncryption	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DatabaseAvailabilityGroup+NetworkOption	The *NetworkEncryption* parameter specifies whether network encryption is disabled on all networks (`Disabled`), enabled on all networks (`Enabled`), enabled for inter-subnet communication only (`InterSubnetOnly`), or enabled only for seeding (`SeedOnly`).
ReplayLagManagerEnabled	Optional	System.Boolean	The *ReplayLagManagerEnabled* parameter specifies whether to disable the automatic playdown of log files for a lagged database copy.
ReplicationPort	Optional	System.UInt16	The *ReplicationPort* parameter specifies a Transmission Control Protocol (TCP) port for replication (log shipping and seeding)

			activity. If this parameter isn't specified, the default port for replication is TCP 64327.
SkipDagValidation	Optional	System.Management.Automation.SwitchParameter	The *SkipDagValidation* switch specifies whether to bypass the validation of the DAG's quorum model and the health check on the DAG's witness when configuring the DAG.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WitnessDirectory	Optional	Microsoft.Exchange.Data.NonRootLocalLongFullPath	The *WitnessDirectory* parameter specifies the name of the directory on the server that's used to store file share

			witness data. The specified directory must not be in use by any other DAGs.
WitnessServer	Optional	Microsoft.Exchange.Data.FileShareWitnessServerName	The *WitnessServer* parameter specifies the name of a server that will act as a witness for the DAG. The server specified can't be a member of the DAG.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Start-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-15*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Start-DatabaseAvailabilityGroup** cmdlet to reincorporate one or more previously failed members of a database availability group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Start-DatabaseAvailabilityGroup -ActiveDirectorySite <AdSiteIdParameter> -
Identity <DatabaseAvailabilityGroupIdParameter> [-ConfigurationOnly
<SwitchParameter>] [-QuorumOnly <SwitchParameter>] <COMMON PARAMETERS>
```

```
Start-DatabaseAvailabilityGroup -Identity
<DatabaseAvailabilityGroupIdParameter> -MailboxServer
<MailboxServerIdParameter> [-ConfigurationOnly <SwitchParameter>] [-
QuorumOnly <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example starts the Mailbox server MBX2 in the DAG DAG1.

```
Start-DatabaseAvailabilityGroup -Identity DAG1 -
MailboxServer MBX2
```

EXAMPLE 2

This example starts the members of the DAG DAG1 in the Active Directory site Redmond.

```
Start-DatabaseAvailabilityGroup -Identity DAG1 -
ActiveDirectorySite Redmond
```

Detailed Description

The **Start-DatabaseAvailabilityGroup** cmdlet is used to activate DAG members in a recovered datacenter after a datacenter switchover, as part of the switchback process to the recovered datacenter. The **Start-DatabaseAvailabilityGroup** cmdlet manipulates configuration and state so that the servers are incorporated into the operating DAG, and joined to the DAG's underlying cluster. The **Move-ActiveMailboxDatabase** cmdlet is then used to activate databases in the primary datacenter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
ActiveDirectorySite	Required	Microsoft.Exchange.Configuration.Tasks.AdSit	The *ActiveDirectorySite* parameter specifies

		eIdParameter	whether to start all DAG members in the specified site.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG being started.
MailboxServer	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *MailboxServer* parameter specifies whether to start a single DAG member.
ConfigurationOnly	Optional	System.Management.Automation.SwitchParameter	The *ConfigurationOnly* switch specifies whether to update the Active Directory properties with the start action, but doesn't perform a start of the DAG or any members.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
QuorumOnly	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet

Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Stop-DatabaseAvailabilityGroup

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-15*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Stop-DatabaseAvailabilityGroup** cmdlet to mark a member of a database availability group (DAG) as failed, or to mark all DAG members in a specific Active Directory site as failed.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Stop-DatabaseAvailabilityGroup -ActiveDirectorySite <AdSiteIdParameter> -
Identity <DatabaseAvailabilityGroupIdParameter> [-ConfigurationOnly
<SwitchParameter>] [-QuorumOnly <SwitchParameter>] <COMMON PARAMETERS>

Stop-DatabaseAvailabilityGroup -Identity
<DatabaseAvailabilityGroupIdParameter> -MailboxServer
<MailboxServerIdParameter> [-ConfigurationOnly <SwitchParameter>] [-
QuorumOnly <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example stops the Mailbox server MBX2 in the DAG DAG1.

```
Stop-DatabaseAvailabilityGroup -Identity DAG1 -
MailboxServer MBX2
```

EXAMPLE 2

This example stops all members in the DAG DAG1 in the Active Directory site Redmond.

```
Stop-DatabaseAvailabilityGroup -Identity DAG1 -
ActiveDirectorySite Redmond
```

EXAMPLE 3

This example stops the Mailbox server MBX3, which is currently offline, in the DAG DAG2.

```
Stop-DatabaseAvailabilityGroup -Identity DAG2 -
MailboxServer MBX3 -ConfigurationOnly
```

Detailed Description

The **Stop-DatabaseAvailabilityGroup** cmdlet is used during a datacenter switchover. This cmdlet is used to mark one or members of the DAG as failed (also known as *stopped*).The **Stop-DatabaseAvailabilityGroup** cmdlet can be run against a DAG only when the DAG is configured with a *DatacenterActivationMode* value of `Dagonly`.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
ActiveDirectorySite	Required	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *ActiveDirectorySite* parameter specifies the Active Directory site containing the DAG members to stop (for example, stop all DAG members in a particular Active Directory site).
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG being stopped.
MailboxServer	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *MailboxServer* parameter specifies a single DAG member to stop. If Datacenter

			Activation Coordination mode is enabled for the DAG and all DAG members are in the same Active Directory site, use the *MailboxServer* parameter to stop individual DAG members instead of the *ActiveDirectorySite* parameter when stopping failed DAG members.
ConfigurationOnly	Optional	System.Management.Automation.SwitchParameter	The *ConfigurationOnly* parameter updates the Active Directory properties with the stop action, but doesn't perform a stop of the DAG or any members. This parameter must be used when the DAG member servers are offline, but Active Directory is up and accessible in the primary datacenter.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
QuorumOnly	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DatabaseAvailabilityGroupNetwork

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-DatabaseAvailabilityGroupNetwork** cmdlet to display configuration and state information for a database availability group (DAG) network.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-DatabaseAvailabilityGroupNetwork [-Identity
<DatabaseAvailabilityGroupNetworkIdParameter>] [-DomainController <Fqdn>]
[-Server <ServerIdParameter>]
```

Examples

EXAMPLE 1

This example gets basic configuration and status information for all networks in the DAG DAG1.

```
Get-DatabaseAvailabilityGroupNetwork -Identity DAG1
```

EXAMPLE 2

This example gets complete configuration and status information for all networks in the DAG DAG1.

```
Get-DatabaseAvailabilityGroupNetwork -Identity DAG1 |
Format-List
```

EXAMPLE 3

This example gets complete configuration and status information for the network DAGNetwork02 in the DAG DAG2 from the Mailbox server MBX1.

```
Get-DatabaseAvailabilityGroupNetwork -Identity DAG2
\DAGNetwork02 -Server MBX1 | Format-List
```

Detailed Description

State information is returned for subnets and for network interfaces, as described in the following tables.

Valid states for Internet Protocol version 4 (IPv4) subnets

State	Description
Up	All defined network interfaces in the DAG are functional and available for communication. This is the expected and normal operational state.
Down	All defined network interfaces in the DAG are nonfunctional and have lost communication with each other and all external hosts. All connected network interfaces are in a Failed or Unreachable state.
Partitioned	One or more network interfaces in the DAG are in an Unreachable state, but at least two interfaces can communicate with each other or an external host.
Misconfigured	All subnets for a specified DAG network must have the same values for *ReplicationEnabled* and *IgnoreNetwork*. If any one of the subnets isn't configured with the same values for these parameters as all other subnets on the network, all subnets are in a Misconfigured state.

Unavailable	The network isn't enabled for replication or use by the DAG, or all DAG members attached to the network are inactive or unavailable.
Unknown	The system was unable to determine the state of the subnet.

Valid states for network interfaces

State	Description
Up	The network interface is functional and can communicate with all other network interfaces. This is the expected and normal operational state.
Failed	The network interface is unable to communicate with other network interfaces or external hosts, although other network interfaces on the local area network (LAN) are able to communicate with each other and external hosts.
Unreachable	The system was unable to communicate with at least one network interface whose state is Up.
Unavailable	The network interface isn't enabled for replication or use by the DAG, or the DAG member associated with this network interface is inactive or unavailable.
Unknown	The system was unable to determine the state of the network interface.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupNetworkIdParameter	The *Identity* parameter specifies the name of a DAG or a DAG network.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies health information for the DAG network from a specific Mailbox server in the DAG.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-

DatabaseAvailabilityGroupNetwork

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-DatabaseAvailabilityGroupNetwork** cmdlet to create a database availability group (DAG) network.

For information about the parameter sets in the Syntax section below, see Syntax.

```
New-DatabaseAvailabilityGroupNetwork -DatabaseAvailabilityGroup
<DatabaseAvailabilityGroupIdParameter> -Name <String> [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DomainController <Fqdn>] [-
IgnoreNetwork <$true | $false>] [-ReplicationEnabled <$true | $false>] [-
Subnets <DatabaseAvailabilityGroupSubnetId[]>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the DAG network DAG1Repl in the DAG DAG1. A subnet of 10.0.0.0 with a bitmask of 8 is assigned to DAG1Repl, and DAG1Repl is also enabled for continuous replication.

```
New-DatabaseAvailabilityGroupNetwork -
DatabaseAvailabilityGroup DAG1 -Name DAG1Repl -Subnets
10.0.0.0/8 -ReplicationEnabled:$true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
DatabaseAvailabilityGroup	Required	Microsoft.Exchange.Configuration.Tasks.Datab	The *DatabaseAvailabilityGr*

		aseAvailabilityGroupId Parameter	*oup* parameter specifies the name of the DAG that'll use the network being created.
Name	Required	System.String	The *Name* parameter specifies the name of the DAG network being created.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies an optional description of up to 256 characters for the DAG network being created.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory.
IgnoreNetwork	Optional	System.Boolean	The *IgnoreNetwork* parameter excludes the DAG network from use by the DAG.
ReplicationEnabled	Optional	System.Boolean	The *ReplicationEnabled* parameter specifies whether the DAG network being created is enabled for continuous replication.
Subnets	Optional	Microsoft.Exchange.Data.DatabaseAvailabilityGroupSubnetId[]	The *Subnets* parameter specifies the subnets for the DAG network being created.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DatabaseAvailabilityGroupNetwork

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-DatabaseAvailabilityGroupNetwork** cmdlet to remove a database availability group (DAG) network.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DatabaseAvailabilityGroupNetwork -Identity
<DatabaseAvailabilityGroupNetworkIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the DAG network DAGNetwork04 from the DAG DAG1.

```
Remove-DatabaseAvailabilityGroupNetwork -Identity DAG1
\DAGNetwork04
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database

availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupNetworkIdParameter	The *Identity* parameter specifies the name of the network being removed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on

			the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DatabaseAvailabilityGroupNetwork

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-DatabaseAvailabilityGroupNetwork** cmdlet to configure a network for a database availability group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-DatabaseAvailabilityGroupNetwork -Identity
<DatabaseAvailabilityGroupNetworkIdParameter> [-Confirm
[<SwitchParameter>]] [-Description <String>] [-DomainController <Fqdn>] [-
IgnoreNetwork <$true | $false>] [-Name <String>] [-ReplicationEnabled
<$true | $false>] [-Subnets <DatabaseAvailabilityGroupSubnetId[]>] [-
WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example enables the DAG network DAGNetwork01 in the DAG DAG1 for replication.

```
Set-DatabaseAvailabilityGroupNetwork -Identity DAG1
\DAGNetwork01 -ReplicationEnabled:$true
```

EXAMPLE 2

This example disables the DAG network DAGNetwork02 in the DAG DAG2 for replication and configures the DAG to ignore the network.

```
Set-DatabaseAvailabilityGroupNetwork -Identity DAG2
\DAGNetwork02 -ReplicationEnabled:$false -
IgnoreNetwork:$true
```

Detailed Description

You can configure a variety of network properties, such as the name for the network, a description of the network, a list of one or more subnets that comprise the network, and whether the network is enabled for replication (log shipping and seeding).

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupNetworkIdParameter	The *Identity* parameter specifies the DAG network being configured.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Description	Optional	System.String	The *Description* parameter specifies an optional description for the DAG network.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
IgnoreNetwork	Optional	System.Boolean	The *IgnoreNetwork* parameter indicates that the specified network should be ignored and not used by the DAG.
Name	Optional	System.String	The *Name* parameter provides a name for the DAG network.
ReplicationEnabled	Optional	System.Boolean	The *ReplicationEnabled*

			parameter specifies whether the network can be used for replication activity. If this parameter isn't specified, the default behavior is to enable the network for replication.
Subnets	Optional	Microsoft.Exchange.Data.DatabaseAvailabilityGroupSubnetId[]	The *Subnets* parameter specifies one or more subnets that are associated with the DAG network.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-DatabaseAvailabilityGroupServer

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-DatabaseAvailabilityGroupServer** cmdlet to add a Mailbox server to a database availability group (DAG). A DAG is a set of Mailbox servers that use continuous replication and managed availability to provide automatic database-level recovery from database, server, or network failures.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-DatabaseAvailabilityGroupServer -Identity
<DatabaseAvailabilityGroupIdParameter> -MailboxServer <ServerIdParameter>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
SkipDagValidation <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds the Mailbox server MBX1 to the DAG DAG1.

```
Add-DatabaseAvailabilityGroupServer -Identity DAG1 -
MailboxServer MBX1
```

Detailed Description

A computer object for a DAG is created in Active Directory when the first server is added to the DAG. This object is used to authenticate servers to each other within a DAG.

To add a Mailbox server to a DAG, the Mailbox server must be running the Windows Server 2008 R2 Enterprise or Datacenter operating system, the Windows Server 2012 Standard or Datacenter operating system, or the Windows Server 2012 R2 operating system, and it must not belong to any other DAG. The Mailbox server must be running the same versions of the Windows operating

system and Microsoft Exchange, and be in the same Active Directory domain as all other Mailbox servers in the DAG. In addition, the Mailbox server must not be configured as an Active Directory domain controller or global catalog server.

To add the first server to a DAG and create a computer object for the DAG, the Exchange Windows Permissions security group must have the appropriate rights to add computer accounts to the domain. Alternatively, a computer account can be created and disabled prior to adding the server. Adding the first server to the DAG enables the computer account for the DAG. Thus, the account used for the task doesn't need permissions to add a computer account to the domain. If you're pre-creating the computer account, the name of the account must match the name for the DAG. For example, if the DAG is named DAG1, the computer account must be named DAG1.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG to which the server is being added.
MailboxServer	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server being added to the DAG.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't

			have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SkipDagValidation	Optional	System.Management.Automation.SwitchParameter	The *SkipDagValidation* switch specifies whether to bypass the validation of the DAG's quorum model and the health check on the DAG's witness when adding members to the DAG.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DatabaseAvailabilityGroupServer

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-DatabaseAvailabilityGroupServer** cmdlet to remove a Mailbox server from a database availability group (DAG). To remove a Mailbox server from a DAG, the Mailbox server must not host any replicated databases.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-DatabaseAvailabilityGroupServer -Identity
<DatabaseAvailabilityGroupIdParameter> -MailboxServer <ServerIdParameter>
[-ConfigurationOnly <SwitchParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-SkipDagValidation <SwitchParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the Mailbox server MBX1 from the DAG DAG3.

```
Remove-DatabaseAvailabilityGroupServer -Identity DAG3 -
```

```
MailboxServer MBX1
```

EXAMPLE 2

This example removes the configuration settings for the Mailbox server MBX4 from the DAG DAG2. MBX4 is currently offline and expected to be offline for an extended period, so its configuration is being removed from the DAG to establish quorum for the DAG or to reduce the number of members needed for quorum by the DAG.

```
Remove-DatabaseAvailabilityGroupServer -Identity DAG2 -
MailboxServer MBX4 -ConfigurationOnly
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupIdParameter	The *Identity* parameter specifies the name of the DAG from which you're removing the server.
MailboxServer	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *MailboxServer* parameter specifies the name of the Mailbox server being removed from the DAG.
ConfigurationOnly	Optional	System.Management.Automation.SwitchParameter	The *ConfigurationOnly* switch should only be used if the Mailbox server has been lost and can no longer be

			contacted, or in situations when the Mailbox server can't be restored to operational service before the messaging service is needed. When used, it removes the Mailbox server from the DAG object in Active Directory. If the Mailbox server is offline but the DAG has quorum, the Mailbox server is evicted from the DAG's cluster and removed from the DAG object in Active Directory.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SkipDagValidation	Optional	System.Management.Automation.SwitchParameter	The *SkipDagValidation* switch specifies whether to bypass the validation of the DAG's quorum model and the health check on the DAG's witness when removing members from the DAG.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-MailboxDatabaseCopy

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-MailboxDatabaseCopy** cmdlet to create a passive copy of an existing active mailbox database.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-MailboxDatabaseCopy -Identity <DatabaseIdParameter> -MailboxServer
<MailboxServerIdParameter> [-ActivationPreference <UInt32>] [-
ConfigurationOnly <SwitchParameter>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-ReplayLagTime <EnhancedTimeSpan>] [-
SeedingPostponed <SwitchParameter>] [-TruncationLagTime
<EnhancedTimeSpan>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example adds a copy of mailbox database DB1 to the Mailbox server MBX3. Replay lag time and truncation lag time are configured with values of 10 minutes and 15 minutes, respectively. The activation preference is configured with a value of 2.

```
Add-MailboxDatabaseCopy -Identity DB1 -MailboxServer MBX3 -
ReplayLagTime 00:10:00 -TruncationLagTime 00:15:00 -
ActivationPreference 2
```

EXAMPLE 2

This example adds a copy of mailbox database DB2 to the Mailbox server MBX1. Replay lag time and truncation lag time are left at the default values of zero, and the activation preference is configured with a value of 3.

```
Add-MailboxDatabaseCopy -Identity DB2 -MailboxServer MBX1 -
```

```
ActivationPreference 3
```

EXAMPLE 3

This example adds a copy of mailbox database DB3 to the Mailbox server MBX4. Replay lag time and truncation lag time are left at the default values of zero, and the activation preference is configured with a value of 5. In addition, seeding is being postponed for this copy so that it can be seeded using a local source server instead of the current active database copy, which is geographically distant from MBX4.

```
Add-MailboxDatabaseCopy -Identity DB3 -MailboxServer MBX4 -
ActivationPreference 5 -SeedingPostponed
```

Detailed Description

To use the **Add-MailboxDatabaseCopy** cmdlet to add a mailbox database copy, the following criteria must be met:

- The specified Mailbox server must be in the same database availability group (DAG), and the DAG must have quorum and be healthy.
- The specified Mailbox server must not already host a copy of the specified mailbox database.
- The database path used by the specified database must also be available on the specified Mailbox server, because all copies of a database must use the same path.
- If you're adding the second copy of a database (for example, adding the first passive copy of the database), circular logging must not be enabled for the specified mailbox database. If circular logging is enabled, you must first disable it. After the mailbox database copy has been added, circular logging can be enabled. After enabling circular logging for a replicated mailbox database, continuous replication circular logging (CRCL) is used instead of JET circular logging. If you're adding the third or subsequent copy of a database, CRCL can remain enabled.

After running the **Add-MailboxDatabaseCopy** cmdlet, the new copy remains in a Suspended state if the *SeedingPostponed* parameter is specified. When the database copy status is set to Suspended, the *SuspendMessage* is set to "Replication is suspended for database copy '{0}' because database needs to be seeded."

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.DatabaseIdParameter	specifies the name of the mailbox database being copied. Database names must be unique within the Exchange organization.
MailboxServer	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *MailboxServer* parameter specifies the name of the server that will host the database copy. This server must be a member of the same DAG and must not already host a copy of the database.
ActivationPreference	Optional	System.UInt32	The *ActivationPreference* parameter value is used as part of Active Manager's best copy selection process and to redistribute active mailbox databases throughout the DAG when using the RedistributeActiveDatabases.ps1 script. The value for the activation preference is a number equal to or greater than 1, where 1 is at the top of the preference order.

			The preference number can't be larger than the number of copies of the mailbox database.
ConfigurationOnly	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ReplayLagTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ReplayLagTime* parameter specifies the amount of time that the Microsoft Exchange Replication service

			waits before replaying log files that have been copied to the database copy. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The maximum allowable setting for this value is 14 days. The minimum allowable setting is 0 seconds, and setting this value to 0 seconds eliminates any delay in log replay activity. For example, to specify a 14-day replay lag period, enter 14.00:00:00. The default value is 00.00:00:00, which specifies that there's no replay lag.
SeedingPostponed	Optional	System.Management.Automation.SwitchParameter	The *SeedingPostponed* parameter specifies that the task doesn't seed the database copy. You must then

			explicitly seed the database copy.
TruncationLagTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TruncationLagTime* parameter specifies the amount of time that the Microsoft Exchange Replication service waits before truncating log files that have replayed into a copy of the database. The time period begins after the log has been successfully replayed into the copy of the database. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The maximum allowable setting for this value is 14 days. The minimum allowable setting is 0 seconds, and setting this value to 0 seconds eliminates any delay in log truncation activity. For example, to specify

			a 14-day truncation lag period, enter 14.00:00:00. The default value is 00.00:00:00, which specifies that there's no truncation lag.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-MailboxDatabaseCopy

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-MailboxDatabaseCopy** cmdlet to remove a passive copy of a mailbox database.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-MailboxDatabaseCopy -Identity <DatabaseCopyIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a copy of mailbox database DB1 from the Mailbox server MBX3.

```
Remove-MailboxDatabaseCopy -Identity DB1\MBX3
```

Detailed Description

To use the **Remove-MailboxDatabaseCopy** cmdlet to remove a mailbox database copy, the following criteria must be met:

- The database availability group (DAG) hosting the mailbox database must have quorum and all cluster and network functions must be healthy.
- If you're removing the last passive copy of the database, continuous replication circular logging (CRCL) must not be enabled for the specified mailbox database. If CRCL is enabled, you must first disable it. After the mailbox database copy has been removed, circular logging can be enabled. After enabling circular logging for a non-replicated mailbox database, JET circular logging is used instead of CRCL. If you aren't removing the last passive copy of a database, CRCL can remain enabled.

You can't use this cmdlet to remove the active copy of a mailbox database. To remove the active copy of a mailbox database, you must first remove all passive copies of the database, and then use the **Remove-MailboxDatabase** cmdlet to remove the active copy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Note:

Running this cmdlet removes the mailbox database copy configuration, but doesn't delete the database copy's files. If necessary, you can manually delete those files.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseCopyIdParameter	The *Identity* parameter specifies the name of the mailbox database whose copy is being removed. When using this parameter, specify a format of *DatabaseName**ServerName*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
WhatIf	Optional	System.Management.A	The *WhatIf* switch

		utomation.SwitchParameter	instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-MailboxDatabaseCopy

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-MailboxDatabaseCopy** cmdlet to unblock activation or resume log copying and replay for a passive mailbox database copy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Resume-MailboxDatabaseCopy -Identity <DatabaseCopyIdParameter> [-
ReplicationOnly <SwitchParameter>] <COMMON PARAMETERS>
```

```
Resume-MailboxDatabaseCopy -DisableReplayLag <SwitchParameter> -Identity
<DatabaseCopyIdParameter> [-DisableReplayLagReason <String>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes replication and replay activity for the copy of the database DB1 hosted on the Mailbox server MBX3.

```
Resume-MailboxDatabaseCopy -Identity DB1\MBX3
```

EXAMPLE 2

This example resumes replication and replay activity for the copy of the database DB2 hosted on the Mailbox server MBX4. After the copy is resumed, it remains administratively blocked for activation.

```
Resume-MailboxDatabaseCopy -Identity DB2\MBX4 -
ReplicationOnly
```

Detailed Description

The **Resume-MailboxDatabaseCopy** cmdlet resumes replication and replay from a suspended state. If a database copy was suspended without administrator intervention, it's because the database copy is in a bad state. You can use the **Get-MailboxDatabaseCopyStatus** cmdlet to see if there are any messages indicating a failure. If the copy of the database is in a bad state, resuming the copy causes replication to fail and the mailbox database copy to return to a suspended state.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
DisableReplayLag	Required	System.Management.Automation.SwitchPara	The *DisableReplayLag* parameter specifies

		meter	that any configured replay lag time for the database copy should be disabled when the passive copy is resumed.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseCopyIdParameter	The *Identity* parameter specifies the name of the database whose copying is being resumed.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DisableReplayLagReason	Optional	System.String	The *DisableReplayLagReason* parameter is used with the *DisableReplayLag* parameter to specify an administrative reason for disabling replay lag time for a passive copy.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ReplicationOnly	Optional	System.Management.Automation.SwitchParameter	The *ReplicationOnly* switch specifies whether to resume replication without affecting the activation setting (for example, the *ActivationSuspended* property for the database copy remains set to True).
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxDatabaseCopy

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxDatabaseCopy** cmdlet to configure the properties of a database copy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-MailboxDatabaseCopy -ClearHostServer <SwitchParameter> -Identity
<DatabaseCopyIdParameter> <COMMON PARAMETERS>

Set-MailboxDatabaseCopy -Identity <DatabaseCopyIdParameter> [-
ActivationPreference <UInt32>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-
DatabaseCopyAutoActivationPolicy <Unrestricted | IntrasiteOnly | Blocked>]
[-DomainController <Fqdn>] [-ReplayLagTime <EnhancedTimeSpan>] [-
TruncationLagTime <EnhancedTimeSpan>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the replay lag time with a value of 3 days for a copy of the database DB2 hosted on the Mailbox server MBX1.

```
Set-MailboxDatabaseCopy -Identity DB2\MBX1 -ReplayLagTime
3.0:0:0
```

EXAMPLE 2

This example configures an activation preference of 3 for the copy of the database DB1 hosted on the Mailbox server MBX2.

```
Set-MailboxDatabaseCopy -Identity DB1\MBX2 -
ActivationPreference 3
```

Detailed Description

With this cmdlet, you can configure the replay lag time, truncation lag time, and activation preference value for a mailbox database copy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
ClearHostServer	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseCopyIdParameter	The *Identity* parameter specifies the name of the database whose copy is being modified.
ActivationPreference	Optional	System.UInt32	The *ActivationPreference* parameter value is used as part of Active Manager's best copy selection process and to redistribute active mailbox databases throughout the database availability

			group (DAG) when using the RedistributeActiveDatabases.ps1 script. The value for the *ActivationPreference* parameter is a number equal to or greater than 1, where 1 is at the top of the preference order. The position number can't be larger than the number of database copies of the mailbox database.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DatabaseCopyAutoActivationPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.DatabaseCopyAutoActivationPolicyType	This parameter is reserved for internal Microsoft use.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ReplayLagTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ReplayLagTime* parameter specifies the amount of time that the Microsoft Exchange Replication service should wait before replaying log files that have been copied to the passive database copy. Setting this parameter to a value greater than 0 creates a *lagged* database copy. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The maximum allowable setting for this value is 14 days. The minimum

			allowable setting is 0 seconds, and setting this value to 0 seconds eliminates any delay in log replay activity. For example, to specify a 14-day replay lag period, enter 14.00:00:00. The default value is 00.00:00:00, which specifies that there's no replay lag.
TruncationLagTime	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TruncationLagTime* parameter specifies the amount of time that the Microsoft Exchange Replication service should wait before truncating log files that have replayed into the passive copy of the database. The time period begins after the log has been successfully replayed into the copy of the database. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m =

			minutes, and s = seconds. The maximum allowable setting for this value is 14 days. The minimum allowable setting is 0 seconds, and setting this value to 0 seconds eliminates any delay in log truncation activity. For example, to specify a 14-day truncation lag period, enter 14.00:00:00. The default value is 00.00:00:00, which specifies that there's no truncation lag.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-MailboxDatabaseCopy

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-MailboxDatabaseCopy** cmdlet to block replication and replay activities (log copying and replay) or activation for a database configured with two or more database copies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Suspend-MailboxDatabaseCopy -Identity <DatabaseCopyIdParameter> [-
ActivationOnly <SwitchParameter>] [-SuspendComment <String>] <COMMON
PARAMETERS>

Suspend-MailboxDatabaseCopy -EnableReplayLag <SwitchParameter> -Identity
<DatabaseCopyIdParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends replication and replay activity for the copy of the database DB1 hosted on the Mailbox server MBX3. An optional administrative reason for the suspension is specified.

```
Suspend-MailboxDatabaseCopy -Identity DB1\MBX3 -
SuspendComment "Maintenance on MBX3"
```

EXAMPLE 2

This example only suspends activation for the copy of the database DB3 hosted on the Mailbox server MBX2.

```
Suspend-MailboxDatabaseCopy -Identity DB3\MBX2 -
ActivationOnly
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
EnableReplayLag	Required	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseCopyIdParameter	The *Identity* parameter specifies the name of the database copy being suspended.
ActivationOnly	Optional	System.Management.Automation.SwitchParameter	The *ActivationOnly* switch specifies whether to suspend only activation for the mailbox database copy.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run.

			To suppress the confirmation prompt, use the syntax -`confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
SuspendComment	Optional	System.String	The *SuspendComment* parameter specifies the reason that the database copy is being suspended. This parameter is limited to 512 characters.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Update-MailboxDatabaseCopy

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Update-MailboxDatabaseCopy** cmdlet to seed or reseed a mailbox database copy.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Update-MailboxDatabaseCopy -Identity <DatabaseCopyIdParameter> [-BeginSeed
<SwitchParameter>] [-CatalogOnly <SwitchParameter>] [-DatabaseOnly
<SwitchParameter>] [-DeleteExistingFiles <SwitchParameter>] [-Force
<SwitchParameter>] [-ManualResume <SwitchParameter>] [-Network
<DatabaseAvailabilityGroupNetworkIdParameter>] [-
NetworkCompressionOverride <UseDagDefault | Off | On>] [-
NetworkEncryptionOverride <UseDagDefault | Off | On>] [-
SafeDeleteExistingFiles <SwitchParameter>] [-SourceServer
<ServerIdParameter>] <COMMON PARAMETERS>

Update-MailboxDatabaseCopy -CancelSeed <SwitchParameter> -Identity
<DatabaseCopyIdParameter> <COMMON PARAMETERS>

Update-MailboxDatabaseCopy -Server <MailboxServerIdParameter> [-
CatalogOnly <SwitchParameter>] [-DatabaseOnly <SwitchParameter>] [-
DeleteExistingFiles <SwitchParameter>] [-ManualResume <SwitchParameter>]
[-MaximumSeedsInParallel <Int32>] [-NetworkCompressionOverride
<UseDagDefault | Off | On>] [-NetworkEncryptionOverride <UseDagDefault |
Off | On>] [-SafeDeleteExistingFiles <SwitchParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
```

```
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example seeds a copy of the database DB1 on the Mailbox server MBX1.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1
```

EXAMPLE 2

This example seeds a copy of the database DB1 on the Mailbox server MBX1 using MBX2 as the source Mailbox server for the seed.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -SourceServer
MBX2
```

EXAMPLE 3

This example seeds a copy of the database DB1 on the Mailbox server MBX1 without seeding the content index catalog.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -DatabaseOnly
```

EXAMPLE 4

This example seeds the content index catalog for the copy of the database DB1 on the Mailbox server MBX1 without seeding the database file.

```
Update-MailboxDatabaseCopy -Identity DB1\MBX1 -CatalogOnly
```

EXAMPLE 5

This example performs a full server reseed of all of the databases on the Mailbox server MBX1.

```
Update-MailboxDatabaseCopy -Server MBX1
```

Detailed Description

Seeding is the process in which a copy of a mailbox database is added to another Mailbox server. This becomes the database copy into which copied log files and data are replayed.

The **Update-MailboxDatabaseCopy** cmdlet can also be used to seed a content index catalog for a mailbox database copy.

You must suspend a database copy before you can update it using the **Update-**

MailboxDatabaseCopy cmdlet. For detailed steps about how to suspend a database copy, see Suspend or resume a mailbox database copy.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
CancelSeed	Required	System.Management.Automation.SwitchParameter	The *CancelSeed* switch specifies whether to cancel an in-progress seeding operation.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseCopyIdParameter	The *Identity* parameter specifies the name or GUID of the mailbox database whose copy is being seeded.
Server	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *Server* parameter is used as part of a full server reseed operation. It can be used with the *MaximumSeedsInParallel* parameter to start reseeds of database copies in parallel across the specified server in batches of up to the value of the *MaximumSeedsInParallel* parameter copies at

			a time.
BeginSeed	Optional	System.Management.Automation.SwitchParameter	The *BeginSeed* parameter is useful for scripting reseeds, because with this parameter, the task asynchronously starts the seeding operation and then exits the cmdlet.
CatalogOnly	Optional	System.Management.Automation.SwitchParameter	The *CatalogOnly* parameter specifies that only the content index catalog for the database copy should be seeded.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DatabaseOnly	Optional	System.Management.Automation.SwitchParameter	The *DatabaseOnly* parameter specifies that only the database copy should be seeded.

			The content index catalog isn't seeded.
DeleteExistingFiles	Optional	System.Management.Automation.SwitchParameter	The *DeleteExistingFiles* switch specifies whether to remove the existing log files at the target location. This parameter removes only the files that it checks for and fails if other files are present. No action is taken on other files at the target location. Therefore, if database-related files are present, you must manually remove them.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run

			programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
ManualResume	Optional	System.Management.Automation.SwitchParameter	The *ManualResume* switch specifies whether to automatically resume replication on the database copy. With this parameter, you can manually resume replication to the database copy.
MaximumSeedsInParallel	Optional	System.Int32	The *MaximumSeedsInParallel* parameter is used with the *Server* parameter to specify the maximum number of parallel seeding operations that should occur across the specified server during

			a full server reseed operation. The default value is 10.
Network	Optional	Microsoft.Exchange.Configuration.Tasks.DatabaseAvailabilityGroupNetworkIdParameter	The *Network* parameter specifies which DAG network should be used for seeding.
NetworkCompressionOverride	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.UseDagDefaultOnOff	The *NetworkCompressionOverride* parameter specifies whether to override the current DAG network compression settings.
NetworkEncryptionOverride	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.UseDagDefaultOnOff	The *NetworkEncryptionOverride* parameter specifies whether to override the current DAG encryption settings.
SafeDeleteExistingFiles	Optional	System.Management.Automation.SwitchParameter	The *SafeDeleteExistingFiles* parameter is used to perform a seeding operation with a single copy redundancy pre-check prior to the seed. Because this parameter includes the

			redundancy safety check, it requires a lower level of permissions than the *DeleteExistingFiles* parameter, enabling a limited permission administrator to perform the seeding operation.
SourceServer	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *SourceServer* parameter specifies the name of a Mailbox server with a passive copy of the mailbox database to be used as the source for the seed operation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxDatabaseCopyStatus

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxDatabaseCopyStatus** cmdlet to view health and status information about one or more mailbox database copies.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxDatabaseCopyStatus -Server <MailboxServerIdParameter> <COMMON
PARAMETERS>

Get-MailboxDatabaseCopyStatus [-Identity <DatabaseCopyIdParameter>] [-
Local <SwitchParameter>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Active <SwitchParameter>] [-ConnectionStatus
<SwitchParameter>] [-DomainController <Fqdn>] [-ExtendedErrorInfo
<SwitchParameter>] [-UseServerCache <SwitchParameter>]
```

Examples

EXAMPLE 1

This example returns status information for all copies of the database DB1. The status results are displayed in a list format.

```
Get-MailboxDatabaseCopyStatus -Identity DB1 | Format-List
```

EXAMPLE 2

This example returns the status for all database copies on the Mailbox server MBX1. The status results are also displayed in a list format.

```
Get-MailboxDatabaseCopyStatus -Server MBX1 | Format-List
```

EXAMPLE 3

This example returns the status for the copy of database DB1 on the Mailbox server MBX2. The status results are also displayed in a list format.

```
Get-MailboxDatabaseCopyStatus -Identity DB1\MBX2 | Format-List
```

Detailed Description

If a database is specified by using the *Identity* parameter with the command, the status of all copies of the database is returned. If a server is specified by using the *Server* parameter with the command, information about all database copies on the server is returned. If neither parameter is specified with the command, information about all database copies in the organization is returned.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.MailboxServerIdParameter	The *Server* parameter specifies that a Mailbox server returns status information for all of its mailbox database copies. This parameter can't be combined with the *Identity* parameter.
Active	Optional	System.Management.Automation.SwitchParameter	The *Active* switch specifies whether to return mailbox

			database copy status for the active mailbox database copy only.
ConnectionStatus	Optional	System.Management.Automation.SwitchParameter	The *ConnectionStatus* switch is obsolete and in the process of being deprecated. Use of this switch will be ignored by the task. The information previously provided by this switch is now provided through an internal caching mechanism and, as such, the switch is no longer needed.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ExtendedErrorInfo	Optional	System.Management.Automation.SwitchParameter	The *ExtendedErrorInfo* switch specifies whether to return an output object containing any exception details.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.Datab	The *Identity* parameter specifies the name of

		aseCopyIdParameter	the database copy for which the command should gather information. The Identity parameter can be specified in the form of <*database*> \<*server*>. Specifying just <*database*> returns information for all copies of the database. This parameter can't be combined with the *Server* parameter.
Local	Optional	System.Management.Automation.SwitchParameter	The *Local* switch specifies whether to return mailbox database copy status information from only the local Mailbox server.
UseServerCache	Optional	System.Management.Automation.SwitchParameter	The *UseServerCache* switch specifies whether to enable a server-side remote procedure call (RPC) caching of status information for 5 seconds.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-ReplicationHealth

Exchange Management Shell > Exchange 2013 cmdlets > High availability cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-ReplicationHealth** cmdlet to check all aspects of replication and replay, or to provide status for a specific Mailbox server in a database availability group (DAG).

For information about the parameter sets in the Syntax section below, see Syntax.

```
Test-ReplicationHealth [-Identity <ServerIdParameter>] [-
ActiveDirectoryTimeout <Int32>] [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-MonitoringContext <$true | $false>] [-
OutputObjects <SwitchParameter>] [-TransientEventSuppressionWindow
<UInt32>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests the health of replication for the Mailbox server MBX1.

```
Test-ReplicationHealth -Identity MBX1
```

Detailed Description

The **Test-ReplicationHealth** cmdlet is designed for the proactive monitoring of continuous replication and the continuous replication pipeline, the availability of Active Manager, and the health and status of the underlying cluster service, quorum, and network components. The **Test-ReplicationHealth** cmdlet can be run locally or remotely against any Mailbox server in a DAG.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Database availability groups" entry in the High availability and site resilience permissions topic.

Parameters

Parameter	Required	Type	Description
ActiveDirectoryTimeout	Optional	System.Int32	The *ActiveDirectoryTimeout* parameter specifies the amount of time, in seconds, allowed for each directory service operation to complete before the operation times out. The default value is 15 seconds.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the name of the Mailbox server that you want to test.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.

OutputObjects	Optional	System.Management.Automation.SwitchParameter	The *OutputObjects* switch specifies whether to output an array of information regarding failures.
TransientEventSuppressionWindow	Optional	System.UInt32	The *TransientEventSuppressionWindow* parameter specifies the number of minutes that the queue lengths can be exceeded before the queue length tests are considered to have failed. This parameter is used to reduce the number of failures due to transient load generation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AcceptedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-AcceptedDomain** cmdlet to view the configuration information for the accepted domains in your organization.

```
Get-AcceptedDomain [-Identity <AcceptedDomainIdParameter>] [-
AccountPartition <AccountPartitionIdParameter>] [-DomainController <Fqdn>]
[-Filter <String>] [-Organization <OrganizationIdParameter>] [-
UsnForReconciliationSearch <Int64>]
```

Examples

EXAMPLE 1

This example lists all the accepted domains in your organization.

```
Get-AcceptedDomain
```

EXAMPLE 2

This example lists all the authoritative accepted domains in your organization.

```
Get-AcceptedDomain | Where{$_.DomainType -eq
'Authoritative'}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Accepted domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AccountPartition	Optional	Microsoft.Exchange.Configuration.Tasks.AccountPartitionIdParameter	This parameter is reserved for internal Microsoft use.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An

			Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Filter	Optional	System.String	The *Filter* parameter specifies a set of attributes used to filter the list of accepted domains.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.AcceptedDomainIdParameter	The *Identity* parameter specifies a string value for the accepted domain. Enter either the GUID or the name of the accepted domain.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
UsnForReconciliationSearch	Optional	System.Int64	This parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AcceptedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-14*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-AcceptedDomain** cmdlet to create an accepted domain in your organization. An *accepted domain* is any SMTP namespace for which an Exchange organization sends and receives email.

```
New-AcceptedDomain -DomainName <SmtpDomainWithSubdomains> -Name <String>
[-AuthenticationType <Managed | Federated>] [-CatchAllRecipient
<RecipientIdParameter>] [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-DomainType <Authoritative | ExternalRelay | InternalRelay>] [-
InitialDomain <$true | $false>] [-LiveIdInstanceType <Consumer |
Business>] [-MailFlowPartner <MailFlowPartnerIdParameter>] [-
MatchSubDomains <$true | $false>] [-Organization
<OrganizationIdParameter>] [-OutboundOnly <$true | $false>] [-
SkipDnsProvisioning <SwitchParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the new authoritative accepted domain Contoso.

```
New-AcceptedDomain -DomainName Contoso.com -DomainType
Authoritative -Name Contoso
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Accepted domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

DomainName	Required	Microsoft.Exchange.Data.SmtpDomainWithSubdomains	The *DomainName* parameter specifies the SMTP domain that you want to establish as an accepted domain. Valid input for the *DomainName* parameter is an SMTP domain. You can use a wildcard character to specify all subdomains of a specified domain, as shown in the following example: `*.contoso.com`. However, you can't embed a wildcard character, as shown in the following example: `domain.*.contoso.com`. The domain name string may not contain more than 256 characters.
Name	Required	System.String	The *Name* parameter specifies a unique name for the accepted domain object.
AuthenticationType	Optional	Microsoft.Exchange.Data.Directory.AuthenticationType	This parameter is reserved for internal Microsoft use.

CatchAllRecipient	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

DomainType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AcceptedDomainType	The *DomainType* parameter specifies the type of accepted domain that you want to configure. Valid values are `Authoritative`, `InternalRelay`, or `ExternalRelay`. You must set at least one value. In an authoritative domain, messages are delivered to a recipient that has a domain account in your Exchange organization. In an internal relay domain, messages are relayed to a server outside your Exchange organization, but still under the authority of your company or IT department. Use the internal relay domain if you want to treat the messages to this domain as internal messages. In an external relay domain, messages are relayed to an email server,

			outside your organization, which you don't control. The default value is `Authoritative`.
InitialDomain	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LiveIdInstanceType	Optional	Microsoft.Exchange.Data.Directory.LiveIdInstanceType	This parameter is reserved for internal Microsoft use.
MailFlowPartner	Optional	Microsoft.Exchange.Configuration.Tasks.MailFlowPartnerIdParameter	This parameter is reserved for internal Microsoft use.
MatchSubDomains	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.
OutboundOnly	Optional	System.Boolean	The *OutboundOnly* parameter specifies whether this accepted domain is an internal relay domain for the on-premises deployment for organizations that have coexistence with a

			cloud-based organization. The authoritative accepted domain for the on-premises deployment is configured as an internal relay accepted domain on the cloud side. If the on-premises deployment is using Microsoft Forefront Online Protection for Exchange, you must set this parameter to `$true` for the accepted domain that represents your on-premises deployment. This parameter is used only if the *DomainType* parameter is set to `Authoritative` or `InternalRelay`. The default value is `$false`.
SkipDnsProvisioning	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on

			the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AcceptedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-AcceptedDomain** cmdlet to remove an accepted domain. When you remove an accepted domain, the accepted domain object is deleted.

```
Remove-AcceptedDomain -Identity <AcceptedDomainIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the accepted domain Contoso.

```
Remove-AcceptedDomain Contoso
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Accepted domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AcceptedDomainIdParameter	The *Identity* parameter specifies the accepted domain you want to remove. Enter either the GUID or the name of the remote domain.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the

			domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AcceptedDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online Protection, Exchange Online*

Topic Last Modified: *2014-07-15*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-AcceptedDomain** cmdlet to configure an existing accepted domain in your organization. An *accepted domain* is any SMTP namespace for which an Exchange organization sends and receives email.

```
Set-AcceptedDomain -Identity <AcceptedDomainIdParameter> [-
AddressBookEnabled <$true | $false>] [-AuthenticationType <Managed |
Federated>] [-CatchAllRecipient <RecipientIdParameter>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-DomainType
<Authoritative | ExternalRelay | InternalRelay>] [-DualProvisioningEnabled
<$true | $false>] [-EnableNego2Authentication <$true | $false>] [-
InitialDomain <$true | $false>] [-IsCoexistenceDomain <$true | $false>] [-
LiveIdInstanceType <Consumer | Business>] [-MailFlowPartner
<MailFlowPartnerIdParameter>] [-MakeDefault <$true | $false>] [-
MatchSubDomains <$true | $false>] [-Name <String>] [-OutboundOnly <$true |
$false>] [-PendingCompletion <$true | $false>] [-PendingRemoval <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example makes the accepted domain Contoso the default accepted domain.

```
Set-AcceptedDomain -Identity Contoso -MakeDefault $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Accepted domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.AcceptedDomainIdParameter	The *Identity* parameter specifies the accepted domain you want to modify. You can use any value that uniquely identifies the accepted domain object. For example, you can use the name, GUID or distinguished name (DN) of the accepted domain.
AddressBookEnabled	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *AddressBookEnabled* parameter specifies whether to enable recipient filtering on the server that accepts mail for this accepted domain. The default values for this parameter are as follows: • For authoritative domains `$true` • For internal relay domains `$false` • For external relay domains `$false`
AuthenticationType	Optional	Microsoft.Exchange.Da	This parameter is reserved

		ta.Directory.AuthenticationType	for internal Microsoft use.
CatchAllRecipient	Optional	Microsoft.Exchange.Configuration.Tasks.RecipientIdParameter	This parameter is reserved for internal Microsoft use.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the

			local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AcceptedDomainType	The *DomainType* parameter specifies the type of accepted domain that you want to configure. Valid values are `Authoritative`, `InternalRelay`, and `ExternalRelay`. You must set at least one value. In an authoritative domain, messages are delivered to a recipient that has a domain account in your Exchange organization. In an internal relay domain, messages are relayed to a server outside your Exchange organization, but still under the authority of your company or IT department. Use the internal relay domain if you want to treat messages to this domain as internal messages. In

			an external relay domain, messages are relayed to an email server outside your organization, which you don't control. The default value is `Authoritative`. `ExternalRelay` is only available in on-premises Exchange 2013.
DualProvisioningEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
EnableNego2Authentication	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
InitialDomain	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
IsCoexistenceDomain	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
LiveIdInstanceType	Optional	Microsoft.Exchange.Data.Directory.LiveIdInstanceType	This parameter is reserved for internal Microsoft use.
MailFlowPartner	Optional	Microsoft.Exchange.Configuration.Tasks.MailFlowPartnerIdParameter	This parameter is reserved for internal Microsoft use.
MakeDefault	Optional	System.Boolean	This parameter is available only in on-premises Exchange 2013. The *MakeDefault*

			parameter specifies whether the accepted domain is the default domain. The default accepted domain is the domain name associated with outbound messages that have encapsulated addresses, such as IMCEANOTES-user +40OtherSystem@contoso.com, for non-Exchange email system interoperability. If you don't interoperate with a non-Exchange email system in your organization, you don't have to set this parameter. For the first accepted domain created in the organization, the default value is `$true`. For subsequent accepted domains, the default value is `$false`.
MatchSubDomains	Optional	System.Boolean	The *MatchSubDomains* parameter enables mail to be sent by and received from users on any subdomain of this accepted domain. The

			default value is `$false`.
Name	Optional	System.String	This parameter is available only in on-premises Exchange 2013. The *Name* parameter specifies a unique name for the accepted domain object.
OutboundOnly	Optional	System.Boolean	This parameter is available only in the cloud-based service. The *OutboundOnly* parameter specifies whether this accepted domain is an internal relay domain for the on-premises deployment for organizations that have coexistence with a cloud-based organization. The authoritative accepted domain for the on-premises deployment is configured as an internal relay accepted domain on the cloud side. If the on-premises deployment is using Microsoft Forefront Online Protection for Exchange, you must set this parameter to `$true`

			for the accepted domain that represents your on-premises deployment. This parameter is used only if the *DomainType* parameter is set to `Authoritative` or `InternalRelay`. The default value is `$false`.
PendingCompletion	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
PendingRemoval	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-AddressRewriteEntry

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Get-AddressRewriteEntry** cmdlet to view an existing address rewrite entry that rewrites sender and recipient email addresses in messages sent to or sent from your organization through an Edge Transport server.

```
Get-Addressrewriteentry [-Identity <AddressRewriteEntryIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example returns a summary listing of all address rewrite entries.

```
Get-AddressRewriteEntry
```

EXAMPLE 2

This example returns the detailed configuration of a single address rewrite entry by piping the results to the **Format-List** command.

```
Get-AddressRewriteEntry "Address rewrite entry for
contoso.com" | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address Rewriting - Edge Transport" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Management.MessagingPolicies.AddressRewrite.AddressRewriteEntryIdParameter	The *Identity* parameter specifies the address rewrite entry to be retrieved. The *Identity* parameter accepts a GUID or the unique address rewrite name. You can omit the *Identity* parameter label.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-AddressRewriteEntry

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **New-AddressRewriteEntry** cmdlet to create an address rewrite entry that rewrites sender and recipient email addresses in messages sent to or sent from your organization through an Edge Transport server.

```
New-AddressRewriteEntry -ExternalAddress <String> -InternalAddress
<String> -Name <String> [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-ExceptionList <MultiValuedProperty>] [-OutboundOnly <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates an address rewrite entry that rewrites the email address david@contoso.com to david@northwindtraders.com in outbound mail. Because the *OutboundOnly* parameter is not set to `$true`, inbound mail sent to david@northwindtraders.com is rewritten back to david@contoso.com.

```
New-AddressRewriteEntry -Name "Address rewrite entry for
david@contoso.com" -InternalAddress david@contoso.com -
ExternalAddress david@northwindtraders.com
```

EXAMPLE 2

This example creates an address rewrite entry that rewrites all email addresses in the contoso.com domain to northwindtraders.com in outbound mail. Because the *OutboundOnly* parameter is not set

to $true, inbound mail sent to northwindtraders.com recipients is rewritten back to contoso.com.

```
New-AddressRewriteEntry -Name "Address rewrite entry for
all contoso.com email addresses" -InternalAddress
contoso.com -ExternalAddress northwindtraders.com
```

EXAMPLE 3

This example creates an address rewrite entry that rewrites all email addresses in the contoso.com domain and all subdomains to northwindtraders.com. However, email addresses in research.contoso.com and corp.contoso.com are not rewritten. Because this address rewrite entry affects a domain and all subdomains (*.contoso.com), address rewriting occurs on outbound mail only.

```
New-AddressRewriteEntry -Name "Address rewrite entry for
contoso.com and all subdomain email addresses" -
InternalAddress *.contoso.com -ExternalAddress
northwindtraders.com -ExceptionList
research.contoso.com,corp.contoso.com -OutboundOnly $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address Rewriting - Edge Transport" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
ExternalAddress	Required	System.String	The *ExternalAddress* parameter specifies the final email addresses that you want. If the *InternalAddress* parameter specifies a single email address (chris@contoso.com), the *ExternalAddress*

			parameter must also specify a single email address (support@contoso.com). If the *InternalAddress* parameter specifies a single domain (contoso.com) or a domain and all subdomains (*.contoso.com), the *ExternalAddress* parameter must specify a single domain (fabrikam.com). **Note:** You can't use the wildcard character (*) with the *ExternalAddress* parameter.
InternalAddress	Required	System.String	The *InternalAddress* parameter specifies the original email addresses that you want to change. You can use the following values: • **Single email address** david@contoso.com • **Single domain** contoso.com or sales.contoso.com • **Domain and all subdomains** *.contoso.com

Name	Required	System.String	The *Name* parameter specifies a unique name for this address rewrite entry.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

ExceptionList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptionList* parameter specifies the email address domains that shouldn't be rewritten when the *InternalAddress* parameter contains the wildcard character to rewrite addresses in a domain and all subdomains (`*.contoso.com`). You can enter multiple domain values in the *ExceptionList* parameter separated by commas.
OutboundOnly	Optional	System.Boolean	The *OutboundOnly* parameter enables or disables outbound-only address rewriting. Valid input for this parameter is `$true` or `$false`. The value `$true` means address rewriting occurs in outbound mail only. The value `$false` means address rewriting occurs on outbound mail and also on inbound mail (rewritten email addresses are changed back to the original email addresses in inbound mail). The

			default value is `$false`. **Note:** You must set this parameter to `$true` if the *InternalAddress* parameter contains the wildcard character to rewrite addresses in a domain and all subdomains (*.contoso.com). Also, when you configure outbound-only address rewriting, you need to configure the rewritten email address as a proxy address on the affected recipients. For example, if laura@sales.contoso.com is rewritten to laura@contoso.com, the proxy address laura@contoso.com must be configured on Laura's mailbox. This allows replies and inbound messages to be delivered correctly.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-AddressRewriteEntry

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Remove-AddressRewriteEntry** cmdlet to remove an existing address rewrite entry that's no longer needed on an Edge Transport server.

```
Remove-Addressrewriteentry -Identity <AddressRewriteEntryIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes a specific address rewrite entry.

```
Remove-AddressRewriteEntry "Address rewrite entry for
contoso.com"
```

EXAMPLE 2

This example removes all address rewrite entries that include contoso.com in the domain name. It accomplishes the following:

- Retrieves all address rewrite entries.
- Filters the result for entries that have contoso.com or its subdomains as the internal address.

- Removes the filtered entries.

```
Get-AddressRewriteEntry | Where {$_.InternalAddress -like
'*contoso.com'} | Remove-AddressRewriteEntry
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address Rewriting - Edge Transport" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.MessagingPolicies.AddressRewrite.AddressRewriteEntryIdParameter	The *Identity* parameter specifies the address rewrite entry you want to remove. The *Identity* parameter accepts a GUID or the unique address rewrite name. You can omit the *Identity* parameter label.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon

			(：) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-AddressRewriteEntry

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available or effective only on Edge Transport servers in on-premises Exchange Server 2013.

Use the **Set-AddressRewriteEntry** cmdlet to modify an existing address rewrite entry that rewrites sender and recipient email addresses in messages sent to or sent from your organization through an Edge Transport server.

```
Set-Addressrewriteentry -Identity <AddressRewriteEntryIdParameter> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-ExceptionList
<MultiValuedProperty>] [-ExternalAddress <String>] [-InternalAddress
<String>] [-Name <String>] [-OutboundOnly <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example modifies the existing address rewrite entry named "Address rewrite entry for contoso.com" with the following settings:

- Changes the original email addresses that are affected by the address rewrite entry to all addresses in the northwindtraders.com domain.
- Changes the Name value to "Address rewrite entry for northwindtraders.com".

```
Set-AddressRewriteEntry "Address rewrite entry for
contoso.com" -Name "Address rewrite entry for
```

```
northwindtraders.com" -InternalAddress northwindtraders.com
```

EXAMPLE 2

This example changes the existing address rewrite entry named "Address entry for all contoso.com email addresses" from inbound and outbound to outbound only. You need to configure a proxy address that matches the rewritten email address for all affected recipients.

```
Set-AddressRewriteEntry "Address rewrite entry for all
contoso.com email addresses" -OutboundOnly $true
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Address Rewriting - Edge Transport" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Messaging Policies.AddressRewrite.AddressRewriteEntryIdParameter	The *Identity* parameter specifies the address rewrite entry you want to modify. You can specify the name or GUID of the address rewrite entry.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
ExceptionList	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExceptionList* parameter specifies the domain names that should be excluded from address rewriting when the *InternalAddress* parameter contains a value that specifies multiple domain names. You can separate multiple domain names included with the *ExceptionList* parameter with commas. For more information

			about how to add values to or remove values from multivalued properties, see Modifying multivalued properties.
ExternalAddress	Optional	System.String	The *ExternalAddress* parameter specifies the final email addresses that you want. If the *InternalAddress* parameter specifies a single email address (chris@contoso.com), the *ExternalAddress* parameter must also specify a single email address (support@contoso.com). If the *InternalAddress* parameter specifies a single domain (contoso.com) or a domain and all subdomains (*.contoso.com), the *ExternalAddress* parameter must specify a single domain (fabrikam.com). **Note:** You can't use the wildcard character (*) with the *ExternalAddress* parameter.

InternalAddress	Optional	System.String	The *InternalAddress* parameter specifies the original email addresses that you want to change. You can use the following values: • **Single email address** david@contoso.com • **Single domain** contoso.com or sales.contoso.com • **Domain and all subdomains** *.contoso.com
Name	Optional	System.String	The *Name* parameter specifies a unique name for this address rewrite entry.
OutboundOnly	Optional	System.Boolean	The *OutboundOnly* parameter enables or disables outbound-only address rewriting. Valid input for this parameter is `$true` or `$false`. The value `$true` means address rewriting occurs in outbound mail only. The value `$false` means address rewriting occurs on outbound mail and also on inbound mail (rewritten email addresses

			are changed back to the original email addresses in inbound mail). The default value is `$false`. **Note:** You must set this parameter to `$true` if the *InternalAddress* parameter contains the wildcard character to rewrite addresses in a domain and all subdomains (*.contoso.com). Also, when you configure outbound-only address rewriting, you need to configure the rewritten email address as a proxy address on the affected recipients. For example, if laura@sales.contoso.com is rewritten to laura@contoso.com, the proxy address laura@contoso.com must be configured on Laura's mailbox. This allows replies and inbound messages to be delivered correctly.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-DeliveryAgentConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-DeliveryAgentConnector** cmdlet to retrieve information about a specific delivery agent connector in your organization.

```
Get-DeliveryAgentConnector [-Identity <DeliveryAgentConnectorIdParameter>]
[-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example reads the configuration of the delivery agent connector named Contoso X.400 Connector from Active Directory and displays all of its properties in a list format.

```
Get-DeliveryAgentConnector "Contoso X.400 Connector" |
Format-List
```

EXAMPLE 2

This example retrieves a list of all delivery agent connectors in your organization and displays their names and delivery protocols in a table format.

```
Get-DeliveryAgentConnector | Format-Table
Name,DeliveryProtocol
```

Detailed Description

Delivery agent connectors are used to route messages addressed to foreign systems that don't use the SMTP protocol. When a message is routed to a delivery agent connector, the associated delivery agent performs the content conversion and message delivery. Delivery agent connectors allow queue management of foreign connectors, thereby eliminating the need for storing messages on the file system in Drop and Pickup directories. For more information, see Delivery agents and Delivery Agent connectors.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Delivery agent connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory

			Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.DeliveryAgentConnectorIdParameter	The *Identity* parameter specifies the GUID or name of the delivery agent connector.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-DeliveryAgentConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

The **New-DeliveryAgentConnector** cmdlet creates a delivery agent connector in your organization.

```
New-DeliveryAgentConnector -AddressSpaces <MultiValuedProperty> -
DeliveryProtocol <String> -Name <String> [-Comment <String>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Enabled <$true |
$false>] [-IsScopedConnector <$true | $false>] [-MaxConcurrentConnections
<Int32>] [-MaxMessageSize <Unlimited>] [-MaxMessagesPerConnection <Int32>]
[-SourceTransportServers <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example creates a delivery agent connector named Contoso X.400 Connector with the following configuration:

- The delivery agent connector is hosted on the following servers:
  - Hub01
  - Hub02
  - Hub05
- The delivery agent connector is designed to handle X.400 connections to a company called Contoso that uses the carrier Fabrikam.
- The address space for the connector is c=US;a=Fabrikam;p=Contoso.

```
New-DeliveryAgentConnector -Name "Contoso X.400 Connector"
-AddressSpaces "X400:c=US;a=Fabrikam;p=Contoso;1" -
DeliveryProtocol "X.400" -SourceTransportServers
Hub01,Hub02,Hub05
```

Detailed Description

Delivery agent connectors are used to route messages addressed to foreign systems that don't utilize the SMTP protocol. When a message is routed to a delivery agent connector, the associated delivery agent performs the content conversion and message delivery. Delivery agent connectors allow queue management of foreign connectors, thereby eliminating the need for storing messages on the file system in the Drop and Pickup directories. For more information, see Delivery agents and Delivery Agent connectors.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Delivery agent connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AddressSpaces	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *AddessSpaces* parameter specifies the domain names for which this delivery agent connector is responsible. The syntax for entering an address space is as

			follows: *<AddressSpaceType>:<AddressSpace>;<AddressSpaceCost>*. You must enclose each address space in quotation marks (").
DeliveryProtocol	Required	System.String	The *DeliveryProtocol* parameter specifies the communication protocol that determines which delivery agents are responsible for servicing the connector.
Name	Required	System.String	The *Name* parameter specifies the name of this delivery agent connector. The value for the *Name* parameter can't exceed 64 characters.
Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: `"This is an admin note"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and

			requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether the delivery agent connector is enabled. The default value is `$true`.
IsScopedConnector	Optional	System.Boolean	The *IsScopedConnector*

			parameter specifies the availability of the connector to other Mailbox servers. If the value of this parameter is `$false`, the connector can be used by all Mailbox servers in your organization. If the value of this parameter is `$true`, the connector can only be used by Mailbox servers in the same Active Directory site. The default value is `$false`.
MaxConcurrentConnections	Optional	System.Int32	The *MaxConcurrentConnections* parameter specifies the maximum number of concurrent connections this connector accepts from a specific IP address. The default value is 5.
MaxMessageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxMessageSize* parameter specifies the maximum size of a message that's allowed to pass through this connector. When you enter a value, qualify the value with one of the following units:

			• B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 65536 through 2147483647 bytes. The default value is `unlimited`.
MaxMessagesPerConnection	Optional	System.Int32	The *MaxMessagesPerConnection* parameter specifies the maximum number of messages this connector accepts per connection. The connector terminates the connection after this limit is reached, and the sending server has to initiate a new connection to send more messages. The default value is 20.
SourceTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SourceTransportServers* parameter specifies the list of Mailbox servers that host this connector. You can specify more than one server by separating their names with commas. By default, only the local

			server on which the command is executed is added to this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-DeliveryAgentConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

The **Remove-DeliveryAgentConnector** cmdlet removes a specific delivery agent connector

configured in your organization.

```
Remove-DeliveryAgentConnector -Identity
<DeliveryAgentConnectorIdParameter> [-Confirm [<SwitchParameter>]] [-
DomainController <Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the delivery agent connector named Contoso Delivery Agent Connector.

```
Remove-DeliveryAgentConnector "Contoso Delivery Agent
Connector"
```

Detailed Description

Delivery agent connectors are used to route messages addressed to foreign systems that don't use the SMTP protocol. When a message is routed to a delivery agent connector, the associated delivery agent performs the content conversion and message delivery. Delivery agent connectors allow queue management of foreign connectors, thereby eliminating the need for storing messages on the file system in Drop and Pickup directories. For more information, see Delivery agents and Delivery Agent connectors.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Delivery agent connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.DeliveryAgentConnectorIdParameter	The *Identity* parameter specifies the GUID or name of the delivery agent connector.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default

			when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes

			would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-DeliveryAgentConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-DeliveryAgentConnector** cmdlet to configure a specific delivery agent connector in your organization.

```
Set-DeliveryAgentConnector -Identity <DeliveryAgentConnectorIdParameter>
[-AddressSpaces <MultiValuedProperty>] [-Comment <String>] [-Confirm
[<SwitchParameter>]] [-DeliveryProtocol <String>] [-DomainController
<Fqdn>] [-Enabled <$true | $false>] [-Force <SwitchParameter>] [-
IsScopedConnector <$true | $false>] [-MaxConcurrentConnections <Int32>] [-
MaxMessageSize <Unlimited>] [-MaxMessagesPerConnection <Int32>] [-Name
<String>] [-SourceTransportServers <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures restrictions on the delivery agent connector Contoso X.400 Connector. It

makes the following configuration changes:

- Sets the maximum message size allowed through the connector to 10 MB.
- Sets the maximum number of messages allowed per connection to 100.
- Sets the maximum concurrent connections to 10.

```
Set-DeliveryAgentConnector "Contoso X.400 Connector" -
MaxMessageSize 10MB -MaxMessagesPerConnection 100 -
MaxConcurrentConnections 10
```

EXAMPLE 2

This example uses the temporary variable *$ConnectorConfig* to add the address space c=US;p=Fabrikam;a=Contoso;o=Sales to the delivery agent connector Contoso X.400 Connector and also adds the server Hub04 to the list of servers that host the connector.

```
$ConnectorConfig = Get-DeliveryAgentConnector "Contoso
X.400 Connector"
$ConnectorConfig.AddressSpaces +=
"X400:c=US;p=Fabrikam;a=Contoso;o=Sales;1"
$ConnectorConfig.SourceTransportServers += Hub04
Set-DeliveryAgentConnector "Contoso X.400 Connector" -
AddressSpaces $ConnectorConfig.AddressSpaces -
SourceTransportServers
$ConnectorConfig.SourceTransportServers
```

Detailed Description

Delivery agent connectors are used to route messages addressed to foreign systems that don't use the SMTP protocol. When a message is routed to a delivery agent connector, the associated delivery agent performs the content conversion and message delivery. Delivery agent connectors allow queue management of foreign connectors, thereby eliminating the need for storing messages on the file system in Drop and Pickup directories. For more information, see Delivery agents and Delivery Agent connectors.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Delivery agent connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.DeliveryAgentConnectorIdParameter	The *Identity* parameter specifies the GUID or name of the delivery agent connector.
AddressSpaces	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AddessSpaces* parameter specifies the domain names for which this delivery agent connector is responsible. The syntax for entering an address space is as follows: *<AddressSpaceType>:<AddressSpace>;<AddressSpaceCost>*. You must enclose each address space in quotation marks (").
Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: `"This is an admin note"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DeliveryProtocol	Optional	System.String	The *DeliveryProtocol* parameter specifies the communication protocol that determines which delivery agents are responsible for servicing the connector.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Enabled	Optional	System.Boolean	The *Enabled* parameter

			specifies whether the delivery agent connector is enabled. The default value is `$true`.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
IsScopedConnector	Optional	System.Boolean	The *IsScopedConnector* parameter specifies the availability of the connector to other Mailbox servers. If the value of this parameter is `$false`, the connector can be used by all Mailbox servers in your organization. If the value of this parameter is `$true`, the connector can only be used by Mailbox servers

			in the same Active Directory site. The default value is `$false`.
MaxConcurrentConnections	Optional	System.Int32	The *MaxConcurrentConnections* parameter specifies the maximum number of concurrent connections this connector accepts from a specific IP address. The default value is 5.
MaxMessageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxMessageSize* parameter specifies the maximum size of a message that's allowed to pass through this connector. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 65536 through 2147483647 bytes. The default value is

			`unlimited`.
MaxMessagesPerConnection	Optional	System.Int32	The *MaxMessagesPerConnection* parameter specifies the maximum number of messages this connector accepts per connection. The connector terminates the connection after this limit is reached and the sending server has to initiate a new connection to send more messages. The default value is 20.
Name	Optional	System.String	The *Name* parameter specifies the name of this delivery agent connector. The value for the *Name* parameter can't exceed 64 characters.
SourceTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SourceTransportServers* parameter specifies the list of Mailbox servers that host this connector. You can specify more than one server by separating their names with commas. By default, only the local server on which the command is executed is

			added to this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-EdgeSubscription

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-EdgeSubscription** cmdlet to retrieve information about Edge Subscriptions in your organization.

```
Get-EdgeSubscription [-Identity <TransportServerIdParameter>] [-
```

```
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves detailed Edge Subscription information for all Edge Transport servers subscribed to your Exchange organization.

```
Get-EdgeSubscription | Format-List
```

EXAMPLE 2

This example retrieves the Edge Subscription information for the Edge Transport server name Edge1 from the domain controller named DC1.

```
Get-EdgeSubscription Edge1 -DomainController
DC1.contoso.com
```

Detailed Description

Run the **Get-EdgeSubscription** cmdlet on an Exchange server in your organization. This cmdlet retrieves the list of Edge Subscriptions. Each Edge Transport server that's subscribed to the Exchange organization has a separate Edge Subscription. You can use this cmdlet to view the Edge Subscription information for a specific Edge Transport server. You can also use this cmdlet to view the Edge Subscription information for all Edge Transport servers subscribed to Active Directory sites.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from

			Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.TransportServerIdParameter	The *Identity* parameter specifies the name of the Edge Transport server for which you want to retrieve Edge Subscription information. The identity is expressed as the host name of the Edge Transport server. If no identity is specified, all Edge Subscriptions are returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-EdgeSubscription

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-EdgeSubscription** cmdlet to export an Edge Subscription file from an Edge Transport server and to import the Edge Subscription file to a Mailbox server.

```
New-EdgeSubscription [-AccountExpiryDuration <TimeSpan>] [-Confirm
[<SwitchParameter>]] [-CreateInboundSendConnector <$true | $false>] [-
CreateInternetSendConnector <$true | $false>] [-DomainController <Fqdn>]
[-FileData <Byte[]>] [-FileName <LongPath>] [-Force <SwitchParameter>] [-
Site <AdSiteIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the Edge Subscription file. It should be run on your Edge Transport server.

```
New-EdgeSubscription -FileName "c:
\EdgeServerSubscription.xml"
```

EXAMPLE 2

This example imports the Edge Subscription file generated in EXAMPLE 1 to the Active Directory site `Default-First-Site-Name`. Importing the Edge Subscription file completes the Edge Subscription process. You must run this command on the Mailbox server.

The first command reads the data from the Edge Subscription file and stores it in a temporary variable as a byte-encoded data object. The second command completes the Edge subscription process.

```
[byte[]]$Temp = Get-Content -Path "C:
\EdgeServerSubscription.xml" -Encoding Byte -ReadCount 0
New-EdgeSubscription -FileData $Temp -Site "Default-First-
Site-Name"
```

EXAMPLE 3

This example also imports the Edge Subscription file generated in EXAMPLE 1 to the Active Directory site `Default-First-Site-Name`; however, the end result is accomplished in a single line of code. You must run this command on the Mailbox server.

```
New-EdgeSubscription -FileData ([byte[]]$(Get-Content -Path
"C:\EdgeServerSubscription.xml" -Encoding Byte -ReadCount
0)) -Site "Default-First-Site-Name"
```

Detailed Description

The Edge Transport server doesn't have access to Active Directory. All configuration and recipient information is stored in the Active Directory Lightweight Directory Services (AD LDS) instance. The **New-EdgeSubscription** cmdlet creates the Edge Subscription file that will be imported on a Mailbox server in the Active Directory site to which you want to subscribe this Edge Transport server..

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AccountExpiryDuration	Optional	System.TimeSpan	The *AccountExpiryDuration* parameter specifies how soon the bootstrap account created by this command will expire. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

			The value for this parameter must be a minimum of `00:02:00` or 2 minutes.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CreateInboundSendConnector	Optional	System.Boolean	The *CreateInboundSendConnector* parameter specifies whether to create the Send connector to connect the Edge Transport server and the Hub Transport servers. The default value is `$true`. The Send connector address space is set to "--", the smart hosts are set to "--", the Edge Transport server is set as the source server, and Domain Name

			System (DNS) routing is disabled. This parameter is only used when you run the command on the Hub Transport server.
CreateInternetSendConnector	Optional	System.Boolean	The *CreateInternetSendConnector* parameter specifies whether to create the Send connector to connect to the Internet. The default value is `$true`. The Send connector address space is set to all domains (*), the Edge Transport server is set as the source server, and DNS routing is enabled. This parameter is only used when you run the command on the Hub Transport server.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change

			to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
FileData	Optional	System.Byte[]	The *FileData* parameter specifies the byte-encoded data object that contains the Edge Subscription file information. For more information about the syntax required to use this parameter, see Exchange Management Shell quick reference for Exchange 2013. You can only use this parameter when you're running this command on a Mailbox server.
FileName	Optional	Microsoft.Exchange.Data.LongPath	The *FileName* parameter specifies the full path of the Edge

			Subscription file. You can only use this parameter when you're running this command on an Edge Transport server.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter. This switch is useful when you use a script with the Edge Subscription command because it bypasses confirmation. Another scenario in which this switch is useful is when

			you have to subscribe an Edge Transport server again, and you want to overwrite the existing configuration information.
Site	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *Site* parameter specifies the name of the Active Directory site that contains the Mailbox servers with which the Edge Transport servers are associated. This parameter is used and required only when you run the command on a Mailbox server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-EdgeSubscription

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-EdgeSubscription** cmdlet to remove Edge Subscription from the Exchange organization and from the subscribed Edge Transport server.

```
Remove-EdgeSubscription -Identity <TransportServerIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-Force <SwitchParameter>]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes Edge Subscription for the Edge Transport server.Edge1.

```
Remove-EdgeSubscription -Identity Edge1
```

Detailed Description

The **Remove-EdgeSubscription** cmdlet removes Edge Subscription. After you remove Edge Subscription, synchronization of information from Active Directory to the Active Directory Lightweight Directory Services (AD LDS) instance stops. All the accounts stored in AD LDS are removed, and the Edge Transport server is removed from the source server list of any Send connector.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.TransportServerIdParameter	The *Identity* parameter specifies the identity of the Edge Transport server for which you want to remove Edge Subscription. The identity is expressed as the host name of the Edge Transport server.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this

			configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter. If you don't specify the `Force` switch, the

			command will inform you that the removal of the replicated recipient data from AD LDS can take a long time and will give you the option to cancel the operation.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Start-EdgeSynchronization

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Start-EdgeSynchronization** cmdlet to immediately start synchronization of configuration data from Active Directory to the subscribed Edge Transport servers.

```
Start-EdgeSynchronization [-Confirm [<SwitchParameter>]] [-ForceFullSync
<SwitchParameter>] [-ForceUpdateCookie <SwitchParameter>] [-Server
<ServerIdParameter>] [-TargetServer <String>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example starts edge synchronization on the Mailbox server named Mailbox01.

```
Start-EdgeSynchronization -Server Mailbox01
```

Detailed Description

The Microsoft Exchange EdgeSync service that runs on Mailbox servers replicates data stored in Active Directory to the local Active Directory Lightweight Directory Services (AD LDS) store on the Edge Transport server. After the initial replication, one-way synchronization of changed data in Active Directory to AD LDS keeps this data up to date.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
ForceFullSync	Optional	System.Management.Automation.SwitchParameter	The *ForceFullSync* switch specifies whether to initiate a full edge synchronization. If you run the command without this switch, only changes since the last replication are synchronized. If you use this switch, the entire configuration information and recipient data are synchronized.
ForceUpdateCookie	Optional	System.Management.Automation.SwitchParameter	The *ForceUpdateCookie* switch specifies whether to force the Microsoft Exchange EdgeSync service to update the replication cookie even if it encounters an error. The cookie maintains the changes in Active Directory since the previous EdgeSync replication. Normally, the Microsoft Exchange EdgeSync service doesn't update the cookie if it encounters any errors

			during replication.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
TargetServer	Optional	System.String	The *TargetServer* parameter specifies an Edge Transport server to initiate edge synchronization with. If omitted, all Edge Transport servers are synchronized. You may want to use this parameter to specify a single Edge Transport server for synchronization if a new Edge Transport server has been installed or if that Edge Transport

			server has been unavailable for some time.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-EdgeSynchronization

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-EdgeSynchronization** cmdlet to diagnose whether the subscribed Edge Transport servers have a current and accurate synchronization status.

```
Test-EdgeSynchronization [-ExcludeRecipientTest <SwitchParameter>] [-
FullCompareMode <SwitchParameter>] [-MaxReportSize <Unlimited>] [-
MonitoringContext <$true | $false>] [-TargetServer <String>] <COMMON
PARAMETERS>

Test-EdgeSynchronization -VerifyRecipient <ProxyAddress> <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example diagnoses the synchronization status of subscribed Edge Transport servers, outputs only the first 500 data inconsistencies, and generates events and performance counters for use by System Center Operations Manager 2007.

```
Test-EdgeSynchronization -MaxReportSize 500 -
MonitoringContext $true
```

EXAMPLE 2

This example verifies the synchronization status of the single recipient kate@contoso.com.

```
Test-EdgeSynchronization -VerifyRecipient kate@contoso.com
```

Detailed Description

The **Test-EdgeSynchronization** cmdlet is a diagnostic cmdlet that provides a report of the synchronization status of subscribed Edge Transport servers. You can use the *VerifyRecipient* parameter with this cmdlet to verify that a single recipient has been synchronized to the Active Directory Lightweight Directory Services (AD LDS) instance. The Edge Subscription process establishes one-way replication of recipient and configuration information from Active Directory to AD LDS.

This cmdlet compares the data stored in Active Directory and the data stored in AD LDS. Any inconsistencies in data are reported in the results output by this cmdlet.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
VerifyRecipient	Required	Microsoft.Exchange.Data.ProxyAddress	The *VerifyRecipient* parameter specifies a single recipient with which to verify the synchronization status. You identify the recipient by specifying a proxy address assigned to the recipient. The proxy address is the recipient's email address. The recipient verification test is mutually exclusive of the test that verifies synchronization of configuration data.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ExcludeRecipientTest	Optional	System.Management.Automation.SwitchParameter	The *ExcludeRecipientTest* switch specifies whether to exclude validation of recipient data synchronization. If you include this switch, only the synchronization of configuration objects is validated. Validating that recipient data is synchronized takes longer than validating only configuration data. You don't have to include a value with this switch.
FullCompareMode	Optional	System.Management.Automation.SwitchParameter	The *FullCompareMode* switch specifies whether a full comparison of the configuration data between Active Directory and AD LDS instance on the target Edge Transport server

			is performed. If you don't use this switch, a full comparison of replicated configuration data is skipped and the command only tests the Edge synchronization by verifying the replication cookie.
MaxReportSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxReportSize* parameter specifies the total number of objects and properties listed in the results. The results output by this command include a list of all out-of-sync objects and properties in both AD LDS and Active Directory. If the directory services aren't synchronized, a large amount of data can result. If you don't specify a value for this parameter, the default value of 1,000 is used. The minimum value for this parameter is 1. The maximum value for this

			parameter is `unlimited`.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
TargetServer	Optional	System.String	The *TargetServer* parameter specifies an Edge Transport server to initiate edge

			synchronization with. If omitted, all Edge Transport servers are synchronized. You may want to use this parameter to specify a single Edge Transport server for synchronization if a new Edge Transport server has been installed or if that Edge Transport server has been unavailable for some time.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-EdgeSyncServiceConfig

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-EdgeSyncServiceConfig** cmdlet to retrieve the edge synchronization services settings that control the general synchronization behavior shared by all Microsoft Exchange EdgeSync services.

```
Get-EdgeSyncServiceConfig [-Identity <EdgeSyncServiceConfigIdParameter>]
[-DomainController <Fqdn>] [-Site <AdSiteIdParameter>]
```

Examples

EXAMPLE 1

This example reads the configuration of the Microsoft Exchange EdgeSync service settings named Primary EdgeSync Settings from Active Directory and displays all its properties in a list format.

```
Get-EdgeSyncServiceConfig "Primary EdgeSync Settings" |
Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.EdgeSyncServiceConfigIdParameter	The *Identity* parameter specifies the name of the Microsoft Exchange EdgeSync service configuration you want to view.
Site	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *Site* parameter specifies the Active Directory site that EdgeSync connects to for synchronizing configuration and recipient data.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-EdgeSyncServiceConfig

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-EdgeSyncServiceConfig** cmdlet to create edge synchronization service settings that control the general synchronization behavior shared by all EdgeSync services.

```
New-EdgeSyncServiceConfig [-ConfigurationSyncInterval <EnhancedTimeSpan>]
[-Confirm [<SwitchParameter>]] [-CookieValidDuration <EnhancedTimeSpan>]
[-DomainController <Fqdn>] [-FailoverDCInterval <EnhancedTimeSpan>] [-
LockDuration <EnhancedTimeSpan>] [-LockRenewalDuration <EnhancedTimeSpan>]
[-LogEnabled <$true | $false>] [-LogLevel <None | Low | Medium | High>] [-
LogMaxAge <EnhancedTimeSpan>] [-LogMaxDirectorySize <Unlimited>] [-
LogMaxFileSize <Unlimited>] [-LogPath <String>] [-OptionDuration
<EnhancedTimeSpan>] [-RecipientSyncInterval <EnhancedTimeSpan>] [-Site
<AdSiteIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates EdgeSync service settings with the following configuration:

- EdgeSync logging is enabled.
- The log files are stored in the EdgeSyncLog share on Server01.
- The maximum individual log file size is 5 megabytes (MB).
- The log files are kept for 3 days.

```
New-EdgeSyncServiceConfig -LogEnabled $true -LogPath "\
\Server01\EdgeSyncLog" -LogMaxFileSize 5MB -LogMaxAge 3
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
ConfigurationSyncInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConfigurationSyncInterval* parameter specifies how

			frequently the EdgeSync service synchronizes configuration data. The default value is 3 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CookieValidDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *CookieValidDuration* parameter specifies how long a cookie record is valid. The default value is 21 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the

			fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
FailoverDCInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *FailoverDCInterval* parameter specifies how long EdgeSync waits before failing over to another domain controller if it can't read configuration data from Active Directory. The default value is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LockDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LockDuration* parameter specifies how long an instance of the EdgeSync service can maintain an exclusive lock on the synchronization rights. While an EdgeSync service maintains an exclusive lock on synchronization rights, no other EdgeSync service can take over

			synchronization. The default value is 6 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LockRenewalDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LockRenewalDuration* parameter specifies how long before the expiry of an exclusive lock an EdgeSync service can renew the lock. The default value is 4 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LogEnabled	Optional	System.Boolean	The *LogEnabled* parameter enables or disables the EdgeSync log. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
LogLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EdgeSyncLoggingLevel	The *LogLevel* parameter specifies the EdgeSync logging level. Valid values for this parameter are `None`, `Low`, `Medium` and

			`High`. The default value is `None`.
LogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LogMaxAge* parameter specifies the maximum duration in days to keep the EdgeSyncLog files. Log files older than the specified value can be overwritten. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *LogMaxDirectorySize* parameter specifies the maximum amount of disk space the EdgeSyncLog directory can use. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes.

			The value of the *LogMaxFileSize* parameter must be less than or equal to the value of the *LogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the EdgeSyncLLog directory.
LogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *LogMaxFileSize* parameter specifies the maximum log file size for the EdgeSyncLog files. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *LogMaxFileSize* parameter must be less than or equal to the value of the

			LogMaxDirectorySize parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the EdgeSyncLog files.
LogPath	Optional	System.String	The *LogPath* parameter specifies the default location for the EdgeSyncLog files. The default value is `TransportRoles\Logs\EdgeSync\`.
OptionDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *OptionDuration* parameter specifies how long an instance of the EdgeSync service can maintain an optional lock on synchronization rights. While an EdgeSync service maintains an optional lock on synchronization rights, another EdgeSync service can take over synchronization after the optional lock has expired if it's initiated using the **Start-**

			EdgeSynchronization command. The default value is 30 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
RecipientSyncInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RecipientSyncInterval* parameter specifies how frequently the EdgeSync service synchronizes recipient data from the global catalog. The default value is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
Site	Optional	Microsoft.Exchange.Configuration.Tasks.AdSiteIdParameter	The *Site* parameter specifies the Active Directory site that EdgeSync connects to for synchronizing configuration and recipient data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-EdgeSyncServiceConfig

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-EdgeSyncServiceConfig** cmdlet to modify the configuration of edge synchronization service settings that control the general synchronization behavior shared by all EdgeSync services.

```
Set-EdgeSyncServiceConfig -Identity <EdgeSyncServiceConfigIdParameter> [-
ConfigurationSyncInterval <EnhancedTimeSpan>] [-Confirm
[<SwitchParameter>]] [-CookieValidDuration <EnhancedTimeSpan>] [-
DomainController <Fqdn>] [-FailoverDCInterval <EnhancedTimeSpan>] [-
LockDuration <EnhancedTimeSpan>] [-LockRenewalDuration <EnhancedTimeSpan>]
[-LogEnabled <$true | $false>] [-LogLevel <None | Low | Medium | High>] [-
LogMaxAge <EnhancedTimeSpan>] [-LogMaxDirectorySize <Unlimited>] [-
LogMaxFileSize <Unlimited>] [-LogPath <String>] [-Name <String>] [-
OptionDuration <EnhancedTimeSpan>] [-RecipientSyncInterval
<EnhancedTimeSpan>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures the Microsoft Exchange EdgeSync service settings named Primary EdgeSync Settings with the following values:

- EdgeSync logging is enabled and set to the medium detail level.
- The log files are stored in the EdgeSyncLog share on the server named Server01.
- The maximum individual log file size is 5 megabytes (MB).
- The log files are kept for 3 days.

```
Set-EdgeSyncServiceConfig "Primary EdgeSync Settings" -
LogEnabled $true -LogLevel Medium -LogPath "\\Server01
\EdgeSyncLog" -LogMaxFileSize 5MB -LogMaxAge 3
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "EdgeSync" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.EdgeSyncServiceConfigIdParameter	The *Identity* parameter specifies the name of the Microsoft Exchange EdgeSync service you want to configure.
ConfigurationSyncInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConfigurationSyncInterval* parameter specifies how frequently the Microsoft Exchange EdgeSync service synchronizes configuration data. The

			default value is 3 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
CookieValidDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *CookieValidDuration* parameter specifies how long a cookie record is valid. The default value is 21 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			writes this configuration change to Active Directory.
FailoverDCInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *FailoverDCInterval* parameter specifies how long EdgeSync waits before failing over to another domain controller if it can't read configuration data from Active Directory. The default value is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LockDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LockDuration* parameter specifies how long an instance of the Microsoft Exchange EdgeSync service can maintain an exclusive lock on the synchronization rights. While an EdgeSync service maintains an exclusive lock on synchronization rights, no other EdgeSync service can take over synchronization. The default value is 6 minutes.

			To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LockRenewalDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LockRenewalDuration* parameter specifies how long before the expiry of an exclusive lock an EdgeSync service can renew the lock. The default value is 4 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LogEnabled	Optional	System.Boolean	The *LogEnabled* parameter specifies enables or disables the EdgeSyncLog. Valid input for this parameter is `$true` or `$false`. The default value is `$true`.
LogLevel	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.EdgeSyncLoggingLevel	The *LogLevel* parameter specifies the EdgeSync logging level. Valid values for this parameter are `None`, `Low`, `Medium` and `High`. The default value is `None`.

LogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *LogMaxAge* parameter specifies the maximum duration in days to keep the EdgeSyncLog files. Log files older than the specified value can be overwritten. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
LogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *LogMaxDirectorySize* specifies the maximum amount of disk space the EdgeSyncLog directory can use. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *LogMaxFileSize* parameter must be less than or equal

			to the value of the *LogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the EdgeSyncLog directory.
LogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *LogMaxFileSize* parameter specifies the maximum log file size for the EdgeSyncLog files. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *LogMaxFileSize* parameter must be less than or equal to the value of the *LogMaxDirectorySize* parameter. The valid input range for either

			parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the EdgeSyncLog files.
LogPath	Optional	System.String	The *LogPath* parameter specifies the disk location to store the EdgeSyncLog files. The default value is `TransportRoles\Logs\EdgeSync\`.
Name	Optional	System.String	The *Name* parameter specifies a unique name for the EdgeSync service configuration.
OptionDuration	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *OptionDuration* parameter specifies how long an instance of the Microsoft Exchange EdgeSync service can maintain an optional lock on the synchronization rights. While an EdgeSync service maintains an optional lock on synchronization rights, another EdgeSync service can take over synchronization after the optional lock has expired

			if it's initiated using the **Start-EdgeSynchronization** command. The default value is 30 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
RecipientSyncInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *RecipientSyncInterval* parameter specifies how frequently the Microsoft Exchange EdgeSync service synchronizes recipient data from the global catalog. The default value is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ForeignConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ForeignConnector** cmdlet to view the configuration information for a Foreign connector in the Transport service of a Mailbox server.

```
Get-ForeignConnector [-Identity <ForeignConnectorIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example lists all Foreign connectors in your organization.

```
Get-ForeignConnector
```

EXAMPLE 2

This example displays detailed configuration information for the Foreign connector named Fax

Connector.

```
Get-ForeignConnector "Fax Connector" | Format-List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Foreign connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ForeignConnectorIdParameter	The *Identity* parameter specifies the Foreign connector that you want to examine. The *Identity*

			parameter can take any of the following values for the Foreign connector object: • GUID • Connector name • *ServerName* *\ConnectorName*

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ForeignConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-ForeignConnector** cmdlet to create a new Foreign connector in the Transport service of a Mailbox server.

```
New-ForeignConnector -AddressSpaces <MultiValuedProperty> -Name <String>
[-Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-
IsScopedConnector <$true | $false>] [-SourceTransportServers
<MultiValuedProperty>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates a Foreign connector with the following properties:

- Connector name: Contoso Foreign Connector
- Address space: "c=US;a=Fabrikam;P=Contoso"
- Address space type: X.400
- Address space cost: 5
- Source transport servers: Hub01 and Hub02

```
New-ForeignConnector -Name "Contoso Foreign Connector" -
AddressSpaces "X400:c=US;a=Fabrikam;P=Contoso;5" -
SourceTransportServers Hub01,Hub02
```

Detailed Description

A *Foreign connector* uses a Drop directory in the Transport service of a Mailbox server to send messages to a local messaging server that doesn't use SMTP as its primary transport mechanism. These messaging servers are known as foreign gateway servers. Third-party fax gateway servers are examples of foreign gateway servers. The address spaces assigned to a Foreign connector can be SMTP or non-SMTP.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Foreign connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AddressSpaces	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *AddressSpaces* parameter specifies the domain names to which the Foreign connector sends messages. The complete syntax for entering each address space is as follows: *<AddressSpaceType>:<AddressSpace>;<AddressSpaceCost>* • **AddressSpaceType:** The address space type

			may be SMTP, X400, or any other text string. If you omit the address space type, an SMTP address space type is assumed. • **AddressSpace:** For SMTP address space types, the address space that you enter must be RFC 1035-compliant. For example, *, *.com, and *.contoso.com are permitted, but *contoso.com isn't permitted. For X.400 address space types, the address space that you enter must be RFC 1685-compliant, such as **o=MySite;p=MyOrg;a=adatum;c=us**. For all other values of an address type, you can enter any text for the address space. • **AddressSpaceCost :** The valid input range for the cost is from 1 through 100. A lower cost indicates a better route. If you omit the address space cost, a

			cost of 1 is assumed. If you enter a non-SMTP address space that contains the semicolon character (;), you must specify the address space cost. If you specify the address space type or the address space cost, you must enclose the address space in quotation marks ("). For example, the following address space entries are equivalent: • `"SMTP:contoso.com;1"` • `"contoso.com;1"` • `"SMTP:contoso.com"` • `contoso.com` You may specify multiple address spaces by separating the address spaces with commas, for example: `contoso.com,fabrikam.com`. If you specify the address space type or the address space cost, you must enclose the address space in quotation marks ("), for example: `"contoso.com;2","fabrikam.com;3"`. To add or remove one or more address space

			values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
Name	Required	System.String	The *Name* parameter specifies the name for the Foreign connector.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge

			Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IsScopedConnector	Optional	System.Boolean	The *IsScopedConnector* parameter specifies the availability of the connector to other Mailbox servers. When the value of this parameter is `$false`, the connector can be used by all Mailbox servers in the Exchange organization. When the value of this parameter is `$true`, the connector can be used only by Mailbox servers in the same Active Directory site. The default value is `$false`.
SourceTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SourceTransportServers* parameter specifies the names of the Mailbox servers that use this Foreign connector. Having a single Foreign connector homed on multiple servers provides fault tolerance and high

			availability if one of the Mailbox servers fails. The default value of this parameter is the name of the server on which this Foreign connector is first installed. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ForeignConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ForeignConnector** cmdlet to delete a Foreign connector in the Transport service of a Mailbox server.

```
Remove-ForeignConnector -Identity <ForeignConnectorIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the Foreign connector named Fax Connector.

```
Remove-ForeignConnector "Fax Connector"
```

Detailed Description

The **Remove-ForeignConnector** cmdlet deletes the object and the configuration information for a Foreign connector.

Caution:
Although a Foreign connector is configured on a local Mailbox server, if you delete a Foreign connector, you may affect mail flow throughout the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Foreign connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ForeignConnectorIdParameter	The *Identity* parameter specifies the GUID or connector name of a specific Foreign connector. You can also include the server name by using the format *ServerName**ConnectorName*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon

			(：) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ForeignConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ForeignConnector** cmdlet to modify an existing Foreign connector in the Transport service of a Mailbox server.

```
Set-ForeignConnector -Identity <ForeignConnectorIdParameter> [-
AddressSpaces <MultiValuedProperty>] [-Comment <String>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-DropDirectory <String>]
[-DropDirectoryQuota <Unlimited>] [-Enabled <$true | $false>] [-Force
<SwitchParameter>] [-IsScopedConnector <$true | $false>] [-MaxMessageSize
<Unlimited>] [-Name <String>] [-RelayDsnRequired <$true | $false>] [-
SourceTransportServers <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example configures a 10 MB message size limit on the existing Foreign connector named Fax Connector.

```
Set-ForeignConnector "Fax Connector" -MaxMessageSize 10MB
```

Detailed Description

A *Foreign connector* uses a Drop directory in the Transport service of a Mailbox server to send messages to a local messaging server that doesn't use SMTP as its primary transport mechanism.

These messaging servers are known as foreign gateway servers. Third-party fax gateway servers are examples of foreign gateway servers. The address spaces assigned to a Foreign connector can be SMTP or non-SMTP.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Foreign connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ForeignConnectorIdParameter	The *Identity* parameter specifies the Foreign connector that you want to modify. The *Identity* parameter can take any of the following values for the Foreign connector object: • GUID • Connector name • *ServerName* *\ConnectorName*
AddressSpaces	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *AddressSpaces* parameter specifies the domain names to which the Foreign connector sends messages. The complete syntax for entering each address space is as follows: *<AddressSpaceType>:<AddressSpace>;<AddressSpaceCost>* • **AddressSpaceType:**

			The address space type may be `SMTP`, `X400`, or any other text string. If you omit the address space type, an SMTP address space type is assumed. • **AddressSpace:** For SMTP address space types, the address space that you enter must be RFC 1035-compliant. For example, `*`, `*.com`, and `*.contoso.com` are permitted, but `*contoso.com` isn't permitted. For X.400 address space types, the address space that you enter must be RFC 1685-compliant, such as **o=MySite;p=MyOrg;a=adatum;c=us**. For all other values of address type, you can enter any text for the address space. • **AddressSpaceCost :** The valid input range for the cost is from 1 through 100. A lower cost indicates a better route. If you omit the

			address space cost, a cost of 1 is assumed. If you enter a non-SMTP address space that contains a semicolon (;), you must specify the address space cost. If you specify the address space type or the address space cost, you must enclose the address space in quotation marks ("). For example, the following address space entries are equivalent: • `"SMTP:contoso.com;1"` • `"contoso.com;1"` • `"SMTP:contoso.com"` • `contoso.com` You may specify multiple address spaces by separating the address spaces with commas, for example: `contoso.com,fabrikam.com`. If you specify the address space type or the address space cost, you must enclose the address space in quotation marks ("), for example: `"contoso.com;2","fabrikam.com;3"`. To add or remove one or more address space

			values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: `"This is an admin note"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.

			The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DropDirectory	Optional	System.String	The *DropDirectory* parameter specifies the name of the Drop directory used by this Foreign connector. All outbound messages sent to address spaces defined by this Foreign connector are put in the specified Drop directory. The location of the Drop directory for each Foreign connector is controlled by the following two items: • **RootDropDirectoryPath parameter in the Set-TransportService cmdlet:** This option is used for all Foreign connectors that exist on the Mailbox server. The value of the *RootDropDirectoryPath*

			parameter may be a local path or a Universal Naming Convention (UNC) path to a remote server. • **DropDirectory parameter in the Set-ForeignConnector cmdlet:** This value is set for each Foreign Connector that exists on the server. By default, the *RootDropDirectoryPath* parameter is blank. This indicates the value of *RootDropDirectoryPath* is the Exchange 2010 installation folder. The default Exchange 2010 installation folder is C:\Program Files\Microsoft\Exchange Server\. By default, the value of the *DropDirectory* parameter is the name of the Foreign connector. If the value of the *DropDirectory* parameter doesn't contain absolute path information, the location of the Drop directory is defined by the

			combination of the *DropDirectory* parameter and the *RootDropDirectoryPath* parameter. If the value of the *DropDirectory* parameter contains absolute path information, the value of the *RootDropDirectoryPath* must be unspecified. The location of the Drop directory is defined only by the value of the *DropDirectory* parameter. The Drop directory isn't created for you. Therefore, you have to manually create each Drop directory folder. The Drop directory must have the following permissions assigned to it: • Network Service: Full Control • System: Full Control • Administrators: Full Control
DropDirectoryQuota	Optional	Microsoft.Exchange.Data.Unlimited	The *DropDirectoryQuota* parameter specifies the maximum size of all message files in the Drop

			directory. When the specified value is reached, no new message files can be copied into the Drop directory until the existing messages are delivered and deleted. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 1 through 2147483647 bytes. If you enter a value of `unlimited`, no message size limit is imposed on the Drop directory. The default value is `unlimited`.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the Foreign connector. The valid values are `$true` or `$false`. The default value is `$true`.

Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.
IsScopedConnector	Optional	System.Boolean	The *IsScopedConnector* parameter specifies the availability of the connector to other Mailbox servers. When the value of this parameter is `$false`, the connector can be used by all Mailbox servers in the Exchange organization. When the value of this parameter is `$true`, the connector can be used only by Mailbox servers in the same Active Directory site. The default value is `$false`.
MaxMessageSize	Optional	Microsoft.Exchange.Da	The *MaxMessageSize*

		ta.Unlimited	parameter specifies the maximum size of a message that can pass through this Foreign connector. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. If you enter a value of `unlimited`, no message size limit is imposed on this Foreign connector. The default value is `unlimited`. The valid input range for this parameter is from 0 through 2147483647 kilobytes. If you set the value of the *MaxMessageSize* parameter to 0, you effectively disable the Foreign connector. However, if you set the value of the *MaxMessageSize* parameter to 0 when the

			value of the *Enabled* attribute is `$true`, you generate event log errors. The preferred method to disable the Foreign connector is to use the *Enabled* parameter.
Name	Optional	System.String	The *Name* parameter specifies a descriptive name for the Foreign connector.
RelayDsnRequired	Optional	System.Boolean	The *RelayDsnRequired* parameter specifies whether a Relay delivery status notification (DSN) is required by the Foreign connector when messages are written to the Drop directory. The valid input values for this parameter are `$true` or `$false`. The default value is `$false`.
SourceTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SourceTransportServers* parameter specifies the names of the Mailbox servers that use this Foreign connector. Having a single Foreign connector homed on multiple Mailbox servers running the Transport service

			provides fault tolerance and high availability if one of the servers fails. The default value of this parameter is the name of the Mailbox server on which this Foreign connector was first installed. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-FrontendTransportService

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-FrontEndTransportService** cmdlet to view the transport configuration information for the Front End Transport service on Client Access servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-FrontendTransportService [-Identity
<FrontendTransportServerIdParameter>] [-DomainController <Fqdn>]
```

Examples

Example 1

This example displays a list of all Client Access servers in your organization.

```
Get-FrontEndTransportService
```

Example 2

This example retrieves the detailed configuration information for the Front End Transport service on the Client Access server named CAS01.

```
Get-FrontEndTransportService CAS01 | Format-List
```

Detailed Description

The Front End Transport service runs on all Client Access servers and acts as a stateless proxy for all inbound and outbound external SMTP traffic for the Exchange organization. The Front End Transport service only communicates with the Transport service on a Mailbox server, and doesn't queue any messages locally.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Front End Transport service" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.FrontEndTransportServerIdParameter	The *Identity* parameter specifies the server that you want to view.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-FrontendTransportService

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-18*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-FrontEndTransportService** cmdlet to set the transport configuration options for the Front End Transport service on Client Access servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-FrontendTransportService -Identity
<FrontendTransportServerIdParameter> [-AgentLogEnabled <$true | $false>]
[-AgentLogMaxAge <EnhancedTimeSpan>] [-AgentLogMaxDirectorySize
<Unlimited>] [-AgentLogMaxFileSize <Unlimited>] [-AgentLogPath
<LocalLongFullPath>] [-AntispamAgentsEnabled <$true | $false>] [-
AttributionLogEnabled <$true | $false>] [-AttributionLogMaxAge
<EnhancedTimeSpan>] [-AttributionLogMaxDirectorySize <Unlimited>] [-
AttributionLogMaxFileSize <Unlimited>] [-AttributionLogPath
<LocalLongFullPath>] [-Confirm [<SwitchParameter>]] [-
ConnectivityLogEnabled <$true | $false>] [-ConnectivityLogMaxAge
<EnhancedTimeSpan>] [-ConnectivityLogMaxDirectorySize <Unlimited>] [-
ConnectivityLogMaxFileSize <Unlimited>] [-ConnectivityLogPath
<LocalLongFullPath>] [-DnsLogEnabled <$true | $false>] [-DnsLogMaxAge
<EnhancedTimeSpan>] [-DnsLogMaxDirectorySize <Unlimited>] [-
DnsLogMaxFileSize <Unlimited>] [-DnsLogPath <LocalLongFullPath>] [-
DomainController <Fqdn>] [-ExternalDNSAdapterEnabled <$true | $false>] [-
ExternalDNSAdapterGuid <Guid>] [-ExternalDNSProtocolOption <Any |
UseUdpOnly | UseTcpOnly>] [-ExternalDNSServers <MultiValuedProperty>] [-
ExternalIPAddress <IPAddress>] [-InternalDNSAdapterEnabled <$true |
$false>] [-InternalDNSAdapterGuid <Guid>] [-InternalDNSProtocolOption <Any
| UseUdpOnly | UseTcpOnly>] [-InternalDNSServers <MultiValuedProperty>] [-
IntraOrgConnectorProtocolLoggingLevel <None | Verbose>] [-

<LocalLongFullPath>] [-ResourceLogEnabled <$true | $false>] [-
ResourceLogMaxAge <EnhancedTimeSpan>] [-ResourceLogMaxDirectorySize
<Unlimited>] [-ResourceLogMaxFileSize <Unlimited>] [-ResourceLogPath
<LocalLongFullPath>] [-SendProtocolLogMaxAge <EnhancedTimeSpan>] [-
SendProtocolLogMaxDirectorySize <Unlimited>] [-SendProtocolLogMaxFileSize
```

```
<Unlimited>] [-SendProtocolLogPath <LocalLongFullPath>] [-
SmtpEnableAllTlsVersions <$true | $false>] [-TransientFailureRetryCount
<Int32>] [-TransientFailureRetryInterval <EnhancedTimeSpan>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example sets the *TransientFailureRetryCount* parameter to 3 and sets the *TransientFailureRetryInterval* parameter to 30 seconds for the Front End Transport service on the Client Access server named CAS01.

```
Set-FrontEndTransportService CAS01 -
TransientFailureRetryCount 3 -TransientFailureRetryInterval
00:00:30
```

Example 2

This example sets the *ReceiveProtocolLogPath* parameter to C:\SMTP Protocol Logs\Receive.log for the Front End Transport service on the Client Access server named CAS01.

```
Set-FrontEndTransportService CAS01 -ReceiveProtocolLogPath
"C:\SMTP Protocol Logs\Receive.log"
```

Detailed Description

The Front End Transport service runs on all Client Access servers and acts as a stateless proxy for all inbound and outbound external SMTP traffic for the Exchange organization. The Front End Transport service only communicates with the Transport service on a Mailbox server, and doesn't queue any messages locally.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Front End Transport service" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.FrontendTransportServerId	The *Identity* parameter specifies the server that you want to modify.

		Parameter	
AgentLogEnabled	Optional	System.Boolean	The *AgentLogEnabled* parameter specifies whether the agent log is enabled. The default value is `$true`.
AgentLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *AgentLogMaxAge* parameter specifies the maximum age for the agent log file. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *AgentLogMaxAge* parameter to 00:00:00 prevents the automatic removal of agent log files because of their age.
AgentLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *AgentLogMaxDirectorySize* parameter specifies the maximum size of all agent logs in the agent log directory. When a

			directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *AgentLogMaxFileSize* parameter must be less than or equal to the value of the *AgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log directory.
AgentLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *AgentLogMaxFileSize* parameter specifies the maximum size of each agent log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB.

			When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *AgentLogMaxFileSize* parameter must be less than or equal to the value of the *AgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log files.
AgentLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *AgentLogPath* parameter specifies the default agent log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\FrontEnd\AgentLog`. Setting the value of this parameter to `$null` disables agent logging. However, setting this parameter to `$null` when the value of the

			AgentLogEnabled attribute is `$true` generates event log errors.
AntispamAgentsEnabled	Optional	System.Boolean	The *AntispamAgentsEnabled* parameter specifies whether anti-spam agents are installed on the server specified with the *Identity* parameter. The default value is `$false` for the Front End Transport service on Client Access servers. **Important:** You set this parameter by using a script. You shouldn't modify this parameter manually.
AttributionLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
AttributionLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
AttributionLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
AttributionLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
AttributionLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectivityLogEnabled	Optional	System.Boolean	The *ConnectivityLogEnabled* parameter specifies whether the connectivity log is enabled. The default value is `$true`.
ConnectivityLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectivityLogMaxAge* parameter specifies the maximum age for the connectivity log file. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25

			days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *ConnectivityLogMaxAge* parameter to 00:00:00 prevents the automatic removal of connectivity log files because of their age.
ConnectivityLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxDirectorySize* parameter specifies the maximum size of all connectivity logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 1000 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes)

			Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log directory.
ConnectivityLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxFileSize* parameter specifies the maximum size of each connectivity log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes)

			• `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log files.
ConnectivityLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ConnectivityLogPath* parameter specifies the default connectivity log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\FrontEnd\Connectivity`. Setting the value of this parameter to `$null` disables connectivity logging. However, setting this parameter to `$null` when the value of the *ConnectivityLogEnabled*

			attribute is `$true` generates event log errors.
DnsLogEnabled	Optional	System.Boolean	The *DnsLogEnabled* parameter specifies whether the DNS log is enabled. The default value is `$false`.
DnsLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *DnsLogMaxAge* parameter specifies the maximum age for the DNS log file. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *DnsLogMaxAge* parameter to `00:00:00` prevents the automatic removal of DNS log files because of their age.
DnsLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *DnsLogMaxDirectorySize* parameter specifies the maximum size of all DNS

			logs in the DNS log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 100 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *DnsLogMaxFileSize* parameter must be less than or equal to the value of the *DnsLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the DNS log directory.
DnsLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *DnsLogMaxFileSize* parameter specifies the maximum size of each DNS log file. When a log file reaches its maximum file size, a new log file is

			created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *DnsLogMaxFileSize* parameter must be less than or equal to the value of the *DnsLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the DNS log files.
DnsLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *DnsLogPath* parameter specifies the DNS log directory location. The default value is blank (`$null`), which indicates no location is configured. If you enable DNS logging, you need to specify a local file path for the DNS log files by using this parameter. If the path

			contains spaces, enclose the entire path value in quotation marks (").
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
ExternalDNSAdapterEnabled	Optional	System.Boolean	The *ExternalDNSAdapterEnabled* parameter specifies one or more Domain Name System (DNS) servers that Exchange uses for external DNS lookups. When the *ExternalDNSAdapterEnabled* parameter is set to `$true`, DNS lookups of destinations outside the Exchange organization are performed by using the DNS settings of the external network adapter specified by the value of the *ExternalDNSAdapterGuid* parameter. If you want to specify a custom list of

			DNS servers used for external Exchange DNS lookups only, you must specify the DNS servers by using the *ExternalDNSServers* parameter, and you must also set the value of the *ExternalDNSAdapterEnabled* parameter to `$false`. The default value of the *ExternalDNSAdapterEnabled* parameter is `$true`.
ExternalDNSAdapterGuid	Optional	System.Guid	The *ExternalDNSAdapterGuid* parameter specifies the network adapter that has the DNS settings used for DNS lookups of destinations that exist outside the Exchange organization. The concept of an external network adapter and an internal network adapter is only applicable in a multi-homed Exchange server environment. When no particular network adapter is specified as the network adapter for external DNS lookups, the value of the

			ExternalDNSAdapterGuid parameter is `00000000-0000-0000-0000-000000000000`, and external DNS lookups are performed by using the DNS settings of any available network adapter. You may enter the GUID of a specific network adapter to use for external DNS lookups. The default value of the *ExternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`. **Note:** If the value of the *ExternalDNSAdapterEnabled* parameter is set to `$false`, the value of the *ExternalDNSAdapterGuid* parameter is ignored, and the list of DNS servers from the *ExternalDNSServers* parameter is used.
ExternalDNSProtocolOption	Optional	Microsoft.Exchange.Data.ProtocolOption	The *ExternalDNSProtocolOption* parameter specifies which protocol to use when querying external DNS servers. The valid options for this parameter are `Any`, `UseTcpOnly`, and `UseUdpOnly`. The default

			value is `Any`.
ExternalDNSServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *ExternalDNSServers* parameter specifies the list of external DNS servers that the server queries when resolving a remote domain. You must separate IP addresses by using commas. The default value is an empty list ({}). **Note:** If the value of the *ExternalDNSAdapterEnabled* parameter is set to `$true`, the *ExternalDNSServers* parameter and its list of DNS servers isn't used.
ExternalIPAddress	Optional	System.Net.IPAddress	The *ExternalIPAddress* parameter specifies the IP address used in the `Received` message header field for every message that travels through the Front End Transport service on a Client Access server. The IP address in the `Received` header field is used for hop count and routing loop detection. The IP address specified by the *ExternalIPAddress* parameter overrides the

			external network adapter's actual IP address. Typically, you would want to set the value of the *ExternalIPAddress* parameter to match the value of your domain's public MX record. The default value of the *ExternalIPAddress* parameter is blank. This means the actual IP address of the external network adapter is used in the `Received` header field.
InternalDNSAdapterEnabled	Optional	System.Boolean	The *InternalDNSAdapterEnabled* parameter specifies one or more DNS servers that Exchange uses for internal DNS lookups. When the *InternalDNSAdapterEnabled* parameter is set to `$true`, DNS lookups of destinations inside the Exchange organization are performed by using the DNS settings of the internal network adapter specified by the value of

			the *InternalDNSAdapterGuid* parameter. If you want to specify a custom list of DNS servers used for internal Exchange DNS lookups only, you must specify the DNS servers by using the *InternalDNSServers* parameter, and you must also set the value of the *InternalDNSAdapterEnabled* parameter to `$false`. The default value of the *InternalDNSAdapterEnabled* parameter is `$true`.
InternalDNSAdapterGuid	Optional	System.Guid	The *InternalDNSAdapterGuid* parameter specifies the network adapter that has the DNS settings used for DNS lookups of servers that exist inside the Exchange organization. The concept of an internal network adapter and an external network adapter is only applicable in a multi-homed Exchange server environment. When no particular network adapter is

			specified as the network adapter for external DNS lookups, the value of the *InternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`, and internal DNS lookups are performed by using the DNS settings of any available network adapter. You may enter the GUID of a specific network adapter to use for internal DNS lookups. The default value of the *InternalDNSAdapterGuid* parameter is `00000000-0000-0000-0000-000000000000`. **Note:** If the value of the *InternalDNSAdapterEnabled* parameter is set to `$false`, the value of the *InternalDNSAdapterGuid* parameter is ignored, and the list of DNS servers from the *InternalDNSServers* parameter is used.
InternalDNSProtocolOption	Optional	Microsoft.Exchange.Data.ProtocolOption	The *InternalDNSProtocolOption* parameter specifies which protocol to use when you query internal DNS servers. Valid

			options for this parameter are `Any`, `UseTcpOnly`, or `UseUdpOnly`. The default value is `Any`.
InternalDNSServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *InternalDNSServers* parameter specifies the list of DNS servers that should be used when resolving a domain name. DNS servers are specified by IP address and are separated by commas. The default value is any empty list ({}). **Note:** If the *InternalDNSAdapterGuid* parameter is set, and the value of the *InternalDNSAdapterEnabled* parameter is set to `$true`, the *InternalDNSServers* parameter and its list of DNS servers isn't used.
IntraOrgConnectorProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *IntraOrgConnectorProtocolLoggingLevel* parameter enables or disables SMTP protocol logging on the implicit and invisible intra-organization Send connectors that are used to transmit messages between Exchange servers

			in the Exchange organization. Valid values for this parameter are `None` or `Verbose`. The value `Verbose` enables protocol logging for the connector. The value `None` disables protocol logging for the connector. The default value is `None`. When the *IntraOrgConnectorProtocolLoggingLevel* parameter is set to `Verbose`, the information is written to the Send connector protocol log specified by the *SendProtocolLog* parameters.
MaxConnectionRatePerMinute	Optional	System.Int32	The *MaxConnectionRatePerMinute* parameter specifies the maximum rate that connections are allowed to be opened with the transport service. If many connections are attempted with the transport service at the same time, the *MaxConnectionRatePerMinute* parameter limits the

			rate that the connections are opened so that the server's resources aren't overwhelmed. The default value is 1200 connections per minute. The valid input range for this parameter is from 1 through 2147483647.
MaxReceiveTlsRatePerMinute	Optional	System.Int32	This parameter is reserved for internal Microsoft use.
ReceiveProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ReceiveProtocolLogMaxAge* parameter specifies the maximum age of the Receive connector protocol log file. Log files that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 20 days for this parameter, use 20.00:00:00. The valid input range for this parameter is from

			00:00:00 through 24855.03:14:07. Setting the value of the *ReceiveProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Receive connector protocol log files because of their age.
ReceiveProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Receive connector protocol log directory shared by all the Receive connectors that exist on the server. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.

			The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log directory.
ReceiveProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxFileSize* parameter specifies the maximum size of the Receive connector protocol log files shared by all the Receive connectors that exist on the server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes)

			• KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log files.
ReceiveProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ReceiveProtocolLogPath* parameter specifies the path of the protocol log directory for all the Receive connectors that exist on the server. The default location is `%ExchangeInstallPath%TransportRoles\Logs\FrontEnd\ProtocolLog\SmtpReceive`. Setting the

			value of this parameter to `$null` disables protocol logging for all Receive connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* attribute for any Receive connector on the server is `Verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-ReceiveConnector** cmdlet to set the *ProtocolLoggingLevel* to `None` on each Receive connector.
ResourceLogEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
ResourceLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter is reserved for internal Microsoft use.
ResourceLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ResourceLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	This parameter is reserved for internal Microsoft use.
ResourceLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	This parameter is reserved for internal Microsoft use.

SendProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SendProtocolLogMaxAge* parameter specifies the Send connector protocol log file maximum age. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *SendProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Send connector protocol log files because of their age.
SendProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxDirectorySize* parameter specifies the maximum

			size of the Send connector protocol log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 MB. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send

			connector protocol log directory.
SendProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxFileSize* parameter specifies the maximum size of the Send connector protocol log files shared by all the Send connectors that exist on a server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1

			through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log files.
SendProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *SendProtocolLogPath* parameter specifies the location of protocol log storage for the Send connectors. The default location is `%ExchangeInstallPath%TransportRoles\Logs\FrontEnd\ProtocolLog\SmtpSend`. Setting the value of this parameter to `$null` disables protocol logging for all Send connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* or *IntraOrgConnectorProtocolLoggingLevel* attribute for any Send connector on the server is `verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-SendConnector**

			cmdlet to set the *ProtocolLoggingLevel* parameter to None on each Send connector and to set the *IntraOrgConnectorProtocolLoggingLevel* parameter to None.
SmtpEnableAllTlsVersions	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
TransientFailureRetryCount	Optional	System.Int32	The *TransientFailureRetryCount* parameter specifies the maximum number of immediate connection retries attempted when the server encounters a connection failure with a remote server. The default value is 6. The valid input range for this parameter is from 0 through 15. When the value of this parameter is set to 0, the server doesn't immediately attempt to retry an unsuccessful connection.
TransientFailureRetryInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TransientFailureRetryInterval* parameter controls the connection interval

			between each connection attempt specified by the *TransientFailureRetryCount* parameter. For the Front End Transport service on a Client Access server, the default value of the *TransientFailureRetryInterval* parameter is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 8 minutes for this parameter, use 00:08:00. The valid input range for this parameter is from 00:00:01 through 12:00:00.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MailboxTransportService

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MailboxTransportService** cmdlet to view the transport configuration information for the Mailbox Transport service on Mailbox servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MailboxTransportService [-Identity
<MailboxTransportServerIdParameter>] [-DomainController <Fqdn>]
```

Examples

Example 1

This example displays a list of all Mailbox servers in your organization.

```
Get-MailboxTransportService
```

Example 2

This example retrieves the detailed transport configuration information for the Mailbox Transport

service on the Mailbox server named Mailbox01.

```
Get-MailboxTransportService Mailbox01 | Format-List
```

Detailed Description

The Mailbox Transport service runs on all Mailbox servers and is responsible for delivering messages to and accepting messages from local mailbox databases using remote procedure calls (RPC). The Mailbox Transport service also uses SMTP to send messages to and from the Transport service that runs on all Mailbox servers for routing their ultimate destinations.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Transport service" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.MailboxTransportServerIdParameter	The *Identity* parameter specifies the server that you want to view.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-MailboxTransportService

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-17*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-MailboxTransportService** cmdlet to view the transport configuration information for the Mailbox Transport service on Mailbox servers.

For information about the parameter sets in the Syntax section below, see Syntax.

```

```

Examples

Example 1

This example sets the *ReceiveProtocolLogPath* parameter to C:\SMTP Protocol Logs\Receive.log for the Mailbox Transport service on server Mailbox01.

```
Set-MailboxTransportService Mailbox01 -
ReceiveProtocolLogPath "C:\SMTP Protocol Logs\Receive.log"
```

Detailed Description

The Mailbox Transport service runs on all Mailbox servers and is responsible for delivering messages to and accepting messages from local mailbox databases using a remote procedure call (RPC). The Mailbox Transport service also uses SMTP to send messages to and from the Transport service that runs on all Mailbox servers for routing messages to their ultimate destinations.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Mailbox Transport service" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxTransportServerIdParameter	The *Identity* parameter specifies the server that you want to modify.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectivityLogEnabled	Optional	System.Boolean	The *ConnectivityLogEnabled* parameter specifies

			whether the connectivity log is enabled. The default value is `$true`.
ConnectivityLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectivityLogMaxAge* parameter specifies the maximum age for the connectivity log file. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *ConnectivityLogMaxAge* parameter to 00:00:00 prevents the automatic removal of connectivity log files because of their age.

ConnectivityLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxDirectorySize* parameter specifies the maximum size of all connectivity logs in the connectivity log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 1000 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807

			bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log directory.
ConnectivityLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ConnectivityLogMaxFileSize* parameter specifies the maximum size of each connectivity log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *ConnectivityLogMaxFileSize* parameter must be less than or equal to the value of the *ConnectivityLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through

			9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the connectivity log files.
ConnectivityLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ConnectivityLogPath* parameter specifies the default connectivity log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Mailbox\Connectivity`. Setting the value of this parameter to `$null` disables connectivity logging. However, setting this parameter to `$null` when the value of the *ConnectivityLogEnabled* attribute is `$true` generates event log errors.
ContentConversionTracingEnabled	Optional	System.Boolean	The *ContentConversionTracingEnabled* parameter specifies whether content conversion tracing is enabled. Content conversion tracing captures content conversion failures that occur in the Transport

			service or in the Mailbox Transport service on the Mailbox server. The default value is `$false`. Content conversion tracing captures a maximum of 128 MB of content conversion failures. When the 128 MB limit is reached, no more content conversion failures are captured. Content conversion tracing captures the complete contents of email messages to the path specified by the *PipelineTracingPath* parameter. Make sure that you restrict access to this directory. The permissions required on the directory specified by the *PipelineTracingPath* parameter are as follows: • Administrators: Full Control • Network Service: Full Control • System: Full Control
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory.
MailboxDeliveryAgentLogEnabled	Optional	System.Boolean	The *MailboxDeliveryAgentLogEnabled* parameter specifies whether the agent log for the Mailbox Transport Delivery service is enabled. The default value is `$true`.
MailboxDeliveryAgentLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MailboxDeliveryAgentLogMaxAge* parameter specifies the maximum age for the agent log file of the Mailbox Transport Delivery service. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *MailboxDeliveryAgentLog*

			MaxAge parameter to 00:00:00 prevents the automatic removal of agent log files because of their age.
MailboxDeliveryAgentLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *MailboxDeliveryAgentLogMaxDirectorySize* parameter specifies the maximum size of all Mailbox Transport Delivery service agent logs in the agent log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *MailboxDeliveryAgentLogMaxFileSize* parameter must be less than or equal

			to the value of the *MailboxDeliveryAgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log directory.
MailboxDeliveryAgentLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MailboxDeliveryAgentLogMaxFileSize* parameter specifies the maximum size of each agent log file for the Mailbox Transport Delivery service. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *MailboxDeliveryAgentLogMaxFileSize* parameter must be less than or equal to the value of the

			MailboxDeliveryAgentLogMaxDirectorySize parameter. If you enter a value of `unlimited`, no size limit is imposed on the agent log files.
MailboxDeliveryAgentLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *MailboxDeliveryAgentLogPath* parameter specifies the default agent log directory location for the Mailbox Transport Delivery service. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Mailbox\AgentLog\Delivery`. Setting the value of this parameter to `$null` disables agent logging. However, setting this parameter to `$null` when the value of the *MailboxDeliveryAgentLogEnabled* attribute is `$true` generates event log errors.
MailboxDeliveryConnectorProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *MailboxDeliveryConnectorProtocolLoggingLevel* parameter sets the protocol logging level for messages transferred

			from the Transport service to the Mailbox Transport Delivery service on Mailbox servers using SMTP. Valid values for this parameter are `None` and `verbose`. The default value is `None`.
MailboxDeliveryConnectorSmtpUtf8Enabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
MailboxDeliveryThrottlingLogEnabled	Optional	System.Boolean	The *MailboxDeliveryThrottlingLogEnabled* parameter specifies whether the mailbox delivery throttling log is enabled. The default value is `$true`.
MailboxDeliveryThrottlingLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MailboxDeliveryThrottlingLogMaxAge* parameter specifies the maximum age for the mailbox delivery throttling log file. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d =

			days, h = hours, m = minutes, and s = seconds. Setting the value of the *MailboxDeliveryThrottlingLogMaxAge* parameter to `00:00:00` prevents the automatic removal of mailbox delivery throttling log files because of their age.
MailboxDeliveryThrottlingLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *MailboxDeliveryThrottlingLogMaxDirectorySize* parameter specifies the maximum size of all mailbox delivery throttling logs in the mailbox delivery throttling log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 200 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are

			treated as bytes. The value of the *MailboxDeliveryThrottlingLogMaxFileSize* parameter must be less than or equal to the value of the *MailboxDeliveryThrottlingLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the mailbox delivery throttling log directory.
MailboxDeliveryThrottlingLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MailboxDeliveryThrottlingLogMaxFileSize* parameter specifies the maximum size of each mailbox delivery throttling log file. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes.

			The value of the *MailboxDeliveryThrottlingLogMaxFileSize* parameter must be less than or equal to the value of the *MailboxDeliveryThrottlingLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on the mailbox delivery throttling log files.
MailboxDeliveryThrottlingLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *MailboxDeliveryThrottlingLogPath* parameter specifies the default mailbox delivery throttling log directory location. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Throttling\Delivery`. Setting the value of this parameter to `$null` disables mailbox delivery throttling logging. However, setting this parameter to `$null` when the value of the *MailboxDeliveryThrottlingLogEnabled* attribute is `$true` generates event log errors.

MailboxSubmissionAgentLogEnabled	Optional	System.Boolean	The *MailboxSubmissionAgentLogEnabled* parameter specifies whether the agent log is enabled for the Mailbox Transport Submission service. The default value is `$true`.
MailboxSubmissionAgentLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *MailboxSubmissionAgentLogMaxAge* parameter specifies the maximum age for the agent log file of the Mailbox Transport Submission service. Log files older than the specified value are deleted. The default value is `7.00:00:00` or 7 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. Setting the value of the *MailboxSubmissionAgentLogMaxAge* parameter to 00:00:00 prevents the automatic removal of agent log files because of their age.

MailboxSubmissionAgentLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *MailboxSubmissionAgentLogMaxDirectorySize* parameter specifies the maximum size of all Mailbox Transport Submission service agent logs in the agent log directory. When a directory reaches its maximum file size, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *MailboxSubmissionAgentLogMaxFileSize* parameter must be less than or equal to the value of the *MailboxSubmissionAgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no

			size limit is imposed on the agent log directory.
MailboxSubmissionAgentLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MailboxSubmissionAgentLogMaxFileSize* parameter specifies the maximum size of each agent log file for the Mailbox Transport Submission service. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. The value of the *MailboxSubmissionAgentLogMaxFileSize* parameter must be less than or equal to the value of the *MailboxSubmissionAgentLogMaxDirectorySize* parameter. If you enter a value of `unlimited`, no size limit is imposed on

			the agent log files.
MailboxSubmissionAgentLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *MailboxSubmissionAgentLogPath* parameter specifies the default agent log directory location for the Mailbox Transport Submission service. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Mailbox\AgentLog\Submission`. Setting the value of this parameter to `$null` disables agent logging. However, setting this parameter to `$null` when the value of the *MailboxSubmissionAgentLogEnabled* attribute is `$true` generates event log errors.
MaxConcurrentMailboxDeliveries	Optional	System.Int32	The *MaxConcurrentMailboxDeliveries* parameter specifies the maximum number of delivery threads that the transport service can have open at the same time to deliver messages to mailboxes. The default value is 20. The valid input range for

			this parameter is from 1 through 256. We recommend that you don't modify the default value unless Microsoft Customer Service and Support advises you to do this.
MaxConcurrentMailboxSubmissions	Optional	System.Int32	The *MaxConcurrentMailboxSubmissions* parameter specifies the maximum number of submission threads that the transport service can have open at the same time to send messages from mailboxes. The default value is 20. The valid input range for this parameter is from 1 through 256.
PipelineTracingEnabled	Optional	System.Boolean	The *PipelineTracingEnabled* parameter specifies whether to enable pipeline tracing. Pipeline tracing captures message snapshot files that record the changes made to the message by each transport agent configured in the

			transport service on the server. Pipeline tracing creates verbose log files that accumulate quickly. Pipeline tracing should only be enabled for a short time to provide in-depth diagnostic information that enables you to troubleshoot problems. In addition to troubleshooting, you can use pipeline tracing to validate changes that you make to the configuration of the transport service where you enable pipeline tracing. The default value is `$false`.
PipelineTracingPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *PipelineTracingPath* parameter specifies the location of the pipeline tracing logs. The default location is `%ExchangeInstallPath%TransportRoles\Mailbox\Hub\PipelineTracing`. The path must be local to the Exchange computer. Setting the value of this parameter to `$null` disables pipeline tracing. However, setting this parameter to `$null` when

			the value of the *PipelineTracingEnabled* attribute is `$true` generates event log errors. The preferred method to disable pipeline tracing is to use the *PipelineTracingEnabled* parameter. Pipeline tracing captures the complete contents of email messages to the path specified by the *PipelineTracingPath* parameter. Make sure that you restrict access to this directory. The permissions required on the directory specified by the *PipelineTracingPath* parameter are as follows: • Administrators: Full Control • Network Service: Full Control • System: Full Control
PipelineTracingSenderAddress	Optional	Microsoft.Exchange.Data.SmtpAddress	The *PipelineTracingSenderAddress* parameter specifies the sender email address that invokes pipeline tracing. Only messages

			from this address generate pipeline tracing output. The address can be either inside or outside the Exchange organization. Depending on your requirements, you may have to set this parameter to different sender addresses and send new messages to start the transport agents or routes that you want to test. The default value of this parameter is `$null`.
ReceiveProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ReceiveProtocolLogMaxAge* parameter specifies the maximum age of the Receive connector protocol log file. Log files that are older than the specified value are deleted. The default value is 30 days. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 20 days for this parameter,

			use 20.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *ReceiveProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Receive connector protocol log files because of their age.
ReceiveProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Receive connector protocol log directory shared by all the Receive connectors that exist on the server. When the maximum directory size is reached, the server deletes the oldest log files first. The default value is 250 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes)

			Unqualified values are treated as bytes. The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log directory.
ReceiveProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ReceiveProtocolLogMaxFileSize* parameter specifies the maximum size of the Receive connector protocol log files shared by all the Receive connectors that exist on the server. When a log file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value,

			qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *ReceiveProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *ReceiveProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Receive connector protocol log files.
ReceiveProtocolLogPath	Optional	Microsoft.Exchange.Data.LocalLongFullPath	The *ReceiveProtocolLogPath* parameter specifies the path of the protocol log directory for all the Receive connectors that exist on the server. The default location is %

			`ExchangeInstallPath%TransportRoles\Logs\Mailbox\ProtocolLog\SmtpReceive`. Setting the value of this parameter to `$null` disables protocol logging for all Receive connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* attribute for any Receive connector on the server is `Verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-ReceiveConnector** cmdlet to set the *ProtocolLoggingLevel* to `None` on each Receive connector.
SendProtocolLogMaxAge	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *SendProtocolLogMaxAge* parameter specifies the Send connector protocol log file maximum age. Log files older than the specified value are deleted. The default value is 30 days. To specify a value, enter it

			as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify 25 days for this parameter, use 25.00:00:00. The valid input range for this parameter is from 00:00:00 through 24855.03:14:07. Setting the value of the *SendProtocolLogMaxAge* parameter to 00:00:00 prevents the automatic removal of Send connector protocol log files because of their age.
SendProtocolLogMaxDirectorySize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxDirectorySize* parameter specifies the maximum size of the Send connector protocol log directory. When the maximum directory size is reached, the server deletes the oldest log files first. The minimum value is 1 MB. The default value is 250 MB. When you enter a value,

			qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log directory.
SendProtocolLogMaxFileSize	Optional	Microsoft.Exchange.Data.Unlimited	The *SendProtocolLogMaxFileSize* parameter specifies the maximum size of the Send connector protocol log files shared by all the Send connectors that exist on a server. When a log

			file reaches its maximum file size, a new log file is created. The default value is 10 MB. When you enter a value, qualify the value with one of the following: When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The value of the *SendProtocolLogMaxFileSize* parameter must be less than or equal to the value of the *SendProtocolLogMaxDirectorySize* parameter. The valid input range for either parameter is from 1 through 9223372036854775807 bytes. If you enter a value of `unlimited`, no size limit is imposed on the Send connector protocol log files.
SendProtocolLogPath	Optional	Microsoft.Exchange.Da	The *SendProtocolLogPath*

		ta.LocalLongFullPath	parameter specifies the location of protocol log storage for the Send connectors. The default location is `%ExchangeInstallPath%TransportRoles\Logs\Mailbox\ProtocolLog\SmtpSend`. Setting the value of this parameter to `$null` disables protocol logging for all Send connectors on the server. However, setting this parameter to `$null` when the value of the *ProtocolLoggingLevel* or *IntraOrgConnectorProtocolLoggingLevel* attribute for any Send connector on the server is `Verbose` generates event log errors. The preferred method of disabling protocol logging is to use the **Set-SendConnector** cmdlet to set the *ProtocolLoggingLevel* parameter to `None` on each Send connector and to set the *IntraOrgConnectorProtocolLoggingLevel* parameter to `None`.

SmtpEnableAllTlsVersions	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Test-Mailflow

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-09*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Test-Mailflow** cmdlet to diagnose whether mail can be successfully sent from and delivered to the system mailbox on a Mailbox server. You can also use this cmdlet to verify that

email is sent between Mailbox servers within a defined latency threshold.

```
Test-Mailflow -AutoDiscoverTargetMailboxServer <SwitchParameter> [-
Identity <ServerIdParameter>] <COMMON PARAMETERS>

Test-Mailflow -TargetEmailAddress <String> [-Identity <ServerIdParameter>]
[-TargetEmailAddressDisplayName <String>] <COMMON PARAMETERS>

Test-Mailflow [-Identity <ServerIdParameter>] <COMMON PARAMETERS>

Test-Mailflow -TargetDatabase <DatabaseIdParameter> [-Identity
<ServerIdParameter>] <COMMON PARAMETERS>

Test-Mailflow -TargetMailboxServer <ServerIdParameter> [-Identity
<ServerIdParameter>] <COMMON PARAMETERS>

Test-Mailflow -CrossPremises <$true | $false> [-
CrossPremisesExpirationTimeout <EnhancedTimeSpan>] [-
CrossPremisesPendingErrorCount <Int32>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-ActiveDirectoryTimeout <Int32>] [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-ErrorLatency <Int32>] [-
ExecutionTimeout <Int32>] [-MonitoringContext <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example tests message flow from the server name Mailbox1 to the server named Mailbox2. Note that you need to run this command while connected to Mailbox1.

```
Test-Mailflow Mailbox1 -TargetMailboxServer Mailbox2
```

EXAMPLE 2

This example tests message flow from the local Mailbox server where you're running this command to the email address john@contoso.com.

```
Test-Mailflow -TargetEmailAddress john@contoso.com
```

Detailed Description

The **Test-Mailflow** cmdlet tests mail submission, transport, and delivery. The cmdlet verifies that each Mailbox server can successfully send itself a message. You can also use this cmdlet to verify that the system mailbox on one Mailbox server can successfully send a message to the system mailbox on another Mailbox server. A system mailbox is required on all servers that are involved in the test.

The test messages are available in the target user or system mailbox. The message subject is `Test-`

`Mailflow <GUID>`, and the message body contains the text `This is a Test-Mailflow probe message.`

The **Test-Mailflow** results are displayed on-screen. The interesting values in the results are:

- **TestMailflowResult** The values returned are typically `Success` or `*FAILURE*`.
- **MessageLatencyTime** The time required to complete the test (deliver the test message). The value uses the syntax *hh:mm:ss.ffff* where *hh* = hours, *mm* = minutes, *ss* = seconds and *ffff* = fractions of a second.

You can write the **Test-Mailflow** results to a file by piping the output to **ConvertTo-Html** or **ConvertTo-Csv** and adding "> <filename>" to the command. For example:

```
Test-Mailflow -AutoDiscoverTargetMailboxServer | ConvertTo-Csv > "C:\My Documents\test-mailflow 2014-05-01.csv"
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Testing mail flow" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AutoDiscoverTargetMailboxServer	Required	System.Management.Automation.SwitchParameter	The *AutoDiscoverTargetMailboxServer* switch specifies whether to automatically populate a list of target Mailbox servers to which to send a test message. The task queries Active Directory to discover all Mailbox servers and then sends each server a test message. When you use this switch, you can't use the *CrossPremises*,

			TargetDatabase, *TargetEmailAddress* or *TargetMailboxServer* parameters.
CrossPremises	Required	System.Boolean	The *CrossPremises* parameter specifies whether the mail flow test will be conducted in cross-premises mode. Set this parameter to `$true` if your organization is using a cross-premises deployment and you want to verify cross-premises mail flow. When you use this parameter, you can't use the *AutoDiscoverTargetMailboxServer*, *TargetDatabase*, *TargetEmailAddress* or *TargetMailboxServer* parameters.
TargetDatabase	Required	Microsoft.Exchange.Configuration.Tasks.DatabaseIdParameter	The *TargetDatabase* parameter specifies the mailbox database to which test messages are sent.

			When you use this parameter, you can't use the *AutoDiscoverTargetMailboxServer*, *CrossPremises*, *TargetEmailAddress* or *TargetMailboxServer* parameters.
TargetEmailAddress	Required	System.String	The *TargetEmailAddress* parameter specifies the SMTP address of the mailbox to which test messages are sent. Use this parameter to send test messages to a Mailbox server in a remote forest. If this parameter is used, the test is always a remote test. When you use this parameter, you can't use the *AutoDiscoverTargetMailboxServer*, *CrossPremises*, *TargetDatabase* or *TargetMailboxServer* parameters.
TargetMailboxServer	Required	Microsoft.Exchange.Co	The

		nfiguration.Tasks.ServerIdParameter	*TargetMailboxServer* parameter specifies one or more Mailbox servers in the local Exchange organization to which test messages are sent. When you use this parameter, you can't use the *AutoDiscoverTargetMailboxServer*, *CrossPremises*, *TargetDatabase* or *TargetEmailAddress* parameters.
ActiveDirectoryTimeout	Optional	System.Int32	The *ActiveDirectoryTimeout* parameter specifies the number of seconds that elapse before the task provides an informational message about the delay. The default value is 15 seconds.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do

			before processing continues. You don't have to specify a value with the *Confirm* switch.
CrossPremisesExpirationTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *CrossPremisesExpirationTimeout* parameter is used when this cmdlet is run by Microsoft System Center Operations Manager 2007 agents for asynchronous monitoring. We don't recommend using this parameter when running this cmdlet manually.
CrossPremisesPendingErrorCount	Optional	System.Int32	The *CrossPremisesPendingErrorCount* parameter is used when this cmdlet is run by System Center Operations Manager 2007 agents for asynchronous monitoring. We don't recommend using this parameter when running this cmdlet manually.

DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
ErrorLatency	Optional	System.Int32	The *ErrorLatency* parameter specifies how long to wait for a test message to be delivered before an error event is logged in Microsoft System Center Operations Manager 2007. The default value when a test message is sent to the local Mailbox server is 15 seconds and 180 seconds when a test message is sent to a remote Mailbox server.
ExecutionTimeout	Optional	System.Int32	The *ExecutionTimeout* parameter specifies the maximum time that this task can run before the test is determined to be a failure. If no test message or delivery report arrives before this time expires, the

			task ends and an error is reported. When the task is run in the Exchange Management Shell, the default setting is 240 seconds. When the *MonitoringContext* parameter is used, the default setting is 15 seconds.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the source Mailbox server name from which a test message is sent. If you don't use this parameter, the local Mailbox server is used.
MonitoringContext	Optional	System.Boolean	The *MonitoringContext* parameter includes or excludes the associated monitoring events and performance counters in the results. Valid input for this parameter is `$true` or `$false`. The default value is `$false`. If you specify the value `$true`, the monitoring events and performance

			counters are included in the command results. Typically, you include the monitoring events and performance counters in the results when the output is passed to Microsoft System Center Operations Manager 2007 or System Center 2012 - Operations Manager.
TargetEmailAddressDisplayName	Optional	System.String	The *TargetEmailAddressDisplayName* parameter specifies a custom display name that's used on events and reports in Microsoft System Center Operations Manager 2007 when the *TargetEmailAddress* parameter is used. If you don't use the *TargetEmailAddressDisplayName* parameter, the events and reports use the email address value specified by the *TargetEmailAddress* parameter.

			This parameter is available only with the *TargetEmailAddress* parameter, and has no effect on the output of the cmdlet outside of Microsoft System Center Operations Manager.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Export-Message

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Export-Message** cmdlet to copy a message from a queue on a Mailbox server or an Edge Transport server to a specified file path in your organization.

```
Export-Message -Identity <MessageIdentity> [-Confirm [<SwitchParameter>]]
[-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example exports a single message to the specified file path. Because the **Export-Message** cmdlet returns a binary object, you must use the **AssembleMessage** filter to be able to save the message content into a specified location.

```
Export-Message ExchSrv1\contoso.com\1234 | AssembleMessage
-Path "c:\exportfolder\filename.eml"
```

EXAMPLE 2

This example retrieves all messages from the specified queue. The query results are then piped to the **Export-Message** command, and all the messages are copied to individual .eml files. The Internet Message IDs of each message are used as the file names. To accomplish this, the command does the following:

- Retrieves all messages in a specific queue using the **Get-Message** cmdlet.
- The result is pipelined into the **ForEach-Object** cmdlet, which prepares a file name including full path using the temporary variable `$Temp` that consists of the Internet Message ID with .eml extension. The Internet Message ID field contains angled brackets (">" and "<") which need to be removed as they are invalid file names. This is done using the **Replace** method of the temporary variable.
- The **ForEach-Object** cmdlet also exports the message using the file name prepared.

```
Get-Message -Queue "Server1\contoso.com" | ForEach-Object
{$Temp="C:\ExportFolder\"+$_.InternetMessageID
+".eml";$Temp=$Temp.Replace("<","_");$Temp=$Temp.Replace(">
```

```
","_");Export-Message $_.Identity | AssembleMessage -Path
$Temp}
```

Detailed Description

The **Export-Message** cmdlet copies messages from the Delivery queue, the Unreachable queue, or the poison message queue on Mailbox server or an Edge Transport server to a specified file path. Before you export a message, you must first suspend the message. Messages in the poison message queue are already suspended. You can use the **Export-Message** cmdlet to copy messages to the Replay directory of another Mailbox server for delivery.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Data.QueueViewer.MessageIdentity	The *Identity* parameter specifies the message. Valid input for this parameter uses the syntax *Server**Queue**MessageInteger* or *Queue**MessageInteger* or *MessageInteger*, for example, `Mailbox01\contoso.com\5` or `10`. For details about message identity, see the "Message identity" section in Use the Exchange Management Shell to manage queues.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-Message

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-Message** cmdlet to view the details of one or more messages in queues on Mailbox servers or Edge Transport servers.

```
Get-Message [-Filter <String>] [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

Get-Message [-Identity <MessageIdentity>] <COMMON PARAMETERS>

Get-Message [-Queue <QueueIdentity>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-BookmarkIndex <Int32>] [-BookmarkObject
<ExtensibleMessageInfo>] [-IncludeBookmark <$true | $false>] [-
IncludeComponentLatencyInfo <SwitchParameter>] [-IncludeRecipientInfo
<SwitchParameter>] [-ResultSize <Unlimited>] [-ReturnPageInfo <$true |
$false>] [-SearchForward <$true | $false>] [-SortOrder
<QueueViewerSortOrderEntry[]>]
```

Examples

EXAMPLE 1

This example displays detailed information about all messages queued on the local server and received from any sender at the contoso.com domain.

```
Get-Message -Filter {FromAddress -like "*@contoso.com"} |
Format-List
```

EXAMPLE 2

This example lists all messages queued on the local server, received from any sender at the contoso.com domain, and that have an SCL value greater than 3.

```
Get-Message -Filter {FromAddress -like "*@contoso.com" -and
SCL -gt 3}
```

EXAMPLE 3

This example displays all messages queued on the server named Server01. The results are sorted first in ascending order by sender address and then in descending order of size.

```
Get-Message -Server Server01.contoso.com -SortOrder:
+FromAddress,-Size
```

Detailed Description

You can display messages by including the server name as part of the *Identity* parameter or the *Queue* parameter or by including the *Server* parameter with a filter query. The *Identity* parameter, *Queue* parameter, and *Filter* parameter settings are mutually exclusive.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
BookmarkIndex	Optional	System.Int32	The *BookmarkIndex* parameter specifies the position in the result set where the displayed results start. The value of this parameter is a 1-based index in the total result set. The *BookmarkIndex* parameter can't be used with the *BookmarkObject* parameter.
BookmarkObject	Optional	Microsoft.Exchange.Data.QueueViewer.ExtensibleMessageInfo	The *BookmarkObject* parameter specifies the object in the result set where the displayed results start. The *BookmarkObject*

			parameter can't be used with the *BookmarkIndex* parameter.
Filter	Optional	System.String	The *Filter* parameter specifies one or more messages by using OPath filter syntax. The OPath filter includes a message property name followed by a comparison operator and value, for example, `{FromAddress -like "*@contoso.com"}`. For details about filterable message properties and comparison operators, see Message filters and Use the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").

Identity	Optional	Microsoft.Exchange.Data.QueueViewer.MessageIdentity	The *Identity* parameter specifies the message. Valid input for this parameter uses the syntax *Server**Queue**MessageInteger* or *Queue**MessageInteger* or *MessageInteger*, for example, `Mailbox01\contoso.com\5` or `10`. For details about message identity, see the "Message identity" section in Use the Exchange Management Shell to manage queues.
IncludeBookmark	Optional	System.Boolean	The *IncludeBookmark* parameter specifies whether to include the bookmark object when the query results are displayed. The *IncludeBookmark* parameter is valid when it's used with the *BookmarkObject* or *BookmarkIndex* parameters. If you don't specify a value for the *IncludeBookmark*

			parameter, the default value of `$true` is used.
IncludeComponentLatencyInfo	Optional	System.Management.Automation.SwitchParameter	The *IncludeComponentLatencyInfo* switch specifies whether the information about component latency is included in the message properties. If you include this switch, the message objects returned will include latency measurements for each Transport component that has contributed to the local server latency for each queued message.
IncludeRecipientInfo	Optional	System.Management.Automation.SwitchParameter	The *IncludeRecipientInfo* switch specifies whether to display the message recipients in the **Recipients** field. If you don't include the *IncludeRecipientInfo* switch, the **Recipients** field is blank. Storing the results of a `Get-Message -IncludeRecipientInfo` command in a variable

			allows you to display additional properties for the message recipients. The following list describes the available recipient properties: • **Address:** The email address of the recipient. • **Type:** The recipient type, which may be External, Mailbox, or Distribution Group. Distribution Group is used when the destination is an expansion server. • **FinalDestination:** The distinguished name (DN) of the object used to route the message. • **Status:** The recipient status may be `Complete`, `Ready`, or `Retry`. • **LastError:** The SMTP response after the last delivery attempt or a localized error message if the message is placed in

			the unreachable queue.
			For example, to store the recipient information of a message in the contoso.com remote delivery queue that has the **MessageIdentity** value of `1234` to a variable named `$x`, use the following command.
			`$x=Get-Message -I`
			To display the extended recipient properties that are now stored in the `$x` variable, use the following command.
			`$x.Recipients`

Queue	Optional	Microsoft.Exchange.Data.QueueViewer.QueueIdentity	The *Queue* parameter specifies the identity of the queue that contains the messages that you want to display. Valid input for this parameter uses the syntax <*Server*>\<*Queue*> or <*Queue*>, for example, `Mailbox01\contoso.com` or

			`Unreachable`. For details about queue identity, see the "Queue identity" section in Use the Exchange Management Shell to manage queues. If you use the *Queue* parameter, you can't use the *Identity*, *Filter* or *Server* parameters.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
ReturnPageInfo	Optional	System.Boolean	The *ReturnPageInfo* parameter is a hidden parameter. Use it to return information about the total number of results and the index of the first object of the current page. The default value is `$false`.
SearchForward	Optional	System.Boolean	The *SearchForward*

			parameter specifies whether to search forward or backward in the result set. The default value is `$true`. This value causes the result page to be calculated forward from either the start of the result set or forward from a bookmark if specified.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the

			same command. You can't use the *Server* parameter and the *Identity* parameter in the same command.
SortOrder	Optional	Microsoft.Exchange.Data.QueueViewerSortOrderEntry[]	The *SortOrder* parameter specifies an array of message properties used to control the sort order of the result set. Separate each property by using a comma. Prepend a plus sign (+) symbol to the beginning of the property name to display the results in ascending order. Prepend a minus sign (-) symbol to the beginning of the property name to display the results in descending order. If you don't specify a sort order, the result set is displayed in ascending order by **MessageIdentity** integer.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Redirect-Message

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Redirect-Message** cmdlet to drain the active messages from all the delivery queues on a Mailbox server, and transfer those messages to another Mailbox server.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Redirect-Message -Server <ServerIdParameter> -Target <MultiValuedProperty>
[-Confirm [<SwitchParameter>]] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example drains the active messages from the delivery queues on the Mailbox server named Mailbox01, and transfers the messages to the server named Mailbox02.

```
Redirect-Message -Server Mailbox01 -Target Mailbox02
```

Detailed Description

When a message queue is drained, the active messages in the queues on the source Mailbox server are routed to the target Mailbox server. After the messages are received and queued by the target Mailbox server, the messages are made redundant. Other considerations include the following:

- Only active messages are drained. Shadow queues aren't drained.

- Messages in the poison message queue aren't drained.
- The source server won't accept new messages while the queues are drained.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Server	Required	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
Target	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Target* parameter specifies the target Mailbox server where you want to transfer the messages from the drained delivery queues. Enter the server name as a fully qualified domain name (FQDN).

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn’t accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn’t return data.

Remove-Message

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-Message** cmdlet to delete a message from a queue on a Mailbox server or an Edge Transport server.

```
Remove-Message -Filter <String> [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

Remove-Message -Identity <MessageIdentity> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]] [-WithNDR <$true | $false>]
```

Examples

EXAMPLE 1

This example removes all messages that meet the following criteria without generating NDRs:

- The messages are sent by the sender Kweku@contoso.com.
- The messages are queued on the server Server1.

```
Remove-Message -Server Server1 -Filter {FromAddress -eq
"Kweku@contoso.com"} -WithNDR $false
```

Detailed Description

A message being transmitted to multiple recipients might be located in multiple queues. If you specify an *Identity* parameter, the message is removed from a single queue if that identity matches only a single message. If the identity matches more than one message, you receive an error. To remove a message from more than one queue in a single operation, you must use the *Filter* parameter. If you try to remove a message currently being delivered, the message status changes to `PendingDelete`. Message delivery isn't interrupted, but if the delivery fails and causes the message to re-enter the queue, it's then removed.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues"

entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Filter	Required	System.String	The *Filter* parameter specifies one or more messages by using OPath filter syntax. The OPath filter includes a message property name followed by a comparison operator and value, for example, `{FromAddress -like "*@contoso.com"}`. For details about filterable message properties and comparison operators, see Message filters and Use the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Required	Microsoft.Exchange.Data.QueueViewer.MessageIdentity	The *Identity* parameter specifies the message. Valid input for this parameter uses the

			syntax *Server**Queue**MessageInteger* or *Queue**MessageInteger* or *MessageInteger*, for example, `Mailbox01\contoso.com\5` or `10`. For details about message identity, see the "Message identity" section in Use the Exchange Management Shell to manage queues.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-confirm:$False`. You must include a colon (`:`) in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name

			(DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use the *Server* parameter and the *Identity* parameter in the same command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.
WithNDR	Optional	System.Boolean	The *WithNDR* parameter specifies whether a non-delivery report (NDR) is returned to the sender of a message. The default value is `$true`. This parameter can be used with both the *Identity*

			parameter and *Filter* parameter sets.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-Message

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-Message** cmdlet to enable delivery of a previously suspended message in a queue on a Mailbox server or Edge Transport server.

```
Resume-Message -Filter <String> [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

Resume-Message -Identity <MessageIdentity> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes delivery of all messages in a suspended state and for which the following conditions are true:

- The messages were sent by the sender kweku@contoso.com.
- The messages are queued on the server Server1.
- The messages will expire before 15:00 on January 5, 2013.

```
Resume-Message -Server Server1 -Filter {FromAddress -eq
"kweku@contoso.com" -and ExpirationTime -lt "1/5/2013 3:00
PM"}
```

Detailed Description

A message being sent to multiple recipients might be located in multiple queues. If you specify an *Identity* parameter, the message is resumed in a single queue if that identity matches only a single message. If the identity matches more than one message, you receive an error. To resume a message in more than one queue in a single operation, you must use the *Filter* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Filter	Required	System.String	The *Filter* parameter specifies one or more messages by using OPath filter syntax. The OPath filter includes a message property name followed by a comparison operator and value, for example, `{FromAddress -like "*@contoso.com"}`. For details about filterable message properties and comparison operators, see Message filters and Use the Exchange Management Shell to manage queues. You can specify multiple

			criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Required	Microsoft.Exchange.Data.QueueViewer.MessageIdentity	The *Identity* parameter specifies the message. Valid input for this parameter uses the syntax *Server**Queue**MessageInteger* or *Queue**MessageInteger* or *MessageInteger*, for example, `Mailbox01\contoso.com\5` or `10`. For details about message identity, see the "Message identity" section in Use the Exchange Management Shell to manage queues.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.

Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use the *Server* parameter and the *Identity* parameter in the same command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a

			value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-Message

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-Message** cmdlet to prevent delivery of a particular message in a queue on a Mailbox server or an Edge Transport server.

```
Suspend-Message -Filter <String> [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

Suspend-Message -Identity <MessageIdentity> <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example prevents delivery of all messages for which the following conditions are true:

- The messages are sent by the sender kweku@contoso.com.
- The messages are queued on the server Server1.

```
Suspend-Message -Server Server1 -Filter {FromAddress -eq
```

```
"kweku@contoso.com"}
```

Detailed Description

A message already in delivery won't be suspended. Delivery will continue and the message status will be `PendingSuspend`. If the delivery fails, the message will re-enter the queue and it will then be suspended. You can't suspend a message that's in the Submission queue or poison message queue.

A message being sent to multiple recipients might be located in multiple queues. If you specify an *Identity* parameter, the message is suspended in a single queue if that identity matches only a single message. If the identity matches more than one message, you receive an error. To suspend a message in more than one queue in a single operation, you must use the *Filter* parameter.

For instructions on how to resume a suspended message, see Resume-Message.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Filter	Required	System.String	The *Filter* parameter specifies one or more messages by using OPath filter syntax. The OPath filter includes a message property name followed by a comparison operator and value, for example, `{FromAddress -like "*@contoso.com"}`. For details about filterable message properties and comparison operators, see Message filters and Use the Exchange Management Shell to manage queues.

			You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Required	Microsoft.Exchange.Data.QueueViewer.MessageIdentity	The *Identity* parameter specifies the message. Valid input for this parameter uses the syntax *Server**Queue**MessageInteger* or *Queue**MessageInteger* or *MessageInteger*, for example, `Mailbox01\contoso.com\5` or `10`. For details about message identity, see the "Message identity" section in Use the Exchange Management Shell to manage queues.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`)

			in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use the *Server* parameter and the *Identity* parameter in the same command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MessageTrackingLog

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-09*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-MessageTrackingLog** cmdlet to search for message delivery information stored in the message tracking log.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MessageTrackingLog [-EventId <String>] [-InternalMessageId <String>]
[-MessageId <String>] [-MessageSubject <String>] [-Recipients <String[]>]
[-Reference <String>] [-Sender <String>] [-DomainController <Fqdn>] [-End
<DateTime>] [-ResultSize <Unlimited>] [-Server <ServerIdParameter>] [-
Start <DateTime>]
```

Examples

EXAMPLE 1

This example searches the message tracking logs on the Mailbox server named Mailbox01 for information about all messages sent from March 13, 2013, 09:00 to March 15, 2013, 17:00 by the sender john@contoso.com.

```
Get-MessageTrackingLog -Server Mailbox01 -Start "03/13/2013
09:00:00" -End "03/15/2013 17:00:00" -Sender
"john@contoso.com"
```

Detailed Description

A unique message tracking log exists for the Transport service on a Mailbox server, for the Mailbox Transport service on a Mailbox server, and on an Edge Transport server. The message tracking log is a comma-separated value (CSV) file that contains detailed information about the history of each email message as it travels through an Exchange server.

The field names displayed in the results from the **Get-MessageTrackingLog** cmdlet are similar to the actual field names used in the message tracking logs. The differences are:

- The dashes are removed from the field names. For example **internal-message-id** is displayed as `InternalMessageId`.
- The **date-time** field is displayed as `Timestamp`.
- The **recipient-address** field is displayed as `Recipients`.
- The **sender-address** field is displayed as `Sender`.

For more information about the message tracking log files, see Message tracking.

The **Get-MessageTrackingLog** results are displayed on-screen. You can write the results to a file by piping the output to **ConvertTo-Html** or **ConvertTo-Csv** and adding "> <filename>" to the command. For example:

```
Get-MessageTrackingLog -Start "03/13/2014 09:00:00" -End
"03/13/2014 09:10:00" | ConvertTo-Html > "C:\My Documents
\message track.html"
```

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message tracking" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that

			retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
End	Optional	System.DateTime	The *End* parameter specifies the end date and time of the date range. Message delivery information is returned up to, but not including, the specified date and time. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If

			you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.
EventId	Optional	System.String	The *EventId* parameter filters the message tracking log entries by the value of the **EventId** field. The **EventId** value classifies classify each message event. Example values include `DSN`, `Defer`, `Deliver`, `Send`, or `Receive`.
InternalMessageId	Optional	System.String	The *InternalMessageId* parameter filters the message tracking log entries by the value of the **InternalMessageId** field. The **InternalMessageId** value is a message identifier that's assigned by the Exchange server that's currently processing the message. The value of the **internal-message-id** for a specific message is different in the message tracking log of every Exchange server that's involved in the

			delivery of the message.
MessageId	Optional	System.String	The *MessageId* parameter filters the message tracking log entries by the value of the **MessageId** field. The value of **MessageId** corresponds to the value of the `Message-Id:` header field in the message. If the `Message-ID` header field is blank or doesn't exist, an arbitrary value is assigned.
MessageSubject	Optional	System.String	The *MessageSubject* parameter filters the message tracking log entries by the value of the message subject. The value of the *MessageSubject* parameter automatically supports partial matches without using wildcards or special characters. For example, if you specify the *MessageSubject* value `sea`, the results include messages with `Seattle` in the subject. By default, message subjects are stored in the message

			tracking logs.
Recipients	Optional	System.String[]	The *Recipients* parameter filters the message tracking log entries by the SMTP email address of the message recipients. Multiple recipients in a single message are logged in a single message tracking log entry. Unexpanded distribution group recipients are logged by using the group's SMTP email address. You can specify multiple recipient email addresses separated by commas.
Reference	Optional	System.String	The *Reference* parameter filters the message tracking log entries by the value of the **Reference** field. The Reference field contains additional information for specific types of events. For example, the **Reference** field value for a DSN message tracking entry contains the **InternalMessageId** value of the message that

			caused the DSN. For many types of events, the value of **Reference** is blank.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Sender	Optional	System.String	The *Sender* parameter filters the message tracking log entries by the sender's SMTP email address.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command

			is run on the local server.
Start	Optional	System.DateTime	The *Start* parameter specifies the start date and time of the date range. Use the short date format defined in the **Regional Options** settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-MessageTrackingReport

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-MessageTrackingReport** cmdlet to return data for a specific message tracking report. This cmdlet is used by the delivery reports feature.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-MessageTrackingReport -Identity <MessageTrackingReportId> [-
BypassDelegateChecking <SwitchParameter>] [-DetailLevel <Basic | Verbose>]
[-DomainController <Fqdn>] [-DoNotResolve <SwitchParameter>] [-
RecipientPathFilter <SmtpAddress>] [-Recipients <String[]>] [-
ReportTemplate <Summary | RecipientPath>] [-ResultSize <Unlimited>] [-
Status <Unsuccessful | Pending | Delivered | Transferred | Read>] [-
TraceLevel <Low | Medium | High>]
```

Examples

EXAMPLE 1

This example gets the message tracking report for messages sent from one user to another. This example returns the summary of the message tracking report for a message that David Jones sent to Wendy Richardson.

```
$Temp = Search-MessageTrackingReport -Identity "David
Jones" -Recipients "wendy@contoso.com"
Get-MessageTrackingReport -Identity
$Temp.MessageTrackingReportID -ReportTemplate Summary
```

EXAMPLE 2

This example gets the message tracking report for the following scenario: The user Cigdem Akin was expecting an email message from joe@contoso.com that never arrived. She contacted the Help desk, which needs to generate the message tracking report on behalf of Cigdem and doesn't need to see the display names.

This example searches the message tracking data for the specific message tracking reports, and then returns detailed troubleshooting information for the specific recipient path.

```
Search-MessageTrackingReport -Identity "Cigdem Akin" -
```

```
Sender "joe@contoso.com" -ByPassDelegateChecking -
DoNotResolve | ForEach-Object { Get-MessageTrackingReport -
Identity $_.MessageTrackingReportID -DetailLevel Verbose -
BypassDelegateChecking -DoNotResolve -RecipientPathFilter
"cigdem@fabrikam.com" -ReportTemplate RecipientPath }
```

Detailed Description

The **Get-MessageTrackingReport** cmdlet requires you to specify the ID for the message tracking report you want to view. Therefore, first you need to use the **Search-MessageTrackingReport** cmdlet to find the message tracking report ID for a specific message. You then pass the message tracking report ID from the output of the **Search-MessageTrackingReport** cmdlet to the **Get-MessageTrackingReport** cmdlet. For more information, see Search-MessageTrackingReport.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message tracking" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Management.Tracking.MessageTrackingReportId	The *Identity* parameter specifies the ID of the message tracking report ID to retrieve. You should run the **Search-MessageTrackingReport** cmdlet to find the message tracking report ID for the specific message you're tracking, and then pass the value of the **MessageTrackingReport ID** field to this parameter.

BypassDelegateChecking	Optional	System.Management.Automation.SwitchParameter	The *BypassDelegateChecking* switch allows Help desk staff and administrators to retrieve message tracking reports for any user. You don't have to specify a value with this switch. By default, each user can only see the message tracking reports for messages sent or received by the user. When you use this switch, Exchange allows you to view the message tracking reports for message exchanges among other users.
DetailLevel	Optional	Microsoft.Exchange.InfoWorker.Common.MessageTracking.MessageTrackingDetailLevel	This parameter is available only in on-premises Exchange 2013. The *DetailLevel* parameter specifies the amount of detail to be displayed for the message tracking report. You can use one of the following values: • `Basic` • `Verbose` If you specify `Basic`, simple delivery report information is displayed, which is more appropriate

			for information workers. If you specify `verbose`, full report information is displayed, including server names and physical topology information.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory.
DoNotResolve	Optional	System.Management.Automation.SwitchParameter	The *DoNotResolve* switch prevents the resolution of email addresses to display names. This improves performance, but the end result may not be as easy to interpret because it's missing the display names. You don't have to specify a value with this switch.
RecipientPathFilter	Optional	Microsoft.Exchange.Data.SmtpAddress	The *RecipientPathFilter* parameter specifies the recipient for which the command returns the

			detailed tracking report. Use this parameter when you're using the `RecipientPath` report template.
Recipients	Optional	System.String[]	The *Recipients* parameter specifies the recipients for whom you want to retrieve the message tracking data. You can use this parameter to specify the recipients in the report details if you're using the `Summary` report template.
ReportTemplate	Optional	Microsoft.Exchange.InfoWorker.Common.MessageTracking.ReportTemplate	The *ReportTemplate* parameter specifies a predefined format for the output. You can either return a summary for all recipients or a detailed tracking report for one recipient. You can specify one of the following values: • `RecipientPath` • `Summary`
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that

			match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Status	Optional	Microsoft.Exchange.Management.Tracking._DeliveryStatus	The *Status* parameter specifies the delivery status codes you're interested in. You can specify one of the following values: • `Delivered` • `Read` • `Pending` • `Transferred` • `Unsuccessful`
TraceLevel	Optional	Microsoft.Exchange.Management.Tracking.TraceLevel	This parameter is available only in on-premises Exchange 2013. The *TraceLevel* parameter specifies whether additional trace details are included in the output of the message tracking report. This parameter is intended to be used when troubleshooting message tracking issues. The acceptable values for the *TraceLevel* parameter are: • `Low` Minimal additional data is returned, including servers that were accessed, timing, message tracking search

			result counts, and any error information. • `Medium` In addition to the data returned for the `Low` setting, the actual message tracking search results are also returned. • `High` Full diagnostic data is returned.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Search-MessageTrackingReport

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-03-13*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Search-MessageTrackingReport** cmdlet to find the unique message tracking report based on the search criteria provided. You can then pass this message tracking report ID to the **Get-MessageTrackingReport** cmdlet to get full message tracking information. For more information, see Get-MessageTrackingReport. The message tracking report cmdlets are used by the delivery reports feature.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Search-MessageTrackingReport -Identity <MailboxIdParameter> -Sender
<SmtpAddress> [-BypassDelegateChecking <SwitchParameter>] [-DoNotResolve
<SwitchParameter>] [-MessageEntryId <String>] [-MessageId <String>] [-
ResultSize <Unlimited>] [-Subject <String>] [-TraceLevel <Low | Medium |
High>] <COMMON PARAMETERS>
```

```
Search-MessageTrackingReport -Identity <MailboxIdParameter> [-
BypassDelegateChecking <SwitchParameter>] [-DoNotResolve
<SwitchParameter>] [-MessageEntryId <String>] [-MessageId <String>] [-
Recipients <SmtpAddress[]>] [-ResultSize <Unlimited>] [-Subject <String>]
[-TraceLevel <Low | Medium | High>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-DomainController
<Fqdn>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example searches the message tracking report for messages sent from one user to another. This example returns the message tracking report for a message that David Jones sent to Wendy Richardson.

```
Search-MessageTrackingReport -Identity "David Jones" -
Recipients "wendy@contoso.com"
```

EXAMPLE 2

This example searches the message tracking report for the following scenario: The user Cigdem Akin was expecting an email message from joe@contoso.com that never arrived. She contacted the Help desk, which needs to generate the message tracking report on behalf of Cigdem and doesn't need to see the display names.

This example returns the message tracking reports that the Help desk can analyze to resolve the issue.

```
Search-MessageTrackingReport -Identity "Cigdem Akin" -
Sender "joe@contoso.com" -BypassDelegateChecking -
DoNotResolve
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Message tracking" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

Identity	Required	Microsoft.Exchange.Configuration.Tasks.MailboxIdParameter	The *Identity* parameter specifies the name of the mailbox for whom the message tracking report is being searched. The message tracking report only contains the tracking events related to the specified mailbox. This parameter accepts the following values: • `Alias` Example: JPhillips • `Canonical DN` Example: Atlanta.Corp.Contoso.Com/Users/JPhillips • `Display Name` Example: Jeff Phillips • `Distinguished Name (DN)` Example: CN=JPhillips,CN=Users,DC=Atlanta,DC=Corp,DC=contoso,DC=com • `Domain\Account` Example: Atlanta\JPhillips • `GUID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2 • `Immutable ID` Example: fb456636-fe7d-4d58-9d15-5af57d0354c2@contoso.com • `Legacy Exchange DN` Example: /o=Contoso/

			ou=AdministrativeGroup/ cn=Recipients/ cn=JPhillips • `SMTP Address` Example: Jeff.Phillips@contoso.com • `User Principal Name` Example: JPhillips@contoso.com
Sender	Required	Microsoft.Exchange.Data.SmtpAddress	The *Sender* parameter specifies the email address of the message sender. By default, this command searches for messages sent by the user specified in the *Identity* parameter. If you want to search the message tracking report for a message sent to the user, you must specify the email address of the sender of that message using this parameter.
BypassDelegateChecking	Optional	System.Management.Automation.SwitchParameter	The *BypassDelegateChecking* switch allows Help desk staff and administrators to track messages for any user. End-users can only track messages that they send or receive. You don't have to specify a value with this switch.

Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory.
DoNotResolve	Optional	System.Management.Automation.SwitchParameter	The *DoNotResolve* switch prevents the resolution of email addresses to display names. This improves performance, but the end result may not be as easy to interpret because it's missing the display names. You don't have to specify a value with this switch.

MessageEntryId	Optional	System.String	This parameter is reserved for internal Microsoft use.
MessageId	Optional	System.String	The *MessageId* parameter specifies the Internet message ID of the message for which you want to get the tracking report.
Recipients	Optional	Microsoft.Exchange.Data.SmtpAddress[]	The *Recipients* parameter specifies the recipients for whom you want to get the tracking report.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
Subject	Optional	System.String	The *Subject* parameter specifies text to be used to track messages that have the specified text in their subject lines.
TraceLevel	Optional	Microsoft.Exchange.Management.Tracking.TraceLevel	This parameter is available only in on-premises Exchange 2013. The *TraceLevel* parameter

			specifies whether additional trace details will be included in the output of the message tracking report. This parameter is intended to be used when troubleshooting message tracking issues. The acceptable values for the *TraceLevel* parameter are: • `Low` Minimal additional data is returned, including servers that were accessed, timing, message tracking search result counts, and any error information. • `Medium` In addition to all the data returned for the `Low` setting, the actual message tracking search results are also returned. • `High` Full diagnostic data is returned.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You

			don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-NetworkConnectionInfo

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-NetworkConnectionInfo** cmdlet to view the network configuration information for all network adapters configured on the local server.

```
Get-NetworkConnectionInfo [-Identity <ServerIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example retrieves network configuration information for all network adapters on the server named `Mailbox01`.

```
Get-NetworkConnectionInfo Mailbox01
```

Detailed Description

This cmdlet retrieves the following configuration information for each network adapter configured on the server:

- **Name:** This field displays the name of the network adapter. This name indicates the manufacturer and model of the network adapter, or the administrator-specified name of the network adapter.
- **DnsServers:** This field displays the DNS servers used by the network adapter. The server names are separated by commas.
- **IPAddresses:** This field displays the IP addresses used by the network adapter. The IP addresses are separated by commas.
- **AdapterGuid:** This field displays the GUID assigned to the network adapter by Windows.
- **MacAddress:** This field displays the media access control (MAC) address of the network adapter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Transport service" and "Edge Transport server" entries in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.

Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Identity* parameter specifies the server you want to query. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Identity* parameter, the command is run on the local server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-Queue

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-05-07*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-Queue** cmdlet to view configuration information for queues on Mailbox servers or

Edge Transport servers.

```
Get-Queue [-Filter <String>] [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

Get-Queue [-Identity <QueueIdentity>] <COMMON PARAMETERS>

COMMON PARAMETERS: [-BookmarkIndex <Int32>] [-BookmarkObject
<ExtensibleQueueInfo>] [-Exclude <QueueViewerIncludesAndExcludes>] [-
Include <QueueViewerIncludesAndExcludes>] [-IncludeBookmark <$true |
$false>] [-ResultSize <Unlimited>] [-ReturnPageInfo <$true | $false>] [-
SearchForward <$true | $false>] [-SortOrder <QueueViewerSortOrderEntry[]>]
```

Examples

EXAMPLE 1

This example displays detailed information for all queues on the Mailbox server on which the command is run.

```
Get-Queue | Format-List
```

EXAMPLE 2

This example lists the queues that contain more than 100 messages.

```
Get-Queue -Filter {MessageCount -gt 100}
```

EXAMPLE 3

This example displays detailed information for a specific queue that exists on the Mailbox server named Server1.

```
Get-Queue Server1\contoso.com | Format-List
```

EXAMPLE 4

This example lists only the external queues.

```
Get-Queue -Exclude Internal
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
BookmarkIndex	Optional	System.Int32	The *BookmarkIndex* parameter specifies the position in the result set where the displayed results start. The value of this parameter is a 1-based index in the total result set. The *BookmarkIndex* parameter can't be used with the *BookmarkObject* parameter.
BookmarkObject	Optional	Microsoft.Exchange.Data.QueueViewer.ExtensibleQueueInfo	The *BookmarkObject* parameter specifies the object in the result set where the displayed results start. The *BookmarkObject* parameter can't be used with the *BookmarkIndex* parameter.
Exclude	Optional	Microsoft.Exchange.Data.QueueViewerIncludesAndExcludes	The *Exclude* parameter specifies the types of queues you want to exclude from the results. Valid values for this parameter are: • Internal • External

			• A valid queue `DeliveryType` value. For details, see the NextHopSolutionKey section in Queues.
Filter	Optional	System.String	The *Filter* parameter specifies one or more queues by using OPath filter syntax. The OPath filter includes a queue property name followed by a comparison operator and value, for example, `{NextHopDomain -eq "contoso.com"}`. For details about filterable queue properties and comparison operators, see Queue filters and Use the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Optional	Microsoft.Exchange.Data.QueueViewer.QueueIdentity	The *Identity* parameter specifies the queue. Valid input for this parameter uses the syntax *Server*

			Queue or *Queue*, for example, `Mailbox01 \contoso.com` or `Unreachable`. For details about queue identity, see the "Queue identity" section in Use the Exchange Management Shell to manage queues.
Include	Optional	Microsoft.Exchange.Data.QueueViewerIncludesAndExcludes	The *Include* parameter specifies the types of queues you want to include the results. Valid values for this parameter are: • Internal • External • A valid queue `DeliveryType` value. For details, see the NextHopSolutionKey section in Queues.
IncludeBookmark	Optional	System.Boolean	The *IncludeBookmark* parameter specifies whether to include the bookmark object when the query results are displayed. The *IncludeBookmark* parameter is valid when it's used with the *BookmarkObject* or

			BookmarkIndex parameters. If you don't specify a value for the *IncludeBookmark* parameter, the default value of `$true` is used.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter specifies the maximum number of results to return. If you want to return all requests that match the query, use `unlimited` for the value of this parameter. The default value is `1000`.
ReturnPageInfo	Optional	System.Boolean	The *ReturnPageInfo* parameter is a hidden parameter. Use it to return information about the total number of results and the index of the first object of the current page. The default value is `$false`.
SearchForward	Optional	System.Boolean	The *SearchForward* parameter specifies whether to search forward or backward in the result set. The default value is `$true`. This value causes the result page to be

			calculated forward from either the start of the result set or forward from a bookmark if specified.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use the *Server* parameter and the *Identity* parameter in the same command.
SortOrder	Optional	Microsoft.Exchange.Data.QueueViewerSortOrderEntry[]	The *SortOrder* parameter specifies an array of message properties used to control the sort order of the result set. Separate each property by using a

			comma. Prepend a plus sign (+) symbol to the beginning of the property name to display the results in ascending order. Prepend a minus sign (-) symbol to the beginning of the property name to display the results in descending order. If you don't specify a sort order, the result set is displayed in ascending order by **QueueIdentity**.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Resume-Queue

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Resume-Queue** cmdlet to restart processing for a suspended queue on a Mailbox server or an Edge Transport server.

```
Resume-Queue -Identity <QueueIdentity> <COMMON PARAMETERS>

Resume-Queue -Filter <String> [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example resumes processing of all queues where the **NextHopDomain** is Fourthcoffee.com on the server Server1.contoso.com.

```
Resume-Queue -Server Server1.contoso.com -Filter
{NextHopDomain -eq "Fourthcoffee.com"}
```

Detailed Description

If you use the *Identity* parameter, the queue is resumed only if that identity matches a single queue. If the identity matches more than one queue, you receive an error. To resume more than one queue in a single operation, you must use the *Filter* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Filter	Required	System.String	The *Filter* parameter specifies one or more queues by using OPath filter syntax. The OPath filter includes a queue property name followed by a comparison operator and value, for example, `{NextHopDomain -eq "contoso.com"}`. For

			details about filterable queue properties and comparison operators, see Queue filters and Use the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Required	Microsoft.Exchange.Data.QueueViewer.QueueIdentity	The *Identity* parameter specifies the queue. Valid input for this parameter uses the syntax *Server**Queue* or *Queue*, for example, `Mailbox01\contoso.com` or `Unreachable`. For details about queue identity, see the "Queue identity" section in Use the Exchange Management Shell to manage queues.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the

			command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use the *Server* parameter and the *Identity* parameter in the same command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object.

			By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Retry-Queue

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Retry-Queue** cmdlet to force a connection attempt for a queue on a Mailbox server or an Edge Transport server.

```
Retry-Queue -Identity <QueueIdentity> <COMMON PARAMETERS>

Retry-Queue -Filter <String> [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-Resubmit <$true |
$false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example forces a connection attempt for all queues that meet the following criteria:

- The queues are holding messages for the domain contoso.com.
- The queues have a status of `Retry`.
- The queues are located on the server on which the command is executed.

```
Retry-Queue -Filter {NextHopDomain -eq "contoso.com" -and
Status -eq "Retry"}
```

Detailed Description

The **Retry-Queue** cmdlet forces a connection attempt for a queue that has a status of Retry. The cmdlet establishes a connection to the next hop if possible. If a connection isn't established, a new retry time is set. To use this command to retry delivery of messages in the Unreachable queue, you must include the *Resubmit* parameter.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Filter	Required	System.String	The *Filter* parameter specifies one or more queues by using OPath filter syntax. The OPath filter includes a queue property name followed by a comparison operator and value, for example, `{NextHopDomain -eq "contoso.com"}`. For details about filterable queue properties and comparison operators, see Queue filters and Use

			the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Required	Microsoft.Exchange.Data.QueueViewer.QueueIdentity	The *Identity* parameter specifies the queue. Valid input for this parameter uses the syntax *Server**Queue* or *Queue*, for example, `Mailbox01\contoso.com` or `Unreachable`. For details about queue identity, see the "Queue identity" section in Use the Exchange Management Shell to manage queues.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm*

			switch.
Resubmit	Optional	System.Boolean	The *Resubmit* parameter specifies whether the queue contents should be resubmitted to the categorizer before a connection is established. Valid input for this parameter is `$true` or `$false`.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use the *Server* parameter and the *Identity* parameter in

			the same command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Suspend-Queue

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Suspend-Queue** cmdlet to stop processing for a queue on a Mailbox server or an Edge Transport server.

```
Suspend-Queue -Identity <QueueIdentity> <COMMON PARAMETERS>
```

```
Suspend-Queue -Filter <String> [-Server <ServerIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-Confirm [<SwitchParameter>]] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example suspends processing on all queues holding messages for delivery to the domain contoso.com and that currently have a status of `Retry`.

```
Suspend-Queue -Filter {NextHopDomain -eq "contoso.com" -and
Status -eq "Retry"}
```

EXAMPLE 2

This example suspends processing on all queues on the server Server1.contoso.com that have more than 100 messages in the queue.

```
Suspend-Queue -Server Server1.contoso.com -Filter
{MessageCount -gt 100}
```

Detailed Description

The **Suspend-Queue** cmdlet stops processing on a queue that has a status of Active or Retry. Messages being processed are delivered, but no additional messages leave the queue. When you use the *Identity* parameter, the queue is suspended only if the identity matches a single queue. If the identity matches more than one queue, you receive an error. To suspend more than one queue in a single operation, you must use the *Filter* parameter.

For instructions on how to resume suspended queues, see Resume-Queue.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Filter	Required	System.String	The *Filter* parameter specifies one or more

			queues by using OPath filter syntax. The OPath filter includes a queue property name followed by a comparison operator and value, for example, `{NextHopDomain -eq "contoso.com"}`. For details about filterable queue properties and comparison operators, see Queue filters and Use the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
Identity	Required	Microsoft.Exchange.Data.QueueViewer.QueueIdentity	The *Identity* parameter specifies the queue. Valid input for this parameter uses the syntax *Server**Queue* or *Queue*, for example, `Mailbox01\contoso.com` or `Unreachable`. For details about queue identity, see the "Queue identity" section in Use the

			Exchange Management Shell to manage queues.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server. You can use the *Server* parameter and the *Filter* parameter in the same command. You can't use

			the *Server* parameter and the *Identity* parameter in the same command.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-QueueDigest

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-QueueDigest** cmdlet to view information about message delivery queues across

database availability groups (DAGs) Active Directory sites, or Active Directory forests in your organization.

Note:
By default, the **Get-QueueDigest** cmdlet displays delivery queues that contain ten or more messages, and the results are between one and two minutes old. For instructions on how to change these default values, see Configure Get-QueueDigest.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-QueueDigest -Dag <MultiValuedProperty> <COMMON PARAMETERS>

Get-QueueDigest -Server <MultiValuedProperty> <COMMON PARAMETERS>

Get-QueueDigest -Site <MultiValuedProperty> <COMMON PARAMETERS>

Get-QueueDigest -Forest <SwitchParameter> <COMMON PARAMETERS>

COMMON PARAMETERS: [-DetailsLevel <None | Normal | Verbose>] [-Filter
<String>] [-GroupBy <NextHopDomain | NextHopCategory | NextHopKey |
DeliveryType | Status | RiskLevel | LastError | ServerName |
OutboundIPPool>] [-IncludeE14Servers <SwitchParameter>] [-Mtrt
<SwitchParameter>] [-ResultSize <Unlimited>] [-Timeout <EnhancedTimeSpan>]
```

Examples

Example 1

This example returns information about all queues in the Active Directory forest.

```
Get-QueueDigest -Forest
```

Example 2

This example returns information about all queues in the DAG named DAG01.

```
Get-QueueDigest -Dag DAG01
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

Dag	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Dag* parameter filters the delivery queue results by DAG. You can specify any value that uniquely identifies the DAG. You can specify multiple values separated by commas. If the value contains spaces, enclose the value in quotation marks ("). You can't use the *Dag* parameter with the *Server*, *Site* or *Forest* parameters.
Forest	Required	System.Management.Automation.SwitchParameter	The *Forest* switch filters the delivery queue results by Active Directory forest. You don't need to specify a value with the *Forest* switch. You can't use the *Forest* switch with the *Server*, *Site* or *Dag* parameters.
Server	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Server* parameter filters the delivery queue results by Exchange server. You can specify any value that uniquely identifies the server. You can specify multiple values separated by commas. If the value

			contains spaces, enclose the value in quotation marks ("). You can't use the *Server* parameter with the *Dag*, *Site* or *Forest* parameters.
Site	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Site* parameter filters the delivery queue results by Active Directory site. You can specify any value that uniquely identifies the site. You can specify multiple sites separated by commas. You can't use the *Site* parameter with the *Server*, *Dag* or *Forest* parameters.
DetailsLevel	Optional	Microsoft.Exchange.Net.DiagnosticsAggregation.DetailsLevel	The *DetailsLevel* parameter specifies the level of detail to display in the results. Valid values for this parameter are `None`, `Normal` and `Verbose`. The default value is `Normal`.
Filter	Optional	System.String	The *Filter* parameter specifies one or more queues by using OPath filter syntax. The OPath filter includes a queue property name followed

			by a comparison operator and value, for example, `{NextHopDomain -eq "contoso.com"}`. For details about filterable queue properties and comparison operators, see Queue filters and Use the Exchange Management Shell to manage queues. You can specify multiple criteria by using the **and** comparison operator. Property values that aren't expressed as an integer must be enclosed in quotation marks (").
GroupBy	Optional	Microsoft.Exchange.Net.DiagnosticsAggregation.QueueDigestGroupBy	The *GroupedBy* parameter sorts the messages in the delivery queue results. Valid values for this parameter are: • `DeliveryType` • `LastError` • `NextHopCategory` • `NextHopDomain` • `NextHopKey` • `RiskLevel` • `Status` • `ServerName` • `OutboundIPPool` The default value is `NextHopDomain`.
IncludeE14Servers	Optional	System.Management.Automation.SwitchPar	This parameter is reserved for internal Microsoft use.

		ameter	
Mtrt	Optional	System.Management.Automation.SwitchParameter	This parameter is reserved for internal Microsoft use.
ResultSize	Optional	Microsoft.Exchange.Data.Unlimited	The *ResultSize* parameter filters the delivery queue results by the number of messages in the queue. Valid input for this parameter is an integer. The default value is 1000. For example, if you specify the value 50, the command displays the 50 queues that contain the most messages.
Timeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *Timeout* parameter specifies the number of seconds before the operation times out. The default value is 10 seconds. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ReceiveConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ReceiveConnector** cmdlet to view the configuration information for a Receive connector.

```
Get-ReceiveConnector [-Server <ServerIdParameter>] <COMMON PARAMETERS>

Get-ReceiveConnector [-Identity <ReceiveConnectorIdParameter>] <COMMON
PARAMETERS>

COMMON PARAMETERS: [-DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays detailed configuration information for the Receive Connector for Contoso.com.

```
Get-ReceiveConnector "Receive Connector for Contoso.com" |
Format-List
```

EXAMPLE 2

This example lists all the Receive connectors on Hub1.

```
Get-ReceiveConnector -Server Hub1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for

this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Receive connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ReceiveConnectorIdParameter	Specifies the GUID or connector name that represents a specific Receive connector. You can also include the server name using the format *ServerName**ConnectorName*. You can omit the

			parameter label so that only the connector name or GUID is supplied.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	Specifies the name of the server to query when the command is run. Only Receive connectors configured on the server you specify are displayed.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-ReceiveConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-ReceiveConnector** cmdlet to create a new Receive connector.

```
New-ReceiveConnector -Bindings <MultiValuedProperty> -RemoteIPRanges
<MultiValuedProperty> [-Custom <SwitchParameter>] <COMMON PARAMETERS>

New-ReceiveConnector -Bindings <MultiValuedProperty> -Internet
<SwitchParameter> <COMMON PARAMETERS>
```

```
New-ReceiveConnector -Internal <SwitchParameter> -RemoteIPRanges
<MultiValuedProperty> <COMMON PARAMETERS>

New-ReceiveConnector -Client <SwitchParameter> -RemoteIPRanges
<MultiValuedProperty> <COMMON PARAMETERS>

New-ReceiveConnector -Bindings <MultiValuedProperty> -Partner
<SwitchParameter> -RemoteIPRanges <MultiValuedProperty> <COMMON
PARAMETERS>

```

Examples

EXAMPLE 1

This example creates the custom Receive connector Test with the following properties:

- It listens for incoming SMTP connections on the IP address 10.10.1.1 and port 25.
- It accepts incoming SMTP connections only from the IP range 192.168.0.1-192.168.0.24

```
New-ReceiveConnector -Name Test -Usage Custom -Bindings
10.10.1.1:25 -RemoteIPRanges 192.168.0.1-192.168.0.24
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Receive connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Bindings	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *Bindings* parameter specifies the local IP address and TCP port number used by the Receive connector to listen for inbound messages. Valid syntax for this parameter is *<IP Address>*:*<TCP Port>*, such as `192.168.1.1:25`. The IP address `0.0.0.0` indicates that the Receive connector uses all IP addresses configured on all network adapters to listen for inbound messages. **Note:** You must specify a local IP address that's valid for the Mailbox server or Edge server on which the Receive connector is located. If you specify an invalid local IP address, the Microsoft Exchange Transport service may fail

			to start when the service is restarted. You must specify a value for the *Bindings* parameter when the following parameters are specified: • *Internet* or *Usage* parameter with a value of `Internet` • *Partner* or *Usage* parameter with a value of `Partner` • *Custom* or *Usage* parameter with a value of `Custom` The values that you specify using the *Bindings* parameter must satisfy one of the following requirements for uniqueness: • You can specify a unique combination of IP address and TCP port that doesn't conflict with the IP address or TCP port used in the *Bindings* parameter of another Receive connector on the server. • You can use an existing combination of IP

			address and TCP port, but use the *RemoteIPRanges* parameter to restrict the remote servers serviced by the Receive connector. However, when you use this command to create a Receive connector, you can only use the *RemoteIPRanges* parameter and the *Bindings* parameter together when the following parameters are specified: *Custom* or *Usage* parameter with a value of `Custom`. *Partner* or *Usage* parameter with a value of `Partner`. You can't specify a value for the *Bindings* parameter with this command when the following parameters are specified: • *Client* or *Usage* parameter with a value of `Client`. The default value of the *Bindings* parameter is

			`0.0.0.0:587`. This value indicates that the connector accepts connections on TCP port 587 on all IP addresses configured on all network adapters in the server. • *Internal* or *Usage* parameter with a value of `Internal`. The default value of the *Bindings* parameter is `0.0.0.0:25`. This value indicates that the connector accepts connections on TCP port 25 on all IP addresses configured on all network adapters in the server.
Client	Required	System.Management.Automation.SwitchParameter	The *Client* parameter specifies the `Client` usage type. The usage type specifies the default permission groups and authentication methods assigned to the Receive connector. If you use the *Client* parameter, you can't use any of the following parameters: • *Internal*

			• *Internet* • *Partner* • *Custom* • *Usage* If you specify the *Client* parameter, you must specify a value for the *RemoteIPRanges* parameter. If you don't specify a value for a required parameter, this command prompts you so that it may continue. For more information about Receive connector usage types, permission groups, and authentication methods, see Receive connectors.
Internal	Required	System.Management.Automation.SwitchParameter	The *Internal* parameter specifies the `Internal` usage type. The usage type specifies the default permission groups and authentication methods assigned to the Receive connector. If you use the *Internal* parameter, you can't use any of the following parameters: • *Client* • *Internet*

			• *Partner* • *Custom* • *Usage* If you specify the *Internal* parameter, you must specify a value for the *RemoteIPRanges* parameter. If you don't specify a value for a required parameter, the command prompts you so that it may continue. For more information about Receive connector usage types, permission groups, and authentication methods, see Receive connectors.
Internet	Required	System.Management.Automation.SwitchParameter	The *Internet* parameter specifies the `Internet` usage type. The usage type specifies the default permission groups and authentication methods assigned to the Receive connector. If you use the *Internet* parameter, you can't use any of the following parameters: • *Client* • *Internal* • *Partner*

			• *Custom* • *Usage* If you specify the *Internet* parameter, you must specify a value for the *Bindings* parameter. If you don't provide a value for a required parameter, this command prompts you so that it may continue. For more information about Receive connector usage types, permission groups, and authentication methods, see Receive connectors.
Name	Required	System.String	The *Name* parameter specifies the administrator-supplied name of the connector. Enter the *Name* parameter as a string, for example: `"New Receive Connector"`.
Partner	Required	System.Management.Automation.SwitchParameter	The *Partner* parameter specifies the `Partner` usage type. The usage type specifies the default permission groups and authentication methods assigned to the Receive connector. If you use the

			Partner parameter, you can't use any of the following parameters: • *Client* • *Internal* • *Internet* • *Custom* • *Usage* If you specify the *Partner* parameter, you must specify a value for the following parameters: • *Bindings* • *RemoteIPRanges* If you don't provide a value for a required parameter, this command prompts you so that it may continue.
RemoteIPRanges	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *RemoteIPRanges* parameter specifies the remote IP addresses from which this connector accepts messages. Valid syntax for this parameter is *<Starting IP Address>-<Ending IP Address>*, such as `192.168.1.1-192.168.1.10`. You can specify multiple IP address ranges separated by commas.

			You must specify a value for the *RemoteIPRanges* parameter when the following parameters are specified: • *Client* or *Usage* parameter with a value of `Client` • *Internal* or *Usage* parameter with a value of `Internal` • *Partner* or *Usage* parameter with a value of `Partner` • *Custom* or *Usage* parameter with a value of `Custom` Multiple Receive connectors on the same server can have overlapping remote IP address ranges as long as one IP address range is completely overlapped by another IP address. When remote IP address ranges overlap, the remote IP address range with the most specific match to the IP address of the connecting server is used. The default value of the

			RemoteIPRanges parameter for the `Internet` usage type is `0.0.0.0-255.255.255.255`. This value indicates that the connector accepts connections from all remote IP addresses.
Usage	Required	Microsoft.Exchange.Management.SystemConfigurationTasks.NewReceiveConnector+UsageType	The *Usage* parameter specifies the default permission groups and authentication methods assigned to the Receive connector. The valid values for the *Usage* parameter are as follows: `Client`, `Custom`, `Internal`, `Internet`, and `Partner`. If you specify a value for the *Usage* parameter, you can't use any of the following parameters: • *Client* • *Internal* • *Internet* • *Partner* • *Custom* A value for the *Bindings* parameter is required if you specify any of the following values for the *Usage* parameter:

			• `Internet` • `Partner` • `Custom` A value for the *RemoteIPRanges* parameter is required if you specify any of the following values for the *Usage* parameter: • `Client` • `Internal` • `Partner` • `Custom` If you don't specify a value for a required parameter, the command ends unsuccessfully. This command won't prompt you for the missing required parameters. For more information about Receive connector usage types, permission groups, and authentication methods, see Receive connectors.
AdvertiseClientSettings	Optional	System.Boolean	The *AdvertiseClientSettings* parameter specifies whether the SMTP server name, port number, and authentication settings are displayed in the Outlook Web App, accessed from **Settings > Options >**

			Account > my Account > Settings for POP or IMAP access. The default value is `$false`.
AuthMechanism	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthMechanisms	The *AuthMechanism* parameter specifies the advertised and accepted authentication mechanisms. The authentication options are `None`, `Tls`, `Integrated`, `BasicAuth`, `BasicAuthRequireTLS`, `ExchangeServer`, and `ExternalAuthoritative`. You can enter multiple values for the *AuthMechanism* parameter by separating the values with commas. If the *RequireTLS* parameter is set to `$true`, the *AuthMechanism* parameter must be set to `Tls`. If you set the *AuthMechanism* parameter to `BasicAuthRequireTLS`, you must also select `BasicAuth` and `Tls`. The *AuthMechanism*

			parameter value `ExternalAuthoritative` may only coexist with the value `Tls`. If you set the *AuthMechanism* parameter to `ExternalAuthoritative`, the *PermissionGroups* parameter must also have the value `ExchangeServers`.
Banner	Optional	System.String	The *Banner* parameter specifies an SMTP 220 banner and overrides the default SMTP 220 banner. When the value of the *Banner* parameter is blank, the default SMTP banner is the following: `220 <Servername> Microsoft ESMTP MAIL service ready at <RegionalDay-Date-24HourTimeFormat> <RegionalTimeZoneOffset>` When you specify a value for the *Banner* parameter, you must use the following syntax: `220 <RemainingBannerText>`. 220 is the default Service ready SMTP response code as defined in RFC 2821.

BinaryMimeEnabled	Optional	System.Boolean	The *BinaryMimeEnabled* parameter specifies whether the BINARYMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *BinaryMimeEnabled* parameter is set to `$true`, the BINARYMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *BinaryMimeEnabled* parameter is set to `$false`, the BINARYMIME EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled.
ChunkingEnabled	Optional	System.Boolean	The *ChunkingEnabled* parameter specifies whether the CHUNKING EHLO keyword is advertised in the EHLO response to the remote server and is available for

			use. Valid input for this parameter is `$true` or `$false`. The default value is `$true`. When the *ChunkingEnabled* parameter is set to `$true`, the CHUNKING EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *ChunkingEnabled* parameter is set to `$false`, the CHUNKING EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled.
Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: `"This is an admin note"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectionInactivityTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectionInactivityTimeout* parameter specifies the maximum amount of idle time before a connection to a Receive connector is closed. The default value for a Receive connector configured on a Mailbox server is 5 minutes. The default value for a Receive connector configured on an Edge server is 1 minute. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The value specified by the *ConnectionTimeout* parameter must be greater than the value specified by the *ConnectionInactivityTimeout* parameter. The valid input range for either parameter is `00:00:01` to

			1.00:00:00.
ConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectionTimeout* parameter specifies the maximum time that a connection can remain open, even if the connection is actively transmitting data. The default value for a Receive connector configured on a Mailbox server is 10 minutes. The default value for a Receive connector configured on an Edge server is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a connection time-out of 5 minutes, enter 00.00:05:00. The value specified by the *ConnectionTimeout* parameter must be greater than the value specified by the *ConnectionInactivityTimeout* parameter. The valid input range for either

			parameter is from `00:00:01` through `1.00:00:00`.
Custom	Optional	System.Management.Automation.SwitchParameter	The *Custom* parameter specifies the `Custom` usage type. The usage type specifies the default permission groups and authentication methods assigned to the Receive connector. If you use the *Custom* parameter, you can't use any of the following parameters: • *Client* • *Internal* • *Internet* • *Partner* • *Usage* If you specify the *Custom* parameter, you must specify a value for the following parameters: • *Bindings* • *RemoteIPRanges* If you don't provide a value for a required parameter, this command prompts you so that it may continue.
DefaultDomain	Optional	Microsoft.Exchange.Co	The *DefaultDomain*

		nfiguration.Tasks.AcceptedDomainIdParameter	parameter specifies the domain name to append to values that are submitted to `MAIL FROM` or `RCPT TO` in the message envelope by a sending server if no domain name is provided.
DeliveryStatusNotificationEnabled	Optional	System.Boolean	The *DeliveryStatusNotificationEnabled* parameter specifies whether the delivery status notification (DSN) EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *DeliveryStatusNotificationEnabled* parameter is set to `$true`, the DSN EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *DeliveryStatusNotificationEnabled* parameter is set to `$false`, the DSN EHLO

			keyword isn't advertised in the EHLO response to the remote server and is disabled. The DSN extension to extended SMTP (ESMTP) provides enhanced DSN functionality specified in RFC 1891.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainSecureEnabled	Optional	System.Boolean	The *DomainSecureEnabled* parameter enables mutual Transport Layer Security (TLS) authentication for

			the domains serviced by this Receive connector. Mutual TLS authentication functions correctly only if the following conditions are true: • The value of the *DomainSecureEnabled* parameter is `$true`. • The *AuthMechanism* parameter contains the value `Tls` and doesn't contain the value `ExternalAuthoritative`. • The value of the *AuthMechanism* parameter contains `Tls`. • The *TLSReceiveDomainSecureList* parameter in the **Get-TransportConfig** command contains at least one domain serviced by this Receive connector. The wildcard character (*) isn't supported in domains that are configured for mutual TLS authentication. The same domain must also be defined on the corresponding Send

			connector, and in the value of the *TLSSendDomainSecureList* parameter in the **Get-TransportConfig** command. The default value for the *DomainSecureEnabled* parameter is `$false` for the following types of Receive connectors: • All Receive connectors defined in the Transport service on a Mailbox server • User-created Receive connectors defined on an Edge server The default value for the *DomainSecureEnabled* parameter is `$true` for default Receive connectors defined on an Edge server.
EightBitMimeEnabled	Optional	System.Boolean	The *EightBitMimeEnabled* parameter specifies whether the 8BITMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this

			parameter are `$true` or `$false`. The default value is `$true`. When the *EightBitMimeEnabled* parameter is set to `$true`, the 8BITMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *EightBitMimeEnabled* parameter is set to `$false`, the 8BITMIME EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled.
EnableAuthGSSAPI	Optional	System.Boolean	The *EnableAuthGSSAPI* parameter specifies the advertisement of the Generic Security Services application programming interface (GSSAPI) authentication method, when Integrated Windows authentication is enabled on this connector. If the *AuthMechanism* parameter contains `Integrated`, and the *EnableAuthGSSAPI* parameter is set to `$true`, the AUTH GSSAPI NTLM

			keyword is advertised in the EHLO response of the Receive connector. Clients may use Kerberos or NTLM to authenticate with the Receive connector. If the *AuthMechanism* parameter contains `Integrated`, and the *EnableAuthGSSAPI* parameter is set to `$false`, the AUTH NTLM keyword is advertised in the EHLO response of the Receive connector. Clients may use only NTLM to authenticate with the Receive connector. If you have Internet Information Services (IIS) messaging servers that authenticate with this Receive connector, you should set the value of the *EnableAuthGSSAPI* parameter to `$false`. Authentication with computers running Microsoft Exchange Server 2003 aren't affected by the value of the *EnableAuthGSSAPI* parameter. Exchange

			2003 servers use the authentication methods advertised in the X-EXPS keyword. The X-EXPS keyword is advertised in the EHLO response of the Receive connector when the *AuthMechanism* parameter contains `ExchangeServer`. The valid values for this parameter is `$true` or `$false`. The default value is `$false`. By default, the *EnableAuthGSSAPI* parameter is set to `$true` only on the default Receive connector Client *<Server Name>* created only in the Transport service on a Mailbox server.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the connector. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. Use the *Enabled* parameter to enable or disable the connector.
EnhancedStatusCodes	Optional	System.Boolean	The

Enabled			*EnhancedStatusCodesEnabled* parameter specifies whether the ENHANCEDSTATUSCODES EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *EnhancedStatusCodesEnabled* parameter is set to `$true`, the ENHANCEDSTATUSCODES EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *EnhancedStatusCodesEnabled* parameter is set to `$false`, the ENHANCEDSTATUSCODES EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The ENHANCEDSTATUSCODES extension provides enhanced error and status information in delivery

			status notification messages sent to remote servers.
ExtendedProtectionPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionPolicySetting	The *ExtendedProtectionPolicy* parameter specifies how Extended Protection for Authentication is implemented on this Receive connector. By default, this parameter is set to `None`. The *ExtendedProtectionPolicy* parameter may have the following values: • `None` Extended Protection for Authentication isn't used. • `Allow` Extended Protection for Authentication is used only if the connecting host supports it. Otherwise, connections are established without Extended Protection for Authentication. • `Require` Extended Protection for Authentication is required for all incoming connections to this Receive connector. If the connecting host doesn't support Extended Protection for Authentication, the

			connection is rejected. Extended Protection for Authentication enhances the protection and handling of credentials when authenticating network connections using Integrated Windows authentication. Integrated Windows authentication is also known as NTLM. We strongly recommend that you use Extended Protection for Authentication if you are using Integrated Windows authentication.
Fqdn	Optional	Microsoft.Exchange.Data.Fqdn	The *Fqdn* parameter specifies the FQDN used as the destination server for connected messaging servers that use the Receive connector to send incoming messages. The value of this parameter is displayed to connected messaging servers whenever a destination server name is required, as in the following examples: • In the default SMTP banner of the Receive

			connector • In the EHLO/HELO response of the Receive connector • In the most recent `Received` header field in the incoming message when the message enters the Transport service of a Mailbox server or an Edge server • During TLS authentication The default value of the *Fqdn* parameter is the FQDN of the Mailbox server or Edge server that contains the Receive connector. **Note:** Don't modify the FQDN value on the default Receive connector Default <*Server Name*> that's automatically created in the Transport service of a Mailbox server. If you have multiple Mailbox servers in your Exchange organization and you change the FQDN value on the Default <*Server Name*> Receive connector, internal mail flow between Mailbox servers will fail.
LiveCredentialEnabled	Optional	System.Boolean	This parameter is reserved

			for internal Microsoft use.
LongAddressesEnabled	Optional	System.Boolean	The *LongAddressesEnabled* parameter specifies whether the Receive connector accepts long X.400 email addresses. The X.400 email addresses are encapsulated in SMTP email addresses by using the Internet Mail Connector Encapsulated Address (IMCEA) encapsulation method. When the value of this parameter is `$false`, the maximum length for a complete SMTP email address is 571 characters. When the value of this parameter is `$true`, the following changes are made: • The XLONGADDR keyword is advertised in the EHLO response of the Receive connector. • The accepted line length of an SMTP session is increased to 8,000 characters. • Valid long addresses are

			accepted by the MAIL FROM and RCPT TO SMTP commands. Therefore, X.400 email addresses can be up to 1,860 characters long after IMCEA encapsulation. The valid values for this parameter are `$true` or `$false`. The default value is `$false`. You can modify this parameter only on Receive connectors configured in the Transport service on a Mailbox server.
MaxAcknowledgementDelay	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	This parameter isn't used by Microsoft Exchange Server 2013. It's only used by Microsoft Exchange 2010 servers in a coexistence environment. The *MaxAcknowledgementDelay* parameter specifies the maximum period the transport server delays acknowledgement until it verifies that the message has been successfully delivered to all recipients.

			When receiving messages from a host that doesn't support shadow redundancy, an Exchange Server 2010 transport server will delay issuing an acknowledgement until it verifies that the message has been successfully delivered to all recipients. However, if it takes too long to verify successful delivery, the transport server will time out and issue an acknowledgement anyway. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The default value is 30 seconds.
MaxHeaderSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MaxHeaderSize* parameter specifies in bytes the maximum size of the SMTP message header that the Receive connector accepts before it closes the connection. The default value is 65536

			bytes. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is from 1 through 2147483647 bytes.
MaxHopCount	Optional	System.Int32	The *MaxHopCount* parameter specifies the maximum number of hops that a message can take before the message is rejected by the Receive connector. The maximum number of hops is determined by the number of `Received` header fields that exist in a submitted message. The default value is 30. The valid input range for this parameter is from 1 through 500.
MaxInboundConnecti	Optional	Microsoft.Exchange.Da	The

on		ta.Unlimited	*MaxInboundConnection* parameter specifies the maximum number of inbound connections that this Receive connector serves at the same time. The default value is 5000. The valid input range for this parameter is from 1 through 2147483647. To disable the inbound connection limit on a Receive connector, enter a value of `unlimited`.
MaxInboundConnectionPercentagePerSource	Optional	System.Int32	The *MaxInboundConnectionPercentagePerSource* parameter specifies the maximum number of connections that a Receive connector serves at the same time from a single IP address, expressed as the percentage of available remaining connections on a Receive connector. Enter the value as an integer without the percent sign (%). The default value is 2 percent. The valid input range for this parameter is 1 to 100.

MaxInboundConnectionPerSource	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInboundConnectionPerSource* parameter specifies the maximum number of connections that this Receive connector serves at the same time from a single IP address. The default value is 100. The valid input range for this parameter is from 1 through 10000. To disable the inbound connection per source limit on a Receive connector, enter a value of `unlimited`.
MaxLocalHopCount	Optional	System.Int32	The *MaxLocalHopCount* parameter specifies the maximum number of local hops that a message can take before the message is rejected by the Receive connector. The maximum number of local hops is determined by the number of `Received` headers with local server addresses in a submitted message. The default value is 8. The valid input range for this parameter

			is 0 to 50. When you specify a value of 0, the message is never rejected based on the number of local hops.
MaxLogonFailures	Optional	System.Int32	The *MaxLogonFailures* parameter specifies the number of logon failures that the Receive connector retries before it closes the connection. The default value is 3. The valid input range for this parameter is from 0 through 10. When you specify a value of 0, the connection is never closed because of logon failures.
MaxMessageSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MaxMessageSize* parameter specifies the maximum size of a message. The default value is 25 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.

			The valid input range for this parameter is from 65536 through 2147483647 bytes.
MaxProtocolErrors	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxProtocolErrors* parameter specifies the maximum number of SMTP protocol errors that the Receive connector accepts before closing the connection. The default value is 5. The valid input range for this parameter is from 0 through 2147483647. When you specify a value of `unlimited`, a connection is never closed because of protocol errors.
MaxRecipientsPerMessage	Optional	System.Int32	The *MaxRecipientsPerMessage* parameter specifies the maximum number of recipients per message that the Receive connector accepts before closing the connection. The default value is 200. The valid input range for this parameter is 1 to 512000.
MessageRateLimit	Optional	Microsoft.Exchange.Da	The *MessageRateLimit*

		ta.Unlimited	parameter specifies the maximum number of messages that can be sent by a single client IP address per minute. The default value for a Receive connector configured on a Mailbox server is `unlimited`. The default value for a Receive connector configured on an Edge server is 600 messages per minute. The valid input range for this parameter is 1 to 2147483647. To remove the message rate limit on a Receive connector, enter a value of `unlimited`.
MessageRateSource	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MessageRateSourceFlags	The *MessageRateSource* parameter specifies how the message submission rate is calculated. It can have one of the following values: • `None`: The message submission rate isn't calculated. • `User`: The message submission rate is calculated for sending users (specified with the MAIL FROM SMTP command). • `IPAddress`: The message

			submission rate is calculated for sending hosts. • `All`: The message submission rate is calculated for both sending users and sending hosts.
OrarEnabled	Optional	System.Boolean	The *OrarEnabled* parameter enables the Originator Requested Alternate Recipient (ORAR). When the value of this parameter is `$false`, ORAR isn't supported. When the value of this parameter is `$true`, ORAR is supported by advertising the XORAR keyword in the EHLO response of the Receive connector. The actual ORAR information is transmitted in the RCPT TO SMTP command. The valid values for this parameter are `$true` or `$false`. The default value is `$false`. If the email address specified in the ORAR information is a long X.400 email address, the *LongAddressesEnabled* parameter must be `$true`.

PermissionGroups	Optional	Microsoft.Exchange.Data.PermissionGroups	The *PermissionGroups* parameter specifies the groups or roles that can submit messages to the Receive connector and the permissions assigned to those groups. A permission group is a predefined set of permissions granted to well-known security principals. The valid values for this parameter are as follows: `None`, `AnonymousUsers`, `ExchangeUsers`, `ExchangeServers`, `ExchangeLegacyServers` `Partners`, and `Custom`. The default permission groups assigned to a Receive connector depend on the connector usage type that was specified by the *Usage* parameter when the Receive connector was created. For more information about Receive connector usage types, see Receive connectors.
PipeliningEnabled	Optional	System.Boolean	The *PipeliningEnabled*

			parameter specifies whether the PIPELINING EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. When the *PipeliningEnabled* parameter is set to `$true`, the PIPELINING EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *PipeliningEnabled* parameter is set to `$false`, the PIPELINING EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The PIPELINING extension enables the remote server to send requests without waiting for a response from this Receive connector. The default value is `$true`.
ProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLev	The *ProtocolLoggingLevel* parameter specifies

		el	whether to enable or disable protocol logging for a Receive connector. A value of `Verbose` enables protocol logging for the connector. A value of `None` disables protocol logging for the connector. The default value is `None`. The location of the Receive connector protocol logs for all Receive connectors configured on a Mailbox server or an Edge server is specified by using the *ReceiveProtocolLogPath* parameter of the **Set-TransportService** cmdlet.
ProxyEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RequireEHLODomain	Optional	System.Boolean	The *RequireEHLODomain* parameter specifies whether the remote computer must provide a domain name in the EHLO handshake after the SMTP connection is established. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. When the *RequireEHLODomain*

			parameter is set to `$true`, the remote computer must provide a domain name in the EHLO handshake after the SMTP connection is established. If the remote computer doesn't provide the domain name, the SMTP connection is closed.
RequireTLS	Optional	System.Boolean	The *RequireTLS* parameter specifies that all messages received by this connector require TLS transmission. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. When the *RequireTLS* parameter is set to `$true`, all messages received by this connector require TLS transmission.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the server on which the new Receive connector is created.
ServiceDiscoveryFqdn	Optional	Microsoft.Exchange.Data.Fqdn	The service discovery fully-qualified domain name (FQDN).
SizeEnabled	Optional	Microsoft.Exchange.Data.SizeMode	The *SizeEnabled* parameter specifies

			whether the SIZE SMTP extension is enabled. Valid values for this parameter are `Enabled`, `Disabled`, or `EnabledwithoutValue`. The default value is `Enabled`. When the *SizeEnabled* parameter is set to `Enabled`, the SIZE SMTP extension is enabled, and the maximum allowed message size value from the *MaxMessageSize* parameter is advertised in the EHLO banner. When the *SizeEnabled* parameter is set to `Disabled`, the SIZE SMTP extension isn't used, and the maximum allowed message size value is never disclosed to the remote server. When the *SizeEnabled* parameter is set to `EnabledWithoutValue`, the SIZE SMTP extension is enabled. However, the maximum allowed message size value from the *MaxMessageSize* parameter isn't advertised

			in the EHLO banner. This allows the message to bypass message size checks for authenticated connections between Mailbox servers. The SIZE SMTP extension is defined in RFC 1870. The SIZE SMTP extension enables the source server to declare the size of the inbound message to the target server. It also allows the target server to declare the maximum message size that it's allowed to accept to the sending server. If the advertised size of the inbound message exceeds the value in the *MaxMessageSize* parameter, the Receive connector responds to the remote server by using an error code and closes the connection.
SuppressXAnonymousTls	Optional	System.Boolean	The *SuppressXAnonymousTls* parameter specifies whether this Receive connector supports the standard TLS encryption

			for incoming connections. By default, all communications between servers is protected with TLS. However, if you need to disable TLS on a specific connection in your organization, you can create a specific Receive connector and set the *SuppressXAnonymousTls* parameter to `$true`. The default value is `$false`. Before you can set this parameter to `$true`, you must use the **Set-TransportService** cmdlet to set the *UseDownGradedExchangeServerAuth* parameter to `$true` on the server this Receive connector is configured.
TarpitInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TarpitInterval* parameter specifies the amount of time to delay an SMTP response to a remote server that may be abusing the connection. Authenticated connections are never delayed in this

			manner. The default value is 5 seconds. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The valid input range for this parameter is from `00:00:00` through `00:10:00`. When you set the value to `00:00:00`, you disable the tarpit interval.
TlsCertificateName	Optional	Microsoft.Exchange.Data.SmtpX509Identifier	The *TlsCertificateName* parameter specifies the X.509 certificate to use with TLS sessions and secure mail. Valid input for this parameter is `[I]`*Issuer*`[S]`*Subject*. The *Issuer* value is found in the certificate's `Issuer` field, and the *Subject* value is found in the certificate's `Subject` field. You can find these values by running the **Get-ExchangeCertificate** cmdlet.
TlsDomainCapabilities	Optional	Microsoft.Exchange.Data.MultiValuedPropert	The *TlsDomainCapabilities* parameter specifies the

		y	capabilities this Receive connector will make available to specific hosts outside your organization. TLS with certificate validation is used to authenticate remote hosts before these capabilities are offered. To specify capabilities for a domain, use the following syntax: *<domain name 1>:<capability 1, capability 2,...,capability N>* If you're specifying capabilities for multiple domains, list the configuration for each domain in quotation marks ("), separated by commas. For example: "contoso.com:AcceptOorgProtocol","fabrikam.com:AcceptOorgProtocol,AcceptOorgHeader" You can configure the capabilities for non-TLS encrypted incoming connections using the special "NO-TLS" domain.

			You can configure the following capabilities for a domain: • `AcceptOorgProtocol` • `AcceptOorgHeader`
TransportRole	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ServerRole	The *TransportRole* parameter designates the server role associated with this connector. Types include `FrontendTransport` and `HubTransport`. Typically used to specify the server role when you host multiple server roles on a single computer.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ReceiveConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ReceiveConnector** cmdlet to delete a Receive connector.

```
Remove-ReceiveConnector -Identity <ReceiveConnectorIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example deletes the Receive connector Contoso.com Receive Connector.

```
Remove-ReceiveConnector "Contoso.com Receive Connector"
```

Detailed Description

The **Remove-ReceiveConnector** cmdlet deletes the object and the configuration information for a Receive connector.

Caution:
Deleting a Receive connector may affect mail flow throughout the organization.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Receive connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ReceiveConnectorIdParameter	The *Identity* parameter specifies the GUID or connector name that represents a specific Receive connector. You can also include the server name by using the format *ServerName**ConnectorName*.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax `-Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge

			Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ReceiveConnector

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-03*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ReceiveConnector** cmdlet to change an existing Receive connector.

```
Set-ReceiveConnector -Identity <ReceiveConnectorIdParameter> [-
AdvertiseClientSettings <$true | $false>] [-AuthMechanism <None | Tls |
Integrated | BasicAuth | BasicAuthRequireTLS | ExchangeServer |
ExternalAuthoritative>] [-Banner <String>] [-BareLinefeedRejectionEnabled
<$true | $false>] [-BinaryMimeEnabled <$true | $false>] [-Bindings

```

Examples

EXAMPLE 1

This example makes the following configuration changes to the Receive connector Internet Receive Connector:

- Sets the *Banner* to `220 SMTP OK`.
- Configures the Receive connector to time out connections after 15 minutes.

```
Set-ReceiveConnector -Identity "Internet Receive Connector"
-Banner "220 SMTP OK" -ConnectionTimeout 00:15:00
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Receive connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ReceiveConnectorIdParameter	The *Identity* parameter specifies the GUID or connector name that represents the Receive connector. The parameter label can be omitted.
AdvertiseClientSettings	Optional	System.Boolean	The *AdvertiseClientSettings* parameter specifies whether the SMTP server name, port number, and authentication settings are displayed in Microsoft Office Outlook Web App, accessed from **Settings > Options > Account > my Account > Settings for POP or IMAP access**. The default value is `$false`.

AuthMechanism	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AuthMechanisms	The *AuthMechanism* parameter specifies the advertised and accepted authentication mechanisms. The authentication options are `None`, `Tls`, `Integrated`, `BasicAuth`, `BasicAuthRequireTLS`, `ExchangeServer`, and `ExternalAuthoritative`. You can enter multiple values for the *AuthMechanism* parameter by separating the values with commas. If the *RequireTLS* parameter is set to `$true`, the *AuthMechanism* parameter must be set to `Tls` (Transport Layer Security). If you set the *AuthMechanism* parameter to `BasicAuthRequireTLS`, you must also select `BasicAuth` and `Tls`. The *AuthMechanism* parameter value `ExternalAuthoritative` may only coexist with the value `Tls`. If you set the *AuthMechanism*

			parameter to `ExternalAuthoritative`, the *PermissionGroups* parameter must also have the value `ExchangeServers`.

Banner	Optional	System.String	The *Banner* parameter specifies an override to the default SMTP 220 banner. When the value of the *Banner* parameter is blank, the default SMTP banner is the following:
			`220 <Servername>`
			When you specify a value for the *Banner* parameter, you must use the following syntax:
			`"220 <RemainingBa`
			220 is the default service ready SMTP response code as defined in RFC 2821.

BareLinefeedRejectionEnabled	Optional	System.Boolean	The *BareLinefeedRejectionEnabled* parameter specifies whether this Receive connector

			rejects messages that contain bare line feed (LF) characters in the SMTP DATA stream. Line feed characters that aren't immediately preceded by carriage return (CR) characters are known as bare line feeds. Bare line feeds aren't allowed in SMTP communications. Although it may be possible for a message containing a bare line feed to be delivered successfully, such messages don't adhere to the SMTP protocol standards and may cause problems with messaging servers. If you set this parameter to `$true`, the Receive connector rejects any messages that contain bare line feeds. The default value is `$false`.
BinaryMimeEnabled	Optional	System.Boolean	The *BinaryMimeEnabled* parameter specifies

			whether the BINARYMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *BinaryMimeEnabled* parameter is set to `$true`, the BINARYMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *BinaryMimeEnabled* parameter is set to `$false`, the BINARYMIME EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The BINARYMIME extension enables remote computers to send binary message data to this Receive

			connector. The BINARYMIME extension requires the data-chunking service extension, CHUNKING, to be enabled. Therefore, if you set the *BinaryMimeEnabled* parameter to `$true`, you should also set the *ChunkingEnabled* parameter to `$true`.
Bindings	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *Bindings* parameter specifies the local IP address and TCP port numbers used by the Receive connector to listen for inbound messages. Valid syntax for this parameter is *<IP Address>*:*<TCP Port>*, such as `192.168.1.1:25`. The IP address `0.0.0.0` indicates that the Receive connector uses all IP addresses configured on all network adapters to listen for inbound messages.

			Note: You must specify a local IP address that's valid for the Mailbox server or Edge server on which the Receive connector is located. If you specify an invalid local IP address, the Microsoft Exchange Transport service may fail to start when the service is restarted. To specify all IP addresses configured on all network adapters, you can use the IP address `0.0.0.0`. The values that you specify by using the *Bindings* parameter must satisfy one of the following requirements for uniqueness: • You can specify a unique combination of IP address and TCP port that doesn't conflict with the IP address or TCP port used in the *Bindings* parameter of another Receive connector on the server. • You can use an existing combination of IP address and TCP port, but use the

			RemoteIPRanges parameter to restrict the remote servers serviced by the Receive connector.
ChunkingEnabled	Optional	System.Boolean	The *ChunkingEnabled* parameter specifies whether the CHUNKING EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *ChunkingEnabled* parameter is set to `$true`, the CHUNKING EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *ChunkingEnabled* parameter is set to `$false`, the CHUNKING EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The CHUNKING

			extension enables large message bodies to be relayed by the remote server to the Receive connector in multiple, smaller chunks.
Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: `"This is an admin note"`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectionInactivityTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectionInactivityTimeout* parameter specifies the maximum amount of idle time before a connection to

			a Receive connector is closed. The default value for a Receive connector configured in the Transport service of a Mailbox server is 5 minutes. The default value for a Receive connector configured on an Edge server is 1 minute. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a connection inactivity time-out of 5 minutes, enter `00:05:00`. The value specified by the *ConnectionTimeout* parameter must be greater than the value specified by the *ConnectionInactivityTimeout* parameter. The valid input range for either parameter is from `00:00:01` through `1.00:00:00`.

ConnectionTimeout	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectionTimeout* parameter specifies the maximum time that a connection can remain open, even if the connection is actively transmitting data. The default value for a Receive connector configured on a Mailbox server is 10 minutes The default value for a Receive connector configured on an Edge server is 5 minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify a connection time-out of 5 minutes, enter `00:05:00`. The value specified by the *ConnectionTimeout* parameter must be greater than the value specified by the

			ConnectionInactivityTimeout parameter. The valid input range for either parameter is from `00:00:01` through `1.00:00:00`.
DefaultDomain	Optional	Microsoft.Exchange.Configuration.Tasks.AcceptedDomainIdParameter	The *DefaultDomain* parameter specifies the domain name to append to values submitted to `MAIL FROM` or `RCPT TO` in the message envelope by a sending server if no domain name is provided.
DeliveryStatusNotificationEnabled	Optional	System.Boolean	The *DeliveryStatusNotificationEnabled* parameter specifies whether the delivery status notification (DSN) EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *DeliveryStatusNotificati*

			onEnabled parameter is set to `$true`, the DSN EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *DeliveryStatusNotificationEnabled* parameter is set to `$false`, the DSN EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The DSN extension to extended SMTP (ESMTP) provides enhanced DSN functionality specified in RFC 1891.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An

			Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainSecureEnabled	Optional	System.Boolean	The *DomainSecureEnabled* parameter specifies the first part of the process to enable mutual Transport Layer Security (TLS) authentication for the domains serviced by this Receive connector. Mutual TLS authentication functions correctly only if the following conditions are true: • The value of the *DomainSecureEnabled* parameter is `$true`. • The value of the *AuthMechanism* parameter contains `Tls` and doesn't contain `ExternalAuthoritative`. • The *TLSReceiveDomainSe*

			cureList attribute of your transport configuration contains at least one domain serviced by this Receive connector. The wildcard character (*) isn't supported in domains configured for mutual TLS authentication. The same domain must also be defined on the corresponding Send connector, and in the value of the *TLSSendDomainSecureList* attribute of your Transport configuration. The default value for the *DomainSecureEnabled* parameter is `$false` for the following types of Receive connectors: • All Receive connectors defined on a Mailbox server. • User-created Receive connectors defined on an Edge server.

			The default value for *DomainSecureEnabled* is `$true` for default Receive connectors defined on an Edge server.
EightBitMimeEnabled	Optional	System.Boolean	The *EightBitMimeEnabled* parameter specifies whether the 8BITMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *EightBitMimeEnabled* parameter is set to `$true`, the 8BITMIME EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *EightBitMimeEnabled* parameter is set to `$false`, the 8BITMIME EHLO keyword isn't advertised in the EHLO

			response to the remote server and is disabled.
EnableAuthGSSAPI	Optional	System.Boolean	The *EnableAuthGSSAPI* parameter specifies how to control the advertisement of the Generic Security Services application programming interface (GSSAPI) authentication method when Integrated Windows authentication is enabled on this connector. If the *AuthMechanism* parameter contains `Integrated`, and the *EnableAuthGSSAPI* parameter is set to `$true`, the AUTH GSSAPI NTLM keyword is advertised in the EHLO response of the Receive connector. Clients may use Kerberos or NTLM to authenticate with the Receive connector. If the *AuthMechanism* parameter contains `Integrated`, and the

			EnableAuthGSSAPI parameter is set to `$false`, the AUTH NTLM keyword is advertised in the EHLO response of the Receive connector. Clients may only use NTLM to authenticate with the Receive connector. If you have Internet Information Services (IIS) messaging servers that authenticate with this Receive connector, you should set the value of the *EnableAuthGSSAPI* parameter to `$false`. Authentication with computers running Microsoft Exchange Server 2003 isn't affected by the value of the *EnableAuthGSSAPI* parameter. Exchange 2003 servers use the authentication methods advertised in the X-EXPS keyword. The X-EXPS keyword is advertised in the EHLO response of the Receive

			connector when the *AuthMechanism* parameter contains `ExchangeServer`. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. By default, the *EnableAuthGSSAPI* parameter is set to `$true` only on the default Receive connector Client <*Server Name*> that's created only in the Transport service on a Mailbox server.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the connector. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. Use the *Enabled* parameter to enable or disable the connector.
EnhancedStatusCodesEnabled	Optional	System.Boolean	The *EnhancedStatusCodesEnabled* parameter specifies whether the

			ENHANCEDSTATUSCODES EHLO keyword is advertised in the EHLO response to the remote server and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *EnhancedStatusCodesEnabled* parameter is set to `$true`, the ENHANCEDSTATUSCODES EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *EnhancedStatusCodesEnabled* parameter is set to `$false`, the ENHANCEDSTATUSCODES EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The ENHANCEDSTATUSCODES extension provides enhanced error and status information in DSNs sent to remote

			servers.
ExtendedProtectionPolicy	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ExtendedProtectionPolicySetting	The *ExtendedProtectionPolicy* parameter specifies how you want to use Extended Protection for Authentication on this Receive connector. By default, this parameter is set to `None`. The following are the valid values of this parameter: • `None` Extended Protection for Authentication won't be used. • `Allow` Extended Protection for Authentication will be used only if the connecting host supports it. Otherwise, the connections will be established without Extended Protection for Authentication. • `Require` Extended Protection for Authentication will be required for all incoming connections to this Receive connector. If the connecting host doesn't support Extended Protection for Authentication,

			the connection will be rejected. Extended Protection for Authentication enhances the protection and handling of credentials when authenticating network connections using Integrated Windows authentication. Integrated Windows authentication is also known as NTLM. We strongly recommend that you use Extended Protection for Authentication if you are using Integrated Windows authentication.
Fqdn	Optional	Microsoft.Exchange.Data.Fqdn	The *Fqdn* parameter specifies the FQDN used as the destination server for connected messaging servers that use the Receive connector to send incoming messages. The value of this parameter is displayed to connected

			messaging servers whenever a destination server name is required, as in the following examples: • In the default SMTP banner of the Receive connector • In the EHLO/HELO response of the Receive connector • In the most recent `Received` header field in the incoming message when the message enters the Transport service on a Mailbox server or an Edge server • During TLS authentication The default value of the *Fqdn* parameter is the FQDN of the Mailbox server or Edge server that contains the Receive connector. **Note:** Don't modify the FQDN value on the default Receive connector Default *<Server Name>* that's automatically created on Mailbox servers. If

			you have multiple Mailbox servers in your Exchange organization and you change the FQDN value on the Default <*Server Name*> Receive connector, internal mail flow between Mailbox servers fails.
LiveCredentialEnabled	Optional	System.Boolean	The *LiveCredentialEnabled* parameter is reserved for internal Microsoft use.
LongAddressesEnabled	Optional	System.Boolean	The *LongAddressesEnabled* parameter enables the Receive connector to accept long X.400 email addresses. The X.400 email addresses are encapsulated in SMTP email addresses by using the Internet Mail Connector Encapsulated Address (IMCEA) encapsulation method. When the value of this parameter is `$false`, the maximum length for a complete SMTP email address is 571 characters.

			When the value of this parameter is `$true`, the following changes are made: • The XLONGADDR keyword is advertised in the EHLO response of the Receive connector. • The accepted line length of an SMTP session is increased to 8,000 characters. • Valid long addresses are accepted by the `MAIL FROM` and `RCPT TO` SMTP commands. Therefore, X.400 email addresses can be up to 1,860 characters long after IMCEA encapsulation. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. You can only modify this parameter on Receive connectors configured in the Transport service on a Mailbox server.
MaxAcknowledgement	Optional	Microsoft.Exchange.Dat	This parameter isn't

Delay		a.EnhancedTimeSpan	used by Microsoft Exchange Server 2013. It's only used by Microsoft Exchange 2010 servers in a coexistence environment. The *MaxAcknowledgementDelay* parameter specifies the period the transport server delays acknowledgement when receiving messages from a host that doesn't support shadow redundancy. When receiving messages from a host that doesn't support shadow redundancy, a Microsoft Exchange Server 2010 transport server delays issuing an acknowledgement until it verifies that the message has been successfully delivered to all recipients. However, if it takes too long to verify successful delivery, the transport server times

			out and issues an acknowledgement anyway. The default value is 30 seconds. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds.
MaxHeaderSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MaxHeaderSize* parameter specifies in bytes the maximum size of the SMTP message header that the Receive connector accepts before it closes the connection. The default value is 65536 bytes. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes. The valid input range for this parameter is

			from 1 through 2147483647 bytes.
MaxHopCount	Optional	System.Int32	The *MaxHopCount* parameter specifies the maximum number of hops that a message can take before the message is rejected by the Receive connector. The maximum number of hops is determined by the number of `Received` headers in a submitted message. The default value is 60. The valid input range for this parameter is from 1 through 500.
MaxInboundConnection	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInboundConnection* parameter specifies the maximum number of inbound connections that this Receive connector serves at the same time. The default value is 5000. The valid input range for this parameter is from 1 through 2147483647. To disable the inbound connection limit on a

			Receive connector, enter a value of `unlimited`.
MaxInboundConnectionPercentagePerSource	Optional	System.Int32	The *MaxInboundConnectionPercentagePerSource* parameter specifies the maximum number of connections that a Receive connector serves at the same time from a single IP address. The value is expressed as the percentage of available remaining connections on a Receive connector. Enter the value as an integer without the percent (%) character. The default value is 2 percent. The valid input range for this parameter is from 1 through 100.
MaxInboundConnectionPerSource	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxInboundConnectionPerSource* parameter specifies the maximum number of inbound connections that this Receive connector

			serves at the same time from a single IP address. The default value is 100. The valid input range for this parameter is from 1 through 10000. To disable the inbound connection per source limit on a Receive connector, enter a value of `unlimited`.
MaxLocalHopCount	Optional	System.Int32	The *MaxLocalHopCount* parameter specifies the maximum number of local hops that a message can take before the message is rejected by the Receive connector. The maximum number of local hops is determined by the number of `Received` headers that have local server addresses in a submitted message. The default value is 8. The valid input range for this parameter is from 0 through 50.

			When you specify a value of 0, the message is never rejected based on the number of local hops.
MaxLogonFailures	Optional	System.Int32	The *MaxLogonFailures* parameter specifies the number of logon failures that the Receive connector retries before closing the connection. The default value is 3. The valid input range for this parameter is from 0 through 10.
MaxMessageSize	Optional	Microsoft.Exchange.Data.ByteQuantifiedSize	The *MaxMessageSize* parameter specifies the maximum size of a message. The default value is 10 MB. When you enter a value, qualify the value with one of the following units: • B (bytes) • KB (kilobytes) • MB (megabytes) • GB (gigabytes) • TB (terabytes) Unqualified values are treated as bytes.

			The valid input range for this parameter is from 65536 through 2147483647 bytes.
MaxProtocolErrors	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxProtocolErrors* parameter specifies the maximum number of SMTP protocol errors that the Receive connector accepts before closing the connection. The default value is 5. The valid input range for this parameter is from 0 through 2147483647. When you specify a value of `unlimited`, a connection is never closed because of protocol errors.
MaxRecipientsPerMessage	Optional	System.Int32	The *MaxRecipientsPerMessage* parameter specifies the maximum number of recipients per message that the Receive connector accepts before closing the connection. The default value is 200. The valid input range

			for this parameter is from 1 through 512000.
MessageRateLimit	Optional	Microsoft.Exchange.Data.Unlimited	The *MessageRateLimit* parameter specifies the maximum number of messages that can be sent by a single client IP address per minute. The default value for a Receive connector configured in the Transport service on a Mailbox server is `unlimited`. The default value for a Receive connector configured on an Edge server is 600 messages per minute. The valid input range for this parameter is 1 to 2147483647. To remove the message rate limit on a Receive connector, enter a value of `unlimited`.
MessageRateSource	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.MessageRateSourceFlags	The *MessageRateSource* parameter specifies how the message submission rate is

			calculated. It can have one of the following values: • `None` No message submission rate is calculated. • `IPAddress` The message submission rate is calculated for sending hosts. • `User` The message submission rate is calculated for sending users (specified with the `MAIL FROM` SMTP command). • `All` The message submission rate is calculated for both the sending users and sending hosts.
Name	Optional	System.String	The *Name* parameter specifies the administrator-supplied name of the connector. Enter the *Name* parameter as a string, for example: `New Receive Connector`.
OrarEnabled	Optional	System.Boolean	The *OrarEnabled* parameter specifies whether to enable the Originator Requested Alternate Recipient (ORAR). When the value of this parameter

			is `$false`, ORAR isn't supported. When the value of this parameter is `$true`, ORAR is supported by advertising the XORAR keyword in the EHLO response of the Receive connector. The actual ORAR information is transmitted in the RCPT TO SMTP command. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. If the email address specified in the ORAR information is a long X.400 email address, the *LongAddressesEnabled* parameter must be `$true`.
PermissionGroups	Optional	Microsoft.Exchange.Data.PermissionGroups	The *PermissionGroups* parameter specifies the groups or roles that can submit messages to the Receive connector and the permissions assigned to those groups. A

			permission group is a predefined set of permissions granted to well-known security principals. The valid values for this parameter are as follows: `None`, `AnonymousUsers`, `Custom`, `ExchangeUsers`, `ExchangeServers`, `ExchangeLegacyServers`, and `Partners`. The default permission groups assigned to a Receive connector depend on the connector usage type specified by the *Usage* parameter when the Receive connector was created. For more information about Receive connector usage types, see Receive connectors.
PipeliningEnabled	Optional	System.Boolean	The *PipeliningEnabled* parameter specifies whether the PIPELINING EHLO keyword is advertised in the EHLO response to the remote server

			and is available for use. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. When the *PipeliningEnabled* parameter is set to `$true`, the PIPELINING EHLO keyword is advertised in the EHLO response to the remote server and is available for use. When the *PipeliningEnabled* parameter is set to `$false`, the PIPELINING EHLO keyword isn't advertised in the EHLO response to the remote server and is disabled. The PIPELINING extension enables the remote server to send requests without awaiting a response from this Receive connector.
ProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *ProtocolLoggingLevel* parameter specifies whether to enable protocol logging for

			the specified Receive connector. A value of `verbose` enables protocol logging for the connector. A value of `None` disables protocol logging for the connector. The default value is `None`. The location of the Receive connector protocol logs for all Receive connectors configured in the Transport service on a Mailbox server or an Edge server is specified by using the **Set-TransportService** cmdlet with the *ReceiveProtocolLogPath* parameter.
ProxyEnabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RemoteIPRanges	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *RemoteIPRanges* parameter specifies the remote IP addresses from which this connector accepts messages. Valid syntax for this parameter is

			<*Starting IP Address*>-<*Ending IP Address*>, such as `192.168.1.1-192.168.1.10`. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...`. To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`. Multiple Receive connectors on the same server can have overlapping remote IP address ranges as long as one IP address range is completely overlapped by another IP address range. When

			remote IP address ranges overlap, the remote IP address range with the most specific match to the IP address of the connecting server is used.
RequireEHLODomain	Optional	System.Boolean	The *RequireEHLODomain* parameter specifies whether the remote computer must provide a domain name in the EHLO handshake after the SMTP connection is established. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. When the *RequireEHLODomain* parameter is set to `$true`, the remote computer must provide a domain name in the EHLO handshake after the SMTP connection is established. If the remote computer doesn't provide the

			domain name, the SMTP connection is closed.
RequireTLS	Optional	System.Boolean	The *RequireTLS* parameter specifies whether all messages received by this connector require TLS transmission. Valid values for this parameter are `$true` or `$false`. The default value is `$false`. When the *RequireTLS* parameter is set to `$true`, all messages received by this connector require TLS transmission.
ServiceDiscoveryFqdn	Optional	Microsoft.Exchange.Data.Fqdn	The service discovery fully-qualified domain name (FQDN).
SizeEnabled	Optional	Microsoft.Exchange.Data.SizeMode	The *SizeEnabled* parameter specifies whether the SIZE SMTP extension is enabled. Valid values for this parameter are `Enabled`, `Disabled`, or `EnabledwithoutValue`. The default value is

			`Enabled`. When the *SizeEnabled* parameter is set to `Enabled`, the SIZE SMTP extension is enabled, and the maximum allowable message size value from the *MaxMessageSize* parameter is advertised in the EHLO banner. When the *SizeEnabled* parameter is set to `Disabled`, the SIZE SMTP extension isn't used, and the maximum allowable message size value is never disclosed to the remote server. When the *SizeEnabled* parameter is set to `EnabledWithoutValue`, the SIZE SMTP extension is enabled, but the maximum allowable message size value from the *MaxMessageSize* parameter isn't advertised in the EHLO banner. This allows the message to bypass

			message size checks for authenticated connections between Mailbox servers. The SIZE SMTP extension is defined in RFC 1870. SIZE enables the source server to declare the size of the inbound message to the target server. It also allows the target server to declare the maximum message size that it's allowed to accept to the sending server. If the advertised size of the inbound message exceeds the value in the *MaxMessageSize* parameter, the Receive connector responds to the remote server by using an error code and closes the connection.
SmtpUtf8Enabled	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
SuppressXAnonymousTls	Optional	System.Boolean	The *SuppressXAnonymousTls* parameter specifies

			whether this Receive connector supports the standard TLS encryption for incoming connections. By default, all communications between Exchange 2010 Mailbox servers is protected with TLS. However, if you need to disable TLS on a specific connection in your organization, you can create a specific Receive connector and set the *SuppressXAnonymousTls* parameter to `$true`. The default value is `$false`. Before you can set this parameter to `$true`, you must use the **Set-TransportService** command to set the *UseDownGradedExchangeServerAuth* parameter to `$true` on the server that this Receive connector is configured on.

TarpitInterval	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *TarpitInterval* parameter specifies the period of time to delay an SMTP response to a remote server that may be abusing the connection. Authenticated connections are never delayed in this manner. The default value is 5 seconds. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. The valid input range for this parameter is from `00:00:00` through `00:10:00`. When you set the value to `00:00:00`, you disable the tarpit interval.
TlsCertificateName	Optional	Microsoft.Exchange.Data.SmtpX509Identifier	The *TlsCertificateName* parameter specifies the X.509 certificate to use with TLS sessions and secure mail. Valid input for this parameter is `[I]`*Issuer*`[S]`*Subject*.

			The *Issuer* value is found in the certificate's `Issuer` field, and the *Subject* value is found in the certificate's `Subject` field. You can find these values by running the **Get-ExchangeCertificate** cmdlet.
TlsDomainCapabilities	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *TlsDomainCapabilities* parameter specifies the different capabilities this Receive connector will make available to specific hosts outside your organization. TLS with certificate validation is used to authenticate remote hosts before these capabilities are offered. To specify capabilities for a domain, use the following syntax: <domain name 1>:<capability 1, capability 2,...,capability N> If you're specifying

			capabilities for multiple domains, list the configuration for each domain in quotation marks, separated by commas. For example: "contoso.com:AcceptOorgProtocol","fabrikam.com:AcceptOorgProtocol,AcceptOorgHeader" You can configure the capabilities for non-TLS encrypted incoming connections using the special "NO-TLS" domain. You can configure the following capabilities for a domain: • `AcceptOorgProtocol` • `AcceptOorgHeader`
TransportRole	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ServerRole	The *TransportRole* parameter designates the server role associated with this connector. Types include `FrontendTransport` and `HubTransport`. Typically used to specify the server role when you host multiple server roles on a single

			computer.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-RemoteDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Get-RemoteDomain** cmdlet to view the configuration information for the remote domains

configured in your organization. You can view the remote domain configuration from inside the Exchange organization or from an Edge Transport server in the perimeter network.

```
Get-RemoteDomain [-Identity <RemoteDomainIdParameter>] [-DomainController
<Fqdn>] [-Organization <OrganizationIdParameter>]
```

Examples

EXAMPLE 1

This example returns all remote domains configured in the Active Directory forest in which you run the command.

```
Get-RemoteDomain
```

EXAMPLE 2

This example returns the configuration for the remote domain Contoso.

```
Get-RemoteDomain Contoso
```

EXAMPLE 3

This example queries Active Directory for all remote domains and displays only those remote domains for which Transport Neutral Encapsulation Format (TNEF) encoding isn't used.

```
Get-RemoteDomain | Where {$_.TNEFEnabled -eq $false}
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController*

			parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.RemoteDomainIdParameter	The *Identity* parameter specifies the remote domain you want to view. Enter either the GUID or name of the remote domain.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.OrganizationIdParameter	The *Organization* parameter is reserved for internal Microsoft use.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-RemoteDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **New-RemoteDomain** cmdlet to create a managed connection for a remote domain. When you create a remote domain, you can control mail flow with more precision, apply message formatting and messaging policies, and specify acceptable character sets for messages sent to and received from the remote domain.

```
New-RemoteDomain -DomainName <SmtpDomainWithSubdomains> -Name <String> [-
Confirm [<SwitchParameter>]] [-DomainController <Fqdn>] [-Organization
<OrganizationIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the remote domain Contoso.

```
New-RemoteDomain -DomainName Contoso.com -Name Contoso
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description

DomainName	Required	Microsoft.Exchange.Data.SmtpDomainWithSubdomains	The *DomainName* parameter specifies the SMTP domain that you want to establish as a remote domain. Valid input for the *DomainName* parameter is an SMTP domain. You can use a wildcard character to specify all subdomains of a specified domain, as shown in the following example: `*.contoso.com`. However, you can't embed a wildcard character, as shown in the following example: `domain.*.contoso.com`. The domain name string may contain a maximum of 256 characters.
Name	Required	System.String	The *Name* parameter specifies a unique name for the remote domain object.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to

			acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Organization	Optional	Microsoft.Exchange.Configuration.Tasks.Orga	The *Organization* parameter is reserved

		nizationIdParameter	for internal Microsoft use.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-RemoteDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Remove-RemoteDomain** cmdlet to remove a remote domain. When you remove a remote domain, the remote domain object is deleted. Removing a remote domain doesn't disable mail flow to that domain.

```
Remove-RemoteDomain -Identity <RemoteDomainIdParameter> [-Confirm
[<SwitchParameter>]] [-DomainController <Fqdn>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example removes the remote domain object named Contoso.

```
Remove-RemoteDomain Contoso
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RemoteDomainIdParameter	The *Identity* parameter specifies the remote domain you want to remove. Enter either the GUID or name of the remote domain.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt,

			use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the

			WhatIf switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-RemoteDomain

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013, Exchange Online*

Topic Last Modified: *2014-04-11*

This cmdlet is available in on-premises Exchange Server 2013 and in the cloud-based service. Some parameters and settings may be exclusive to one environment or the other.

Use the **Set-RemoteDomain** cmdlet to configure a managed connection for a remote domain.

```
Set-RemoteDomain -Identity <RemoteDomainIdParameter> [-AllowedOOFType
<External | InternalLegacy | ExternalLegacy | None>] [-AutoForwardEnabled
<$true | $false>] [-AutoReplyEnabled <$true | $false>] [-
ByteEncoderTypeFor7BitCharsets <Use7Bit | UseQP | UseBase64 |
UseQPHtmlDetectTextPlain | UseBase64HtmlDetectTextPlain |
UseQPHtml7BitTextPlain | UseBase64Html7BitTextPlain | Undefined>] [-
CharacterSet <String>] [-Confirm [<SwitchParameter>]] [-ContentType
<MimeHtmlText | MimeText | MimeHtml>] [-DeliveryReportEnabled <$true |
$false>] [-DisplaySenderName <$true | $false>] [-DomainController <Fqdn>]
[-IsInternal <$true | $false>] [-LineWrapSize <Unlimited>] [-
MeetingForwardNotificationEnabled <$true | $false>] [-
MessageCountThreshold <Int32>] [-Name <String>] [-NDRDiagnosticInfoEnabled
<$true | $false>] [-NDREnabled <$true | $false>] [-NonMimeCharacterSet
<String>] [-PreferredInternetCodePageForShiftJis <Undefined | Iso2022Jp |
```

```
Esc2022Jp | Sio2022Jp>] [-RequiredCharsetCoverage <Int32>] [-
TargetDeliveryDomain <$true | $false>] [-TNEFEnabled <$true | $false>] [-
TrustedMailInboundEnabled <$true | $false>] [-TrustedMailOutboundEnabled
<$true | $false>] [-UseSimpleDisplayName <$true | $false>] [-WhatIf
[<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example performs the following actions:

- It disables out-of-office notifications to the remote domain.
- It suppresses read receipts sent from clients in your organization to the remote domain.
- It enables TNEF message data on messages sent to the remote domain.

```
Set-RemoteDomain Contoso -AllowedOOFType None -
DeliveryReportEnabled $false -TNEFEnabled $true
```

EXAMPLE 2

This example queries Active Directory for all remote domains for which auto replies are disabled. Using the pipelining feature, it also disables auto forwards and NDRs to those domains.

```
Get-RemoteDomain | Where {$_.AutoReplyEnabled -eq $false} |
Set-RemoteDomain -AutoForwardEnabled $false -NDREnabled
$false
```

Detailed Description

When you set a remote domain, you can control mail flow with more precision, specify message formatting and policy, and specify acceptable character sets for messages sent to or received from the remote domain.

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Remote domains" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Configuration.Tasks.RemoteDomainIdParamete	The *Identity* parameter specifies the display name of the remote domain.

		r	The length of the name can't exceed 64 characters.
AllowedOOFType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.AllowedOOFType	The *AllowedOOFType* parameter specifies the type of out-of-office notification returned to users at the remote domain. Valid values are `External`, `ExternalLegacy`, `None`, and `InternalLegacy`. The default value is `External`.
AutoForwardEnabled	Optional	System.Boolean	The *AutoForwardEnabled* parameter specifies whether to allow messages that are auto-forwarded by client e-mail programs in your organization. Setting this parameter to `$true` enables auto-forwarded messages to be delivered to the remote domain. The default value is `$false`.
AutoReplyEnabled	Optional	System.Boolean	The *AutoReplyEnabled* parameter specifies whether to allow messages that are automatic replies from client e-mail programs in

			your organization. Setting this parameter to `$true` enables automatic replies to be delivered to the remote domain. The default value is `$false`.
ByteEncoderTypeFor7BitCharsets	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ByteEncoderTypeFor7BitCharsetsEnum	The *ByteEncoderTypeFor7BitCharsets* parameter specifies the 7-bit transfer encoding method for MIME format for messages sent to this remote domain. The valid values for this parameter are: • `Use7Bit` Always use default 7-bit transfer encoding for HTML and plain text. • `UseQP` Always use QP (quoted-printable) encoding for HTML and for plain text. • `UseBase64` Always use Base64 encoding for HTML and for plain text. • `UseQPHtmlDetectTextPlain` Use QP encoding for HTML and for plain text unless line wrapping is enabled in plain text. If line wrapping is enabled, use 7-bit encoding for plain text. • `UseBase64HtmlDetectTextPlain` Use Base64

			encoding for HTML and for plain text, unless line wrapping is enabled in plain text. If line wrapping is enabled in plain text, use Base64 encoding for HTML, and use 7-bit encoding for plain text. • `UseQPHtml7BitTextPlain` Always use QP encoding for HTML. Always use 7-bit encoding for plain text. • `UseBase64Html7BitTextPlain` Always use Base64 encoding for HTML. Always use 7-bit encoding for plain text. • `Undefined` Always use QP encoding for HTML and plain text. The default value is `Undefined`.
CharacterSet	Optional	System.String	The *CharacterSet* parameter specifies a character set for this remote domain. The character set that you specify is only used for MIME messages that don't have their own character set specified. Setting this parameter doesn't overwrite character sets already specified in the outbound mail. To remove the character set value, set

			the value to `$null`.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ContentType	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.ContentType	The *ContentType* parameter specifies the outbound message content type and formatting. Valid values for this parameter are `MimeHtmlText`, `MimeText`, or `MimeHtml`: • `MimeHtmlText` converts messages to MIME messages that use HTML formatting, unless the original message is a text message. If the original message is a text message, the outbound message is a MIME message that uses text formatting. • `MimeText` converts all messages to MIME messages that use text formatting. • `MimeHtml` converts all messages to MIME

			messages that use HTML formatting. The default value is `MimeHtmlText`.
DeliveryReportEnabled	Optional	System.Boolean	The *DeliveryReportEnabled* parameter specifies whether to allow delivery reports from client software in your organization to the remote domain. The default value is `$true`.
DisplaySenderName	Optional	System.Boolean	The *DisplaySenderName* parameter specifies whether to display the sender name. Valid values for this parameter are `$true` or `$false`. The default value is `$true`. This parameter is used for older versions of Exchange and should only be set under the direction of Microsoft Customer Service and Support.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	This parameter is available only in on-premises Exchange 2013. The *DomainController* parameter specifies the fully qualified domain

			name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
IsInternal	Optional	System.Boolean	The *IsInternal* parameter specifies whether the recipients in this remote domain should be considered internal recipients. Set this parameter to `$true` if this remote domain is part of your cross-premises deployment. When you set this parameter to `$true`, all transport components, like transport rules or any agents you may have deployed, treat this remote domain as an

			internal domain. The default value is `$false`.
LineWrapSize	Optional	Microsoft.Exchange.Data.Unlimited	The *LineWrapSize* parameter specifies the line-wrap size for outbound messages. The parameter takes an integer from 0 through 132, or you can overload the parameter by setting the value to `unlimited`. The default value is `unlimited`.
MeetingForwardNotificationEnabled	Optional	System.Boolean	The *MeetingForwardNotificationEnabled* parameter specifies whether to enable meeting forward notifications. When this parameter is enabled, meeting requests forwarded to recipients in the remote domain generate a meeting forward notification to the meeting organizer. When this parameter is disabled, meeting requests forwarded to recipients in the remote domain won't generate a meeting

			forward notification to the meeting organizer. Valid values for this parameter are `$true` or `$false`. The default value is `$true`.
MessageCountThreshold	Optional	System.Int32	This parameter is available only in on-premises Exchange 2013. The *MessageCountThreshold* parameter specifies the acceptable message count for the remote domain. If the message count exceeds this value, an event is generated that's visible using the **Get-ServerHealth** and **Get-HealthReport** cmdlets. Valid input for this parameter is an integer. The default value is **Int32** (2147483647). The default value indicates there is no message count threshold defined, and that the message count to the remote domain is unmonitored.
Name	Optional	System.String	The *Name* parameter

			specifies a unique name for the remote domain object.
NDRDiagnosticInfoEnabled	Optional	System.Boolean	The *NDRDiagnosticInfoEnabled* parameter specifies whether the diagnostic information is included in NDRs sent to the remote domain. The diagnostic information of an NDR includes details that help administrators troubleshoot delivery problems. This detailed information includes internal server names. You may not want to expose this information to NDRs sent to external users. If you set this parameter to `$false`, the diagnostic information section in the NDR body as well as internal server headers from the attached original message headers are removed from the NDR. The default value is `$true`.

NDREnabled	Optional	System.Boolean	The *NDREnabled* parameter specifies whether to allow non-delivery reports (NDRs) from your organization. Setting this parameter to `$false` suppresses NDRs to the remote domain. The default value is `$true`.
NonMimeCharacterSet	Optional	System.String	The *NonMimeCharacterSet* parameter specifies a character set for this remote domain. The character set that you specify is only used for non-MIME (RFC 822 text) messages that don't have their own character set specified. Setting this parameter doesn't overwrite character sets already specified in the outbound mail. To remove the character set value, set the value to `$null`.
PreferredInternetCodePageForShiftJis	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.PreferredInternetCodePageForShiftJisEnum	The *PreferredInternetCodePageForShiftJis* parameter specifies the specific code page to use for Shift JIS character encoding when

			sending messages to this remote domain. The valid values for this parameter are: • 50220: Use ISO-2022-JP codepage. • 50221: Use ESC-2022-JP codepage. • 50222: Use SIO-2022-JP codepage.
RequiredCharsetCoverage	Optional	System.Int32	The *RequiredCharsetCoverage* parameter specifies a percentage threshold for characters in a message that must match to apply your organization's preferred character set before switching to automatic character set detection. For example, if you set this parameter to 60, the preferred character sets will still be used during content conversion for messages that contain characters from non-preferred character sets as long as the percentage of those characters is 40 percent or less. If the percentage of characters in a message doesn't

			belong to preferred character sets, Exchange analyzes the UNICODE characters and automatically determines the best matching character set to use. If users in this remote domain use characters that span character sets, you may want to specify a lower percentage to ensure that your organization's preferred character set is used during content conversion.
TargetDeliveryDomain	Optional	System.Boolean	The *TargetDeliveryDomain* parameter specifies the e-mail domain that's used when generating target addresses for new mail users in a cross-premises deployment scenario. When you have a cross-premises deployment, the user mailboxes on the remote location are represented as mail user objects. For example, all mailboxes hosted on

			Exchange Online are represented as mail users in your on-premises organization. The value of this parameter is used to determine what domain should be used for the target e-mail address for these mail users.
TNEFEnabled	Optional	System.Boolean	The *TNEFEnabled* parameter specifies whether Transport Neutral Encapsulation Format (TNEF) message encoding is used on messages sent to the remote domain. Valid values for this parameter are `$true`, `$false`, or `$null`. The action associated with each value is as follows: `$true` TNEF encoding is used on all messages sent to the remote domain. `$false` TNEF encoding isn't used on any messages sent to the remote domain. `$null` TNEF encoding isn't specified for the remote domain. TNEF encoding for recipients in the remote domain may be specified by the

			following: • Value of the *UseMapiRichTextFormat* parameter for any mail user or mail contact objects • Sender's per-recipient settings in Microsoft Outlook • Sender's default Internet message settings in Outlook The default value is `$null`.
TrustedMailInboundEnabled	Optional	System.Boolean	The *TrustedMailInboundEnabled* parameter specifies whether Exchange will treat e-mail received from this remote domain as trusted messages. If you set this parameter to `$true`, all incoming messages from this remote domain are considered safe and they will bypass content and recipient filtering. We recommend that you set this parameter to `$true` for cross-premises deployment scenarios. The default value is

			`$false`.
TrustedMailOutboundEnabled	Optional	System.Boolean	The *TrustedMailOutboundEnabled* parameter specifies whether the remote domain is considered a trusted domain. We recommend that you set this parameter to `$true` for cross-premises deployment scenarios. The default value is `$false`.
UseSimpleDisplayName	Optional	System.Boolean	The *UseSimpleDisplayName* parameter specifies whether simple display names for senders appear in messages sent to this domain. Setting this parameter to `$true` enables simple display names for this remote domain. The default value is `$false`.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what

			changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Add-ResubmitRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Add-ResubmitRequest** cmdlet to add requests to replay redundant copies of messages from Safety Net after a mailbox database recovery.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Add-ResubmitRequest -Destination <Guid> -EndTime <DateTime> -StartTime
<DateTime> [-Confirm [<SwitchParameter>]] [-CorrelationId <Guid>] [-Server
<ServerIdParameter>] [-TestOnly <$true | $false>] [-
UnresponsivePrimaryServers <MultiValuedProperty>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example replays the redundant copies of messages delivered from 6:00 PM June 1, 2012 to

5:00 AM June 2 2012 to the recovered mailbox database 5364aeea-6e6b-4055-8258-229b2c6ac9a2.

```
Add-ResubmitRequest -Destination 5364aeea-6e6b-4055-8258-
229b2c6ac9a2 -StartTime "06/01/2012 6:00 PM" -EndTime
"06/02/2012 5:00 AM"
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Destination	Required	System.Guid	The *Destination* parameter specifies the GUID of the destination mailbox database. To find the GUID of the mailbox database, run the command: `Get-MailboxDatabase -Server <servername> | Format-List Name,GUID`.
EndTime	Required	System.DateTime	The *EndTime* parameter specifies the delivery time of the latest messages that need to be resubmitted from Safety Net. Use the short date format defined in the **Regional Options** settings for the computer on which the

			command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**. The date and time specified by the *EndTime* parameter must be later than the date and time specified by the *StartTime* parameter. The date and time specified by both parameters must be in the past.
StartTime	Required	System.DateTime	The *StartTime* parameter specifies the delivery time of the oldest messages that need to be resubmitted from Safety Net. Use the short date format defined in the **Regional**

			Options settings for the computer on which the command is run. For example, if the computer is configured to use the short date format mm/dd/yyyy, enter **03/01/2010** to specify March 1, 2010. You can enter the date only, or you can enter the date and time of day. If you enter the date and time of day, you must enclose the argument in quotation marks ("), for example, **"10/05/2010 5:00 PM"**. The date and time specified by the *StartTime* parameter must be earlier than the date and time specified by the *EndTime* parameter. The date and time specified by both parameters must be in the past.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before

			processing continues. You don't have to specify a value with the *Confirm* switch.
CorrelationId	Optional	System.Guid	This parameter is reserved for internal Microsoft use.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
TestOnly	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
UnresponsivePrimaryServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *UnresponsivePrimaryServers* parameter identifies the primary servers that should resubmit the messages from Safety Net as being unavailable so other servers can

			resubmit the messages. If the primary servers are unavailable, you can designate other servers that hold redundant copies of the messages in Safety Net to resubmit their copies of the messages. However, you must identify the unresponsive primary servers to the other servers using this parameter.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-ResubmitRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-ResubmitRequest** cmdlet to view requests to replay redundant copies of messages from Safety Net after a mailbox database recovery.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Get-ResubmitRequest [-Identity <ResubmitRequestIdentityParameter>] [-
Server <ServerIdParameter>]
```

Examples

Example 1

This example returns the details of all resubmit requests.

```
Get-ResubmitRequest
```

Example 2

This example returns details about the resubmit request with the identity 1.

```
Get-ResubmitRequest 1
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.ResubmitRequestIdentityParameter	The *Identity* parameter specifies the resubmit request you want to view. Each resubmit request is identified by an incremented integer value.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Remove-ResubmitRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Remove-ResubmitRequest** cmdlet to remove requests to replay redundant copies of messages from Safety Net after a mailbox database recovery.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Remove-ResubmitRequest -Identity <ResubmitRequestIdentityParameter> [-
Confirm [<SwitchParameter>]] [-Server <ServerIdParameter>] [-WhatIf
[<SwitchParameter>]]
```

Examples

Example 1

This example removes the resubmit request with the identity 5.

```
Remove-ResubmitRequest 5
```

Example 2

This example removes all resubmit requests.

```
Get-ResubmitRequest | Remove-ResubmitRequest
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Identity	Required	Microsoft.Exchange.Co	The *Identity* parameter

		nfiguration.Tasks.ResubmitRequestIdentityParameter	specifies the resubmit request you want to remove. Each resubmit request is identified by an incremented integer value.
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch can be used to suppress the confirmation prompt that appears by default when this cmdlet is run. To suppress the confirmation prompt, use the syntax -`Confirm:$False`. You must include a colon (`:`) in the syntax.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.

WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Set-ResubmitRequest

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-03-05*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Set-ResubmitRequest** cmdlet to enable or disable requests to replay redundant copies of messages from Safety Net after a mailbox database recovery.

For information about the parameter sets in the Syntax section below, see Syntax.

```
Set-ResubmitRequest -Identity <ResubmitRequestIdentityParameter> -Enabled
<$true | $false> [-Confirm [<SwitchParameter>]] [-Server
```

```
<ServerIdParameter>] [-WhatIf [<SwitchParameter>]]
```

Examples

Example 1

This example disables the resubmit request with the identity 8.

```
Set-ResubmitRequest 8 -Enabled $false
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Queues" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
Enabled	Required	System.Boolean	The *Enabled* parameter enables or disables an active resubmit request. Valid input for this parameter is `$true` or `$false`. Setting the value to `$false` disables the resubmit request.
Identity	Required	Microsoft.Exchange.Configuration.Tasks.ResubmitRequestIdentityParameter	The *Identity* parameter specifies the resubmit request you want to modify. Each resubmit request is identified by an incremented integer value.
Confirm	Optional	System.Management.	The *Confirm* switch

		Automation.SwitchParameter	causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
Server	Optional	Microsoft.Exchange.Configuration.Tasks.ServerIdParameter	The *Server* parameter specifies the Exchange server on which you want to run this command. You can use any value that uniquely identifies the server. For example: • Name • FQDN • Distinguished name (DN) • Exchange Legacy DN If you don't use the *Server* parameter, the command is run on the local server.
WhatIf	Optional	System.Management.Automation.SwitchParameter	The *WhatIf* switch instructs the command to simulate the actions that it would take on the object. By using the *WhatIf* switch, you can view what changes would occur without having to apply

			any of those changes. You don't have to specify a value with the *WhatIf* switch.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

Get-SendConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-04-11*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **Get-SendConnector** cmdlet to view the settings for a Send connector.

```
Get-SendConnector [-Identity <SendConnectorIdParameter>] [-
DomainController <Fqdn>]
```

Examples

EXAMPLE 1

This example displays detailed information about the Send connector named Contoso.com Send Connector.

```
Get-SendConnector "Contoso.com Send Connector" | Format-
List
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Send connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that retrieves data from Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
Identity	Optional	Microsoft.Exchange.Configuration.Tasks.SendConnectorIdParameter	The *Identity* parameter specifies the name, or GUID of the Send connector. If the *Identity* name contains spaces, enclose the

			name in quotation marks ("). You can omit the *Identity* parameter label. You can also include the server name by using the format *ServerName**ConnectorName*.

Input Types

To see the input types that this cmdlet accepts, see Cmdlet Input and Output Types. If the Input Type field for a cmdlet is blank, the cmdlet doesn't accept input data.

Return Types

To see the return types, which are also known as output types, that this cmdlet accepts, see Cmdlet Input and Output Types. If the Output Type field is blank, the cmdlet doesn't return data.

New-SendConnector

Exchange Management Shell > Exchange 2013 cmdlets > Mail flow cmdlets >

Applies to: *Exchange Server 2013*

Topic Last Modified: *2014-07-17*

This cmdlet is available only in on-premises Exchange Server 2013.

Use the **New-SendConnector** cmdlet to create a new Send connector.

```
New-SendConnector -AddressSpaces <MultiValuedProperty> -Name <String> [-
IsScopedConnector <$true | $false>] [-AuthenticationCredential
<PSCredential>] [-CloudServicesMailEnabled <$true | $false>] [-Comment
<String>] [-Confirm [<SwitchParameter>]] [-ConnectionInactivityTimeOut
<EnhancedTimeSpan>] [-Custom <SwitchParameter>] [-DNSRoutingEnabled <$true
| $false>] [-DomainController <Fqdn>] [-DomainSecureEnabled <$true |
$false>] [-Enabled <$true | $false>] [-ErrorPolicies <Default |
DowngradeDnsFailures | DowngradeCustomFailures | UpgradeCustomFailures>]
[-Force <SwitchParameter>] [-ForceHELO <$true | $false>] [-Fqdn <Fqdn>] [-
FrontendProxyEnabled <$true | $false>] [-IgnoreSTARTTLS <$true | $false>]
[-Internal <SwitchParameter>] [-Internet <SwitchParameter>] [-
MaxMessageSize <Unlimited>] [-Partner <SwitchParameter>] [-Port <Int32>]
[-ProtocolLoggingLevel <None | Verbose>] [-RequireOorg <$true | $false>]
[-RequireTLS <$true | $false>] [-SmartHostAuthMechanism <None | BasicAuth
| BasicAuthRequireTLS | ExchangeServer | ExternalAuthoritative>] [-
SmartHosts <MultiValuedProperty>] [-SmtpMaxMessagesPerConnection <Int32>]
```

```
[-SourceIPAddress <IPAddress>] [-SourceTransportServers
<MultiValuedProperty>] [-TlsAuthLevel <EncryptionOnly |
CertificateValidation | DomainValidation>] [-TlsCertificateName
<SmtpX509Identifier>] [-TlsDomain <SmtpDomainWithSubdomains>] [-Usage
<Custom | Internal | Internet | Partner>] [-UseExternalDNSServersEnabled
<$true | $false>] [-WhatIf [<SwitchParameter>]]
```

Examples

EXAMPLE 1

This example creates the Send connector named MySendConnector with the following properties:

- It sends email messages over the Internet.
- It processes messages addressed only to Contoso.com and Fabrikam.com domains.

```
New-SendConnector -Internet -Name MySendConnector -
AddressSpaces contoso.com,fabrikam.com
```

EXAMPLE 2

This example creates the Send connector Secure Email to Contoso.com with the following properties:

- It processes messages only for the Contoso.com domain.
- It uses Basic authentication.
- It uses a specific authentication credential.

To assign a specific authentication credential for the Send connector, you must first run the **Get-Credential** command and store the user input in a temporary variable. When you run the **Get-Credential** command, the command asks for the user name and password of the account used during authentication with the Contoso.com email server. The temporary variable can then be used in the **New-SendConnector** cmdlet to create the new connector.

```
$CredentialObject = Get-Credential
New-SendConnector -Name "Secure Email to Contoso.com" -
AddressSpaces contoso.com -AuthenticationCredential
$CredentialObject -SmartHostAuthMechanism BasicAuth
```

Detailed Description

You need to be assigned permissions before you can run this cmdlet. Although all parameters for this cmdlet are listed in this topic, you may not have access to some parameters if they're not included in the permissions assigned to you. To see what permissions you need, see the "Send connectors" entry in the Mail flow permissions topic.

Parameters

Parameter	Required	Type	Description
AddressSpaces	Required	Microsoft.Exchange.Data.MultiValuedProperty	The *AddressSpaces* parameter specifies the domain names to which the Send connector routes mail. The complete syntax for entering each address space is as follows: *<AddressSpaceType>:<AddressSpace>;<AddressSpaceCost>* • **AddressSpaceType:** On an Edge server, the address space type must be SMTP. In the Transport service on a Mailbox server, the address space type may be SMTP, X400, or any other text string. If you omit the address space type, SMTP is assumed. • **AddressSpace:** For SMTP address space types, the address space that you enter must be RFC 1035-compliant. For example, *, *.com, and *.contoso.com are permitted, but *contoso.com is not. For X.400 address space types, the address space that you enter must be

			RFC 1685-compliant, such as **o=MySite;p=MyOrg;a=adatum;c=us**. For all other values of address space type, you can enter any text for the address space. • **AddressSpaceCost:** The valid input range for the cost is from 1 through 100. A lower cost indicates a better route. This parameter is optional. If you omit the address space cost, a cost of 1 is assumed. If you enter a non-SMTP address space that contains the semicolon character (;), you must specify the address space cost. If you specify the address space type or the address space cost, you must enclose the address space in quotation marks ("). For example, the following address space entries are equivalent: • `"SMTP:contoso.com;1"` • `"contoso.com;1"` • `"SMTP:contoso.com"` • `contoso.com`

			You may specify multiple address spaces by separating the address spaces with commas, for example: `contoso.com,fabrikam.com`. If you specify the address space type or the address space cost, enclose the address space in quotation marks ("), for example: `"contoso.com;2","fabrikam.com;3"`. If you specify a non-SMTP address space type on a Send connector configured in the Transport service on a Mailbox server, you must configure the following parameters: • The *SmartHosts* parameter must be set to a value that specifies a smart host. • The *DNSRoutingEnabled* parameter must be set to `$false`. **Note:** Although you can configure non-SMTP address spaces on a Send connector in the Transport service on a

			Mailbox server, the Send connector uses SMTP as the transport mechanism to send messages to other messaging servers. Foreign connectors in the Transport service on a Mailbox server are used to send messages to local messaging servers, such as third-party fax gateway servers, which don't use SMTP as their primary transport mechanism. For more information, see Foreign connectors.
Name	Required	System.String	The *Name* parameter specifies a descriptive name for the connector.
AuthenticationCredential	Optional	System.Management.Automation.PSCredential	The *AuthenticationCredential* parameter specifies a credential object. This credential object is created by using the **Get-Credential** cmdlet. For more information about the **Get-Credential** cmdlet, enter **Get-Help Get-Credential** in the Exchange Management Shell.
CloudServicesMailEnabled	Optional	System.Boolean	Set to `$true` to enable this connector to send messages to the cloud service.

Comment	Optional	System.String	The *Comment* parameter specifies an optional comment. If you specify a value that contains spaces, enclose the value in quotation marks ("), for example: "This is an admin note".
Confirm	Optional	System.Management.Automation.SwitchParameter	The *Confirm* switch causes the command to pause processing and requires you to acknowledge what the command will do before processing continues. You don't have to specify a value with the *Confirm* switch.
ConnectionInactivityTimeOut	Optional	Microsoft.Exchange.Data.EnhancedTimeSpan	The *ConnectionInactivityTimeOut* parameter specifies the maximum time an idle connection can remain open. The default value is ten minutes. To specify a value, enter it as a time span: dd.hh:mm:ss where d = days, h = hours, m = minutes, and s = seconds. For example, to specify

			fifteen minutes, set it to `00:15:00`. The valid input range for this parameter is `00:00:01` to `1.00:00:00`.
Custom	Optional	System.Management.Automation.SwitchParameter	The *Custom* parameter specifies the `custom` usage type. The usage type specifies the permissions and authentication methods assigned to the Send connector. If you use the *Custom* parameter, you can't use any of the following parameters: • *Internal* • *Internet* • *Partner* • *Usage* For more information about Send connector usage types, permissions, and authentication methods, see Send connectors.
DNSRoutingEnabled	Optional	System.Boolean	The *DNSRoutingEnabled* parameter specifies whether the Send connector uses Domain Name System (DNS) to route mail. Valid values for this parameter are

			`$true` or `$false`. The default value is `$true`. If you specify a *SmartHosts* parameter, the *DNSRoutingEnabled* parameter must be `$false`.
DomainController	Optional	Microsoft.Exchange.Data.Fqdn	The *DomainController* parameter specifies the fully qualified domain name (FQDN) of the domain controller that writes this configuration change to Active Directory. The *DomainController* parameter isn't supported on Edge Transport servers. An Edge Transport server uses the local instance of Active Directory Lightweight Directory Services (AD LDS) to read and write data.
DomainSecureEnabled	Optional	System.Boolean	The *DomainSecureEnabled* parameter enables mutual Transport Layer Security (TLS) authentication for the domains serviced by the Send connector when

			set to `$true`. Mutual TLS authentication functions correctly only if the following conditions are met: • *DomainSecureEnabled* is set to `$true`. • *DNSRoutingEnabled* is set to `$true`. • *IgnoreSTARTTLS* is set to `$false`. The wildcard character (*) isn't supported in domains configured for mutual TLS authentication. The same domain must also be defined on the corresponding Receive connector, and in the value of the *TLSReceiveDomainSecureList* attribute of the transport configuration. The default value for the *DomainSecureEnabled* parameter is `$false` for the following types of Send connectors: • Those defined in the Transport service on a Mailbox server. • User-created Send

			connectors defined on an Edge server. The default value is `$true` for a default Send connector defined on an Edge server.
Enabled	Optional	System.Boolean	The *Enabled* parameter specifies whether to enable the Send connector to process email messages. Valid values are `$true` or `$false`. The default value is `$true`.
ErrorPolicies	Optional	Microsoft.Exchange.Data.ErrorPolicies	The *ErrorPolicies* parameter specifies how communication errors are treated. Possible values are the following: • `Default` A non-delivery report (NDR) is generated for communication errors. • `DowngradeDnsFailures` All DNS errors are treated as transient. • `DowngradeCustomFailures` Particular SMTP errors are treated as transient. • `UpgradeCustomFailures` Custom transient failures are upgraded and treated as permanent failures. Multiple values can be

			specified for this parameter, separated by commas. Specify a value other than `Default` for this parameter only if this Send connector is used to send messages over a reliable and well-defined communication channel where communication errors aren't expected. For example, consider specifying a value other than `Default` if this Send connector is used to send messages to a partner.
Force	Optional	System.Management.Automation.SwitchParameter	The *Force* switch specifies whether to suppress warning or confirmation messages. This switch can be used when the task is run programmatically and prompting for administrative input is inappropriate. If the *Force* switch isn't provided in the command, you're prompted for administrative input. You don't have to specify a value with this parameter.

ForceHELO	Optional	System.Boolean	The *ForceHELO* parameter specifies whether HELO is sent instead of the default EHLO. Valid values are `$true` or `$false`. The default value is `$false`.
Fqdn	Optional	Microsoft.Exchange.Data.Fqdn	The *Fqdn* parameter specifies the FQDN used as the source server for connected messaging servers that use the Send connector to receive outgoing messages. The value of this parameter is displayed to connected messaging servers whenever a source server name is required, as in the following examples: • In the EHLO/HELO command when the Send connector communicates with the next hop messaging server • In the most recent `Received` header field added to the message by the next hop messaging server after the message leaves the Transport service on a Mailbox server or an

			Edge server • During TLS authentication The default value of the *Fqdn* parameter is `$null`. This means the default FQDN value is the FQDN of the Mailbox server or Edge server that contains the Send connector.
FrontendProxyEnabled	Optional	System.Boolean	The *FrontendProxyEnabled* parameter routes outbound messages through the CAS server, where destination specific routing, such as DNS or IP address, is set, when the parameter is set to `$true`.
IgnoreSTARTTLS	Optional	System.Boolean	The *IgnoreSTARTTLS* parameter specifies whether to ignore the StartTLS option offered by a remote sending server. This parameter is used with remote domains. This parameter must be set to `$false` if the *RequireTLS* parameter is set to `$true`. Valid values for this parameter are `$true` or `$false`.

Internal	Optional	System.Management.Automation.SwitchParameter	The *Internal* parameter specifies the `Internal` usage type. The usage type specifies the permissions and authentication methods assigned to the Send connector. If you use the *Internal* parameter, you can't use any of the following parameters: • *Custom* • *Internet* • *Partner* • *Usage* For more information about Send connector usage types, permissions, and authentication methods, see Send connectors.
Internet	Optional	System.Management.Automation.SwitchParameter	The *Internet* parameter specifies the `Internet` usage type. The usage type specifies the permissions and authentication methods assigned to the Send connector. If you use the *Internet* parameter, you can't use any of the following parameters:

			• *Custom* • *Internal* • *Partner* • *Usage* For more information about Send connector usage types, permissions, and authentication methods, see Send connectors.
IsScopedConnector	Optional	System.Boolean	The *IsScopedConnector* parameter specifies the availability of the connector to other Mailbox servers with the Transport service. When the value of this parameter is `$false`, the connector can be used by all Mailbox servers in the Exchange organization. When the value of this parameter is `$true`, the connector can only be used by Transport service on Mailbox servers in the same Active Directory site. The default value is `$false`.
MaxMessageSize	Optional	Microsoft.Exchange.Data.Unlimited	The *MaxMessageSize* parameter specifies the maximum size of a

			message that can pass through a connector. The default value is 25 MB. When you enter a value, qualify the value with one of the following units: • `B` (bytes) • `KB` (kilobytes) • `MB` (megabytes) • `GB` (gigabytes) • `TB` (terabytes) Unqualified values are treated as bytes. Values entered in bytes are rounded up to nearest kilobyte. The valid input range for this parameter is 0 to 2147483647 bytes. To remove the message size limit on a Send connector, enter a value of `unlimited`.
Partner	Optional	System.Management.Automation.SwitchParameter	The *Partner* parameter specifies the `Partner` usage type. The usage type specifies the permissions and authentication methods assigned to the Send connector. If you use the *Partner* parameter, you can't use any of the following parameters:

			• *Custom* • *Internal* • *Internet* • *Usage* For more information about Send connector usage types, permissions, and authentication methods, see Send connectors.
Port	Optional	System.Int32	The *Port* parameter specifies the port number for smart host forwarding, if you specify a value in the *SmartHosts* parameter. The valid input range is an integer from 0 through 65535. The default value is 25. In most organizations, the port number is set to 25.
ProtocolLoggingLevel	Optional	Microsoft.Exchange.Data.ProtocolLoggingLevel	The *ProtocolLoggingLevel* parameter specifies whether to enable protocol logging. `Verbose` enables protocol logging. `None` disables protocol logging. The location of the Send connector protocol logs for all Send connectors configured in the Transport service on a

			Mailbox server or on an Edge server is specified with the *SendProtocolLogPath* parameter of the **Set-TransportService** cmdlet.
RequireOorg	Optional	System.Boolean	This parameter is reserved for internal Microsoft use.
RequireTLS	Optional	System.Boolean	The *RequireTLS* parameter specifies whether all messages sent through this connector must be transmitted using TLS. The default value is `$false`.
SmartHostAuthMechanism	Optional	Microsoft.Exchange.Data.Directory.SystemConfiguration.SmtpSendConnectorConfig+AuthMechanisms	The *SmartHostAuthMechanism* parameter specifies the smart host authentication mechanism to use for authentication with a remote server. Use this parameter only when a smart host is configured and the *DNSRoutingEnabled* parameter is set to `$false`. Valid values are `None`, `BasicAuth`, `BasicAuthRequireTLS`, `ExchangeServer`, and `ExternalAuthoritative`.

			All values are mutually exclusive. If you select `BasicAuth` or `BasicAuthRequireTLS`, you must use the *AuthenticationCredential* parameter to specify the authentication credential.
SmartHosts	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SmartHosts* parameter specifies the smart hosts the Send connector uses to route mail. This parameteris required if you set the *DNSRoutingEnabled* parameter to `$false` and it must be specified on the same command line. The *SmartHosts* parameter takes one or more FQDNs, such as `server.contoso.com`, or one or more IP addresses, or a combination of both FQDNs and IP addresses. If you enter an IP address, you must enter the IP address as a literal. For example, `10.10.1.1`. The smart host identity can be the FQDN of a smart-host server, a mail exchanger (MX) record, or an address

			(A) record. If you configure an FQDN as the smart host identity, the source server for the Send connector must be able to use DNS name resolution to locate the smart-host server. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
SmtpMaxMessagesPerConnection	Optional	System.Int32	The *SmtpMaxMessagesPerConnection* parameter specifies the maximum number of messages the

			server can send per connection.
SourceIPAddress	Optional	System.Net.IPAddress	The *SourceIPAddress* parameter specifies the local IP address to use as the endpoint for an SMTP connection to a remote messaging server. The default IP address is `0.0.0.0`. This value means that the server can use any available local IP address. This parameter is valid only for Send connectors configured on an Edge server.
SourceTransportServers	Optional	Microsoft.Exchange.Data.MultiValuedProperty	The *SourceTransportServers* parameter specifies the names of the Mailbox servers that can use this Send connector. This parameter isn't valid for Send connectors configured on an Edge server. To enter multiple values and overwrite any existing entries, use the following syntax: `<value1>,<value2>...`. If the values contain spaces

			or otherwise require quotation marks, you need to use the following syntax: `"<value1>","<value2>"...` To add or remove one or more values without affecting any existing entries, use the following syntax: `@{Add="<value1>","<value2>"...; Remove="<value1>","<value2>"...}`.
TlsAuthLevel	Optional	Microsoft.Exchange.Data.TlsAuthLevel	The *TlsAuthLevel* parameter specifies the TLS authentication level that is used for outbound TLS connections established by this Send connector. Valid values are: • `EncryptionOnly`: TLS is used only to encrypt the communication channel. No certificate authentication is performed. • `CertificateValidation`: TLS is used to encrypt the channel and certificate chain validation and revocation lists checks are performed. • `DomainValidation`: In addition to channel

			encryption and certificate validation, the Send connector also verifies that the FQDN of the target certificate matches the domain specified in the *TlsDomain* parameter. If no domain is specified in the *TlsDomain* parameter, the FQDN on the certificate is compared with the recipient's domain. You can't specify a value for this parameter if the *IgnoreSTARTTLS* parameter is set to `$true`, or if the *RequireTLS* parameter is set to `$false`.
TlsCertificateName	Optional	Microsoft.Exchange.Data.SmtpX509Identifier	The *TlsCertificateName* parameter specifies the X.509 certificate to use with TLS sessions and secure mail. Valid input for this parameter is `[I]`*Issuer*`[s]`*Subject*. The *Issuer* value is found in the certificate's `Issuer` field, and the *Subject* value is found in the certificate's `subject` field. You can find these values by running the **Get-ExchangeCertificate**

			cmdlet.
TlsDomain	Optional	Microsoft.Exchange.Data.SmtpDomainWithSubdomains	The *TlsDomain* parameter specifies the domain name that the Send connector uses to verify the FQDN of the target certificate when establishing a TLS secured connection. This parameter is used only if the *TlsAuthLevel* parameter is set to `DomainValidation`. A value for this parameter is required if: • The *TLSAuthLevel* parameter is set to `DomainValidation`. • The *DNSRoutingEnabled* parameter is set to `$false` (smart host Send connector).
Usage	Optional	Microsoft.Exchange.Management.SystemConfigurationTasks.NewSendConnector+UsageType	The *Usage* parameter specifies the default permissions and authentication methods assigned to the Send connector. The valid values are as follows: `Custom`, `Internal`, `Internet`, or `Partner`. The default is `Custom`.
